Foreword

Dear Guests;

Welcome to International Science and Technology Conference, ISTEC, International Distance Education Conference, IDEC, International Trends and Issues in Communication & Media Conference, ITICAM & International Teacher Education Conference, ITEC.

Every year conferences are held at different locations around the world. This year we are in St. Petersburg/Russia. Here is the content of each one of conferences:

International Science and Technology Conference, ISTEC, is a multidisciplinary meeting in fields of science and technology. The talks range from historical restoration projects to frontiers of science.

International Distance Education Conference, IDEC, is about distance education and multitude of ways to improve the structure and quality of learning process.

International Trends and Issues in Communication & Media Conference, ITICAM, hosts a multitude of contributions as regards latest trends in communication and media.

International Teacher Education Conference, ITEC, is a platform where attendees can discuss latest trends in education.

These conference are now well-known events and the number of paper submissions and attendees are increasing every year. During the sessions, the participants will share their knowledge, research and experiences with us. They also talk about the recents developments in these fields.

We hope that we will meet again.

Thank you for your participations and contributions for the success of this conference.

ISTEC 2016 Organizing Committee

Honorary

Prof. Dr. Elaine P. MAIMON, President, Governor State University, United States

Prof. Dr. Gwo-Dong CHEN**,** President, National Central University Chung-Li, Taiwan

Prof. Dr. Muzaffer ELMAS, President, Sakarya University, Turkey

Prof. Dr. Sabine SEIDLER**,** President, Technische Universität Wien, Austria

General Coordinator

Prof. Dr. Aytekin İŞMAN, Dean, Sakarya University, Turkey

ISTEC Coordinators

Prof. Dr. Mustafa Şahin DÜNDAR, Sakarya University, Turkey

Prof. Dr. Colleen SEXTON, Governors State University, United States

Prof. Dr. Hellmuth STACHEL, Vienna University of Tecnology, Austria

Prof. Dr. Carlos De Sousa REIS**,** Coimbra University, Portugal

Prof. Dr. Douglas FRANKLIN**,** Ohio University, United States

Prof. Dr. Paolo Di Sia**,** University of Verona, Italy

ISTEC Associate Coordinators

Assist. Prof. Dr. Engin CAN, Sakarya University, Turkey

Assist. Prof. Dr. İrfan ŞİMŞEK, Istanbul University, Turkey

ISTEC Conference Secretary

Res. Assist. Hüseyin ESKİ, Sakarya University, Turkey

[2]-ROTAXANE & [2]-CATENANE FORMATION FROM ARENE RUTHENIUM COMPLEXES

Benan Kilbaş
bkilbas@gmail.com

Supramolecules formed by intermolecular interactions of covalently bonded molecules are thermodynamically stable compounds. Traditionally, supramolecules have been mostly generated by organic receptors. More recently, coordination directed self-assembly of transition metal and multi-topic ligands have been well established for the formation of metallasupramolecules due to the predetermined shapes and geometries. Catenane is a type of ring in ring system whereas rotaxane is formed by an axle and rod. Adressed herein, [2]-rotaxane and [2]-catenane supramolecules were successfully exhibited by arene ruthenium complexes.

Keywords: Arene ruthenium complexes, catenane, rotaxane.

9TH GRADE STUDENTS' AWARENESS AND MISCONCEPTIONS ABOUT THE ENVIRONMENTAL RELATED CONCEPTS

Uçal Özel [a], Ayşe Yalçın Çelik [b], Nejla Gültepe [c], Ziya Kılıç [b]

[a] *Şehit Sertac Uzun Vocational and TechnicalAnatolian High School, Ankara, Turkey*

[b] *Faculty of Education, Department of Science and Mathematics Education, Gazi University, Ankara, Turkey*

[c] *Faculty of Education, Department of Science Education, Dumlupınar University, Kütahya, Turkey*

ucalankara@hotmail.com

Students generally get scientific knowledge about environmental issues from the curriculum courses in schools, teachers and books, and their environment1, and from the printed and visual media2,3 in recent years. Their influence is great on the development of students' own concepts and unfortunately these concepts usually differ from scientific view4,5.The awareness and misconceptions of students about the environmental related concepts such as greenhouse effect and global warming, acid rain, ozone layer depletion and factors destroying our habitat were investigated in this study. 340 students in a high school located in Ankara were subjected to a 27 question Likert type survey and a 20- questioned five choice test. The evaluation of the answers revealed that the students were aware of these environmental concepts however they had non-scientific rumor type opinions. But, after being taught with constructivist method, their opinions relating to the environmental issues changed in correct direction.

Keywords: greenhouse effect, global warming, acid rain, ozone layer depletion

Abstract: Nowadays, energy and source requirements are significant issues, as in the past. Besides, renewable energy sources that especially hybrid energy systems and their usages have been very popular in recent years because of a lot of reasons. In this study, efficiency of solar-Hydro Electric (SHE) is compared with hydro energy and solar energy systems and a case situation is computed with real data and it is clarified the efficiency, generation, cost and available credibility items of system in Turkey. Energy efficiency, systems cost, investment repayment period, operation expenditures, available energy credibility and optimum energy costs are computed and shown in study. Electricity generation of solar is calculated by PVsyst program. Generation and capacity utilization rates of systems are shown in graphics.

Keywords: SHE (Solar-Hydroelectric), Energy Efficiency, Energy Credibility, Distributed Energy Systems

Introduction

Nowadays, energy and source requirements are significant issues, as in the past. It is a usual application that restriction of the transformer capacity as 30% for renewable energy in most countries. It has become a necessity for supplying system stability and quality. But this situation is limited for renewable energy investments. A new transformer building and its infrastructure costs are very expensive. So, productive usage of transformer is more effective than build a new one. Hybrid systems like SHE (Solar-Hydroelectric) is aim to provide this efficiency. Despite a lot of scientific studies can be finds about hybrid energy systems, there are a few studies about SHE (solar-Hydro Electric) in literature. Hybrid system applications are steadily increased in Turkey, but there is no SHE application. So, in this study, a case situation is computed with real data and it is clarified the efficiency, generation, cost and available credibility items of system in Turkey.

Most of the researches are about water pumping which using solar energy for irrigation. One of them was released by Dursun and Özden (2014). Also, most of them are about off grid systems and generally solar and wind energy is used as integrated system for hybrid systems. Some SHE (Solar-Hydroelectric) studies in recent years is started all over the World. It could not have done yet at any project in Turkey.

It is mentioned in many articles about solar and Hydro Electric, in recent years. Some of them are Glasnovic and Margeta (2009), called their Project as SHE (Solar-Hydroelectric) which is tested in Croatia. They have explained that the system is not only an applicable project but also a complementary system. Bekele and Tadesse (2012) studied hydro-wind-solar in 6 different area of Ethiopia and published their article. Glasnovic and Margeta (2010), studied about solar-hydroelectric system for Europe. They offered a mathematical model for finding the optimum point of system's installed capacity. It is stated in their study that solar-hydroelectric is a good approach for management of electric generation due to their generation time. Kusakana and Jimoh (2009) stated that solar-hydroelectric systems are low-cost type project and it is so useful for rural zone. And solar-hydroelectric systems are compared with other renewable energy systems. Meshram and et. al (2013), analyzed on grid solar-hydroelectric system performance. It is stated in study that solar-hydroelectric system is reducing the complexity and cost. Sirasani and Kamdi (2013), studied about hybrid system which is occurred wind, solar and hydroelectric. It is investigated multiple effects on systems like social, environmental, affordability and efficiency. It is offered in study that solar-hydroelectric systems should be extended. A solution is searched in Afify's (2014) study by using solar and hydroelectric system for Qattara zone of Egypt.

There are a lot of methods for supplying lack of energy. The solar-hydro is one of them and it has been examined since 2000. But, these studies are about separate energy system for hydro and solar. It is stated in these studies, solar and hydroelectric systems are located in different places, but use same infrastructure for on grid. There are

 Copyright © International Science and Technology Conference (ISTEC)

a few applications which using hydro energy structures to establish SPP. Generally reservoir area of HEPP is used for SPP plants.

Materials and Methods

Turkey is not a rich country in term of water resources. Most of the water resources of Turkey are depended to rainfall. The capacity utilization rate of HEPP (hydroelectric power plant) is between 25-40% in Turkey. Generally, electric generation of HEPP is more than average in spring and less than average in summer time in Turkey. According to the January 2016 data, 559 HEPPs in operation and total installed capacity is 26,136 MW. Average electric generation of Hydro Electric is 70,000 GWh and capacity utilization rate is about 35%. Turkey is located in a relatively advantageous geographical situation about solar radiation. Capacity utilization rate of SPP (solar power plant) is between 15-20% in Turkey. Generally, electric generation of SPP is more than average in summer time. Approved and commissioned SPP projects by TEDAŞ-TEDC (Turkish Electricity Distribution Corporation-until January 2016) are given in Table 1.

Table 1: Approved and commissioned SPP projects by TEDAŞ-TEDC

	Quantity	**Installed Capacity (kW)**
Approved SPP	2,748	2,544,816
Commissioned SPP	384	259,748

Allocated transformer capacity is limited for renewable energy in Turkey. Individually capacities are allocated for hydro and solar energy. Most of the investors wanted to enterprise renewable energy. But they cannot do it, because there is no suitable transformer capacity. Indeed hydro energy and solar energy are complemented each other, because of natural generation time. HEPP is not generated more electricity in summer. On the contrary summer time is the highest electricity generation time of SPP. So, they are complemented each other naturally and they do not need to a separate transformer capacity. Same transformer utilization can be possible for SHE (Solar-Hydroelectric) systems. It is a natural compensation for electricity generation and it is an efficiency system. Generation, cost, efficiency and credibility items are examined in this study.

A HEPP project is chosen for case study which is located in Siirt province of Turkey. In this study, cost, generation, capacity utilization rate and credibility items of solar system, hydroelectric system and solar-hydroelectric system are compared with each other. It is shown that solar-hydroelectric system is the best offer for the matter in hand.

HEPP Project characteristics are given in Table 2.

Table 2: Project characteristics

Project Characteristics	
Installed Capacity	12.78 MW
Turbines Type	Francis–horizontal axis
Gross Height	41.26 m
Net Height	40.85 m
Drainage Area	1,077.6 km^2
Dam Volume	1 hm^3
Project Flow	36 m^3/s
Average Flow	12.42 m^3/s
Canal Type	Trapeze
Base-Width of Canal	5 m
Height of Canal	3 m
Long of Canal	8,200 m

HEPP project has 12.78 MW transformer capacities that had been given permission by authorities. So, a system is planned to design that under limit of transformer and used same infrastructure. 100 Wp First Solar FS-3100-PLUS model solar panel and SMA Sunny Central 850 CP XT model inverter are used in design. 14.80 MW SPP can be assembled on canal which is 8,200 m length and 11 m surface width. SPP and HEPP can be using same infrastructure of grid and transformer. This is the main aim of solar-hydroelectric system. So, solar-hydroelectric system offers energy efficiency and transformer capacity and do not need a new ones. 14.80 MWdc and 12.75

 Copyright © International Science and Technology Conference (ISTEC)

MWac is planned to installed capacity of SPP. 12.75 MWac is preferred as installed capacity, because of HEPP's 12.78 MW transformer capacity. It is allocated to the HEPP by Electricity Distribution Corporation.

The credibility, cost, electric generation and capacity utilization rate of SPP, HEPP and SHE (solar-hydroelectric) was calculated in this study. HEPP's electric generation is calculated from formula and SPP's electric generation was calculated by PVsyst energy program. Acceptances of SPP, HEPP and SHE Project is given below;

- 1 USD = 3 Turkish Liras
- Ignore the promotion of deductible VAT, accounting ETL(energy transmission line) and the other promotions which are accepted by Turkish Government
- Same balance-sheet and financial data are accepted for SPP, HEPP and SHE projects
- Canal is covered by solar panels which is 8,200 m lengthy
- No land acquisition, ETL and on grid system infrastructure is accepted to solar part of SHE system. All infrastructure and land is common in SHE project
- SPP's electric generation is calculated by PVsyst program
- 39 years flow data are used in HEPP's electric generation calculation which is obtained in 1972-2010
- 0.073 USD is accepted for SPP and 0.133 USD is accepted for HEPP as unit price of revenue
- Annual 5% interest rate, 1.1 solvency, 2 years nonpayment and 10 years loan term are accepted as criteria of credibility for systems

Transform of Solar radiation to electric is termed as photovoltaic effect. Photovoltaic cell is the main equipment of SPP. The photovoltaic module is a form of cell series. And the photovoltaic array is a form of series-parallel combination (Ayyoubi, 2009, Said, 2003, İbrahim, 2009). A solar cell can be represented as a current model as simplified equivalent circuit of photovoltaic cell shown in Figure 1.

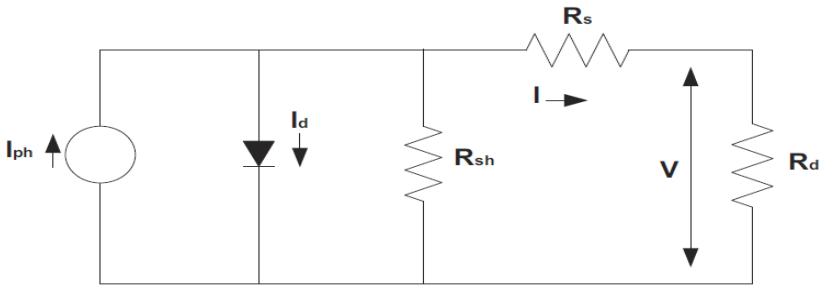

Figure 1. Simplified equivalent circuit of photovoltaic cell

The typical I-V characteristic of a PV array is given by the following in Equation 1. (Hussein, 1995);

$$I = Np.Iph - Np.Id.e^{\left(\frac{q}{kTA}X\frac{V}{Ns}\right)-1} \quad (1)$$

where, I is the photovoltaic array output current (A), Iph is the photo current, Np is the number of modules connected in parallel, Id is the cell reverse saturation current, q is the charge of an electron, V is the photovoltaic array output voltage (V), k is the Boltzman's constant, T is the cell temperature, A is the pn junction ideality factor, Ns is the number of cells connected in series, The factor 'A' determines the cell deviation from the ideal pn junction characteristic; it ranges from 1 to 5, 1 being the ideal value (Khallat, 1986).

The cell reverse saturation current I_d versus to temperature was given by in Equation 2. (Vachtsevanos, 1987);

$$Id = Ic.[\frac{T}{Tc}]^3.e^{(\frac{qEg}{kA}[\frac{1}{Tc}-\frac{1}{T}])} \quad (2)$$

where, Ic is the reverse saturation, Tc is the cell reference temperature, current at Tc, and Eg is the band gap energy of the semiconductor used in the cell. The photo current Iph depends on the solar radiation and the cell temperature as given by in Equation 3.

$$Iph = [Iscr + Ki.(T - Tc)].\frac{S}{100} \quad (3)$$

 Copyright © International Science and Technology Conference (ISTEC)

where Iscr is the cell short circuit current at reference temperature and radiation, Ki is the short circuit current temperature coefficient, and S is the solar radiation in mW/cm^2. The PV array power can be calculated by Equation 4.

$$P = I \,.\, V \qquad (4)$$

$$P = V.Np.(Iph - Id).e^{\left(\frac{q}{kTA}X\frac{V}{Ns}\right)-1} \qquad (5)$$

Hydroelectric energy generation formulas are given in below Equation 6.

$$N = \varrho \,.\, g \,.\, \mu \,.\, Q \,.\, H \qquad (6)$$

where, N is the power (MW), ϱ is the water density (1000 kg/m^3), g is the gravity (9.81 m/s^2), μ is the efficiency of plant (multiplications of turbine, generator and transformer's efficiencies), Q is the project flow (m^3/s), H is the height of project (m).

Results and Discussion

HEPP transformer capacity (power) is 12.78 MW. Capacity Utilization Rate of HEPP is 33.37%. Capacity Utilization Rate of SPP is 22%. And Capacity Utilization Rate of SHE is 55.23%. So, most part of transformer capacity is useless in HEPP and SPP projects. SHE system is more effective than HEPP and SPP.

SPP and HEPP Projects have to use 2 separate transformer to connect grid. But a transformer is adequate in SHE system. New transformer investment is unnecessary in SHE systems. So, SHE systems can be called as efficient projects. Tables and graphics are obtained from studies is given below.

Table 3: Monthly electric generation summary table for three different position (kWh)

	Electric Generation (kWh)			
Months	**HEPP**	**SPP**	**SHE**	**Installed Cap.-12.78 MW**
Oct.	2,172,229	2,076,000	4,248,229	9,329,400

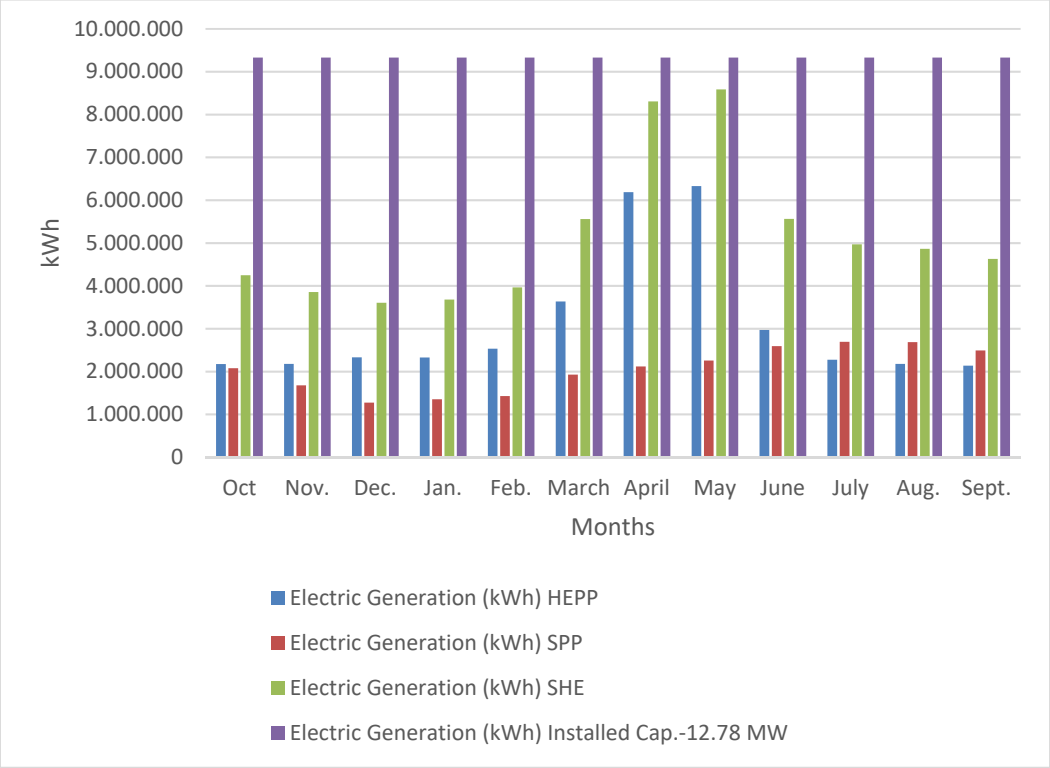

Figure 2: Monthly electric generation summary graphic of 3 different position (kWh)

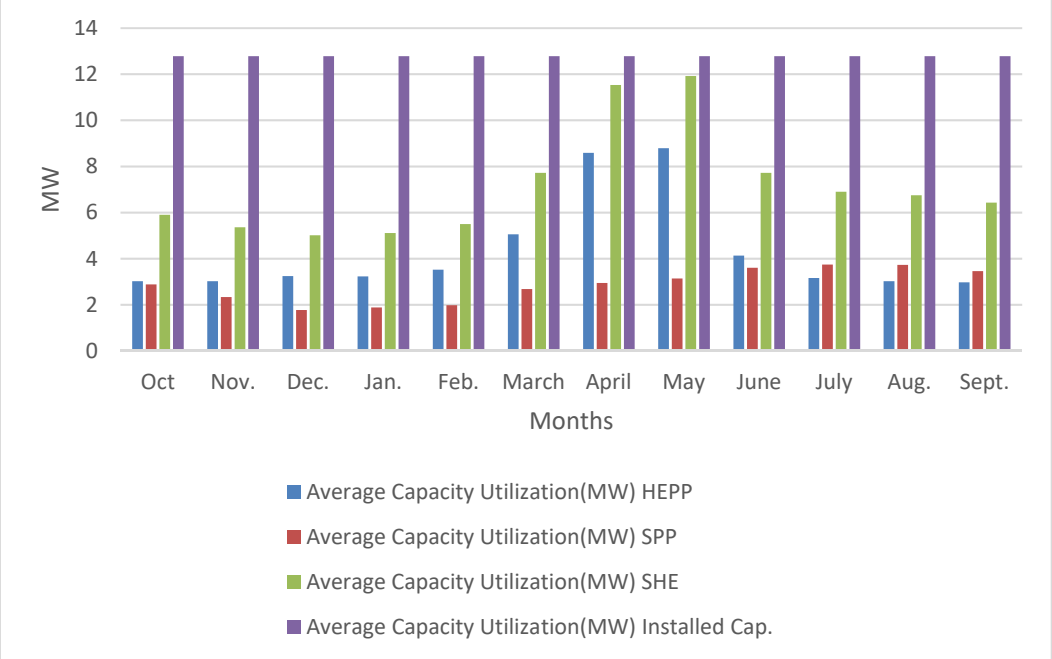

Figure 3: Average capacity utilization of 3 different position obtained from electricity generation (MW)

Reservoir area of HEPP and 8,200 m length storage capacity is about 8 hours in case study. Seasonal electricity generation discrepancy can be monitored in HEPP system because of rainfall dependence. Energy can be managed in SHE systems. Solar part of SHE system is generates electric only daytime. HEPP has enough storage capacity for interrupted electricity generation. The main idea of SHE system is efficiency usage of transformer capacity and interrupted electricity generation. A sample energy management of SHE system is given Figure 4 for a day.

 Copyright © International Science and Technology Conference (ISTEC)

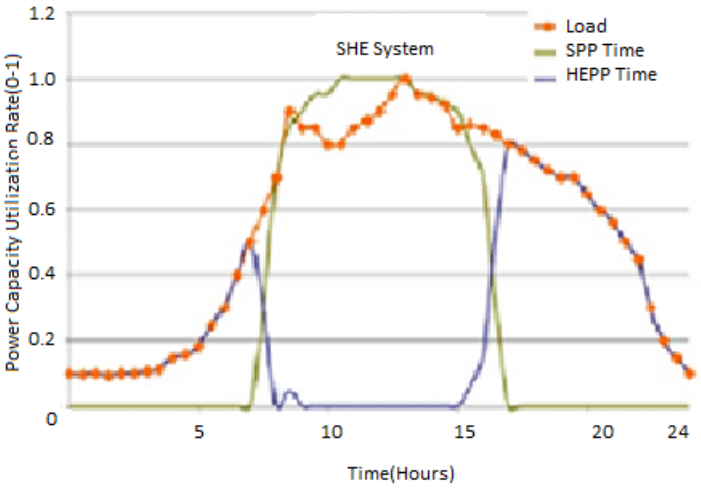

Figure 4: A Sample energy management of she for a day (Sunengy diagram)

Conclusion

Summary of SHE system is given in Table 5;

Table 5: Summary of case study

Items/Plants	HEPP	SPP	SHE
Electricity Generation (kWh)	37,250,000	24,576,000	61,826,000
Power Capacity Utilization Rate (%)	33.37	22	55.23
Total Fixed İnvestment Cost (USD)	16,600,000	17,750,000	33,460,000
General Investment Cost (USD)	17,781,072	18,324,991	35,170,538
Annual Operation Income (USD)	2,719,250	3,268,608	5,987,858
Annual Operation Expenditure (USD)	515,000	485,000	715,000
Project Credit Amount (USD)	10,750,000	15,750,000	31,000,000
Credibility - (%)	60.46	85.95	88.14
Recycling Period (years)	8.07	6.58	6.66

As a result of this study it can be concluded below;

- It is a usual application that restricts the transformer capacity as 30% for renewable energy in most countries. It has become a necessity for supplying system stability and quality. But this situation is limited the renewable investments. Transformer capacity is vital for renewable energy investments. An average capacity utilization rate of HEPP is 25-40% and capacity utilization rate of SPP is 15-20%. So, great part of transformer capacity is useless in single-handed energy transformer capacity like HEPP or SPP. HEPP and SPP are complementary systems actually, because of electricity generation time period. Solar part of SHE systems can be generated more energy in summer when hydroelectric generation is so limited and contrary to this hydroelectric part of SHE systems can be generated more energy in spring when SPP's electricity generation is so limited. And if a HEPP has got enough storage flow capacity, it can generate energy at night when generation is impossible for SPP. So, efficiency transformer capacity and interrupted energy generation can be supplied by SHE systems. With correct energy management capacity utilization rate of SHE can be between the ranges of 40-60%.
- SPP projects use 20,000 m^2 land for per 1 MW installed capacity. In addition, investor has to get dry marginal agricultural land permission. In SHE system, investors do not need to extra land and permission for activating the plant. It is time and Money saving part of SHE systems.
- Separately plants like HEPP or SPP is more expensive than SHE systems. SHE systems offered low-cost investment and operation expenditures because of common usages.
- There is a lot of credit loan about renewable energy. Generally International Banks like World Bank is evaluated this system with suitable lines. So, credibility of efficiency SHE system is higher than separately plants like HEPP or SPP.
- Equity is the most important part of investments. Many investors avoid from high equity investments. It is clear from table 5 that SHE systems offer minimum equity and maximum credibility. An investor can spend more money to HEPP, than SHE system. So, it is understood that SHE system is the smartest choice for investors.

A COMPARATIVE PERSPECTIVE ON WOMEN IN THE 19TH CENTURY THROUGH LITERATURE

Zuhal Eroğlu*

Uludağ University, Department of Turkish Language and Literature, Bursa, Turkey

zuhaleroglu@uludag.edu.tr

Abstract: 19th century is a very hot period in terms of scientific developments, economical and sociological transformations. Accordingly, the economic and social conditions of people were changing dramatically. Yet, no doubt that it was a patriarchal society and that the stage belonged to men even though women gradually started to appear on the stage as well. There were *Great Expectations*, hopes and fights for the future among men. Even after the fact that women's rights started to be advocated, the approach towards women did not really change easily. Although their existence in society was visible now, its limits were smartly drawn. Literature has a very interesting role here because it both helped women to enlarge their world and drew the line of the individuality at the same time. The depictions of women in the narratives of the male authors in this period show how it works. In this paper I am going to analyze two novels from two different cultures: *The Blue and the Black* (*Mai ve Siyah*) by Halid Ziya Uşaklıgil and *Great Expectations* by Charles Dickens. In these novels we can see both the world of women in this period vis-à-vis men and how literature works to draw the line for women socially and economically.

Keywords: 19th century, women, men, literature

19th century is a very hot period in terms of scientific developments, economical and sociological transformations. Although it has been a long process which has started long before, 19th century was the peak. The economic and social conditions of people were changing dramatically. Yet, no doubt that it was a patriarchal society and that the stage belonged to men even though women started to appear on the stage as well. There were *Great Expectations*, hopes and fights for the future among men. Anyone could come up in the world through education, hard work and passion. Nothing was stable now, as Karl Marx manifested for the era that "all that is solid melts into air."

Yet it cannot be ignored the fact that this is also the period that women are accepted as individuals who have some rights. Even after the fact that their rights started to be advocated, the approach towards women did not really change easily. Although their existence in society was visible now, its limits were smartly drawn. Literature has a very interesting role here because it both helped women to enlarge their world and drew the line of the individuality at the same time. The depictions of women in the narratives of the male authors in this period show how it works. In this paper I am going to analyze two novels from two different cultures: *The Blue and the Black* (*Mai ve Siyah*) by Halid Ziya Uşaklıgil and *Great Expectations* by Charles Dickens. The reason I chose these novels is to have a comparative perspective between different cultures, one of which is my country and the other is one of the representatives of the West, which is also one of the role models of Turkey at the time. Though French literature was more effective on Turkish writers at the time, what is more the protagonist in *The Blue and the Black* is fascinated by French poets, I preferred to compare the novel with one from English literature because of the analogy between the two novels regarding both the conditions and positions of characters and the external reality the novels depict. Analyzing these novels, I want to show the positions of women in society vis-a-vis men.

The Blue and the Black is a novel written in 1897. It depicts the era from Ahmet Cemil's point of view. Ahmet Cemil, the protagonist of the novel, is a student in The Military School. He has high expectations for the future: being a famous poet who has an eloquent and avant-garde style. After his father died, however, being the only man in the family he has no choice but to leave the school in order to put bread on the table for his family. He makes his living from translating books and tutoring children of wealthy families. Then he begins to work in a newspaper. Meanwhile, he works passionately for his masterwork which he believes that it will bring fame to him. One day the owner of the newspaper dies and his son, Vehbi Effendi starts to head it. Dreaming of being the owner of the newspaper and of being wealthy one day, Ahmet Cemil weds his sister to Vehbi Effendi. After then he believes that Lamia, sister of Ahmet Cemil's best friend Hüseyin Nazmi, would marry him. Yet his dreams and plans do not come true. First Vehbi Effendi starts to live with them and behaves badly to his sister

 Copyright © International Science and Technology Conference (ISTEC)

and to all family. He runs into debt and mortgages the house inherited from his father. His sister, İkbal dies in misery. Furthermore, his masterpiece, contrary to his expectations, is mortified just in his own newspaper and he gets fired by Vehbi Effendi. Finally, he learns that Hüzeyin Nazmi, his idol in life moves to Europe as a principal officer and Lamia is engaged to a military officer. After his blue dreams turned into black realities, he decides to leave the city with his mother and heads for the east, on the contrary to his ideals.

Great Expectations, written in 1861, is also about a young man who has *Great Expectations* which he loses throughout the book. Pip, a seven-year-old orphan boy, lives with his sister who is always angry and hot tempered and with her husband Joe Gragery, a blacksmith. Sitting in a cemetery one evening he encounters an escaped convict. He orders some food and a file for his leg iron. The next day, he is recaptured with another escaped convict who came after him. One day his uncle Pumblechook takes Pip to Miss Havisham's Satis Hous to play with her adopted daughter Estella. Miss Havisham is a strange woman who lives in a strange house. She still wears her old wedding dress, the clocks stopped at the same time and the house is untouched since the wedding day on which her fiancé jilted her. Although Pip is always insulted by Miss Havisham and Estella being common and coarse, he continues to visit them because he falls in love with Estella. He begins to dream to be a gentleman admired by Estella. Miss Havisham, however, sends him back for his indenture as a blacksmith. Four years later in a pub a man whom Pip once saw in Miss Havisham's mansion, tells him that he is to be given monthly stipend by a secret benefactor. Thinking his benefactor is Miss Havisham he goes to London in order to be a gentleman. Years later, however, he learns the fact that his benefactor was the escaped convict, Magwitch. He is disappointed with the truth but at the end he acknowledges it and asks Joe and Biddy forgiveness, whom he ignored that much just because of thinking that they are common. His sister is already death and Joe is married now to Biddy who once fell in love with Pip. Estella also gets married to another man. Therefore, for many years Pip goes abroad to work. Coming back, he meets Estella in the Satis House, her husband is now dead. She was bitterly regretful of what she did to him. Finally, they leave the garden hand in hand.

What we see in these novels at first is nothing but a world of men. It is not only about protagonists' gender, but rather about their relationships with women and about the positions of women in general. It goes without saying that in a novel would be men and women; but the question here is how their positions in all respects, be it social, be it economic or political etc., are depicted. The crucial point for both novels is that their authors manifest that they present things as they are. In other worlds, the worlds in these novels are just representatives of the outside world they just live in. It does not necessarily mean that we should accept it as a mere reality. On the contrary, we should not forget that they are fiction, but we should also keep in mind that there is a different kind of reality there. It is different from history and documentary; yet it tells something about their era. It says a lot about gender relations, class differences and the institutions of society. On this basis, these novels give us some clue on how patriarchy works and what the positions of women in the late 19th century are.

The 19th century is the period marked by the collapse of the empires like Ottoman Empire and by the rise of British power all over the world with Russian Empire. Globalization and industrialization are the keywords. Science and technology are on the rise. There is a great belief in humanity and ability to progress. Vertical and horizontal social mobility was increasing incrementally. Man could move up social ladder. This is why the protagonists in these novels have *Great Expectations* for the future. They dream of a better position for themselves in terms of economic and social. Correspondingly they always dream of a beautiful, wealthy and noble woman whom they can only reach by belonging to the upper class.

Yet here comes the point: since this is the world of men, women do not have similar positions and expectations. For instance, the female main characters in other novels like *Aşk-ı Memnu* and *Tess of the D'Ubbervilles* which were written in the same century by Halid Ziya Uşaklıgil and Thomas Hardy respectively do not have such motives in their lives. Bihter in Aşk-ı Memnu wants to belong to high society and be in fashion. All Tess wants is just to survive and earn a living for he family. Bihter wants to fulfill her desires and Tess no to be condemned by something she is guilty of. What they suffer is patriarchal society which does not allow them to live as a woman. In this period woman are not depicted by male authors as individuals who are working for a better world like men, on the contrary depicted as subjects always related with men through sexual relationships[1]. Their lives are full of love and marriage, but no educational or career planning. They are always weak and sentimental. The only moment they are rational is the time they decide to marry to someone for his money and status.

Women who are not main characters in the novels aforesaid have similar positions, too; they are bound to male characters somehow. Lamia in *The Blue and the Black*, for example, is the woman of Ahmet Cemil's

[1] Female authors in this period may depict woman from a different perspective. For example, Fatma Aliye and Halide Edip from Turkish literature tell stories of strong women who are thirsty for a better world like men and struggle for it. This is why I emphasized authors' gender.

 Copyright © International Science and Technology Conference (ISTEC)

dreams. Lamia is not a character in the novel as an individual, she is like a ghost. She is only there for her social status. With her house, her car, her piano etc. which represent her class, she stands where Ahmet Cemil just exactly wants to be. This is why Ahmet Cemil hopes to marry her one day until he burns his work with the thought of failure. When he learns that she is engaged to another man, he loses his last hope. Until then, he married her sister İkbal to Vehbi Efendi in the hope of being a printing house owner; but her sister died in misery because of this marriage. İkbal was a girl who never tells her brother her feelings and thoughts, who is submissive to her family. She is another ghost who is there to make Ahmet Cemil's desires come true. Yet, she cannot help him because she, like all her other family members, is weak and ineffective in the face of Vehbi Effendi. She has no voice in the novel. Ahmet Cemil exploits her as a capital. Vehbi Effendi abuses her mentally and physically.

There are two other women, Ahmet Cemil's mother Sabiha Hanım and the maid Seher, in *The Blue and the Black*, but they are all like İkbal. Seher is harassed by Vehbi Effendi. Although İkbal and Sabiha Hanım are aware of the fact, they say nothing. Seher cannot take action or leave the house. This is because she does not have social and economic freedom. Neither in this novel nor in others written by Uşaklıgil are there such powerful women who can support themselves. They are all dependent on men. In *The Blue and the Black* Ahmet Cemil is the only one to take care of his family after his father's death. No woman is supposed to work. This causes both Ahmet Cemil's whole world turning upside down and women's committing themselves totally to home and men. This leads Ahmet Cemil being the only authority at home, but eventually causes a total catastrophe. The novel tries to show the problematic here, but never offers a solution[2]. Here come some solutions by female authors. Fatma Aliye, for instance, depicts women who have economic and social difficulties and needs to earn her living like men. This brings to mind some questions like what difference makes the gender of the author of a narrative regarding the world portrayed, what kind of audience they address, how literature serves ideology even if the authors claim otherwise, how literary narratives shape our vision and vice versa.

Those questions are also valid for *Great Expectations*. Likewise, gender relations, social and economic relations, expectations for the future and future anxiety can be observed here, too. Estella is raised as a misandrist by Miss Havisham who is a woman left by her fiancé on the wedding day. She wants Estella take her revenge. Both are portrayed as that cruel, proud and shallow. They do not have any concerns, but to agonize to men. Estella, like Lamia, is there as a statue representing upper class. Pip is charmed by her elegant dresses and manners. He begins to be ashamed of his family and to dream of being a wealthy gentleman in order to get married to Estella who insults him being common. Yet neither Miss Havisham nor Estella is successful at the end. Miss Havisham makes amends at the end to Pip for everything she has done to him and Estella. And Estella tells Pip that she suffered from her husband and that she feels sorry for making him suffer. Therefore, both women are depicted here totally different from men who have economic and social concerns. They are isolated from society. One may claim that they are exceptional, but telling a story of someone exceptional is a preference and tells us also something. Dickens is known by his realist attitude, which makes his preferences important. Dickens describes women through their outward appearances which indicates their inner world. But this prevents us from hearing their voice and having empathy with female characters. In fact, as Gregory Jusdanis and Rita Felski point out in their books *Fiction Agonistes: In Defense of Literature* and *Uses of Literature* respectively, literature enlarges our vision, helps us to see the world from different perspectives and to understand others different from us. Dickens' women conform with the Victorian thought which assigns women to home. A woman must devote herself to her house, husband and children; that is to say a woman must be "the angel in the house". This is why Miss Havisham and Estella are depicted as outsider and regretful at the end. It should be noted here again that they are not outsider because they seek professional training and careers but because they are misandrists and refuse to obey social norms.

Dickens' women are usually not sympathetic. Mrs. Joe Gargery, Pip's older sister is one of them. She is from lower class. She is home all day and keeps cleaning the house. She is very ambitious. She wants to get higher economically but what she does is nothing but complaining about her economic conditions and about Pip whom she sees as a burden. Always angry and stern, she makes life miserable for Pip and Joe. This is a woman "in the house" but apparently not "angel". Therefore, she is not an idol for the reader to identify with, too. Then, who is the ideal woman? Or is there an ideal one whom the narrator appreciates and the readers pattern themselves on her?

Biddy, Pip's classmate, is a kind of ideal woman of the novel. She is from lower class, but she is at peace with herself. She improves herself, and what is more teaches Pip. She is also Pip's confident till he leaves home. After then, she helps Mrs. Joe after she is attacked by Orlick and become invalid. She is depicted as naïve, plain,

[2] Here it should be noted again that the sense of art of the author requires such an attitude. What I am trying to say is not that the novel should do it, but just to reveal the novel's position.

 Copyright © International Science and Technology Conference (ISTEC)

decent and kind as opposed to Estella and Mrs. Joe. She is never selfish. As long as she stays with Gargery family she lives off there. Although she is cute and intelligent, her end is nothing but a happy marriage. Improving herself does not help her to build a career. At the end she gets married to Joe who is naive and decent as well, although she is into Pip at the beginning. This is a sort of reward for her. She becomes the lady of her own house and becomes happy.

Consequently, in *Great Expectations* and *The Blue and the Black* all women are somehow socially, economically and psychologically bound to men. None of them have desires and expectations from life and future, which are independent from men. If they are wealthy, they do not have economic concerns and do not need to work professionally. Otherwise, as opposed to men, they usually do housework or work as a maid. None of them have a chance to get education and do a career, unlike men. They find a place for themselves only next to men. Biddy's training only works to help a man, Pip. She has limited choices in life. She is appreciated just because of being the angel in the house. In *The Blue and the Black* there is no ideal woman. Women are just there for men to either as a symbol indicating men's social and economic position in society or as a capital for men to climb the social ladder or as a burden on men's shoulder. The depiction of women is important because literary narratives are not only shaped by outer reality but also shape the outer world. Here, the difference between female and male authors comes into prominence. Male authors, even they support women's rights and uprisings, are out of their depth in face of patriarchy. Patriarchy, as Ayşe Saraçgil manifests, "is a system which expresses the most intimate forms and structures of power relations in all kinds of unique historical, socio-economic and cultural settings" (Saraçgil, 2005, p. 10-11). Therefore, it penetrates everywhere and it is really hard to get out of it. Again as Saraçgil points out that "cultural history shows us that radical changings in politics, economy and institutional organizations do not automatically lead to changes in identity. When individual and social identities started to be threatened and lose their descriptions, various forces come into action in order to protect and redefine them firmly" (Saraçgil, 2005, p. 204). Here literature works two-way. According to Althusser, it is impossible to escape from ideology because all ideologies constitutes a subject through ideological state apparatuses which are family, media, schools etc. Literature, at this point works as one of them.

The Blue and the Black and *Great Expectations* at this point corroborate patriarchy; which can be observed in the characterization of women and men. The world they portray does not only reflect the outer world as their authors claim, but also limits and restructures it. The image of women in these novels shows us that a woman's place is her home. She is always bound to a man. Her education only helps her to be a better wife. The 19th century which is depicted as the period of hope and expectation ultimately is the era of men although it is also the period that women start to speak up. Male authors, however, do not hear their voices and project it into their novels which they claim that they reflect the outer world. It is particularly seen in comparison with other novels both by the same authors telling female protagonists' stories and by female authors wrote in the late 19th century.

A COMPARATIVE STUDY ON THE OPTICAL PARAMETERS OF SOL GEL DERIVED DIFFERENT DOPED ZNO FILMS

Saliha Ilican
silican@anadolu.edu.tr

To further expand the area of optoelectronic applications, ZnO can be doped with different dopants. Therefore, researchers are making intensive research on the physical properties of the doped ZnO films. In order to investigate the influence of dopant such as magnesium (Mg) and sodium (Na) content on structural and optical properties of ZnO films, all the ZnO films were prepared by facile solgel method using spin coating technique. Zinc acetate dihydrate, 2-methoxyethanol and monoethanolamine were used as a starting material, solvent and stabilizer, respectively. The dopant sources are used in salt formed. The influence of different dopant elements on the crystalline structure and orientation of the ZnO films have been investigated by X-ray diffraction (XRD) study. The structural parameters of the films were determined and compared. A double beam UV-vis spectrophotometer with an integrating sphere was used for the optical transmittance and diffuse reflectance measurements, respectively. At the visible region, the average optical transmittance values of all the films are greater than 80%. The values of absorption band edge were determined different optical methods. The optical constants of the films were calculated using transmittance and diffuse reflectance spectra.

A CONTROL STRATEGY OF A TENDON DRIVEN MECHANISM BASED ON THE HUMAN LIKE DISCRETE/CONTINUOUS TIME CONTROLLER

Ryota ISHIBASHI
Department of System Design
Tokyo Metropolitan University
Japan
ishibash@tmu.ac.jp

Abstract: This research proposes a control strategy of a tendon driven mechanism based on the analysis of human like motion. Based on the human like muscle activities, proposed controller uses both the discrete-time and the continuous-time controller. The continuous-time controller adjusts the stiffness of the muscle and the discrete-time controller changes the units of the active muscle. Then, based on the knowledge of the predictive and the learning control strategy of the human motion, proposed controller can realize a force control with high resolution in the low force range. In addition, the controller can select the number of the muscle units.
Key Words: Mixed discrete/continuous system, Force control, Artificial muscle model, SMA actuator, Tendon driven

INTRODUCTION

The understanding of the communication way of such as the injured peoples seems to be important to develop effective communication devices for these peoples. Examination of the human communication way, the knowledge of the human sensory-motor system must be the effective tool. This research proposes a control strategy of s tendon driven mechanism based on the analysis of human like motion.

About the muscle activity, it is well known that signals from the CNS make action to the motor units as shown in **Fig. 1**. The number of them will be selected that depending on the desired motion. Thus, the muscles will be activated by the number of units and the stimulus level such as the duration, the intensity, and also the frequency [6-8]. From this knowledge, muscles potentially have a capacity to make both the wide range and the high sensitivity of the output force fields. We usually training the muscles in order to make some special tasks such as craft worker, artists, and etc.. In order to study about these human activities and to apply to the other fields, the control theory of the muscle activity becomes important. In common case, we usually make separate controller about the discrete time and the continuous time. However, thinking about the actual human neuromuscular controller, it should be better to make a controller uses both the discrete-time and the continuous-time controller.

In the engineering fields, we usually make the Iterative Learning Controller, the Model Predictive Controller, or such as the Adaptive Controller [9, 10]. Here, we think about the high performance controller of the human. Then, from the previously section, it should be better to make these controller with the capability of the mixed analog-digital circuit model, or to make such a controller uses both the discrete-time and the continuous-time controller as previously described. If we think about a closed loop system as such a mixed analog-digital circuit model, we make assumptions about the human motion generate scheme from the engineering knowledge. It has a possibility that we can make various motions based on the wide range and the high sensitivity actuator output. The knowledge of the human sensory-motor system must be effective tools for the communication research area such as the human-to-human or the human-to-machine communications. And also, it becomes effective tools for the understanding of the communication way of the injured peoples and the development of the communication devices.

In this research, based on the human like muscle activities, proposed controller uses both the discrete-time and the continuous-time controller. Then, based on the knowledge of the predictive and the iterative learning control strategy of the human motion, proposed controller can realize a force control with high resolution in the low force range. To analyze the assumption, the experimental system consists of ball joints and parallelogram linkage was developed. At first, the proposed control system and the assumption will be described. Then, some experimental results show the effectiveness of them.

PROPOSED SYSTEM

From the skeletal system, neuromuscular system, and also total sensory-motor system of the human beings, here the assumption of this paper will be discussed. In order to discuss the assumption, this paper utilized an artificial model of the human like body structure robot arm. Proposed mechanism can realize slide and twist motion with simple structure. **Fig. 2** shows that the muscle for the twist motion and artificial model with artificial muscles and **Fig. 3** shows an artificial muscle structure SMA [1-5] and elastica. The system utilized ball joints and parallelogram linkage. The system becomes mixed analog-digital circuit models as shown in **Fig. 3(ii)**.

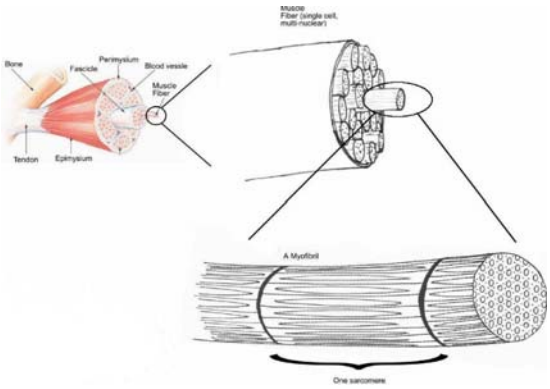

Figure 1 Muscle structure

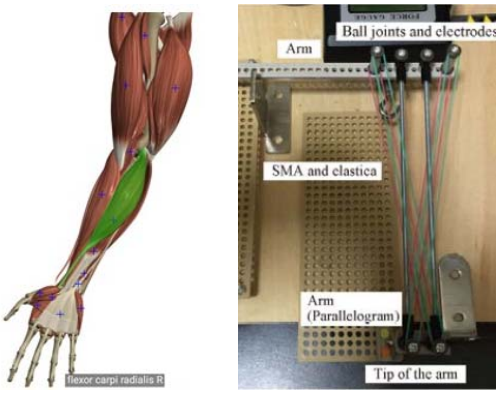

Figure 2 Muscle for the twist motion and Artificial model with SMA and Elastica

In the proposed artificial muscle model in **Fig. 3**, SMA will be controled by both the continuous and descrete input signals such as the PWM control. The elastica will be the passive stiffness elements and its stiffnes and position will be adjusted by SMA as shown in **Fig. 3(ii).** Thus, the proposed artificial muscle model can generate both the continuous and discrete contraction. **Fig. 4** shows that the experimental setups of the proposed model. The system in **Fig. 4(i)** can select the number of the motor units like a discrete controller as shown in **Fig. 5**. **Fig. 4(ii)** indicate that the concept of the isometric/isotonic contraction as shows in **Fig. 3(ii).**

The proposed artificial muscle model in **Fig. 3** and **Fig. 5** is similor to the Hill and Wilkie-based muscle model but different.

ASSUMPTION

Neuromusclar controller has both the discrete and the continuous time controller as described in the previopus section. It leads to following assumptions and properties:

- The continuous controller activete the muscle to controll the position and force and the discrete controller changes the number of the motor units.
- A motor unit model with SMA and elastica as shown in **Fig. 3** can be proposed.
- If these two assumptions are true in the industrial model, output force can be sensitive by using a motor unit model and it can realize a wide output range by using the proposed descrete motor unit controller.

Then, if these assumptions are true, we can arrange the constructions of the artificial muscles in the tendondriven robot arm with the artificial muscles. Then, in order to examine these assumptions, this paper shows an example case to satisfie the assumptions by using the experimentral system as shown in **Fig. 4.**

For the experiments, the artificial muscles consist of the SMA actuators and the elastica. The construction of them can be arranged. Thus, we can adjust the stiffness using not only the SMA actuators but also the nonlinear property of the elastica.

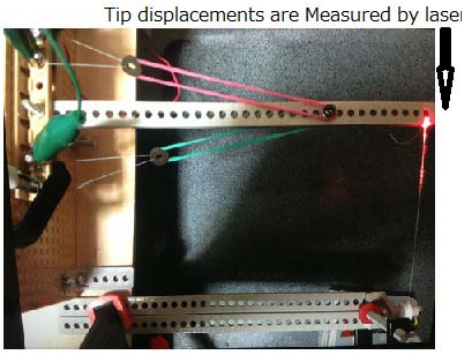
RESULTS AND DISCUSSION

 Copyright © International Science and Technology Conference (ISTEC)

To examine the above assumptions and properties, the experimental system in **Fig. 4** was utilized. **Fig. 6(i)** shows that the tip displacement of the system when the tip twist motion. In this condition, upper side two SMA was heated by 1.5[V] to make a gravitational compensation term. Internal force was supplied by the elastica. Here, we can see that the system was well actuated and it had been accomplished under the bias initial force the elastica. **Fig. 6(ii)** shows that stiffness control of the isometric contraction condition. The external force had been affected and measured the displacements of the tip of arm. **Fig. 7(i)** shows the tip displacement under the external force. Results are average of 5 trials and external force affected at 65[mm] point from the base joint of arm. Input voltage 1.9[V] was affected for the each two SMA. Here, we can see that the stiffness was changed by the isometric contraction of **Fig. 3(ii).** In this case, on the other hand, external force made isotonic contraction. **Fig. 7(ii)** shows the difference of the displacement between 0[V] and 1.9[V] input for the SMA. Results are average of 5 trials and external force affected at 65[mm], 115[mm] points from the base joint of arm. Here, the difference between the isometric contraction and non-activated was changed depend on the Jacobean matrix of the base joint of arm to the force affected point.



In the results of **Fig. 6 (i)**, the twist motion was actuated by the heated SMA with elastica. The elastica made bias initial force. Thus, the continuous controller activete the muscle to controll the position and force and the discrete controller changes the number of the motor units as shown in **Fig. 5** was examined. In the results of **Fig. 6 (ii) and Fig. 7**, a motor unit model with SMA and elastica as shown in **Fig. 3** can be examined and an example of the isometric contraction was verified. Thus, about thsese two assumptions,results showed an example case to satisfie the assumptions by using the experimentral system as shown in **Fig. 4.** Then, it seems that the previously discribed two assumptions are true in the industrial model case of the proposed system. In this case, output force can be sensitive by using a motor unit model and it can realize a wide output range by using the proposed descrete motor unit controller. More examination seems to be made the knowledge of the human sensory-motor system must be the effective tool for the future communication tools.

CONCLUSIONS

This research proposes a control strategy of a tendon driven mechanism based on the analysis of human like motion. Based on the human like muscle activities, proposed controller uses both the discrete and continuous controller. The continuous controller adjusts the stiffness of the muscle and the discrete controller changes the units of the active muscles. Then, based on the knowledge of the predictive and the iterative learning control strategy of the human motion, proposed controller can realize a force control with high resolution with wide output range. And also, the controller can select the number of the motor units. The controller and the mechanism can be applied to various applications for the communication way of such as the injured peoples.

A FUZZY COGNITIVE MAP APPROACH TO PREDICT THE CHROMOSOMAL ABNORMALITIES BY USING THE TRIPLE TEST MARKERS AND DEMOGRAPHIC FACTORS

Tacettin Arıcı
tacettin.arici@zirve.edu.tr

Alptekin Durmuşoğlu
durmusoglu@gantep.edu.tr

Chromosomal abnormalities are the major defects that effect babies and their parents during and after the gestation. These defects, such as Trisomy 21 (Down Syndrome), Trisomy 18 (Edward's Syndrome) and Trisomy 13 (Patau Syndrome) that are most commonly faced abnormalities, can be detected by prenatal invasive and non-invasive tests. Although invasive tests have higher accuracy of prediction, their higher risk of pregnancy loss makes non-invasive tests more preferable. Triple Test is one of these non-invasive tests, but its estimated accuracy does not satisfy parents since false positive and false negative rates are too high. Fuzzy Cognitive Maps (FCMs) are analytical and supportive tools which are capable to express the behavior of a system by using the accumulated knowledge obtained via the observations. In this study, a Two Level of Fuzzy Cognitive Map will be constructed which is expected to produce relatively less false positive and false negative predictions. The level-1 FCM will model the demographic risk profile while the level-2 will model the parameters of the blood screening. Subsequently, an overall risk grade will be calculated by an accurate combination of those results obtained in level-1 and level-2.

A NEW IMPLICIT TIME INTEGRATION METHOD FOR NONLINEAR STRUCTURAL DYNAMICS PROBLEMS

Kamil AYDIN

Erciyes University, Department of Civil Engineering, Kayseri, TURKEY

kaydin@erciyes.edu.tr

Abstract: A new time integration method is suggested for solving equation of motion of structural dynamics problems. The method is established upon the principle of impulse-momentum, leading to a lesser number of assumed fields. The algorithmic properties of the procedure are determined by stability and accuracy analyses. Overshooting tendency and order of accuracy are also examined. It is shown that the proposed method is unconditionally stable and non-dissipative. Its numerical dispersion appears to be much less than the commonly used integration methods. The method has no tendency to overshoot both the displacement and velocity response solutions. Its order of accuracy is around four as compared to two of the other methods considered in the study. A few numerical examples consisting of both linear and nonlinear single and multi-degree of freedom systems are carried out to see the overall behavior of the method in various practical problems.

Keywords: Time Integration, Implicit Procedure, Numerical Stability and Accuracy, Overshooting

Introduction

Many methods have been proposed in the last fifty years (Katsikadelis, 2013) for the numerical solution of equations of motion encountered in seismic and structural dynamic problems. These methods can fundamentally be classified as either explicit or implicit methods (Wood, 1990; Chung and Lee, 1994; Bathe, 1996). In explicit integration, the equation of motion of the current time step is not employed in determining the displacement of the current time step. The great advantage of explicit integration is that it does not require solving a set of algebraic equations at each time step (Rio et al., 2005) leading to less computation. Yet, according to the second barrier of Dahlquist (Dahlquist, 1963), all explicit methods are conditionally stable with respect to the size of time step. On the other hand, most implicit integration methods are unconditionally stable. Unconditional stability is an important property to be considered when selecting the proper integration algorithm for analysis of structures with a large number of degrees of freedom. The disadvantage of implicit integration methods is that they require the solution of a system of equations at each time step (Hulbert and Chung, 1996; Chang and Liao, 2005). This makes them computationally more expensive per time step. Apparently, each type of integration has its own advantages and disadvantages. It would be instrumental for an integration method to possess the advantages of explicit and implicit procedures simultaneously. For this purpose, several explicit algorithms with unconditional stability have recently been proposed (Chang and Huang, 2010; Chang, 2002, Chang, 2007; Kolay and Ricles, 2014).

It has been suggested that a desirable time integration method should possess the following criteria (Dokainish and Subbaraj, 1989; Hughes, 1987; Hilber and Hughes, 1978): unconditional stability for application to both linear and nonlinear problems, at least a second order accuracy, self-starting and one step scheme, no more than one set of implicit equations to be solved at each time step, controllable algorithmic damping in higher modes and no overshooting. Many methods have been developed in the last few decades to satisfy these criteria such as the Newmark family methods (Newmark, 1959), Houbolt method (Houbolt, 1950), Wilson-θ method (Bathe and Wilson, 1973), Park method (Park, 1975), HHT-α method (Hilber et al., 1977), WBZ-α method (Wood et al., 1981), generalized-α method (Chung and Hulbert, 1993), and collocation method (Hilber and Hughes, 1978). These algorithms differ from each other mainly with respect to their numerical dissipation and overshooting characteristic. None of them fully satisfies all the criteria. It seems that the development of an effective and accurate integration scheme that satisfies the aforementioned criteria will still be the aim of future research studies in the respective field.

The experience has shown that single-step implicit and unconditionally stable methods are the most preferred methods for the solution of dynamic response of structural systems (Wilson, 2002). Implicit methods use the equation of motion of a dynamic system at the end of each time step to determine the response variables. Direct time integration methods assume a specific type of variation of displacement u, velocity $\dot{u}$ and acceleration $\ddot{u}$ within each time increment (Dukkipati, 2009). Instead of equation of motion, equation of impulse-momentum is utilized in this study to relate the unknown parameters. Hence, the proposed method is based upon employing

 Copyright © International Science and Technology Conference (ISTEC)

displacement and velocity fields as the unknowns. This results in a decrease in the order of assumed quantities. Eventually, this decrease is expected to lead to smaller errors in comparison with the existing integration schemes. Numerical stability, dispersion, dissipation are investigated to evaluate the accuracy of the proposed method. Overshooting effect, which is not related to the stability and accuracy characteristics of an integration algorithm, is also examined. Finally, a selection of numerical examples comprising both linear and nonlinear single and multiple degree of freedom systems are studied in order to readily observe and practically evaluate the characteristics of the proposed scheme.

Proposed Method

The general equation of a viscously damped and linear single degree of freedom dynamical system can be expressed as

$$m\ddot{u} + c\dot{u} + ku = p(t) \tag{1}$$

where m, c and k are the mass, damping and stiffness of the system; $p(t)$ is the externally applied force, and u, $\dot{u}$ and $\ddot{u}$ are the displacement, velocity and acceleration response. The numeric integration procedure involves discretization of both the response and excitation into small time increments Δt. Therefore, by replacing continuous variable t by the discrete variable t_i, the differential equation changes to

$$m\ddot{u}_i + c\dot{u}_i + ku_i = p_i \tag{2}$$

This is equation is solved progressively in time increments Δt starting from the known initial conditions. Integration of Eq. (2) yields

$$m\dot{u}_i + cu_i + kq_i + \int p_i d\tau = m\dot{u}_{i+1} + cu_{i+1} + kq_{i+1} \tag{3}$$

This equation indicates that the sum of linear momentum of the system at ith time step and linear impulse of the excitation over Δt is equal to momentum of the dynamic system at $(i+1)$th time step. In this equation, variable τ changes from 0 to Δt and q is the integration of displacement response over Δt. Eqs. (2) and (3) can be reformulated in an incremental form:

$$m\Delta\dot{u}_i + c\Delta u_i + k\Delta q_i = I_i \tag{4}$$

$$m\Delta\ddot{u}_i + c\Delta\dot{u}_i + k\Delta u_i = \Delta p_i \tag{5}$$

where I_i is the impulse of the applied force and $\Delta p_i = p_{i+1} - p_i$. The derivative of acceleration response is assumed to be linear in the proposed study. This yields a second order acceleration and fourth order displacement function as follows:

$$\ddot{u}(\tau) = \ddot{u}_i + \frac{\tau}{\Delta t}\Delta\ddot{u}_i \tag{6}$$

$$\Delta\dot{u}(\tau) = \ddot{u}_i\tau + \frac{\tau^2}{2\Delta t}\Delta\ddot{u}_i \tag{7}$$

$$\Delta u(\tau) = \dot{u}_i\tau + \frac{\ddot{u}_i\tau^2}{2} + \frac{\tau^3}{6\Delta t}\Delta\ddot{u}_i \tag{8}$$

$$\Delta q(\tau) = u_i\tau + \frac{\dot{u}_i\tau^2}{2} + \frac{\ddot{u}_i\tau^3}{6} + \frac{\tau^4}{24\Delta t}\Delta\ddot{u}_i \tag{9}$$

$$\Delta q(\tau) = u_i\tau + \frac{\dot{u}_i\tau^2}{2} + \frac{\ddot{u}_i\tau^3}{6} + \frac{\ddot{u}_i\tau^4}{24} + \beta\frac{\tau^5}{\Delta t}\Delta\ddot{u}_i \tag{10}$$

From Eq. (9), $\Delta\ddot{u}$ is obtained as

$$\Delta\ddot{u}_i = \frac{24\Delta u_i}{\Delta t^3} - \frac{24\dot{u}_i}{\Delta t^2} - \frac{12\ddot{u}_i}{\Delta t} - 4\ddot{u}_i \tag{11}$$

Based on this equation, the expressions for acceleration, velocity and q_i can be rewritten in incremental form:

$$\Delta\ddot{u}_i = \frac{12\Delta u_i}{\Delta t^2} - \frac{12\dot{u}_i}{\Delta t} - 6\ddot{u}_i - \ddot{u}_i\Delta t \tag{12}$$

$$\Delta\dot{u}_i = -\frac{\ddot{u}_i\Delta t^2}{6} + \frac{4\Delta u_i}{\Delta t} - 4\dot{u}_i - \ddot{u}_i\Delta t \tag{13}$$

$$\Delta q_i = u_i\Delta t + \frac{\dot{u}_i\Delta t^2}{2} + \frac{\ddot{u}_i\Delta t^3}{6} + \frac{\ddot{u}_i\Delta t^4}{24} + 24\beta\Delta t\Delta u - 24\dot{u}\beta\Delta t^2 - 12\ddot{u}\beta\Delta t^3 - 4\ddot{u}_i\beta\Delta t^4 \tag{14}$$

Substituting the above equalities in Eq. (4), one determines $\ddot{u}$ as

 Copyright © International Science and Technology Conference (ISTEC)

$$\dddot{u}_i = \frac{1}{a_1}\left\{\begin{array}{c}\ddot{u}_i\left(-m\Delta t+\frac{k\Delta t^3}{6}-12k\beta\Delta t^3\right)+\dot{u}_i\left(-4m+\frac{k\Delta t^2}{2}-24k\beta\Delta t^2\right)+u_i k\Delta t \\ +\Delta u\left(\frac{4m}{\Delta t}+c+24k\beta\Delta t\right)-I_i\end{array}\right\} \tag{15}$$

with

$$a_1 = -\left(-\frac{m\Delta t^2}{6}+\frac{k\Delta t^3}{24}-4k\beta\Delta t^4\right) \tag{16}$$

Once $\dddot{u}$ has been determined, it can be substituted in Eqs. (12) and (13) to give

$$\begin{array}{l}\Delta\ddot{u}_i = -\frac{\Delta t}{a_1}\ddot{u}_i\left(-m\Delta t+\frac{k\Delta t^3}{6}-12k\beta\Delta t^3\right)-\frac{\Delta t}{a_1}\dot{u}_i\left(-4m+\frac{k\Delta t^2}{2}-24k\beta\Delta t^2\right)-\frac{\Delta t^2}{a_1}ku_i \\ -\frac{\Delta t}{a_1}\Delta u_i\left(\frac{4m}{\Delta t}+c+24k\beta\Delta t\right)-4\ddot{u}_i-\frac{12\dot{u}_i}{\Delta t}+\frac{12\Delta u_i}{\Delta t^2}+\frac{I_i\Delta t}{a_1}\end{array} \tag{17}$$

$$\begin{array}{l}\Delta\dot{u}_i = -\frac{\Delta t^2}{6a_1}\ddot{u}_i\left(-m\Delta t+\frac{k\Delta t^3}{6}-12k\beta\Delta t^3\right)-\frac{\Delta t^2}{6a_1}\dot{u}_i\left(-4m+\frac{k\Delta t^2}{2}-24k\beta\Delta t^2\right)-\frac{\Delta t^3}{6a_1}ku_i \\ -\frac{\Delta t^2}{6a_1}\Delta u_i\left(\frac{4m}{\Delta t}+c+24k\beta\Delta t\right)-\ddot{u}_i\Delta t-4\dot{u}_i+\frac{4\Delta u_i}{\Delta t}+\frac{I_i\Delta t^2}{6a_1}\end{array} \tag{18}$$

where

$$I_i = \frac{1}{2}(p_i + p_{i+1})\Delta t \tag{19}$$

Substituting Eqs. (17) and (18) into Eq. (9) yields

$$\begin{array}{c}m\left\{\begin{array}{l}-\frac{\Delta t}{a_1}\ddot{u}_i\left(-m\Delta t+\frac{k\Delta t^3}{6}-12k\beta\Delta t^3\right)-\frac{\Delta t}{a_1}\dot{u}_i\left(-4m+\frac{k\Delta t^2}{2}-24k\beta\Delta t^2\right) \\ -\frac{\Delta t^2}{a_1}ku_i-\frac{\Delta t}{a_1}\Delta u_i\left(\frac{4m}{\Delta t}+c+24k\beta\Delta t\right)-4\ddot{u}_i-\frac{12\dot{u}_i}{\Delta t}+\frac{12\Delta u_i}{\Delta t^2}+\frac{I\Delta t}{a_1}\end{array}\right\} \\ + \\ c\left\{\begin{array}{l}-\frac{\Delta t^2}{6a_1}\ddot{u}_i\left(-m\Delta t+\frac{k\Delta t^3}{6}-12k\beta\Delta t^3\right)-\frac{\Delta t^2}{6a_1}\dot{u}_i\left(-4m+\frac{k\Delta t^2}{2}-24k\beta\Delta t^2\right) \\ -\frac{\Delta t^3}{6a_1}ku_i-\frac{\Delta t^2}{6a_1}\Delta u_i\left(\frac{4m}{\Delta t}+c+24k\beta\Delta t\right)-\ddot{u}_i\Delta t-4\dot{u}_i+\frac{4\Delta u_i}{\Delta t}+\frac{I\Delta t^2}{a_1}\end{array}\right\} \\ + \\ +k\Delta u_i = \Delta p_i\end{array} \tag{20}$$

from which Δu_i value can be determined as

$$\Delta u_i = \frac{\Delta p_x}{k_x} \tag{21}$$

where

$$k_x = 12\frac{m}{\Delta t^2}-m\frac{\Delta t}{a_1}\left(\frac{4m}{\Delta t}+c+24k\beta\Delta t\right)+\frac{4c}{\Delta t}-\frac{c\Delta t^2}{6a_1}\left(\frac{4m}{\Delta t}+c+24k\beta\Delta t\right)+k \tag{22}$$

and

$$\begin{array}{l}\Delta p_x = \Delta p_i-\ddot{u}_i\left(-6m-m\frac{\Delta t}{a_1}\left(-m\Delta t+k\frac{\Delta t^3}{6}-12k\beta\Delta t^3\right)\right)-c\Delta t-c\frac{\Delta t^2}{6a_1}\left(-m\Delta t+k\frac{\Delta t^3}{6}-12k\beta\Delta t^3\right) \\ -\dot{u}_i\left(-12\frac{m}{\Delta t}-m\frac{\Delta t}{a_1}\left(-4m+\frac{1}{2}k\Delta t^2-24k\beta\Delta t^2\right)\right)-4c-c\frac{\Delta t^2}{6a_1}\left(-4m+\frac{1}{2}k\Delta t^2-24k\beta\Delta t^2\right) \\ +u_i\left(mk\frac{\Delta t^2}{a_1}+kc\frac{\Delta t^3}{6a_1}\right)-I_i\left(m\frac{\Delta t}{a_1}\Delta+c\frac{\Delta t^2}{6a_1}\right)\end{array} \tag{23}$$

 Copyright © International Science and Technology Conference (ISTEC)

In the above equations, k_x represents the effective stiffness and Δp_x the effective external loading. Once Δu_i is known, $\Delta \dot{u}_i$ and $\Delta \ddot{u}_i$ can be computed from Eqs. (17) and (18), respectively; and the displacement, velocity and acceleration at time i+1 can be calculated from the following equations:

$$u_i + \Delta u_i = u_{i+1} \tag{24}$$

$$\Delta \dot{u}_i + \dot{u}_i = \dot{u}_{i+1} \tag{25}$$

$$\Delta \ddot{u}_i + \ddot{u}_i = \ddot{u}_{i+1} \tag{26}$$

Performance of the Proposed Method

Numerical Stability

In a general discussion of the stability of an integration algorithm, it is common practice to apply the algorithm to a single degree of freedom system governed by

$$\ddot{u}(t) + 2\xi\omega\dot{u}(t) + \omega^2 u(t) = p(t) \tag{27}$$

where ξ, ω and p are the damping ratio, natural cyclic frequency of the system and (modal) external excitation. Most one-step integration methods recursively relate the displacement u_{i+1} and velocity $\dot{u}_{i+1}$ at the end of any arbitrary ith step to the u_i and $\dot{u}_i$ at the beginning of that step as

$$\begin{Bmatrix} u_{i+1} \\ \dot{u}_{i+1} \\ \ddot{u}_{i+1} \end{Bmatrix} = \begin{bmatrix} A_{11}(\Delta t) & A_{12}(\Delta t) & A_{13}(\Delta t) \\ A_{21}(\Delta t) & A_{22}(\Delta t) & A_{23}(\Delta t) \\ A_{31}(\Delta t) & A_{32}(\Delta t) & A_{33}(\Delta t) \end{bmatrix} \begin{Bmatrix} u_i \\ \dot{u}_i \\ \ddot{u}_i \end{Bmatrix} = [A] \begin{Bmatrix} u_i \\ \dot{u}_i \\ \ddot{u}_i \end{Bmatrix} \tag{28}$$

where $[A]$ is referred to as numerical amplification matrix. The algorithmic characteristics of an integration method are determined from the numerical amplification matrix $[A]$. The particular solution of the forced vibration in Eq. (28) is generally omitted in the investigation of stability conditions since any integration method that is unstable under complementary solution will already be unstable under the addition of particular integral.

The amplification matrix for the proposed method is obtained from

$$\begin{bmatrix} k & 0 & m \\ -\frac{4}{\Delta t} + \frac{\Delta t^2}{6a_1}\left(\frac{4m}{\Delta t} + 24k\beta\Delta t\right) & 1 & 0 \\ -\frac{12}{\Delta t^2} + \frac{\Delta t}{a_1}\left(\frac{4m}{\Delta t} + 24k\beta\Delta t\right) & 0 & 1 \end{bmatrix} \begin{Bmatrix} u_{i+1} \\ \dot{u}_{i+1} \\ \ddot{u}_{i+1} \end{Bmatrix} = \begin{bmatrix} 0 & 0 & 0 \\ -\frac{4}{\Delta t} + \frac{\Delta t^2}{6a_1}\left(\frac{4m}{\Delta t} + 24k\beta\Delta t\right) & -3 - \frac{\Delta t^2}{6a_1}\left(-4m + 0.5k\Delta t^2 - 24k\beta\Delta t^2\right) & -\Delta t - \frac{\Delta t^2}{6a_1}\left(-m\Delta t + \frac{k\Delta t^3}{6} - 12k\beta\Delta t^3\right) \\ -\frac{12}{\Delta t^2} + \frac{\Delta t}{a_1}\left(\frac{4m}{\Delta t} + 24k\beta\Delta t\right) & -\frac{12}{\Delta t} - \frac{\Delta t}{a_1}\left(-4m + 0.5k\Delta t^2 - 24k\beta\Delta t^2\right) & -5 - \frac{\Delta t}{a_1}\left(-m\Delta t + k\frac{\Delta t^3}{6} - 12k\beta\Delta t^3\right) \end{bmatrix} \begin{Bmatrix} u_i \\ \dot{u}_i \\ \ddot{u}_i \end{Bmatrix} \tag{29}$$

for the case of zero damping. The components of the amplification matrix can be obtained from this equation, but due to shortage of space, they are not provided herein.

The characteristic equation of amplification matrix can be obtained from the following relationship:

$$\left\| [A] - \lambda [I] \right\| = 0 \tag{30}$$

in which λ and $[I]$ are eigenvalues of square matrix $[A]$ and unit matrix, respectively. Expansion of Eq. (30) gives

$$\lambda^3 - 2\alpha_1\lambda^2 + \alpha_2\lambda - \alpha_3 = 0 \tag{31}$$

where α_1 is the half-trace, α_2 is the sum of principal minors, and α_3 is the determinant of $[A]$. Solution of Eq. (31) will give three different eigenvalues denoted by λ_1, λ_2 and λ_3. The maximum of the eigenvalues is called the spectral radius:

$$\rho([A]) = \max\left\{|\lambda_1|,\ |\lambda_2|,\ |\lambda_3|\right\} \tag{32}$$

Eq. (31) has three roots whereas the general equation of free vibration for a single degree of freedom system provides two roots. Therefore, the solution of Eq. (31) gives an extra root called the spurious root. The other two roots are referred to as the principal roots. The roots of the proposed method are given as follows:

 Copyright © International Science and Technology Conference (ISTEC)

$$\alpha_1 = \frac{(\Delta t^4 - 192\beta\Delta t^4)\omega^4 + (576\beta\Delta t^2 + 16\Delta t^2 - 16\Delta t^2\xi^2)\omega^2 - 48}{(96\beta\Delta t^4 - \Delta t^4)\omega^4 + (576\beta\Delta t^3\xi - 8\Delta t^3\xi)\omega^3 + (576\beta\Delta t^2 - 8\Delta t^2 - 16\Delta t^2\xi^2)\omega^2 - ((-48)\Delta t\xi)\omega - 48} \quad (33)$$

$$\alpha_2 = 1 - \frac{\xi(96\Delta t\omega - \Delta t^3\omega^3(1152\beta - 16))}{\Delta t^4\omega^4 - 96\beta\Delta t^4\omega^4 + 8\Delta t^3\xi\omega^3 - 576\beta\Delta t^3\xi\omega^3 + 8\Delta t^2\omega^2 - 576\beta\Delta t^2\omega^2 + 16\Delta t^2\xi^2\omega^2 + 48\Delta t\xi\omega + 48} \quad (34)$$

$$\alpha_3 = 0 \quad (35)$$

It is noted that the proposed method produces no spurious root. The stability of an algorithm can be investigated by examining the two roots. A plot of the spectral radius against $\Delta t/T$ (or $\omega\Delta t$ in some cases) shows the stability properties of the algorithm. For an integration procedure to have a stable solution the spectral radius should be less than or equal to 1 for all values of $\Delta t/T$. This condition is satisfied if β=1/144 for the proposed method. Figure 1 presents the spectral radius of the proposed method along with those of the central difference, Newmark average acceleration, Newmark linear acceleration, and Wilson-θ methods. This plot is obtained for ξ=0. It is observed that the central difference method with $\Delta t > 0.31T$ and linear acceleration method with $\Delta t > 0.55T$ becomes unstable. The spectral radii for the remaining methods are always less than or equal to 1 for all $\Delta t/T$; thus, they are unconditionally stable.

It is well known that the condition of stability may be affected by the presence of physical damping in the system. To study this effect, the spectral radii of the mentioned algorithms are determined using a damping ratio of 5%. Figure 2 shows that the damping causes a downward shift in the low-frequency region of vibration modes but does not influence the critical time of instability for the conditionally stable methods. It is observed that the cusp point of Wilson-θ method is delayed from $\Delta t/T$=2.3 to $\Delta t/T$=2.7 in the case of physical damping. Hence, it can be said that the inclusion of damping in the numeric integration algorithms makes the stability condition less restrictive.

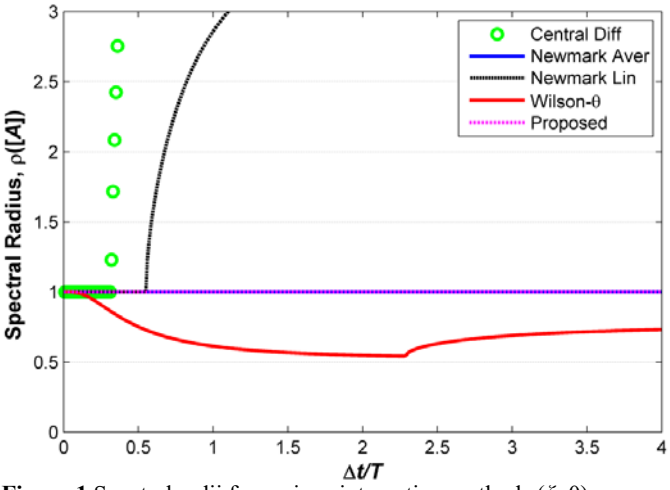

Figure 1 Spectral radii for various integration methods (ξ=0).

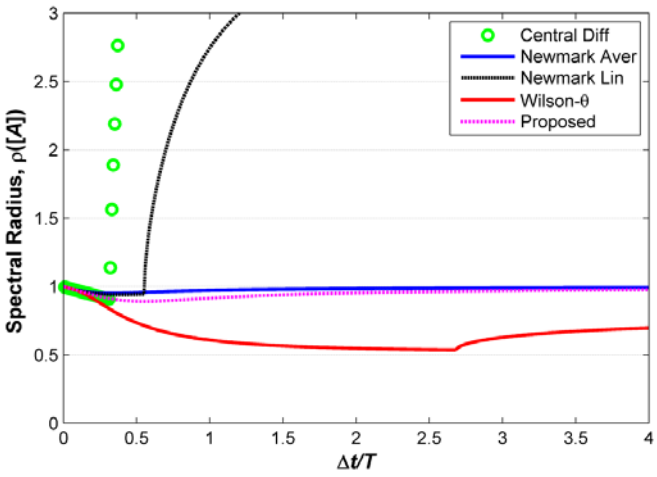

Figure 2 Spectral radii for various integration methods (ξ=5%).

Numerical Accuracy

The accuracy of a time integration procedure is investigated by assessing two types of errors (i.e., numerical dissipation and numerical dispersion) and the order of accuracy of the procedure. Eq. (28) can be rewritten in terms of finite difference equation upon the elimination of velocity and acceleration terms in the equation:

$$u_{i+1} - \alpha_1 u_i + \alpha_2 u_{i-1} - \alpha_3 u_{i-2} = 0, \qquad i \in \{2, 3, \ldots, M-1\} \quad (35)$$

where, as defined earlier, α_1 is the half-trace of $[A]$, α_2 is the sum of principal minors of $[A]$, α_3 is the determinant of $[A]$, and M is the number of steps utilized in the numeric integration. The solution to this equation in terms of the ith displacement function can be given as

$$u_i = e^{-\bar{\xi}\bar{\omega}t_i}\left\{c_1\cos\left(\bar{\omega}t_i\right) + c_2\sin\left(\bar{\omega}t_i\right)\right\} + c_3\lambda_3^i \quad (36)$$

The spurious root λ_3 is determined to be zero for all the time steps considered in this study. The principal roots are given by

$$\lambda_{1,2} = a \pm bj = e^{\bar{\Omega}\left(-\bar{\xi}\pm j\right)} \quad (37)$$

which indicates that the principal roots are complex conjugates of each other and are of the form $a+bj$ and $a-bj$ with j being the complex number. In Eq. (37), $\bar{\Omega} = \bar{\omega}\Delta t$ is referred to as phase of the numeric solution, $\bar{\xi}$ is the numeric viscous damping, and $\bar{\omega}$ is the numeric frequency. The numeric frequency value nominally must be

 Copyright © International Science and Technology Conference (ISTEC)

equal to theoretical frequency ω but, in general, this condition is not satisfied. The numeric phase and damping coefficient are given in the following based on the principal roots:

$$\bar{\Omega} = \tan^{-1}\left(\frac{b}{a}\right) \tag{38}$$

$$\bar{\xi} = -\frac{\ln\sqrt{a^2+b^2}}{2\bar{\Omega}} \tag{39}$$

If the quantity $\sqrt{a^2+b^2}$ is less than unity, the time integration procedure provides a positive damping; if it is greater than unity, the numerical damping is negative; and it is equal to unity, then there will be no damping in the solution. As an alternative to numeric damping, an amplitude decay (AD) can also be defined as

$$\text{AD} = 1 - \left(\sqrt{a^2+b^2}\right)^{\frac{2\pi}{\bar{\Omega}}} \tag{40}$$

A second type of error for measuring the relative accuracy of an integration procedure can be provided by

$$\text{PE} = \frac{\bar{T}-T}{T} = \frac{\omega\Delta t - \bar{\Omega}}{\bar{\Omega}} \tag{41}$$

This equation is expressed with regard to period elongation, where $T=2\pi/\omega$ is the actual period of vibration. The period elongation for the previously-examined integration methods is plotted in Figure 3 as a function of $\Delta t/T$. It is seen that the proposed method will elongate the true period like the Newmark average acceleration, linear acceleration and Wilson-θ methods. But, the amount of numerical dispersion in the proposed method is much less than those of the other methods. From the figure, it is evident that the central difference method would shorten the actual period.

Figure 4 compares the numerical damping ratio of the proposed method to those of the other methods. It is observed that Newmark average acceleration and the proposed method yield almost no damping. The Newmark linear acceleration method produces numerical damping once it has reached the critical value for stability. The Wilson-θ method has a positive numerical damping while the central difference has negative damping. It can be said that the proposed method is non-dissipative. The data in Figure 4 can also be presented in terms of amplitude decay (AD) in Figure 5, from which it is again noted that the Newmark average acceleration and the proposed method show no amplitude decay in displacement response. The Wilson-θ method would decrease the amplitude of actual oscillation gradually as the frequency of oscillation increases. The amount of amplitude decay in the central difference method and Newmark linear acceleration methods decreases without bound once the value of $\Delta t/T$ becomes equal to the critical time step of the respective method. It indicates that the solutions of these two methods would be meaningless after this point on.

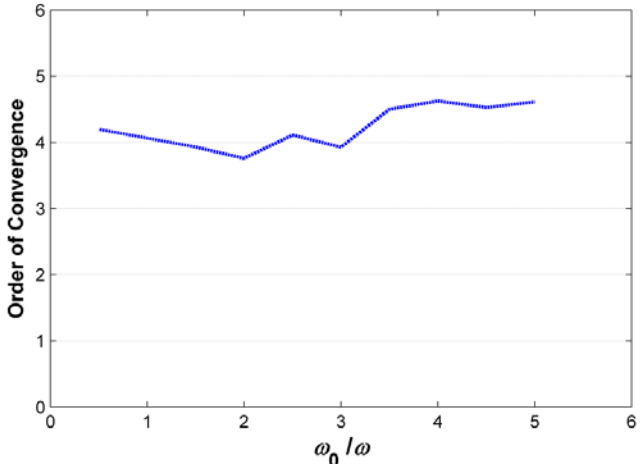

Figure 6 Order of accuracy for the proposed method

Order of Accuracy

The order of convergence is determined by evaluating the local truncation error in displacement response (Kavetski et al., 2004; Razavi et al., 2007; Gholampour and Ghassemieh, 2013). Varying the time step size and keeping the time instant of computation fixed, the displacement error can be determined from the following equation:

$$\left|u - u^{\text{exact}}\right| = \gamma \left(\frac{\Delta t}{T}\right)^{\alpha} \tag{42}$$

where u and u^{exact} are the numerical and exact displacement solutions of the system under harmonic excitation, γ and α are coefficients that would be determined from a regression analysis. α is referred to as the order of accuracy of the numeric procedure. The results of the regression analysis are shown in Figure 6 in terms of order of accuracy against the ratio of ω_0/ω, where ω_0 and ω are the cyclic frequencies of the external excitation and system, respectively. It is observed that the proposed method has an order of convergence of about 4. Note that the Newmark's methods has an order of around 2 (Gholampour and Ghassemieh, 2013), the central difference method has an order of slightly higher than 2 (Razavi et al., 2007), and the Wilson-θ method has an order of accuracy of 1 (Soroushian et al., 2012). The fourth order convergence of the proposed method means that if the time step size is halved, the error in displacement response will then be sixteen times smaller.

Overshooting effect

This specific phenomenon was first realized by Goudreau and Taylor (1972) as a property of the Wilson-θ method. Despite being unconditionally stable, the method showed a tendency to overshoot substantially the displacement and velocity solution during the first few time steps of calculation. This effect is not related to the stability and accuracy of properties of an integration procedure. Therefore, the tendency of an implicit method to overshoot should be considered in the evaluation of an integration method. In order to study the overshooting behavior of a method, the free vibration of a single degree of freedom system can be considered under non-zero values of initial displacement u_i and/or velocity $\dot{u}_i$ at the ith time step (Hilber and Hughes, 1978; Hulbert and Chung, 1994). Then, the responses u_{i+1} and $\dot{u}_{i+1}$ must be calculated at the end of time step as a function of $\Omega_i = \omega_i \Delta t$. The status of the phase approaching to infinity ($\Omega_i \to \infty$) provides an indication of tendency to overshoot.

The displacement and velocity responses at the end of any arbitrary time step for the proposed method are obtained upon the elimination of acceleration terms in Eq. (28) as:

$$u_{i+1} = u_i - \frac{24u_i\Omega_i^3 + (72u_i + 12\Delta t\dot{u}_i)\Omega_i^2 - 144\Delta t\dot{u}_i}{(\Omega_i^2 + 6\Omega_i + 12)^2} \tag{43}$$

$$\dot{u}_{i+1} = \frac{12u_i + \Delta t\dot{u}_i}{\Delta t} - \frac{144u_i\Omega_i^3 + (864u_i + 72\Delta t\dot{u}_i)\Omega_i^2 + (1728u_i + 228\Delta t\dot{u}_i)\Omega_i + 1728u_i}{\Delta t(\Omega_i^2 + 6\Omega_i + 12)^2} \tag{44}$$

In order for the proposed method to avoid overshooting phenomenon, the powers of Ω_i in the numerators of Eqs. (43) and (44) should be less than or equal to the powers of Ω_i in their denominators (Chung & Hulbert, 1993). The above equations reveal that there is no overshoot in both displacement and velocity responses of the proposed

 Copyright © International Science and Technology Conference (ISTEC)

method. The Newmark's average acceleration method exhibits no overshoot in displacement but it has a tendency to overshoot quadratically in the velocity solution (Hughes, 2000). The Wilson-θ method shows overshooting quadratically both in displacement and velocity solutions (Gholampour and Ghassemieh, 2013).

Numerical Examples

In order to confirm the numerical properties and evaluate the overall behavior of the proposed method, two examples are formed. The selection of example problems includes nonlinear single and multi-degree of freedom systems. Results of the study are compared to those of the Newmark's methods, central difference method and Wilson-θ method.

Example 1: Nonlinear single degree of freedom system

The second-order nonlinear equation of motion of a dynamic system is given by

$$10\ddot{u} + 5\dot{u} + 3u^2 + 200u = 500\cos(25t) - 200\sin(10t) \tag{54}$$

which is subjected to initial conditions of $u(0) = 0$ and $\dot{u}(0) = 0$. The displacement response for the first five seconds of time history is obtained using the five mentioned integration methods. The response of the Newmark's linear acceleration method with a time step increment of 0.001 sec is considered to be exact (Chang and Huang, 2010). In the rest of integration procedures a time step of 0.02 sec is utilized. The obtained time histories are plotted in Figure 7. In order to see clearly the performance of the methods, an error metric is defined at each time instant t as

$$\text{error}^t = \left| u^t - u^t_{\text{exact}} \right| \tag{55}$$

The values of error versus time parameter are shown in Figure 8. It is observed that the errors of the proposed method are the smallest among the considered methods.

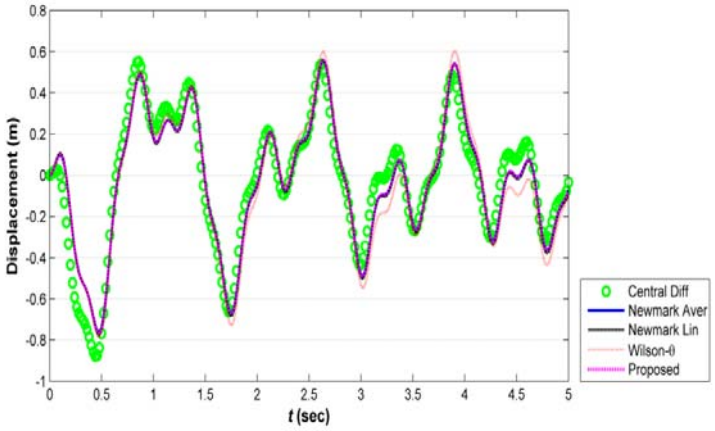

Figure 7 Displacement response of nonlinear SDOF system using the considered methods

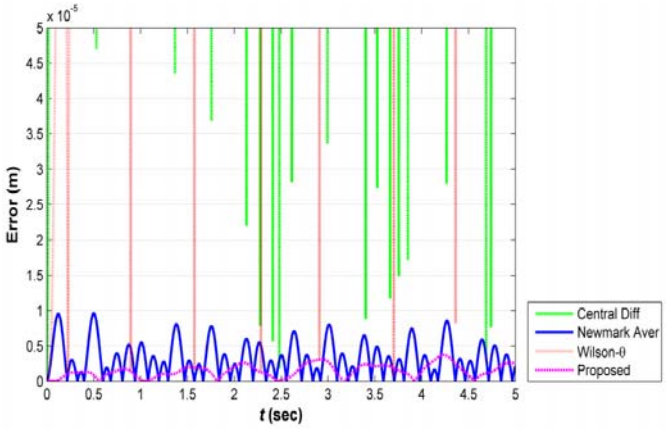

Figure 8 Comparison of error in displacement response of the nonlinear SDOF system

Example 2: Two-story shear building

In this example, a two-story shear building is considered with initial conditions of $\{u(0)\} = [0 \quad 0]^T$ and $\{\dot{u}(0)\} = [0 \quad 0]^T$. The columns of the system have nonlinear stiffness as described in Figure 9. The beams are assumed to infinitely stiff and the total mass of the system is concentrated at the floor levels. The building is subjected to external forces at floor levels that have two distinct frequencies of oscillation. The system has also damping and the damping coefficients are indicated in the figure. Story displacement responses are determined through the five methods. Again, the solution of the Newmark's linear acceleration with Δt=0.001 sec is assumed to be "exact". Figures 10 and 11 show the computed story displacements and Figure 12 displays the error quantities in the displacement response of the second story. It is observed that the proposed method with Δt=0.02 sec closely follows the solution of the Newmark's linear acceleration with Δt=0.001 sec. The error in the central difference method appears to be the largest, followed by that of the Wilson-θ method.

Conclusions

A new implicit step-by-step integration algorithm is proposed in this study for the solution of nonlinear problems in structural dynamics. The algorithmic characteristics of the proposed method are determined through stability and accuracy analyses. Also, to observe the general behavior of the proposed scheme in various dynamics problems, numerical tests are carried out in comparison with frequently used integration procedures such as the Newmark's family methods, central difference method and Wilson-θ method. Based on these studies, the following conclusions can be reached:

- With the use of β=1/144, the proposed method becomes unconditionally stable.
- The inclusion of physical damping in the system does not influence the unconditional stability of the method. However, it makes the stability conditions of the Newmark's linear acceleration and the central difference methods less restrictive.
- The numerical dispersion error of the proposed method is much smaller in comparison with the other methods considered in the study.
- The proposed method does not generate any numerical damping; hence, it is non-dissipative.
- This conclusion may be put it differently to state that the proposed scheme shows no amplitude decay regardless of the time step size used.
- The order of accuracy is about 4 for the proposed scheme. It is about 2 for Newmark's family methods and the central difference method, and 1 for the Wilson-θ method.
- Overshooting analysis reveals that the proposed method has no tendency to overshoot both the displacement and velocity solutions.
- The numerical example problems show that the displacement solutions of the proposed algorithm closely follow the exact solution of the Newmark's linear acceleration method, where a rather small time increment is employed to simulate the true displacement response.

The behavior of the proposed numerical integration scheme in the solution of large and sophisticated structures comprising both very stiff and flexible components and structures that exhibit spurious high mode responses arising due to inaccuracies and inadequacies in the finite element assemblages may be investigated as a further study.

Abstract: NDT (Non-Destructive Testing) is a analysis technique of materials without causing damage. Common techniques of NDT are ultrasonic, acoustic emission, penetrometer, radiography etc. This methods depends on distinctive features of materials. NDT is used in a variety of settings that covers a wide range of industrial activity, with new NDT methods and applications, being continuously developed. Non-destructive testing methods are routinely applied in industries where a failure of a component would cause significant hazard or economic loss, such as in transportation, pressure vessels, building structures, piping, and hoisting equipment. Thermal conductivity is a inherit feature of wood material and it is related with density. In this study, a developed thermal conductivity based NDT device will be introduced and it's reliability will be exhibited.

Keywords: Non-Destructive Testing, Wood Material, Thermal Conductivity

Introduction

Wood is an engineering material with these known properties; lightweight, durable, easily worked, ecological, stylish, natural, versatile, low-density, cellular, hygroscopic, polymeric, and composite. Thanks to this excellent properties, woodcan potentially be used for a large variety of applications such as traditional buildings, earthquake resistant buildings, flooring, roofing, utensils, indoor and outdoor furniture, boat and shipbuilding, bridges, sport equipment, etc.

The using of wood as construction material is nearly as old as the history of mankind. In addition, wooden houses are already in existence. Wooden houses still subsist and widely preferred especially in many countries in Europe and United States. Turkey has wooden and half-masonry structures built especially during the times of Ottoman Empire. However, only a part of these structures remain standing from past to the present as cultural heritages reflecting the related period. Maintenances and restorations of this structures have a critical importance for their transfer to the next generations. Today, the tests of these structures are performed with visual inspection by the relevant institutions. Recently, in parallel with technological developments, some non-destructive testing methods have been developed for testing the durability of historical wooden house's constructions. The most important methods among them are penetrate, acoustic, microwave, electricity and magnetic assessment methods.

Wood has an historical impact on the life and cultural development process of human (Erdin, 2003). The using of wood material as a construction material has started too many years ago and this process has extended until today with the technological developments (Korkmaz, 2012). In America, especially in California, which is located on the seismic zone, approximately 90% of houses were made of wood (Mcrea et al, 2001). However, some disadvantages of wood, for example, bad dimensional steadiness, relatively low strength,easy worm-eaten and decay, and bad fire resistance, prevent wood extensive usages. These disadvantages limits to expected life of the wood material (Yalınkılıç, 1992).

Non Destructive Testing (NDT) covers a wide group of examination methods used to assess the properties of a material, part, product, weld, or system without causing harm. It is a commonly-used instrument in mechanical engineering, forensic engineering, civil engineering, mechanical engineering, aerospace and aeronautical engineering and medical applications. This term can also be used as Non Destructive Inspection (NDI), and Non Destructive Evaluation (NDE) in literature. Visual assessment and classification of wood which is one of the oldest forms of non-destructive testing needs another method to verify reliability of findings. Visual assessment is totally subjective and directed by the performer. Non-destructive testing methods provide an opportunity to get more reliable results (Bodig and Jayne, 1982). According to Youngquist and Hamilton (1999), NDT is a method which is needed to focus on in the 21 century.

 Copyright © International Science and Technology Conference (ISTEC)

Heat is the total energy of molecular motion in a substance while temperature is a measure of the average energy of molecular motion in a substance. Heat energy relies on the speed of the particles, the quantity of particles (the size or mass), and the kind of particles in an object. Temperature does not rely on the size or type of object. Heat exchange is the transfer of thermal energy between physical systems. The rate of heat exchange is reliant on the temperatures of the systems. The direction of heat exchange is from a region of high temperature to another region of lower temperature. On a microscopic scale, heat conduction occurs as hot, rapidly moving or vibrating atoms and molecules interact with neighboring atoms and molecules, transferring some of their energy (heat) to these neighboring particles. In other words, heat is transferred by conduction when adjacent atoms vibrate against one another, or as electrons move from one atom to another. Conduction is the most significant means of heat transfer within a solid or between solid objects in thermal contact.

Thermal conductivity can be expressed in terms of a coefficient of thermal conductivity (k). According to Fourier's law, in steady state condition, this is the measure of the rate of heat flow through one unit thickness of a material subjected to a temperature gradient, i.e., k is measured in W·m−1·K−1 (Kollmann and Cote 1968; Lienhard IV znd Lienhard V 2011). When heat is applied to a body, the vibratory energy of its molecules in that vicinity is increased. These molecules collide with neighboring molecules and, in so doing, transmit to them a part of their newly acquired energy. These neighboring molecules then in turn transmit a part of their newly acquired energy to still other molecules farther from the center of the disturbance (Brown et al. 1952).Due to the connections between atoms, the displacement of one or more atoms from their equilibrium positions will give rise to a set of vibration waves propagating through the lattice, and heat transfer in a dielectric solid occurs through elastic vibrations of the lattice.

The solid may be a crystal or it may be amorphous, but each atom has afixed equilibrium position, and the thermal vibrations can thus be resolved into normal modes. For a perfect crystal, these normal modes are plane travelling waves. Departures from the perfect lattice result in interactions, which are responsible for the statistical equilibrium between the normal modes. The thermal conductivity at liquid helium temperatures is due solely to phonons of the longitudinal mode of vibration (Debye 1912;Pomeranchuk 1941; Klemens 1951; Stephens 1973; Pohl et al. 1999).Jayne (1959) proposed in his well-known hypothesis for NDE of wood-based materials that energy storage and dissipation properties of wood-based materials are controlled by the same mechanisms that determine static behavior of such materials.

The above differential equation, when integrated for homogeneous material of 1-D geometry between two endpoints at constant temperature, gives the heat flow rate as:

$$\frac{\Delta Q}{\Delta T} = -kA \frac{\Delta T}{\Delta x}$$

Where
A is the cross-sectional surface area,
ΔT is the temperature difference between the surfaces,
Δx is the distance between the surfaces.

Density one of the major factor of the thermal conductivity with material's atoms and molecules are bonded together and their arrangement.

Materials and Methods

In this study, a portable machine which gives an idea about the strength of the wooden material depending on it's the rate of thermal conductivity was used. With the help of this machine, it is aimed to manufacture an alternative portable testing machine to acoustic and microwave testing systems. With this machine, especially in historical wooden houses, acceptable strength values of column-row systems will be determined through thermal conductivity coefficient without damaging the structure. Also, by using this machine it will be provide that defining the thermal conductivity values of facade systems of houses that are being used or ongoing construction. For the determination of strength values, thermal conductivity was defined on same test samples via new designed portable machine.

This machine consists of a terminal board, a heater and a thermo probe. Terminal board communicates with computer by USB serial. Also, the software was developed which process data comes from terminal board. A

plate type sensor board was developed as probe with dimension of 50 mm * 70 mm. This sensor board was connected to terminal board with 3.5 mm jack and supplied with 3.5 V (DC). On the terminal board, Atmega 328 microcontroller was used. Because this microcontroller was used in arduino systems, the software of microcontroller was developed on Arduino platform.

A plate type resistance was used as heater with dimension of 100 mm * 70 mm. This resistance was supplied with 24V (DC) constant supply by a transformator. The surface of heater resistance was packaged with insulation materials to prevent heat escape and to provide reliability in experiments. The surface of sensor board was packaged with insulation materials to provide reliability. In order to measure the heat flow on the wood material, the temperature data were carried to the computer via USB bus using two meter sensor cable. Software of device takes data from sensors placed on the sensor board. This data processed in background and showed on the interface as a curve chart. When the test was finished, the results saved into the CSV file. The testing assembly shown in figure 1.

Figure 1: The testing assembly

In this study, 30 samples with a dimension of 2x5x10 cm obtained from Uludağ fir (*Abies bornmulleriana Mattf.*) wood were used. These samples separated into 3 equal groups. One of these groups was undensified, the others were densified at 25% and %50 ratio. Timbers were supplied as logs from a lumber yard in Düzce, Turkey. The sapwood was cut from the logs with an automatically controlled band saw. Rough-scale planks were formed, the cuts being determined by considering the annual rings parallel to the surface (tangent section) and the sample dimensions. Attention was paid to ensure that no rot, knot, crack, color, or density differences were present in the samples (TS 2470, 1976). The samples were initially subjected to natural drying to approximately 12% moisture content. Before the densification process, the samples were held in a conditioning cabin with a relative humidity of 65 ± 3%, and a temperature of 20 ± 2 °C until they reached a stable weight (TS 2471, 1976).

Results and Discussion

The air-dry density values of samples were determined. The average oven-dry density and air-dry density of Uludağ fir samples were given in Table 1.

Table 1. Oven-dry densities of Uludağ fir samples

Densification	Sample Number									
	1	2	3	4	5	6	7	8	9	10
Undensified	0,4103	0,3952	0,4214	0,4242	0,3856	0,3696	0,4263	0,4010	0,4123	0,4413
25% Densified	0.5715	0,5521	0.5817	0.5762	0.5561	0.5427	0.5884	0.5587	0.5709	0.6123
50% Densified	0.6689	0.5721	0.8121	0.7123	0.7434	0.7929	0.7672	0.8550	0.7659	0.8120

 Copyright © International Science and Technology Conference (ISTEC)

The air-dry thermal conductivity values of samples were determined. The average oven-dry density and air-dry density of Uludağ fir samples were given in Table 1.

According to Table 1, it can be said that the density values of samples increase with densification. It is expected that this situation affects the thermal conductivity values of samples. For that reason, the thermal conductivity values of samples were measured with designed thermal conductivity testing machine. These results were given in Table 1.

Table 1. Thermal conductivity values of Uludağ fir samples

Densification	Sample Number									
	1	2	3	4	5	6	7	8	9	10
Undensified	0.1216	0.1152	0.1274	0.1282	0.1137	0.1114	0.1238	0.1196	0.1203	0.1312
25% Densified	0.1417	0.1377	0.1521	0.1532	0.1503	0.1522	0.1604	0.1531	0.1590	0.1612
50% Densified	0.1689	0.1621	0.1772	0.1782	0.1743	0.1739	0.1912	0.1735	0.1765	0.1942

According to this results, as would be expected, it can be said that there is a significant interaction between thermal conductivity and density of wood. And this values can be determined with designed device. In the next step of study, obtained data will compare with data will be obtained from QTM 500 Quick Thermal Conductivity Meter.
CTC tests have a good potential to be used as an alternative in situ NDE method to assess density and residual strength of wood. CTC test have a good potential to be used as an alternative NDT method to assess density and residual strengt of wood.

A NEW MICROWAVE ASSISTED SYNTHETIC METHOD FOR THE SYNTHESIS OF 2-(1H-BENZO[D]IMIDAZOL-1-YL)-1-PHENYLETHAN-1-ONE OXIMES: AN EXPERIMENTAL AND COMPUTATIONAL STUDY

Taner ERDOĞAN

Kocaeli University, Kocaeli Voc.Sch. Dept.of Chemistry and Chemical Processing Tech. Kocaeli Turkey

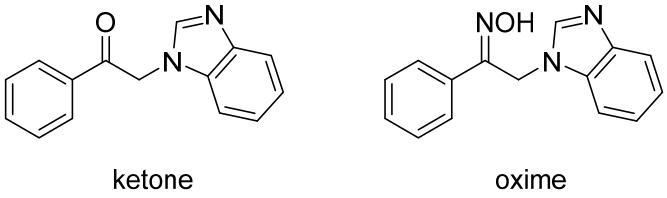
taner5500@gmail.com

Abstract: This study consists of two parts. In the first part, we have studied on a new microwave assisted synthetic method for the synthesis of 2-(1H-benzo[d]imidazol-1-yl)-1-phenylethan-1-one oximes from corresponding ketones. The results showed that the proposed microwave assisted method is efficient and time and energy saving. In the second part of our study some density functional theory (DFT) calculations have been performed on the selected molecules and compared with the experimental results. In the computational part of the study; single point energy calculations, geometry optimizations, frequency analysis, NMR spectral analysis, molecular electrostatic potential map calculations, frontier molecular orbital calculations, determination of some global reactivity descriptors and Mulliken atomic charge calculations have been performed. All DFT calculations were carried out at the B3LYP/6-31G(d), B3LYP/6-311G(d,p) and B3LYP/6-311+G(2d,p) level of theories.

Keywords: Microwave synthesis, oximes, benzimidazole, DFT calculation, computational chemistry

Introduction

Oximes and related compounds are important compounds in organic chemistry. This type of organic compounds can be very useful for the synthesis of wide range of organic molecules. Additionally, especially with the integration of some certain groups, like imidazole, benzimidazole, triazole, benzotriazole etc. this organic compounds exhibit broad spectrum of biological activities (Jiang, 2011). They can act as antibacterial (Kaplancikli, 2004), antifungal (Madkour, 2006) and antiviral (Beaulieu, 2006) agents etc. Figure 1 represents a typical 2-(1H-benzo[d]imidazol-1-yl)-1-phenylethan-1-one and its oxime form.



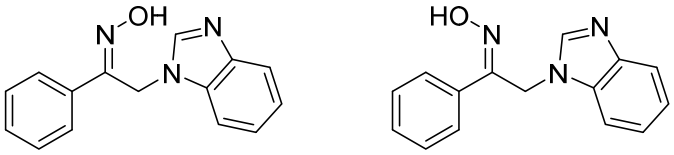


Figure 1. A typical 2-(1H-benzo[d]imidazol-1-yl)-1-phenylethan-1-one and its oxime form.

Miconazole is an important antifungal agent. It is the active ingredient of some commercially available pharmaceuticals. Oxiconazole is the oxime ether form of miconazole and it is also an important commercially available antifungal agent.

Literature contains various methods for the synthesis of oximes. Oximes can be prepared by the addition of hydroxylamine to aldehydes or ketones (Smith, 2007). This reaction is generally carried out in the presence of bases, and ethyl alcohol is commonly used as solvent. But some other methods also can be used, for example, refluxing in pyridine without using additional base (Abdel-Megid, 2002). Phase transfer reactions also can be used in this type of conversion and PEG-600 and high carbon number phenols, for example, nonyl phenol or dodecylphenol, can increase reaction rate as phase transfer catalysts (Liu, 1997; Krbechek, 1994). Microwave energy can also be used in the transformation of ketones to the corresponding oximes (Puciova, 1992; Mitra, 1999; Hajipour, 1999).

Oxime can be obtained either (E)- or (Z)- isomers. It is related to the relative stability of the isomers which will be the major product. In some cases (E)- isomer is more stable and becomes the major product but in some cases the (Z)- isomer is the major one. Figure 2 represents (E)- and (Z)- forms of 2-(1H-benzo[d]imidazol-1-yl)-1-phenylethan-1-one oxime.

(Z)-oxime (E)-oxime

Figure 2. (E)- and (Z)- forms of 2-(1H-benzo[d]imidazol-1-yl)-1-phenylethan-1-one oxime.

One of the methods for the synthesis of 2-(1H-benzo[d]imidazol-1-yl)-1-phenylethan-1-one oxime is reported by Abdel-Megid (2002). In this method ketone was refluxed in pyridine for 6 hours in the presence of hydroxylamine. The yield was reported as 55%. Another method is reported by Özel Güven (2007). In this method, the reaction was carried out at room temperature in 24 hours. Methanol and water were used as solvents. The reported yield is 65%.

Materials and Methods

This study consists of two parts. In the first part, we have studied on a new microwave assisted synthetic method for the synthesis of 2-(1H-benzo[d]imidazol-1-yl)-1-phenylethan-1-one oxime from corresponding ketone. However the literature contains various methods for the conversion of this type of ketones to their oxime forms (Abdel-Megid, 2002, Ozel Guven, 2007, Rad, 2009, Roeintan, 2015), the results showed that the proposed microwave assisted method is efficient and time and energy saving. Microwave assisted ketone to oxime conversion reactions was carried out in pyridine in the presence of hydroxylamine hydrogenchloride under 200 W of microwave energy in 30 minutes. Prior to ketone to oxime conversion reaction we have used a two step literature method for the synthesis of ketone (Özel Güven, 2007).

In the second part of our study some density functional theory (DFT) calculations have been performed on the synthesized molecules and compared with the experimental results. In the study; single point energy calculations, geometry optimizations, frequency analysis, NMR spectral analysis, molecular electrostatic potential map calculations, frontier molecular orbital calculations, determination of some global reactivity descriptors and Mulliken atomic charge calculations have been performed. All DFT calculations were carried out at the B3LYP/6-31G(d), B3LYP/6-311G(d,p) and B3LYP/6-311+G(2d,p) level of theories using Gaussian 09W Rev.D.01 Program Package (Frisch, 2013). GaussView 5 Program Package (Dennington, 2009) was used for the visualization of the computational results.

Results and Discussion

In the synthesis of oxime from corresponding ketone, optimal ketone to hydroxylamine hydrogenchloride molar ratio was found to be 1:1.5. The reaction yield was found to be nearly 65%. The optimal microwave energy and microwave irradiation time was found to be 200W and 30 minutes, respectively.

In computational studies, firstly, calculations on the relative stability of the (E)- and (Z)- isomers of 2-(1H-benzo[d]imidazol-1-yl)-1-phenylethan-1-one oxime was carried out. Energies for the (Z)- and (E)- isomers and the energy differences between two isomers are given in Table 1. Results showed that the (Z)-isomer is more stable than the (E)- isomer.

Table 1: Relative stability of the (E)- and (Z)- isomers of 2-(1H-benzo[d]imidazol-1-yl)-1-phenylethan-1-one oxime.

Isomer	6-311G(d,p) (hartree)	6-311+G(2d,p) (hartree)	6-311G(d,p) (eV)	6-311+G(2d,p) (ev)

For a comparison, the same calculation was carried out on the imidazole substituted oxime. Results for the calculations on the relative stability of the (E)- and (Z)- isomers of 2-(1H-imidazol-1-yl)-1-phenylethan-1-one oxime are given in Table 2. It can be seen that the energy differences between (E)- and (Z)- isomers for the imidazole substituted oxime is bigger than the benzimidazole substituted oxime. The (Z)- isomer is again the more stable isomer.

Calculated and experimentally obtained selected geometric parameters for the 2-(1H-benzo[d]imidazol-1-yl)-1-phenylethan-1-one oxime was given in Figure 3 and Table 3. Calculated values were obtained at the B3LYP/6-311+G(2d,p) level of theory. Experimental geometric parameters are literature values (Özel Güven, 2007). The results show that there is a good agreement between the experimental and computational results.

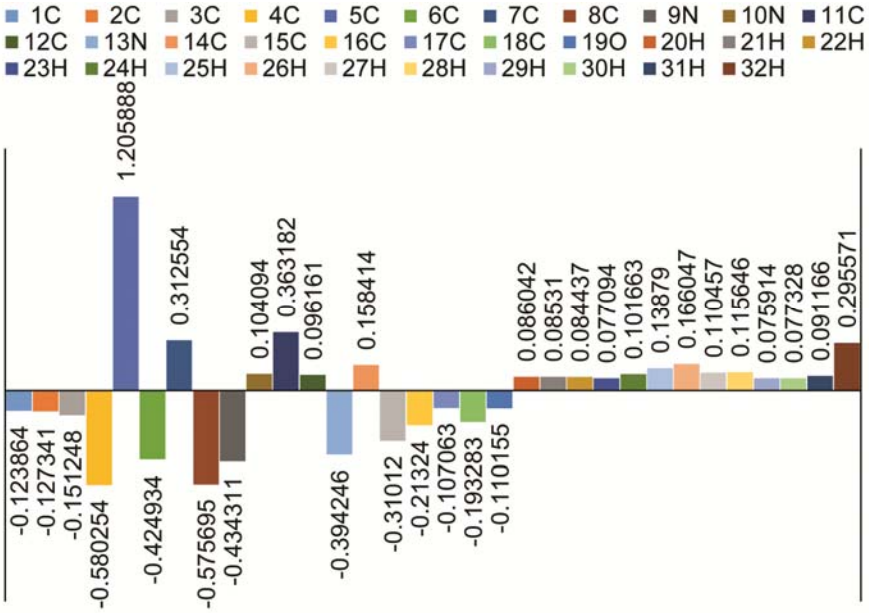

Figure 9. Mulliken atomic charges for 2-(1H-benzo[d]imidazol-1-yl)-1-phenylethan-1-one oxime calculated at the B3LYP/6-311+G(2d,p) level of theory.

Conclusion

As a result, in this study we have been studied on 2-(1H-benzo[d]imidazol-1-yl)-1-phenylethan-1-one oxime. The study consist of two parts. In the first part we have been studied on a new microwave assisted synthetic method for the conversion of 2-(1H-benzo[d]imidazol-1-yl)-1-phenylethan-1-one to its oxime form. The results showed that the proposed microwave assisted method is efficient and time and energy saving. In the second part of our study we have performed some density functional theory calculations on the selected molecules and compared them with the experimental results obtained from the literature. In the synthesis of oxime from corresponding ketone, the major product is the (Z)- isomer. This is not a surprising result because of the more stable structure of the (Z)-isomer than the (E)- isomer. Computational results also support this experimental results. There is a considerable energy difference between the (E)- and (Z)- isomers and the (Z)- isomer is the more stable one. In ^{1}H NMR chemical shift calculations there is a good agreement between the calculated values and the experimental values obtained from the literature. The best results have been obtained from the calculations performed at the B3LYP/6-311+G(2d,p) CSGT and B3LYP/6-311G(d,p) GIAO.

A NEW RP-HPLC METHOD FOR SIMULTANEOUS DETERMINATION AND VALIDATION OF ETODOLAC AND THIOCOLCHICOSIDE IN HUMAN PLASMA

Aysel Küçük Tunca
ayselk@sakarya.edu.tr

Neşe Şirin
nesealtuntas34@hotmail.com

In this work, an easy, fast, economical, repeatable, sensitive and new RP-HPLC (Reverse Phase-High Performance Liquid Chromatography) method been developed for the simultaneous quantitative estimation of Etodolac (ETD) and Thiocolchicoside (THC) combination (Etotio tablet containing 400 mg ETO and 8 mg TIO) in human plasma (in-vitro). Determination of ETD and THC without without any need for extraction process in human plasma was carried out at 259 nm by using Photo Diode Array Detector (DAD), on Tosoh Bioscience TSKgel ODS-80TM column (150×4.6mm, 5 µm). A mobile phase mixture consisting of Methanol: Phosphate Buffer (pH 3.5) were applied into the system as gradient elution and in flow rate of 1.0 ml/min. ETD and THC retention times were detected as 6.4 and 4.1 min, respectively. Validation parameters such as sensitivity, linearity, accuracy and precision were applied to the method in compliance with ICH validation guidelines (ICH Harmonized Tripartite Guideline, 2005). Calibration working range was 20-500 µg mL^{-1} for ETD and 0.4-10 µg mL^{-1} for THC and good linearities were obtained. Very high recovery values as 97.50-100.24% for ETD and 97.21-100.68% for THC was obtained.In contrary with the other methods encountered in the literature, the best separation was obtained between these two active ingredients thanks to the changes on mobile phase, flow rate and column type (Alagar, R. M., 2012-Sujatha, K., 2014). Furthermore, an environmental friendly and more economical method was developed by decreasing the methanol rate within the mobile phase mixture. This method also applied in human plasma media and it was seen that it can be easily and successfully applied in routine quantity analysis processes.

A NEW SINGLE-PHASE PLL STRUCTURE FOR GRID-CONNECTED CONVERTERS

Hasan DİRİK

Sinop University, Vocational School, Department of Electric and Energy, Sinop-Turkey

hasan_dirik@hotmail.com

Abstract: In grid connected-converters, switching signals are produced by using phase and frequency of grid voltages. Conventionally, these variables are computed by making use of PLL (Phase Locked Loop) structures in real time. The most important factor that affects the performance of a PLL is generally harmonic components of voltages. Thus, design of these structures is a difficult task. In the design of these structures, another difficulty is met in the case of single-voltages. In three-phase systems, orthogonal components of voltages can be obtained by using Park or Clarke transforms and these components provide to reach phase and frequency of voltages easily. In despite of this, reaching the orthogonal components from single-phase voltages is more difficult. In this paper, a new single-phase PLL structure that is developed for grid-connected converters is presented. New PLL structure is not affected by harmonics and captures the phase and frequency of single-phase voltage very well. This PLL structure has been tested by using both real and synthetic voltage signals and its superior performance has been verified.

Keywords: PLL, Single-Phase, phase angle, Orthogonal Components, Grid-Connected Converters

Introduction

Phase angle of grid voltages are the basic signal required for the synchronization of grid-connected converters. The major structures that include grid-connected converters are parallel and series APFs, uninterruptible power supplies and flexible alternative current transmission systems. In these structures, it is important determining the phase angle of grid voltage quickly and accurately in terms of obtaining reference signals properly (Arruda et al., 2001).

In literature, there are many works related to the obtaining synchronization signal for grid-connected converters. These structures are referred to phase locked loops (PLL). In almost all of these works, synchronization angle is reached over a closed control loop (Arruda et al., 2001; Ciobotaru et al., 2006; Ghoshal and John 2007; Timbus et al. 2005;Kaura and Blasko, 1997; Chung, 2000). With the use of a PLL, not only the instantaneous phase angle of reference voltage signal is obtained but also its frequency and amplitude values are computed (Ciobotaru et al., 2006). The most important feature expected from a PLL structure is to compute phase angle quickly and accurately even in the case of highly distorted voltages and to work stably in transient conditions. PLL structures are one of the important parts of the reference current methods such as synchronous reference frame and direct current control methods that are able to compensate reactive power compensation.

General form of these structures is given in Figure 1. Here, the PLL captures the phase angle of alternative voltage with the help of a low pass filter (LPF) and a voltage controlled oscillator (VCO) (Kaura and Blasko, 1997).

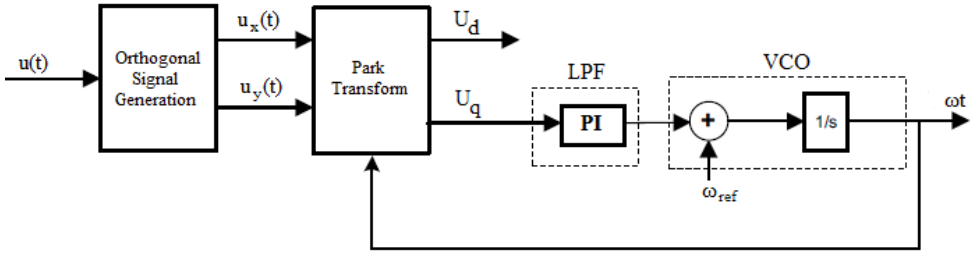

Figure 1: General form of PLLs

The primary problem faced in the designing a single-phase PLLs is the difficulty of computing orthogonal components from single-phase signal differing from the designing of three-phase PLLs. In order to achieve this,

 Copyright © International Science and Technology Conference (ISTEC)

usually, a quarter-period phase shifting is applied to voltage signal then orthogonal components are reached. In non-fixed frequency conditions, due the period that is taken as base is variable, some errors occur.
In this paper, a new PLL structure that provides to obtain orthogonal components without using any phase shifting method and thus, does not contain these errors is presented. As the used method for the computation of orthogonal components eliminates the harmonics of single phase voltage due to its nature, the suggested PLL structure is irresponsive to harmonics. Below, firstly the suggested PLL structure is described and then simulations that have been done in the Matlab/Simulink environment using both a synthetic signal and a real voltage signals measured from a distribution system is given. Lastly, some discussion on the results is given.

Proposed PLL Structure

In this paper, the suggested single-phase PLL structure uses a method computing orthogonal components of voltage directly. In order to obtain the orthogonal components of voltage, a method is derived from differential equation algorithm (DEA). G and H (G=1/R, H=1/L) parameters of an equivalent parallel R-L load can be computed by using successive 3 samples of voltage and current samples that are sampled with a sampling period of T_s by the use of DEA as in the following equations.

$$G = \frac{(u_3+u_2)\cdot(i_2-i_1)-(u_2+u_1)\cdot(i_3-i_2)}{(u_3+u_2)\cdot(u_2-u_1)-(u_2+u_1)\cdot(u_3-u_2)} \quad \textbf{(1)}$$

$$H = \frac{2}{T_S}\frac{(u_2-u_1)\cdot(i_3-i_2)-(u_3-u_2)\cdot(i_2-i_1)}{(u_3+u_2)\cdot(u_2-u_1)-(u_2+u_1)\cdot(u_3-u_2)} \quad \textbf{(2)}$$

In the approach of this paper, values of orthogonal components (U_x ve U_y) of voltage on a reference axis rotating with an angular velocity of ω are computed instead of G and H parameters by using unit sine (*sin(ωt)*) and voltage (*u(t)*) signals instead of voltage (*u(t)*) and current (*i(t)*) signal respectively. That is, by representing unit sine signal with S as in the following equation,

$$S = \sin(\omega t) \quad \textbf{(3)}$$

orthogonal components of a voltage are

$$U_x = \frac{(S_3+S_2)\cdot(u_2-u_1)-(S_2+S_1)\cdot(u_3-u_2)}{(S_3+S_2)\cdot(S_2-S_1)-(S_2+S_1)\cdot(S_3-S_2)} \quad \textbf{(4)}$$

$$U_y = \frac{2}{\omega T_s}\cdot\frac{(S_2-S_1)\cdot(u_3-u_2)-(S_3-S_2)\cdot(u_2-u_1)}{(S_3+S_2)\cdot(S_2-S_1)-(S_2+S_1)\cdot(S_3-S_2)} \quad \textbf{(5)}$$

Here, U_x and U_y denote in phase and quadrature components. U_y can be also computed by using (5) instead of (4) and by taking cosine instead of sine in this equation. It means by the use of cosine signal:

$$C = \cos(\omega t) \quad \textbf{(6)}$$

U_y can be also obtained by the following equation.

$$U_y = \frac{(C_3+C_2)\cdot(u_2-u_1)-(C_2+C_1)\cdot(u_3-u_2)}{(C_3+C_2)\cdot(C_2-C_1)-(C_2+C_1)\cdot(C_3-C_2)} \quad \textbf{(7)}$$

In the case of voltages containing harmonics, quadrature components obtained by (7) will consist of a dc signal and oscillating signals representing harmonics. This means quadrature component that is computed by (7) in the form of (8).

$$U_y = \bar{U}_y + \tilde{U}_y \quad \textbf{(8)}$$

Here, $\bar{U}_y$ will be the quadrature component of voltage at the interested frequency. This value can be reached by applying a LPF to U_y.

In this work, the suggested PLL structure computes the phase angle (ωt) and angular frequency (ω) of voltages by using the method mentioned above providing to obtain orthogonal components. General form of the suggested

 Copyright © International Science and Technology Conference (ISTEC)

PLL is given in the Figure 2. According to this figure, U_y component of voltage is computed by using last 3 samples of voltage signal (u_1, u_2, u_3) and cosine of the last 3 phase angle values obtained by the PLL loop in (7). This component, then, purified from the effects of harmonics by applying a LPF and thus U_y component of voltage at fundamental frequency is reached. Instantaneous angle value (ωt) that makes U_y zero (0) gives real phase angle of voltage. So the value of ωt is tried to be obtained by using a PI controller that makes this component zero. Output of the PI controller is the deviation of angular frequency from its reference value. Thus, real angular frequency (ω) is gained by summing this deviation with its reference value. Discrete time integral of real angular frequency is also gives the desired instantaneous value of phase angle.

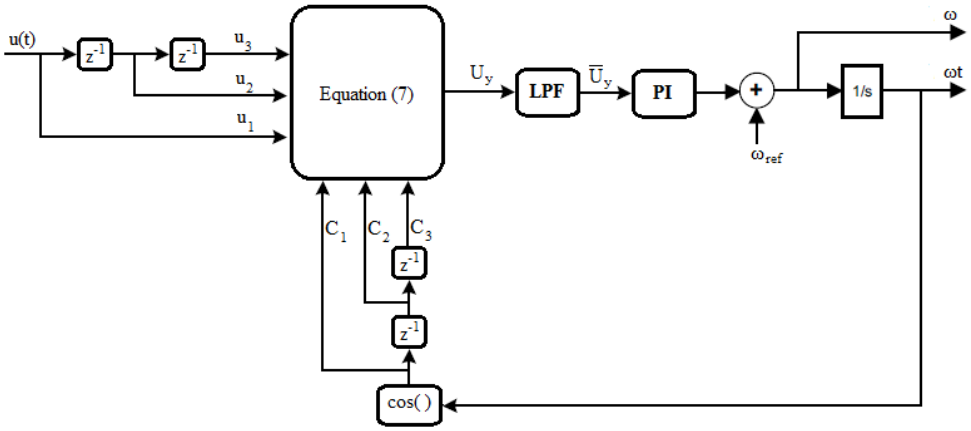

Figure 2: Block scheme of the suggested PLL

Simulations

In this section, simulations of the suggested PLL structure that have been done in the Matlab/Simulink environment using both synthetic and real voltage signals are presented. Real voltage signal has been measured from a real distribution system by a power quality analyzer (PQA). In the simulation of synthetic voltage signal, response of the PLL structure against pure sinusoidal voltage, voltage containing harmonics, sudden phase jumps, sudden frequency and amplitude deviation has been investigated respectively. Time dependent equation of the voltage signal used for this aim has been given in (9). Graph of this voltage signal has been also given in Figure 3.

$$u(t)=\begin{cases} 200\sin(100\pi t) & t\le 0.1s \\ 200\sin(100\pi t)+70\sin(300\pi t)+20\sin(500\pi t) & 0.1s<t\le 0.2s \\ 200\sin\left(100\pi t+\frac{\pi}{2}\right)+70\sin(300\pi t)+20\sin(500\pi t) & 0.2s<t\le 0.3s \\ 200\sin\left(99,8\pi t+\frac{\pi}{2}\right)+70\sin(299,4\pi t)+20\sin(499\pi t) & 0.3s<t\le 0.4s \\ 100\sin\left(99,8\pi t+\frac{\pi}{2}\right)+35\sin(299,4\pi t)+10\sin(499\pi t) & 0.4s<t\le 0.5s \end{cases} \quad \textbf{(9)}$$

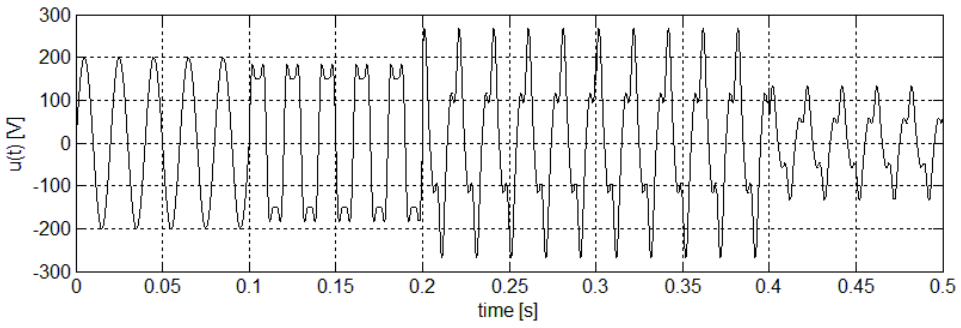

Figure 3: Waveform of the synthetic voltage signal used in the simulations

As voltage has a pure sinusoidal waveform during first 0,1 second of the simulation that totally lasted 0,5 second, this voltage has been changed to be with harmonics at the time of 0,2 second. At the 0,2 second of the simulation, phase angle of the fundamental component has been suddenly changed from 0 radian to π/2 radian. Fundamental frequency of the voltage has been suddenly decreased from 50 Hz to 49,9 Hz at the 0,3 of the simulation. At the 0,4

 Copyright © International Science and Technology Conference (ISTEC)

second of the simulation, all amplitudes of the harmonic components have been also halved. With sudden changes, it is aimed to reveal the response of the designed PLL against transient conditions.

For this input voltage, output of the PLL with the output that must be has been given in Figures 4-8. Simulation results show the suggested PLL structure captures phase angle of the voltage correctly and quickly in the both of steady state and transient conditions. After sudden changes, this time takes 2 or 3 periods at most. THD value of the voltage used for the test is about 36% and phase angle of the voltage with harmonics even at this rate could be computed very accurately as can be seen in the Figure 5. This demonstrates robustness of the suggested PLL structure against harmonics. Sudden change in the phase angle is one of the best ways to test performance of a PLL. Here, as can be seen from Figure 6, a sudden phase angle change with an amount of $\pi/2$ radian caused to sudden change in the output of the PLL and PLL structure has been captured the actual value in approximately 2 or 3 fundamental periods. In real grid conditions, the deviation in the frequency is not to be expected very much. Thus, a frequency change rate at a 0,2% has been applied to test signal in order to see the response of the proposed PLL against frequency deviation. For the limited deviation in the frequency of the test signal has been caused a limited change in the phase angle at the PLL output as can be seen from Figure 7. The effect of the sudden amplitude change at a rate of 50% on the output of the proposed PLL is given in Figure 8. Since changes in the voltage amplitude are not a factor affecting phase angle, it has limitedly affected the PLL output.

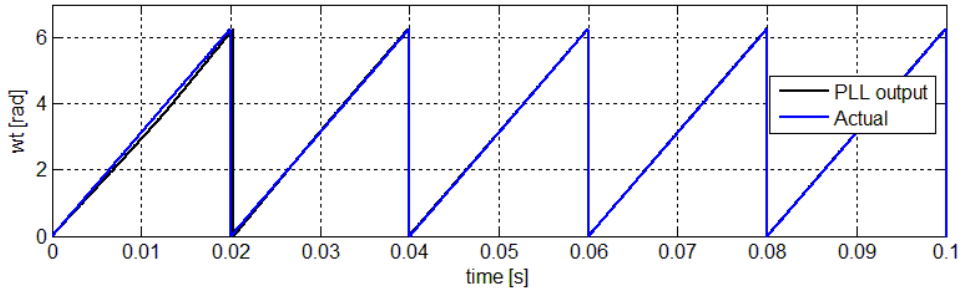

Figure 4: PLL output and actual output for the case of pure sinusoidal input voltage

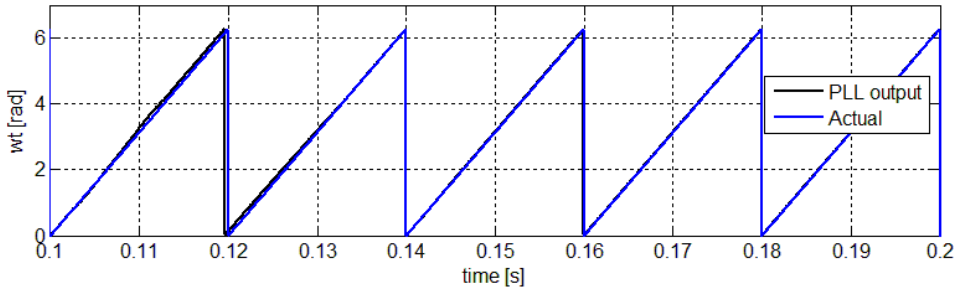

Figure 5: PLL output and actual output for the case of harmonic voltage input

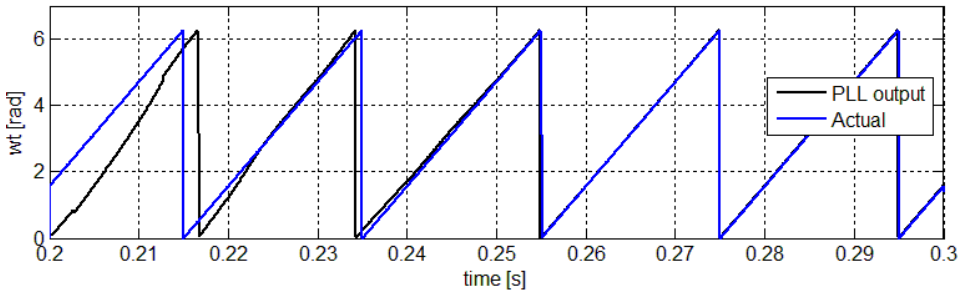

Figure 6: PLL output and actual output for the case of sudden phase angle jump

 Copyright © International Science and Technology Conference (ISTEC)

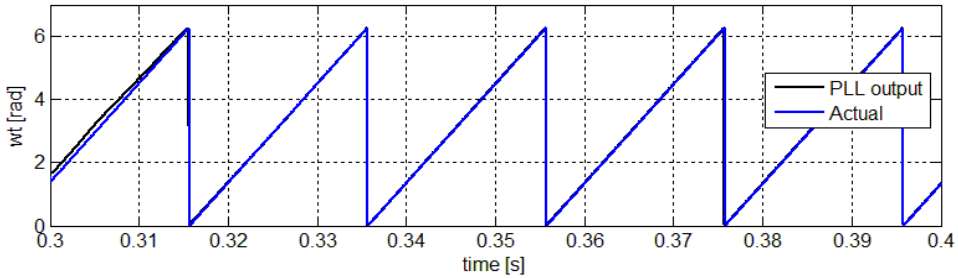

Figure 7: PLL output and actual output after sudden frequency change

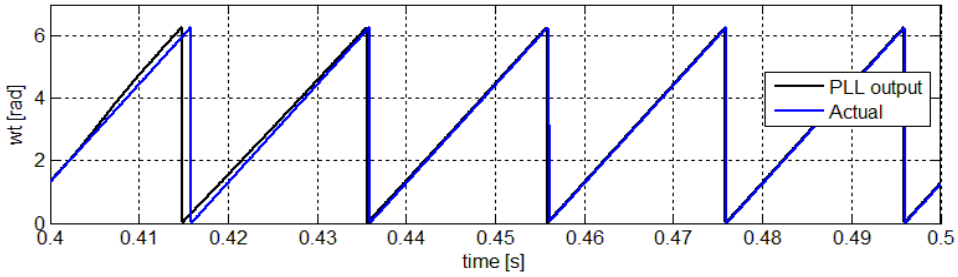

Figure 8: PLL output and actual output after sudden amplitude change

Suggested PLL structure has been also tested with a real voltage signal that measured from a real distribution system by a PQA. THD value of this voltage is about 7%. Waveform of this voltage is given in Figure 9. In the Figure 10, output of the PLL and its actual values is also shown. Result in the Figure 10 demonstrates that the suggested PLL can compute phase angle of a real voltage signal very accurately and very quickly.

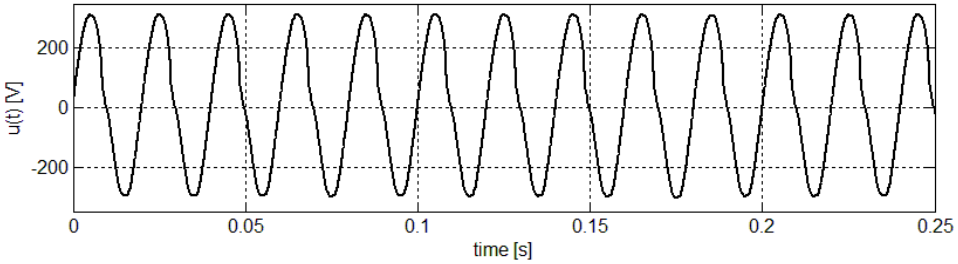

Figure 9: Waveform of the real voltage signal measured from a real distribution system

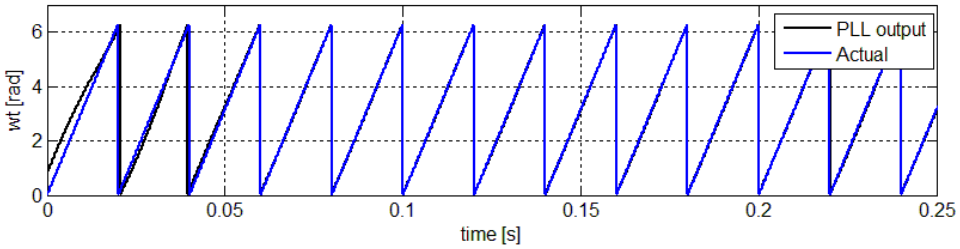

Figure 10: PLL output obtained by real voltage signal input and actual output

Conclusions

In this work, a new form of PLLs that provides fundamental synchronization signal for grid-connected converters such as APFs and FACTS is suggested. Suggested structure is a single-phase PLL and its operation principle is based on the obtaining orthogonal components directly by using sampled values of voltage. Computation of orthogonal components is done by a new method derived from DEA. Dc part of orthogonal components obtained by new method represents the fundamental frequency component of input voltage. With this way, it has been possible to obtain phase angle and frequency of fundamental frequency component of input voltage without using any phase shifting method. Suggested structure has been tested with both synthetic voltage signal and real voltage signal. Test results have shown that performance of the suggested PLL is satisfactory under various conditions. In simulations, it has been observed that output of the suggested PLL reaches to its actual value in a very short duration (2 or 3 period at most) even in the cases of voltages with harmonics, sudden frequency, phase angle jump and amplitude changes.

A QUALITATIVE ANALYSIS OF EFL WRITTEN CORRECTIVE FEEDBACK

İhsan Ünaldı
ihsanunaldi@gmail.com

This study focuses on the qualitative aspects of inter-rater reliability in foreign language teachers' written corrective feedbacks. The participants were 171 Turkish EFL teachers working at state schools in Turkey. The participants were provided with an essay written by a B1 level 20-year-old Turkish EFL learner. They were asked to evaluate the essay holistically and write feedbacks to the learner. The results were analyzed through an inductive approach; the themes and recurring ideas were watched for without any predetermined concepts or categories. The results revealed that the feedbacks given to the learner varied to certain extents; several categories emerged during the analysis. However, it was concluded that the expectations of EFL teachers from a written text in English focused dominantly on grammatical accuracy.

A RELATIONSHIP BETWEEN BASIN AREA AND AVERAGE DISCHARGE: A CASE STUDY FOR TURKEY

[1]Mehmet Ishak Yuce, [*2]Musa Esit, [3]Abdullah Muratoglu
[1]Faculty of Engineering, Department of Civil Engineering, Gaziantep University, Turkey
[2]Faculty of Engineering, Department of Civil Engineering, Adiyaman University, Turkey
[3]Faculty of Engineering, Department of Civil Engineering, Batman University, Turkey
yuce@gantep.edu.tr, mesit@adiyaman.edu.tr, abdullah.muratoglu@batman.edu.tr

ABSTRACT: Precipitation area is of great importance for water works such as irrigation, canal design and hydropower production etc. Due to change of basins' topographic, geologic and climate characteristics, the annual average discharge values differ from each other. Turkey is divided into 26 hydrological basins. Average annual discharge data has been obtained from 293 gaging stations and some of them have at least 50 years of observation. The aim of this study is to predict a function between the precipitation area and annual average discharge for all main basins of Turkey. The relationship between basin areas and discharge has been set up by using fundamental statistic linear regression analyses. The best fitted linear line between a basin's precipitation area and the average discharge has been generated in order to predict the aforementioned function. The results of this study were interpreted according to different characteristics of the basins.

Keywords: Basin, Annual discharge, Linear regression, Precipitation area

Introduction

Due to climate change, global average temperature has increased over the past century. Managing the water resources gained a great importance, globally. In many parts of the world, water scarcity is taken into consideration as a priority. Causes of water scarcity include overuse related to numerous fields such as land, people and recreational activities; pollution of water because of poorly designed sewage system and contaminating materials such as oil, chemicals and fecal matter; conflict between people over an area of land; distance to water sources; drought because of lack of rainfall; and finally governmental access. Effects of water scarcity are proposed as lack of access to drinking water which is the biggest problem, hunger, lack of education, diseases, sanitation issues and poverty. For the solutions, numerous studies have been applied by researches. Primarily the main solution is based on education, water recycle, technological development related to water conversation, improving practices related to farming, improving sewage systems and supporting clean water initiatives (CEF, 2016). Water is a valuable resource that is gradually getting scarcer due to rapid population growth in the world affecting water consumption, urbanization, industrialization etc. Contrary to general belief, Turkey is not a freshwater resources rich country and it is not the richest country in the region (RTMFA, 2016). The average total amount of water per person per year for different regions is shown in Table 1. Freshwater resources seem to be much lower than the world average in Turkey (Table 1). According to this data, the total amount of water per capita in South America appears to be the most and the lowest rate is observed in Syria.

Turkey is a country on the edge of the water shortage. Average annual precipitation of Turkey is approximately 643 mm which is below the world average of 800 mm. This amount corresponds to 501 km^3 average annual water. Turkey's consumable surface and underground water potential is 112 km^3 per year (Muluk, 2013). Turkey aims to use all available water potential by 2023 (DSI, 2009). The water resources potential of Turkey is given Table 2. The given water potential values are calculated as a result of 73 years by states water works (DSI). Consumable surface water potential of rivers in Turkey is 95 km^3 and including 3 km^3 of rivers from neighboring countries. In total, usable surface water is approximately 98 km^3 per year.

Table 1: According to region, the amount of water per person (yearly)

Country	The amount of water per person (yearly)
Syria	1.200 m³
Lebanon	1.300 m³
Turkey	**1.430 m³**
Iraq	2.020 m³
Asian Avg.	3.000 m³
Western European Avg.	5.000 m³
Africa Avg.	7.000 m³
South America	23.000 m³
World Average	**7.6000 m³**

Table 2: The water resources potential of Turkey (DSI, 2009)

Annual Average Precipitation	643 mm/year
Annual Rainfall	501 km³
Evaporation	274 km³
Groundwater Seepage	41 km³
Disused Water	88 km³
Useable Surface Water	98 km³
Potable Groundwater	14 km³
Total Useable Water	112 km³

In this paper, in view of Turkey's water shortages, a relationship between basins area and their discharge have been determined by using statistical analyses. Long term hydrologic data shows variation according to basins topographic characteristics.

Material and Methods

Location Data

Turkey is located in Eurasia, mainly on the Anatolian Peninsula in the Western Asia (97%) and a smaller portion on the Balkan Peninsula (3%) in the Southeast Europe. Turkey's land extends less than 800 km from north to south and more than 1600 km from west to east. The area of Turkey is approximately 783 562 km^2, of which 770 760 km^2 is land the rest is inland waters. Turkey consists of 26 large hydrological basins, which show great differences in terms of average annual rainfall, precipitation, evaporation and surface flow. Dry period takes place about every 30 year. This dry period continues usually one year and sometimes can continue up to two or three years (Akkemik, 2005). However, it has been observed that the prolonged dry period of the 1960s. and the drought lasted 5 years in 1994 (Kömüşcü, 2005). Water basins in Turkey are shown in Figure 1. Basin characteristics in terms of precipitation area, average annual flow and selected gaging stations for this study are given in Table 3.

Dicle	184,918	21,33	68,8	17

Due to different annual precipitation amount, the basins' yield and water potential vary. Fırat basin has the highest water yield with 31.61 billion m^3 of water and The Dicle basin ranks second with 21.33 billion m^3. The Fırat and Dicle basins provide approximately 28.5% of the country's total water potential. Akarcay and Burdur basins have the lowest water potential with 0.49 and 0.5 billion m^3 respectively. Burdur and Kucuk Menderes basins are not included in this study due to lack of available data. Many river basins in the Mediterranean Region will be faced with water stress problem in the near future. More than 40% of Turkey in the central and western regions of the country is expected to experience water stress by 2030. This ratio is between 20% and 40% in the southeast and eastern regions (DSI, 2009). Climate change projections indicate that increase in the temperature and decrease in precipitation will affect Turkey seriously. In this study, determining a relation between basin area and their

 Copyright © International Science and Technology Conference (ISTEC)

discharge has been obtained employing regression analysis. The main aim of this paper is to understand and interpret the relationships between two variables which are expressed in Equation 1.

$$A = aQ + c \quad (1)$$

Where, A is basin area, Q is discharge, a, b and c are numerical constant coefficients.

Gaging Stations

The flow measuring stations (FMS) provide information about channel characteristics such as surface width, depth, velocity and channel discharge. In this study, totally 293 stations were taken into consideration. Each basin in Turkey has numerous stations according to their sizes. Burdur and Kucuk Menderes basins have not been taken into account due to limited number of flow measuring stations installed. Some of FMS have a dataset of at least 50 years of observation. For the majority of the basins, the long term data is available in which the generation of the proposed model is suitable. Some specific information for Buyuk Menderes basin is given in Table 4 as an example.

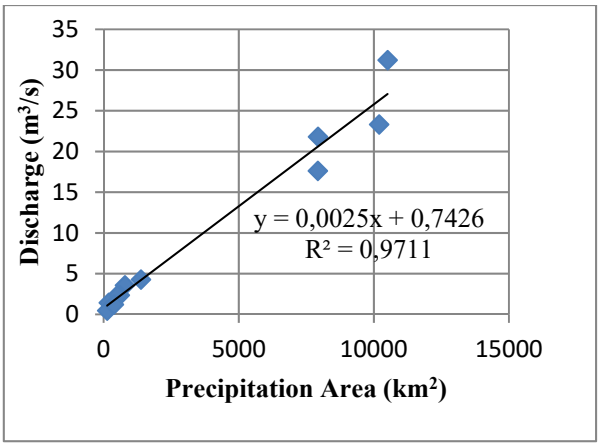

Table 4: Information gaging station of Buyuk Menderes basin

Data and Analysis

Precipitation area is an important factor in order to determine basin's water potential. Basin topographies play an important role in the amount of precipitation because of variation in the elevation. Totally 293 gaging stations' precipitation area data were obtained. Precipitation area versus annual average discharge is expressed graphically. These relations are shown for each basin in Turkey below.

Results

In this study, each of 26 basins in Turkey is analyzed in order to establish a relationship between the precipitation area of all these basins and their average annual discharge. However, due to lacking number of stations and the measurement period, Burdur and Kucuk Menderes basin were not taken into account. The relationship between the precipitation area and the average annual discharge of the remaining 24 basins were analyzed by linear regression. Reasonable values of R^2 for majority of basins have been obtained. Unexpected results for R^2 were

 Copyright © International Science and Technology Conference (ISTEC)

found in West Mediterranean and Antalya basins due to lack of data. Although coefficients of *a* and *b* of Equation 1 for 24 basin vary within a specified range, b values are observed highly in Antalya watershed. For Asi watershed, coefficient *a* has been found great value as different from others because of the lack of observing station number. Coefficients *a, b* and R^2 values are given in Table 5 for all basins.

Discussion and Conclusion

Water gained a great importance, globally due to the increasing number of population, industrialization and globalization. This paper aims to set up a relationship between precipitation area and the average annual discharge of all watersheds in Turkey. In most of the basins, functional parameters were found to have a good consistency except a number of watersheds. The result of this study is expected to shed light for hydrologic and hydraulic works, in the future. Coefficients and R^2 values can be helpful to understand watershed characteristic. Further studies can be developed by adding runoff, evaporation, moisture and temperature.

[c]Scientific and Technological Research Application Center, Sinop University, Sinop, Turkey, onurs@sinop.edu.tr

In recent years, the studies of the synthesis of coordination polymers constructed from semi-flexible ligands which possess both aromatic and aliphatic groups have been increased due to the fact that they used for many different technologies such as gas storage, purification, separation, catalysis and drug delivery [1, 2].

This work presents a systematic investigation of the reactions of semi-flexible 1,4-phenylenediacetate (ppda) with Cd(II) salts in the presence of different semi-flexible bis(imidazol-1-ylmethyl)benzene co-ligands (o/m/pbix=1,2/1,3/1,4-bis(imidazol-1-ylmethyl)benzene). According to the results of X-ray single-crystal analysis, $[Cd(\mu_3\text{-ppda})(\mu\text{-obix})]_n$ **(1)**, $[Cd(\mu_3\text{-ppda})(\mu\text{-mbix})]_n$ **(2)** and$[Cd(\mu_3\text{-ppda})(\mu\text{-pbix})]_n$ **(3)** were found to be two-dimensional (2D). The structures of complexes were characterized by elemental analysis, IR and X-ray single crystal and X-ray powder diffraction analyses. The asymmetric units of **1**–**3** contain one Cd(II) ion, one ppda and one bix ligands (obix for **1**, mbix for **2** and pbix for **3**). Each Cd(II) ion is coordinated by two nitrogen atoms from two different bix ligands and five oxygen atoms from three different ppda ligands. The Cd(II) ions and ppdaligands produce $[Cd_2(ppda)_2]$metalloligand. The combination of $[Cd_2(ppda)_2]$ and Cd_2O_2 rings produces 2D coordination polymer. Moreover, thermal stabilities and luminescent properties of **1**–**3**were also investigated.

A SHOCK DAMPER BASED ON A SYSTEM NANOPOROUS MEDIUM – NON-WETTING LIQUID

Anton Belogorlov
AABelogorlov@mephi.ru

Danil Paryohin
danya92@list.ru

Over the past ten years in the world the interest for the properties of systems nanoporous medium –non-wetting liquid was increased. Such systems investigate in the USA, France and Japan. Interest forthe systems nanoporous medium – non-wetting liquid is primarily related to the prospects for their use in power engineering in parts of the machinery of accumulation and dissipation of mechanical energy. In this work the method of system nanoporous medium – non-wetting liquid testing for damping devices presented. The method was tested for four systems nanoporous medium – non-wetting liquid. As a nanoporous medium was used industrially produced hydrophobic silicas Fluka 60 C8, Fluka 100 C8, Fluka 100 C18 and Fluka 90 C18. As a non-wetting liquid was used distilled water. These systems have been investigated in the temperature range 20 - 60° C, the maximum energy of impact was 100 J. According to the method, time, power and energy characteristics of the process of non-wetting liquid intrusion - extrusion was determined. Also presented the dependences of impact processes characteristics on temperature and energy of impact.

Keywords: shock damper; nanoporous medium; non-wetting liquid

A SHOT IN THE ARM FOR HANDLING CONSUMER DISPUTES ACROSS THE EU: ALTERNATIVE DISPUTE RESOLUTION SYSTEM

Yildiz Sekban
Istanbul Sabahattin Zaim University, Faculty of Law
Department of Civil Law
Turkey
yildiz.sekban@izu.edu.tr

Abstract: The handling of disputes between consumers and traders is now evolving on a more consumer-friendly ground across Europe. Following the steadily stronger consumer protection laws, the growth of online mechanisms for alternative dispute resolution (ADR) bodies is further swinging the legal pendulum from the judicial protection to developing out-of-court structures that provide cheaper and effective relief. In this regard, the recent launch of a new online dispute resolution (ODR) platform by the European Commission is quite likely to contribute to the effort to avoid disputes reaching court, providing settlement of the millions of both domestic and cross-border e-commerce disputes using online technologies, as well as strengthening the EU's Digital Single Market Strategy. The disputes will be channelled to national ADR bodies in each Member State that are related to the platform of which online traders are required to provide notice. In this study,
Keywords: Alternative dispute resolution (ADR), Online dispute resolution (ODR), Consumer disputes, E-commerce

1. INTRODUCTION

Due to the growing use of the Internet across the Europe, the number of disputes arising from the Internet has increased exponentially. Becoming a new realm of commerce, the Internet has enabled businesses to expand their markets and offer a vast selection of products and services to cross-border customers. Geographical distance, time and language ceased to prevent trade, and, as a result, gave rise to e-disputes. In this regard, ensuring a safer participation of all parties in e-commerce transactions requires e-disputes be resolved in sufficiently certain ways. The reason is that the lack of legal certainty and online consumer trust may prevent consumers from entering into online transactions, as well as companies from participating in the electronic markets (Morris et. al., 2000).

Online dispute resolution (ODR) refers to the Alternative Dispute Resolution (ADR) mechanisms that use technology to facilitate the resolution of disputes between the parties. It mainly involves negotiation, mediation or arbitration, as well as a combination of all these alternative methods. Thus, it can be concluded that the ODR corresponds to the online version of the ADR. It can, however, expand these traditional ADR methods by using various online technologies during the process.
ODR covers vast fields of law, ranging from the disputes between private parties involving consumer to consumer (C2C) and business to consumer (B2C) disputes or marital separation, to court disputes and interstate conflicts (National Centre for Technology and Dispute Resolution, 2011). Without prejudice to having such a wide scope of application, the ODR is most importantly tailor-made for the resolution of B2C online transactions. The reason for the suitability of the ODR in the resolution of e-commerce disputes is that, the use of the Internet which is the same medium giving rise to disputes is ideal when parties reside in different countries (Bygrave, 2002).

2. ONLINE DISPUTE RESOLUTION

As abovementioned, ODR represents an innovative means for handling disputes, particularly those with the underlying contracts concluded between consumers and businesses in virtual space. Lacking the expertise and resources for the resolution of cross-border disputes, traditional courts may not be suitable in e-commerce. Moreover, where transactions are of low value and the parties are located in different countries, litigation is quite an unattractive option with disproportional costs and long proceedings.

As a collective term, the ODR covers different combinations of online dispute settlements by using the ADR methods. To put it simply, the ODR refers to the assistance of certain computer networks and applications to the settlement of disputes with the ADR methods. Depending on the extent of control over the process and outcome the parties and/or Information and Communication Technology (ICT) have, dispute resolution techniques vary

 Copyright © International Science and Technology Conference (ISTEC)

(Cortes, 2009). Based on the cooperation of the ADR and ICT, the ODR requires the resolution process to be conducted mainly online.

Information management in the ODR is carried out by physical persons as well as computers and software. The complementation of the traditional ADR methods with the ICT was referred to as the so-called "fourth party", since the ODR was considered as an additional party in the resolution process (Katsh and Rifkin, 2001). In addition to the two disputants and the neutral third party, addressing technology as the fourth party emphasizes its growing importance in a traditional trilateral dispute. Despite having the entitlements and capabilities of the third party, the fourth party will rather serve as a tool for assisting the process. Nevertheless, the fourth party may replace the third party as in automated negotiation. The fourth party may also manage information, send automatic responses, reorganize written communications in a politer manner, monitor performance, and organize meetings. The more technology enhances, the more the fourth party stands out, thereby diminishing the significance of the neutral third party (Gaitenby, 2006; Katsh and Wing, 2006).

Similar to the ADR, companies involved in the ODR process agree upon the out-of-court settlement with the difference of using the Internet. To contribute to this settlement process on the Internet, professionals lead the way by utilizing their ADR experiences. In order to best suit the needs of the Internet, the ADR rules and practices are adjusted when necessary. To this end, software tools are utilized and enhanced. Moreover, new web-based services have been developed to enable parties and arbitrators to meet online and work in secure, joint workspaces, access precedents, attain and manage important documents, and organize meetings with the services of voice and video conferencing, and with translation services as well (Katsh and Rifkin, 2001).

3. ONLINE DISPUTE RESOLUTION METHODS

3.1. Consensual Online Dispute Resolution

3.1.1. Automated Negotiation

Also known as the so-called "blind-bidding" method, automated negotiation involves the methods mostly used for the claims of monetary value, i.e. personal injury or a worker's compensation claim. It is based on a software program to which the parties submit their offers and demands for settlement and determine a percentage range. The program organizes the communications between the parties. However, the offers, demands, and percentages concerned are not revealed to the other party. The offering party refers to the party who makes the offer or the party who is going to pay, whereas the demanding party makes the demand or seeks for the relief as the payment of a sum of money. The ODR algorithm calculates a settlement amount between the offer and demand ranges of the parties. When offer and demand match or fall within the determined range, the dispute is settled at the defined amount and the parties are informed. Parties are allowed to try to settle until their offers and demands match (Kaufmann-Kohler and Schultz, 2004).

3.1.2. Assisted Negotiation

Assisted negotiation is a dispute resolution process to which technology assists in an evaluative manner, i.e. providing communication facilities. The role of technology here is similar to that of the mediator in mediation, with the difference that the former is based on only technological tools while the latter may also use different electronic communication tools, ranging from e-mail and chat rooms to video conferencing. Unlike arbitration, the third party maintains its neutrality and does not give a binding decision on the parties through an enforceable award. Using information management skills and enabling more efficient communication by paraphrasing the arguments concerned, mediators help the parties reach an amicable settlement. Though the procedural similarity of conciliation to mediation, councillors can provide solutions for the parties before reaching a settlement. The primary objective of assisted negotiation is to enhance the communications of the parties with the assistance of a third party or software technology (Jacobs, 2007). When used online, these processes are informal, simple and user-friendly (Motion, 2005).

3.1.3. Mediation with Online Technologies

In order to facilitate the resolution of disputes, some websites such as Internet Neutral or SquareTrade have been established. These websites are equipped with online technologies, i.e. e-mail, instant messaging, chat rooms, as well as traditional communication methods. First, a party goes to the website and fills in an online form including the problem and potential resolutions. After reviewing this form, a mediator asks the other party

 Copyright © International Science and Technology Conference (ISTEC)

whether or not he will participate in the mediation. If the response is affirmative, the other party can fill in a new form or answer the former form through e-mail. Thus, parties are more likely to grasp the dispute and reach a settlement.

3.2. Adjudicative Online Dispute Resolution

3.2.1. Online Arbitration

Arbitration is referred to the dispute resolution mechanism whereby parties agree to submit their disputes to an independent third party (arbitrator or arbitral tribunal), who in turn delivers a final and binding award on both parties. Arbitration relies on party autonomy, beginning as a private agreement and continuing with private proceedings as planned by the parties. Nevertheless, it is still characterized as a quasi-judicial process as the arbitral award substitutes for a judicial decision. Arbitration is less formal than litigation, yet it includes the most formal process compared to all other ADR methods. Confidentiality and fastness are key features of arbitration that attract especially business parties in choosing arbitration over litigation. Another advantage of arbitration is the easy enforceability on the ground of the 1958 New York Convention on the Recognition and Enforcement of Foreign Arbitral Awards.

In order to limit the scope of application, online arbitration is assumed to cover only disputes that arise online. For a more efficient and broader resolution mechanism, however, disputes that arise offline may also be submitted to online arbitration with diverse online techniques, ranging from e-mail, chat groups or video conferencing. This wider approach relies on the qualification of online arbitration on the ground that submissions to the arbitral tribunal and the conduct of all proceedings takes place over the Internet, regardless of partly covering offline disputes. In doing so, disputes both in virtual and online medium can be handled efficiently via online arbitration (Piers, 2014).

4. ONLINE DISPUTE RESOLUTION IN THE EUROPEAN UNION

After the Recommendation 12/1986 of the Committee of Ministers at the Council of Europe on Measures to Prevent and Reduce the Workload of the Courts, the EU attempted to introduce the out-of-court dispute resolution mechanisms concerning civil matters. The European Commission Communication on Consumer Redress in 1985 and the Supplementary Communication from the Commission on Consumer Redress in 1987 illustrate these attempts. Publishing the Green Paper on Consumer Access to Justice and Dispute Resolution in Consumer within the Single Market in 1993, the EU Commission urged the Member States for collaboration to improve the settlement of disputes in cross-border commerce. The following enactments of various action plans, communications, and the Stockholm Program contributed to the current position of alternative dispute resolution mechanisms concerning consumer law in the EU.

Moving on, the EU has issued Directive 2013/11 of 21 May 2013 on Alternative Dispute Resolution for Consumer Disputes (the ADR Directive) and Regulation No 524/2013 of 21 May 2013 on Online Dispute Resolution for Consumer Disputes (the ODR Regulation), which is applicable since 15 February 2016.

The ODR Regulation is to be read in conjunction with the ADR Directive, which functions as a complement to the Regulation. It is, thus, appropriate to touch upon the main features of the ADR Directive. Laying down minimum standards, it does not impede the consumers to apply for a more extensive consumer protection. The scope of application of the Directive is both domestic and cross-border disputes arising from the contracts concluded between a trader established in the EU and a consumer resident in the EU. On the other hand, it does not stipulate an enforcement mechanism for recognition and enforcement of binding ADR decisions in the other Member States. The Directive requires the Member States to ensure that consumer disputes with a trader established in their countries can be submitted to an “ADR entity” that meets the conditions in the Directive, i.e. sufficient accessibility, effectiveness, fairness, transparency, impartiality, and expertise.

Moreover, each Member State is required to designate a “competent authority” that will determine, on the ground of the information received from entities wishing to become an ADR entity, whether they meet the abovementioned conditions in the Directive. Then approved entities are notified to the Commission, which in turn will publish and keep updated the list of them with their contact details, fees, languages they use, the disputes they handle. Each competent authority in the Member States will demonstrate in its website the link to this list of entities.

 Copyright © International Science and Technology Conference (ISTEC)

Building on the structure of the ADR Directive, the ODR Regulation is related to the out-of-court settlement of disputes based on contractual obligations arising from online sales or service contracts concluded between a consumer resident in the EU and a trader established in the EU. Such settlement is conducted through the intervention of an ADR entity approved and listed according to the criteria in the ADR Directive. Similar to the ADR Directive, the ODR Regulation covers cross-border e-commerce disputes. However, the Regulation applies only to the disputes arising from the contracts concluded online, where the trader or the trader's intermediary offers the goods or services on a website or other electronic means by which the consumer makes an order. Therefore, whether the Regulation covers certain disputes depends on the online conclusion of the contract, but not the online performance.

The key feature of the Regulation is the establishment of an online platform, which is an interactive website to provide access to the consumers and traders free of charge, and to facilitate contacting with an approved ADR entity under the ADR Directive. The Commission will be in charge of the establishment and development of the platform, which will in turn provide an electronic complaint form to be filled and submitted online, inform the other party of the complaint, assist the parties to determine the competent ADR entities and transmit the complaint to the agreed entity, and offer a free of charge electronic case managing tool that enables the parties and the ADR entity to conduct the dispute resolution online. The platform will give assistance in all official languages of the EU, including the electronic translation of the exchanged information required for the settlement of the dispute. The relative link about the platform is to be provided in the general terms and conditions and on the websites of all traders established in the EU and dealing with online sales of goods and services. This requirement is also sought for the contract offers made by e-mails.

The Regulation stipulates, among the detailed provisions on the submission, transmission, and processing of a complaint, that "only data which are accurate, relevant and not excessive in relation to the purpose for which they are collected shall be processed through the electronic complaint form and its attachments." As parties are disputants, they are likely to have different views on the relevance and accuracy of the submitted data. Therefore, leaving the decision of whether the submitted data meet the abovementioned criteria to the electronic ODR platform would not serve to the purpose of this provision. Another interesting point is that, after determining the competent ADR entity, the ADR procedure does not necessarily have to be conducted through the online ODR platform. In other words, the ADR entity can proceed with traditional methods under its national law. Nevertheless, it would undermine the online nature of the procedure if it requires the physical presence of the parties. The Regulation also highlights the significance of a user-friendly platform appealing to everyone, particularly the vulnerable consumers. In line with this approach, the Member States are required to provide an "ODR contact point" with at least two advisors giving assistance to the parties who are resident in different countries and wish to use the platform.

5. CONCLUSION

The ICT has recently transformed traditional trade, leading to new terminology, actors and innovative ODR techniques. Equally important is ensuring confidence in e-commerce and the ODRs. The use of out-of-court means of settlement does not necessarily diminish legal certainty or protection. Contrary to litigation, these alternative methods provide more effective, fast, and generally free of charge resolutions to consumers. In order to promote the use of these extra-judicial means, the European legislators have been undertaking many initiatives, including the ADR Directive and the ODR Regulation. The assistance of technology to the ADR proceedings as a fourth party in the ODR Regulation diminishes the burden of secretarial management and facilitates the submission, transmission, and processing of a complaint. Furthermore, the ODR contact points will make the platform more user-friendly.

The purpose of this study is to understand the benefits which were produced after school evaluation by conducting questionnaire on educators related to technical high school. The research tool is “the assessingindicators of technical high school evaluation benefit” which were built in the pilot study. The main result is: The importance and current situation of the assessing indicators for technical high school evaluation benefit both achieve the high level; besides, there are statistically significant differences between each dimension. Also, there are statistically significant differences between the importance of each dimension and the actual performance of the assessing indicators for technical high school evaluation benefit. Several suggestions in accordance with the result in this study are presented and could be provided for the practical promotion.

A TENDON DRIVEN MECHANISM USING PARALLELOGRAM LINKAGE WITH BALL JOINTS

Ryota ISHIBASHI
Department of System Design
Tokyo Metropolitan University
Japan
ishibash@tmu.ac.jp

Abstract: This paper proposes a tendon driven robot arm using artificial muscles. The proposed system consists of ball joints and parallelogram linkage. The mechanism can realize slide and twist motion with simple structure. The artificial muscles consist of the SMA actuators and the elastica. The construction of them can be arranged. Thus, we can adjust the stiffness using not only the SMA actuators but also the nonlinear property of the elastica. Based on the analysis of the human motion as the cascade control strategy, the mechanism can realize a force controller that uses both the discrete-time and the continuous-time controller.
Key Words: Tendon driven, Parallelogram linkage with ball joints, Force control, Variable stiffness mechanism

INTRODUCTION

Recently, knowledge of the human sensory-motor system must be effective tools for the communication research area such as the human-to-human or the human-to-machine communications. In the communication research area, understanding of the communication way of the injured peoples as the **Fig. 1**, the development of the communication devices becomes important as the **Fig. 2**. For these research areas, the analysis of human motion has been considered both the engineering fields and the scientific fields. Especially, about the neuromuscular and skeletal system, mathematical modeling, controller analysis and experimental verification with the physiological assumptions had been conducted.

For the future development of the previous fields, it becomes important to analyze the human motion with its dynamics. Actually, in the human body, muscular controller is similar to both the discrete-time and the continuous-time controller [6-7]. Then, such as the slide and twist motions are realized with simple tendon driven structure. This research proposes a control strategy of a tendon driven mechanism based on the analysis of human like motion [8-10].

This paper proposes a tendon driven robot arm using artificial muscles [1-5]. For the development, we analyzed the human sensory motor system. Control strategies of the human motion were analyzed in order to apply to the various applications for the human-to-human or the human-to-machine communication. Especially, in this paper, the controller of the neuromuscular and skeletal system was analyzed based on the structural properties of the human body.

Proposed system consists of ball joints and parallelogram linkage. Proposed mechanism can realize slide and twist motion with simple structure. The concepts of the controller were based on the analysis of the human motion as the cascade control strategy. The proposed mechanism can realize a force controller of the muscles that uses both the discrete-time and the continuous time controller.

At first, concepts of this paper will be explained. Then, sensory motor controller and the proposed controller will be described. Experimental model with artificial muscles and parallelogram linkage mechanism will be indicated and how will it make a motion will be explained. The experimental system utilizes shape memory alloy as the artificial muscles of the system and the elastica. The stiffness control strategies and the assumptions of this paper will be explained. Then, some results were explained to verify the effectiveness of the proposed system and assumptions of this paper.

BACK GROUNDS AND PROBLEMS

Back grounds of this research are that the development of the communication methods for the human-to-human or the human-to-machine communications. Thus, understanding of the communication way of the injured peoples, the development of the communication devices becomes important as shown in the **Fig. 1 and 2**. If some peoples who want to communicate other persons, the cell-phones becomes a communication devices. If some peoples who are injured but want to communicate other persons, various kinds of tools will assist their communication. Then, control strategies of the human motion were analyzed in order to apply to these industrial applications as the communication devices. Skeletal system, neuromuscular system, and also total sensory-motor

 Copyright © International Science and Technology Conference (ISTEC)

system were well discussed and there are many outstanding assumptions.

Figure 1 The communication of the injured peoples.

Figure 2 The human-to-human or the human-to-machine communications.

HUMAN MOTION MODEL AND PROPOSED SYSTEM

The proposed system as shown in **Fig. 3, 4** consists of ball joints and parallelogram linkage. This mechanism can realize the tip of manipulator as the linear motion and the twist motion with simple structure as shown in **Fig. 5**. The concept of the controller was based on the analysis of the human motion as the cascade control strategy. The proposed mechanism can realize a force controller of the muscles that uses both the discrete-time and the continuous-time controller.

In the biomimetic fields, integrated system of the skeletal system and the neuromuscular system as we often call sensory-motor system of the human beings were studied. Animals have both the skeletal and the exoskeltal properties. This research focused on the joint structure with neuromuscular system. The system constructs a tendon driven mechanism with parallelogram linkage and ball joints. The skeletal and neuromuscular system has a sensory-motor control system. Then, it becomes important to construct the controller of the proposed tendon driven mechanism. Key points of the controller are as follows:

- Control strategy of the human motion has the cascade control property by such as the CNS and etc..
- Neuromuscular controller has both the discrete and the continuous time controller based on the muscle activities.

From these key points, assumptions of this paper will be described.

PROPOSED SENSORY MOTOR CONTROLLER AND THE VARIABLE STIFFNESS MECHANISM

Proposed tendon driven system uses artificial muscle consists of the SMA (Shape Memory Alloy) and the elastica. To control the system, feed forward controller uses internal force was utilized.

$$\boldsymbol{u} = \boldsymbol{k}_e(\mathbf{I}-\boldsymbol{W}\boldsymbol{W}^{+}) \quad (1)$$

where, $\boldsymbol{k}_e$ means gain, $\boldsymbol{W}$ means Jacobean matrix of the system. Construction of the SMA actuator has various ways. As the proposed system, we can control the artificial muscles for the position and the force control. **Fig. 6** shows a variable stiffness mechanism with SMA and elastica. In the system, length of the elastic elements and SMA are contracted and position and stiffness will be adjusted. Neuromuscular controller has both the discrete and the continuous time controller. Then, it leads to following assumptions and properties.

- **Sensitive in the low region**
- **Realize a wide force output range**

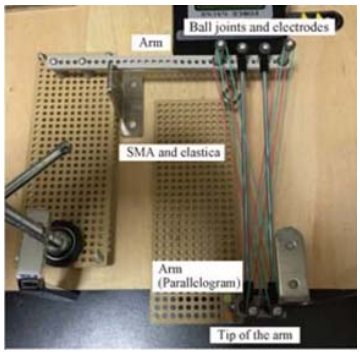

Figure 3 The proposed system consists of ball Joints, artificial muscle as the SMA and the elastica, and parallelogram linkage.

Figure 4 Joints and the artificial muscles.

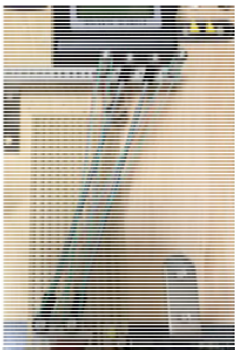

Figure 5 the linear motion and the twist motion.

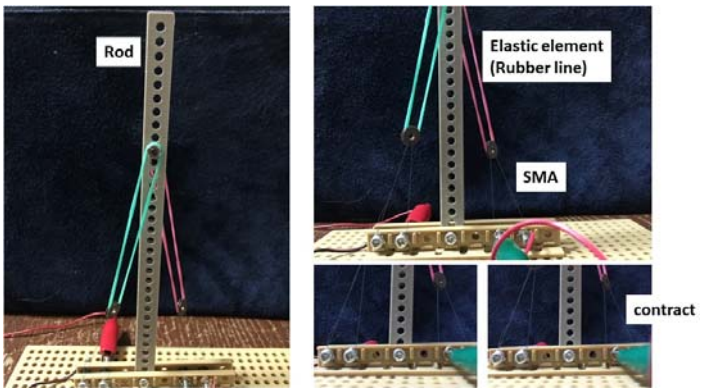
 Copyright © International Science and Technology Conference (ISTEC)

On the other hand, some of the skeletal system constructs a tendon driven mechanism with parallelogram linkage and ball joints. Then, the mechanism has a possibility to realize various motions such as liner and twist motion of the tip. It leads to such a variable stiffness mechanism consists of the actuators and the elastic elements.



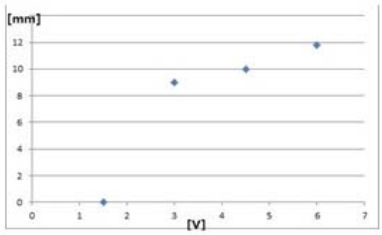


Figure 6 Variable stiffness mechanisms. Lengths of the elastic and SMA are contracted and position and stiffness are adjusted.

(i) Tip twist motion

(ii) Displacement of the tip twist motion

Figure 7 Twist motion of the system as shown in the Fig. 3.

RESULTS AND DISCUSSION

To examine the above assumptions and properties, the system as shown in **Fig. 3-5** was developed. The artificial muscles consist of the SMA actuators and the elastic. The construction of them can be arranged. Thus, we can adjust the stiffness using not only the SMA actuators but also the nonlinear property of the elastica.

Fig. 7(i) shows a twist motion of the system as shown in the **Fig. 3**. This system uses four SMA actuator and elastica. The elastica make an internal force field at the initial position. So, this means that the controller uses both the discrete-time and the continuous-time controller. **Fig. 7(ii)** shows displacement of the tip twist motion of the system. Vertical line means the displacement of the tip of the arm at the point of the **Fig. 7(i).** In the experimental condition, upper side two SMA was heated by 1.5[V] to make a gravitational compensation term. Then, a single SMA was heated to make a twist motion. In the results, we can see that the displacement was increase and to be saturated.

CONCLUSION

This paper proposes a tendon driven robot arm using artificial muscles. The proposed system consists of ball joints and parallelogram linkage. The mechanism can realize slide and twist motion with simple structure. The artificial muscles consist of the SMA actuators and the elastica. The construction of them can be arranged. Thus, the stiffness can be adjusted not only the SMA actuators but also the nonlinear property of the elastic. Then, based on the analysis of the human motion as the cascade control strategy, the mechanism can realize a force controller that uses both the discrete-time and the continuous-time controller.

A THEORETICAL SYNTHESIS AND ASSESSMENT STUDY ON THE MATH USAGE SKILLS

Hayal Yavuz Mumcu
hayalym52@gmail.com

The reason for the fact that math is the only and the greatest educational phenomenon of the world is the fact that it is used in lots of non-mathematical areas and in various ways. Significant amounts of time of the curriculum programs in most countries have been spared for the teaching of math. The reasons for this is both its help for understanding the courses of other curriculums and the indisputable benefits it provides to the solution of the problems encountered in life. We learn math for the purpose of learning the mathematical concepts, skills and strategies and using these tools in solving the problems we encounter in the real world. In accordance with this understanding; today, the purpose of teaching math has become to provide mathematical aptitude and form the skill of being able to use math in necessary conditions conveniently.

Then, what are the mathematical skills that are necessary for an individual who is able to efficiently make use of math and how are we going to be able to assess these skills? The purpose of this study is to find the answers for these questions and to contribute to the literature in theoretical meaning. Within the scope of the study; the studies conducted regarding the issue have been examined, the indicators of using math have been studied and a synthesis has been tried to be formed according to the scanned studies. At the end of the process, it has been decided that the theoretical frame that shall be formed for the math using skills shall consist of problem solving, reasoning, regression and modeling. Afterwards, graded scoring scales (DPAs) have been formed for each skill type regarding the assessment of these skills. Therefore; a total of 4 DPAs consisting of Graded Scoring Scale for Reasoning Skills (MBDPA), Graded Scoring Scale for Problem Solving Skills (PÇDPA), Graded Scoring Scale for Regression Skills (İBDPA) and Graded Scoring Scale for Modeling Skills (MoBDPA) have been formed. The opinions of 4 different researchers who are experts in their area have been taken for the graded scoring scales (DPAs) having been formed and the assessment of the mentioned DPAs by the experts have been ensured. In this process; the expert researchers have commented as “completely convenient” (2), “partly convenient” (1), “not convenient” (0) for each one of the mentioned DPAs and their sub-dimensions. In this way; the averages of the comments attained from the sub-dimensions have been taken for each skill and the assessment scores have been attained. At the end of the mentioned expert assessment process, the assessment score average for PÇBDPA has been calculated as 1.57, the assessment score average for MBDPA has been calculated as 1.68, the assessment score average for İBDPA has been calculated as 1.72 and the assessment score average for MoBDPA has been calculated as 1.68. In addition; In the light of the categories formed as dependent on the mentioned frame; for the purpose of realizing the reliability of the study, the analyses conducted independently by the researchers for the math usage skills have been compared with the use of the formula P (Negotiation Percentage) = [Na (Consensus) / Na (Consensus) + Nd (Dissensus)] X 100 (Miles and Huberman, 1994). As a result of this calculation; the mentioned values have been calculated as respectively P1= %81, P2= %79, P3= %79 and P4= %82 for the graded scoring scales for problem solving, reasoning, regression and modeling skills. Therefore; it has been decided that the developed DPAs are convenient for usage in the study.

ACCOUNTING-BASED ANOMALIES IN THE BOND MARKET

Pietro Perotti
p.perotti@bath.ac.uk

Steve Crawford
scrawford@bauer.uh.edu

Richard Price
richard.price@usu.edu

Christopher Skousen
chris.skousen@usu.edu

We examine the relation between future bond returns and seven groups of accounting-based fundamental measures shown by other researchers to be related to future stock returns. Findings indicate that the frequency of significant returns to trading strategies based on these anomalies is similar in both the bond and stock markets. The magnitude of returns is generally lower with bonds, but the significance and Sharpe ratios of these returns are comparable to those observed with stocks. We show that returns in the bond market are concentrated in bonds where investors are less sophisticated and where accounting information is more relevant for bondholders. Specifically, the anomalies are driven by speculative bonds, bonds without credit default swaps, bonds with a low intensity of institutional trading, bonds with low investor attention, bonds with high uncertainty regarding the ability of the firm to service and repay debt, bonds whose issuer have negative unexpected earnings, and bonds with strict covenants.

ADANA İLİNDE ÇİFTÇİLERİN PÜLVERİZATÖR DOLUMU, TEMİZLİĞİ VE BİOBED KULLANIMI KONUSUNDAKİ ALIŞKANLIKLARININ BELİRLENMESİ

Ali Musa Bozdogan
amb@cu.edu.tr

Tülin Dağlıoğlu
tulindagloglu@gmail.com

Bu çalışmada, bitkisel üretim yapan çiftçilerle bireysel görüşme yapılarak çiftçilerin pülverizatör dolumu, temizliği ve biobed kullanımı konusundaki alışkanlıkları incelenmiştir. Çalışmada, Adana ili merkez olmak üzere Yüreğir ve Seyhan İlçe Tarım Müdürlüklerine gelen çiftçiler arasından rastgele seçilmek suretiyle bireysel görüşme yapılmıştır. Çiftçilere öğrenim durumları, yaşları, ilaçlama öncesi pülverizatör dolumlarını nerede yaptıkları, her ilaçlama sonrasında pülverizatör temizliği yapıp-yapmadıkları, temizliği ne ile yaptıkları gibi sorular sorulmuştur. Bireysel görüşmeye katılan çiftçilerin ortalama yaşlarının 50.5 yaş, %37.6'sının ilkokul mezunu ve eğitim ortalamalarının 8.8 yıl olduğu belirlenmiştir. Pülverizatör sahipliği incelendiğinde; çiftçilerin %93'ünün kendilerine ait pülverizatörleri olduğu görülmektedir. Kullanılan pülverizatörlerin %58.4'ünün tarla pülverizatörü olduğu belirlenmiştir. Çiftçiler pülverizatörlerini en fazla çiftlik avlusunda doldurmakta (%41.6) ve temizlemektedir (%57.4). Çiftçilerin çevre kirliliğinin azaltılması konusunda %82.2'sinin ekipman ve yapı yatırımı konusunda devletten destekleme beklediği sonucuna varılmaktadır. Biobedi %7.9'unun daha once duyduğu ve %35.6'sının biobedi kendi avlusunda kullanmak istediği görülmektedir. Tarım alanlarında pülverizatör dolumu ve temizliği sırasında pestisitlere bağlı çevre kirliliğini en aza indirmek için çiftçilere biobed hakkında görsel bilgilendirme ve seminer etkinlikleri düzenlenmesinin önemli katkı sağlayacağı düşünülmektedir.

Keywords: Biobed, Pülverizatör, Çiftçi, Pestisit, Bireysel Görüşme.

ADAPAZARI-KARASU YÖRESİNDEKİ SAF DOĞU KAYINI (*Fagus orientalis* Lipsky.) ORMANLARINDA SIKLIK BAKIMININ ÇAP VE BOY GELİŞİMİ ÜZERİNDEKİ ETKİLERİ

*Halil Barış ÖZEL[1], Erdal ÖZBAY[1], Nebi BİLİR[2]

[1]Bartın Üniversitesi, Orman Mühendisliği Bölümü, Silvikültür Anabilim Dalı, Bartın-TÜRKİYE
[2]Süleyman DEMİREL Üniversitesi, Orman Fakültesi, Silvikültür Anabilim Dalı, Isparta-TÜRKİYE

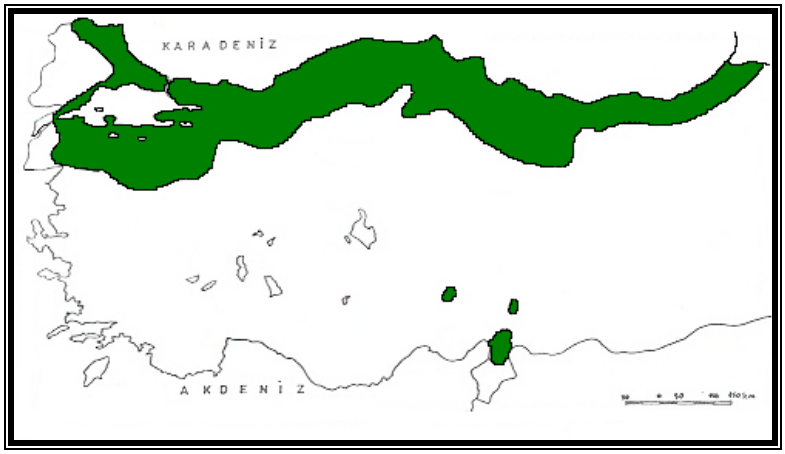
*halilbarisozel@yahoo.com

Özet: Adapazarı-Karasu yöresinde gerçekleştirilen bu çalışmada farklı şiddetlerde uygulanan sıklık bakımı çalışmalarının doğu kayını (*Fagus orientalis* Lipsky.) bireylerinin çap ve boy gelişimi üzerindeki etkileri incelenmiştir. Yapılan varyans analizi ve Duncan testi sonuçlarına göre ılımlı (13,41 m) ve kuvvetli (13,76 m) olarak gerçekleştirilen sıklık bakımı çalışmalarının çap gelişimi (18,45 cm) üzerinde ve kuvvetli sıklık bakımı müdahalesinin de boy büyümesi üzerinde olumlu etkileri olmuştur. Ayrıca mutedil ve kuvvetli yoğunluklarda yapılan sıklık bakımı müdahalelerinin hacim, hacim artımı, birey sayısı, gövde düzgünlüğü ve meşcere dayanışması (k(f)=1,48) üzerinde de olumlu etkileri tespit edilmiştir. Doğu kayını meşcerelerinin gelişimi ve dayanıklılığı üzerinde sıklık bakımı önemli etkilere sahiptir. Bu nedenle araştırma alanı ile benzer yetişme ortamı koşullarına sahip kayın ormanlarında mutedil ve zaman zaman kuvvetli şiddette sıklık bakımı teknikleri yararlı sonuçlar verebilir.

Keywords: Doğu kayını, sıklık bakımı, çap, boy, hacim, stabilite, vitalite

Giriş

Toplum yaşamına çok yönlü ekolojik ve ekonomik faydalar sağlayan orman kaynaklarının, çeşitli nedenlerle (aşırı yararlanma, yangınlar, tarım ve yerleşim alanı kazanımı amacıyla yapılan açmalar, asit yağmurları, fırtına ve kar zararları v.b.) tahrip edilmesi yeryüzünde çok daha büyük çevre sorunlarının meydana gelmesine neden olmuştur. Bu çevre sorunlarının başında; erozyon, sel ve çığ felaketleri, hava kirliliği, olumsuz iklim değişiklikleri, biyolojik ve genetik çeşitliliğin azalması gelmektedir (Çepel, 2003). Nitekim, atmosferdeki zararlı maddelerin ve gazların artması özellikle son 40 yıl içinde Orta Avrupa'daki canlı ekosistemlerinin önemli ölçüde tahrip olmasına neden olmuştur (Çolak ve Pitterle, 1999). Ortaya çıkan bu çevre sorunları, doğal yetişme ortamı koşullarını da önemli ölçüde değiştirmiştir. Bu değişime bağlı olarak, başta bitkiler olmak üzere tüm canlı populasyonlarında biyolojik çeşitlilik zamanla azalmıştır. Buna göre, geçmişe oranla doğal bitki türlerinin toplam sayısında Danimarka'da %20, Fransa'da %12, Yunanistan'da %15 ve İrlanda'da %13 azalma olduğu belirlenmiştir (Emborg, 1999; Falcone, 1999; Kassioumis vd., 1999).



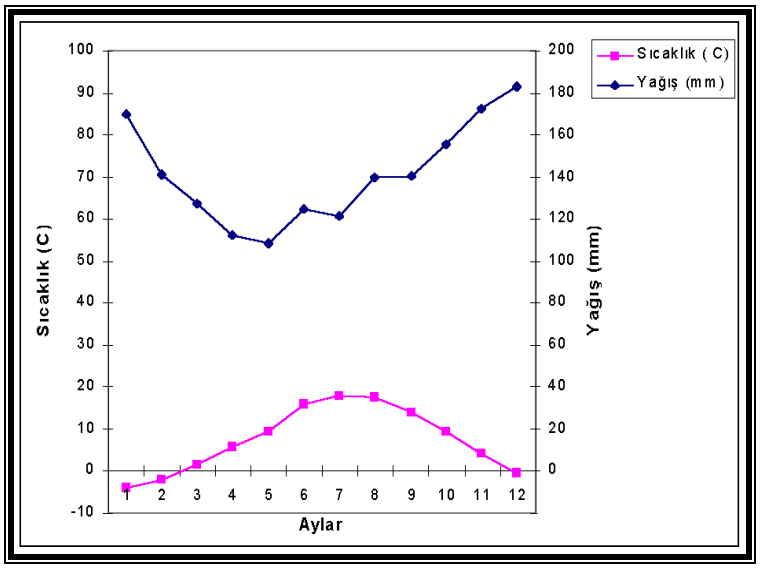
Ülkemiz, çok çeşitli iklim ve fizyografik koşulların varlığına bağlı olarak ortaya çıkan farklı yetişme ortamı koşulları nedeniyle gerek ağaç türü, gerekse meşcere kuruluşları bakımından biyolojik ve ekonomik değeri yüksek saf ve karışık doğal orman kaynaklarına sahiptir. 2004 yılı verilerine göre ülkemizin toplam orman alanı 21.188.747 hektardır. Bu rakam, ülke yüzölçümünün %27,2'si gibi önemli bir kısmını kapsamaktadır. Nitelikleri bakımından ise, sahip olduğumuz orman kaynaklarının, %50'si (10.621.221 ha) normal koru ve normal baltalık, %50'si (10.567.526 ha) ise bozuk koru ve bozuk baltalık niteliğindedir (Anon., 2014). Bu rakamlardan da anlaşılacağı üzere, ülkemiz ormanlarının büyük bir bölümünün doğal yapısı yapılan aşırı faydalanmalar, hatalı teknik müdahaleler, yangınlar, kar ve fırtına zararları gibi çeşitli biyotik ve abiyotik faktörler nedeniyle bozulmuş ve verimlilikleri azalmıştır. Doğal orman kaynaklarımızın verimliliğinde yaşanan bu düşüşe bağlı olarak, bu kaynaklardan elde edilen ürün miktarı da her geçen yıl azalmıştır. Nitekim, son verilere göre ülkemiz ormanlarından 15-16 milyon m^3 eta alınabilmektedir. Bu değer ortalama yılda 0,750-0,800 m^3/ha'lık bir artıma karşılık gelmektedir. Bu miktar, Romanya (2,6 m^3/ha), Yunanistan (2,1 m^3/ha) ve eski Yugoslavya (2,7 m^3/ha) gibi ülkelerle karşılaştırıldığında oldukça düşüktür (Ürgenç, 1998).

Ormanlardan istenilen ürün verimliliğinin elde edilmesi için yapılması gereken en önemli hususların başında, meşcere bakımının zamanında ve tekniğine uygun olarak yapılması gelmektedir. Meşcere bakımları ile hem

 Copyright © International Science and Technology Conference (ISTEC)

meşcerenin sağlığı ve kalitesi artırılmakta hem de ürün çeşitliliğine önemli katkılar sağlanmaktadır. Nitekim günümüzde ormanların büyük bir çoğunluğu fonksiyonel amaçlara yönelik olarak işletilmektedir. Bu itibarla ormanların fonksiyonel amaçları yerine getirmesi için genleştirme ve ağaçlandırma çalışmalarından daha ziyade bakım çalışmaları ön plana çıkmaktadır. Meşcere bakımının ilk aşamasını gençlik ve sıklık bakımı çalışmaları oluşturmaktadır. Gençlik bakımı tedbirleri doğal veya yapay yolla alana getirilen gençlik ve kültürler alanda tutunmasını sağlamak açısından önemli rol oynamaktadır. Yeni generasyonun kapalılığının oluşmasından itibaren ise sıklık bakımı çalışmaları başlamaktadır. Sıklık bakımı çalışmaları meşcerenin gelecekteki şekillenmesi, kalitesi ve sağlık durumu açısından büyük bir önem taşımaktadır. Bu konuda sıklık bakımının, istikbal bireylerinin belirlenmesinde dahi aralama çalışmalarına önemli bir alt yapı oluşturduğu, bireyler arasındaki dayanışmayı ve vitaliteyi artırdığı belirtilmektedir (Genç, 2004). Ancak bu şekilde önemli etkilere sahip olan sıklık bakımı çalışmaları konusunda ülkemizde yeterli sayıda araştırmanın yer aldığından söz etmek oldukça güçtür. Özellikle yetişme ortamı çeşitliliğine bağlı olarak ortaya çıkan asli tür zenginliğimiz yönünden orman ağaçlarımızda değişik ekolojik koşullarda bakım çalışmalarının farklı boyutlardan incelenmesi ve değerlendirilmesi gerekmektedir.

Adapazarı-Karasu yöresinde gerçekleştirilen bu araştırmada, doğal doğu kayını (*Fagus orientalis* Lipsky.) meşceresinde farklı şiddetlerde gerçekleştirilen sıklık bakımı müdahalelerinin kayın bireylerinin gelişimi ve büyümesi üzerinde etkileri incelenmiştir. Bu amaçla alınan deneme alanlarında çeşitli ölçü ve tespitlerde bulunulmuştur (Şekil 1).



Şekil 1: Doğu kayınının Türkiye'deki doğal yayılışı (Alemdağ, 1963).

Material ve Metotlar

Araştırma Alanının Genel Tanıtımı

Adapazarı-Karasu ilçesi sınırları içinde bulunan ve idari açıdan Karasu Orman İşletme Müdürlüğü'ne bağlı olan Karasu Orman İşletme Şefliğinin denize olan yatay mesafesi 3 km'dir. Genel olarak düze yakın ve orta engebeli bir arazi yapısına sahip olan Karasu Orman İşletme Şefliğinin ortalama rakımı 100 m'dir (Anon., 2015). Araştırma alanı, orman toplumları bakımından, euxin orman kuşağının, kuzeybatı euxin alt orman kuşağında kalmaktadır (Mayer ve Aksoy, 1998). Karasu plan ünitesinde, 2014 yılında gerçekleştirilen envanter çalışmaları sonucunda elde edilen bilgilere göre, toplam 7459 ha orman alanı bulunmaktadır. Bu orman alanın; %86,7'si normal, %13,3'ü ise, bozuk orman niteliğindedir. Uygulanmakta olan model amenajman planına göre, işletme şefliği ormanları dört işlem ünitesine ayrılmıştır. Karasu bölgesi, Türkiye makroiklim tipleri sınıflandırmasına göre, Batı Karadeniz alt iklim tipinin (IIc) etkisi altında bulunmaktadır (Saatçioğlu, 1969; Özyuvacı, 1999). Araştırma alanında meteoroloji istasyonu bulunmamaktadır. Çepel (1995) ve Özyuvacı (1999)'da, denizden ortalama yükseltisi bilinen fakat meteoroloji istasyonu bulunmayan bir yörenin iklimi hakkında genel bir bilgi sahibi olabilmek için, denizden ortalama yüksekliği bilinen bir meteoroloji istasyonundan elde edilen yağış ve sıcaklık değerlerinin, Schreiber ve Lapse-Rate formülleri kullanılarak enterpole edilmesini önermektedirler. Bu nedenle, araştırma alanının Walter yöntemine göre iklim diyagramının çizilmesinde, bölgeye en yakın meteoroloji istasyonu olan 18 m yükseklikteki Adapazarı Meteoroloji İstasyonu'nun uzun yıllar ortalama verilerinden faydalanılmıştır. Bu değerlere göre, Karasu bölgesinde yıllık ortalama sıcaklık 14.3°C olup, en düşük olduğu ay Ocak, en yüksek olduğu aylar ise Temmuz ve Ağustos'dur. Ayrıca, yörede vejetasyon süresi 8 aydır. Araştırma alanının, Walter yöntemine göre düzenlenmiş olan iklim diyagramı ise Şekil 2'de gösterildiği gibidir.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 2: Walter yöntemine göre Karasu'nun iklim diyagramı.

Karasu yöresinde jeolojik yapı; II. Zamanın (Mesozoik) kretase döneminde oluşmuştur. Bu nedenle, bölgedeki anakayalar sedimanter yapıdadır. Yörenin, özellikle sarp ve dik eğimli kısımlarında kalker, kil, marn, şist, konglomera ve filiş oluşumları bulunmaktadır. Düz ve daha az eğimli kısımlarında ise, kumtaşı formasyonları vardır (MTA, 2014). Ayrıca uygulanmakta olan amenajman planında ve detay silvikültür planında, plan ünitesindeki genel toprak yapısının; az taşlı, orta derinlikte, alkalen, kumlu balçık ve kumlu killi balçık tekstüründe olduğu bildirilmektedir (Anon., 2015).

Deneme Alanlarının Özellikleri

Karasu yöresinde gerçekleştirilen bu araştırmada da, araştırmanın amacı, süresi, çalışma imkanları ve arazi koşulları göz önünde tutularak deneme alanlarının 25x40 m (1000 m^2) büyüklüğünde alınması uygun görülmüştür. Deneme alanlarının şekli, sınırlarının kolay ve sağlıklı bir şekilde araziye uygulanması açısından önem taşımaktadır (Kalıpsız, 1993; Atıcı, 1998; Carus, 1998). Araştırma süresince çeşitli ölçü ve tespitlerin gerçekleştirildiği bu deneme alanlarının sayılarının belirlenmesinde, 1000 m^2 büyüklüğünde 3 tekrarlı ve her bir yoğunlukta 1 adet kontrol olmak üzere topla 12 adet deneme alanı alınmıştır.

Karasu 130c nolu bölmecik; II. bonitet sınıfında olup, aktüel meşcere tipi Knb_3'dir. Bölmecik; kuzeybatı bakılı olup, rakımı 253 m ve arazi eğimi %30-35 arasında değişmektedir. Bu bölmecikte, 2005 yılında 20,4 ha büyüklüğünde alanda sıklık bakımı çalışması yapılmıştır. 130c bölmeciğinde yapılan sıklık bakımı çalışmasında, yapılan kesimler aynı yılın Eylül ayında tamamlanmıştır. Yapılan sıklık bakımı kesimlerinden kayında toplam 18,203 m^3 ara hasılat etası alınmıştır. Yapılan sıklık bakımı çalışmalarında toplam birey sayısının %20'si, %50'si ve %70'i alınmıştır. Bartın ve Devrek yörelerinde, kayın doğal grup gençleştirme alanlarından alınan, 25x40 m büyüklüğündeki deneme alanlarında bulunan tohum ağaçlarında; yaş, ağaç sayısı, çap, boy, göğüs yüzeyi alanı, hacim, ortalama yıllık hacim artımı, sıklık, karışım oranı, tepe formu, gövde durumu, tepe genişliği ve tepe projeksiyonu alanı yönünden ölçü ve tespitler yapılmıştır. Araştırmada, deneme alanlarında bulunan tohum ağaçlarında tespit edilen önemli bir değişken de, göğüs yüksekliği çapıdır ($d_{1.30}$). Bu amaçla, 25x40 m büyüklüğündeki deneme alanlarına giren tüm ağaçların göğüs yüksekliği çapları, mm hassasiyetindeki bir çap ölçer ile ölçülmüştür. Ölçülen göğüs yüksekliği çap değerlerinin, aşağıdaki formülde belirtildiği gibi aritmetik ortalaması alınarak, deneme alanları düzeyinde kayın ağaçlarının ortalama çapları bulunmuştur.

Dayanıklı ve sağlıklı yaşlı meşcere kuruluşları, gençleştirme çalışmalarında her zaman önemli avantajlar sağlamaktadır. Bunların başında ise, kar ve fırtına devriklerinin azalması gelmektedir. Çünkü, yaşlı meşcere oluşturan ağaçların devrilmesi sonucunda, alt tabakada bulunan ve gelişim evrelerinin henüz başında olan genç fidanlar önemli zararlar görmekte ve çoğunlukla elimine olmaktadırlar (Nyland, 2002). Bu bilgiler çerçevesinde, deneme alanlarında bulunan ağaçların göğüs yüksekliği çaplarının, gençlik üzerinde dolaylı etkileri söz konusudur. Bu nedenle, deneme alanlarında bulunan kayın ağaçlarının ortalama çaplarının istatistik analizlere bir değişken olarak katılması uygun görülmüştür. Deneme alanı ortalama göğüs yüksekliği çapına ($d_{1.30}$) göre belirlenen orta ağaçların boyları, cm hassasiyetindeki dijital boy ölçer ile ölçülmüş ve ölçülen boy değerlerinin aşağıda belirtilen formülde gösterildiği gibi aritmetik ortalaması alınarak, kayın ağaçlarının deneme alanlarındaki ortalama boyları m olarak belirlenmiştir.

 Copyright © International Science and Technology Conference (ISTEC)

Deneme alanlarında bulunan kayın ağaçlarına ait ortalama boy, çap ve yaş değişkenlerinin belirlenmesinden sonra, bu ağaçların aktüel hacim durumlarının da tespit edilmesinde yarar görülmüştür. Bu itibarla, deneme alanlarındaki kayın ağaçlarının ortalama hacim değerleri aşağıda belirtilen formüle göre hesaplanmıştır. Ortalama ağaç hacimlerinin belirlenmesinde kullanılan tek ağaç hacim değerleri, Carus (1998) tarafından yapılan, "Aynıyaşlı Doğu Kayını (*Fagus orientalis* Lipsky.) Ormanlarında Artım ve Büyüme" isimli doktora çalışması kapsamında bonitete göre hazırlanan hacim tablolarından alınmıştır.

Araştırmada, deneme alanları itibarıyla tohum ağaçlarında hesaplanan bir başka değişken ise, ortalama yıllık hacim artımıdır. Bu itibarla, deneme alanlarına göre kayın ağaçları için ayrı ayrı belirlenen ve hektara dönüştürülen ortalama hacim değerleri, yine deneme alanlarında türlere göre tespit edilen yaş değerlerine oranlanmak suretiyle ortalama yıllık hacim artımı, m^3/ha/yıl olarak hesaplanmıştır. Bu amaçla, aşağıda belirtilen Eşitlik 4'den yararlanılmıştır.

Kayın bireylerinde hacim artımının belirlenmesi amacıyla gövde analizleri gerçekleştirilmiştir. Bu amaçla 10 cm'lik seksiyonlar şeklinde alınan disklerde çift taraflı olmak üzere çap artımı ve boy büyüme değerleri belirlenmiş ve bu değerlerden yararlanılarak hacim artım miktarları tespit edilmiştir. Bu amaçla 3 farklı şiddette gerçekleştirilen sıklık bakımı alanlarından 5 tekrarlı olacak şekilde toplam 15 birey ve yine herbir sıklık bakımı uygulama alanından 3 tekrarlı olacak şekilde toplam 9 adet kontrol bireyi kesilmiş ve tüm gövde analizi uygulamaları toplam 24 ağaç üzerinde gerçekleştirilmiştir.

Kayın ağaçlarının seçiminde dikkat edilen diğer bir kriter de gövde formudur. Genel olarak kayın ağaçlarının, düzgün ve dolgun gövde formuna sahip bireylerden seçilmesi önerilmektedir (Saatçioğlu, 1979; Ürgenç, 1982, 1998; Tunçtaner, 2007; Nyland, 2002). Ağaçlarda meydana gelen böcek ve mantar zararlarından, biyolojik bağımsızlığını kazanmamış olan gençlikler önemli ölçüde zarar görebilmektedir. Ayrıca gövde formu, erken yaşlardan itibaren öz çürüklüğü meydana gelen kayında daha da büyük bir önem arz etmektedir. Nitekim Alemdağ (1963) tarafından yapılan bir araştırmada, Tokat yöresindeki kayın ormanlarında, öz çürüklüğünün erken yaşlardan itibaren meydana geldiği ve bu ormanlar için idare süresinin belirlenmesinde bu durumun göz önünde bulundurulması gerektiği bildirilmektedir. Bu bilgiler ışığında, araştırma alanlarından alınan deneme alanlarında bulunan kayın ağaçlarında gövde formuna yönelik tespitlerde bulunulmuştur. Bu amaçla, gövde formuna yönelik tespitlerin yapıldığı bazı araştırmalarda olduğu gibi, deneme alanlarında bulunan kayın ağaçlarında gözlemlenen gövde formlarına göre belirlenen ve dört kategoriden oluşan bir gövde formu indeksi kullanılmıştır (Şekil 3).

Şekil 3: Kayın ağaçlarında gövde formunu.

Şekil 3'deki gövde formu indeks değerlerine (1-4) göre, kayın tohum ağaçlarına ait gövde formu değişkeni istatistik analizlere dahil edilmiştir.

Araştırmadan elde edilen verilerin istatistiki değerlendirmeleri için, SPSS (Statistical Package for Social Science) 9.0 paket programından yararlanılmıştır. İstatistik analizlerde kullanılan verilerin normal dağılım gösterip göstermediğini belirlemek için, Kolmogoraf Simirnov testi uygulanmıştır. 2005 yılında 3 farklı şiddette gerçekleştirilen sıklık bakımı müdahaleleri sonucunda kayın bireyleri arasında istatistiki bakımdan anlamlı farklılığın bulunup bulunmadığını belirlemek için varyans analizi uygulanmıştır. Varyans analizinde belirgin bir farklılığın çıkması durumunda, gruplandırmalar Duncan testi ile yapılmıştır (Kalıpsız, 1994; Batu, 1995; Ercan, 1997; Özdamar, 2004). Araştırmada komşuluk ilişkileri de belirlenmiştir. Bu amaçla deneme alanlarında kalan serveti oluşturan kayın bireylerinin hepsinin bulunduğu konuma gidilerek ayrı ayrı GPS yardımıyla koordinat

 Copyright © International Science and Technology Conference (ISTEC)

tespiti gerçekleştirilmiş ve daha sonra bu koordinatlar Arc.GIS programının 3D analiz setinde özel analizler menüsü kullanılarak analiz edilmiş ve k(f) fonksiyonuna ait katsayı değerleri belirlenmiştir.

Sonuçlar ve Tartışma

2005 yılında 3 farklı yoğunlukta gerçekleştirilen sıklık bakımı çalışmaları sonucunda bu bakım uygulamalarının gerçekleştirildiği alanlardan alınan kayın bireylerine ilişkin ortalama boy değerlerine uygulanan varyans analizi ve Duncan testinin sonuçları Tablo 1'de verilmiştir.

Tablo 1: Farklı şiddetlerde uygulanan sıklık bakımı sonucu kayın bireylerine ait 10. yıldaki ortalama boy değerleri, varyans analizi ve Duncan testi sonuçları.

Sıklık Bakımı Şiddeti	**F=13,48** Ort. Boy (m)**	**Homojen Gruplar**
Hafif (%20)	10,54	*a*†
Mutedil (%50)	13,41	*b*
Kuvvetli (%70)	13,76	*b*
Kontrol	9,67	*a*

**: *P<0.01* güven düzeyinde anlamlı farklılık
†: Aynı harfler benzer grupları göstermektedir.

Gerçekleştirilen varyans analizi sonucunda 3 farklı şiddette uygulanan sıklık bakımı uygulamaları sonrasında kayın bireylerinin ortalama boy büyümesi arasında P<0,01 güven düzeyinde anlamlı farklılığın olduğu tespit edilmiştir. Bu kapsamda homojen gruplandırmayı gerçekleştirmek amacıyla uygulanan Duncan testi sonucunda 2 farklı homojen grubun olduğu belirlenmiştir. Buna göre ortalama boy büyümesi en düşük hafif şiddetli sıklık bakımı uygulamasının gerçekleştirildiği kısımda gerçekleşirken, mutedil ve şiddetli sıklık bakımı uygulaması gerçekleştirilen alanlarda ortalama boy büyümesi birbirine oldukça yakın değerler göstermiş ve aynı grupta yer almışlardır (Tablo 1). Buna göre farklı şiddetlerde sıklık bakımının uygulandığı kayın meşceresinde 10. yıl sonunda ortalama boy büyümesi 10,54-13,76 m arasında değişmektedir. Bu durum kontrol alanında 9,67 m olarak tespit edilmiştir. Bu konuda İran'da yapılan benzer bir araştırmada mutedil ve şiddetli sıklık bakımı çalışmaları sonrasında doğu kayını bireylerinde ortalama boy büyümesinin 10. yaşta 8,96-17,48m arasında değiştiği tespit edilmiştir (Tabari vd., 2005). Diğer taraftan her 3 şiddet derecesinde de sıklık bakımı müdahalelerinin gerçekleştirildiği alandaki kayın bireylerinin ortalama boy büyümesi yönünden kontrol parselinden daha yüksek değerlere sahip olduğu saptanmıştır. Nitekim Saatçioğlu (1971) ve Atay (1989) tarafından sıklık bakımı müdahalelerinin hemen hemen tüm asli orman ağacı türlerinde gelişim ve büyüme yönünde pozitif etkiler meydana getirdiği bildirilmektedir. Diğer taraftan ortalama boy büyümesinin ve meşcere üst boyunun doğrudan doğruya meşcere kapalılığını da etkilediği bilinen bir gerçektir (Avşar, 2004; Yücesan vd., 2015). Bu kapsamda söz konusu bu araştırmada da kayında yapılan farklı şiddetlerdeki sıklık bakımı tedbirlerinin meşcere dinamikleri ve boy gelişimi açısından olumlu etkiler meydana getirdiğini söylemek mümkündür.

Araştırmanın gerçekleştirildiği bölmecikte farklı şiddetle sıklık bakımının uygulandığı kayın alanlarından 10. yaşta 3 tekrarlı olarak kesilen deneme ağaçlarında yapılan gövde analizleri sonucunda elde edilen ortalama çap değerlerine uygulanan varyans analizi ve Duncan testinin sonuçları Tablo 2'de belirtilmiştir.

Tablo 2: Farklı şiddetlerde uygulanan sıklık bakımı sonucu kayın bireylerine ait 10. yıldaki ortalama çap değerleri, varyans analizi ve Duncan testi sonuçları.

Sıklık Bakımı Şiddeti	**F=28,45* Ort. Çap (cm)**	**Homojen Gruplar**
Hafif (%20)	14,37	a†
Mutedil (%50)	16,56	b
Kuvvetli (%70)	18,45	c
Kontrol	11,43	d

*: P<0.05 güven düzeyinde anlamlı farklılık
†: Aynı harfler benzer grupları göstermektedir.

Yapılan varyans analizi sonucunda 10 yaşındaki kayın bireylerinin çap gelişimi açısından P<0,05 güven düzeyinde anlamlı farklılık bulunmuştur. Bu kapsamda uygulana Duncan testi sonucunda aynı güvenlik düzeyinde 4 farklı homojen grup ortaya çıkmıştır. Buna göre en düşük çap gelişimi hafif düzeyde gerçekleştirilen sıklık bakımında elde edilirken, en yüksek çap gelişimi en geniş yaşam alanına sahip olan kuvvetli düzeydeki sıklık bakımı alanında tespit edilmiştir (Tablo 2). Doğu kayınında yapılan benzer bir çalışmada da yapılan sıklık bakımı tedbirlerinin

 Copyright © International Science and Technology Conference (ISTEC)

meşcerede kalan kayın gövdelerinin çap gelişimi üzerinde olumlu etkiler meydana getirdiği belirlenmiştir (Yücesan vd., 2015). Çünkü tekniğine uygun olarak gerçekleştirilen gövde ayrılması sonucunda meşcere kalan bireyler daha geniş bir yaşama alanına kavuşmakta ve daha fazla ışıktan yararlanarak çap artımı gerçekleştirmektedirler (Atay, 1989).

Araştırma kapsamında sıklık bakımı uygulamalarının 10 yılında kayın bireylerinin yaptıkları artım miktarları kesilen deneme ağaçlarında yapılan gövde analizleri sonucunda tespit edilmiştir. Gövde analizleri sonucunda elde edilen çap artımı değerlerine uygulanan varyans analizi ve Duncan testinin sonuçları Tablo 3'de gösterilmiştir.

Tablo 3: Farklı şiddetlerde uygulanan sıklık bakımı sonucu kayın bireylerine ait yıllık ortalama çap artımı değerleri, varyans analizi ve Duncan testi sonuçları.

Sıklık Bakımı Şiddeti	**F=3,556*** **Ort. Çap Artımı(cm/yıl)**	**Homojen Gruplar**
Hafif (%20)	1,356	*a*†
Mutedil (%50)	2,145	*b*
Kuvvetli (%70)	4,563	*c*
Kontrol	1,016	*d*

*: *P<0.05* güven düzeyinde anlamlı farklılık
†: Aynı harfler benzer grupları göstermektedir.

Kayın bireylerinde gövde analizi ile tespit edilen ortalama yıllık çap artımı değerlerine uygulanan varyans analizi sonucunda 3 farklı şiddetteki sıklık bakımı alanları arasında P<0,05 güven düzeyinde anlamlı farklılık tespit edilmiştir. Bu itibarla yapılan Duncan testi sonucunda 4 farklı homojen grup belirlenmiştir. Buna göre ortalama yıllık çap artımı değeri en düşük hafif şiddette gerçekleştirilen sıklık bakımı alanlarında belirlenirken, en yüksek ortalama yıllık çap artımı değeri kuvvetli sıklık bakımı tedbirlerinin uygulandığı kayın meşcere mıntıkalarında saptanmıştır (Tablo 3). Bu bulgular ışığında çap gelişiminde olduğu gibi yapılan farklı şiddetteki sıklık bakımı uygulamalarının meşcerede kalan serveti oluşturan kayın bireylerinin çap artımı üzerinde olumlu etkiler meydana getirdiği ortaya çıkmaktadır. Nitekim sıklık bakımı uygulamaları sonucunda elde edilen çap artım değerlerinin tamamının kontrol alanındakilerden daha yüksek olması da bu durumu desteklemektedir. Ayrıca gerek Avrupa kayının da gerekse doğu kayınında yapılan bazı çalışmalarda sıklık bakımı tedbirlerinin çap artımı üzerinde % 12,8-% 23,6 arasında değişen oranlarda artış sağladığı tespit edilmiştir (Wang vd., 1998; Wilson ve Oliver, 2000; Tabari vd., 2005).

Sıklık bakımı tedbirlerinin odun hacmi yönünden etkileri konusunda elde bulunan bilgiler oldukça sınırlıdır. Özellikle doğu kayını türünde bu bilgilere ilişkin araştırma çalışmaları ülkemizde yetersiz düzeydedir. Bu anlamda söz konusu bu araştırma kapsamında farklı yoğunluklarda uygulanan sıklık bakımı tedbirlerinin hacim üzerindeki etkileri de incelenmiş ve gövde analizleri sonucunda ortaya çıkan çap ve çap artımı değerlerinden yararlanılarak kayın bireylerinin hacim değerleri de hesaplanmıştır. Hesaplanan hacim değerlerine uygulanan varyans analizi ve Duncan testinin sonuçları Tablo 4'de belirtilmiştir.

Tablo 4: Farklı şiddetlerde uygulanan sıklık bakımı sonucu kayın bireylerine ait ortalama hacim değerleri, varyans analizi ve Duncan testi sonuçları.

Sıklık Bakımı Şiddeti	**F=2,536** **Ort. Hacim(m^3/ha)**	**Homojen Gruplar**
Hafif (%20)	0,986	*a*†
Mutedil (%50)	1,113	*a*
Kuvvetli (%70)	5,447	*b*
Kontrol	0,563	*c*

**: P<0.01 güven düzeyinde anlamlı farklılık
†: Aynı harfler benzer grupları göstermektedir.

Tablo 4'te yer alan değerler incelendiğinde, 3 farklı şiddette uygulanan sıklık bakımları sonucunda ortalama hacim değişkeni yönünden varyans analizine göre P<0,01 güven düzeyinde farklılık bulunmuştur. Bu kapsamda uygulanan Duncan testi sonucunda 3 farklı grup ortaya çıkmıştır. Bu itibarla hafif ve mutedil olarak uygulanan sıklık bakımı tedbirlerinin yapıldığı alanlardaki kayın bireylerinde ortalama hacim değerleri birbirine oldukça yakın olup, bu iki sıklık bakımı tedbirlerinin yapıldığı alanlardaki bireyler aynı grupta yer almışlardır. Diğer taraftan kuvvetli sıklık bakımı tedbirlerinin uygulandığı alandaki bireylerin ortalama hacim değeri hafif ve mutedil

 Copyright © International Science and Technology Conference (ISTEC)

şiddetteki alanlarda bulunan bireylere göre oldukça yüksek çıkmıştır (Tablo 4). Ülkemizdeki kayın ormanları tohum ve sürgün kökenli olup olmamaları durumuna göre farklı büyüme ve meşcere parametresi değerlerine sahip olabilmektedir (Saatçioğlu, 1969). Bu itibarla sıklık bakımı müdahaleleri sonrasında alanda kalan kayın bireylerinin II. ve III. bonitet sınıflarında uygulamaların 10. yılında ortalama tek ağaç hacminin 4,56-13,65m^3/ha arasında değiştiği belirlenmiştir (Carus, 1998). Nitekim yapılan farklı şiddetteki sıklık bakımı uygulamaları sonrasında kayın bireylerinde ortaya çıkan hacmin sayısal değer bakımından, kontrol alanındakinden yüksek olması bunun en önemli göstergesi olmaktadır.

Araştırmada gerçekleştirilen boy ölçümleri ile gövde analizlerinden elde edilen çap artımı ve çap değerleri kullanılarak gerçekleştirilen hesaplamalar sonucunda kayın bireylerine ait ortalama yıllık hacim artımı değerleri tespit edilmiştir. Ortalama yıllık hacim artım değerlerine uygulanan varyans analizi ve Duncan testine ilişkin sonuçlar Tablo 5'de verilmiştir.

Tablo 5: Farklı şiddetlerde uygulanan sıklık bakımı sonucu kayın bireylerine ait yıllık ortalama hacim artımı değerleri, varyans analizi ve Duncan testi sonuçları.

Sıklık Bakımı Şiddeti	**F=124,563**** **Ort. Yıllık Hacim Artımı (m^3/ha/yıl)**	**Homojen Gruplar**
Hafif (%20)	0,763	*a*†
Mutedil (%50)	0,942	*a*
Kuvvetli (%70)	1,816	*b*
Kontrol	0,445	*c*

**: P<0.01 güven düzeyinde anlamlı farklılık
†: Aynı harf benzer grupları göstermektedir.

Yıllık ortalama hacim artımı değişkeni yönünden 3 farklı şiddette uygulanan sıklık bakımı alanlarında P<0,01 güven düzeyinde anlamlı farklılık bulunmuştur. Bu kapsamda gerçekleştirilen Duncan testi sonucunda 3 farklı homojen grup ortaya çıkmıştır. Buna göre ortalama hacim değişkeninde olduğu gibi ortalama yıllık hacim artımı değişkeninde de hafif ve mutedil şiddette sıklık bakımı yapılan alanlardaki kayın bireyleri aynı grupta yer alırken, kuvvetli sıklık bakımı gerçekleştirilen alanlardaki kayın bireylerinde ortalama yıllık hacim artımı daha yüksek olarak tespit edilmiştir (Tablo 5). Yıllık ortalama hacim artım değeri de meşcerenin verimliliğinin belirlenmesinde ve yapılan silvikültürel müdahalelere ilişkin sonuçların değerlendirilmesinde kullanılan önemli bir değişkendir (Genç, 2004). Bu kapsamda araştırmada yıllık ortalama hacim artım değişkeni de incelenmiştir ve yapılan incelemeler sonucunda bu değişkenin de uygulanan farklı şiddetteki sıklık bakımı tedbirlerinden etkilendiği yapılan varyans analizi ve Duncan testi sonucunda ortaya çıkmıştır. Bu durum doğu kayınında yapılan ve özellikle araştırma alanı ile benzer ekolojik koşullara sahip olan alanlarda gerçekleştirilen bir araştırmada da, sıklık bakımı müdahalelerinin uygulandığı alanlarda kalan serveti oluşturan kayın bireylerinin ortalama yıllık hacim artımının II. ve III. bonitet alanlarda 0,982-4,562m^3/ha/yıl arasında değiştiği belirlenmiştir (Carus, 1998). Bu konuda Bartın ve Devrek yörelerindeki doğu kayını ormanlarında gerçekleştirilen kapsamlı bir araştırmada da genç kayın meşcerelerinde ortalama cari artımın tek ağaç gövdesi üzerinden 0,775-6,323 m^3/ha/yıl arasında değiştiği belirlenmiştir (Özel, 2007).

Sıklık bakımı tedbirleri bireylerin kantitatif karakterlerinin yanı sıra kalitatif karakterleri üzerinde de etkili olan bir orman bakımı uygulamasıdır. Bu anlamda ekonomik değerin artmasında belirleyici rol oynayan gövde düzgünlüğü değişkeni sıklık bakımı uygulanan bu alanlarda bir indeks yardımıyla araştırma kapsamında değerlendirilmiştir. Bu amaca yönelik olarak Şekil 4'te yer alan gövde düzgünlüğü indeksinden yararlanılarak sıklık bakımı yapılan alanlardaki kayın bireylerinin ortalama gövde düzgünlükleri değerlendirilmiştir. Bu noktada elde edilen ortalama indeks değerlerine uygulanan varyans analiz ve Duncan testi değerleri Tablo 6'da gösterilmiştir.

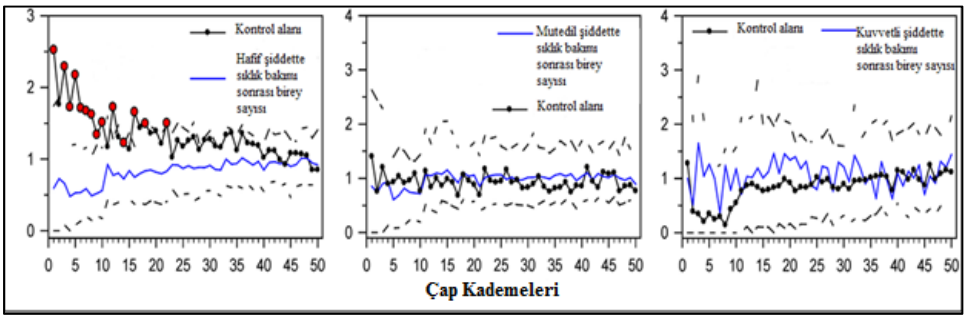
NS: İstatistiki açıdan anlamlı farklılık yok
†: Aynı harf benzer grupları göstermektedir.

Ortalama gövde düzgünlüğü değişkenine uygulanan varyans analizi sonucunda 3 farklı şiddette gerçekleştirilen sıklık bakımı alanlarında istatistiki açıdan anlamlı farklılık belirlenmemiştir. Ancak her 3 sıklık bakımı derecesi sonrasında yani 10. yaşta ortaya çıkan ortalama gövde düzgünlüğü değeri kontrol alanından daha iyi bulunmuştur. Bu itibarla sıklık bakımının kayın bireylerinin ortalama gövde düzgünlüğü üzerinde pozitif bir etkisinin olduğunu söylemek mümkündür. Geniş yapraklı türlerin gövde düzgünlüğü konusunda yapılan çalışmaların sayısı ve içeriği oldukça zayıftır.

Birey sayısı sıklık bakımı tedbirlerinin sonuçlarının değerlendirilmesinde önemli bir değişkendir. Çünkü bakım tedbirleri sağlıklı ve kaliteli meşcerelerin tesis edilmesinde ve özellikle gelecekte genç generasyonun oluşmasını sağlayacak tohum ağaçlarının belirlenmesinde önemli rol oynamaktadır. Bu nedenle başarı doğal gençleştirme çalışmalarının yapılmasında alanda yeterli sayıda ve homojen dağılışta tohum ağacının alanda bulunması gerekmektedir. Bu meşcere stabilitesinin sağlanmasında ilk temeller sıklık bakımı ile atılmaktadır. Bu kapsamda araştırma kapsamında 3 farklı şiddette uygulanan sıklık bakımı tedbirlerinin birey sayısı ve dağılımı üzerindeki etkileri de incelenmiştir. Bu amaçla, deneme alanlarında tespit edilen birey sayıları hektara dönüştürülmüş ve bu değerlere varyans analizi ve Duncan testi uygulanmıştır (Tablo 7).

Tablo 7: Farklı şiddetlerde uygulanan sıklık bakımı sonucu kayın bireylerine ait ortalama birey sayısı değerleri, varyans analizi ve Duncan Testi sonuçları.

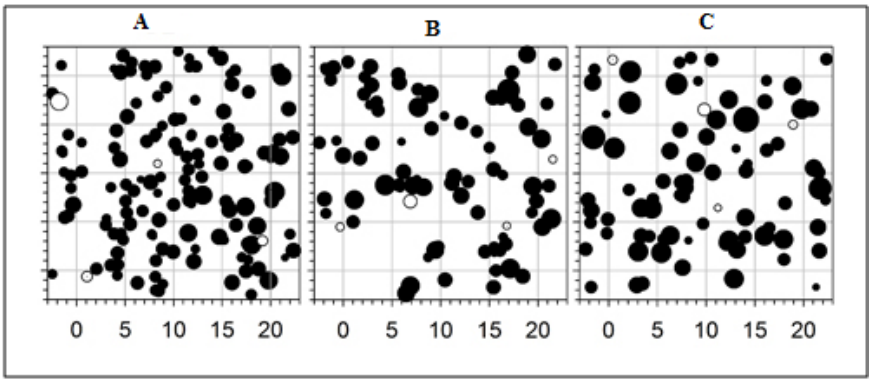


Sıklık Bakımı Şiddeti	**F=1226,23*** **Ort. Birey Sayısı (adet/ha)**	**Homojen Gruplar**
Hafif (%20)	2216	*a†*
Mutedil (%50)	1980	*a*
Kuvvetli (%70)	1420	*b*
Kontrol	3128	*c*

***:** *P<0.05* güven düzeyinde anlamlı farklılık
†: Aynı harf benzer grupları göstermektedir.

Birey sayısı sıklık bakımı tedbirlerinin etkilerini yansıtması ve değerlendirme açısından önemli bir değişkendir (Saatçioğlu, 1971). Nitekim bu konuda ülkemiz ormancılığında çok önemli eksikliklerin bulunduğu orman bakımı disiplinine ait araştırmalarda ayrıntılı olarak yer almaktadır (Odabaşı vd., 2004). 3 farklı şiddette uygulanan sıklık bakımı müdahalelerinin etkilerini belirlemek amacıyla 10 yaşındaki kayın bireylerinden alınan 3 tekrarlı deneme alanlarında tespit edilen birey sayısının hektara uyarlanmış değerlerine uygulanan varyans analizi sonucunda P<0,05 güven düzeyinde istatistik açıdan anlamlı farklılık bulunmuştur. Bu kapsamda uygulanan Duncan testi sonucunda 3 farklı homojen grup tespit edilmiştir (Tablo 7). Bu sonuca göre hafif ve mutedil şiddetteki sıklık bakımı müdahaleleri ortalama birey sayısı yönünden aynı grupta yer alırken, kuvvetli derecede gerçekleştirilen sıklık bakımı müdahalesi yapılan alan tek başına bir grup oluşturmuştur. Diğer taraftan her üç sıklık bakımı müdahalesi de ortalama birey sayısı yönünden kontrol alanındaki kayın birey sayısından istatistiki açıdan anlamlı farklılık ortaya koymuştur. Nitekim İran'da yapılan bir araştırmada sıklık bakımı tedbirlerinin birey sayısı üzerinde negatif bir etki yaratmakla beraber, bireylerin dağılımı yönünden pozitif bir etki meydana getirdiği belirlenmiştir. Ayrıca aynı çalışmada sıklık bakımı sonrası optimum birey sayısının 1145 adet/ha olduğu belirlenmiştir (Tabari vd., 2005). Diğer taraftan aynıyaşlı kayın meşcerelerinde gerçekleştirilen hasılat çalışmasında sıklık bakımı sonrası alanda kalması gereken doğu kayını birey sayısının 10. yıl sonunda 1174-1678 adet/ha arasında olması gerektiği vurgulanmıştır (Carus, 1998). Bu sonuçlar ile söz konusu bu araştırma sonucunda elde edilen bulgular değerlendirildiğinde hektardaki ortalama birey sayısı yönünden özellikle mutedil

 Copyright © International Science and Technology Conference (ISTEC)



şiddetteki sıklık bakımı müdahalelerinin yerinde olduğunu söylemek mümkündür. Araştırma kapsamında birey sayısının 3 farklı şiddette uygulanan sıklık bakımı alanlarındaki dağılımı da incelenmiştir. Buna göre hafif ve mutedil şiddetteki sıklık bakımı çalışmalarında birey sayısının çap kademeleri bakımından dağılımı düzgün olmakla birlikte, kuvvetli derecede gerçekleştirilen sıklık bakımı uygulamalarında birey sayısının çap kademelerine dağılımı düzensiz olarak tespit edilmiştir (Şekil 4). Buna göre Karasu Orman İşletme Şefliğindeki doğu kayını meşcerelerinde yapılacak sıklık bakımı müdahalelerinde hektardaki birey sayısının düzenli ve optimum seviyede sağlanması mutedil şiddetteki sıklık bakımı uygulamaları ile gerçekleştirilebilmektedir.

Şekil 4: Farklı şiddetteki sıklık bakımı uygulamalarında birey sayısının çap kademelerine dağılımı.

Meşcere Komşuluk İlişkilerine İlişkin Bulgular

Bakım çalışmalarının en önemli etkilerinin başında meşceredeki galip bireyler arasındaki komşuluk ilişkilerini ve dayanışmayı artırmasıdır (Odabaşı vd., 2004). Bu nedenle araştırmada farklı şiddetlerde sıklık bakımı uygulanan alanlarda meşcere komşuluk ilişkileri Arc.GIS programı yardımıyla incelenmiştir. Yapılan komşuluk analizleri sonucunda farklı şiddette sıklık bakımı tedbirlerinin uygulandığı alanlarda bireylerin dağılımı ve düzeni Şekil 5'de gösterilmiştir.

Şekil 5: Farklı şiddette (A: Hafif, B: Mutedil ve C: Kuvvetli) uygulanan sıklık bakımı alanlarında kayın bireyleri arasındaki komşuluk ilişkileri.

Yapılan bu analiz sonucunda komşuluk ilişkisini gösteren k(f) katsayısı en fazla (2,34) mutedil şiddetteki sıklık bakımı uygulanan doğu kayını meşcere kısmında tespit edilmiştir. Bu konuda doğu kayınında yapılan bir çalışmada da ılımlı sıklık bakımı tedbirlerinin komşuluk ve yardımlaşma ilişkileri açısından oldukça olumlu etkiler meydana getirdiği belirlenmiştir (Yücesan vd., 2015). Diğer taraftan benzer silvikültürel özelliklere sahip olan Avrupa kayınında yapılan araştırmalarda da komşuluk ilişkilerinin optimum düzeyde gerçekleştiği sıklık bakımı şiddetinin hafif ve mutedil şiddetteki sıklık bakımı müdahalelerinde olduğu belirlenmiştir (Chapeck, 1996; Madsen, 1999).

Öneriler

Araştırmadan elde edilen bu sonuçlar ışığında Karasu Orman İşletme Şefliği ve benzer ekolojik koşullara sahip tek tabakalı ve aynıyaşlı saf doğu kayını meşcerelerinde gerçekleştirilecek sıklık bakımı müdahalelerine ilişkin olarak aşağıdaki silvikültürel önerilerde bulunmak mümkündür;

- Meşcerede bakım tedbirleri her gelişim çağında ve tekniğine uygun olarak yapılmalıdır.
- Sıklık bakımı tedbirlerinde geç kalınmamalı ve meşcerede primer kapalılık meydana gelir gelmez sıklık bakımı uygulamaları gerçekleştirilmelidir.
- Sıklık bakımı uygulamalarında yapılacak kesimlerin şiddeti yöresel koşullar ve meşcere kuruluş özellikleri dikkate alınarak belirlenmelidir.

 Copyright © International Science and Technology Conference (ISTEC)

- Karasu yöresinde ve benzer yetişme ortamı koşullarına sahip doğu kayını meşcerelerinde sıklık bakımı tedbirleri uygulanırken meşcere parametreleri dikkate alınmalı ve özellikle hektardaki birey sayısı ve dağılımı yakından incelenmelidir. Bu kapsamda hektarda 850-1200 adet bireyin alanda bırakılması uygun olacaktır.
- Araştırma alanında ve benzer ekolojik koşullara sahip alanlarda bulunan saf doğu kayını meşcerelerinde boy, çap, hacim ve artım gibi meşvere gelişim parametrelerinin optimum düzeyde tutulması açısından mutedil veya kuvvetli derecede sıklık bakımı tedbirleri uygulanmalı ve alanda kalan kayın bireylerinin azman yapma eğilimleri kontrol altında tutulmalıdır.
- Araştırma alanındaki doğu kayını meşcerelerinde sıklık bakımı tedbirleri sonrası mutlaka en az 10 yıllık adaptasyon ve gelişim performansları izlenmelidir. Bu itibarla söz konusu bu araştırmadan elde edilen sonuçların uygulamaya aktarılması oldukça yararlı olacaktır.
- Araştırma alanında incelenen sıklık bakımı müdahaleleri sonrası doğu kayını meşcerelerinde özellikle eşit siper durumunun, sıklığın ve kapalılığın korunması ile optimum birey sayısı ve dağılımının sağlanması açısından mutedil şiddette sıklık bakımının uygulanması önerilebilir. Bu kapsamda söz konusu doğu kayını meşcerelerinde sıklık bakımı tedbirleri gerçekleştirilirken alandaki birey sayısının %50'sinin alınması meşcere dinamiklerinin korunması ve vitalitesi yüksek kayın meşcerelerinin sağlanması açısından yeterli olabilecektir.
- Sıklık bakımı sonrası doğu kayını meşcerelerinde kalan ağaç servetini oluşturan kayın istikbal bireyleri arasındaki komşuluk ilişkileri ve dayanışma performansları incelenmelidir. Bu kapsamda Karasu Orman İşletme Şefliğindeki gibi ılıman ve verimli yetişme ortamı koşullarına sahip kayın meşcerelerinde optimum dayanışma ve komşuluk ilişkileri için ve stabilitesi yüksek kayın meşcerelerinin tesisi açısından mutedil şiddette sıklık bakımı tedbirleri uygulanmalıdır.

TEŞEKKÜR

Bu çalışma Bartın Üniversitesi, Fen Bilimleri Enstitüsü, Orman Mühendisliği Anabilim Dalı Tezli Yüksek Lisans programı kapsamında Doç. Dr. Halil Barış ÖZEL'in danışmanlığında Erdal ÖZBAY tarafından yüksek lisans tezi olarak hazırlanmıştır. Araştırmaya sağladıkları katkılardan dolayı Karasu Orman İşletme Müdürlüğü personeline teşekkürlerimizi sunarız.

ADIYAMAN İLİNDE YABAN KEÇİSİ AV TURİZMİ

Abdulkadir GÜZEL, Mehmet ÖZCANLI

Harran Üniversitesi, Fen-Edebiyat Fakültesi Coğrafya Bölümü. Şanlıurfa/Türkiye

akdguzel@harran.edu.tr mehmetozcanli@harran.edu.tr

Özet: Av turizmi; turizmin değişik bir uygulama şekli olup avcı niteliğine sahip kişilerin avlanma amaçlarını gerçekleştirmek üzere belirlenmiş ilkelerle yaptıkları etkinliklerdir. Avcılar, av turizmi faaliyetleri ile yaban hayvanlarının boynuz, diş, post benzeri hatıra değeri taşıyan kısımlarına sahip olmakla birlikte, değişik kültürleri tanıma ve değişik yerleri görme olanağı elde etmektedirler. Av turizmi kırsal alanlardaki insanların sosyo-ekonomik ve kültürel açıdan yapısını değiştirecek biçimde gelir ve refah seviyesinin iyileştirilmesi, dengesizliklerin giderilmesi ve yörede üretilen ürünlerin değerlendirilmesi, bakımından önemlidir.

7614 km²'lik yüz ölçüme sahip olan Adıyaman İlin arazi yapısı kuzeyden güneye doğru alçalan engebeli bir görünüm arz etmektedir. Çok farklı jemorfolojik ünitelere sahip Adıyaman havzasında ilk bakışta göze çarpan ana jeomorfolojik birimler dağlık alanlar, platolar ve bu her iki üniteyi parçalayan vadilerdir. Genel hatlarıyla en kuzeyde 800 metrelerden başlayıp 2000 metrelere kadar devam eden dağlık alanlar ve yüksek platolar yer alırken güneye doğru alçak platolara ve havza tabanına, daha sonra da Fırat ve kollarının oluşturduğu vadi ve seki sistemlerine geçilir.

Yukarıda ifade edildiği gibi birçok farklı yer şekillerinin görüldüğü Adıyaman ilinin özellikle Güneydoğu Torosların hakim olduğu alanlardaki çok engebeli alanlarda yabani hayvanların kolayca saklanabilecekleri gerek yer şekilleri gerekse bitki örtüsünün varlığına bağlı olarak yaban hayatı gelişmiştir. Özellikle bu sahada gün gittikçe sayıları artan yabani keçilere bağlı olarak yabani av hayatına uygundur.

Anahtar Kelimeler: Turizm, Ekonomi, Türkiye, Adıyaman

Adıyaman Wıld Goat Huntıng Tourısm

Abstract: Hunting tourism; a variant form of tourism is determined to achieve the objectives of the people who have the qualifications hunter hunting are activities they do with principles. Hunters, hunting tourism activities of wild animals with horns, teeth, albeit with parts carrying value of the post-like memories, know different cultures and gain the ability to see different places. Hunting tourism and income of people in rural areas so as to change the socio-economic structure and improving the cultural level of welfare, the elimination of imbalances and evaluation of products produced in the region in terms is important.

7614 square kilometers of Adiyaman province with the area's terrain poses a rugged appearance descending from north to South. Jemorfolojik unit in very different at first glance to have Adiyaman basin main geomorphological units outstanding mountainous areas, plateaus and valleys that are degrading both units. In general terms the north, starting from 800 meters to 2000 meters to up ongoing mountainous areas and high plateaus, while to the south the low plateau and basin base, then the Euphrates and passed the valley, and bench system formed by the arm.

Many different places, especially in a very hilly area in areas dominated by the Southeastern Taurus of Adiyaman seen the way the province need can easily be stored wild animals landforms, as stated above, depending on the presence of both vegetation has developed wildlife. In particular, numbers growing days in this area is suitable for hunting wild life due to increased wild goats.

1. ÇALIŞMA ALANININ DOĞAL COĞRAFYA ÖZELLİKLERİ

 Copyright © International Science and Technology Conference (ISTEC)

Güneydoğu Anadolu bölgesinin yukarı Fırat bölümündeki Adıyaman ilinin bir bölümü Güneydoğu Anadolu bölgesinin dışına taşar, Güneydoğu Torosların hakim olduğu Sincik ve Çelikhan ilçeleri değişen yerşekilleri, yükselti, iklim özellikleri, doğal bitki örtüsünün yanında değişen beşeri faaliyetlere bağlı olarak doğu Anadolu bölgesi içinde kalırlar.

Adıyaman ili Akdeniz Bölgesi'ne yakınlığı nedeniyle 800 m' ye kadar olan sahalarda yarı kurak Akdeniz iklimi, yüksek kesimlerde ise karasal dağ iklimi hüküm sürmektedir. Yaz mevsiminde güneyden gelen kuru tropikal (sıcak) hava kütlesi etkisini göstermektedir. Nisan ayından itibaren yöreyi etkisine alan bu hava kütlesi, haziran sonundan itibaren güneş radyasyonunun da artması ile temmuz ve ağustos aylarında şiddetli sıcaklara neden olur. Ekim sonu ve kasım başından itibaren yöre Akdeniz Bölgesi'ni etkilemeye başlayan ve Doğu Anadolu'dan güneye doğru ilerleyen polar hava kütlesinin etkisi altına girer. Özellikle tropikal ve polar hava kütlelerinin karşılaşması ile cephe faaliyetleri ve bunun sonucu olarak yağışlar başlar. Toros dağ kuşağının ön silsilesini oluşturan Nemrut Dağı ve çevresindeki dağlar, güneyden sokulan cephelerin iç kısımlara geçmesini engeller, bu nedenle güneye bakan yamaçlar fazla miktarda yağış alır. Yörede yükseltiye bağlı olarak sıcaklık düşer, güneş radyasyonu artar ve özellikle güneye bakan yamaçlar aşırı derecede ısınır (Atalay v.d., 2002:352).Sözü edilen bu iki ilçede yüksek dağlık ve engebelik alanlara bağlı olarak yaban hayatı gelişmiştir, bu yaban hayatından biri de yaban keçisi avcılığıdır. Yaban keçileri sarp alanlar ile bitki örtüsünün hem beslenme hem e korunmaya imkan verdiği alanlarda gelişip çoğalma imkanı bulabilirler.

Tablo 1: Adıyaman İli Arazi Kullanım oranları(2013)

Arazilerin Kullanım Türü	Alan (Ha)	%
Tarım Alanı	251.580	33
Çayır ve Mera	225.775	30
Orman ve Fundalık	177.701	23
Tarım Dışı Arazi	60.155	8.5
Su Yüzeyi	31.962	4
Turizm (Milli Park Alanı)	13.827	1.5
Toplam	761.000	100.00

Adıyaman ilinin arazi kullanma özelliklerine baktığımızda yaban hayatının gelişine uygun olduğunu görebilmekteyiz. İl dağlık, engebeli akarsularla yarılmış derin vadiler geniş alanlar kaplamaktadır.

Adıyaman ilinde 7'si memeli, 31'i kuş, 6'sı sürüngen ve 104'ü omurgasız olmak üzere toplam 148 hayvan türü tespit edilmiştir. Bu türlerin hepsi geniş yayılış alanına sahip olup endemik değillerdir. Böyle olmakla birlikte, yer şekillerinin ve iklimin getirdiği avantaj sayesinde araştırma sahası av hayvanları açısından zengin sayılabilecek bir potansiyele sahiptir. Özellikle ilin kuzey kesiminde yer alan Toros Dağları'nın uzantısında bulunan Şengil-Hisar Dağı, Bezar Dağı, Hallof (Yarlıca) Dağı, Akdağ, Zivar Dağı, Çetirge, Koru ve Ulubaba Dağı yaban keçisi avlanma alanları olarak önemli avlak alanlarıdır. Bu alanlar da avlanma kotaları da belirlenmiştir. Av turizmine uygun olan il de şu anda yaban keçisi ve melez yaban keçisi avı yapılmaktadır.

2. AV TURİZMİ

Prideaux göre; ''Dünya ülkelerinin birçoğunda yapılmış olan anketlerde, ortaya çıkan sonuç turizmin yeni gözdelerinin doğal, tarihi ve kültürel çekicilikler olduğu yönündedir. Deniz, güneş ve kum üçlüsüne bağlı olarak gelişen ve kitleleri etkileyen turizm olgusu, günümüzdeki turizm eğilimleri doğrultusunda, alternatif arayışlar içine yönelmişlerdir.

Av turizmi; turizmin değişik bir uygulama şekli olup avcı niteliğine sahip kişilerin avlanma amaçlarını gerçekleştirmek üzere belirlenmiş ilkelerle yaptıkları etkinliklerdir. Avcılar, av turizmi faaliyetleri ile yaban hayvanlarının boynuz, diş, post benzeri hatıra değeri taşıyan kısımlarına sahip olmakla birlikte, değişik kültürleri

tanıma ve değişik yerleri görme olanağı elde etmektedirler. Kırsal alanlarda yaşayan insanların sosyo-ekonomik ve kültürel açıdan yapısını değiştirecek biçimde gelir ve refah seviyesinin iyileştirilmesi, dengesizliklerin giderilmesi ve yörede üretilen ürünlerin değerlendirilmesi, av turizmi ile söz konusu olabilmektedir

Adıyaman coğrafi yapısı, iklimi, bitki örtüsü ve yaban hayatı yönünden av turizmine en uygun illerimizden birisidir. Son yıllarda yapılan düzenlemeler sonucu av turizminde büyük bir hareketlilik yaşanmaktadır. Her geçen yıl bilinçli koruma sayesinde yaban keçisi sayısında artışlar görülmektedir. Önümüzdeki yıllarda yaban keçisi popülasyonunda Adıyaman'ın önemli bir potansiyele ulaşacağı anlaşılmaktadır. Buna paralel olarak avlanabilecek dağ keçisi sayısında da artışlar olacaktır. Adıyaman'da 9 adet devlet avlak alanı bulunmaktadır. Yöre bu yönüyle yabancı avcılar açısından bir çekim merkezi niteliği taşımaktadır. Adıyaman'a başta ABD ve Alman vatandaşları olmak üzere Avusturyalı, Danimarkalı, Hollandalı, Meksikalı, Rus ve Fransız avcılar avlanmak üzere gelmektedir (Ukav, 2012:4-16).

Tablo 2: Adıyaman İli'nde Bulunan Devlet Avlak Alanları

Devlet Avlağı Adı	Hektar	Tescil Tarihi
Ulubaba-Bezar Devlet Avlağı	13.834	2012
Akdağ Devlet Avlağı	11.346	2010
Sincik Devlet Avlağı	36.231	2015
Tut Devlet Avlağı	31.671	2015
Kuzey Gerger Devlet Avlağı	30.364	2015
Harmanlı Devlet Avlağı	34.851	2015
Güney Besni Devlet Avlağı	28.402	2015
Gilisi Besni Devlet Avlağı	26.287	2015
Gerger Devlet Avlağı	29.847	2015

Kaynak: Orman ve Su İşleri Bakanlığı 15. Bölge Müd. Adıyaman Şube Müdürlüğü (2015)

Adıyaman'da her yıl düzenli olarak av turizmi kapsamında yerli ve yabancı avcılara 8 yaş ve üzeri erkek yaban keçisi avlattırılmaktadır. 2013-2014 av yılı, av turizmi kapsamında Adıyaman genelinde 3191 adet yaban keçisi bulunmakta olup, 27 adet yaban keçisi, 13 adet melez yaban keçisi ve 7 adet hatalı boynuz/şelek yaban keçisi olmak üzere toplam 47 adet yaban keçisi kotası tahsis edilmiştir. Tahsis edilen kotalar yabancı avcıya ihale yoluyla, yerli avcıya bakanlık tarafından tahsis yoluyla verilmiştir. İhale yoluyla yabancı avcıya verilen kotalardan 99.485 TL, yerli avcılardan ise 36.650 TL olmak üzere toplam 136.135 TL gelir elde edilmiştir (Adıyaman Doğa Turizm Master Planı, 2013-2023:126-127). Adıyaman'da yıllar itibariyle yaban keçisi envanter bilgilerine baktığımızda, av turizmi açısından yeterli sayıda yaban keçisinin bulunduğu görülmektedir (Tablo 36).

Tablo 3: Adıyaman İli'nde Yıllar İtibariyle Yaban Keçisi Envanter Bilgileri

Yılı	Yaban Keçisi	Melez	Toplam
2012-2013	2785	232	3017
2013-2014	2913	277	3191
2014-2015	3023	250	3273
2015-2016	3115	285	2800

3. SONUÇ

Toplam alanının %63 çayır mera, orman, fundalık milli park vb. sahalardan oluşan Adıyaman ili doğal hayat bakımından yabani keçilerin gelişimine uygundur. Özellikle güneydoğu Torosların kireç taşından oluşmasıyla meydana gelen erimler sonucu oluşan mağaralarda hayvanların korunma imkanları ortaya çıkmıştır. Yine sözü edilen alandaki çalılıklar dışarıdan gelebilecek tehlikelere karşı korunma imkanı sağlamıştır.

Yıllar itibariyle keçi sayısındaki artışların olması dikkat çekicidir. Bu artışlar sözü edilen alanların korunmasıyla doğru orantılıdır. Adıyaman'da turizm faaliyetleri nisan ve ekim ayları arasında gerçekleşmektedir. Av turizminin ise ağustos-mart ayları arasında yapılması turizmin sezonluk özelliğinin getirmiş olduğu bazı olumsuzlukları ortadan kaldırmasına yardımcı olacaktır.

Ayrıca, av turizmine katılan turistler harcama eğilimi yüksek olan kişilerdir ve alışverişlerde yüksek oranlarda harcama yapabilmektedirler. Araştırma sahasındaki yerleşim birimlerinde turistlere hitap eden köy konakları yapıldığı takdirde, avcıların hizmetine sunularak konaklama ücreti ile birlikte, üretilen ürünler ve köylü kadınların yaptıkları yemekler yöre için önemli gelir kaynağı oluşturabilecektir.

Sözü edilen alana yakın köy ve mahallerde yaşayan ve bilinçsize avlanan insanların eğitimle bilinçlendirilmesi, avlanma sezonuna ve yasaklara uymayanların caydırıcı cezalarla cezalandırılmasıyla buradaki yabani keçi hayatı daha da geliştirilebilir. Özellikle kaçak avlanan avcılar anaçların hamile olduğu dönemde yaptıkları avlarla buradaki yaban hayatına zarar vermektedirler. Ayrıca bu turizm şekli diğer turizm faaliyetlerinden bağımsız olmadığından bu sahaya gelecek insan sayısının çoğalmasına etki ederek ülkemize daha fazla girdi sağlayacaktır

Yabani hayvan avcılık türü olan teke avcılığı bir tek insanla yapılmayıp grupça yapılan bir faaliyettir. Ayrıca yüksek dağlık alanlara günübirlik gidilip gelinemediğinden bazı ekipmanlara da ihtiyaç vardır. Ayrıca sağlıklı tırmana bilen insanların yapabileceği bir faaliyettir.

Üniversitelerde üniversitenin büyüklüğüne göre diğer atık türlerinin yanında ciddi miktarlarda kâğıt, karton, plastik, cam ve metal gibi geri dönüştürülebilir atıklar üretilmektedir. Bu atık türleri hem yürürlükteki mevzuat hükümleri gereğince hem düzenli depo sahasına gidecek olan atık miktarının azaltılması için hem de geri dönüştürülebilmelerinden dolayı doğal kaynakların korunması ve ekonomik sebeplerden dolayı diğer atıklardan ayrı olarak biriktirilmesi ve toplanması gereken atık türleridir. Bu atıkların kaynağında etkin ve ayrı olarak biriktirilmesi ve toplanması için de bir yönetim sistemine/stratejisine/planına ihtiyaç duyulmaktadır. Bu çalışmada, Adıyaman Üniversitesinde kurulmuş olan geri dönüştürülebilir atık yönetim sistemi incelenmiş, sistemin işletilmesi esnasında karşılaşılan sorunlar tespit edilmeye çalışılmış ve sonuçta sistemin iyileştirilmesine yönelik olarak önerilerde bulunulmuştur.

AĞIZ ÇALIŞMALARINDA ARAŞTIRMACI VE KAYNAK KİŞİ İLE İLGİLİ SORUNLAR

Gönül ERDEM NAS

Bartın Üniversitesi, Dilbilim Bölümü, Bartın-Türkiye

gerdem@bartin.edu.tr

Özet: Türkiye Türkçesi ağız çalışmaları son yıllara kadar yaşadığı yavaş ilerlemeyi araştırıcıların yoğun merakı sayesinde hızlandırarak oldukça geliştirmiştir. Bu alanda birçok çalışma yapılmış ve yapılmaya da devam etmektedir. Bununla birlikte istenilen düzeye ulaşıldığı pek söylenilemez. Bilindiği üzere ağız çalışmaları dilin saha çalışmasının birkaç basamakta şekillenmiş halini oluşturmaktadır. Belli bir Türkoloji bilgisine sahip araştırmacı (derleyici) belirlediği sahada ağız özelliklerinin daha çok korunduğu yörelere giderek daha çok eğitim görmemiş, yöresinden ayrılmamış bireylerle düzenlediği mülakatları ses kayıt cihazı yardımıyla kayıt altına alarak bu kayıtları transkibe etmektedir. Böylelikle yöreye ait ses, şekil ve söz dizim özellikleriyle ilgili bilgi sahibi olmak amaçlanmaktadır. Temelde yapılan bu uygulama, içerisinde özellikle araştırıcı ve kaynak kişi bakımından sorunlar da taşıyabilmektedir. Bu sorunlar kısaca araştırıcının cinsiyeti, Türkoloji bilgisi, ağız çalışması yapacağı yöreye hâkimiyeti gibi başlıklarda toplanabilirken benzer sorunlar derleme yapılacak kaynak kişiler için de geçerlilik göstermektedir. Kaynak kişinin cinsiyeti, eğitim durumu, akıl ve beden sağlığı, konuşma bozukluğunun olup olmayışı, yörede yaşama süresi (Yöreden ayrılmaması) gibi başlıklar da kaynak kişi ile ilgili sorunları yansıtabilmektedir. Tüm bu sorunlar bir araya geldiğinde istenilen çalışmanın amaçlanan düzeylere ulaşamaması ise en büyük sorundur. Bu çalışmada karşılaşılan bu sorunlara uygulama esnasında ve sonrasında üretilmeye çalışılan çözümler ele alınmaya çalışılmıştır. Çalışmanın var olan ve yapılacak benzer ağız çalışmalarında araştırmacılara fikirler sunacağı düşünülmektedir.

Anahtar Kelimeler: Ağız, derleme, kaynak kişi.

Ağız terimi ile ilgili birçok tanım bulunmaktadır. Bunlardan kısaca söz edilecek olunursa "*Bir dilin veya bir lehçenin yazı diline oranla ve çoğunlukla ses, bazen de şekil, anlam ve söz varlığı bakımından birbirinden az çok ayrılan konuşma biçimleri*." (Korkmaz, 2003, s. 4) olarak ifade edilebilir. Bununla birlikte dil coğrafyası incelemeleri çerçevesinde kullanılabilecek bir terim olarak *ağız,* aynı kökenden geldiği üst sistem durum undaki bir standart dile bağlı, doğal olarak ortaya çıkmış; aile ve dost çevresinde, iş yerlerinde; okuryazarlığı az, bulunduğu bölgeden uzun süre ayrı kalmamış insanlarca sözlü iletişimde dilin başka türleriyle karşı karşıya gelme oranına göre değişen biçimde kullanılan, resmi ortamlarda kullanılmasından kaçınılan, azılı bir gelenek oluşturamamış, iletişim alanı sınırlı, bağlı olduğu üst sistemden dilin her alanında karşılıklı anlaşmanın korunacağı oranda ayrılabilen, prestiji standart dile göre daha az yerel konuşma biçimleridir. Sınıflandırmaya esas alınacak ölçütlere göre ağızların sınırları genişleyip daralabilir. Bir ağız, birden fazla alt ağzı içerisinde barındırabilir. Bu yüzden *geniş bölge ağızları* ve *dar bölge ağızlarından* söz edilebilir. Daha prestijli görülen bir konuşma biçimi yaygın değil ise, standart varyantın beklendiği durumlarda da kullanılabilirler (Demir, 2002, s.105-116). Aynı dili konuşan bir milletin farklı coğrafyalara yerleşmiş farklı boyları, eskiden kalma söyleyiş şekillerini de beraberlerinde getirirler. Ağızlar üzerindeki çalışmalar, hem bu ses, şekil ve anlamların tespitinde hem de bunlardaki değişimlerin boyalara göre seyrinin gözlemlenmesinde önem arz eder. Bu tespitlerin tarih, coğrafya, toplumbilim gibi diğer disiplinlerdeki bilgilerle birleştirilerek, teyit edilmiş bilgilere dönüşmesi ve toplumsal, kültürel değişmelerin izahında "dayanaklara sahip bilgi olarak" kayıt altına alınması sağlanabilmektedir (Öçalan, 2006, s. 169-188).

Ağız çalışmaları bir dilin çalışması en zor alanlarından biridir. Bu zorluk temelde çalışan kişinin konuya hâkimiyeti ile başlayıp sahaya yabancı olmayışı, bulacağı kaynak kişilerin özellikleri, konuşmaların kayıt altına alındıktan sonra doğru bir şekilde transkiribe edilerek yazıya geçirilmesi olarak devam etmektedir. Bu alanda uzun yıllardır çalışma yapan araştırıcılara göre de bunlar bazı başlıklar altında toplanmıştır. En başta adlandırmanın Anadolu ve Rumeli Ağızları olarak kullanılmasının sakıncasını belirten adlandırmadaki *terim*

 Copyright © International Science and Technology Conference (ISTEC)

sorunu, çok geniş bir coğrafi alanda konuşulan Türkçenin ağız derlemelerinin yapılması sürecindeki *derleme bölgelerinin tespiti sorunu*, içerisinde üç başlık bulunan (1. Derleyici, 2. Kaynak kişi, 3. Malzeme) *derleme ile ilgili sorunlar*, temeli ses bilgisine dayanan ve yapılan çalışmanın doğru, bilinçli bir şekilde *işaretlendirilme sorunu*, derlenen dil malzemesinin başka başka gramerlerle incelenmesinden kaynaklanan bu sebeple de ortak bir gramerin zorunluluğunu gösteren *inceleme yöntemi sorunu*, birçok boy ve etnik yapının oluşturduğu ağız özelliklerinin incelenmesinde karşılaşılan *ağız-etnik yapı ilişkisi sorunu*, bu alanda toplanılan bilgi ve belgelerin düzenlenmesinden kaynaklanan *bilgi ve belge yönetimi sorunları* alandaki başlıca sorunlardır denilebilir (Akar, 2006, s. 43-51).

Söz konusu sorunlara birçok araştırıcının önerileri birbirine benzer nitelikler taşımaktadır. Genel anlamda derleyicinin öncelikle yeterli Türkoloji bilgisine sahip olması ardından mutlaka yaşadığı yeri çalışma sahası olarak belirlemesidir. Bu çalışma sahası mutlaka derleyicinin yabancısı olmadığı bir saha olmalı, konuşulan ağzı derlerken ve çözümlerken oluşabilecek dinleme hatalarının önüne böylelikle geçilmelidir. Derleyici sahaya çıkarken birçok yöntem belirleyebilir. Bununla birlikte sahada en fazla işe yarayan yöntem ise kaynak kişilere ulaşırken kullanılan aracı kimseler olduğu gerçeğidir. Geleneksel yapının çok sıkı korunduğu kırsal yörelerde yaşayan bireyler, yabancı kimselere konuşmaktan çekinmekte mutlaka arada tanıdık bir kimse olmasını tercih etmektedirler. Bireylerle bu yoldan kurulan bağda derleyicinin cinsiyeti de çok önem taşımaktadır. Derleyicin kadın olması saha çalışmasında kaynak kişilerin temelini oluşturan eğitimsiz yaşlı kadınlar için çok önemli bir özelliktir.

Görüşmeler diğer seslerin birbirine karışmayacağı bir ortamda rahat bir soru tekniği ile yapılmalıdır. Çalışmayı derleyicinin doktora tezi olan Anamur ve yöresi ağızlarını derlerken karşılaştığı temel sorunlar oluşturmaktadır. Uzun yıllardır yaşanılan bu coğrafyada sahaya çıkıldığında birkaç köye aracı kimse olmaksızın gidilmiş bu sebeple kaynak kişileri bulmadan, kişilerle görüşmeye kadar birçok sorunla karşılaşıldığı görülmüştür. Bu sorunlardan karşımıza engel olmayan tek sorun ise derleyicinin cinsiyetidir. Birçok çalışmada da belirtildiği gibi derleyicinin cinsiyeti oldukça önemlidir. Kaynak kişilerin çoğunluğu eğitimsiz yaşlı kadın bireylerden oluşmaktadır. Derleyicinin kadın olması kaynak kişilerce olumlu karşılanarak görüşmeler çekinilmeden yapılabilmiştir. Kaynak kişilerin erkek olduğu durumlarda bu durum sorun olmazken derleyicinin yanında olan yabancı erkek varlığından bile rahatsız olan kadın görüşmeciler ancak ve tek şartla derleyici ile yalnız görüşmeyi kabul etmişlerdir. Kartopu yöntemiyle belirlenen kaynak kişiler öncelikle derleyicinin kim olduğu ile ciddi anlamda ilgilenmektedirler. Bu sebeple ilk kaynak kişiye ulaşmada mutlaka derleyicinin kaynak kişinin akrabasıyla veya onu tanıyan biriyle gitmesi gerekmektedir. Köydeki ilk kaynak kişiden sağlanan güvenle diğer kaynak kişiler ilk kaynak kişice önerilerek yönlendirilmekte böylelikle diğer kaynak kişiler de derleyiciye güvenerek her soruya oldukça rahat cevap vermektedir.

Derleyicinin bu aşamada karşılaştığı diğer bir sorun ise eğer o yörenin insanı değilse o ağızdan konuşamamasıdır. Standart Türkiye Türkçesi (İstanbul ağzı) ile konuşmak zorunda kalan derleyici ile iletişime geçemeyeceğini düşünen kaynak kişi kendini zorlayarak Standart Türkiye Türkçesi ile konuşma çabası içerisine girebilmektedir. Bu durum, her yönüyle başarılı bir derlemeyi etkileyen bir durumdur. Bu durumun önüne iki aşamada geçilebilmektedir. İlki mutlaka kaynak kişinin derleyici ile birlikte gelen tanıdığı ile derleyiciden önce görüşmesidir. Sonra kısa sorularla kaynak kişinin daha çok konuşması sağlanmalıdır böylelikle kısa cevaplarla derleyicinin kendisini anladığı gören kaynak kişi rahatlayarak Standart Türkiye Türkçesi konuşma çabasından vazgeçmektedir.

Buraya kadar derleyicinin sahada karşılaşabileceği sorunlardan bahsedilmiştir. Derleyicinin karşılaşacağı diğer bir sorun ise kayıtların metin haline getirilmesi sürecidir. Bunun için derleyicinin bu ses kayıtlarını mümkünse teknolojiyi kullanarak metin haline getirmesi ve transkribe etmesi önerilebilir. Bunu yapabilmesi için teknolojinin el verdiği en iyi ses kayıt cihazlarını kullanması daha sonrasında yapılacak dinlemelerdeki pürüzlerin de önüne geçebilmektedir. Derleyicinin fonetik laboratuarında kayıtları incelemesi ona büyük kolaylık sağlayabileceği gibi kayıtların en az hatayla transkribe edilmesine de olanak sağlayacaktır. Eğer derleyicinin laboratuara ulaşımı mümkün değilse bilgisayar ortamında bu konudaki ses programları kullanılarak ses kayıtları incelenmelidir (nero, cool edit pro gibi).

Derleme sürecinde diğer bir sorun ise kaynak kişidir. Genel veriler ışığında kaynak kişilerin ileri yaşlı, akıl sağlığı ve konuşma becerisi yerinde olan, çoğunlukla kadın, yaşadığı yerden çıkmamış, eğitimsiz bireyler olması tercih edilmektedir. Yalnız sahaya çıkıldığında bu şartları taşıyan bireyleri bulmak oldukça zor olabilmektedir. Bu sebeple derleyici birçok görüşme yapmak zorunda kalabilmekte çalışma için uzun bir sürede dinleyerek elemeleri yapabilmektedir. Kaynak kişilere tüm bu şartlarla ulaşıldığında bile genelde karşılaşılan sorun kişinin yaşlılığa bağlı unutkanlık ve bu sebeple bitirilmemiş birçok anlamsız cümle kurmasıdır. Bu soruna da çözüm genelde yine kaynak kişi ile derleyici buluşturan aracı bireydir. Derleyici kaynak kişide olması gereken

 Copyright © International Science and Technology Conference (ISTEC)

özellikleri –kaynak kişinin yaşlı olması, akıl sağlığının yerinde olması, ağzında konuşmasını engellemeyecek şekilde dişsizlik gibi bir sorunun olmaması vb.- aracı olan bu kişilere söylemelidir. Yöreye hâkim olan bu kişi ya da kişiler söz konusu kaynak kişileri bu bilgiler ışığında daha rahat bulabilmektedir. Kaynak kişinin derleyiciye güvenmesi de önemli bir sorundur. Derleyicinin kadın olması bu sorunu büyük ölçüde ortadan kaldırabilmektedir.

Sonuç olarak Türkiye Türkçesi Ağızları incelemesinde alanında yeterli bilgiye sahip, insan ilişkileri iyi, yaşadığı yöreyi bilen o yörenin ağız özelliklerine hâkim ve özelikle kadın araştırmacıların eksikliği giderilmelidir. Daha sonra derlenen bu çalışmalar titizlikle incelenmeli, bu anlamda Türk Dil Kurumu'nda bir komisyon oluşturulmalıdır. Oluşturulan bu komisyon tarafından uygun görülen nitelikli çalışmalardan elde edilen verilerle Türkiye Türkçesi Ağızları atlası oluşturulmalıdır.

ÖZET

Modern Türkiye'nin kuruluşundan bu yana toplumsal ve kurumsal bazda önemli sorunlu alanlarından biri akademik çevreler olmuştur. Akademik faaliyetlerin (master & doktora) uzun süreli ve yorucu bir uğraş olduğu söylenebilir. Akademik hayatla sosyal hayatın birbirinin tamamlayıcısı olduğu ve her hangi birinin ihmal edilmemesinin mutlu olmanın önemli bir şartı olduğu göz önüne bulundurulduğunda, birini diğeri üzerine olumlu ya da olumsuz etkileri önemli bir araştırma konusu olarak ortaya çıkmaktadır. Bu çalışmada, Kocaeli üniversitesinde görev yapan 94 öğretim üyesinin master ve doktora eğitimleri döneminde yaşadıkları sorunların, görüşlerinden faydalanılarak belirlenmesi hedeflenmektedir. Öğretim üyesi görüşlerine göre, ertelenmiş evlilikler ve ekonomik yetersizlikler akademik hayatın sosyal hayat üzerindeki en önemli olumsuz etkileridir.

Anahtar Kelimeler: akademik kariyer, öğretim üyesi, sosyal hayat

GİRİŞ

Gerek akademik hayatta gerekse serbest piyasa çalışma alanında, kariyer yapmak, çalışma hayatının temel kavramlarından biri haline gelmiştir. Meslek tercihlerinde belirleyici olan temel unsurlardan bir tanesi de kariyer olanaklarıdır. Akademik kariyer, üniversitelerdeki öğretim elemanlarının akademik unvanlardan (Dr. & Yrd. doç. dr. & Doç. Dr. & Prof. Dr.) her hangi birisine sahip olması olarak ifade edilebilir. Akademik kariyer süreci ise akademik hayatın başlangıç düzeyinden en üst düzey akademik dereceye kadar olan "yükseltme ve atamalar" ı ifade etmektedir. Üniversite ve akademik camiadaki tartışmalar yoğunluk olarak yükseltme ve atama kriterleri üzerinde yapılmaktadır. Lisansüstü eğitim ise yükselme ve atama sürecinin yüksek lisans ve doktora eğitim ve araştırmalarını ifade eder. Bu fonksiyonuyla yüksek lisans ve doktora araştırmaları, toplumsal, ekonomik, siyasal, kültürel, bilimsel ve teknolojik gelişmelerde belirleyici etkiye sahiptir (İnandı, Tunç, & Uslu, 2013).

Bütün bilim alanlarındaki akademisyenlerin, çalışma alanı ne olursa olsun, özgür bilim insanı, en yeni ve orijinal bilgilere ulaşma veya üretme ayrıca bunları insanlığın hizmetine sunma sorumluluğu vardır. Bununla birlikte, her sektörde olduğu gibi akademik hayat veya lisansüstü eğitim sürecinin kendine has sorunları vardır. Akademisyenlerin zaman zaman mesleki yorgunluk ya da mesleki tükenmişlik boyutlarına varan sosyolojik sorunları olabilmektedir. Akademik doyumsuzluk olarak ta ifade edilen bu sorunlar, kişileri ruhsal ve duygusal anlamda olumsuz etkilediğinden bu durumdan kendileri, aileleri dolayısıyla akademik çalışmalarda ki verimliliği de olumsuz etkilenmektedir. Bu olumsuzluk bedensel, ruhsal ve sosyal yapıya zarar vererek, bireyde işten uzaklaşma, isteksizlik ve geleceğe ilişkin umutsuz olma düşüncelerine kapılma gibi doyumsuzluk belirtilerine sebep olmaktadır.

Öğretim üyelerinin, öğrencilerle aktif iletişim içinde olduklarından ve alanlarıyla ilgili dünyadaki gelişmelerin yakından ve sürekli takip etmeleri gerektiğinden ve aynı zamanda akademik kariyerlerini zaman kaybına

 Copyright © International Science and Technology Conference (ISTEC)

uğramadan ileri düzeylere taşımaları gerektiğinden sürekli stresli ve gergin bir yaşam tarzları olduğu söylenebilir. Bu yoğunluk ve hedeflerde sapmalar ileri düzeylerde yaşandığında tükenmişlik yaşanmasına sebep olmaktadır. Ülkemizdeki üniversitelerde öğretim elemanı başına düşen öğrenci sayısını fazlalığı ve birçok bölümde sınıfların aşırı kalabalık oluşuna bağlı olarak hoca öğrenci arasında verimli iletişimin olamayışı da olumsuz faktörler olarak değerlendirilebilir. Bu çalışmada, öğretim elemanlarının akademik kariyer yaptıkları dönemler de dâhil olmak üzere mesleki hayatları hakkındaki görüşlerini belirlemektir.

YÖNTEM

Bu çalışmada veriler tarama modeli kullanılarak toplanmıştır. Tarama modelinde, bir durumu ya da bir olayı aynen olduğu biçimde üzerinde her hangi bir değişiklik yapmadan betimlemeyi amaçlayan bir araştırma modelidir. (Karasar, 2005). Araştırmanın evreni Kocaeli üniversitesinde öğretim üyesi olarak çalışan öğretim üyeleri oluşturmaktadır. Veriler, Dilci ve Gürol (2012), tarafından geliştirilen veri toplama ölçeği kullanılarak toplanmıştır. Dilci ve Gürol, ölçeğin geçerlilik analizi için uzman görüşlerine başvurmuşlar, güvenirlik analizi için ise Cronbach Alpha testi uygulanmış ve güvenirlik katsayısını 0,79 olarak belirlemişlerdir. Verilerin analizinde SPSS programı kullanılarak betimsel istatistikler yapılmıştır.

Çalışmada öğretim üyelerinin görüşlerinin belirlenmesi genel amacı çerçevesinde aşağıdaki sorulara cevap aranmıştır;

- Öğretim üyelerinin unvanlara göre medeni durumları nasıldır?
- Öğretim üyelerinin cinsiyet değişkenine göre medeni durumları nasıldır?
- Öğretim Üyelerinin Lisansüstü Eğitimin Hayata Getirilerine İlişkin Görüşleri nelerdir?
- Öğretim Üyelerinin lisansüstü eğitimden psikolojik sağlıkları etkilenmiş midir?

BULGULAR

- **Öğretim Üyelerinin Unvan ve Medeni Durumlarının Karşılaştırılması**

Öğretim üyelerinin verdikleri yanıtlar, "öğretim üyelerinin unvan ve medeni durumları arasındaki ilişki nedir?" araştırma sorusuna göre sınıflandırıldığında, elde edilen bulgular Tablo 1' de sınıflandırılmıştır.

	Yrd. Doç.		Doçent		Prof		Toplam	
	f	%	f	%	f	%	f	%
Bekâr	7	7,4	3	3,1	1	1,0	11	11,7
Evli	32	34,0	30	31,9	21	22,3	83	88,3
Öğretmen ile Evli	8	8,5	3	3,1	5	5,3	16	17,0
Akademisyen ile Evli	5	5,3	9	9,5	7	7,4	21	22,3
Sağlık çalışanı ile Evli	4	4,2	2	2,1	2	2,1	8	8,5
Memur ile Evli	11	11,7	7	7,4	8	8,5	26	27,6
Diğer ile Evli	4	4,2	5	5,3	3	3,1	12	12,7

Tablo 1. Öğretim Üyelerinin Unvan ve Medeni Durumuna İlişkin Verilerin Dağılımı

Copyright © International Science and Technology Conference (ISTEC)

Tablo 1'e göre, araştırmaya katılan öğretim üyelerinin %11,7' sinin bekâr, %88,3' nünde ise evli olduğu görülmektedir. %22,3 oranla, evli öğretim üyelerinin daha çok akademisyenle evlenmeyi tercih ettikleri görülmektedir. Bekâr öğretim üyeleri içerisinde %7,4' lük oranla en yüksek orana sahip oldukları görülmektedir. Bu tabloda öğretim üyelerinin kendi meslek grubundan insanlarla evlenmeyi tercih ettikleri söylenebilir.

- **Öğretim Üyelerinin Cinsiyete Göre Medeni Durumları**

Öğretim üyelerinin verdikleri yanıtlar, "öğretim üyelerinin cinsiyet ve medeni durumları arasındaki ilişki nedir?" araştırma sorusuna göre sınıflandırıldığında, elde edilen bulgular Tablo 2' de sınıflandırılmıştır.

Medeni Durum		**Bekâr**		**Öğretmen ile evli**		**Akademisyen ile evli**		**Sağlıkçı ile evli**		**Memur ile evli**		**Diğer ile evli**		**Toplam**	
		f	%	f	%	f	%	f	%	f	%	f	%	f	%
Cinsiyet	**Kadın**	6	6,3	6	6,3	9	9,5	3	3,1	10	10,6	7	7,4	41	43,7
	Erkek	**5**	5,3	10	10,6	12	12,7	5	5,3	16	17,0	5	5,3	53	56,3
Toplam		11	11,7	16	17,0	21	22,3	8	8,5	26	27,6	12	12,7	94	100

Tablo 2. Öğretim Üyelerinin cinsiyet ve Medeni Durumuna İlişkin Verilerin Dağılımı

Araştırmaya katılan öğretim üyelerinin 41 tanesinin (%43,7) kadın, 53 tanesinin ise erke (%56,3) olduğu Tablo 2' den anlaşılmaktadır. Bekâr kadınların örneklem içindeki oranı %6,3 ve evli kadınların örneklem içindeki oranının ise %37,4 olduğu görülmektedir. Bekâr erkelerin örneklem içindeki oranı %5,3 ve evli erkeklerin örneklem içindeki oranının ise %51 olduğu görülmektedir. Genel olarak kadın ve erkek öğretim üyelerinin cinsiyete bağlı medeni durumlarının bir birine yakın olduğu söylenebilir.

- **Öğretim Üyelerinin Lisansüstü Eğitimin Hayata Getirilerine İlişkin Görüşleri**

"Lisansüstü eğitimin hayata getirisi nedir?" sorusuyla bağlantılı öğretim üyesi görüşleri gruplandırıldığında, ortaya çıkan durum Tablo 3'te görülmektedir.

Lisansüstü Eğitimin Hayatınıza Getirileri nedir?	**Yrd. Doç.**		**Doçent**		**Prof**		**Toplam**	
	f	%	f	%	f	%	f	%
Kariyerimde yükselme sağladı	39	100	33	100	22	100	94	100
Maddi kazancım arttı	8	20,5	21	63,6	20	90,9	49	52,1
Sosyal yönüm gelişti	12	30,7	10	30,3	13	59,0	35	37,2
Aile yaşamım renklendi	5	12,8	6	18,1	12	54,5	23	24,4
Yaşam doyumum arttı	17	43,5	20	60,6	19	86,3	56	59,5
Toplam	80	100	90	100	84	100		100

Tablo 3. Öğretim Üyelerinin Lisansüstü Eğitimin Hayata Getirilerine İlişkin Görüşleri

 Copyright © International Science and Technology Conference (ISTEC)

Yukarıdaki tablo incelendiğinde, Öğretim üyelerinin tamamı (%100), lisansüstü eğitimin kendilerine akademik kariyer sağladığını ifade ettikleri görülmektedir. Lisansüstü eğitimin yardımcı doçentler için pek kazan sağlamadığı, daha çok profesörlük unvanında maddi getirisi olduğu düşünülmektedir. Lisansüstü eğitim –yaşam doyumu ilişkisine bakıldığında ise tatmin edici doyumu yine profesörlerin yaşadığı anlaşılmaktadır. Bununla birlikte lisansüstü eğitimin gerek sosyal yönü geliştirmesi gerekse aile yaşamını renklendirmesi konularında akademisyenlerin olumlu düşünmedikleri söylenebilir.

- **Öğretim Üyelerinin "Lisansüstü Eğitim Psikolojik Sağlığınızı Olumsuz Etkiledi mi?" Sorusuna İlişkin Görüşleri**

Öğretim üyelerinin verdikleri yanıtlar, **"Lisansüstü Eğitim Psikolojik Sağlığınızı Olumsuz Etkiledi mi?"** araştırma sorusuna göre sınıflandırıldığında, elde edilen bulgular Tablo 4' de sınıflandırılmıştır.

Lisansüstü Eğitim Psikolojik Sağlığınızı Olumsuz Etkiledi mi?	**Yrd. Doç.**		**Doçent**		**Prof**		**Toplam**	
	f	%	f	%	f	%	f	%
Hayır	28	71,7	22	66,6	16	72,7	66	70,2
Tedavi gördüm	0	0	1	3,0	0	0	1	1,0
Psikolojim bozuldu	1	2,5	2	6,0	1	4,5	4	4,2
Sosyal ilişkilerim zedelendi	5	12,8	3	9,0	2	9,0	10	10,6
Aile yaşamımım zedelendi	4	10,2	5	15,1	2	9,0	11	11,7
Diğer	1	2,5	0	0	1	4,5	2	2,1
Toplam	39	100	33	100	22	100	94	100

Tablo 4. Öğretim Üyelerinin "Lisansüstü Eğitim Psikolojik Sağlığınızı Olumsuz Etkiledi mi?" Sorusuna İlişkin Görüşleri

Tablo 4 incelendiğinde, öğretim üyelerinin yarıdan biraz fazlasının lisansüstü çalışmalardan psikolojik olarak olumsuz etkilenmediği görülmektedir. Lisansüstü faaliyetlerin psikolojiye olumsuz etkileri daha çok sosyal ilişkileri zedeleme veya aile yaşamını olumsuz etkileme şeklinde ortaya çıktığı anlaşılmaktadır. Akademik kariyerin, tedavi gerektirecek düzeyde veya psikolojiyi bozacak düzeyde olumsuz etkisi yok denecek kadar az olduğu görülmektedir.

SONUÇ VE ÖNERİLER

Akademik hayatın sosyal hayat üzerindeki etkilerinin araştırıldığı bu çalışmada temel olarak elde edilen sonuçlar; Akademisyenler daha çok ya akademisyenle ya da farklı bir eğitimci grubu olan öğretmenlerle evlenmeyi tercih ediyorlar. Akademisyenlerin cinsiyet dağılımında kadın ile erkek arasında belirgin bir farklılık olmadığı söylenebilir. Örneklem seçiminde kadın ve erkek öğretim elemanları homojenlik anlamında her iki gruptan eşit oranda seçilmiştir. Bu durum Türkiye geneli düşünüldüğünde erkek öğretim üyelerinin sayısının kadınlardan daha fazla olduğu bilinmektedir. Lisansüstü eğitimin en önemli getirisinin akademik kariyer olduğu çok net bir şekilde söylenebilir. Öğretim üyeleri lisansüstü eğitimleri süresince aile yaşamlarının olumsuz etkilenmesini ve sosyal ilişkilerinin zayıflamasını sorun olarak gördükleri sonucuna varılmıştır.

 Copyright © International Science and Technology Conference (ISTEC)

Lisansüstü eğitimin akademik kariyer dışında daha cazip hale gelmesi için neler yapılabilir sorusu üzerine çalışılmalıdır. Özellikle maddi anlamda daha iyi bir düzeye gelme akademisyenliği daha cazip hale getirebilir. Uzun süren master ve doktora çalışmaları sosyal ilişkileri azalttığından bu süreç içerisinde olanlar evlenmeyi genellikle ertelemektedirler. Uzun sayılabilecek bu süreç akademik hayatı tercih edenlerin genelde geç sayılabilecek bir yaşa evlenmelerine sebep olmaktadır. Bu durum bu işin doğası olarak değerlendirilmelidir.

ALİYA İZZET BEGOVİÇ'İN EĞİTİM ANLAYILIŞI ÜZERİNE DEĞERLENDİRMELER

Asım Yapıcı
asimyapıcı@cu.edu.tr
Mehmet Özcan
ozcmehmet@gazi.edu.tr

Özet: İnsan ,ahlak ve hayat bağlamında ortaya konulan medeniyet anlayışı nihai olarak ifadesini bütünlüklü bir eğitim anlayışında bulur. Eğitim modern dünyada teknik endüstriyel toplumun ihtiyaçlarını karşılayan fonksiyonel bir alan olarak görülmez. Eğitim insana özgürlüğe giden yolun ipuçlarını farkettiren bir metodolojik alan olarak ortaya konulur.

Anahtar Kelimeler: Aliya İzzet Begoviç,Medeniyet,İslam ve Eğitim

Giriş

Begoviç tarihsel ve toplumsal sorunlara bütüncül bir bakış açısıyla ele alarak eğitim konusunuda bu be zeminde kavramaya çalışır. Genel teorik perspektif içerisinde eğitim bu temel felsefi temel üzerinde ele alınır. Begoviç'in genel felsefi değerlendirmesinde eğitim;insan,ahlak ve hayat kavramları bağlamında bir karşılık bulur.

1.Begoviç'in İnsan ve Ahlak Anlayışı

Begoviç'in düşünce dünyasında medeniyet anlayışının temelinde belirli bir insan anlayışı yatar. Ne insanı akıllı hayvan ne de ekonomik insan düşüncesinden uzakta bir değerlendirme zemininde bu insan anlayışı ortaya konulur. Düşünce tarihi bağlamında birçok düşünce tasavvuru bu anlamda insanı anlamakta yetersiz kalmıştır. Bu insan anlayışı ontolojik bağlanış ve varoluşsal bir düzlemdedir. İnsan irade sahibi ve özgürlüğün ikametgahıdır. Ahlak bu özgürlük zeminin de ontolojik bağlanış ve ilahi olanın bir ifadesidir. İnsan dinin dışında anlaşılamaz.Sanat belki bu mevziye yaklaşabilir. Sanat ve din bu bağlamda ortak bir dilin dünyasına mahsus alanlardır. Dini düşünce insanın ve ahlakın ontolojik değeri konusunda temel yaklaşımların adresidir. Begoviç'in düşünce dünyasında "semadaki prolog" kavramı merkezi bir tutar (Begoviç:2012,25). Bu kavram din ve insanın ontolojik kökeni ve bunun anlamı arasındaki temel bağı ortaya koyar. Din insanın nihai anlamına ilişkin temel referanstır. İnsanın dünya tarihi bu arkapılana ilişkin bir mücadele alanıdır. Ahlak teorisi bu bu mücadele dizlemininde iyi ve kötünün karşılaşmasında semadaki prologun sürecidir. İnsan iyi ve kötü karşılaşmasında semadaki prolog ile düşüş arasında kendi varoluşsal geriliminde özgürlük ve köleliğin alanıdır. İnsan ve ahlak bu düzlemde bir hayat kavrayışı içerisinde ele alınır. Hayat insanın ontolojik kökeniyle bağ kurmasıyla bir özgürlük iadeli ortaya koyabilir. Hayat, modernist düşüncenin öne çıkardığı iktisadi içerik olan ne ekonomik refah ne hazcı geleneğin anlam dünyasında çerçevesinde ele alınmaz. Hayat ontolojik kökene yani semadaki prolog ile bağ kurmak olarak değerlendirilir. Bunun dışındaki hayat telakkileri özgürlüğün reddidir.

2.Eğitim Anlayışı ve Eğitim Konusundaki Eleştirileri

Müslüman toplumların son yüzyılda yaşadıkları çöküşü ve bundan kurtulmamalarının temel sebebi olarak eğitimi gösterir. Bu eğitim kurumsal olarak mevcur sorunlara cevap vermekten uzaktır (Begoviç:2014,27). Mevcut eğitim anlayışı bireylerin İslam anlayışlarının doğru bir biçimde oluşmasını engelleyen bir dinamik ortaya koyarak, müslüman toplumların gelişmesi ve temel varoluş sorunlarını kavramaları ertelenmiş olur. Burada dinin temel ontolojik ve ahlaki değerlerinin anlaşılmasının sistematik bir çarpıtılması olarak sonuçlar ortaya konulması ele alınır. Burada itaat kavramına yüklenilen anlam bunladan bir tanesidir. Kötü tarühsel durumun meşrulaştırılması bile bu anlayış üzerinden bir karşılık bulduğu dile getirilir. Bu yanlış eğitim toplumun ve bireyin öz varoluş sorunlarını kavramalarını da çarpıtarak kötülüğün eğemenliğini kurumsallaştırır. Eğitim kişiye ve topluma özgürlük ve kendi olmayı hedef olarak vermelidir. Özgürlük kendi olmak ve kendini bilmektir. Mevcut eğitim sistemleri kendinden uzaklaşma ve kendi tarihsel ve toplumsal meselelerinini kavramaktan da acizdir. İslam toplumlarının temel sorununu bu bağlamda eğitimsiz ve yanlış eğitim almış olanlar olarak ortaya koyar. Müslüman toplumlar kendi toplumlarının temel sorunlarını kavrayacak ve ona

 Copyright © International Science and Technology Conference (ISTEC)

çözümler üretecek eğitim sistemerine sahip olmadıklarını ileri sürer. Eğitim kurumları ve genel olarak eğitim ihmal edilmiş ya da özgün olmayan etkiler çerçevesindedir. Yabancı etkiler de eğitimin gelişimini engellemiştir. Bu bağlamda eğitim sistemleri kendi dışındaki güç merkezlerine hayranlığı öğreterek toplumun ve bireylerin zayıf kalmasını sağlamıştır. Müslüman toplumların bu eğitimi de pasif bir biçimde reddettiklerini de dile getirir. Eğitime uzak durarak adeta kendilerini koruduklarını dile getirir. Maneviyatı reddeden eğitimi kabul etmeyerek dönemsel olarak okula da bu sebeble uzak durması da bu bağlamda değerlendirir. Modern bir eğitim kurumu olarak okul, modern toplumun teknik beklentilerine cevap veren bir işlev düzeyinde bir karşılık bulur . Bu bağlamda modern eğitim kurumlarına dönük eleştiriler eğitimin kadim ve gelneksel boyutunun paranteze alınarak bir varlık ortaya koyması eğitim pratiğinde bir kırılmaya da işaret eder. İslam toplumlarında öncelikle ele alınarak bir değişim yaşaması gereken kurumun eğitim kurumu oduğunu dile getirir (Begoviç:2015,45). Cami ve okul arasında eğitim zemininde tekrar bir ilişkinin kurularak ,müslüman toplumlarda caminin yeniden tarihsel bir rol oynayacağını belirtir. Eğitim temelde bireye eleştirel düşünmeyi öğtermelidir. Eğitim kurumunun temel hedefi toplumsal düzlemde bu yönelimin kazanmasıdır. Bu durum toplumsal değişimin temel gücü olarak ele alınır. Modern okul sisteminin pek az manevi ve hümanistik olduğunu vurgulayarak, teknik dünyaya dönük pratik bir işlevinin önplanda olmasını eleştirir. Batıda eğitim fonksiyon ve pratik ihtiyaçları öne çıkaran bir anlayışla düzenlenmiştir. Modern bilimlerin; sayılar,hesaplar ve ölçümlerden oluşan oluşan niceliği, niteliği yani ahlak ve hayat ya da özgürlük temalarını bir anlamda gündem dışı bırakarak bir kurumsallaşma ortaya koyar. Teorik ve pratik düzeyde "insan ne ile yaşar " sorusu marjinal bir soru ve sınırlı bir akademik-eğitim alanının gündemi olarak kalır. Günümüzde mühendislik bilimlerinin önceliği bu manada insanın düşüşünün bir penceresi olarak görülür.

Begoviç birçok yerde eğitim yerine terbiye kavramını kullanır. Terbiye eğitimden ziyade özgür bir yönelimle üretilebilir. İyilik ve kötülüğün yurdu insandadır. İnsan zor ve baskıya dayalı olarak değişmez ,buna dayalı olarak sadece davranışlar değişebilir fakat özünde aynı kalır. Eğitimin sahih amacı insanı zorla değiştirmek olmamalı, diyaloga dayalı bir süreçle insanın içsel motivasyonları harekete geçirilerek sahih sonuçlara ulaşılarak. "Terbiye, insan için ; zorla alıştırma ise hayvan içindir." Eğitim insanı daha iyi yapmaz, sadace daha verimli ve ekonomik üretim paradigmasına uygun topluma faydalı yapar (Begoviç:2007;56). Eğitim insanı tek başına iyi yapmaz. Tarihin akışı içerinde büyük toplumsal çöküşler eğitimli insanların aldıkları kararlara dayalı olarak gerçekleşmiştir.

İnsanın tarihsel düşüşü semadaki prolog sonrası süreçtir. Uygarlık tarihi teknik olarak göreli birçok başarıya imza atsa da, buna karşılık insanın ahlaki kimliği tersi duraklarla düşüş içerisinde olmuştur.

Sonuç

Begoviç'in düşüncesinde insanın merkeziliği dinin merkeziliği anlamına gelir. Modernite paradigma olarak içsel olana karşılık dışsal olanı önpalana çıkarmıştır. Eğitim de dışsal öğelerin geliştirilmesine yönelirken, Begoviç'in düşüncesinde içsel olanın geliştirilmesine odaklanılmıştır. İçsel olan ruha karşılık gelirken ,dışsal olana maddi dünyanın teknik pratik serüvenlerine karşılık gelir. İçsel olan insanın ontolojik kökenine tanıklık edecek bir alandır. Bu bağlamda terbiye odaklı eğitimde insanın kabiliyetleri de gelişirken,yeteneği ve maddi dünyanın ihtiyaçlarına dönük eğitimden terbiyenin çıkamayacağını ifade eder.

AN ACTUATOR SENSOR NODE PROTOTYPE FOR INTERNET OF THINGS APPLICATIONS

Ismail Kirbas
ismailkirbas@mehmetakif.edu.tr

Internet of Things (IoT) systems are realized through data sharing system on the internet in order to ensure the needs of people from interacting with the objects that are connected to the Internet. The rapid development of the Internet and internet connected objects have become hot research topics for both academic and industrial researchers. Today's IoT devices can detect the needs of the users and communicate each other thanks to the integration with the Internet to meet the users' necessities.

The basic idea of this concept is to make objects interact with each other using a unique addressing systems. For example, Radio Frequency Identification (RFID) technology using mobile phones, sensors, tags and so on. This is a collaboration of the objects to reach a common goal. "Internet of Things" that can communicate with each other using different communication protocols, objects capable of exchanging data among themselves (devices) can be defined as a community. "Object" is defined as the sensor element, cameras, phones, cars, clocks, refrigerator, curtains, boilers, etc. In this presentation we offer a new actuator sensor node prototype to accomplish secure communication over internet for IoT requirements.

Keywords: internet of things, actuator, sensor node design, secure communication

AN INVESTIGATION OF MALATHION TREATABILITY BY O_3 AND O_3/UV PROCESSES FROM AQUEOUS SOLUTIONS

[a*]Melike ISGOREN, [b]Ayla ARSLAN, [b]Eylem TOPKAYA, [b]Sevil VELİ

[a]University of Kocaeli, Deparment of Environmental Protection, Kartepe, Kocaeli, Turkey.

[b]University of Kocaeli, Department of Environmental Engineering, 41380, Kocaeli, Turkey,(melikeisgoren@hotmail.com)

Abstract: In this study, treatability of malathion aqueous solution by O_3 and O_3/UV processes, which is a highly accumulated insecticide in environment and food chain due to its extensive usage in agricultural areas, was investigated. Effects of initial malathion concentration (20-60 mg/l), existence of UV (2x8 Watt) and reaction time (5-60 minutes) on malathion removal efficiency was evaluated. In ozone oxidation, at first 15 minutes of the study, 100 percent of removal was obtained for 20 mg/l initial malathion concentrations. By increasing the initial concentration, complete removal of malathion couldn't be achieved. To enhance the process efficiency, UV oxidation was integrated to the system. In O_3/UV oxidation, at first 45 minutes of the study, 100 percent of removal was obtained for 40-60 mg/l initial malathion concentrations. For 60 mg/l of initial concentration, at the end of 30 minutes of reaction time, removal efficiencies of ozone oxidation and O_3/UV processes were 75% and 90%, respectively.

Keywords: Malathion, Ozone oxidation, UV, Advanced treatment.

1. INTRODUCTION

The usage of pesticides without control in agricultural activities leads to the contamination of surface water and to the accumulation of pesticides in the groundwater. The most important sources of pesticide pollution are drainage waters and liquid wastes which come from agricultural industries, pesticide-producing plants. In 2001, organophosphorus insecticides represented 70% of the total insecticide usage in the United States and malathion was the most widely used of all (32–44% of total organophosphorus insecticide usage)(Zhang and Pagilla 2010). Malathion (diethyl dimethoxythiophosphorylthio succinate) is a highly toxic organophosphorous insecticide, registered in 1956, and it is abundantly used in agricultural, industrial and public health areas to kill insects, ants, aphids, bagworm, beetle, cotton leaf worm, mosquito, lice etc. by inhibiting cholinesterase enzyme (Kumar et al. 2014). On the other hand, the experiments of embryo development and in vitro fertilization indicated that malathion was an endocrine disruptor and could interfere with reproductive functions. Pesticides are generally toxic and non-biodegradable compounds. Treatment of organophosphorus pesticide containing wastewaters by using biodegradation is difficult due to they have a low biodegradability. There are a few research reports in the literature that aimed elimination of malathion with advanced treatment systems like photocatalytic degradation (Kralj et al. 2007; Yu et al. 2010; Kadam et al. 2014), O_3/UV/TiO_2 treatment (Lin et al. 2012), nanofiltration and photo-Fenton oxidation (Zhang and Pagilla 2010), ultrasonic treatment (Zhang et al. 2010), adsorption (Naushad et al. 2013) etc. advanced oxidation processes seem more effective and have the advantage of not to cause any other secondary pollution and other toxic by-products.

Chemical oxidation, especially ozone-based homogeneous processes including O_3, O_3/UV and O_3/UV/H_2O_2 have already been demonstrated to be an effective means of removing refractory and/or toxic chemicals from water and wastewater (Arslan et al. 2014). Typically, ozonation does not yield complete mineralization to CO_2 and H_2O but leads to formation of partial oxidation products such as organic acids, aldehydes and ketones. Applicability of ozone directly in its gaseous state, not causing any increase of neither waste water nor sludge volume and shortage of the reaction time are the advantages of using ozone oxidation.. Lin et al, studied the degradation of cypermethrin, malathion and dichlorovos in water and on tea leaves with O_3/UV/TiO_2 treatment and they concluded that the treatment resulted in an 80% removal rate for cypermethrin and 78% for malathion.

In the present paper we reported the study of malathion aqueous solution treatment by using O_3 and O_3/UV processes. And also effects of initial malathion concentration (20-60 ppm), UV strength (2x8 Watt) and reaction time (5-60 minutes) evaluated.

2. MATERIAL AND METHODS

2.1. Material and samples

Malathion solution (technical grade; >96% purity) was obtained from Shenzhen Longshine Chemical Co. Ltd. Specifications of malathion solution are given in the Table 1. Ultra pure water was used to make the synthetic samples. pH adjusted at 5.5 for all samples for the elimination possibility of malathion degradation, at higher values of pH. adjustments were done with 0.1 M NaOH and 0.1 M H_3PO_4 and measured by pH meter (WTW Inolab pH 720 model). Acetone and acetonitrile (ACN) that are used to prepare malathion sample solution were HPLC grade. Malathion standards (>99% purity), that used to set the method with HPLC-UV for the determination of malathion purchased from Dr. Ehrenstorfer Reference Materials. **Table 1** shows the specifications of malathion solution.

Table 1. Specifications of malathion solution

General name	Malathion
Chemical name	S-1,2-bis(ethoxycarbonyl) O, O-dimethyl phosphorothioate
Chemical formula	$C_{10}H_{19}O_6PS_2$
Chemical structure	
Malathion content	minimum 96 %
Molecular weight	330.3 g/mol
Density	1.23 g/cm^3 (20 ºC)
Solubility	solubility in water: 145 mg/l (at room temperature)

2.2. Ozonation System

The experimental set-up for ozone treatment consisted of ozone generator, ozone monitor and reaction tank, as detailed in our previous study (Fig.1). The ozonation experiments were conducted in a batch reactor (2L) with the concentration 5 ppm ozon dose . At the beginning of the reaction, 1.5L malathion solution at chosen concentration was added into the reactor. Liquid samples were periodically taken from the reactor to determine the concentration of the malathion. The O_3/UV experiments were carried out by activating different number of UV lamps. All samples were analyzed as soon as possible with HPLC-UV.

 Copyright © International Science and Technology Conference (ISTEC)

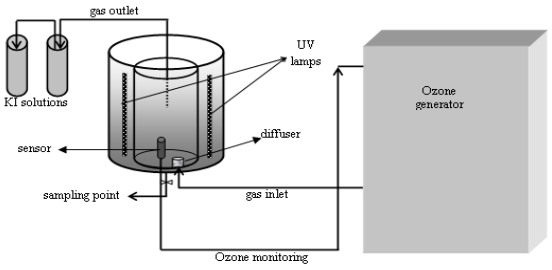

Figure 1. Experimental set up of ozonation system

2.3. Analysis Techniques

Residue concentration of malathion after treatment were measured by an Agilent 1260 Infinity HPLC with a UV detector. A 250 mm long C-18 capillary column (Eclipse XDB, Agilent) with an internal diameter of 4.6 mm was used to separate compounds. A 50:50 v/v mixture of ultra pure water: acetonitrile was used as a mobil phase. Flow rate was set to 1 ml/min.

3. Results and Discussion

According to the differences of processes in insecticide manufacturing industry, wastewaters of these industries show varied characteristics. In this study, for the purpose of malathion treatment with ozon oxidation and O_3/UV, synthetic malathion solution was prepared with the concentrations of 20-60mg/L, representing mean concentration of value existing plants (Zhang and Pagilla 2010). The influence of malathion concentration investigated for the concentrations of, 20, 25, 30, 40, 50, 60 mg/l in the time internal of 15-30 min. Ozone dose optimized at 5mg/l according to experiments done at the beginning of the study. In the concentrations of ozone higher than 5 mg/l, a rapid degradation of malathion occurred in a short time (as 5 min). So the minimum concentration of ozone was chosen from the perspective of cost benefit. It is known that in the acidic conditions ozone oxidation is limited because of the low formation of free radical and direct molecular ozonolysis should be predominant and oxidation of aromatic rings seems to be provided by ozonolysis (Usharani et al. 2010). By the way sufficient malathion degradation supplied for the low concentrations. As seen from the Figure 2 and 3, for the 20 mg/l malathion concentration 100% removal was achieved in 15 min. But when the concentration got higher the removal efficiency became low. Especially for the concentrations higher than 40 mg/l a limited degradation occurred and only 75% removal realized in 30 min for the 60mg/l malathion concentration. While the removal efficiency in 15 min for the concentrations of 25, 30, 40, 50, 60 mg/l were 43%, 29%, 20%, 15%, 10% respectively, for 30 min reaction time efficiencies were 89%, 84%, 80%, 79%, 75%. Figure 2 shows the malathion removal efficiency for different concentrations in O_3 treatment and Figure 3 shows the C/Co vs. reaction time for O_3 treatment.

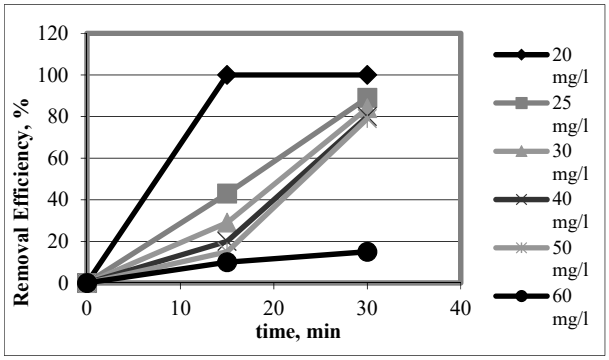

Figure 2. Malathion removal efficiency for different concentrations in O_3 treatment

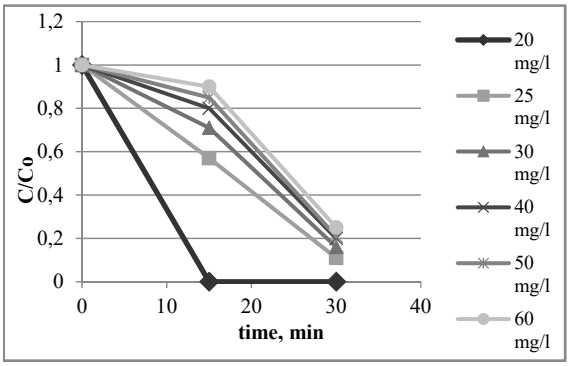

Figure 3. C/Co vs. reaction time for O_3 treatment

 Copyright © International Science and Technology Conference (ISTEC)

To improve the oxidation efficiency for higher malathion concentrations pH have to be get higher level to provide free radical (OH) oxidation reactions. But as it is mentioned before at higher pH values of solution malathion degraded to izomalathion and malaoxon. These compounds are by products of the malathion degradation which are more toxic and resistant environmental polluters. Than another alternative was tried for the concentrations higher than 40 mg/l and the UV irradiation was (2 lamp) added to the system. Removal efficiency well effected from the UV irradiation with O_3. For the malathion concentrations of 40, 50, 60 mg/l, removal efficiency got the level of 56%, 45%, 47% from the 20%, 15%, 10% respectively, in 15 min reaction time. And 100% removal efficiency was achieved for all concentrations at the end of the 45 min. as seen in Figure 4 and Figure 5. Figure 4. show the malathion removal efficiency for 40, 50 and 60 mg/l concentrations in O_3/UV treatment and Figure 5 shows the C/Co vs. reaction time for O_3/UV treatment.

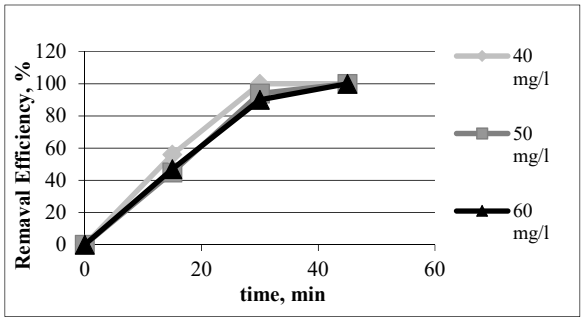

Figure 4. Removal efficiency for 40, 50 and 60 mg/l concentrations in O_3/UV

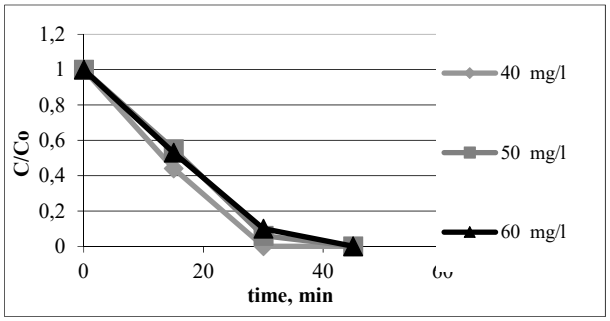

Figure 5. C/Co vs. reaction time for O_3/UV treatment

This improvement of the oxidation level can explain by the UV adsorption of ozone. Ozone degradation follows many ways while there is a UV light. One of them is getting reaction with OH^- ions, the other is photolysis with UV light and the last one is reaction with the OH radical which formed in the first step. Especially when the solution is in acidic conditions UV absorbance is more dominate and when the pH increases the effect of the UV decreases. In other word, ozon degradation is very low while there is no UV light in acidic conditions.

Conclusion

As a result, sufficient malathion degradation was supplied for the low concentrations, but concentrations higher than 40 mg/l and the UV irradiation was added to the system and removal efficiency well effected from the UV irradiation with O_3. We can clearly concluded that the degradation of malathion is more prone to take place with O_3/UV processes especially at high concentrations. But for lower concentrations only ozone oxidation is efficient. And these methods are applicable for malathion and the other organophosphorus pesticides removal.

ANADOLU KENT YAPISINDA GÖÇEBENİN YERLEŞME SÜRECİNE ETKİSİ

Süheyla BİRLİK, Fuat FİDAN

Karabük Üniversitesi, Safranbolu FTGSTF Mimarlık Bölümü, Karabük-TÜRKİYE

suheylabirlik@karabuk.edu.tr, ffidan@karabuk.edu.tr

Özet: Büyük insan kaynağı Asya'dan geri dönüşü olmayan yolları kat ederek batıya göç eden Türklerin tarih öncesi dönemlerden başlayarak en eski uygarlıkların vatanı olmuş Anadolu ile karşılaşması, kültürümüzün özellikli ve ilgi çekici bir yanıdır. Orta Asya kültürünün sahipleri ve taşıyıcıları olarak kimliğini yitirmeden Asya'dan Avrupa'ya çeşitli coğrafyalara yerleşerek devlet strüktürleri kuran Türkler, geleneksel Türk kültür sanatının var olması ve gelişmesinde etkili olmuşlardır. Göçebe kültürü yüzyıllarca süren bir yerleşme süreci içinde yerleşik kültür ile birlikte Anadolu'da yeniden biçimlenmiştir. Göçer-yerleşik toplumların genel özelliklerini ve ilişkilerini, Anadolu'yu Türkleştiren göçebelerin yerleşik düzene geçişini, yaşam biçimleri-gelenekleri ve İslam dünyası içinde gözledikleri, özümsedikleri ve yarattıkları ile birlikte yeni bir kültür ortamının doğuşunu ve bu ortamın niteliklerini... kısacası göçebelerin yapılı çevrede yer alan özelde konut tasarımlarına genelde yerleşime etkisini araştırmak bu çalışmanın amacı olmuştur.

Anahtar Kelimeler: Göçebe Kültürü, Yurt, Kara Çadır, Sofasız Ev, Dış Sofalı Ev

Orta Asya Türkleri ve göç

Orta Asya steplerinden kopup gelen göçebe Türk topluluklarının/Oğuzlar kitleler halinde yurt peşinde koşmaları sonucu, Anadolu -11. yy.dan itibaren- iki yüzyıl süren ve kesintisiz devam eden müthiş bir göç hareketine sahne olmuştur. Bizans İmparatoru I. Aleksios Komnenos'un (1081-1118 yılları arasında hükümdar) büyük kızı, tarihçi Anna Komnena'nın 11. yy. Anadolu'suna tanıklığı şöyledir: "Türklerin bahtının, Rumların bahtına üstün geldiği ve Rum hakimiyetinin pek sarsıldığı bir zamanda, Türkler ayaklar altında çıtırdayan kum taneleri kadar kalabalık sayıda sökün etmişti." İlk Haçlı Seferi'ni anlatanlar da, yürüyüşleri esnasında sürekli onları izleyen bu kadar çok Türkün nereden çıktığını anlayamıyor, "Bütün bayırlar, tepeler, çataklar ve ovalar bu aforoz edilmiş halk ile dolu idi." diyorlardı (Tayfur, 1998).

Göçerler-Yerleşikler

Erken dönem Anadolu Türk kültürünü anlayabilmek için, bölgede iki farklı toplumsal grubun yaşadığı gerçeğini dikkate almak gerekir.

Göçerler-yerleşikler ikilemine bağlı olarak, her iki grup insanının yaşam biçimlerinin genel özellikleri şu şekilde ele alınabilir (Güvenç, 1997, Tayfur, 1998, Kuban, 1995, Kuban, 2009):

- Göçebelik (hayvancılık, avcılık, tüccarlık) yerleşiklik (tarımcılık, çiftçilik) kadar saygın bir yaşam biçimi ya da kültürdür.
- Doğal çevre özellikleri ya hayvancılığa ya da tarımcılığa daha elverişlidir. Fakat insanoğlu hem etobur hem de otobur olduğu için; göçebe ihtiyaçlarına yetecek kadar ziraat ile uğraşsa da çiftçinin otuna ve otlağına, çiftçi de göçebe evcil hayvanının çekim gücüne, gübresine, etine ve sütüne muhtaçtır.
- Yerleşikler üretim alanlarını muhafaza etmek zorunda iken, göçerler -düzenli olarak- hayvanları için yaylak ve kışlak bulmak çabasındadırlar. Bu mevsimlik hareketler, göçebelerin çevredeki köylüler ile sürtüşmelerine yol açmaktadır.
- Seyyar (gezgin) olan atlı göçebe kültüründe ayrı bir savaş gücüne ihtiyaç yoktur; çünkü Orta Asya steplerinde olduğu gibi topluluğun kendisi ordudur. Göçebe ordu bütün yaşam ve savaş gereçlerini yanında taşıyarak hızla yer değiştirebilir. İhtiyaç duydukları malları yerleşikler gibi değişmeleri ya da para ile satın almaları mümkün olmadığından köylere ve şehirlere çapul düzenlemekten geri kalmaz; fırsat buldukça uygun bir yer ve zamanda düşman topraklarına akınlar yaparak hedefini vurur, geçimlerini karşılamaya çalışırlar. Topraklarını savunmak durumunda kalan yerleşikler de, düşmana karşı ilk savaşlarını belki kaybederler; ama zamanla onu çeker, içine alır, özümser... ve kültür savaşımını kazanırlar.
- Göçebeler toprağın kişi malı olmasını anlamazlar; üzerinde yaşadığı yeri ve sürüsünü otlattığı çayırı bölünmez sayar, dağınık ve bağımsız yaşarlar. Yerleşikler ise toprağı özel mülk olarak görürler, bölüşmeye razı olmazlar.

 Copyright © International Science and Technology Conference (ISTEC)

- Yerleşikler üretim teknolojisi ve artık ürün/verimlilik açısından göçebelerden üstündürler; göçebe avcılar aynı nüfusu besleyebilmek için yerleşik tarımcılardan 5-10 kat daha fazla toprağa ihtiyaç duyarlar.
- Doğal çevre ile iç içe yaşayan göçebe, kendisini doğanın bir parçası olarak görür ve doğa ile uzlaşmaya çalışır. Bu yüzden göçebe toplumlar için uygun bir din olan Şamanlık, doğa güçlerine egemen olmaya çalışan yerleşik toplumlar için uygun değildir.
- Yerleşik toplumlara ait bazı eserler günümüze kadar kalabilmiştir; çünkü göçerler yapay çevresini dayanıksız/ yok olan malzemeden, yerleşikler ise uzun ömürlü malzemeden oluşturmuşlardır.
- Göçebe toplumlar dokumacılıkta (halı, kilim vb.), dülgerlikte (ahşap işleri), debbağlıkta (dericilik), metalürjide (madencilik) gelişmiş olup yerleşik toplumlar ile boy ölçüşebilen nitelikte bir üretim gerçekleştirmişlerdir.

Yerleşik Düzene Geçiş

Şamanizm'e inanan Türklerin Anadolu'da İslam dini ile tanışmaları, yerleşik düzene geçişlerini hızlandırmıştır. İslamiyet'i kabul eden Türkler, kimi zaman uzlaşıp kimi zaman çatışarak bir kısmı hemen bir kısmı aşama aşama bir kısmı da zorunlu olarak -eski yaşantılarını yeni ortam ile kaynaştıracak şekilde- yerleşik hayata geçmişlerdir. Böylece Anadolu'da yeni bir yaşam biçimi gelişmiştir.

Türkler göçerlikten yerleşikliğe geçerken mevcut yapısal oluşumlardan pek az yararlanabilmişlerdir:

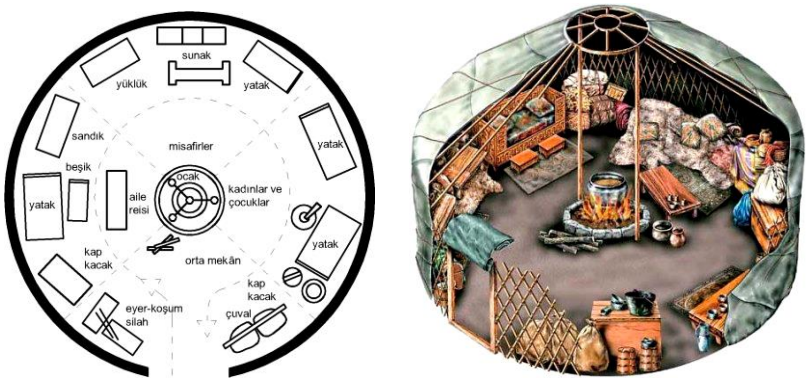
- Doğal çevreyi yeğlemiş göçerler kırsal alanlarda yaşayabilecekleri sağlam konstrüksiyonlara sahip konutlar ile karşılaşmadıklarından, bölgenin otokton mimarisi yerine kendi çadır kültürlerini devam ettirmişlerdir.
- Kent çevrelerinde bırakılmış tarım alanlarına yerleşen göçerler doğa ile uyumlu bir düzen kurmuşlar ve nüfus artışına bağlı olarak toprak parçalarının bölünmesi sonucu yeni mahalleler oluşturmuşlardır. Bu mahalleleri ya bir çeşme ya bir meydan ya da bir dini merkez etrafında geliştirmişler; özellikle mekân organizasyonunu çadır mimarisine benzeterek tasarladıkları sabit meskenleri çıkmaz yol aksları ile merkeze bağlamışlardır.
- Yerleşik alanlara gelen göçerler ya kent merkezlerine ya da terk edilmiş mahallelerine konumlanmışlar; kentin sağlam yapılaşmalarını kullanarak mevcut mimarisini korumuşlar ve güzelleştirmişlerdir.

Yurt→Kara Çadır→Sofasız Ev→Dış Sofalı Ev

Anadolu'nun yapılı çevresini biçimlendiren bazı konut oluşumlarında (kara çadır, sofasız ev, dış sofalı ev) göçer çadır kültürünün (yurt) sınırlı bir katkısı olduğu söylenebilir:

yurt (topak ev)

Rus etnolog/budun bilimci Lev Nikolaevič Gumilëv (Duru, 2010); Orta Asya steplerinde göçebe hayatı yaşayan insan topluluklarının sıcak ve kurak yaz aylarında serin hava ve yeşil ot için yaylalarda konumlandıklarını, soğuk ve kar yağışlı kış aylarında da kar otları kapattığı için bulundukları yerleri terk ettiklerini hatırlatarak... Türklerin -olumsuz- iklim koşulları yüzünden sabit mekânlar kurmadıklarını (çadırlarda yaşadıklarını) ve bağ-bahçelerinin olmadığını söyler.

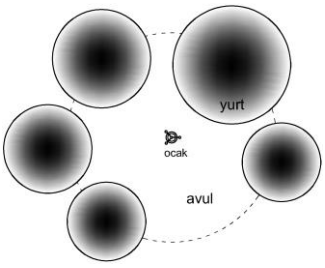


Yurt, eski Türklerin Orta Asya'da ev olarak kullandıkları çadırlardır (Şekil 1). Ahşap iskeleti silindir biçimli bir gövde ile kubbe ya da koni biçimli bir çatıdan oluşmuş olup üzeri beyaz veya boz bir keçe ile kaplanmıştır.

Şekil 1. Yurt, genel görünüm (Luckydoris, 2015).

Kadınlar tarafından erkeklerin yardımı ile kurulan (Bammer, 1996) ve dışarıdan bakıldığında içinde tek göz/oda olduğu düşünülen yurt'lar, gerektiğinde ihtiyaçlar özelinde hasır perdeler ile bölünüp şekillendirilirdi (Şekil 2).

 Copyright © International Science and Technology Conference (ISTEC)

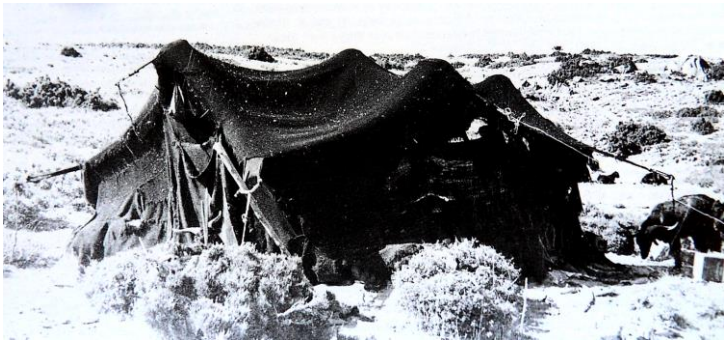


Şekil 2. Yurt, iç düzen (Khishigdorj, 2012, http://hrenovina.net/1289, 2008).

Göçebe yurt'larında en önemli alan orta mekân'dır . Bu mekânın merkezinde ısınma ve yemek pişirme amacıyla kullanılan bir ocak bulunur. Çadırın tepesindeki kasnak, yanan ateşin dumanının dışarı çıkması ve temiz hava ile ışığın içeri girmesi için açık bırakılır; geceleri ve yağmurlu havalarda keçe ile örtülür (Bozkurt, 1993). Aile reisi girişi görecek konumda girişin solunda, misafirler ocağın başında -aile reisinin solunda-, kadınlar ve çocuklar ise girişin sağında -aile reisinin karşısında- otururlar. Şamanizm inancına göre ateş kutsal sayıldığından, çadır içinde ve önünde yanan ocak iç/kapalı ve dış/açık mekânların düzenlenmesinde ve biçimlenmesinde etkili olmuştur.

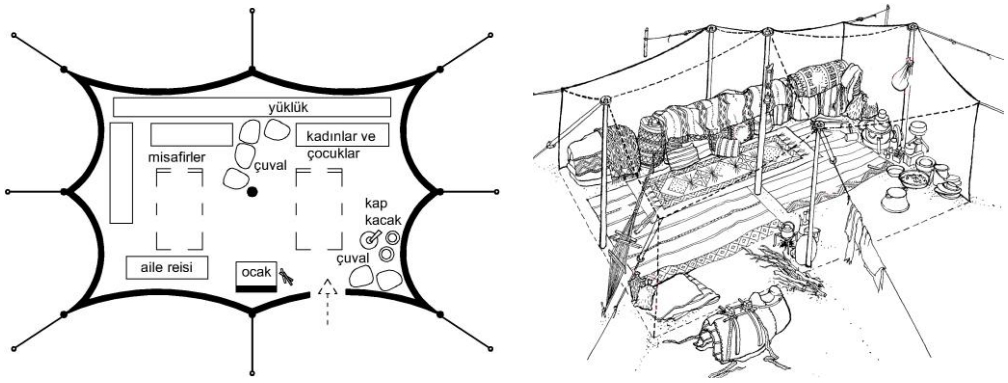
Orta mekânın dışında (çevresinde) kalan bölüm, oturma ve uyuma amaçlı olarak taşınabilir ahşap malzemeler ile zeminden 20 cm. kadar yükseltilmiştir (Duru, 2010). Girişin hemen sağında -kadınlar bölümünün arkasında- kap kacak/mutfak eşyaları ve yiyecek deposu, az ilerisinde çadır sahibinin/aile reisinin yatağı; solunda binek ve araba hayvanlarının eyerleri, koşum takımları ve silahlar, ilerisinde oğul-gelinin yatağı yer alır. Güneşin doğduğu yönü yani doğuyu görecek biçimde çatılan kapının tam karşısında -ocağın arkasında- bir sunak, hemen solunda yatak, yorgan, yastık ve çarşafların istiflendiği keçe, kilim veya halı gibi örtüler ile kapatılmış bir yüklük ve takı, elbise vb. değerli ve mahrem eşyaların muhafaza edildiği bir sandık vardır.

Yurt'lar, mekân geometrisine göre şekillendirilmiş strüktürel yapısı belirli bir boyutu (çap: 5-6 m.) aşmadığından geniş bir ailenin yaşaması için pek uygun barınaklar değillerdir... Ailelerin erkek çocuklarını evlendirdiklerinde veya kız çocuklarını gelin edip iç güveyi aldıklarında bir arada yaşamaları zorlaşır. Yoksul ailelerde, aile reisinin karşısındaki bölme gelin ya da damada ayrılır. Bu düzen, mekânların özelleşmesi anlamına gelmemekle birlikte, mahremiyetin korunması açısından önem taşır; ikinci aileye paylaştırılan bölüm gerektiğinde çit, keçe veya kilim ile perdelenir. Ailenin ekonomik durumu yeterli ise genç evli çiftlere baba ocağının hemen yanında yeni bir çadır kurulur (Duru, 2010). Birbirleri ile bağlantıları avul ile sağlanan ve aralarında kan bağı bulunan en az üç en fazla on hanenin çadırlarının oluşturduğu topluluğa da 'oba' denir (Şekil 3).



Şekil 3. Oba.

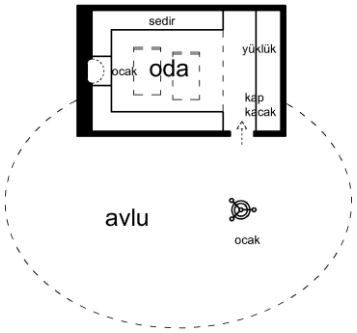
kara çadır (kıl çadır)



Araplar ile temas kuran Türkmenler (Müslüman Oğuzlar) tarafından kullanılmış bir göçebe meskenidir (Gürbüz, 1997). Siyah keçi kılından örülmüş iplikler ile tezgâhlarda gevşek bir şekilde dokunmuş dar (~1 m.) ve uzun (10-15 m.) kanatların (5-6 adet) yan yana dikilmesi ile üretilmiş su sızdırmaz ve ısı geçirmez bir çulun birbirlerinden bağımsız ana/orta ve tali/yan ahşap direkler üzerine yayılması, uçlarına bağlanan kalın ipler ile kenarlarda yeterli uzaklığa çakılmış kazıklara gerilerek sıkıca bağlanması, çul ile toprak arasındaki açıklığın su, kuvvetli rüzgâr ve hayvanların içeri girmelerini engellemek için giriş hariç hasır (sitil) ile çevrelenerek ya da taşlar ile doldurularak kapatılması sonucu oluşturulan, gerektiğinde yeni kanatlar ve direkler eklenerek genişletilebilen bir çadır tipidir (Gürbüz, 1997, Bozkurt, 1993) (Şekil 4).

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 4. Kara çadır, genel görünüm (Bammer, 1996).

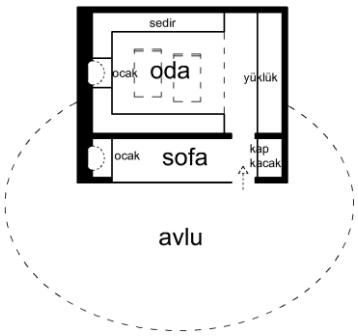


Kara çadır da, kadınlar tarafından dokunur, kurulur ve sökülür. Mekân organizasyonu yurt ile hemen hemen aynı olmasına rağmen, malzeme ve strüktürü farklıdır (Şekil 5). Yapılı çevre koşulları göz önüne alındığında, yurt'un dikdörtgen planlı ve beşik çatılı olarak Anadolu'da yeniden biçimlenmiş halidir; Toros Yörükleri tarafından hâlâ kullanılmaktadır.

Şekil 5. Kara çadır, iç düzen (perspektif: My Favorite Rugs and Kilims, 2013)

sofasız ev
Yerleşik düzene geçişi simgeleyen ve Osmanlı mimarisi içinde yer alan 'Türk evi' plan tipinin ilk aşamasıdır.

Doğan Kuban, Ayda Arel, Cengiz Eruzun, Önder Küçükerman (Çevrimli, 2014) göçebe çadırı ile oda arasındaki işlevsel benzerliklerden yola çıkarak, geleneksel Türk evinin oluşumunun Orta Asya Türklerinin yaşam biçimine dayandığını ileri sürmüşlerdir. Yurt'un oturma, yemek pişirme ve yeme, toplanma, ibadet etme, uyuma, yıkanma gibi eylemlerin gerçekleştirildiği çok amaçlı kullanım pratiği, sofasız evde de devam etmiş; sadece Anadolu'daki kara çadır ve yerleşik konut kültürüne bağlı olarak mekân geometrisi dikdörtgene dönüşmüş ve ocak da anlamsal özelliğini kaybetmeden duvar içerisine gömülmüştür (Şekil 6).



Şekil 6. Sofasız ev, yerleşim ve iç düzen

Bu ilkel/basit evlere büyükbaş ve küçükbaş hayvancılığın yapıldığı dağlık alanlarda (köylerde seyrek, yaylalarda sıkça) rastlanmaktadır.

 Copyright © International Science and Technology Conference (ISTEC)

dış sofalı ev

'Türk evi' plan tipinin ikinci aşamasıdır. Bu plan tipinde, bir önceki modelden farklı olarak 'sofa' birimi gelişmiş; oda önündeki avlu sofa'ya dönüştürülmüştür. Burada; oda sadece oturma ve uyuma amaçlı kullanılan bir mekân iken... sofa ilk zamanlar oda ile avlu arasında ve iki ya da üç odalı evlerde odalar arasında dolaşımın sağlandığı, giderek yemek pişirme ve yeme, toplanma amaçlı günlük uğraşların gerçekleştirildiği ve hayatın paylaşıldığı bir diğer mekân/ortak mekân durumundadır (Şekil 7). Olumsuz iklim koşullarından korunmak için üstü kapalı olup, yine dışarıda kalma olanağı sağlayacak şekilde ya bir ya iki ya da üç yüzü açıktır; bu yönüyle dışa dönük yaşam biçiminden içe dönük yaşam biçimine geçiş trendinin ilk somut işaretidir.

Şekil 7. Dış sofalı ev, yerleşim ve iç düzen

Bu evler yaylak-kışlak hayatı yaşayan Türkmenler/Yörükler tarafından hâlâ kullanılmaktadır.

Sonuç

-İklim ve bitki örtüsü bağlamında- su ve verimli otlak peşinde yer değiştiren göçebeler konumlandıkları Anadolu coğrafyasında kültürlerini devam ettirebilmişlerdir.

Kurulup sökülebilir ve taşınabilir 'çadır', bağımsız hareket eden göçerlerin mimari açıdan ürettikleri tek birimdir; etkilerini ev oluşumlarında aramak gerekir. Bu bağlamda... Orta Asya kökenli Türk-Moğol yurt'ları, Anadolu'da çevresel etkileşim ara kesitinde zamanla kara çadırın ve sonraki süreçte de Türk evi prototipinin ana kaynağıdır.

Kara çadır -yurt gibi- geçici bir barınak iken, ev kalıcı barınağa geçişin ilk modelidir ve her iki yaşama birimi de hem göçebe kültürün hem de yerleşik kültürün izlerini taşımaktadır: Göçer kültürün iç mekân düzenlenmesinde, yerleşik kültürün mekân geometrisinde (dikdörtgen) etkili olduğu gözlemlenmektedir.

Kara çadır ve sofasız ev'de tüm eylemler yine tek bir mekânda gerçekleştirilirken; dış sofalı ev'de oda önündeki avlunun sofaya dönüştürülmesi sonucu mekân sayısı artmış, işlevler de bu mekânlar içinde ayrıştırılmıştır.

Nüfus artışa bağlı olarak, zamanla; çadırlar avulları ile birlikte obaların, evler de avluları ile birlikte mahallelerin oluşumuna katkı sağlamıştır.

... ve günümüz Türkiye'sinde değişen yaşam koşulları gereği göçebe hayatı yok olsa da kültürünün izleri devam etmektedir; bu nedenle maddi ve manevi değerlerinin korunması, tanınması ve gelecek kuşaklara aktarılabilmesi açısından önemlidir.

ANALYSES OF ABA RESPONSES GENES IN *ARABIDOPSIS THALIANA sos5* MUTANT UNDER NaCI STRESS

Tuba ACET

Gümüşhane University, Engineering and Applied Sciences Faculty, Department of Genetic and Bioengineering, Gümüşhane- TURKEY

tubaacet@hotmail.com

Abstract: Abscisic acid (ABA) is an important phytohormone that regulates a lot of physiological, biochemical and molecular processes during plants life and response stress conditions. In this paper, *Arabidopsis thaliana salt overly sensitive* (*sos5*) mutant which known hyper sensitive to NaCI stress was used to investigate ABA regulation. Because of this, ABA depended genes determined by q-RT PCR method under 2h. 100 mM NaCI stress. Findings indicated that RD29A, RD 29B and RD22 which ABA dependent gene expressions were highly lower than *Col-gl* (wild type); however ERD1 which ABA in depended gene expression was higher than WT. Based on these results, we suggest that defect of ABA responses gene regulation might be responsible for hypersensitivity to Arabidopsis *sos5* mutant under salt stress.

Keywords: ABA, *Arabidopsis thaliana*, *sos5* mutant, salt stress

Introduction

Salinity is one of the most serious problems limiting the productivity of agricultural crops, with adverse effects on germination, plant defense system and crop yield (Munns & Tester, 2008). More than 45 million hectares of irrigated land have been damaged by salt, and 1.5 million hectares are taken out of production each year as a result of high salinity levels in the soil around the world (Munns & Tester, 2008). High salinity affects plants in several ways: water stress, ion toxicity, nutritional disorders, oxidative stress, alteration of metabolic processes, membrane disorganization, reduction of cell division and expansion, genotoxicity (Hasegawa, Bressan, Zhu, & Bohnert, 2000; Munns, 2002; Zhu, 2007). According to them, plant growth, development and survival highly reduced. Plants effected from salt stress in some different aspects such as osmotic, ionic and toxic. Meanwhile, plants have evolved several mechanisms to cope with salt stress. One of the most related defense mechanism is that produce ABA and express ABA related genes under salinity. For example, some researches showed that ABA-deficient mutants perform poorly under salinity stress (Xiong, Gong, Rock, Subramanian, Guo, Xu, et al., 2001). On the other hand, it has been shown that ABA-dependent and -independent transcription factors may also cross talk to each other in a synergistic way to amplify the response and improve stress tolerance (Shinozaki & Yamaguchi-Shinozaki, 2000).

There are some mutants characterized related to ABA and these are giving clues about ABA's role under stresses. But, we have very few ideas about Arabidopsis *sos5* mutant related to ABA. Shi et. al., (2003) has been shown firstly the *sos5* mutant of *A. thaliana* by root growth under salt stress. The root of *sos5* shows a drastic reduction of elongation growth combined with radial swelling of the elongation zone. Cell walls appear abnormally thin in *sos5*, apparently lacking the middle lamella (Shi et al., 2003).

To better understand the ABA related genetic pathway linking *sos5* mutant with salt tolerance and root growth, we exposed 2 hour 100 mM NaCI both WT and mutant. Then, we compared some ABA dependent and independent gene expression levels. We found that abscisic acid (ABA) dependent genes lower on *sos5* mutant compared to WT. We propose that Arabidopsis *sos5* mutant is hypersensitive to salt stress because of does not able to expressed ABA dependent genes enough and seem very sensitive.

Materials and Methods

Growth conditions

Arabidopsis thaliana ecotype *Col gl* wild type and the mutant (*sos5-1*) were kindly provided by Jian-Kang Zhu (University of California, Riverside, CA, USA). Growth conditions were as previously described (Blaukopf et al.,

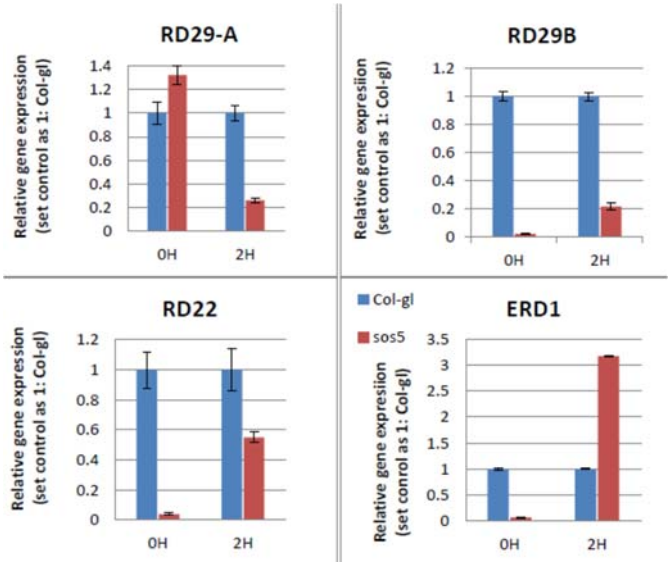
 Copyright © International Science and Technology Conference (ISTEC)

2011). For phenotypic observation, ten seedlings were manually transferred to test media containing standard medium alone or also including the NaCI, and were examined using a dissecting microscope (Leica EZ4 HD). Stock ABA solution was prepared that was dissolved in 0.01 M NaOH.

Quantitative real-time PCR (qRT-PCR)

Samples were treated in biological triplicates. For each biological replicate, 150 seedlings were grown on a nylon mesh (20 mmmesh size; Prosep, Belgium) for 4 d and were transferred to standard medium with or without 100 mM NaCl and incubated for 120 min. Roots were removed from the seedlings, frozen in liquid nitrogen, ground in a ball mill (Retsch, Germany) for 2 min and RNA was extracted using peqGOLD Trifast (Peqlab, Germany) according to the manufacturer's instructions. The RNA concentration was measured using a Nano Drop 2000c Spectrophotometer (Thermo Scientific, USA). For each sample, 1 mg of total RNA was reverse-transcribed with oligo(dT) primers using a first-strand cDNA synthesis kit (Thermo Scientific, USA) according to the manufacturer's instructions.
Real-time PCR was performed using Solis BioDyne 5 × HOT FIREPol EvaGreen qPCR Mix Plus (no ROX) (Medibena, Austria), and a CFX96 TM Real-Time PCR Detection System (Bio-Rad, USA) was used for detection. Information on the oligonucleotides used can be found in Data Table 1. For real-time PCR, the following program was used: 95.0 8C for 15 min, 40 cycles of 95.0 8C for 10 s, 55.0 8C for 30 s, 72.0 8C for 30 s. Each biological replicatewas analysed in technical duplicates. The average technical error was 0.5 (+1) Ct values. Technical outliers were identified when the DCt between technical replicates was 2.5, and the higher Ct value was removed. The remaining technical replicates were averaged and the DCt (Ct test – CtUBQ5) was calculated.The effect of genotypes and treatments was tested by subjecting the DCt values of three biological replicates to a two-sided t-test.
For this study, the relative mRNA levels of three ABA dependent genes and one independent gene were analysed.

Results and Discussion



The mechanisms of genetic control of salt tolerance in plants have not yet fully understood. Because, salt stress sensed by different sensors. For instance, when plants exposed to salt stress, cell wall, cell surface and vacuole affected immediately and then triggered genes that over come to this case. One of the significant sensors that cell surface proteoglycans have been implicated in many aspects of plant growth and development, but genetic evidence supporting their function has been lacking. Shi et. al., (2003), reported in their paper that the Salt Overly Sensitive5 (SOS5) gene encodes a putative cell surface adhesion protein and is required for normal cell expansion. They isolated *sos5* mutant in a screen for Arabidopsis salt-hypersensitive mutants. According to them, under salt stress, the root tips of *sos5*mutant plants swell and root growth is arrested. The root-swelling phenotype is caused by abnormal expansion of epidermal, cortical, and endodermal cells. So, it means SOS5 gene is responsible for plant growth and development. Even under salt stress, the roots of the wild-type plants exhibit highly organized and defined cell shapes. Cell wall architecture, cytoskeleton, wall–membrane interactions and interaction between neighboring cells play a vital role in the control of cell expansion (Darley et. al., 2001). When this gene function knock out, in response to salt stress, the root tips of *sos5* plants swell and the root growth and elongation was arrested. We hypothesized that the certain phenotypic abnormalities of *sos5* related to ABA regulation.
According to our qRT-PCR results (**Figure 1.**), *At*-RD29A, *At*-RD29B and *At*-RD22 which are ABA dependent genes were highly expressed in WT plants, compare to *sos5* mutants. On the other hand, when we checked *At*-ERD1 which is ABA independent gene was higher in *sos5* mutants than WT under 100 mM NaCI. These results suggested that SOS5 gene have a synergistic function with ABA gene regulation. If there is no SOS5, in other word *sos5* mutant plants, there is a problem with ABA regulation and plants do not able to handle with salt stress affects. Based on this, Seifert et., al., (2014) pointed out that application of ABA suppresses the non-redundant role of *At*-SOS5 in the salt response and Salt oversensitivity in *At-sos5* is suppressed by the exogenous ABA applications. All tested ABA-dependent genes displayed a significant repression in *At-sos5*, suggesting that the effect of *At*-SOS5 on stress signaling might be specific for ABA.

Conclusion

The predicted lipid-anchored glycoprotein *At*-SOS5 positively regulates cell wall biosynthesis and root growth by modulating ABA signalling. Taken together, we suggest that *At*-SOS5 and ABA signalling act in genetic synergy, leading to suppression of At-sos5 by ABA. Overall, we conclude that *At*-SOS5 regulates normal root growth via an ABA-depedent signalling pathway that might be upstream of cell wall biosynthesis.

ANALYSIS OF CUTTABILITY OF METAL MATERIALS BY USING ABRASIVE WATERJET

Lutfiye Dahil
lutfiyedahil@gmail.com

Ismet Dahil
ardahil@hotmail.com

Abdurrahman Karabulut
akarabulut@aku.edu.tr

The method of cutting with corrosive waterjet, which is an advanced technology that is widely used in any production domain throughout the world, involves too many parameters. For this reason, the optimization of these parameters is very important. In order to ensure this optimization, it is necessary to consider many factors such as equipment capacity, processing parameters, and various physical factors.

In this study, it was aimed to analyze the abrasive waterjet cutting method in details and to promote its superiorities to other cutting methods. St37 and St50 alloy steel samples, which are widely used in machinery manufacturing industry, were used in this experimental study. The changes that the used cutting method created in micro structure of the particle were investigated. Since all the methods other than waterjet involve heat treatment, significant changes in hardness of material were observed.

ANALYZING CPU SCHEDULING ALGORITHMS ACCORDING TO WAITING TIMES - A CASE STUDY

Ruya SAMLI

Istanbul University, Department of Computer Engineering, Istanbul - Turkey

ruyasamli@istanbul.edu.tr

Abstract: In multiprocessing operating systems, maximum CPU utilization is one of the most important goals. To obtain the maximum rate, the processes in the CPU queue must be scheduled properly. There are several scheduling algorithms to decide this process order as First-Come First-Served Scheduling, Last-Come First-Served Scheduling, Shortest Job Scheduling, Random Scheduling etc. This paper presents a case study to examine which of these scheduling methods is the most efficient one between these policies according to total waiting times.

Keywords: CPU scheduling, waiting time, First-Come First-Served Scheduling, Last-Come First-Served Scheduling, Shortest Job Scheduling, Priority Scheduling, Random Scheduling.

Introduction

In multiprocessing operating systems, the system need a method to decide the order of processes. This process is called CPU scheduling. In the literature there are lots of CPU scheduling policies such as First-Come First-Served Scheduling, Last-Come First-Served Scheduling, Shortest Job Scheduling, Random Scheduling and lots of criteria used for examining the efficiency of the algorithms such as waiting time, response time, turnaround time (Beru, 2015; Carithers and Duncan 2013; Singhoff, 2012; Kohout, 2012; Baskiyar and Meghanathan, 2005). Because most of the examinations about CPU scheduling used total waiting times in the literature, we also use this criteria in this study. The explanations of the methods are given below.

First-Come First-Served Scheduling : The first executed process is the first one in the waiting queue (Kumar et. Al, 2014; Rogiest. et al,2015; Huang, 2014).
Last-Come First-Served Scheduling : The first executed process is the last one in the waiting queue (Harchol-Balter, 2013; Jouini, 2012; Lister, 1993).
Shortest Job First : The first executed process is the shortest one in the waiting queue (Ru and Keung, 2013).
Random Scheduling : The first executed process is a random one in the waiting queue (Tsichritzis and Bernstein, 2012).

In this paper, the CPU scheduling algorithms are analyzed according to total waiting times of the processes. For this reason, 30 process set who has 10 processes and whose burst times are randomly generated (less than or equal to 50ms) are used. The arrival times are accepted as 0. The CPU scheduling algorithms are applied to these process sets and the total waiting times are calculated. This study aims to find the most efficient CPU scheduling method for this case-study. To form more general solutions about the policies, these 30 × 10 sets are chosen as different characteristics. For example in some sets, all of the processes have equal burst times, in some cases, some of them are equal and in the remaining ones, there are no equal burst times in the processes.

Materials and Methods

The CPU scheduling policies can be seperated as preemptive methods and non-preemptive methods. First Come First Served, Last Come First Served, Priority Scheduling, Shortest Job First and Random Scheduling are non-preemptive methods while Round Robin, Shortest Remaining Time are preemptive. In this study the non-preemptive policies are handled because preemptive policies need different types of inputs. The policies that are compared to eachother in this study are First Come First Served, Last Come First Served, Shortest Job First and Random Scheduling. As mentioned above, 10 processes are produced with random burst times in his study. This random burst times are shown in Table 1 which also shows the First Come First Served policy order. Table 1 also shows the processes according to First Come Firs Served Scheduling. Table 2, Table 3, and Table 4 are formed by using the same burst values with Last Come First Served, Shortest Job First and Random Scheduling.

In this table the proceses are ordered according to their burst times in the ascending order. This means the shortest job becomes the first and the longest jobe becomes the last. Finally, another policy called Random Scheduling Policy is applied to the processes. Random Scheduling Policy choses processes randomly as the name implies.

Results and Discussion

We constituted computer programs by using MATLAB simulation program and calculated the total waiting times of First Come First Served (FCFS), Last Come First Served (LCFS), Shortest Job First (SJF) and Random Scheduling (RS).

The total waiting times for each process set are calculated according to the algorithms and the results are given below :

Conclusion

This paper presents a case study to examine which one of the scheduling methods is the most efficient one between First-Come First-Served Scheduling, Last-Come First-Served Scheduling, Shortest Job Scheduling, Random Scheduling according to total waiting times.

As it can be seen easily from the tables, in all the situations Shortest Job First policy is the most efficient one. Because the total waiting time is of course will be the smallest one in all the other policies. Also, when we look at the average times, SJF has the smallest one. The order of the other policies can be changed according to policy but SJF will be the best one in all the cases.

ANDROID TABANLI MOBIL TELEFON VE SMART CIHAZLAR ILE BLUETOOTH DÜŞÜK ENERJI ETKILEŞIMLI SINAV UYGULAMA VE DEĞERLENDIRME SISTEMI

Muhammer Ilkucar
imuammer@yahoo.com

Akıllı telefonlarının gelişmesi ve yaygınlaşması ile uygulama alanları da artmıştır. Günümüzde akıllı cep telefonları, telefon özelliğinin yanında, fotoğraf makinesi, kamera, hız ölçer, ivme ölçer, not defteri, ajanda, oyun konsolu, el feneri, harita, navigasyon, adım sayar, e-kitap okuyucu, gibi bir çok amaç için kullanılabilecek donanıma sahiptir. Eğitim alanında cep telefonları ile ders notu, sınav olma, eğitim videoları, hatta canlı yayın dahi yapmak mümkündür. Yapılan çalışmada Android tabanlı akıllı cep telefonları üzerinde uygulanabilen sınav yapma ve değerlendirme sistemi geliştirilmiştir. Sistem belirli bir derse ait önceden oluşturulmuş sınav bilgileri (sorular, sınav tarihi ve saati, sınav süresi, katılımcılar vb.) öğretmen tarafından sunucu üzerinde belirlenir. Sınav ancak öğretmen gözetiminde belirli bir salonda yapılması mümkündür. Sorular aynı salondaki (birbirleri ile Bluetooth mesafesinde) katılımcılara, karıştırılarak birbirinin aynı olmayacak şekilde yöneltilir. Katılımcıların cep telefonlarının bluetooth ile birbirinin etkileşimleri tespit edilir. Böylece öğrencilerin birbirinden yardım alma imkanı minimize edilmiştir. Her katılımcı sınav sonuçlarını, sınava giren tüm katılımcıların sınavı bittikten sonra görülebilecektir. Sınav skorları ve yanlışları ile birlikte hangi konularda eksik oldukları rapor olarak öğrenciye bildirilecektir. Mobil sınav uygulaması ile, daha ekonomik, daha hızlı ve daha çok sınav olma imkanı olacaktır. Bu tür sınavların öğrencinin derse olan ilgi ve motivasyonu ile başarıya olan katkısı araştırılacaktır. Sistem mobil uygulama, soru bankası oluşturma, soru yöneltme uygulaması ve veri tabanından oluşmaktadır.

ANTI-SCALE MAGNETIC METHOD AS A PREVENTION METHOD FOR CALCIUM CARBONATE SCALING

M. A. Salman and G. Al-Nuwaibit
Kuwait Institute for Scientific Research, Water Research Center, P.O. Box 24885,
Safat 13109, Kuwait. Tel. +965-24878124; Fax: +965-24879238;
email: matallah@kisr.edu.kw

Abstract

The effect of anti-scale magnetic method (AMM) in retarding scaling deposition is confirmed by many researchers, to result in new crystal morphology, crystal which has the tendency to remain suspended more than precipitated. AMM is considered as an economic method when compared to other common methods used for scale prevention in desalination plant as acid treatment and addition of antiscalant. The current project was initiated to evaluate the effectiveness of AMM in preventing calcium carbonate scaling. The AMM was tested at different flow velocities (1.0, 0.5, 0.3, 0.1, and 0.003 m/s), different operating temperatures (50, 70, and 90°C), different feed pH and different magnetic field strength. The results showed that AMM was effective in retarding calcium carbonate scaling deposition, and the performance of AMM depends strongly on the flow velocity. The scaling retention time was found to be affected by the operating temperatures, flow velocity, and magnetic strength (MS), and in general, it was found that as the operating temperatures increased the effectiveness of the AMM in retarding calcium carbonate ($CaCO_3$) scaling increased.

Key Words: Magnetic field strength, flow velocity, scale retention time.

Introduction

Scaling is considered to be the biggest operating problem in desalination plants. The deposition of scales can lead to a decrease in the operating efficiency, and equipment life, as well as increase in the maintenance cost and energy consumption. Calcium carbonate ($CaCO_3$) scaling is considered as the most common scale in all desalination plants especially in reverse osmosis plant and in multistage flashing desalination plants. Therefore, it has received since special attention in desalination plant and at different operating temperatures (Segnit et al., 1962; ;Langmuir, 1968; Brecevic and Nielsen, 1989; Cubillas et al., 2005; Tarek et al., 2012; Chaussemier et al., 2015). $CaCO_3$ can be precipitated at three different polymorphs such as calcite, vaterite, and aragonite. Aragonite is considered as the easiest form of $CaCO_3$ and can be removed by flushing with water, because it is a soft scale; while calcite is a hard scale and it could usually be avoided by using antiscant or addition of acid. Aragonite is known with a unique morphology or crystal shape, which makes it be suspended more time than calcite scale. Furthermore, the solubility of aragonite is more than the solubility of calcite at the same temperature and condition (Morse et. al., 1980).

Acid addition is considered as a reliable method to prevent calcite scaling in desalination plants, where acid was added to the feed water, to consume part of the bicarbonate in feed water and convert it to a carbon dioxide.

 Copyright © International Science and Technology Conference (ISTEC)

$$H^+ + HCO_3^- \longleftrightarrow CO_2 + H_2O \quad (1)$$

This type of treatment method will result in shifting reaction 2, which is responsible in the precipitation of $CaCO_3$ to the left side, and prevents precipitation of $CaCO_3$.

$$Ca^{+2} + HCO_3^- \longleftrightarrow H^+ + \uparrow CaCO_3 \downarrow \quad (2)$$

However, acid addition treatment method is always accompanied with corrosion problems and requires special care and precautions. Furthermore, acid cleaning forces the operators to shut down the plant, which could lead to less productivity and low availability. Antiscalant is also considered as a reliable method to prevent calcite precipitation inside desalination plants.

Scale inhibitor can also be considered as a reliable method used for a long time in desalination plant to control $CaCO_3$ scaling. Antiscalant is a chemical impurity that could modify or change the shape, size, and morphology of crystal formed during crystallization or scale formation processes (Greenlee et. al., 2011). Polyelectrolytes as polycarboxylate, polyacrylates and polyphosphate have been reported as efficient inhibitors that could control $CaCO_3$ precipitation, by reacting with mineral nuclei to disrupt the crystallization process and keep the crystal particles dispersed in the scaling solution (Chauhan et. al., 2012). Other types of antiscalant have the ability to retard the crystal growth rate to suppress the scale formation, and then control the scaling processes. The threshold inhibitors are special additives, where threshold inhibitors can retard scale precipitation for a sufficiently long period of time, and the scale will precipitate outside the desalination system. The influence of antiscalant on the precipitation of $CaCO_3$ was investigated by many authors at different operating pH, and the result confirmed the relation between the functional group in the Antiscalant and increasing the induction time (ß), which is the time required for precipitation of $CaCO_3$(Amjad et al., 1994; Tarek et al., 2012).

Phosphonate antiscalant additives can be classified to be protonated phosphonate group (PO_3H^-) and fully dissociated group (PO_3^{2-}) that work according to adsorption model, where it can inhibit the growth of crystal by adsorption of the reactive surface site. At present, there are various types of phosphonate antiscalant chemicals, such as condensed polyphosphate, organo phosphate, and polyelectrolyte phosphate; however under neutral pH and low temperatures, linear polyphosphonates undergo relatively slow hydrolysis, and the rate of hydrolysis will increase as the operating temperature increases (Gryta, 2012). Furthermore, it is well-known, that special care must be taken to avoid hydrolysis of sodium hexameta phosphate (SHMP) antiscalant in dosing tank, where the hydrolysis process can be described in the following equation.

$$PO_3^- + H_2O \longrightarrow H_2PO_4^{2-} \longrightarrow PO_4^{3-} \quad (3)$$

the hydrolysis will result to losing the effectiveness of the antiscalant in preventing scaling deposition. Furthermore, hydrolysis process can create a phosphonate scaling risk as illustrated in the following equation

$$3Ca^{2+} + 2\,PO_4^{3-} \longrightarrow Ca_3(PO_4)_2 \quad (4)$$

 Copyright © International Science and Technology Conference (ISTEC)

However, high cost is a problem. It has been calculated that the cost of antiscalant chemicals accounts for about 10% in the production of freshwater in Dalian (Li Hai Yan et. al., 2006). In Kuwait, the annual cost for using a low concentration (not exceeding 3 mg/l) of antiscalant chemicals, is about KD0.95 million (MEW, 2010). This annual cost is expected to increase as the production of desalination plant increases.

Even so, Antiscalant chemicals play an important role in preventing $CaCO_3$ precipitation in reverse osmosis system; they are prone to enhance biofilm growth on reverse osmosis membrane by either altering the membrane surface properties or by serving as nutritional source for microorganisms (Sweity et. al., 2013). In addition, many types of chemical antiscalants on the market are harmful to the environment, and could result to serious environmental influence (Chauhan et. al., 2012). Because of this, researchers have looked for a new promising treatment method referred to as anti-scale magnetic treatment method, which is a nonchemical treatment method, and it is expected to reduce the operating cost of desalination plant. Anti-scale magnetic method (AMM) is a physical pretreatment method, which has been applied as a controlling and/or preventing tool for several decades for the deposition of scale in the domestic and industrial water systems.

Although the operating cost of AMM is very low when compared to that of chemical antiscalant method, the AMM is still not totally accepted by the scientific research community. The main reason for that is the lack of repeatable data, where the AMM was reported to work in some applications and not in the others. Furthermore, until now a few and limited researchers have proposed a scientific theory, explaining the work of AMM. In the last few years, the attention to AMM had increased as an attractive, low cost, treatment method, to prevent scaling deposition in desalination plant. A literature survey has been conducted at KISR on the effectiveness of AMM in preventing $CaCO_3$ scaling. It was concluded that the AMM can be considered as an effective method in controlling $CaCO_3$ scaling (Ben Salah, 2015; Cefalas et. al., 2010; Alimi et. al., 2009; Eliassen et al. 1985; Hasson and Bramson, 1985; Baker et. al., 1997; Sohnel and Mullin, 1988; Barrett and Barsons, 1998). Moreover, the result of literature survey confirmed that the AMM cannot totally prevent the formation of $CaCO_3$ crystals, but it can affect the scale formation process by increasing the retention or conducting time, producing crystals with different morphology (aragonite morphology), higher tendency for suspension and smaller in sizes, which can be carried out away with the brine water flow without Antiscalant treatment. Furthermore, it was found that the effectiveness of the AMM method in preventing precipitation of $CaCO_3$ was strongly affected by the chemical properties of the scaling solution, magnetic field strength (MFS), water temperature, and flow velocity (Busch et. al., 1986; Biochenko et. al., 1977; Gryta, 2011; Cai et. al., 2009; Gabrielli et al., 2000). Because of the lower operating cost of AMM and the encouraging results obtained from the literature survey, AMM was tested at desalination research plant (DRP), to assess the effectiveness of the AMM in retarding CaCO3 scaling deposition or increasing the induction time ((ß) at different operating temperatures, different feed water pH and different MFS to identify favorable operating conditions for effective $CaCO_3$ scale prevention. The chemical composition of Kuwait seawater used in the experiments is shown in Table 1, where about 51% of Kuwait seawater showed chloride ions and 29.4% sodium ions. Sulfate ions also compose a high percentage of Kuwait seawater. Scaling of $CaCO_3$ is the dominated scale expected to precipitate when Kuwait seawater is concentrated to one or more concentration factor, as expected by Staff and Davis saturation index, followed by scaling of calcium sulfate, barium sulfate, and strontium sulfate, but with less amount than $CaCO_3$ scaling.

PO_4^{3-}(mg/l)	0.23	0.0005

Experimental Procedures Description

The AMM testing unit was shown in Fig. 1. The test unit primarily consists of two tanks, A and B, fabricated from glass sheets and located inside two water baths to control the temperature of the tested solution. The testing unit also contained a variable speed pump, needle valves to control the flow, thermometers, a pH adjustment section, and a magnetic field section. The magnetic field section contains a permanent antiscalant magnets treatment unit (AMT)) as shown in Fig. 1 with north and south facing each other, as a source for the magnetic treatment around the pipe. The magnets were positioned orthogonally to the direction of the flow of fluid inside the pipe. Pairs were changed according to the magnetic field strength required. A Tesla meter was used to measure the strength of the magnetic field in each experiment. An automatic titrator, ion chromatography, spectrophotometer DRL/2000, and other instruments were used for analyzing scaling ions such as Ca^{2+} and HCO_3^- ions at the Doha Research Plant (DRP).

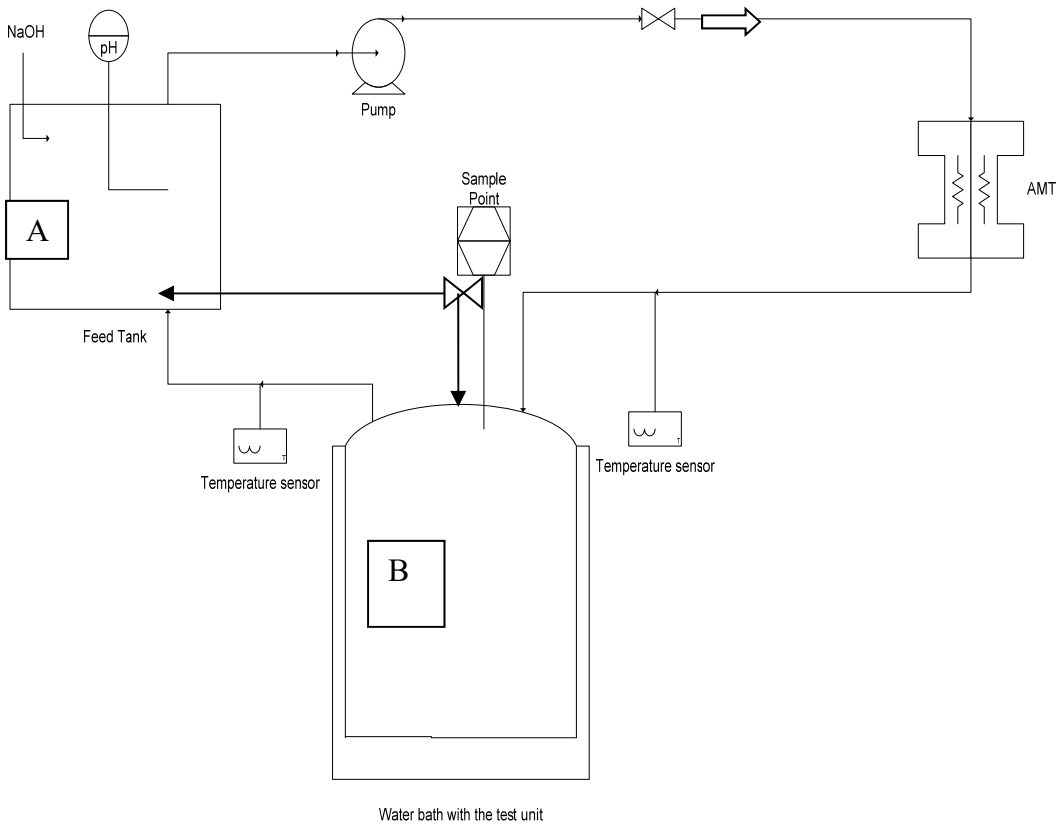

Fig.1. The antiscalant magnetic treatment testing unit.

The two tanks, A and B, are connected to each by a valve and a variable speed pump, which was used to pump the test solution from tank A to tank B, and to circulate the test solution through the magnetic fields at a controlled flow velocity. Both tanks A and B were installed inside a water bath to enable temperature controlling during the tests. Two types of solutions were mixed to prepare the required precipitated salt. Calcium carbonate precipitated scaling ($CaCO_3$) was prepared by mixing two solutions, which are 0.5 M of $CaCl_2$ and 0.5 M of Na_2CO_3. Na_2CO_3 solution was considered as the base solution for preparing $CaCO_3$ scaling. Hence, the base solution was prepared at tank A; while $CaCl_2$ was prepared at tank B. First, the pHs of both tested solutions were adjusted to a desirable value using acid. Then, the temperatures were heated to a required testing temperature before mixing the two solutions, using the water baths at both tanks A and B separately. Then, the base solution was circulated through the AMT unit to be magnetically treated without mixing with $CaCl_2$ solution in Tank B, using a controlled valve and variable speed pump, for almost one hour. Then, the solutions were mixed, and the mixing time was considered as time zero for scale formation, and then, the samples were drawn from tank B every minute for bicarbonate analysis to test the effectiveness of the AMT unit in retarding scale deposition and increasing ß. Thus, three MSF were tested (0T,0.48T and 0.96T) , three operating temperature (50, 70 and 90 ºC), two PH values (8.3 and 9.5) and different flow velocities (1.0, 0.5, 0.3, 0.1 and 0.03 m/s)

Results and Discussions

Calcium Carbonate Scaling

The performance of AMM in retarding $CaCO_3$ at a pH of 8.3 and variable magnetic field and operating temperatures, are shown in figs. 2 to 13. Figures 2, 3, and 4 shows the performance of AMM at 0.5 m/s flow velocity, while Figs. 5, 6 and 7 show the performance of AMM at a flow velocity of 0.3 m/s. However, the flow velocity of 0.1 and 0.03 is shown in Figs. 8 to 10 and Figs. 11 to 13 respectively.

Performance of Magnetic Treatment Method in Retarding Calcium Carbonate at a Flow Velocity of 0.5 m/s. The AMM was tested at three magnetic field strength which are 0 Tesla, (without magnetic treatment method), 0.48 Tesla and 0.96 Tesla. Although the differences between the three magnetic field is not too much clear in Figures 2 to 4. However, it is clear that the ATM decreased the potential for calcium carbonate scaling, and the power for retarding calcium carbonate by AMM can be increased when the applied magnetic field strength (MFS) is increased.

The AMM increased ß for calcium carbonate scaling at a concentration of 1000 mg/l of HCO_3^- from less than 3 min to 5 min at 0.96 T magnetic fields. Moreover, it can retard the carbonate scaling at a concentration of 800 mg/l of HCO_3^- for about 45 min as shown in Fig. 2, when compared to 12 min without applying AMM with increment equal to 2.75 times. The increment in ß is calculated as follows:

$$\text{Increment in ß} = \frac{\text{The retention time ß under AMM} - \text{retention time ß without AMM}}{\text{Retention time ß without AMM}}$$

Thus, it is clear that AMM is a selective treatment. However, knowing that the bicarbonate concentration in Kuwait seawater does not exceed 200 mg/l (Salman et. al., 2013), this implies that the AMM could be effective in retarding calcium carbonate scaling. Figs. 3 and 4 show the performance of AMM in retarding calcium carbonate concentration under pH 8.3 and flow velocity of 0.5 m/s and a temperature of 70°C and 90°C. Both figures show that the AMM could increase ß for about 50 min instead of 12 min without AMM at a concentration of 800 mg/l of calcium carbonate scaling, which represent an increment of 3.16 fold as shown in Figs 3 and 4 under 0.96 T. ß was increased to 60 min when the operating temperature was increased from 70°C to 90°C as shown in Fig. 4.

Performance of Magnetic Treatment Method in Retarding Calcium Carbonate at a Flow Velocity of 0.3 m/s. Figs. 5, 6, and 7 show the performance of AMM at different operating temperatures and different magnetic fields under 0.3 m/s of flow velocity.

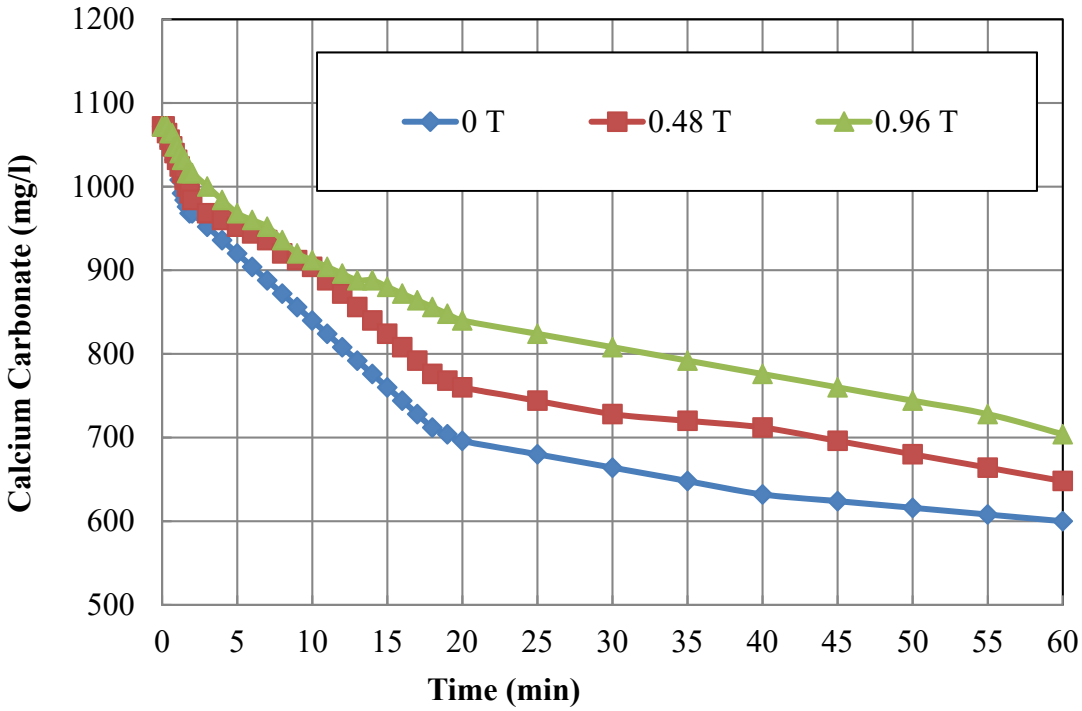

Fig. 5. Calcium carbonate concentration at 0.3 m/s velocity, pH 8.3, and 50°C at different magnetic field.

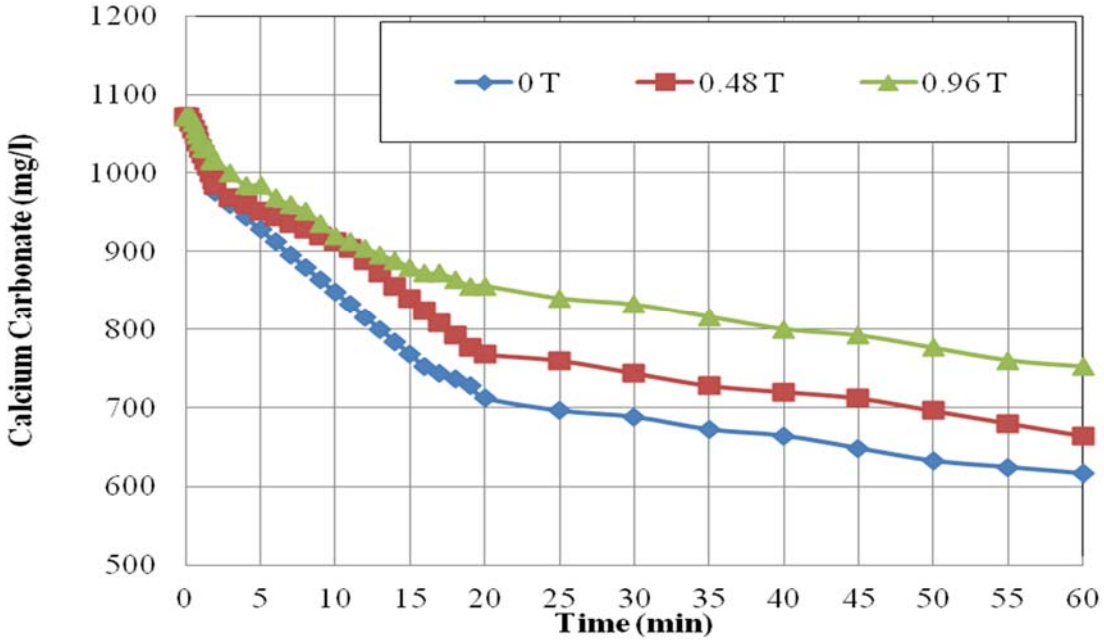

Fig.6. Calcium carbonate concentration at 0.3 m/s velocity, pH 8.3 and 70°C at different magnetic field.

 Copyright © International Science and Technology Conference (ISTEC)

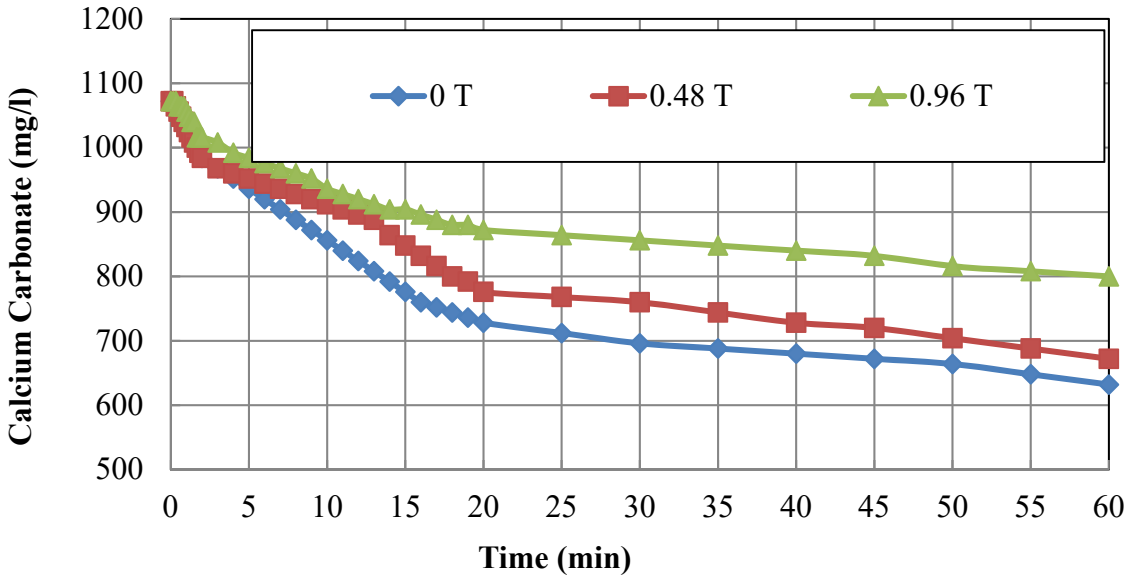

Fig.7. Calcium carbonate concentration at 0.3 m/s velocity, pH 8.3 and 90°C at different magnetic field.

From Figs 5, 6, and 7, it is clear that the AMM succeeded in increasing the retention time from 11 min at 800 mg/l of calcium carbonate concentration to about 35 min at 0.96 T and an operating temperature of 50° C as shown in Fig. 5. Moreover, ß was increased from 12 min without AMM to about 40 min at an operating temperature of 70°C and 0.96 T as shown in Fig. 6. The ß at 800 mg/l of calcium carbonate concentration was increased from 14 min to 55 min as shown in Fig. 7.

Performance of Magnetic Treatment Method in Retarding Calcium Carbonate At a Flow Velocity of 0.1 m/s. Figs. 8, 9, and 10 show the performance of AMM at different operating temperatures and different magnetic fields under 0.1 m/s flow velocity.

From Figs. 8, 9, and 10, it is clear that the effective concentration level was decreased from 800 mg/l to about 700 mg/l, where noticeable rice in retention time can be found. The increment in ß at 800 mg/l was almost small and did not exceed 7 min at 0.96 T and an operating temperature of 90° C. However, at a concentration of 700 mg/l, marked rise in retention time ß was noticed. This implies that the performance of AMM decreased strongly, with a decrease in flow velocity, than that of a reduction in operating temperatures.

The AMM succeeded in increasing the ß from 17 min at 700 mg/l of calcium carbonate concentration to about 35 min at 0.96 T and an operating temperature of 50° C as shown in Fig. 8. Moreover, the retention time ß increased from 19 min. without AMM to about 35 min. at an operating temperature of 70°C and 0.96 T as shown in Fig. 9 at the same level of calcium carbonate concentration. However, at 90°C as shown in Fig. 10, the retention time ß at 700 mg/l of calcium carbonate concentration increased from 19 min to 40 min, which is an increase of 110.5 %.

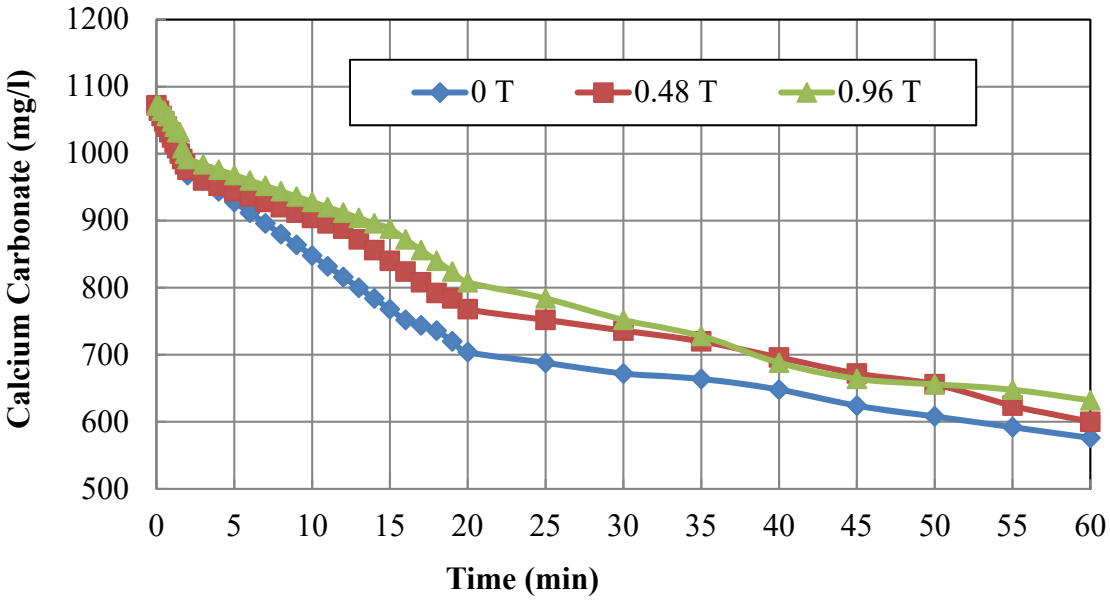

Fig.10 . Calcium carbonate concentration at 0.1 m/s velocity, pH 8.3, and 90°C at different magnetic field.

Performance of Anti-Scale Magnetic Treatment Method in Retarding Calcium Carbonate at a Flow Velocity of 0.03 m/s. Figs. 11, و12 and 13 show the performance of AMM at different operating temperatures and at different magnetic fields under 0.03 m/s flow velocity.

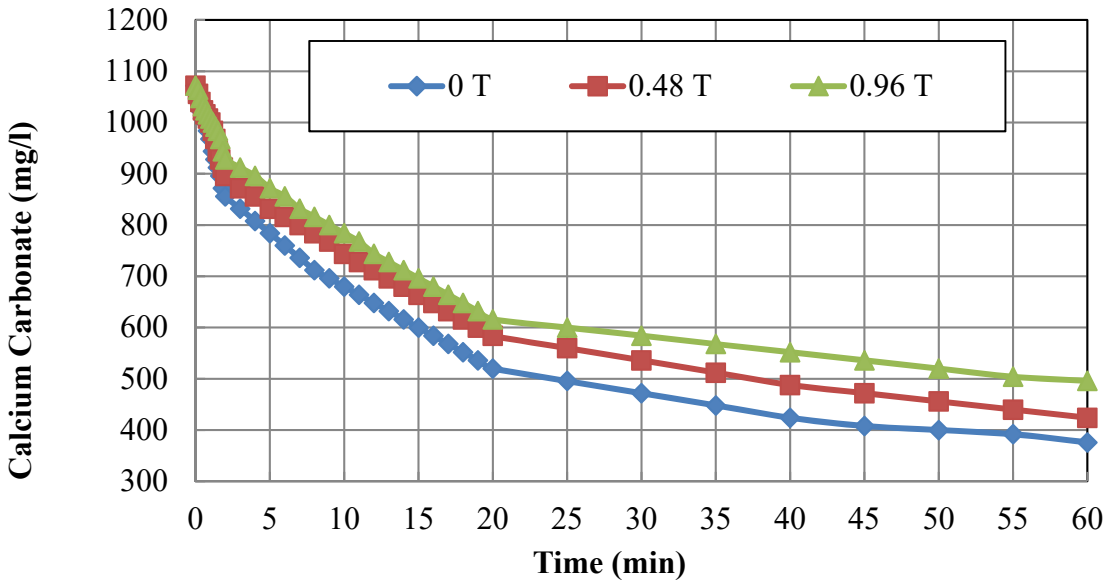

Fig.11. Calcium carbonate concentration at 0.03 m/s velocity, pH 8.3 and 50° C at different magnetic field.

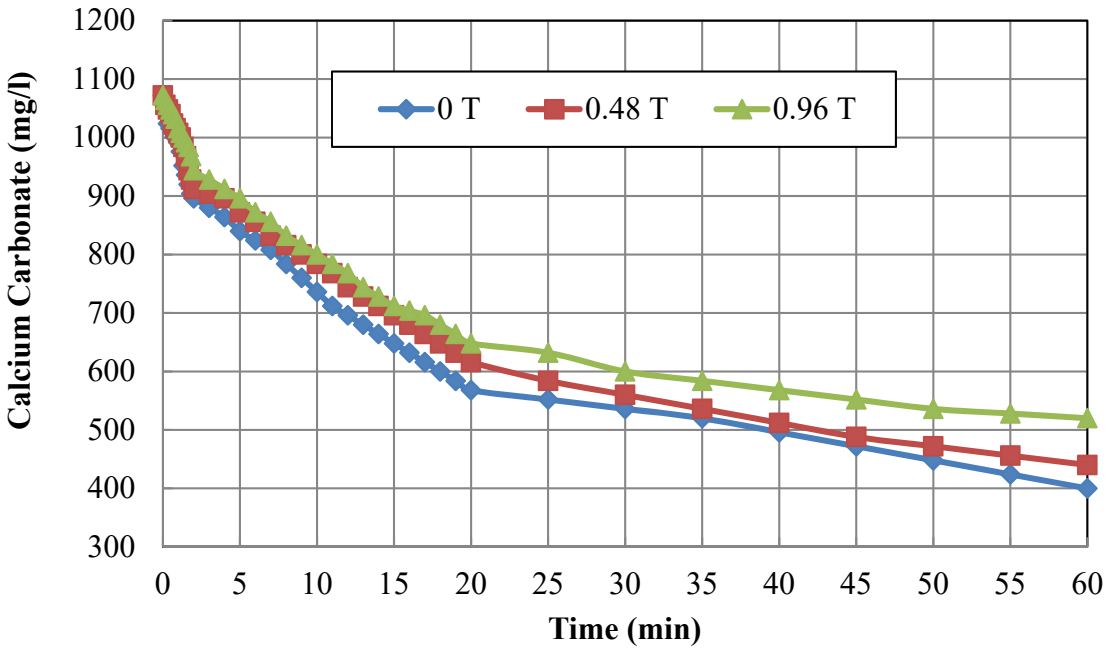

Fig. 12. Calcium carbonate concentration at 0.03 m/s velocity, pH 8.3 and 70° C at different magnetic field.

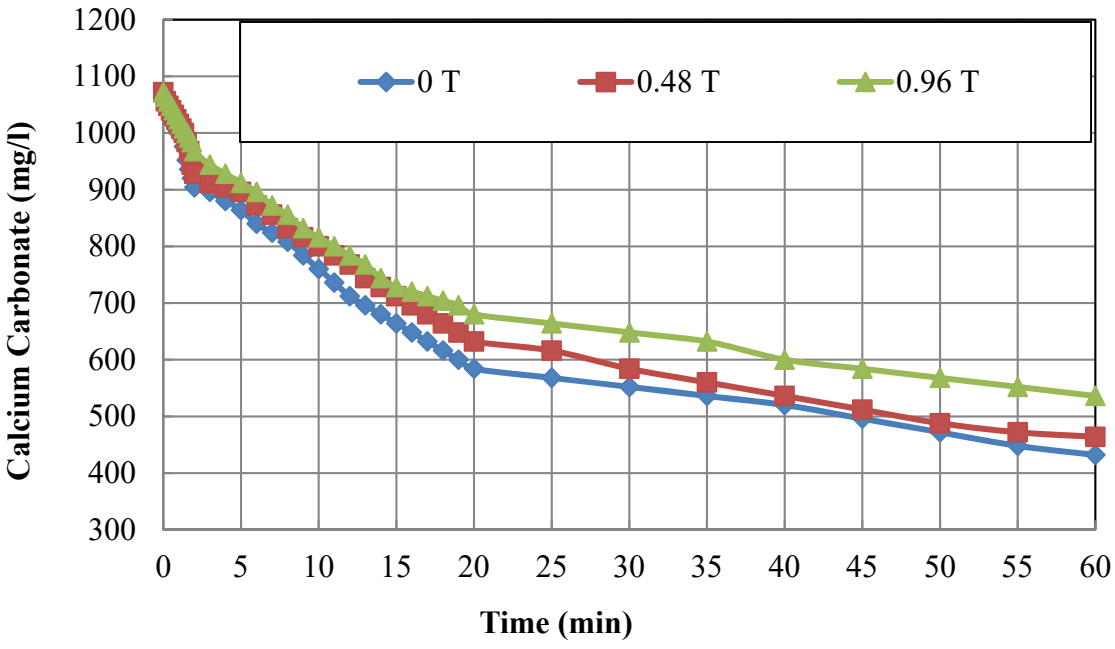

Fig.13 . Calcium carbonate concentration at 0.03 m/s velocity, pH 8.3 and 90° C at different magnetic field.

 Copyright © International Science and Technology Conference (ISTEC)

From Figs. 11, 12, and 13 it is clear that the effective concentration level reduced from 700 mg/l at flow velocity of 0.1 m/s to about 500 mg/l at a flow velocity of 0.03 m/s, where a noticeable increment in the retention time can be found. Thus, the increment in ß at 700 mg/l was almost small and did not exceed 7 min at 0.96 T and operating temperature of 90°C. However, at a concentration of 500 mg/l, a big increment in retention time can be noticed. This confirms the fact concluded before, where the performance of AMM decreased more strongly with a decrease in flow velocity, than that of the decrease in operating temperatures or a decrease in magnetic field strength.

The AMM succeeded in increasing the retention time from 20 min at 500 mg/l of bicarbonate concentration to about 55 min at 0.96 T and an operating temperature of 50°C as shown in Fig. 11. Moreover, the retention time increased from 20 min without AMM to about 55 min. at an operating temperature of 70°C and 0.96 T as shown in Fig. 12 at a concentration level of 550 mg/l of bicarbonate. However, at 90°C as shown in Fig. 13, the retention time at 700 mg/l of bicarbonate concentration increased from 19 min to 40 min, which represents an increment of 110.5 %.

Performance of Magnetic Treatment Method in Retarding Calcium Carbonate at pH of 9.5. Figures 14 to 16 show the performance of the AMM at a flow velocity of 0.5 m/s at different operating temperatures at different magnetic field strengths and a higher pH of 9.5.

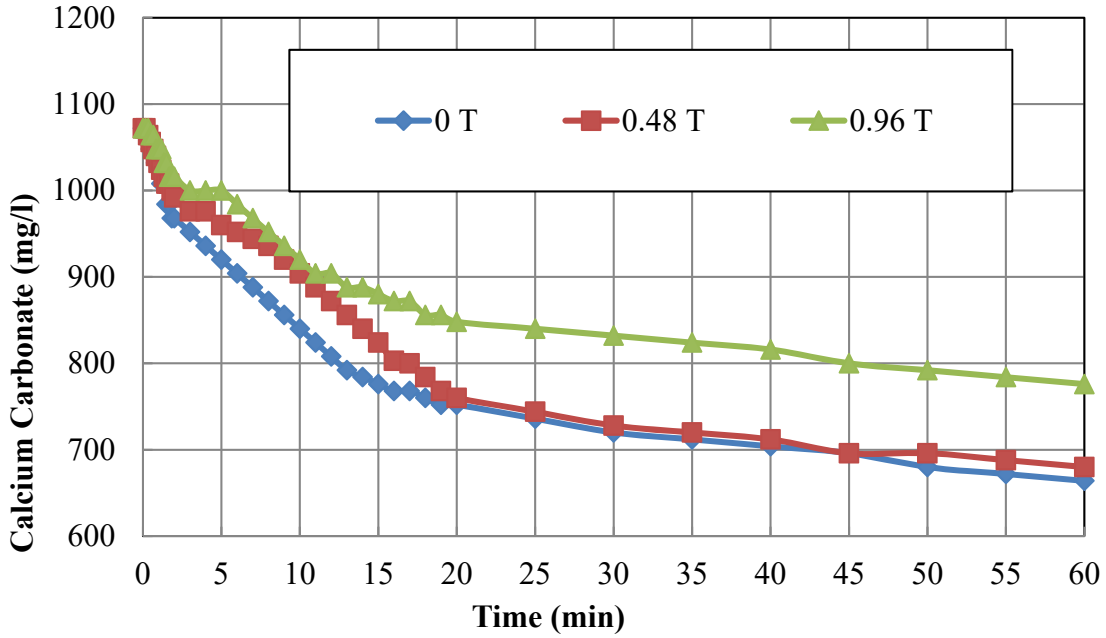

Fig.14. Calcium carbonate concentration at 0.5 m/s velocity, pH 9.5, and 50°C at different magnetic fields.

Abstract: This research was designed to see how much importance is given by architecture students to building physics in the process of architectural project development. In this scope heat-moisture, air circulation (wind control/natural ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics and noise control, building biology, ecology and fire insulation were defined as criteria related to building physics. In the scope of the study, 100 students out of the 217 volunteers from Bursa Orhangazi University, Architecture and Design Faculty, Architecture Department during the 2015-2016 education year, were asked to rate each criteria. At the end of the study it has been understood that students were highly sensitive and had a high level of awareness and sensitivity on this subject.

Abstract: This article aims to set out architecture students' preferences on architectural design studio in terms of building physics in the process of architectural project development. In this scope heat-moisture, air circulation (wind control/natural ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics and noise control, building biology, ecology and fire insulation were defined as criteria related to building physics. In the scope of the study, 100 students out of the 217 volunteers from Bursa Orhangazi University, Architecture and Design Faculty, Architecture Department during the 2015-2016 education year, were asked to rate each criterion according to what they thought about the importance of the criterion and had a high level of awareness and sensitivity on this subject.

Keywords: Architectural Design Studio, Architecture Students' Preferences, Building Physics

The result showed a similar performance of AMM at 9.5 to that at pH 8.3. At pH of 9.5, the AMM effectiveness was found to be increasing with increasing magnetic field from 0.48 T to 0.96 T as shown in Fig. 14. This trend was observed also at 70 and 90°C (Figs. 15 and 16).

It is clear from Fig. 14that the AMM at pH 9.5 and flow velocity of 0.5 m/s increased the retention time at 800 mg/l from 12 min to about 45 min using 0.96 T magnetic fields with an increment of 2.75 equal to exactly the increment at a pH 8.3. On the other hand, the retention time increased from 12 to about 55 min at 800 mg/l concentration as shown in Fig. 15. However, the AMM could increase the retention time at 800 mg/l from 14 min to about more than 60 min, as shown in Fig 16. Hence, we can conclude that the AMM shows the same performance at a pH of 8.3 and 9.5.

Critical Flow Velocity Using Magnetic Treatment Method for Retarding Calcium Carbonate. Table 2 summarizes the performance of AMM at different flow velocities where it is clear that the critical velocity was 0.5 m/s for calcium carbonate scaling, and when the flow velocity exceeded this value, the AMM was not a more effective method in retarding carbonate scale as shown in Table 2.

Table 2. The Effect of Different Flow Velocity on the Performance of Magnetic Treatment Method for Retarding Calcium Carbonate Scaling Solution

Flow Velocity (m/s)	Effectiveness
1.0	No effect
0.5	Effective
0.3	Effective
0.1	Effective
0.03	Effective

The performance of AMM in retarding calcium carbonate at different flow velocities is presented in Figs. 17, 18, and 19 for four flow velocities (0.5, 0.3, 0.1, and 0.03) and the three operating temperatures as 50, 70, and 90°C.

Fig. 17 shows the performance of AMM at 50°C; while Figs. 18 and 19 show the performance of AMM in retarding calcium carbonate at 70 and 90°C, respectively.

It is clear from Fig. 17 that the effective concentration decreased as the flow velocity decreased, where at 0.5 m/s, the effective concentration was 800 mg/l which decreased to 500 mg/l at a flow velocity of 0.03 m/s.

It can be concluded from Fig. 17 that the performance of AMM improved when the flow velocity increased from 0.03 m/s to 0.1, then to 0.3, until a critical flow velocity, equal to 0.5 m/s was reached. After the critical flow velocity, the effect of AMM would be demolished.

Figures. 18 and 19 confirm the fact that as the flow velocity increased, the effectiveness of AMM in retarding calcium carbonate increased. Furthermore, Figs. 18 and 19 confirm the effect of temperatures, where, as the operating temperature increases, the performance of AMM improved.

Performance of Magnetic Treatment Method in Retarding Calcium Carbonate at Different Operating Temperatures. Figures. 20, 21, 22, and 23 show the effect of different operating temperatures on the performance of AMM under the highest magnetic field strength at 0.96 T and a pH of 8.3, and different operating temperature.

It can be concluded from Fig. 20 that when the flow velocity was low at 0.03 m/s, the calcium carbonate scaling can be retarded for about 20 min at 50°C and a concentration of 600 mg/l, the retention time increased to 30 min when the operating temperature increased to 70°C. However, the retention time increased to 40 min when the temperature increased to 90°C.

Keywords: Architectural Design Studio, Architecture Students' Preferences, Building Physics

It was found that from previous Figs. 23, 24, 25, and 26, the effect of pH on the performance of AMM in retarding calcium carbonate at high flow velocity (0.5 m/s) was negligible, where a similar effect was found in Figs. 24, 25, and 26. Hence, pH cannot be considered an effective parameter on the performance of AMM in retarding calcium carbonate scaling.

Conclusions

Based on the test results and data analysis, the following conclusions have been derived.

- It was confirmed that the effectiveness of AMM increased as the magnetic field strength increased.
- The performance of AMM in retarding calcium carbonate could depend on different parameters as flow velocity, operating temperatures, and magnetic strength.
- AMM decreased the potential of calcium carbonate scaling, at a concentration of 800 mg/s of calcium carbonate and at a flow velocity of 0.5 m/s by a three-fold increase.
- The power to retard calcium carbonate using AMM increased when the applied magnetic field was increased.
- The power to retard calcium carbonate using AMM increased when the operating temperatures were increased.

 Copyright © International Science and Technology Conference (ISTEC)

- AMM was effective in retarding calcium carbonate at a concentration level of 700 mg/l when the flow velocity was 0.1 m/s. However, the effective concentration level decreased to 500 mg/l as the flow velocity decreased to 0.03 m/s.
- The flow velocity is the key parameter of the performance of AMM in retarding calcium carbonate, while other effecting parameters had lower effect on the performance of AMM in retarding calcium carbonate.
- The performance of AMM in retarding calcium carbonate scaling at pH 8.3 and 9.5 was found to be similar, and the pH cannot be considered an effective parameter on the performance of AMM in retarding calcium carbonate scaling.

Abstract: This research was designed to see how much importance is given by architecture students to building physics in the process of architectural project development. In this scope heat-moisture, air circulation (wind control/natural ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics, and noise control, building biology, ecology, and fire insulation were defined as criteria related to building physics. In the scope of the study, 100 students out of the 217 volunteers from Bursa Orhangazi University, Architecture and Design Faculty, Architecture Department joined the 2015-2016 academic year architectural design studio criteria. At the end of the study it has been understood that students were highly sensitive and had a high level of awareness and sensitivity on this subject.

Sol-gel process is one of methods of manufacturing inorganic and hybrid organic-inorganic material. Hybrid material comprises two different substances at the molecular scale. Sol-gel method begins processing with a solution containing components for the desired source material. Initially, the solution upon the formation of polymers and fine colloidal particles (sol) is obtained and then sol is converted to a gel. Solution was converted to gel at low temperatures, then given the desired shape with the mounting, coating and fiber drawing methods. Then to get the desired product is obtained by heating at high temperature from dried gel.

Copper, silver, zinc solid metals and their ions are known to antibacterial. Especially silver has a broad antibacterial spectrum of these substances. Silver shows high levels of toxic properties against bacteria, but less toxic to humans. Silver has been a material known to be used for sanitary and medical purposes since ancient times. In recent years, there have been many research on the antibacterial silver-doped materials.

In this study, silicate-based thin films containing Ag + contribution were prepared by sol-gel method and the antibacterial properties of films have been investigated. For this purpose, non-Ag contribution and rates varying between 1% and 5% Ag + doped antibacterial films were prepared by spin coating method on the glass surfaces. The prepared samples were cultivated bacteria Staphylococcusaureus and bacterial colony counts were performed at 0., 6.,12., and 24. hours. As a result of antibacterial tests, when silver ions increase in the samples, numbers of bacterial colonies were observed to have disappeared quickly. In addition, crystallographic structure of thin coatings were examined by XRD instrument, also the thin films microstructures were determined by SEM instrument.

Introduction

Architectural design studios aim to create a connection between theory and implementation in the architecture education programs. Architectural design studios are central parts of and create the foundation of architecture education programs (Schön, 1985; Kuhn, 2001; Oh, Ishizaki, Gross, Yi-Luen, 2013). Architectural Design classes contain many fields, which are integrated to architecture training throughout the education process. Architectural designs not only depend upon context, topography, information of the physical environment, construction, materials and details, but also on features that can be considered as a part of the building physics such as heat-humidity, air circulation (control of wind/natural ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics and noise control, building biology and ecology, and fire insulation. But when observed from the point of view of an architectural design class administrator, the general belief during the education process is that technical matters related to buildings and building physics remain in the background when compared with the architectural design process, and that there are some difficulties in integrating information related to building physics to architectural design project (Erbil Y., 2009). In order to overcome this difficulty, approaches that are based on performance come to the forefront in which technical information is considered together with the design problem. In this approach a building is examined as a system and students are thought that even small decisions can have an impact on the whole building. This way the building physics, which cause performance deficiencies, are brought to the agenda and evaluated during taking design decisions. This aims to provide the students the ability to integrate all the information students gather with their designs (Altun et al., 2006). This study will examine the importance given by architectural design studio students to buildings physics.

Materials and Methods

This study was designed to understand how much importance is given to building physics criteria by architecture students during architectural project development process. In the scope of this research a survey was implemented, which was prepared by the authors. There were 18 questions in the survey. The questions were related to heat-humidity, air circulation (control of wind/natural ventilation), solar power (usage/protection),

Results and Discussion

When the demographic findings of the survey are examined it has been seen that 74% of the students are women and 26% of the students are men. When the demographic findings of the survey are examined it has been seen that 24% of the students are 18 years old, 46% are 19 years old and 30% of the students are 20 years old.

Within the scope of the questionnaire, architecture students were asked to rate the importance of building physics criteria they encounter while designing their architectural design projects. According to the questionnaire, the building physics criteria of architecture students could be followed under the eight sections. These criteria were related to heat-humidity, air circulation (control of wind/natural ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics and noise control, building biology and ecology, and fire insulation criteria and students were required to present how much they value each statement related to the criteria.

Heat-humidity: Related to the heat-humidity criteria the following answers were given to the following statements: "I care about integrating heat insulation in my projects"; 16% very great importance, 38% great importance, 31% moderate, 15% little importance and 0% very little importance. "I care about profiles' and glass' heat performance"; 18% very great importance, 26% great importance, 36% moderate, 12% ü little importance and 8% very little importance. "I care about the heat performance of building structures such as walls, tiling, doors and windows"; 18% very great importance, 26% great importance, 36% moderate, 23% little importance and 8% very little importance. "I care about designing my projects with simple plans and compact form to reduce heat dissipation and energy consumption"; 11% very great importance, 20% great importance, 29% moderate, 34% ü little importance and 6% very little importance (Figure 1).

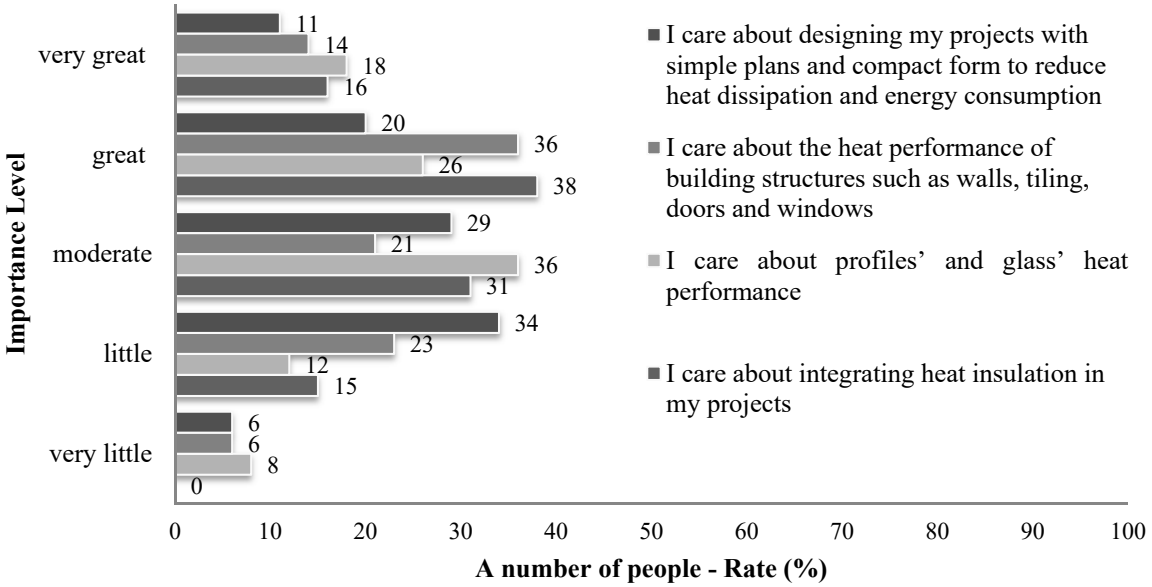

Figure 1. Architecture students' preference on "heat-humidity insulation" in percentages

Air circulation (wind control/natural ventilation): Related to the air circulation (wind control/natural ventilation) criteria the following answers were given to the following statements: "I care about creating adequate natural ventilation in my projects"; 25% very great importance, 45% great importance, 19% moderate, 9% little importance and 2% very little importance (Figure 2).

Conclusion

The building physics lessons in the scope of the architecture curriculum in Turkey aims to establish the required comfort conditions that enable people to be healthy and productive. In Turkey, building physics lessons are imperative in undergraduate programs. Also there are selective classes related to this subject. In accordance with these data the level of significance score was voted within -2 and +2. In this regard the findings from this study are summarized below (Table 1). The findings indicate that all the building physics criteria were highly valued by the students. However even though building physics lessons are in the curriculum as elective and imperative classes they are mostly not adequate and students find it hard to integrate their building physics knowledge to architectural projects.

Abstract: This research was designed to see how much importance is given by architecture student to building physics in the process of architectural project development. In this research, adequate natural ventilation (natural ventilation, control/avoid ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics and noise control, building biology, ecology and fire insulation were defined as criteria related to building physics. In the scope of the study, 100 students out of the 217 total students from Bursa Orhangazi University, Architecture and Design Faculty, Architecture Department during the 2015-2016 education year, were asked to rate each criteria. At the end of the study it has been understood that students were highly sensitive and had a high level of awareness and sensitivity on this subject.

Keywords: Architectural Design Studio, Architecture Students' Preferences, Building Physics

Table 1. Evaluation Results of Level of Significance

BUILDING PHYSICS CRITERIA	STATEMENTS	LEVEL OF SIGNIFICANCE Positive	Negative
Heat-humidity	I care about integrating heat and humidity insulation into my project	+55	
	I care about the insulation performance of joineries and glasses	+50	
	I care about the heat performance of building components such as walls, tiling, windows, doors, etc.	+29	
	I care about designing simple and compact projects to reduce heat dissipation and energy consumption	+7	
Air circulation	I care about creating adequate natural ventilation when I determine the windows in my projects	+82	
Solar power	I care about designing buildings in which I can use renewable energy sources	+46	
	I care about placing the buildings that I design in a way that enables the building to use sun for heating and wind for cooling and ventilation.	+73	
Indoor air quality	I care about creating adequate natural ventilation when I determine the windows in my projects	+37	
Natural and artificial lighting	I care about natural and artificial lighting in my designs to ensure visual comfort conditions are created	+83	
Building acoustics and noise control	I care about creating designs that create audial comfort conditions	+71	
Building biology and ecology	I care about designs that preserve the land's natural contours and that harms the soil to the least amount	+84	
	I care about collecting and using rainwater	+34	
	I care about using botanical natural materials (wood, straw, fungi etc.) in my designs	+48	
	I care about using local materials in my designs	+51	
	I care about using materials that have low embodied energy in my designs	+24	
	I care about reusing recycled or recovered building materials or components in my designs	+14	
Fire insulation	I care about taking fire insulation precautions in my designs	+71	

Level of significance: very great importance 2, great importance 1, moderate 0, little importance -1, very little importance -2

When the results of the survey are taken into consideration, it has been seen that the level of awareness and the sensitivity of the students on this subject is high on the subject. In order to increase this level, approaches that help architecture students to understand building physics and that encourage them to increase their knowledge in this area should be employed when project subjects are selected in design studios.

Öz: Çalışmamızın konusu Osmanlı İmparatorluğu'nun Balkanlardaki gerilemesinin sosyolojik analizini yapmaktır. Osmanlı İmparatorluğu kısa sürede Balkanlara yerleşmiş, ancak bu bölgeden tamamen çıkması çok uzun sürmüştür. Tarihte imparatorluklara bakıldığında genellikle en geniş sınırlarına ulaşmalarına kadar geçen zaman ile gerilemenin gerçekleştiği zaman arasında ilkinin ağır bastığı bir oran görülür. Ancak Osmanlı İmparatorluğu'nda durum aksi bir oluşum görülecektir. Özellikle Balkanlar'da bu oran çok daha belirgindir. Bu çalışma bu problemden hareketle, devşirme sistemi, Balkanlardaki şehirleşme, yapı, sokak ve tasavvufi oluşumlar bütününde bu duruma açıklama getirmektedir.

Anahtar Kelimeler: Osmanlı, Balkanlar, devşirme sistemi, vakıflar, tasavvuf.

Abstract: This research aims to analyze the sociological decline of Ottoman Empire in the Balkans. Although Ottoman Empire settled in the Balkans in a short time, it took a very long time to withdraw from there completely. In the history, the ratio between the time when empires reached their widest borders and the time when they started to decline is usually in favor of the former. However, the Ottoman Empire is an exception to this rule. This is especially true for the Balkans. This study aims to explain this situation by examining the devshirme system, urbanization in the Balkans, and architectural, mystical and social formations in general.

Keywords: Ottoman, Balkans, devshirme system, vakıfs, mysticism.

Giriş

Osmanlı Devleti ile ilgili her alanda yapılan çalışmalar tasnif edildiğinde kuruluş ve yükselme devri üzerine çalışmaların belirgin bir üstünlük taşıdığı görülecektir. Tarihimizle ilgili ilk akla gelen ve duymak istediklerimiz genelde fütuhat olmuştur. Gerek lise tarih derslerimizde, gerek küçüklere tarih hikayelerinde genellikle büyük zaferlerden bahsedilir, ancak yenilgiler üstünkörü anlatılır, geçiştirilir. Kanunî'ye kadar olan sultanlar bir çırpıda sayılabilirken, duraklama devri sonrasında bu sıra çok kimsede şaşmaktadır.

Söz konusu refleksler toplum psikolojisi açısından anlaşılır bir durum kabul edilebilir. Eşyanın tabiatı gereği üstünlük, zaferler, olumlu yönler görülür, aksi durumlar bastırılır. Bu nedenle bir Osmanlı refleksi olarak gerileme döneminde yaşananlar psikolojik bir savunma mekanizması olarak bastırılmaya tabi tutulmuştur. Osmanlı'nın kuruluş ve yükselme devri gerçekten takdire şayan zaferlerle doludur. Gerek İstanbul'un Fethi'ne kadarki Balkanlar'da gerçekleşen başarılar, gerekse Fetih sonrası birbirinden parlak yükselme devri padişahları dönemleri, milli duyguları kabaracak zaferlerle doludur. Bunun yanı sıra Sokollu'nun ölümünden sonra girilen duraklama dönemi sürecinden itibaren aynı hislerle moral bozucu süreçler yaşanmıştır. Ancak Osmanlı İmparatorluğu'nun gerileme ve çöküş dönemi tabir ettiğimiz tarih aralıkları gerçek anlamıyla incelendiğinde, yaşanan sürecin bir yenilginin aksine kendine özgü bir başarı süreci olduğu görülecektir. Ve Osmanlı'nın gerileme dönemi gerçekte bir açıdan bakıldığında sanıldığının aksine farklı bir zafer niteliği taşımaktadır. Bu çalışmamızda söz konusu zaferin anlamını ortaya koymaya ve Osmanlı İmparatorluğu'nun Balkanlardaki gerileyişinin sosyolojik analizini yapmaya çalışacağız. Belli bir perspektifle bakıldığında bir devlet için olumsuz bir durum olan gerileme ve çöküş süreci, kendi içinde nasıl bir başarı öyküsü olarak kabul edilebilir ve bu durumun siyasal ve sosyal nedenleri nelerdir sorunsalı çalışmamızın ana eksenini oluşturacaktır.

Osmanlı'nın Avrupa'daki Görüntüsü

Bilindiği üzere Osmanlı bir beylik olarak Anadolu'nun Bitinya ucu tabir edilen bölgesinde kurulmuş ve ilerlemesini kuruluş döneminde sürekli batıya doğru gerçekleştirmiştir. Ve denilebilir ki Osmanlı'nın hızlı ilerlemesinin en önemli sebebi, diğer beyliklerden farklı olarak Bizans sınırında yerleşmiş olması ve nedenle beylikler arası mücadele yerine "gaza" fikriyle "küffara karşı" bir mücadeleye girmiş olmasıdır. (Kemal Tahir, 1967) Bu durum Anadolu içinden birçok unsurun da Osmanlı Beyliği'ne katılmasını ve giderek büyüyen bir kitle ile beyliğin kuruluş dönenimde bir "gaziler birliği" haline gelmesini sağlamıştır. (Wittek, 2000) Bu nedenle hızlı bir ilerleme sağlanacaktır. Osmanlı'nın Rumeli'ye geçişi 1352 yılında Çimpe Kalesi'nin alınması ile başlar. Kuruluşundan 50 yıl sonra Osmanlı Beyliği bu şekilde Balkanlara geçişin toprak kazancı anlamında ilk adımını atmıştır. Balkan fütuhatını sırasıyla Sırpsındığı (1364), I. Kosova (1389), Niğbolu (1396), Varna (1444) ve II. Kosova (1448) savaşları izler. Bu son savaşla birlikte Balkanlarda Osmanlı egemenliği tam anlamıyla tesis edilmiştir ve II. Viyana Kuşatması'na kadar da bölgede diğer dönemlere oranla daha sakin ve huzurlu bir ortam söz konusudur. Viyana ile başlayan duraklama ve ardından gelen yenilgiler serisi ve toprak kaybı çöküş sürecine kadar devam etmiştir. Bu süreç sonunda Avrupa'daki topraklar tamamen elden çıkmış, 1912-1913 Balkan Savaşları sonucunda Balkanlar kaybedilmiş ve Osmanlı İmparatorluğu'nun Rumeli'deki toprakları önce Midye-

Abstract: This research was designed to see how much importance is given by architecture students to building physics in the process of architectural project development. In this scope heat-moisture, air circulation (wind control/natural ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics and noise control, building biology, ecology and fire insulation were defined as criteria related to building physics. In the scope of the study, 100 students out of the 217 volunteers from Bursa Orhangazi University, Architecture and Design Faculty, Architecture Department during the 2015-2016 education year, were asked to rate each criteria. At the end of the study it has been understood that students were highly sensitive and had a high level of awareness and sensitivity in this subject.

Keywords: Architectural Design Studio, Architecture Students' Preferences, Building Physics

Enez hattı sonra bir miktar daha ötesi dâhil edilerek Edirne, Tekirdağ ve Kırklareli sancakları ile sınırlı kalmıştır. Yükselme Devri'nde Balkanlardaki toprakları Anadolu'dan daha fazla olan ve bir *"Balkan İmparatorluğu"* olarak nitelendirilebilecek Devlet'in elinde 1913 sonrasında bu bölgede üç vilayetlik bir toprak parçası kalmıştır. Birinci Dünya Savaşı sonunda da Balkan Değu Eden çıkacak ve Osmanlı İmparatorluğu yeniden Anadolu'ya sıkışacaktır.

Yukarıdaki kısa Balkanlar kronolojisi üzerinden basit bir matematik hesabı yapacak olursak sözünü ettiğimiz Osmanlı gerilemesinin aslında bir başarı hikâyesi olduğu daha net ortaya çıkacaktır. Kuruluşundan en geniş sınırlara ulaşmasına kadar geçen süre yaklaşık 300 yıl olan İmparatorluk, bu noktadan yıkılışa gene 300 yılda gelmiştir. Kendinden önceki özellikle Orta Asya Türk devletleri tarihine bakıldığında aradaki fark belirgin şekilde görülecektir. Çok kısa sürede çok geniş topraklara yayılan devletler, genellikle en parlak hükümdarlarından sonra çok kısa sürede çöküş sürecine girmişlerdir. Ki, biz bu hesabı 1299 tarihinden bakarak yapmaktayız. Bilindiği gibi 1402 tarihinde Ankara Savaşı'nda Devlet dağılmış, Fetret Devri'nin ardından yeniden kurulmuştur. Bu tarihten baz alınırsa 1402-1595 arası gerileme, 1595-1922 arası ise toprak kaybetme dönemi olacaktır ki, 200 yıla 300 yıllık bir oran ortaya çıkacaktır. İlaveten söylenecek çok önemli bir gerçek de şudur ki, 1402 bozgunundan sonra Osmanlı'dan bağımsızlığını kazanarak Anadolu'da beylikler yeniden kurulurken Balkan toprakları hiçbir şekilde elden çıkmamış, fethedilen bölge halkları bağımsızlık telaşına düşmemişlerdir. Bir devletin gerileme ve çöküşünün 300 yıl sürdüğü tarihte başka çok az sayıda örnek bulunmaktadır. Osmanlı'nın parçalanma dönemi olarak nitelendirilebilen 19. yüzyılda adına *"güneş batmayan imparatorluk"* denilen İngiliz İmparatorluğu doğmuş, büyümüş ve dağılmıştır. Bu anlamda Batı'da belli bir süre dünya egemenliğini temsil eden bir ülke bile Osmanlı'nın sadece çöküş dönemi kronolojisine sığabilmektedir.

Konunun bir diğer boyutu ve daha dikkat çekici yanı Balkanlar olacaktır. Matematik hesabını Balkanlar yönünden yapacak olursak daha çarpıcı bir sonuç ortaya çıkmaktadır. Osmanlı Devleti'nin Balkanlardaki hâkimiyetinin tam anlamı ile tesis edilmesi ve Avrupalıların Türkleri Avrupa dışına atma ümitlerinin tamamen kaybolması Varna (1444) ve II. Kosova (1448) Savaşları ile sağlanmıştır. Kronolojiyi 1299'dan başlatırsak yaklaşık 150 yıl içinde Balkanlar Osmanlı egemenliğine girmiş, ancak 450 yılda bu egemenlik son bulmuştur. Bu, büyük çoğunluğu farklı dinden olan ve fetihle ele geçirilen bir alanda idaresini tesis eden bir devlet için mucize kabilinden bir durumdur. 150 yılda ele geçen topraklar 450 yılda elden çıkmıştır. Hızlı bir fetih sürecine karşı, toprak kaybı üçte bir zaman oranında gerçekleşmiştir ki, bu oran tarihte hiçbir devlette yoktur.

Yukarıda belirttiğimiz kronolojik detaylar, *"Balkanlar sosyolojisi"* üzerine dikkatle eğilmemizi gerektirmektedir. Tarihte eşi benzeri görülmemiş bu çekilme öyküsü, yalnızca askeri bir direniş değil aynı zamanda derin bir sosyolojik analiz gerektiren bir durumdur. Balkanlardan daha büyük Orta Doğu toprakları tek bir savaş sonunda, yalnızca dört yıl içinde elden çıkarken dört yüz elli yıl süren direniş sürecinin hassasiyetle incelenmesi gerekir. Burada bunun nedenlerini ortaya koymaya çalışacağız.

Balkanlardaki uzun süreli Osmanlı varlığını açıklama girişimlerinde ilk akla gelen sebep engin Osmanlı hoşgörüsü olmaktadır. Fatih Sultan Mehmet'in İstanbul'u fethettiğinde Ayasofya ahalisine sözleri bu durumun simge örneklerinden biridir. Osmanlı'nın fethettiği yerlerdeki inançlara olan hoşgörüsü ve her türlü dinî ve etnik kimliğe duyduğu saygı, varlığının kalıcılığını sağlamadaki elbette en önemli unsurlardan biri olmuştur. Ancak tek başına yeterli bir açıklama değildir. Ayrıca bu hoşgörünün de sosyolojik temelli açıklamasının yapılası gerekmektedir. Hoşgörü, fethedilen yerlerde nasıl Devlet algısı oluşturmuştur? Nasıl bir Türk ve Osmanlı algısı, yüzyıllarca kaynaşık halklar profili yaratmıştır? Bunun üzerinde durulması kanımızca daha doğru olur.

Gerilemenin çok yavaş olması, ilerlemenin çok sağlam olması nedeniyledir. Sağlam bir kök salış, kısa sürede yok olmayı engellemiştir. Bu nedenle Osmanlı İmparatorluğu'nun bölgedeki hızlı ilerlemesinin askeri sebepler dışında kalan ve uzun süreli egemenlik imkânını sağlayan dinamiklerini ortaya koymak gerekecektir.

Yüzlerce yıllık Osmanlı damgasını açıklayabilmek için ilk olarak Osmanlı devlet teşkilatının analiz edilmesi ve özellikle "devşirme" yönteminin konu ile bağlantısı ortaya konabilir. Devlete onlarca vezir, sayısız bürokrat veren bir bölgedeki sürekliliğin kaynağını açıklamak için bu durum önemli bir unsurdur. Bu nedenle Osmanlı sınıfsal yapısının ve yönetici sınıf unsurlarının Balkan halkları ile ilişkisi ciddi bir araştırma konusudur. Bilindiği üzer Osmanlı yönetici sınıfı padişahın altında İlmiye, Kalemiye ve Seyfiye adı verilen sacayağı biçiminde üçlü bir yapıdan oluşmaktadır. Bu yapının İlmiye sınıfı hariç diğer ikisinde devşirme sistemi ile yetiştirilen yöneticilerin ağırlığı önemlidir. Ve denilebilir ki Osmanlı devşirme sisteminin en önemli insan kaynağı Balkan Hıristiyan halkları olmuştur. Bu bölgelerden devşirilen çocuklar bürokraside görev alarak devletin en üst kademelerine kadar yükselebilmişledir. Osmanlı'da Balkan kökenli çok sayıda sadrazam bulunmaktadır. Bölge halklarının devlet bürokrasisine girebilmeleri, başka deyişle sınıf atlama olanaklarının bulunması ve devlette kimliğe dayalı bir temsil imkânı olmasa dahi şahsen yer tutabilme imkânlarının olması, devlet ile bağlarının daha güçlü olmasını sağlamıştır. Osmanlı kapıkulu sınıfının uzun dönem büyük çoğunluğu devşirme kökenli yöneticilerden oluşmaktadır. Kuruluş döneminde Anadolu kökenli devlet adamlarını rahatsız eden ve belli bir süre yerli-devşirme çekişmesini ortaya çıkaran bu durum, yer yer Anadolu'da ortaya çıkan ayaklanmaların da nedenleri arasında gösterilebilir. Osmanlı'da "kapıda yer tutabilme" her zaman ön planda olmuş ve devlet içi

çekişmelerin de başlıca nedeni olarak yorumlanır. Balkan halkları için devletlerarasında yer alabilme ihtimal ve imkânlarının bulunması bir açıdan bakıldığında kendi kontrollerindeki devletin uzun süre ayakta kalması için çabalamalarını sağlamıştır. Devşirme sistemi bu anlamda Balkan egemenliğinin sürekliliği açısından önemli unsurlardan bir olmuştur.

Bunun yanı sıra Balkanlardaki üretim ilişkileri ve sınıfsal yapı da önemlidir. Tarih sahnesine çıktığı dönemde Batı'ya doğru uzanan feodal bir dünya ile mücadele eden beylik, sürekli fetihler sonucunda bu feodal dünyanın sınırına kadar dayanmıştır. Bizans'ın Balkanlardaki egemenlik sınırlarına bakıldığında Osmanlı İmparatorluğu ile yaklaşık olarak aynı alanlarda egemenlik sürdüğünü söylemek mümkündür. Balkanlardaki Bizans haritası yaklaşık, aşağı yukarı Osmanlı haritasıdır. Bu durumun Gibbons'un Osmanlı'nın din değiştirmiş bir Bizans olduğu tezine de kaynaklık ettiğini söylemek mümkündür. (Gibbons, 1998) Bu tarihsel gerçeklik Gibbons'un tezinin dayanağını oluşturmuş olabilir. Daha sonra Köprülü de buna antitez olarak Osmanlı'nın kuruluşu ile ilgili farklı bir tez ortaya atacaktır. (Köprülü, 1999)

Bilindiği üzere Roma İmparatorluğu 395 yılında ikiye ayrılmış ve çöken Batı kısmı feodal bir örgütlenme biçimine girmiştir. Avrupa tarihi Roma'nın yıkılışından itibaren feodalizm adı verilen küçük birimler halinde örgütlenmeye dayalı bir askeri/dini örgütlenme biçiminin tarihidir. Doğu Roma ise küçük birimler yerine cephe örgütlenmesine dayalı büyük ölçekli merkezi bir devlet şeklinde biçimlenmiştir ve Batı sınırları günümüz Balkanlarını içine alacak şekilde (Sezer, 1990) Osmanlının 15. yüzyılda dayandığı Balkanlar hattına kadar bu anlamda gerçekte feodal Avrupa'nın ve eski Bizans'ın sınırıdır. Bu süre zarfında Avrupa'nın geri kalan kısmında feodal ilişkiler çözülmeye başlamış ve yeni bir iktisadi düzen kurulmaya başlanmıştır. Osmanlı, Balkanlardaki bu sosyal ve iktisadi yapıya karşı kendi düzen önerisini götürmüş ve Osmanlı sistemi bölge halkları tarafından kısa sürede özümsenmiştir. Balkan halkları feodal ilişkiler yerine merkezi devletlerden yana olmuşlar, Balkan fethi süresince bölgedeki yöneticı unsurlar da Osmanlı saflarına katılmakta tereddüt etmemişlerdir. Doğu Avrupa aristokrat sınıfı ve feodalleri mevcut sistem yerine Osmanlı siyaseti etrafında bütünleşmeyi tercih etmişlerdir. Bu tercihin görüntüsü yalnızca egemenlik kabulü olmamış, başlangıçtan sona kadar çok uzun süre Devlet'in yanında yer almaları ile belirgin şekilde kendini göstermiştir. Örneğin Ankara Savaşı'nda bazı Anadolu Türkmen beyleri Timur saflarına katılırken Sırplar son ana kadar Yıldırım Beyazıt'ın yanında kalmışlardır. Bu sadakati fethedilen bölgelerin Devlet'e asker gönderme zorunluluğundan başka nedenlerle açıklamak gerekmektedir. Balkanların Osmanlılık siyaseti etrafında bütünleştiğini söylemek daha doğru olur.

Osmanlı İmparatorluğu'nun Balkan egemenliğinin diğer bir boyutunu da gerek fetih hareketleri öncesinde, gerekse fetih süreci sırası ve sonrasında bölgeye yönlenen tasavvufî unsurlar oluşturmaktadır. Sadece Balkanlar'da değil Anadolu'nun Türkleşmesi sürecinde de rol oynayan "dervişler" (Barkan, no date), bölgenin sadece askeri bir fethine değil sosyo-kültürel bir yerleşim alanı olmasına zemin hazırlamışlardır. Osmanlı devletinin genişleme sürecinde üç temel politikası bulunmaktaydı: Fetih, imar ve iskân… Kuruluş devrinde Anadolu'daki Ahi teşkilatı ve Balkanlardaki genişleme sürecinde bu bölgedeki tekkeler ve dervişler özellikle iskân siyaseti bağlamında yerleşen Türk ve Müslüman ailelerin gerek dinî temelde organizasyonun gerekse bir siyaset etrafında örgütlenilmesinin önemli bir destekleyici unsuru olmuşlardır.

Balkanlardaki iskân siyaseti sonucunda Anadolu'dan Türk ailelerin bölgeye yerleştirildiği bilinmektedir. Ancak bir o kadar da bölgede Müslüman olan kitle mevcuttur. Boşnaklar en bilinen örnekleridir. Kendilerine Evlad-ı Fatihan denilmektedir. Gene Pomaklar başka bir örnektir. Bu halkların İslamiyet'e yönelmesinde söz konusu dervişlerin rolü önemlidir. Meselenin başka bir boyutu bölgede günümüzde de kimi durumlarda ve kimi yerlerde Müslümanlık kimliği ile Türklük kimliğinin eş anlamlı kullanılır olmasıdır. Her iki kimlik tanımlaması dini ve etnik anlamından sıyrılarak siyaset kavramı adı altında kavramsallaştırılmakta ve "Osmanlılık" siyaseti altında yer almaktadır. Bölge halkı kendini Türk kökenli olmamasına rağmen Müslüman kimliği ile Türklüğü özdeşleştirir ve kendini Türk olarak tanımlar. Bu durum günlük hayatta da kendini göstermektedir. (Taşkıran, 2010) Bu bağlamda bu tasavvufi unsurların bölgede tesis edilecek Osmanlı siyasetinin işlevsel bir parçası olduğunu söylemek mümkündür. Egemenlik altına alınan bölgenin yalnızca askeri bir denetim değil sosyolojik temelleri olan bir hâkimiyet projesi altında değerlendirilmesi, sözünü ettiğimiz çekilme sürecinin neden bu kadar uzun sürdüğünü de açıklamaktadır. Olaya bu açıdan bakıldığında I. Dünya Savaşı ile birlikte Orta Doğu'nun neden çok kısa sürede elden çıktığını da daha iyi anlamak mümkündür. Balkanlardaki iskan siyaseti Arap Yarımadası'nda gerçekleştirilmemiş, bu nedenle bir bölge 400 yılda ancak kaybedilirken, diğer 4 yılın sonunda bir anda ve bütünüyle egemenlik alanı dışına çıkmıştır.

Osmanlı İmparatorluğu'nun Balkan hâkimiyetinin sosyolojik altyapısında karşımıza çıkan önemli bir unsur da bölgedeki vakıf örgütlenmesidir. Vakıflar, sadece bir yardımlaşma kurumu olarak kalmamış, sözünü ettiğimiz fetih, imar ve iskan sacayağının imar boyutunda önemli roller üstlenmişlerdir. Balkan fethi sürecinde askeri ve idari alanda gerçekleşen egemenlik devri yanında bölgenin sosyal meselelerine de el atılmış, bu alandaki imar faaliyetleri vakıflar tarafından finanse edilmiştir. Vakıflar bu boyutu ile sürdürülebilir yardımlaşmanın ve sosyal dayanışmanın önemli bir unsuru olduğu kadar, şehir kültürünün ve Osmanlı mimarisinin tesis edilmesi açısından da çok önemli işlevlere sahip olmuşlardır. Bir bölgede mimari damganın vurulması, başka deyişle şehrin

 Copyright © International Science and Technology Conference (ISTEC)

imarının sağlanması bölgede yüzyıllarca sürecek kültürel bir etkileşimin başlamasına yol açmıştır. Bu nedenle Balkan vakıfları yalnızca kültürel bir miras değil, somut anlamda da Osmanlı damgasını ve mirasını sağlama noktasında önemli işlevler görmüştür denilebilir.

Sonuç

Balkanlar, kelimenin tam anlamıyla bir Osmanlı toprağı haline gelmiş ve Osmanlı Devleti, yüzyıllar süren bu çekilme sürecinde askeri işgal altında olan bir sömürgeden değil çekilme değil, kendi toprağını kaybetmeme mücadelesi vermiştir. "Balkanlardaki Türk istilasını yalnız maharetli kumandanlar ve askeri kahramanlıklar sayesinde, bir sıra mesud tesadüflerin zoruyla yapılmış ve sadece askeri mahiyette kalmış bir işgal ve istila gibi görmek katiyen doğru değildir. Türklerin imparatorluk kurmak teşebbüsü, büyük ölçüde bir *kolonizasyon hareketi*ydi ve bu iş için Türk soyunun ne kadar, bol ve bereketli olduğu, istladan sonra Rumeli'ne dökülen yüzbinlerce Türk kolonunun imparatorluğun askeri ve idari emniyeti için lazım gelen büyük yolları, geniş vadileri ve önemli bölgeleri daima ve süratle hakimiyet altına alacak bir şekilde Türkleşmesiyle ispat edilmiştir." (Barkan, 1980) Bu nedenlerle Balkanların elden çıkması çetin bir direnme sürecinin sonunda ancak 400 yıla yakın bir zamanda gerçekleşmiştir.

Denilebilir ki, Osmanlı'nın ilerlemesi kadar, gerilemesi de muhteşem olmuştur. Osmanlı İmparatorluğu'nun gerilemesi metre metre, adım adım gerçekleşmiştir. Ve belki de asıl muhteşem yüzyıl Osmanlı'nın son yüzyıllıdır. Balkanlardaki Osmanlı gerilemesinin önemi büyüktür. Bu kısa çerçeve içinde biz yalnızca konunun önemine dikkat çekmeye çalıştık. Meselenin statik olarak alınması Osmanlılık siyasetinin de gerçek anlamıyla ortaya konmasını sağlayacak önemli bir adım olacaktır. Bu adımı, ulus devlet sınırlarını zorlayan günümüz Türkiye'nin yeni bir hayata geçmesine giden yolda önemli bir aşama olacaktır. Balkanların sosyolojisini anlamak yeni Türkiye sosyolojisini anlamakla eş anlamlıdır.

Abstract: Isparta angle is one of the major tectonic elements of Turkey which is a region of intensity seismic activity. Such areas as more of the earthquake activity, depth knowledge of the basin is very important. Isparta basin selected as the study area in the southwest of Isparta angle has an area of about 12 x 15 km. In order to determine the depth of the basin, 108 points gravity values were measured. In this study, survey is used widely in determining of bedrock depth to use in the building physics. According to the gravity analysis, the maximum depth of Isparta basin was found to be about 550 m. In the study area, bedrock depth values obtained from the previous geophysical data and the gravity data are compatible with each other. Basin sedimentary thickness and bedrock depth distribution map are to be used in building physics as prismatic. The thickness of the sedimentary in the basin from northwest to southeast increases which is related to the city Bursa. The amount of this increase between 200-550 m. This change in the depth distribution was observed to be very evident in each profile. The cross section profiles. Thus, the results obtained from this study are expected to contribute to the earthquake simulations studies for the region.

Abstract: This research was designed to see how much importance is given by architectural students to building physics in the process of architectural project development. In this scope, the study was carried out in the city of Bursa. The amount of this increase between 200-550 m. This change in the Department during the 2015-2016 education year, were asked to state their criteria. At the end of this study, it has been understood that students are highly perceptive and have a high level of awareness about issues related to building physics.

Giriş

Türkiye tektonik yönden son derece aktif bir kuşak üzerindedir. Karmaşık bir yapıya sahip olan Isparta açısı da Türkiye'nin en önemli tektonik elemanlarının arasında yer almaktadır. Çalışma alanı olan Isparta şehir merkezi ve çevresini kapsayan Isparta havzası ters v şeklindeki bu bölgenin güneyinde yer almaktadır. Abbott ve Louie 2000 de yaptıkları çalışmada bu gibi tektonik yönden aktif alanlarda havza geometrisi ve sediman kalınlığının belirlenmesinin, deprem zararlarını en aza indirgeyecek çalışmalara önemli katkılar sağlayacağını belirtmiştir. Birçok araştırmacı da deprem simülasyon çalışmalarıyla ana kaya geometrisi ve üzerindeki malzemenin deprem hasarına etkilerini araştırmıştır (Olsen vd. 2003, Hallier vd. 2008, Frankel vd. 2009, Vuan vd. 2011).

Bu çalışmada 12x15 km'lik alan içerisinde 108 noktada gravite ölçümü gerçekleştirilerek havza geometrisinin üç boyutlu ortaya çıkarılması hedeflenmiştir. Elde edilen bouguer gravite verilerine sonsuz plaka yaklaşımı uygulanarak basen kalınlığı tespiti yapılmıştır. Hızlı bir şekilde sonuç veren bu yöntem havza geometrisini ortaya çıkarmada yaygın bir şekilde kullanılmaktadır(Işık ve Şenel 1997, Godoy vd. 1999, Chakravarthia ve Sundararajanb 2004, Özalaybey vd. 2008).

Havza içerisinde ana kaya ile kuvaterner yaşlı alüvyon malzeme ayrımı yapılmış ve havza modeli oluşturulmuştur. Şehir merkezinin kurulu olduğu alanda havza derinliğinin tespiti yapılmıştır. Buna ek olarak şehir merkezinin havzadaki konumu birbirine dik iki derinlik kesiti üzerinde net bir şekilde ortaya konulmuştur.

Çalışma Alanı ve Jeolojisi

İnceleme alanı Isparta havzası genel olarak otokton ve allokton jeolojik malzemelerden bir araya gelmektedir (Karaman 1994, Kanbur vd. 2008, Yılmaz 2010). Çalışma alanı ve çevresini kapsayan alanın Şekil 1 de verilen genel jeoloji haritası üzerinde; otokton Davraz kireçtaşı, Söbüdağ kireçtaşı, Çiğdemtepe formasyonu, Güneyce formasyonu, Kızılkırma formasyonu, Gölcük volkanitleri ve Volkanik filişlerinin Isparta şehir merkezini çevrelediği, allakton kuvaterner yaşlı alüvyon malzemenin ise ova düzlüğüne yayıldığı açıkça görülmektedir.

Havzanın genel olarak yaşları Miyosen ile Jura arasında değişen ince, orta ve kalın tabakalaşma yapısına sahip yer yer kırıntılı ve masif kireçtaşları tarafından çevrelendiği görülmektedir. Havzanın güneybatı kısmında ise pliyosen-kuvaterner yaşlı gölcük volkanikleri, volkanoklastikler ve prioklastik malzemelerin baskınlığı söz konusudur. Bunların içeriğinde volkanik kökenli yer yer blok şeklinde kum, kil, silt ve sertleşmiş veya sıkı dokulu tüf-tüfit yer alır(Karaman 1994). Havza içerisine uzanan kuvaterner alüvyon malzeme ise çakıl, kum, kil ve silt

Abstract: This research was designed to see how much importance is given by architecture students to building physics in the process of architectural project development. In this scope heat-moisture, air circulation (wind control/natural ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics and noise control, building biology, ecology and fire insulation were defined as criteria related to building physics. In the scope of the study, 100 students out of the 217 volunteers from Bursa Orhangazi University, Architecture and Design Faculty, Architecture Department during the 2015-2016 education year, were asked to rate each criteria. At the end of the study it has been understood that students were highly sensitive and had a high level of awareness and sensitivity on this subject.

Şekil 1. Çalışma alanı ve yakın çevresi jeoloji haritası. (Olası fay olarak gösterilen yapı Demer vd. 2010'dan düzenlenmiştir)

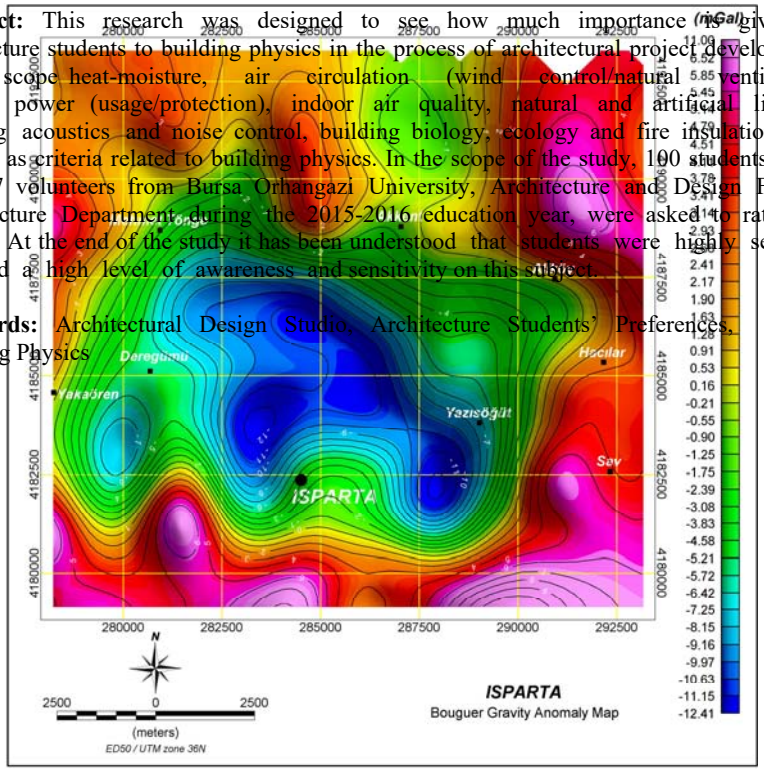
Materyal ve Metot

Bu çalışmada 12x15 km'lik Isparta şehir merkezi ve çevresini kapsayan alanda havza geometrisinin modellenmesinde jeofizik tekniklerden gravite yöntemi kullanılmıştır. Yöntem bu gibi çalışmalarda birçok araştırmacı tarafından tercih edilen bir tekniktir(Abbott ve Louie 2000, Özalaybey vd. 2011, Maden ve Dondurur 2012, Dossing vd. 2014).

Şekil 2. İnceleme alanı dijital yükseklik haritası ve gravite ölçüm noktaları

 Copyright © International Science and Technology Conference (ISTEC)

Çalışma kapsamında yaklaşık 1,3x1,3 km karelajlama sıklığında toplamda 108 nokta üzerinde veri kazanı yapılmıştır (Şekil 2). Araştırma kapsamında planlanan bazı ölçüm noktalarının askeri alan içerisine girmesinden kaynaklı bu noktalarda ölçüm yapılamamıştır.



Çalışmanın arazi kısmında CG-5 AUTOGRAV gravimetresi kullanılarak ölçümler gerçekleştirilmiştir. Veri kazanımında sabit baz noktası kullanılarak her 6 saatte bir baz ölçümü yapılmıştır. Bouguer gravite anomalilerinin veri işlemde sırasıyla aşağıdaki adımlar Oasis Montaj paket programı kullanılarak gerçekleştirilmiştir.

- Drift düzeltmesi
- Yükseklik düzeltmesi
- Enlem düzeltmesi
- Serbest hava düzeltmesi
- Bouguer ve topoğrafya düzeltmesi(topoğrafa indirgeme yoğunluk değeri 2.4 gr/cm^3 alınmıştır)

Son olarak yüzeye yakın sığ kütlelerin bozucu etkilerini gidermek için rejyonal değerler rezidüel değerlerden ayrılmış ve havza geometrisini modellemede kullanılacak Bouguer gravite anomali haritası elde edilmiştir(Şekil 3).

Şekil 3. Isparta Bouguer Gravite haritası

Rejyonal Gravite anomali değerleri sonsuz slap yaklaşımı ve aşağıda verilen eşitlik kullanılarak ana kaya derinlik modellemesi yapılmıştır.

$$\mathbf{\Delta g} = 0.04192 \times \mathbf{\Delta \rho} \times \mathbf{\Delta h}$$

Burada; Δg ölçülen gravite değeri, Δρ ana kaya ile alüvyon arasındaki yoğunluk farkı, Δh derinlik bilgisidir. Formülde ana kaya ile havza çökelleri arasındaki yoğunluk farkı 0,6 gr/cm^3 olarak alınmıştır. Bu değer bölgede Devlet Su İşleri tarafından açılan sondaj kuyu kütük bilgilerinden elde edilen ana kaya derinlik bilgisini sağlayacak şekilde belirlenmiştir.

Bulgular

Çalışma alanından toplamda 108 noktada gravite ölçümü gerçekleştirilerek şekil 3 de verilen gravite dağılım haritası elde edilmiştir. Gravite anomali değerleri -12,41 ile 11.00 mGal arasında değişen haritada; basen olarak düşünülen alanın negatif değerlerden oluştuğu, baseni çevreleyen alanın ise pozitif değerlere sahip olduğu görülmektedir. Bununla birlikte şekil 2 de verilen jeoloji haritası ile gravite anomali dağılım haritası birbiri ile yüksek uyumluluk göstermektedir.

Rejyonal Bouguer Gravity değerlerinden yukarda verilen eşitlik kullanılarak hesaplanan ana kaya derinlik dağılım haritası incelendiği zaman, en derin yerin 550 m civarında olduğu ve şehir merkezinin basenin kalınlığının yaklaşık 450-500m civarında değişen bir alanda geliştiği görülmektedir(Şekil 4). Şekil 4 detaylı irdelendiği zaman havzanın üçgen prizmatik benzeri yapıda kuzeybatıdan güneydoğuya doğru jeolojik haritada verilen muhtemel fay dokanağı boyunca geliştiği gözlemlenmektedir.

Şekil 4. Isparta ana kaya derinlik haritası

Şekil 5. Şehir merkezinin havza içerisindeki konumunu gösteren derinlik kesitleri

Şehir merkezinin basen içerisindeki konumunu incelemek amacı ile oluşturulan derinlik kesitlerinde çanak şeklinde ortaya çıkan havzanın, Özalaybey vd. 2008 de tanımladı gibi deprem dalgalarını odaklama etkisine sahip bir yapıda olduğu gözlemlenmiştir.

Sonuçlar

Isparta şehir merkezi ve çevresini kapsayan 12x15 km'lik alanda havza geometrisi ortaya çıkarmaya yönelik toplamda 108 noktada gravite ölçümleri alınmıştır. Oluşturulan Bouguer Gravite anomali haritası yorumlanmış ve bu harita kullanılarak basenin derinlik bilgisi ortaya çıkarılmıştır.

Baseni oluşturan düşük yoğunluklu alüvyon malzemenin negatif gravite değerlerine sahip olduğu, yüksek yoğunluktaki çevre kayaçların pozitif değere sahip olduğu gözlenmiştir. Elde edilen bu haritanın bölgenin jeolojisi ile son derece uyumlu olduğu ve basen içerisinde gelişen tektonik faaliyetlerden kaynaklı yapı sınırları net bir şekilde ayırt edilebilmiştir.

Oluşturulan havza geometrisi incelendiğinde, havzanın en derin yeri 550m civarında olmasına karşın, şehir merkezinin 450-500 m kalınlığa sahip alüvyon malzeme üzerinde kurulu olduğu saptanmıştır. Çökel malzemenin havza içerisindeki konumu, kuzeydoğu-güneybatı yönünde uzanım göstermesi, bu yapı şekilde gelişim gösterdiği düşüncesini doğurmuştur. Şehrin basen içerisindeki lokasyonunu daha net görebilmek için oluşturulan derinlik kesitlerinde çanak şeklinde ortaya çıkan basen, deprem anasında üreyen deprem dalgalarına odaklanma etkisi yapabilecek bir yapıda olduğu gözlenmiştir.

Senaryo deprem simülasyonu projesi kapsamında gerçekleştirilen bu araştırma, projenin ilk ayağını oluşturmaktadır. Isparta havzasının geometrisinin ortaya çıkarılması üzerine yapılan ilk jeofizik çalışma olması açısından elde edilen sonuçlar son derece önem arz etmektedir. Çalışmadan elde edilen verilerin gerek proje içerisinde gerçekleştirilecek olan deprem simülasyonu gerekse bölgede yapılacak diğer araştırmalara önemli katkılar sağlayacaktır.

Teşekkür

Bu çalışma **TUBITAK 114Y836** numaralı proje kapsamında gerçekleştirilmiştir. Oasis Montaj paket programının kullanımını sağladığı için Yrd. Doç. Dr. Can Karavul'a teşekkür ederiz.

Özet: İnsanların yaşamış olduğu ortak deneyimlerinden biri olan ölüm, insan hayatının tabii sonucu olması sebebiyle hem bireyler hem de toplum açısından önemli bir geçiş dönemidir. Bu geçiş döneminde kültürel, sosyal ve dinî bakımdan pek çok husus barındıran başsağlığı (taziye) ritüelleri gerçekleştirilmektedir. Pek çok kültür gibi Türk kültüründe de başsağlığı, acıyı paylaşmak ve kalanlara teselli verme amacını taşır. Ölümden sonra yapılan tören ve ritüller kadar bu süreç içerisinde söylenen sözler de hem kültürel hem de dil verileri olarak değer taşımaktadır. Kitle iletişim araçları, çağımızın gereği olarak insan hayatının her alanında kendisine yer edinmiştir. Toplumsal ve kültürel pek çok unsur da bu kitle iletişim araçlarında kendisini göstermektedir. Ticari olmayan kişisel ilanlardan biri olan başsağlığı ilanları da bu kitle iletişim araçlarında, özellikle de gazetelerde, haber verme işlevini yerine getirirken toplumsal ve psiko-sosyal işlevler de gerçekleştirmektedir. Bu çalışma kapsamında ülkemizde yayınlanan gazetelerde kullanılan başsağlığı ilanları incelenecektir. Bu ilanlar, biçim özellikleri yanında içerik ve dil özellikleri açısından değerlendirilecektir.

Anahtar Kelimeler: Başsağlığı ilanları, taziye, başsağlığı ilanlarında dil kullanımı

Giriş

Ölüm insanlığın yaşamış olduğu ortak deneyimlerden biri olarak insan hayatının en önemli geçiş dönemlerinden birini oluşturur (Yıldız, 2012, s. 93). Bu bakımdan ölüm olgusu hem bireyler hem de toplumlar için son derece önemlidir. Ölüm olayını müteakip ölen kişinin yakınlarına ilgi ve yakınlık gösterme amacıyla başsağlığında (taziye) bulunulur. Başsağlığı içerisinde kültürel ve dinî unsurlar barındırması bakımından hem toplum hem de birey açısından oldukça önemli bir ritüeldir. Türk kültüründe, pek çok kültürde de olduğu gibi, başsağlığında bulunmanın amacı acıyı paylaşmak ve kalanlara teselli vermektir. Bu ritüel gerçekleştirilirken başvurulan kalıp ifadeler, toplumların sahip olduğu kültürel yapı ve inanç sistemlerinin dile yansımış halidir. Ölüm olayı gerçekleştiğinde veya gerçekleştikten sonraki süreçte eli olayın acısını aktarabilmek, dayanışma sağlamak, müteveffaya dua etmek, iyi dileklerde bulunmak ve onun yakınlarına başsağlığında bulunmak için çoğunlukla kalıplaşmış ifadeler kullanmaktadır. Bu ifadelerdeki anlatım, ölüm olayını tekrar tekrar hatırlatmamak için örtülü olarak ifade edilmektedir. Bu bakımdan "ölmek" olgusunu karşılamak için *vefat etmek, bu dünyadan ayrılmak, ahiret yolcusu olmak, günü dolmak, dünyaya gözlerini kapamak, toprak olmak* (Türkmen, 2009, s. 134) gibi deyimler kullanılmaktadır. Başsağlığı dilemek için de vefat eden kişiye dua etmek amacıyla *Allah rahmet eylesin, Mekânı cennet olsun, Allah taksiratını affetsin, Nur içinde yatsın* gibi ifadeler kullanılırken vefat eden kişini yakınlarına teselli vermek için *Başınız sağ olsun, Allah kalanlara sabır versin* gibi ifadeler kullanılmaktadır.

Başsağlığı İlanları

Yazılı ya da sözlü haber olarak tanımlanan *ilan*ların temel işlevi haber vermektir; bu ilanlar gelişen teknoloji ve sürekli yenilenen iletişim araçlarından dolayı toplumsal ve psiko-sosyal işlevler de üstlenmekle birlikte bazı mesajlar da taşır. Okuyucu kitlesinin algısına göre anlam kazanan bu mesajların hem toplumsal hem de kültürel olarak pek çok göndermeye sahip olduğu söylenebilir. Başsağlığı ilanları da toplumu bilgilendirme ve yaşanan acının paylaşılması amacıyla verilen ve ticari olmayan ilanlardır (Ergin, 2009-2010, s. 182). Günümüzde kitle iletişim araçlarının yaygın ve etkin kullanılmasından dolayı başsağlığı dilemek için gazetelere ilanlar verilmektedir. Gazetelerde yer alan başsağlığı (taziye) ilanları, "kültürel yapı içerisinde kalıplaşmış biçimleriyle, toplum içindeki gereksinimleri ve ideolojileri yansıtan birtakım mesajlar taşımaktadır. Bu ilanlar sosyal ve psikolojik göstergelerle bir semboller hiyerarşisi oluşturmaktadır." (Polat, 2011, s. 87).

Bu çalışmada Türkiye'deki gazeteler arasında en yüksek tiraja (Gazete Tirajları, 2016) (Gazeteciler, 2016) sahip olan *Hürriyet* gazetesinde yer alan başsağlığı ilanları ele alınmıştır. Çalışmanın kapsamını *http://www.hurriyetvefatilani.net/hurriyet-gazetesi-bassagligi-ilanlari (son erişim tarihi: 27.07.2016)* web adresinde yer alan toplam 44 başsağlığı ilanı oluşturmaktadır. Bu ilanlar arasından 22 tanesi kurum/kuruluşlar tarafından, 22 tanesi de ölen kişinin bir yakını (aile, akraba, tanıdık vb.) tarafından verilen ilanlardır. Çalışmada ilanların kimler/hangi kurum/kuruluşlar tarafından verildiği, ilanların biçim, içerik ve dil özellikleri

 Copyright © International Science and Technology Conference (ISTEC)

değerlendirilmiştir. Ayrıca ilanlarda bulunan kalıplaşmış ifadelerin kültürel, sosyal ve ekonomik göndermeleri tespit edilmeye çalışılmıştır.

Başsağlığı İlanlarının Biçimsel ve İçerik Özellikleri

Başsağlığı ilanları kısa ve birbirine çok benzeyen metinlerden oluşmaktadır; fakat metinlerin içerikleri detaylı olarak incelendiğinde başsağlığında bulunurken birey veya topluma ait pek çok kültür unsuru yanında gerek vefat eden kişinin veya yakınlarının gerekse ilan verenin kişinin din, meslek, toplumsal statüsünü tespit etmek mümkündür.

İlanlar genellikle gazetenin üç veya dört sütununu kaplayacak şekilde olup bir kutucuk içerisinde verilmektedir. İlanların tümünde siyah ve beyaz renk kullanılmıştır. Bu durumun matemin bu iki renk ile temsil edildiği şeklinde yorumlanabilir. Bu 44 ilandan sadece 2'sinde siyah renk fon olarak kullanılmış, metinler beyaz ile yazılmıştır. Fonda siyah renk kullanımı, karamsarlığa işaret etmektedir (Türkel, 2016, s. 13). Diğer ilanların tümünde beyaz fon üzerine siyah yazı tercih edilmiştir. İlanların sadece 3'ünde vefat eden kişinin fotoğrafı yer almaktadır. Bu fotoğraflara başlıktan hemen sonra yer verilmektedir.

Metinler genel olarak aynı biçim özelliklerine sahiptir. İlanın en başında başlık mahiyetinde koyu ve büyük harflerle ortalı şekilde "Başsağlığı" ifadesi yer almaktadır. Kurumlar ve kişiler tarafından verilen ilanlardan ikişer tanesinde "Vefat Ve Başsağlığı" başlık olarak kullanılmıştır. Kişiler tarafından verilen ilanların sadece 1 tanesinde "Tazziye" başlığı kullanılmıştır. 3 tanesinde herhangi bir başlık yer almamaktadır. Diğer ilanlarda başlıktan sonra yer alan vefat eden kişi ile ilan veren arasındaki yakınlık durumunu ifade eden cümlelerle ilana başlanmıştır. Bu 3 ilandan ikisinde "Canımız, Sevgili Kardeşimiz, Kuzenimiz", "Kıymetli Çalışma Arkadaşımız" ifadeleri yer alırken diğerinde "Çok Acı Kaybımız" ifadesine yer verilmiştir. Diğer ilanlarda başlıktan sonra ya vefat eden kişinin mesleğini/toplumsal statüsünü ya akrabalık/yakınlık durumunu ifade eden örnekteki gibi cümleler yer almaktadır: *"Büyüğümüz, dostumuz, eşimizin yüz ak'ı, Yargıtay Eski 6. Ceza Dairesi Başkanı Mustafa Aydın'ı", "Kültürümüzün kurucu üyesi Viktor BALI'yı", "Bankamız Emekli Müdürlerinden (Diyarbakır Şubesi) Ahmet Kadıoğlu'nu"*. 3 ilanda bu ifadeler olmadan vefat eden kişinin adı ve soyadı yazılmaktadır. Başlık ve bu ifadelerden sonra dikkat çekmesi amaçlayan metnin diğer yazılarının tümünden daha büyük puntoyla koyu ve büyük harflerle kutucuğun ortasına denk gelecek şekilde vefat eden kişinin adı ve soyadı yazılmaktadır. Bununa birlikte 1 ilanda bir saldırı sonucu hayatını kaybeden kişiler birden fazla olduğu için ad ve soyad kısmı yer almamaktadır. Ad ve soyadın arkasından yazılacak olan başsağlığı cümlesine uygun olarak gelen ek, 32 ilanda kesme işareti (') ile ayrılmaktadır. Diğer ilanlarda cümlenin tamamlanışından dolayı ad ve soyad kısmının herhangi bir ek almasına gerek yoktur: *"Hacı Nezahat Özdemir Hanım'ın vefatına çok üzüldüm.", "Mustafa Çağan'ı vakitsiz kaybetmenin büyük üzüntüsü içerisindeyiz."*

Çalışılan ilanlardan 34'ünde ad ve soyad kısmından önceki veya bazen sonraki bölümde vefat eden kişinin mesleği de yer almaktadır. İlanlardan 9 tanesinde ise vefat eden kişinin değil, onun yakınları içerisinde meslekî konumu önemli olan kişilerin meslekleri belirtilmektedir. *Özaltın Yönetim Kurulu Başkanı Hayrettin Özaltın, Nurettin Özaltın ve Öznur Özaltın'ın babaları Nuri Özaltın…* Bu durum sadece vefat eden kişinin değil aynı zamanda aile, arkadaş, tanıdık gibi onunla bağlantılı kişilerin de toplumsal statüsünü belirtmek açısından en önemli bir yoldur (Ergin 2009-2010, s. 189): "*Kurucu ortaklarından ve ilk Yönetim Kurulu Başkanı", "35 yıllık Avukatımız", "Türk İlaç sektörünün duayeni", "15.-16. Yasama Dönemi Afyonkarahisar Milletvekili, Sağlık ve Sosyal Yardım Bakanı", "Çankırı Ilgaz Eşrafından İstanbul Büyükşehir Belediyesi emekli din görevlilerinden Hafiz Mevlüthan"* örneklerinde görüldüğü gibi kişilerin konumu vurgulanmaktadır. Meslekî başarı ve itibar arasındaki bağlantı, ilanı veren ve ilanın boyutunu dikkate aldığımızda daha belirgin olmaktadır (Ergin, 2009-2010, s. 192). Kişi/kişilerin verdiği ilanlarda vefat eden kişinin daha çok kişilik özellikleri sevgi ve özlem duygularıyla birlikte öne çıkarılırken kurum/kuruluş veya meslekî bağlantıya sahip kişiler tarafından verilen ilanlarda mesleği, bulunduğu görevler ve meslekî başarı üzerinde durulmaktadır. Bunun yanı sıra bazı ilanlarda ilanı veren kişi merhum/merhumenin aile üyelerinden birinin arkadaşı olabilmektedir. Bu durumda ilanı veren kişi daima arkadaşının adını önceleyerek merhum/merhumeden söz etmektedir. Bu ilanlarda vefat eden kişinin değil, bu yakını ile ilgili övgü sözleri yer almaktadır: *Çok değerli dostum, sevgili kardeşim Aziz Yeniay'ın kıymetli babası Bekir Yeniay…* örneğinde olduğu gibi övgü sözcükleri önceliklidir.

İlanlarda metinler için çok kısa yer ayrılmış olmasına rağmen burada kişi hakkında önemli bilgiler verildiği görülmektedir. Vefat eden kişinin mesleği yanında onun övülecek kişilik özelliklerine de vurgu yapılmaktadır: *Kendini dinine adamış, iyi insan", Dürüstlüğü, iyilikseverliği ve sıcakkanlılığı ile herkesin sevgisini ve saygısını kazanan, hem başarılı bir işadamı hem de mükemmel bir aile babası olmayı başaran uzun yıllar beraber çalışma şansına eriştiğim çok değerli dostum", "Bizlerden kılavuzluğunu esirgemeyen, hayatıma yön vermekte büyük payı olan", "İyiliksever insan"* örneklerinde de görüldüğü üzere merhum/merhume aile ve iş hayatındaki başarısı yanında sevilen ve iyi bir insan olması hususları ön plana çıkarılmıştır.

İlan metinlerinin devamında yer alan başsağlığı ifadeleri birbirine çok benzemektedir. Bunlar, genel olarak yaşanan elim olaydan duyulan üzüntüyü ifade eden, aile/yakın/arkadaşlar vb. ile acıyı paylaşmayı amaçlarken vefat eden kişiye de dua edilen kalıplaşmış cümlelerden oluşmaktadır. Yaşanan derin acı ve üzüntü bu kalıp cümleler vasıtasıyla aktarılmaya çalışılmaktadır: *"Değerli merhumeye Allah'tan gani rahmet, tüm aileye sabır ve*

Abstract: This research was designed to see how much importance is given by architecture students to building physics in the process of architectural project development. In this scope heat-moisture, air circulation (wind control/natural ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics and noise control, building biology, ecology and fire insulation were defined as criteria related to building physics. In the scope of the study, 100 students out of the 217 volunteers from Bursa Orhangazi University, Architecture and Design Faculty, Architecture Department during the 2015-2016 education year, were asked to rate each criteria. A three level of importance and likelihood scale was used.

Abstract
This research is a part of a master thesis which is still in progress. The thesis aims to find out architecture students' preferences on architectural design studio in terms of building physics. In this scope heat-moisture, air circulation (wind control/natural ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics and noise control, building biology, egology and fire insulation were defined as criteria related to building physics. In the scope of the study, 100 students out of the 217 volunteers from Bursa Orhangazi University, Architecture and Design Faculty, Architecture Department during the 2015-2016 education year, were asked to rate each criteria. At the end of the study it has been understood that students were highly sensitive and had a high level of awareness and sensitivity on this subject.

Keywords: Architectural Design Studio, Architecture Students' Preferences, Building Physics

başsağlığı diliyoruz, Ailesine ve tüm sevenlerine başsağlığı dileriz.”

İncelenen ilanlardan pek çoğunda ilanlarında *Allah/Tanrı rahmet eylesin, Nur içinde yat, Işıklar içinde rahat uyusun* gibi dua sözleri barındıran kalıplaşmış dinî ifadeler yer almaktadır. İlanlardan 2 tanesinde dinî ifade ve duygu bulunmamakta ve bu ilanlarda ölüme yaklaşım daha mesafeli olup sadece “… vefat etmiştir.” ifadesi yer almaktadır. Diğer ilanlarda yaşanan acı ve duygular işin içine katılarak *Kaybetmenin derin üzüntüsü içerisindeyiz, Vefatını öğrenmenin derin üzüntüsü içindeyiz, Aramızdan ani ayrılışının derin üzüntüsü içindeyiz* cümleleri kullanılmıştır; vefat eden kişiden kopuş anlatılmak istenmiştir.

Allah ve Tanrı kelimelerinin kullanımına bakıldığında da incelenen ilanların 33'ünde *Merhuma/merhumeye Allah'tan rahmet*, 3'ünde de *Merhuma/Merhume'ye Tanrı'dan rahmet* ifadesi kullanılmaktadır. 8 ilanda ise buna benzer bir ifade söz konusu değildir. Allah'tan rahmet dileme cümlesinin de yer aldığı 2 ilanın devamında *Onu gönüllerimizin en derininde yaşatacağız, ışıklar içinde rahat uyusun* ile *Nur içinde yatsın* ifadeleri de bulunmaktadır. Rahmet ifadesi bulundurmayan 8 ilan diğer başsağlığı ilanlarından pek çok bakımdan da farklılık göstermektedir. Bu ilanlarda sevgi, özlem, övgü gibi duygular barındıran ifadelerin ön plana çıkarıldığı görülmektedir: *Seni özleyeceğiz., Acımız sonsuzdur., Ebediyete yürüdü., Umarız ki bu Anadolu yeni Mustafa Aydınlar çıkarır., Çelink, Memiş, Mini ve Bobiler seni çok seviyor*. Bir ilanda da vefat eden kişi için benzer duyguları ve bir kavuşulacağını belirten yazılmış şiir yer almaktadır: *Gidip gidip geliyoruz / Dünya denen bu yere / Melekler misafir bir / Sevdiğini tanıdıkça / Yeniden doğmak için / Ve her ilk bahar o vadide / Rengârenk çiçekler olup açarım / Seni sevenlerle ve meleklerle / Hep beraber kucaklaşalım / Ve öylece hep kalalım.*

İlan metnin son bölümünde ilanı veren kişi/kişilerin veya kurum/kuruluşun adı yer almaktadır. Kişi/kişilerin verdiği ilanların büyük çoğunluğu ya vefat eden kişinin ailesi/akrabası/arkadaşı ya da onlarla yakın ilişkileri bulunan farklı aile/kişiler tarafından verilmiştir. 2 ilanda ilanı veren kişinin mesleki statüsü (rektör, yönetim kurulu başkanı) belirtilmiştir. Kurum/kuruluşlar tarafından verilen ilanların banka, özel şirket, kamu kuruluşu, vakıf ve dernekler tarafından verildiği görülmektedir. Ölüm ve cenaze gerçekleştikten kısa bir zaman sonra verilen bu ilanlarda acıyı paylaşmak temel amaç olmakla birlikte kişi ya da kurum/kuruluşların kendi toplumsal statülerini de ortaya koyma amacını taşımaktadırlar. Bu ilanlar “esasen aile üyeleri, tanıdıklar, arkadaşlar, çalışma arkadaşları ve etnik, dinî ve politik gruplar arasında güçlü bir dayanışmaya hizmet etmektedir” (Ergin, 2009-2010, s. 1821).

Sonuç

Birey ve toplum için önemli bir geçiş devresi olan ölüm olayının arkasından başsağlığında bulunmak için günümüzde kitle iletişim araçlarının çok yaygın ve etkin olmasından dolayı gazete ilanları da kullanılmaktadır.

Bu ilanlar, temelde ölümü haber vermek ve kalanlarla acıyı paylaşmak amacını taşısa biçim ve içerikleri incelendiğinde pek çok kültürel, dinî, sosyal vb. göstergelere sahiptir. Bu ilanlar vasıtasıyla çeşitli mesajlar gönderilmekte ve bu yönüyle toplumsal bir işlevi de yüklenmektedir.

İncelenen ilanların tümünde matemi temsil eden iki renk olan siyah ve beyaz kullanılmıştır. İlanların çoğunda beyaz zemin üzerine siyah yazı tercih edilmiştir, her iki renk de karamsarlık ve yas ifadesi olarak değerlendirilebilir. İlanlarda fotoğraf kullanımın çok az olduğu görülmektedir. İlanın en başında başlık mahiyetinde “Başsağlığı” ifadesi yer almaktadır. Daha sonra genellikle vefat eden kişinin mesleğini/toplumsal statüsünü ya da akrabalık/yakınlık durumunu belirten ifadeler ile birlikte vefat eden kişini adı ve soyadı bulunmaktadır. Vefat eden kişinin veya onun yakın bir akrabasının mesleğini belirten ifadelerin bu küçük ilan metinlerinde yer alması hem vefat eden kişi ve akrabalarının hem de ilanı veren kişinin toplumsal statüsünü belirtmek açısından önemlidir. Kişi/kişilerin verdiği ilanlarda vefat eden kişinin daha çok övülecek kişilik özellikleri sevgi ve özlem duygularıyla birlikte öne çıkarılırken kurum/kuruluş veya meslekî bağlantıya sahip kişiler tarafından verilen ilanlarda mesleği, bulunduğu görevler ve meslekî başarı üzerinde durulmaktadır.

Başsağlığı ifadelerinin yer aldığı son kısımda ise vefattan dolayı duyulan üzüntüyü ifade etmekte zorlanan insanın dilin kalıplaşmış ifadelerinden yardım aldığı görülmektedir. Vefat eden kişiye iyi dileklerde bulunmak için de kalıplaşmış dua sözleri kullanılmaktadır. İncelenen ilanların 33'ünde *Allah,* 3'ünde *Tanrı ('dan rahmet*) ifadesi kullanılırken 8 ilanda ise buna benzer bir ifade söz konusu değildir. Bu durum ilanı veren kişi/kurumların düşünce ve inançlarının birer göstergesi olarak değerlendirilebilir.

İlan metnin son bölümünde ilanı veren kişi/kişilerin veya kurum/kuruluşun adı yer almaktadır. Kurum/kuruluşlar tarafından verilen ilanların çoğunluğu banka, özel şirket, kamu kuruluşu, vakıf ve dernekler tarafından verilmiştir. Bu ilanlar, temelde dayanışma amacına sahip olsa da toplumsal yapı içerisinde belli bir statü edinme ve var olan statüyü koruma amacı da kendisini hissettirmektedir.

ARCHITECTURE STUDENTS' PREFERENCES ON ARCHITECTURAL DESIGN STUDIO: IN TERMS OF BUILDING PHYSICS

Yasemin ERBİL

erbil.yasemin@gmail.com

Abstract: This research was designed to see how much importance is given by architecture students to building physics in the process of architectural project development. In this scope heat-moisture, air circulation (wind control/natural ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics and noise control, building ecology, and fire insulation were defined as criteria related to building physics. 28 of the study, 100 students out of the 217 volunteers from Bursa Orhangazi University, Architecture and Design Faculty, Architecture Department during the 2015-2016 education year, were asked to rate each criteria. At the end of the study it has been understood that students were highly sensitive and had a high level of awareness and sensitivity on this subject.

Zemin emme basıncı ölçülmesi en zor olan zemin özelliklerinden biridir. Zemin emme basıncı doymamış zeminlerin nem durumunu açıklamak için önemli parametrelerin başındadır ve ölçülmesi en zor olan zemin özelliklerinden biridir. Killi karışımların su emme basınçlarının belirlenmesine yönelik pek çok çalışma mevcuttur ancak bunların oldukça az bir kısmı bentonit-zeolit karışımları üzerinedir. Oysaki zeolitlerin kafes şeklindeki mikro boşluklu yapısı, iyon değişim ve kimyasal reaksiyonlar için geniş iç ve dış yüzey alanı bu malzemeyi su emme açısından uygun bir malzeme haline getirmektedir. Zeolit ve bentonitin bir karışım içerisinde olduğu zaman su emme konusunda bir yarış içinde olduğu düşünülebilir. Bu durum karışımdaki her zemin için su içeriği dağılımını da değiştirilebilir. Bu çalışmada, sıkıştırılmış zeolit ve bentonit karışımlarının, değişik su oranlarındaki su emme basınçlarına zamanın etkisi sunulmaktadır. Emme basıncının belirlenmesi için kullanılan yöntem filtre kâğıdı tekniğidir ve filtreler Whatman No 42 tip filtre olarak belirlenmiştir. Toplam kuru ağırlığın %10'u bentonit olacak olacak şekilde sıkıştırılmış karışımların, %20 ve %40 su içeriğine sahip hallerine zaman etkisi (1 haftalık ve 2 haftalık dengeye gelme süresi) hem matrik hem de total su emme açısından incelenmiş ve karşılaştırılmıştır. Sonuç olarak matrik emmelerin dengeye gelme süresinden etkilenmediği fakat toplam emmelerin etkilendiği görülmüştür. Toplam emme değerlerinde, 2 haftalık denge süresi sonunda 1 haftalık denge süresince elde edilen değerlere göre artış gözlenmiştir. Bu artış %5 ve %15 arasında değişmektedir.

Abstract: Innovation diffusion has become a large and growing field with considerable amount of publications as the pioneering studies have appeared in the literature. In this context, the main purpose of this paper is to analyze the scientific publications on innovation diffusion by providing basic statistics (distributions of publications by document types, publication years, authors' origins, and etc.) and distinct trends in publication topics. With this purpose, a bibliometric analysis will be performed for a total of 900 papers published between January 1, 1981 and December 5, 2013. The findings of the study are expected to be helpful and insightful for understanding the current state and trends of research on innovation diffusion and thereby guiding researchers for their future studies.

Introduction

Innovation diffusion has generally been defined as *the process by which an innovation is communicated through certain channels over time among members of a social system* (Rogers, 2003). The theory of innovation diffusion simply explains how new ideas, technologies, and practices spread within a social system (Bohlmann, Calantone, and Zhao, 2010; Mahajan, Muller, and Bass, 2010; Valente and Davis, 1999). This theory originates in anthropology and sociology ("The laws of imitation" 2016) with some principles adapted from epidemiology (Bailey, 1975, Valente and Davis, 1999). In time, it has spread to several different research areas.

The modeling and forecasting of the innovation diffusion introduced to marketing area when the pioneering studies of it started to appear in 1960s. After its introduction to marketing, the theory of innovation diffusion has sparked considerable research among consumer behavior, marketing management, and management and marketing scholars (Mahajan, Muller, and Bass, 1990). Several different models for innovation diffusion have been built in order to investigate the diffusion of new ideas, technologies and practices.

In 1969, Bass presented a diffusion model that is one of the most popular diffusion models, has been widely used for investigating the diffusion process of innovation in a social system (Cho and Koo, 2012). Since the publication of the Bass model, the researchers on the modeling of innovation diffusion has set a vast literature consisting of several dozens of articles, books, and assorted other publications (Mahajan, Muller, and Bass, 1990). Correspondingly, innovation diffusion has become a large and growing field by numerous researchers across multiple disciplines with the primary objective of understanding the mechanism that motivate the innovation and diffusion process (Rogers, 2003). In this context, the main objective of the present paper was to perform a bibliometric analysis on the vast bodies of literature of innovation diffusion in order to find the basic statistics (distributions of publications by document types, publication years, author numbers, authors' origins, and research areas) and examine hot topics and trends of them.

For this study, publications on innovation diffusion were collected from Web of Knowledge database. Also, the time period of the publications was restricted from January 1, 1981 through December 5, 2013.
The rest of this paper was structured as follows. Section 2 provided information for used methodology and the data collection process. Section 3 presented the results of the analysis by several dimensions. Lastly, section 4 concluded the present study

Materials and Methods

In this study, a bibliometric analysis was performed for investigating the publications on innovation diffusion. Bibliometric analysis (the quantitative analysis of publications) is particularly an applicable method for the fields with vast bodies of literature which are difficult to analyze by traditional review methods (Belter and Seidel, 2013). This method is a considerable part of reference and research services (Song and Zhao, 2013) and utilizes quantitative analysis and statistics to get the bibliographical works within a given area, topic, and etc. (Wallin,

Abstract: This research was designed to see how much importance is given by architecture students to building physics in the process of architectural project development. In this scope heat-moisture, air circulation (wind control/natural ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics and noise control, building biology, ecology and fire insulation were defined as criteria related to building physics. In the scope of the study, 100 students out of the 217 volunteers from Bursa Orhangazi University, Architecture and Design Faculty, Architecture Department during the 2015-2016 education year, were asked to rate each criteria. At the end of the study it has been understood that students were highly sensitive and had a high level of awareness and sensitivity on this subject.

Keywords: Architectural Design Studio, Architecture Students' Preferences, Building Physics

2005, Jiang Tan, 2014; Zyoud, Al-Jabi, and Sweileh, 2014). It is also a useful method for getting a clear picture of the current state of the scientific researches in particular fields and allocates researchers to recognize and undertake new lines of researches (Battisti and Salimi, 2012; Zyoud, Al-Jabi, and Sweileh, 2014). Due to the practicability of the method, it has been used large amounts of publications in several different research topics. Some examples for these studies are given in table 1. In the present study, this method is applied for innovation diffusion topic.

The current analysis focused on the scientific publications in innovation diffusion. For this study, the term "*innovation diffusion*" was searched in the topics of the publications that exist in the Web of Knowledge database. More than 950 papers were found for this search key in the selected database. However, the search was restricted by some criteria. These are given below.

- The papers were restricted by document types. Only articles and proceeding papers were included for the study.
- Publication years of the papers were also limited from January 1, 1981 through December 5, 2013 due to the lack of access to full texts and abstracts for previous papers
- Lastly, the papers that did not have abstracts available, is not included in this study.

Table 1: Examples of bibliometric analysis studies in the literature.

Reference Number	*Title*	*Topic*
(Zyoud, Al-Jabi, and Sweileh, 2014)	Bibliometric analysis of scientific publications on waterpipe (narghile, shisha, hookah) tobacco smoking during the period 2003-2012	Tobacco smoking
(Belter and Seidel, 2013)	A bibliometric analysis of climate engineering research	Climate Engineering
(Fu etc., 2010)	A bibliometric analysis of solid waste research during the period 1993-2008	Solid Waste
(Kim and McMillan, 2008)	Evaluation of internet advertising research: a bibliometric analysis of citations from key sources	Internet Advertising
(Falagas, Karavasiou, and Bliziotis, 2006)	A bibliometric analysis of global trends of research productivity in tropical medicine	Productivity in Tropical Medicine
(Mela etc., 2003)	Radiological research in Europe: A bibliometric study	Radiology

After these arrangements, 900 articles were found and downloaded from the database to analyze for the present study. The document types, publication years, author numbers, countries of author(s), and research areas of the downloaded documents were collected.

Results

This section of the present paper stressed on the general findings of the analysis that was performed for chosen publications. The results of the analysis were presented under the titles of *document types, publication years, research areas, author number, countries of authors,* and *abstracts* respectively.

By Document Types

A total 900 publications were analyzed for document types in this study. The document types of the publications were restricted as only article and proceeding paper at data collection process. Correspondingly, there are only two different types of documents for this analysis. Figure 1 presents the distribution of the analyzed publications according to document types.

The 665 of all publications (74% of all papers) consists of articles while the remaining 235 of the all papers (26% of all papers) were the proceeding papers. As seen in the figure 1, the large amounts of the papers (74% of the analyzed papers) have been prepared as articles. This may show us that researchers generally focus on producing articles for innovation diffusion topic all over the world

Figure 1. Distribution of the analyzed papers by document types.

Abstract: This research was designed to see how much importance is given by architecture students to building physics in the process of architectural project development. In this scope heat-moisture, air circulation (wind control/natural ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics and noise control, building biology, ecology and fire insulation were defined as criteria related to building physics. In the scope of the study, 100 students out of the 217 volunteers from Bursa Orhangazi University, Architecture and Design Faculty, 1990 the number of papers increased to 20. Among these papers, there was still no proceeding paper criteria. At the end of the study it has been understood that students were highly sensitive and had a high level of awareness and sensitivity on this subject.

Keywords: Architectural Design Studio, Architecture Students' Preferences, Building Physics

By Publication Years

The publication years of the papers were restricted from January 1, 1981 through December 5, 2013. Figure 2 shows the annual distributions of the analyzed publications and figure 3 represents the number of papers in five years ranges. As seen in figure 2, the number of papers published on innovation diffusion was really low at the beginning years of the research time period. For example; only 5 papers were published from the beginning of 1981 to the end of 1985. And all of them were prepared as articles.

From 1986 to 1990, the number of papers increased to 20. Among these papers, there was still no proceeding paper to our knowledge. 59 papers were published on innovation diffusion. One of them was a proceeding paper within the range 1991-1995.

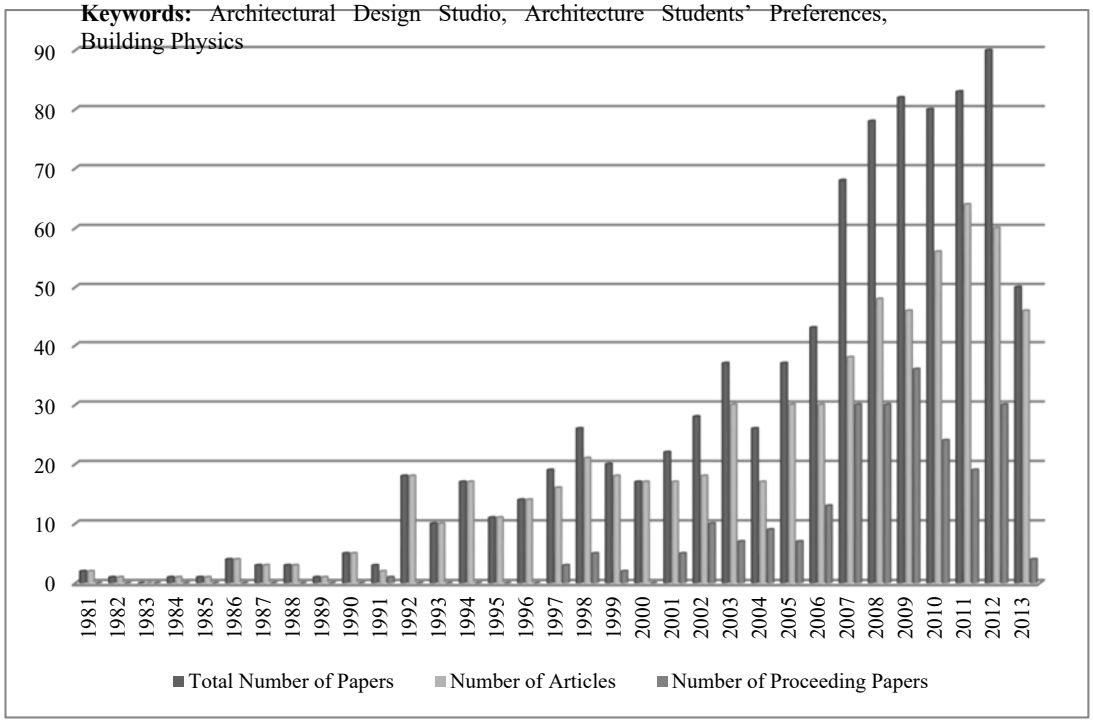

Figure 2. Annual distribution of the papers on innovation diffusion.

By Research Areas

The research areas were categorized in five main groups similar to the categorization of Web of Knowledge in this paper. The areas are: arts & humanities, life sciences & biomedicine, physical sciences, social sciences, technology.

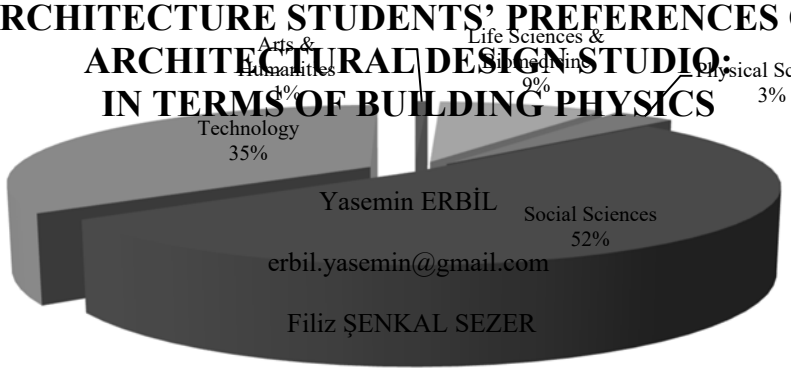

Figure 3. Distribution of the analyzed papers according to research areas

During data collection process, the research areas of each paper was also recorded from the searched database and analyzed for the given period of time.

Figure 3 presents the distribution of the papers by research areas. As seen in the figure 3, 52% of the analyzed papers were related with social sciences. The social sciences area includes topics like Business & Economics; Psychology; Public Administration; Education; etc. according to the categorization of the selected database. The percentage of the papers for social sciences may show that the innovation diffusion researchers mostly focused on the social sciences areas for the given period.

The researches about technology field followed the social sciences area with 35%. Thus, the largest amounts of the papers were related with social sciences and technology areas with 88%. Apart from these two areas, papers were distributed to life sciences & biomedicine with 9%, physical sciences with 3%, and arts & humanities research areas with 1% of all papers.

By Number of Authors

In this study, the papers were also analyzed for the number of authors. A total of 2136 authors participated in innovation diffusion related studies. The range of the authors was within 1 to 14. Average number of authors per paper is 2,373.

Figure 4 gives the distribution of the papers according to the number of authors. The 343 of the analyzed papers were prepared by two authors. The papers with three authors followed them with 225 of all papers. And, 214 of the papers were made by one author.

The remaining of the papers was prepared by four or more authors. However, the amount of papers with more than three authors showed considerable decrease. Correspondingly, the biggest amount of the papers (86% of all papers) was written one, two, or three author(s).

Abstract: This research was designed to see how much importance is given by architecture students to building physics in the process of architectural project development. In this scope heat-moisture, air circulation (wind control/natural ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics and noise control, building biology, ecology and fire insulation were defined as criteria related to building physics. In the scope of the study, 100 students out of the 217 volunteers from Bursa Orhangazi University, Architecture and Design Faculty, Architecture Department during the 2015-2016 education year, were asked to rate each criteria. At the end of the study it has been understood that students were highly sensitive and had a high level of awareness and sensitivity on this subject.

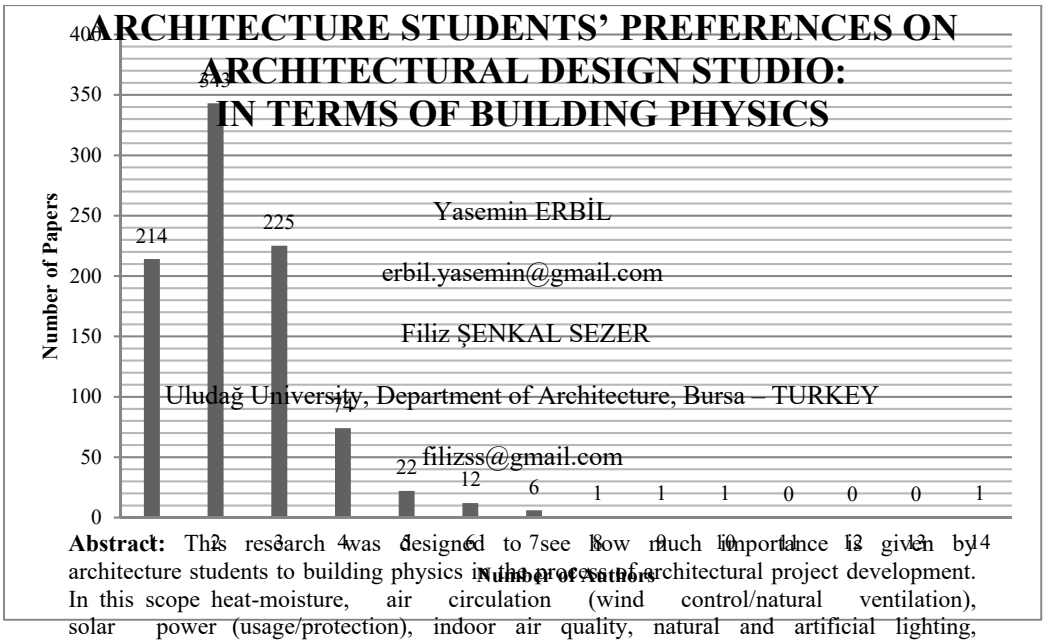

Figure 4. Distribution of the analyzed papers by number of authors.

Abstract: This research was designed to see how much importance is given by architecture students to building physics in the process of architectural project development. In this scope heat-moisture, air circulation (wind control/natural ventilation), solar power (usage/protection), indoor air quality, natural and artificial lighting, building acoustics and noise control, building biology, ecology and fire insulation were defined as criteria related to building physics. In the scope of the study, 100 students out of the 217 volunteers from Bursa Orhangazi University, Architecture and Design Faculty, Architecture Department during the 2015-2016 education year, were asked to rate each criteria. At the end of the study it has been understood that students were highly sensitive and had a good level of awareness and sensitivity on this subject.

Keywords: Architectural Design Studio, Architecture Students' Preferences, Building Physics

By Countries of Authors

The analyzed publications were written by a total of 2136 authors from 68 different countries. It should be noted that the country knowledge of the authors were based on the correspondence addresses of the papers. The authors who did not give information about the origin of themselves were accepted as *unknown* in the analysis.

Figure 5 shows the percentage distribution of countries of authors. Authors originating from USA (United States of America) had the largest amount of the publications with 26% (with 568 papers). Authors originating from China ranked as the second with 11% (with 233 papers). Taiwan (Republic of China) had the third place for authors' origins with 9% (with 201 papers). Taiwan was followed by England, Italy, and Australia with 6%, 5%, and 4% respectively. More than the half (52% of all authors) of all authors was from the first four countries: USA, China, Taiwan, and England.

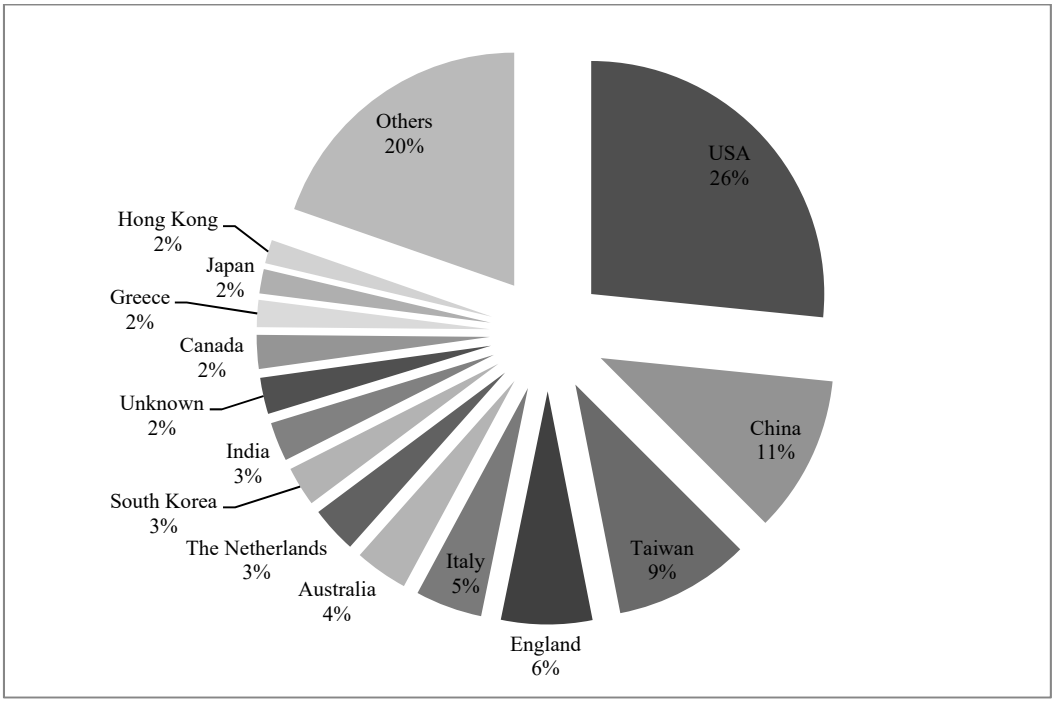

Figure 5. Percentage distribution of country origins of authors.

 Copyright © International Science and Technology Conference (ISTEC)

Conclusion

This paper mainly investigated the statistical distribution of the papers published about innovation diffusion in Web of Knowledge database from January 1, 1981 through December 5, 2013.

A bibliometric analysis was performed in order to compute basic statistics and examining the current state, hot topics and trends of innovation diffusion researches. The main findings of the present work are given below.

- The 665 of all publications (74% of all papers) consisted of articles while the remaining 235 of the all papers (26% of all papers) were the proceeding papers.
- The number of papers published on innovation diffusion was really low at the beginning years of the research time period. It showed a considerable increase at 1992 and fluctuated until 2000. The largest amount of the analyzed papers (724 of 900 papers) was written after 2000. And it peaked at 2012 with 90 papers.
- The biggest amount of the papers (52% of all papers) was related with social sciences research area. The papers related with Technology research area followed it with 35%.
- The biggest amount of the papers (86% of all papers) was written one, two, or three author(s).
- 900 papers were written by 2136 authors from 68 different countries.
- Authors originating from USA (United States of America) ranked to the first place with 26% (568 of all papers). Authors originating from China had the second place with 11% (235 of all papers). Taiwan (Republic of China) had the third place for authors origins with 9% (201 of all papers). More than the half (52%) of all authors was from USA, China, Taiwan, and England respectively.

The findings given in this study present some basic statistics and trends obtained innovation diffusion papers for the given period. However, the analyses in this study were subject to certain limitations. First, the document types of the papers were restricted as articles and proceeding papers. Second, the papers that did not have abstracts available online were not included in this study. Consequently, future researches may perform a more detailed study taking these limitations of the present study into account.

Abstract: This research was conducted to determine which architecture students to building physics in the process of architectural project development. In this scope, heat, moisture, air, circulation (wind, control(natural), ventilation), solar, power, (usage/protection), indoor, air, quality, natural, and, artificial, lighting, building, acoustics and noise control, building biology, ecology and fire insulation were defined as criteria related to building physics. In the scope of the study, 100 students out of the 217 volunteers from Bursa Orhangazi University, Architecture and Design Faculty, Architecture Department during the 2015-2016 education year, were asked to rate each criteria. At the end of the study it has been understood that students were highly sensitive to the subject in the study. Consequently, this research

Bilgisayar teknolojisinin ülkemizde oldukça takip edildiği göz önünde bulundurulduğunda bilgisayarın etkili kullanımının eğitim hayatımızı ne şekilde etkilediği önemli bir konudur. Ülkemizin temel hedefi kaliteli ve bilgili öğrenci yetiştirilmesidir. Sayıları gün geçtikçe artan öğrenci potansiyelinin; en iyi şekilde yetiştirilmesinde bilgisayar destekli eğitim en büyük yardımcı olarak düşünülmelidir. Bu amaçla Kırklareli Üniversitesi Teknik Bilimler Yüksek Okulunun Giyim Üretim Teknolojisi, Tekstil Teknolojisi programlarında okuyan 101 öğrenciye anket çalışması yapılmıştır. Bu çalışmanın sonucunda verilen bilgisayar destekli eğitiminin yeterli olup olmadığı ve daha etkin bir eğitim öğretimin sağlanabilmesi için neler yapılabileceği ortaya çıkarılmaya çalışılmıştır.

Computer-Assisted Design –Use of Software Programs on Presentation Studies and Evaluation of Its Education

The fact that how effective use of computer affects our educational life considering that computer technology is highly followed in our country is an important subject. Our country's main aim is to raise qualified and knowledgeable students. Computer- Assisted Education should be considered as the biggest help on raising student potential whose number is increasing day by day. For this purpose, a questionnaire has been conducted on 101 students who study in the programs of Vocational School of Technical Sciences Clothing Production Technology, and Textile Technology at University of Kırklareli. As a result of this study, whether the given Computer-Assisted Education is sufficient or not and what can be done in order to provide more active education has been attempted to be found out.

Jaehee Chung
archijenny@gmail.com

Dongan Shin
dashin@seon.co.kr

The study intends to present a direction for BIM Library Development customized for the Elderly Housing, which can be used for modular housing by analyzing the behaviors of the elderly and the relevant researches on the elderly housing. The existing BIM library targets ordinary people as users, and the direction of the research tend to focus only on the system. The existing BIM library, in terms of practical and pragmatic point of view, is inappropriate for the elderly housing sincec it is not divided in detail to apply to space. Therefore, this research aims to develop the BIM library applicable for modular housing for the elderly. The spatial extent of the study is limited to the entrance, kitchen and bathroom, which have the biggest differentiation between the elderly housing and the public housing, and require the system customized for the elderly.

This study, through the precedent research and theoretical consideration, analyzes the behaviors of the elderly and residential design technique, modular housing, and BIM library, and the domestic standards relevant to the elderly. Then, the guidelines customized for the elderly housing are derived.. Also, analysis on the exisitng BIM library customized for the elderly housing are conducted. Finally, BIM library customized for the entrance, kitchen, and bathroom are proposed, based on the guidelines deduced from above.

Through this research, it is expected to present basic directions for modular-based BIM Library Development customized for the Elderly Housing and contribute to the supply and activation of the modular housing customized for the elderly.

BIODIESEL FUEL OBTAINED FROM SUNFLOWER OIL AS AN ALTERNATIVE FUEL FOR DIESEL ENGINES

Cumali ILKILIC* Cengiz ÖNER*

* Firat University Technology Faculty, Automotive Engineering, Elazığ 23119, Turkey

Abstract
In this study, an alternative diesel fuel, of which chemical modification was made by transesterification with short chain methyl alcohols, was produced from sunflower oil, a designated as B100. The modified products were then evaluated according to their fuel properties as compared to diesel fuel. The fuel properties considered were viscosity, pour point, calorific value, flash point, and cetane number in addition to some other properties. The effects of sunflower oil methyl ester (biodiesel) and diesel fuel on a direct injected, four strokes, single cylinder diesel engine performance were studied. The results showed that the performance of the engine using biodiesel fuel differed very little from the engine's using diesel fuel.
Keywords: diesel engine, alternative fuel, biodiesel fuel, performance.

1. Introduction

The prevalence of internal combustion engines and subsequent developments in engine technology have led to wide spread consumption of the petroleum fuels. Due to the shortage of petroleum products and its increasing cost, many efforts are put on the stage to develop alternative fuels, especially for fully or partial replacement of diesel oil. The high cost of petroleum and petroleum crises have brought much pressure on many countries to re-evaluate their national energy strategies. Thus energy conservation and alternative fuels research are given high priority in energy planning in some countries. Many studies have been performed in developed countries and elsewhere involving vegetable oils as a primary source of energy. Particularly, during the early 1980's, studies on the possibility of using unmodified vegetable oils as a diesel fuel were conducted.

Since the petroleum crises in 1970's and 1980's, rapidly increasing petroleum prices and uncertainties concerning petroleum availability, a growing concern of the environment, and the gases affecting global warming have attracted more interests in the use of vegetable oils as a substitute of diesel fuel. The acceptability of vegetable oils as diesel fuel has been evaluated for the first time in the 70th years because of the well known energy crises. Thus energy conservation and alternative fuel researches are given high priority in energy planning in some countries. Several studies conducted worldwide have shown that vegetable oil, without any modification on diesel engine, can give performances comparable with those of diesel fuels. The most important advantage of vegetable oils is that they are renewable energy sources compared to the limited resources of petroleum. Many of these studies are on vegetable oils to be used in diesel engines (Labeckas et al. 2005), (Ryu et al. 2004), (Rakopoulos et al 1992), (Lapuerta et al 2005), (Huzayyin et al 2004), (Hebbal et al 2006), (Geyer et al 1984), (Yoshimoto et al 2002). It has been found that the vegetable oils are promising fuels because their properties are similar to diesel and can be produced easily from the crops (Jung et al 2004), (Zou et al 2003), (Nagaraj et al 2002).

Vegetable oils are non-toxic renewable sources of energy, which do not contribute to the global CO_2 buildup. Vegetable fuels can be used as an emergency energy source in the event of any petroleum shortage. Extensive studies on alternative fuels for diesel engines have been carried out since the fossil based fuels are limited. Common vegetable oils are sunflower, cottonseed, olive, soybean, corn, nut, leenseed and sesame oils. The most produced ones in Turkey are sunflower, cottonseed, corn, soybean, olive and nut oils.
Sunflower and other vegetable seeds release oil on compression processes. During the processes of compression of these seeds and final storage, many fatty acids are formed (Gunstone et al 2003), (Bikou et al 2003), (Warner et al 1997), (Yücesu et al 2006). These are palmitic, stearic, oleic, lynoleic, arachidic and behenic acids. Sunflower oil also contains some fatty acids like other vegetable oils. The chemical formulations and the percentage of sunflower oil and some other oils fatty acids are given in Table 1.

 Copyright © International Science and Technology Conference (ISTEC)

Table 1. Fatty acid composition of sunflower oil in comparison with other vegetable oils

Component	Chemical Bond	Chemical equation	Sunflower oil	Cottonseed oil	Soybean oil	Corn oil
Palmitic acid	16:0	C16H32O2	23	22	17	12
Stearic acid	18:0	C18H36O2	3	2	3	2
Oleic acid	18:1	C18H34O2	24	25	26	25
Linoleic acid	18:2	C18H32O2	49	50	54	60
Linolenic acid	18:3	C19H32O2	1	1	3	1

The melting point of fatty acids rises with the length of the structural chain of acid. Some vegetable oil contains high concentrations of less common fatty acids. Physical properties of sunflower oil used in this study in comparison with other some vegetable oils are given in Table 2. These oils are almost entirely consumed in foods. The excess of these could be used as diesel fuel besides consuming in foods.

Table 2. Physical properties of sunflower oil in comparison with other some vegetable oils

Properties	Sunflower oil	Cottonseed oil	Soybean oil	Corn oil
Density @ 26ºC (Kg/lt)	0.918	0.912	0.92	0.91
Viscosity(mm^2/s) at 26°C	34	35	34	36
Flash point (°C)	220	210	230	280
Calorific value (kJ/kg)	39500	39450	39600	39550
Setan number	36	42	38	37
Acid value	0.15	0.11	0.20	0.16
Sulphur value (%)	0.01	0.01	0.01	0.01

It has been shown that pure vegetable oils have harmful effects on engine parts and cause a starting up problem (Engler et al 1983), (Schlick et al 1988), (Ramadhas et al 2005), (Muñoz et al 2004), (Bari et al 2002), (Goodrum et al 2005), (Dorado et al 2002), (Krishna et al 2004). The problems due to the viscosity and density of the vegetable oils having different physical and chemical properties from the diesel fuel should be eliminated by making them less viscous. High viscosity of the vegetable oils and its tendency to polymerise within the cylinder are major chemical and physical problems encountered. With this aim, it is necessary to obtain either esters or emulsions of vegetable oils (Bhattacharyya et al 1994), (Agarwal et al 2001), (Barnwal et al 2005), (Schwab et al 1987). Vegetable oils can be used as material to produce methyl or ethyl ester. There are several methods for producing of ester; and the best method is known as transesterification (Freedman et al 1986), (Mittelbach et al 1999), (Schuchardt et al 1998), (Ramadhas et al 2005), (İlkılıç et al 2005), (Megahed et al 2004), (Dorado et al 2004), (Encinar et al 2002), (Noureddini et al 1997), (Ma et al 1999), (Harrington et al 1985).

2. Experimental procedure

Transesterification is the most frequently applied method of industrial ester production. A strong acid can be used in transesterification process. Vegetable oils' methyl or ethyl ester is considered as a promising alternative fuel for the reduction of pollutant from diesel engines. Biodiesel can be used in any diesel engine in pure form or blended with diesel fuel at any rate. Even a blend of 20% biodiesel and 80% diesel fuel will significantly reduce carcinogenic emissions by 27% and gases that may contribute to global warming up (Petrowski, 2002). Biodiesel fuel production from sunflower oil has been studied as an alternative fuel for compression ignition engines. Detailed reviews about biodiesel fuel production processes are available in the literature. In this study, crude sunflower oil was obtained from the oil processing factory of Karadeniz Birlik, Elazığ, Turkey. Diesel fuel was obtained from a commercial gas station in Elazığ, Turkey. The biodiesel fuel produced by a transesterification technique was further reacted by using a peroxidation process. Physical properties of crude sunflower oil (CSO), Biodiesel (B100) fuel, and diesel fuel are given Table 3.

B100 fuel prepared in laboratory conditions was tested in an engine of which technical data is detailed in table 4.

Table 4. Lombardini Diesel Engine Details.

Type	6LD 400 Lombardini
Number of cylinder	1
Cylinder diameter	86 mm
Stroke	68 mm
Clearance volume	395 cm^3
Compression ratio	18:1
Maximum speed	3600 l/min
Maximum power	6.2 kW @ 3600 l/min
Maximum torque	20 N.m @ 2200 l/min
Fuel tank capacity	4.3 lt
Oil consumption	0.0115 kg/h
Cooling	air
Injection timing	30 BTDC
Injection opening pressure	200 kg/cm^2
Starting	by dynamometer
Dry weight	45 kg

Tests were held on a laboratory test bed which consisted of an electrical dynamometer, an exhaust gas analyzer, a data acquisition system and engine mounting elements, as shown in Fig. 1. Diesel fuel and biodiesel fuel were compared for their fuel properties and their engine performance.

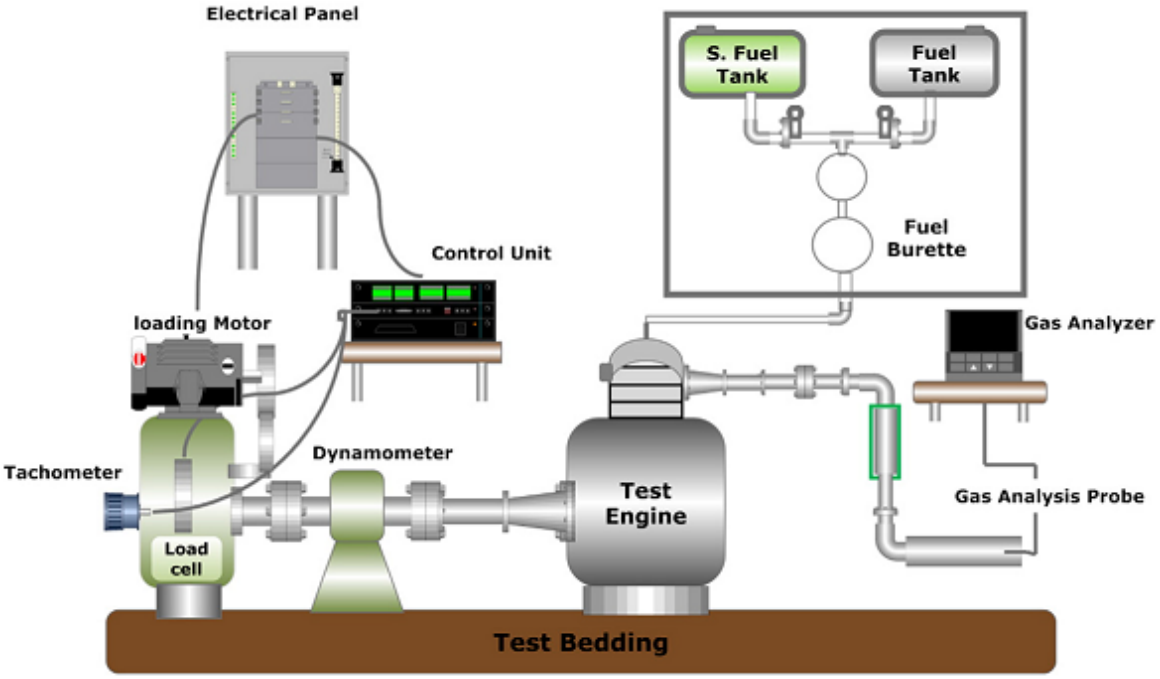

Figure 1. Schematic layout of the engine test system

3. Results and discussions

3.1. The engine power

During the injection period, the injection conditions such as injection pressure, nozzle size, and injection rate may vary. The droplet size distribution in the spray may also change with time during the injection period. The effect of injection pressure has been studied. The injected diesel fuel and B100 fuel are atomised into small drops near the nozzle exit to form a spray. Good atomisation requires high fuel injection pressure small injector nozzle size, optimum fuel viscosity and high cylinder air pressure at the time of injection. The variations of engine power values in relation with the various injection pressures are shown in Fig. 2. The maximum power for diesel fuel and B100 fuel occurred at 200 bar pressure injection. The power output of diesel engine using B100 fuel was lower than the power output using diesel fuel.

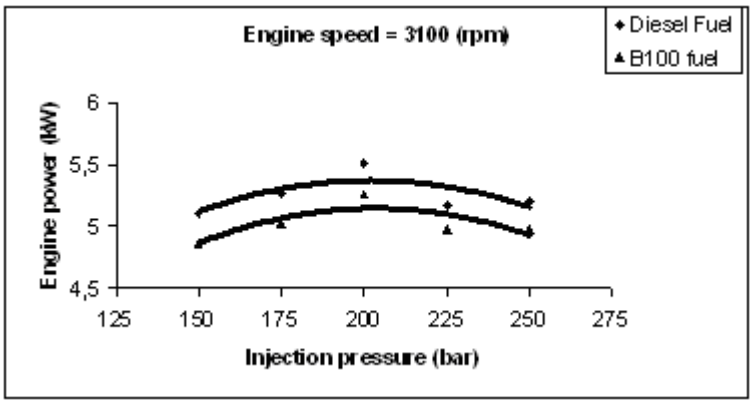

Figure 2. The variation of the engine power at the various injection pressure.

The maximum power obtained by diesel fuel was 5.51 kW while 5.26 kW by B100 fuel at 200 bar injection pressure. This was due to an increase in fuel consumption with an increase of injection pressure. The difference in power outputs was caused by the difference between the calorific values of the fuels. The power increases from 5.11 kW to about 5.51 kW when the injection pressure is increased from 150 bar to 200 bar for diesel fuel. From injection pressure of 150 to 200 bar the power increases from 4.86 kW to about 5.26 kW and then

 Copyright © International Science and Technology Conference (ISTEC)

decreases slowly the other injection pressures for B100 fuel. From injection pressure of 200 to 250 bar the power decreases from 5.51 kW to 5.21 kW for diesel fuel and from injection pressure of 200 to 250 bar the power increases from 5.26 kW to 4.97 kW for B100 fuel. The maximum power between diesel fuel and B100 fuel represents a difference of 5% of the 200 bar injection pressure. The small difference was mainly a result of reduction at heating value of diesel fuel due to the lower heating value of B100 fuel.

3.2. Engine torque

The variation of engine torque by injection pressure for the two fuels was shown in Fig. 3.

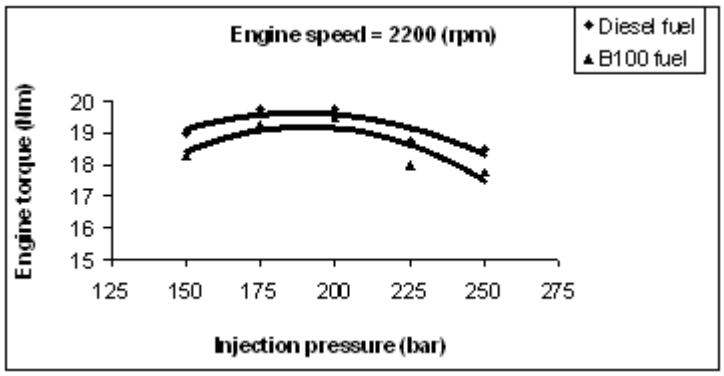

Figure 3. The variation of the engine torque at the various injection pressure

The torque decreased with increase of injection pressure for the two fuels. Up to a pressure of 200 bar the engine torque is about constant and then it is decrease slowly for diesel fuel and B100 fuel. The torque increases from 19 Nm to about 19.75 Nm when the injection pressure is increased from 150 bar to 200 bar for diesel fuel. From injection pressure of 150 bar to 200 bar the torque increases from 18.25 Nm to about 19.50 Nm and then decreases the other high injection pressures for B100 fuel. From injection pressure of 200 bar to 250 bar the power decreases from 19.75 Nm to 18.50 Nm for diesel fuel and from injection pressure 200 bar to 250 bar the power increases from 19.50 Nm to 17.50 Nm for B100 fuel.

3.3. Specific fuel consumption

Figure 4 showed the specific fuel consumption (SFC) for the two fuels. Specific fuel consumption increased with increase of injection pressure. The specific fuel consumption of B100 fuel was higher than of diesel fuel. This was due to the calorific value of B100 fuel being lower than that of diesel fuel. But the density of the B100 fuel was higher than that of diesel fuel so their calorific value by volume was relatively close. In addition, B100 fuel contains a certain amount of oxygen and the high viscosity. B100 fuel may also provide a good sealant between the piston rings and cylinder wall. The utilization ratio of energy can be raised so the fuel consumption rate was higher than diesel fuel. Because of the lower calorific value, with an increase in B100 fuel, the specific fuel consumption of B100 fuel was a little higher than that of diesel fuel.

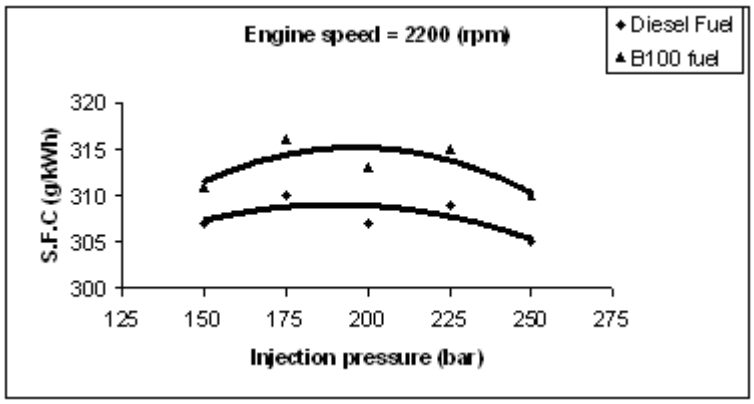

Figure 4. The variation of the engine specific fuel consumption (SFC) at the various injection pressure

 Copyright © International Science and Technology Conference (ISTEC)

Up to a pressure of 225 bar SFC is increased and then it is decreased slowly for diesel fuel. The SFC increases from 307 g/kWh to about 309 g/kWh when the injection pressure is increased from 150 bar to 225 bar for diesel fuel. From injection pressure of 150 bar to 200 bar the SFC increases from 311 g/kWh to about 313 g/kWh and then decreases the other high injection pressures for B100 fuel. From injection pressure of 225 bar to 250 bar the SFC decreases from 309 g/kWh to 305 g/kWh for diesel fuel and from injection pressure 200 bar to 250 bar the specific fuel consumption decreases from 313 g/kWh to 310 g/kWh for B100 fuel. The largest effect of high injection pressure is the state of the fuel as it passes through the nozzle. The injection pressure can be reduced slightly leave the fuel emerging from the nozzle in mostly vapour state. The question that remains is the increase in the specific fuel consumption at the high engine injection pressure due to the deacrease in drop size and the calorific value or some other factors.

4. Conclusions

Engine tests have been conducted with the aim of obtaining comparative measures of torque, engine power, specific fuel consumption to evaluate and compare the behaviors of the direct injected diesel engine running by diesel fuel and B100 fuel. Diesel fuel and B100 fuel was compared and its physical and chemical characteristics were determined. Fuel characterization data showed some similarities and differences between diesel fuel and B100 fuel. From the results obtained in this study it can be concluded that;

The physical properties of diesel and B100 fuel are not very different. While the density and viscosity of B100 fuel decreased from 0.92 kg/lt to 0.88 kg/lt and from 33.98 mm^2/s to 4.5 mm^2/s respectively at 26°C, the heat capacity increased from 39342 kJ/kg up to 40565 kJ/kg. Viscosity considerably decreased as a result of esterification.

Flash point, density, cetane number and viscosity of B100 fuel were higher than those of diesel fuel. Calorific value of B100 fuel was lower about 6% than diesel fuel. Engine performance and exhaust gas emission of B100 fuel are comparable with diesel fuel. When the engine performance is considered, there are slight decreases in the engine torque and power with respect to diesel fuel. Thus B100 fuel is technically feasible in diesel engine.

The high fuel consumption of B100 fuel at all injection pressure will compensate for the lower heating values such that the engine consumes equal amount energy.

B100 fuel doesn't affect engine and bearing components seriously. It doesn't degrade lubricating oil and produces comparable amount of carbon deposit.

Vegetable oils and biodiesel hold great promise as substitutes of diesel in existing diesel engines without any modification. Edible and non-edible oil and animal fats can be used to produce biodiesel. Non-edible or crude oils offer great promise as biodiesel, and hence there is a need to grow high yielding non-edible oil seed crops.

Vegetable oils are renewable in nature and can be produced locally and environmentally friendly as well. They have no sulfur content and have excellent lubrication properties. Moreover, trees yielding vegetable oils absorb carbon dioxide from the atmosphere during their photosynthesis. Vegetable oil plants that produce oils used for making biodiesel draw CO_2 from the atmosphere to build stems, leaves, seeds and roots.

BIQUATERNIONIC UNIFICATION OF THE GENERALIZED FIELD EQUATIONS IN GRAVITY AND ELECTROMAGNETISM

Murat Tanışlı
mtanisli@anadolu.edu.tr

Süleyman Demir
sudemir@anadolu.edu.tr

In relevant literature, several noncommutative mathematical structures have been proposed in order to formulate the possible relations between linear gravity and electromagnetism. In this study, using the similarities between gravity and electromagnetism, an alternative formulation has been derived. As a member of noncommutative division algebra, the real quaternions are one of the four dimensional number systems and have many applications in mathematics and physics. Since the biquaternions are composed of two real quaternions, they can be used to represent up to the 8-dimensional physical structures. In this work, introducing a hyperbolic unit into biquaternion formalism, a sixteen dimensional mathematical structure has been obtained. By this way, the massive field equations including monopole terms in electromagnetism and linear gravitation have been combined in the single equation. The generalized wave equation with simultaneous existence of electric, magnetic, gravitoelectric, gravitomagnetic charge (mass) terms has been formulated in compact and elegant manner.

**Süleyman Demirel Üniversitesi, Maden Mühendisliği Bölümü, Isparta, Türkiye

*hakan.sarikaya@usak.edu.tr

Özet: Yapılarda kullanılacak malzemelerin seçiminde, enerji-malzeme üretim teknikleri dikkate alınmalı, karbondioksit ile hava ve çevre kirlenmesi dengeleri hesaba katılmalı ve alternatiflerden en az zararlısı seçilmelidir. Bu nedenle mimarlar, mühendisler ve tüketiciler yapı malzemelerini seçerken üretim aşamasında en az enerji kullanan, çevre ile uyumlu malzemeleri seçmek durumundadırlar. Alçının hazırlanmasında kullanılan temel hammadde alçıtaşıdır. Alçı taşı değişik yerlerde değişik saflıkta yataklanmış doğal oluşumlu bir kayaçtır. Bu çalışmada, alçı ağırlıkça farklı oranlarda kullanılarak 10×10×10 ebatlarında üretilmiştir. Üretilen numunelerde su ve alçı oranı sabit tutularak alçı yerine ağırlıkça % 2,5, 5, 7,5, ve 10 oranlarında bor (Üleksit-Konsantre ve Üleksit- Tüvenan) kullanılmıştır. Üretilen numunelerin yoğunlukları, ultrases hızları ve ısı iletkenlikleri belirlenmiştir. Bor oranı arttıkça numunelerin ısı iletkenlik katsayısının azaldığı görülmektedir. Isı iletkenlik katsayısının azalması ise ısı yalıtımına katkı sağlayacağı düşünülmektedir.

Anahtar Kelimeler: Alçı, Bor, Isı İletkenlik

THERMO-MECHANİCAL PROPERTİES OF BORON REİNFORCED GYPUMUS

Abstract: In the selection of materials to be used in buildings, energy-fabrication must be considered, carbon dioxide must be taken into account by air pollution and balances and least harmful to the alternative should be selected. For this reason, architects, engineers, and consumers use the least energy when selecting the building materials, during the production phase, to select materials compatible with the environment are required. The basic raw material used in the preparation of gypsum plaster. Supported in different places purity of gypsum is a naturally occurring rock. This rock within the body of around 20% chemically bound water it contains. In this study, different proportions by weight of gypsum using 10×10×10 sizes are manufactured. The produced water samples instead of plaster when plaster is held constant and the ratio of % by weight to 2.5, 5, 7.5 and 10 in a ratio of boron (Üleksit-Concentrate and Üleksit-Tuvenan) was used. The densities of the samples produced, the ultrasound velocity and the thermal conductivity was determined. The ratio of boron increases, it is observed that the coefficient of thermal conductivity of the samples is reduced. To reduce the coefficient of thermal conductivity is considered to contribute to thermal insulation.

Keywords: Gypumus, Boron, Thermal Conductivity

Giriş

İnsanoğlunun var oluşundan bu yana yeme içme ihtiyacından sonra ikincil temel ihtiyacı barınma olmuştur. Böylece yapı sektörü hep gündemde kalmış ve her an daha güzel, pratik yöntemler geliştirmeye yönelik çalışmalar devam etmiştir. Günümüz dünyasında ise her alanda olduğu gibi bu alanda da temel gaye, en kısa zamanda en az harcama ile çözüme ulaşmaktır. Günümüzde kullanımda ortaya çıkan ihtiyaçlar nedeni ile, çeşitli özelikleri geliştirilmiş veya üretim ve uygulama teknikleri farklı bazı özel betonlar yaygın biçimde kullanılmaktadır. Üretilen betonların kullanım amacına yönelik olarak tasarımının yapılması ve ekonomik olması çok önemlidir (Sarıkaya, 2014). Dünya nüfusunun artması nedeniyle, basit ve tek katlı yapılar yerine, karmaşık ve çok katlı yapılar son yıllarda yaygınlaşmıştır. Bina yüksekliği ve kat sayısı arttıkça, kullanılan malzemenin niteliği de önem kazanmaktadır (Erdem vd.,, 1997). Çok katlı yapılarda, yapısal güvenlik ve depremin etkisini azaltmak için beton performansı büyük önem taşır (Neville, 1981).

 Copyright © International Science and Technology Conference (ISTEC)

Beton; çimento, su, agrega ve gerektiğinde katkı maddelerinin (mineral, kimyasal, fiber vb) belirli şartlar ve oranlarda karıştırılmasıyla elde edilen, başlangıçta şekil verilebilen plastik formda olup, zamanla çimento ve su arasındaki kimyasal reaksiyonun gelişmesiyle (hidratasyon) sertleşerek mukavemet kazanan, harç fazı ve agregadan oluşan kompozit bir yapı malzemesidir (Özel, 2007). Beton henüz yeni karıldığında taze beton adını alırken, katılaşıp sertleşince sertleşmiş beton adını alır (Neville, 1993). Betonda bileşime giren malzemeler özel olarak oranlandığı zaman karışım herhangi bir yere dökülebilir ve ebadı ile kalıpların şeklini alabilen plastik bir kütle meydana getirir (Baradan, 1997).

Bor madeni, periyodik tabloda B simgesiyle gösterilen, atom numarası 5, atom ağırlığı 10.81, yoğunluğu 2.84 gr/cm^3, ergime noktası 2300 °C, kaynama noktası 2550 °C olan, metalle ametal arası yarı iletken özelliklere sahip bir elementtir (Etimaden, 2016). Genellikle doğada tek başına değil, başka elementlerle bileşikler halinde bulunan bor madeni, çeşitli metal veya ametal elementlerle yaptığı bileşiklerin gösterdiği değişik özellikler nedeniyle, endüstrinin birçok alanında kullanılmaktadır. Doğadaki yaklaşık 150 mineralin bor elementi içerdiği bilinmesine rağmen, endüstriyel açıdan önemli ve ticari değeri olan bor bileşikleri arasında boraks, kolemanit, tinkal, üleksit, kernit, pandermit, probertit, szyabelit ve hidroborasit yer almaktadır. Bor mineraleri doğadaki halleriyle ticari önem taşımalarına rağmen, farklı tipteki rafine bor bileşiklerinin üretilmesi için bazen teknolojik işlemlere tabi tutulmaktadır. Öte yandan bu bor bileşikleri içerdikleri B_2O_3 (borik oksit) miktarına, taşıdıkları fiziksel veya kimyasal özelliklerine göre farklı alanlarda kullanılmaktadır (Boraxs, 2016).

Türkiye Dünya bor madeni rezervinin %72'sine sahiptir. Bu özelliği ile Dünya ham bor madeni üretiminde birinci sırada yer almaktadır. Öte yandan, tek başına dünya bor talebini 567 yıl karşılayabilmesi söz konusudur. Dünya bor madeni rezervinin %7'sine sahip olan ABD ise, yakın gelecekte bor rezervlerinin tükenmesi ile karşı karşıyadır. ABD'deki bor rezervlerinin dünya bor talebini karşılayabilme süresi ise yalnızca 53 yıldır (Etimaden, 2016).

Türkiye'de bulunan bor madenleri diğer ülke rezervlerine göre karşılaştırmalı üstünlüğe sahiptir. Ülkemizde bulunan bor madenlerinin yerleşim yerlerinin hemen yanında yer alması, rezervlerin kolaylıkla işletilebilmesini sağlamaktadır. Ayrıca Türkiye'deki bor madenlerinin içindeki borik oksit oranının yüksek olması, boraks ve borik asit üretilmesi için madenlerin ek işlemlerden geçirilme zorunluluğunu da ortadan kaldırmaktadır. Bütün bu özelliklere rağmen, Türkiye'nin bor ürünleri piyasasında aldığı pay ise yalnızca % 7'dir. Oysa ABD'nin aynı piyasadan aldığı pay yaklaşık % 60–70 civarındadır (Etimaden, 2016).

Yapılarda kullanılacak malzemelerin seçiminde ise enerji-malzeme üretim teknikleri dikkate alınmalı, karbondioksit ile hava ve çevre kirlenmesi dengeleri hesaba katılmalıdır. Alternatiflerden en az zararlısı seçilmelidir. Bu nedenle mimarlar, mühendisler ve tüketiciler yapı malzemelerini seçerken üretim aşamasında en az enerji kullanan, çevre ile uyumlu malzemeleri seçmek durumundadırlar. Alçının hazırlanmasında kullanılan temel hammadde alçıtaşıdır. Doğada bulunan jipsit veya anhidrit olarak rastlanan Ca^{+2}, SO^{-4} iyonlarının bileşiminden oluşan ve oluşum ortamına göre içeriğinde bazen su bulunan mineral topluluğuna, mineral farklılığına bakılmaksızın alçıtaşı denilmektedir. Malzeme bileşimleri, bağlayıcı olarak görev yapan %25-30 alçı, % 70-75 kuartz ve kristobalit formundaki silika karışımı ve düşük miktarlarda kontrol ilavelerinden oluşmaktadırlar (Ünlüer, 2001).

Alçı taşı değişik yerlerde değişik saflıkta yataklanmış doğal oluşumlu bir kayaçtır. Bu kayaç bünyesinde % 20 civarında kimyasal olarak bağlanmış su içerir. Bu öğütülüp ısıtıldığında bünyesinde suyun yaklaşık 3/4' ünü kaybeder ve genel adıyla kalsine alçı yada "plaster of paris" denilen bir yapıya dönüşür. Kalsine edilmiş olan bu alçı tekrar su ile karıştırıldığında plastik ve akışkan bir kütle halini alır ve isteğe göre kalıplanabilir veya şekillendirilir (Kaya, 2000).

Ülkemizde alçının inşaat malzemesi olarak üretimi 1990'lı yılların ortalarında yaygınlaşmıştır. 2000'li yılların başları ile birlikte alçı sektörü hızla büyümüştür. Ülke ekonomisine paralel olarak inşaat sektöründe görülen dönemsel yoğunluklar alçı sektöründeki talebi de doğrudan etkilemektedir. Alçının inşaat malzemesi olarak sağladığı avantajları son on yılda fark eden Türkiye, 2000' li yıllara girerken yılda bir milyon ton alçıyı yapılarda kullanır hale gelmiştir. Ancak ülkemizin çağdaş konut ihtiyacını rasyonel bir biçimde ve bir kuşakta karşılayabilmesi bundan çok daha fazlasını kullanmayı gerektirmektedir (Alçıder, 2016).

Bu çalışmada, ağırlıkça alçı oranı sabit tutularak alçı yerine ağırlıkça % 2,5, 5, 7,5 ve 10 oranlarında (Üleksit-Konsantrre ve Üleksit-Tüvenan) kullanılarak 10 x 10 x10 ebatlarında numuneler üretilmiştir.

Numunelerin üretimi ile fiziksel ve mekanik özelliklerinin tespiti için yapılan deneyler Süleyman Demirel Üniversitesi Mühendislik Fakültesi Maden Mühendisliği Bölümü Kazı ve Doğal Taşlar Teknolojisi laboratuarında gerçekleştirilmiştir. Bu çalışmada 9 seri borlu alçı üretilmiştir. Üretilen borlu alçıların kodlar Çizelge 2' de, karışıma giren borlu betonların 1 m^3 içindeki bileşenleri ise Çizelge 3.' de verilmiştir. Karışıma giren alçı, bor, su ve çimento üretilecek beton numunesin koduna göre önceden tartılıp hazırlanmıştır. Karışım suyu için doğal kaynak suyu kullanılmıştır. Karılma işlemi düşey eksenli cebri karıştırmalı mikser yardımıyla yapılmıştır. Numunelerin kıvamını belirlemek amacıyla abrams konisi ile çökme miktarları, birim hacim ağırlıkları ölçülmüştür. Çeşitli deneylerde kullanılmak üzere sarsma tablası üzerindeki 100 mm × 100 mm × 100 mm boyutlu küp kalıplara harç üç aşamada konmuş ve her aşamada 10 saniye sarsma tablası aleti ile sarsılmıştır. Her seri için 10 adet küp numune üretilmiştir. Numunelerin 24 saat kalıp içinde bırakılmış, bu sürenin sonunda lastik takozlar yardımıyla kalıptan çıkarılmıştır. Numuneler deneylerin yapılacağı güne kadar saklanmıştır.

Üretilmiş olan alçı numunelerinin ısı iletkenlik katsayısını saptamak üzere yapılan deneyler Dokuz Eylül Üniversitesi Mühendislik Fakültesi Makine Mühendisliği Laboratuarı'nda 8 x 4 x 1 cm numuneler üzerinde gerçekleştirilmiştir. Homojen bir malzemenin ısı iletkenliği, dengeye ulaşmış şartlar altında, iki yüzey sıcaklığı arasındaki fark 1 °C olduğu zaman, birim zamanda, birim alan ve dik yöndeki birim kalınlıktan geçen ısı miktarıdır. Yapı ve çeşitli ısı yalıtım malzemesinin ısı iletkenliğinin ölçümü, kararlı durumda ve geçiş durumunda olmak üzere iki yöntemle yapılmaktadır. Alışılmış yöntem, kararlı durumda ısıtılmış plaka yöntemidir. Bu metodla ısıtılmış bir plakanın iki tarafına simetrik olarak yerleştirilen, levha biçiminde muayene örneğinin, ortalama ısı iletkenliği bulunur. Geçiş durumunda ölçüm yapan cihazlar, daha ufak boyutlardaki malzemenin ısı iletkenliğini daha kısa sürede saptayabilmektedir. Geçiş yöntemleri arasında Angstrom yöntemi, Flash yöntemi ve Hot Wire yöntemi başlıcalarıdır. Bu çalışmada numuneler üzerinde uygulanan ısı iletkenlik ölçme cihazı (Shoterm QTM-D2) "Hot Wire" yönteminden yararlanılarak geliştirilmiştir (Şekil 1).

Şekil 1. Isı iletkenlik ölçme cihazı

Ultrases geçiş hızlarını ölçmek için S.D.Ü. Mühendislik Fakültesi Maden Mühendisliği Bölümü Kazı Mekaniği ve Doğal Taşlar Teknolojisi Laboratuarında bulunan Ultrases ölçüm (Şekil 2.) cihazı kullanılmıştır. Ultrases hız ölçümü 12 voltluk akümülatör ile çalışan dijital göstergeli Ultrases ölçme aleti ile yapılmıştır. Aletin önce sıfır ayarı yapılmış sonra kalibre edilmiştir. Numunelerin her iki yanına gres yağı sürülerek proplar ile numune arasında boşluk oluşması önlenmiştir. Küp numuneler üzerinde yapılan deney ile ses dalgaları geçirme süreleri ölçülmüştür. Ultrases hızı deney sonuçlarının değerlendirilmesinde mikro saniye (µsn) olarak okunan Ultrases hızı geçiş süresi değerleri Eşitlik 1 ile hesaplanarak Ultrases hızı km/s cinsinden hesaplanmıştır.

$$V = \frac{L}{t} \qquad \textbf{(1)}$$

V: Ultrases hızı (km/s), L: Numune boyu (km), t: Ultrases geçiş süresi (s)

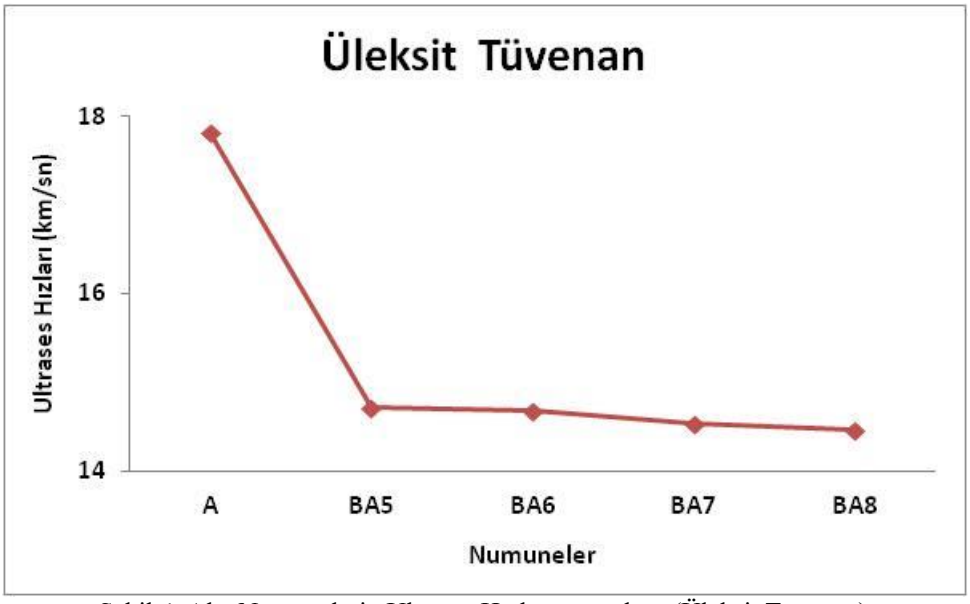
Bulgular

Bu çalışma kapsamında üretilen alçı numuneleri üzerinde ısı iletkenlik katsayısını saptamak üzere yapılan deneyler Dokuz Eylül Üniversitesi Mühendislik Fakültesi Makine Mühendisliği Laboratuarı'nda 8 x 4 x 1 cm numuneler üzerinde her bir numuneden 3 ölçüm alınmak suretiyle gerçekleştirilmiştir. Ayrıca Süleyman Demirel Üniversitesi Mühendislik Fakültesi Maden Mühendisliği Bölümü Kazı Mekaniği ve Doğal Taşlar Teknolojisi Laboratuarında yapılan Ultrases hızı deney sonuçları Çizelge 4.' de verilmiştir. Alçı numunelerin Ultrases hızları sonuçları ve Isı İletkenlik katsayısı sonuçları ise Şekil 3-8.' de verilmiştir.



Çizelge 4. Alçı numunelerinin fiziksel ve mekanik özellikleri

Numunenin Kodu	Kuru Birim Hacim Ağırlığı (kg/m^3)	Ultrases Hızları (km/sn)	Isı İletkenlik Katsayısı (W/mK)

Şekil 8. Alçı Numunelerin Isı İletkenlik Katsayısı sonuçları (Üleksit Konsantre ve Üleksit Tüvenan)

Sonuçlar

Bu çalışma kapsamında üretilen alçı numunelerinde bor miktarı arttıkça ultrases hızlarında bir azalma görülmektedir. Ayrıca üretilen alçı numunelerinde bor miktarı arttıkça ısı iletkenlik katsayısı sonuçlarında olumlu yönde bir azalma görülmektedir. Elde edilen sonuçların Sarıkaya (2014)' nün yapmış olduğu çalışmaya paralel olduğu görülmüştür. Çalışmada kullanılan bor mineralleri % 28 ile % 39 oranları arasında B_2O_3 içermektedir. Bu borların çevreye vereceği zararlarda oldukça büyüktür. Bu zararlı etkileri ortadan kaldırmak ve ekonomiye yeniden kazandırmak amacıyla beton endüstrisinde bir katkı malzemesi olabileceği düşünülmektedir. Bor oranının artması ile ısı iletkenlik değerini azaltarak ısı yalıtımına katkı sağlayacağı düşünülmektedir.

CANONICAL MAP IN THE STABILITY OF CONTINUOUS TIME SYSTEMS

Vakıf Cafer
vcaferov@anadolu.edu.tr

Taner Büyükköroğlu
tbuyukkoroglu@anadolu.edu.tr

Gökhan Çelebi
gcelebi@anadolu.edu.tr

Stability of a control system is one of the main topic of control theory. If a given system is unstable, we can try to stabilize the system by low order controllers. Stabilization of single-input single-output systems by low order controllers is one of the challenging problems in control theory [1,2,3]. The stabilization problem can be formulated as follows: Given polynomials $p_0(s), p_1(s), \dots, p_l(s)$ consider the family $p(s,c)=p_0(s)+c_1p_1(s)+c_2p_2(s)+\cdots+c_lp_l(s)$, where $c_1, c_2, \dots, c_l$ are stabilizing parameter. The problem is as follows: Determine the values of the parameter $c=(c_1,c_2,\dots,c_l)^T$, for which the polynomial $p(s,c)$ is stable. Two types of stability can be considered: Hurwitz stability, in which all roots must be in the left half plane, and Schur stability, in which all roots must belong to the unit open disc.

In this report, we consider the stabilization problem for continuous time systems. For this purpose a canonical map $F(k)$ is determined. This map is defined on the set $(0,\infty)^n=\{(k_1,k_2,\dots,k_n)^T\in \mathbb{R}^n: \ k_i>0 \mbox{ for all } i=1,2,\dots,n \}$ and is one-to-one. The range of this map is the Hurwitz stability region in parameter space. By using this map, we obtain sufficient conditions for stabilizability of continuous time control systems.

CARBON FOOTPRINT DETERMINATION OF A TURKISH CEMENT FACTORY

Betül ÖZER

Kırklareli University, Department of Energy Systems Engineering, Kırklareli, Turkey

betulozer@klu.edu.tr

Abstract: Carbon footprint can be defined as the carbon dioxide (CO_2) equivalent of greenhouse gas (GHG) emissions caused by anthropogenic activities (such as transportation, energy generation, services or purchasable products, etc.). The carbon footprint of a facility can be determined due to reasons such as legal obligations, social responsibilities, customer demand, or reduction of GHG emissions. In this study carbon footprint of a cement factory is ascertained. The amount of greenhouse gas emissions from the factory is 1,64 million tons of CO_2 in 2014. 65% of them come from clinker production and the remaining comes from combustion, mainly petroleum coke which has the largest share of approximately 30% of contribution. It will be a good opportunity for the factory to use waste oil and end of life tires (ELT) as alternative fuels to mitigate its the carbon footprint.

Keywords: carbon footprint, cement industry, clinker production, greenhouse gas emission

Introduction

World's rapid industrialization is causing ecologically deterioration gradually. Correspondingly, global climate change has become a major threat to the environment and the economic development of the world (Zhang and Zhang, 2015). In this regard, Kyoto Protocol (KP) is the most important step taken in the worldwide. KP aims to mitigate GHG emissions by obligating developed countries to pay the price for their emissions.

Carbon footprint (CF) can be defined as a measure of total amount of carbon-dioxide (CO_2) released into the atmosphere in the given time frame that is directly or indirectly caused by any activity to provide service or a product. This approach has become a widely used concept in greenhouse gas emissions assessments recently (Andrić, et. Al., 2015).

Carbon footprint calculations are made due to reasons such as legal obligations, social responsibility, customer or investor demands, corporate image, voluntary or mandatory greenhouse gas emission reduction or the participation in the emissions trading mechanisms.

In Turkey calculation of carbon footprint is not an obligation, but it is significant to the facilities for their own emission inventory and to put forward strategies for prevention of climate change. The current legal regulation on the greenhouse gas emissions monitoring is entered into force in 2014 with the name of "Regulation on Monitoring of Greenhouse Gas Emissions (RMGHGE)" (Official Gazette 2014a). This regulation aims monitoring, reporting, and verification of the GHG emissions occurring from the listed activities in its Annex 1.

Turkey's CO_2 emissions were estimated at 363.5 million tons in 2013 and about 18% of it comes from industry. Cement sector is one of the major industrial greenhouse gas emission sources. The aim of this study is to calculate the carbon footprint of a cement factory in Turkey and give suggestions to decrease greenhouse gas emissions. The factory is producing clinker and cement since 2009 with 242,824 m^2 surface area, about 2 million ton/year clinker production capacity and exists in Annex 1 of the regulation (as its capacity exceeds 50 tons daily clinker production.) It is in the top 500 industrial enterprises of Turkey.

Besides Turkish cement sector is in the top 10 in the world and ranked third in Europe with about 71 million tons of production in 2014. Due to the increase of infrastructure and construction activities in Turkey in the last years, cement demand is increasing. Accordingly, the production is expected to be about 100 Mt in 2023 (Url-1)

There are varies international standards and regulations to help users for carbon footprint calculations. However most of the studies in the literature used IPCC Guideline 2006 (IPCC, 2006; Jiang et. Al., 2015; Xu and Lan 2015; Yaka and Güngör, 2015; Cai et al., 2008).

Materials and Methods

For the carbon footprint analysis, all the sources of emissions in the factory have been primarily defined. Emissions are categorized as combustion-sourced and process based. Fuels used for the combustion are domestic lignite, petroleum coke, steam coal, fuel oil, waste oil, end of life tires (ELT) contaminated waste.

Process-based emissions are come from clinker production, the non-carbonate carbon raw material. IPCC (2006) methodology with 2014data is used for the carbon footprint calculations.

 Copyright © International Science and Technology Conference (ISTEC)

Energy balance diagram was set up and accordingly emission sources are defined for the CO_2 emission calculations.
CO_2 emission sources of the factory are given in Table 1.

Table 1: CO_2 emission factors (EF).

Item No	Source	EF	Source
1	Clinker production	0.51 tCO_2/t	IPCC 2006
2	Domestic lignite	99.27 tCO_2/TJ	TURKSTAT, 2014
3	Petroleum coke	92.79 tCO_2/TJ	TURKSTAT, 2014
4	Steam coal	92.79 tCO_2/TJ	TURKSTAT, 2014
5	Fuel oil	76.66 tCO_2/TJ	TURKSTAT, 2014
6	Waste oil	73.3 tCO_2/TJ	Official Gazette 2014b
7	ELT	85 tCO_2/TJ	Official Gazette 2014b
8	Contaminated waste	83 tCO_2/TJ	Personal info, 2016.
9	Raw material: cement clinker non-carbonate carbon	3.664 tCO_2/TJ	Personal info, 2016.

CO_2 emissions are calculated according to IPCC Guideline Tier methodology that is given by Eq. 1 [3].
CO_2 emission=Fuel consumption x emission factor x oxidation ratio

Eq.1

where, CO_2 emission, kg emission by fuel type
fuel consumption, consumed fuel, kg, l
emission factor, GHG emission factor by fuel type, kg/TJ
oxidation ratio is assumed 100%.

Results and Discussion

The calculations indicate that the factory released 1.64 M tons of CO2 emissions in 2014, which was %3 of the total industrial GHG emissions of Turkey in 2014. The distribution of the emission sources are given with Fig. 1. 65% of the total emissions come from the process that is clinker production and the remaining 35% comes from combustion, mainly petroleum coke which has the largest share of approximately 30% of contribution. Steam coal is the second important emission source from combustion which has 4% contribution to the total CO_2 emissions.

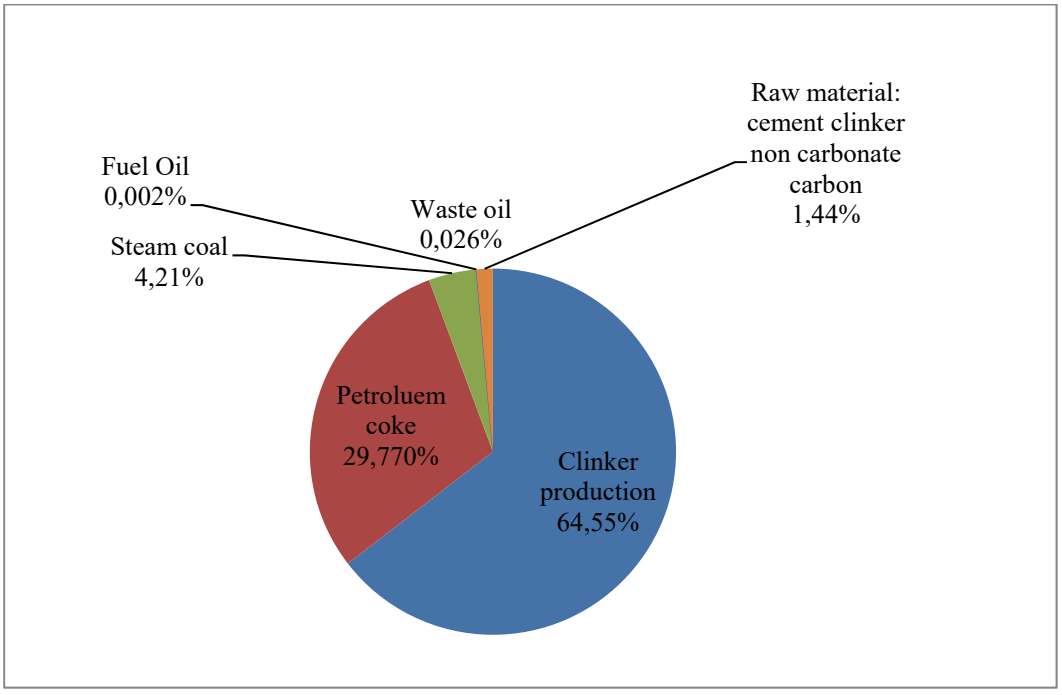

Fig.1: CO_2 Emission distribution of the cement factory.

 Copyright © International Science and Technology Conference (ISTEC)

Conclusion

Cement industry is one of the major industries for mitigation of the GHG emissions since it is the main emission sources in Turkey, as in the world. In this study the emissions are calculated according to the Tier 1 approach of the IPCC methodology. Thus process emission factor of the factory is the default value. In the future study factory specific CO2 emission factor may be calculated to get more certain values to evaluate. Since the major combustion emissions come from petroleum coke and steam coke, it will be a good opportunity for the factory to use waste oil and ELT as alternative fuels to mitigate its the carbon footprint.

CFD STUDY ON HEAT TRANSFER ENHANCEMENT IN A CIRCULAR TUBE EQUIPPED WITH TWISTED TAPE INSERT

[1]Hakan BUCAK [2]Fuat YILMAZ

[1]Faculty of Engineering, Department of Mechanical Engineering, Adiyaman University, Turkey
[2]Faculty of Engineering, Department of Mechanical Engineering, Gaziantep University, Turkey

hbucak@adiyaman.edu.tr, fuatyilmaz@gantep.edu.tr

Abstract: Twisted tapes are swirl turbulators and one of the passive methods used for heat transfer enhancement. In this CFD study on heat transfer enhancement in a circular tube equipped with twisted tape insert, a bowed twisted tape in a circular tube is compared with plain tube by means of Nusselt, friction, and thermohydraulic performance. A comparative study was performed numerically in laminar tubular flows with Reynolds number between 404.8 and 1764.5. The numerical studies were carried out with three different twist ratios (H/w = 3, 4, and 5). By using bowed twisted tape in a plain tube, a good thermohydraulic performance than the plain tube was observed. It was also noticed that thermohyraulic performance increased with decreasing twist ratio, and increasing Re number.

Keywords: Twisted Tape, Heat Transfer Enhancement, Flow Turbulator, CFD

Introduction

In general, the techniques for heat transfer enhancement can be divided into two categories. One is the active method, which requires extra external power sources, for example, mechanical aids, surface-fluid vibration, injection and suction of the fluid, jet impingement, and use of electrostatic fields. The other is the passive method, which requires no direct employment of the external power. The passive method includes a surface coating, wavy surfaces, rough, and extended surfaces, convoluted (twisted) tube, additives for liquid and gases, turbulators (coil wire, conical ring, helical screw tape, axial/radial guide vane, tangential inlet nozzle and snail entrance). Swirl/vortex flow devices form an important group of passive augmentation techniques, and twisted tape is one of the most important members of this group, which is employed extensively in many heat exchanging systems such as solar water heater, refrigeration system and chemical process industry.

Here are some advantages of using twisted tape inserts in plane tubes. A flow in a plane tube has some temperature difference between core region and near the wall surface. Twisted tape insert gives swirling motion to the flow and enhances the fluid mixing of the near-wall and central regions (Rahimi, et al., 2009) (Guo et al., 2011). Twisted tape can partition and block the flow, reduce the hydraulic diameter, elongate the twisted flow path and generate fin effect (Guo et al., 2011). In addition to simple configuration and easy installation (Guo et al., 2011), as a general advantage of twisted tape, enhancement in heat transfer makes heat exchangers more compact and cheaper (Sivashanmugam and Suresh, 2006). Here are some disadvantages of using twisted tape inserts in plane tubes. All these advantages lead to additional heat transfer improvements. However, the thermal improvements are accompanied by increased pressure drop (Eiamsa-ard et al., 2013) (Guo et al., 2011).

Zhang et al. (2012) numerically studied in order to gain an understanding of physical behavior of the thermal and fluid flow in the tube fitted with triple and quadruple twisted tapes for the Reynolds number from 300 to 1800. The obtained results showed that a maximum increase of 171% and 182% are observed in the Nusselt number by using triple and quadruple twisted tapes. The friction factors of the tube fitted with triple and quadruple twisted tapes are around 4.06-7.02 times as that of the plain tube. Eiamsa-ard and Promvonge (2010) experimentally studied on turbulent heat transfer and flow friction characteristics in a circular tube equipped with two types of twisted tapes: (1) typical twisted tapes and (2) alternate clockwise and counterclockwise twisted tapes with three twist ratios, 3.0, 4.0 and 5.0, each with three twist angles, 30°, 60° and 90°, respectively. The Reynolds-number range is between 3000 and 27,000 under uniform heat flux conditions, using water as a working fluid. The obtained results revealed that the C–CC twisted-tapes provided higher heat transfer rate, friction factor and heat transfer enhancement index than the typical twisted-tapes at similar operating conditions. In addition, correlations of the Nusselt number and the friction factor for using the C–CC twisted tapes were also determined. Bhuiya et al. (2013) performed an experimental research on Nusselt number, friction factor and thermal performance factor in a circular tube equipped with perforated twisted tape inserts with four different porosities of Rp = 1.6, 4.5, 8.9 and 14.7% under Reynolds number ranging from 7200 to 49,800. Air is the working fluid. Uniform wall heat flux was selected as the boundary condition at walls. The experimental results revealed that both heat transfer rate and friction factor

 Copyright © International Science and Technology Conference (ISTEC)

of the tube fitted with perforated twisted tapes were significantly higher than those of the plain tube. Over the range investigated, Nusselt number, friction factor, and thermal performance factor for the tube with perforated twisted tape inserts were found to be 110–340, 110–360 and 28–59% higher than those of the plain tube values, respectively. Empirical correlations of Nusselt number, friction factor and thermal performance factor were also formulated from their experimental results. Eiamsa-ard et al. (2009) studied a 3-D numerical investigation and found that SST k–ω turbulence models are better to use. They came up with a result that, twisted tape inserts for 2.5 with CR=0.0 (tight-fit), 0.1, 0.2, and 0.3 can enhance heat transfer rates up to 73.6%, 46.6%, 17.5% and 20%, respectively and increase friction factors up to 330%, 262%, 189%, and 160%, respectively, in comparison with those of the plain tube. The tube with loose-fit twisted tape inserts with CR=0.1, 0.2 and 0.3 provide heat transfer enhancement around 15.6%, 33.3% and 31.6% lower than those with CR=0.0. Shabanian et al. (2011) studied both experimentally and numerically on heat transfer, friction factor and thermal performance of an air-cooled heat exchanger equipped with three types of tube insert, including butterfly, classic, and jagged twisted tape. In their investigation, the maximum thermal performance factor was obtained by the butterfly insert with an inclined angle of 90°. They used the CFD predicted results to explain the observed results in terms of turbulence intensity.

Materials and Methods

The geometry of the bowed twisted tape is shown in Figure 1. The distances a, b, and c refer to 1.2mm, 50mm, and 50mm. Bowed twisted tape is fitted in the full length of tube having diameter and length of 50mm and 6000mm. Twist ratios (180-degree twist pitch/tape width) are set to 3, 4 and 5. The formulas used can also be found below.

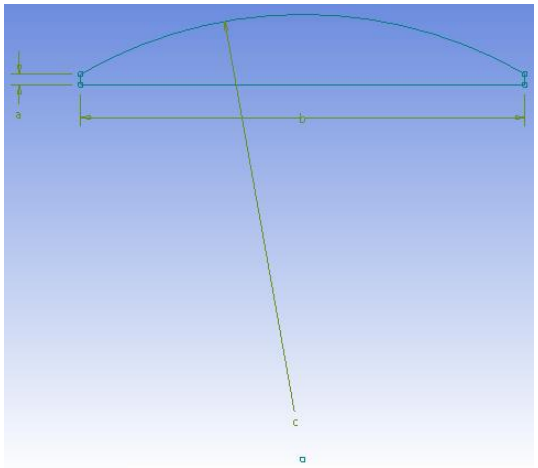

Figure 1.The Geometry of the bowed twisted tape.

$$Re = \frac{\rho u D}{\mu}$$

$$Nu = \frac{hD}{k}$$

$$f = \frac{\Delta p}{(\rho u^2/2)(L/D)}$$

$$\eta = \frac{Nu/Nu_0}{(f/f_0)^{(1/3)}}$$

Here, Nu_0 and f_0 are referring to the Nusselt number, and the friction factor of the plain tube. Air is selected as the working fluid. Thermophysical properties of the working fluid are temperature dependent. Values of thermophysical properties are taken from Çengel et al. (2011) and are used to make a fit equation to use it in the calculations except viscosity term (power law used for this term). Comparison of the original values and the values from the fit are shown in Figure 2. As seen from the figure, the (T, temperature-dependent 1st row in Kelvin, 2nd row in Celsius) fits given below, perfectly matches with the original values.

*Temperature ^{0}C, Density kg/m^3, Specific Heat J/kg.K, Conduction W/m.K, Dynamic Viscosity kg/m.s, Kinematic Viscosity m^2/s.

Inlet velocity depends on Reynolds number that is between 404.8 and 1764.5 in the computations.

The problem is considered as steady, laminar, and 3D. While modeling the pipe and the bowed twisted tape, the tape was subtracted off from the pipe geometry to have the way of working fluid only. The walls at the side of bowed twisted tape are defined as “no heat generation” and all walls are defined as a no-slip condition. The heated walls (pipe inner walls) are set to constant heat flux changing with respect to inlet velocity between the values of 10W to 65W. Boundary conditions are constant velocity inlet, pressure outlet, no-slip conditions at the walls, no heat generation at the walls of the bowed twisted tape side, and constant heat flux at the inner walls of the pipe.

Continuity equation:

$$\frac{\partial(\rho u_i)}{\partial x_i} = 0$$

Momentum equations:

$$\frac{\partial}{\partial x_j}(\rho u_i u_j) = -\frac{\partial p}{\partial x_i} + \frac{\partial}{\partial x_j}\left[\mu\left(\frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i}\right)\right]$$

Energy equation:

$$\frac{\partial}{\partial x_j}\left(\rho u_j c_p T - k\frac{\partial T}{\partial x_j}\right) = 0$$

A commercial CFD tool, Ansys Fluent v17.1 was used for the calculations. The boundary conditions above were taken account by this CFD tool to solve the problem with the finite volume method. Solution methods; “SIMPLE” scheme, “least squares cell based” gradient, “second-order” pressure, “first-order upwind” momentum and energy

are set for calculations. Convergence criteria of 10^-6 were used for all the residuals, and calculations are converged.

For bowed twisted tape, all thermophysical properties of air are calculated at bulk temperature. $T_b=(T_{inlet}+T_{outlet})/2$ and hydraulic diameter is used in the calculations.

Table 1. Grid independent check results (4*10^6 grids were chosen for the calculations for the bowed twisted tape.)

Grid Number	Re	Nu	f

1947000	0,839	0,161	15,509	1784,02	4,40576	0,036429	-0,965424	1,54682	0,57

Results and Discussion

According to the grid independent test at Table 1, 4*10^6 grids were chosen for the calculations of the bowed twisted tape because changes in Nu and f are acceptable for this amount of grids. In Figure 3, it can be seen that mesh is getting concentrated near the walls. Theoretical values for Nu=48/11, and for f=64/Re for fully developed flow in laminar region and validation results are given in Table 2.

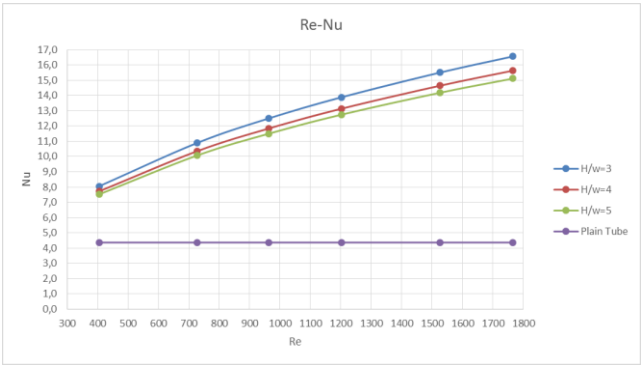

Figure 4. Re-Nu comparison between the plain tube and bowed twisted tape with different twist ratios.

In Figure 4, Re-Nu comparison between the plain tube and bowed twisted tape with different twist ratios is given. It is clear in this figure that,

- When Re is increased, Nu of bowed twisted tape is increased.
- When a twist ratio decreased 5 to 3, Nu of bowed twisted tape is increased.
- The bowed twisted tape has better Nu values than the plain tube with respect to this figure's ranges.

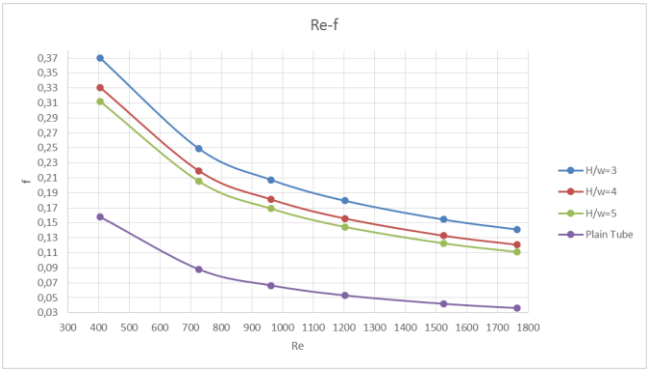

Figure 5. Re-f comparison between the plain tube and bowed twisted tape with different twist ratios.

In Figure 5, Re-f comparison between the plain tube and bowed twisted tape with different twist ratios is given. It is clear in this figure that,

- When Re is increased, f of bowed twisted tape is decreased.
- When a twist ratio decreased 5 to 3, f of bowed twisted tape is increased.
- Bowed twisted tape has higher f values than the plain tube with respect to this figure's ranges.

By judging the results in Figure 4 and Figure 5, It can be seen that the handicap of "increase in Nu comes with an increase in f". The highest Nu value belongs to bowed twisted tape with a twist ratio of 3. However, on the other hand, it has the highest f value. In order to make another comparison, thermal performance factors are given in Figure 6.

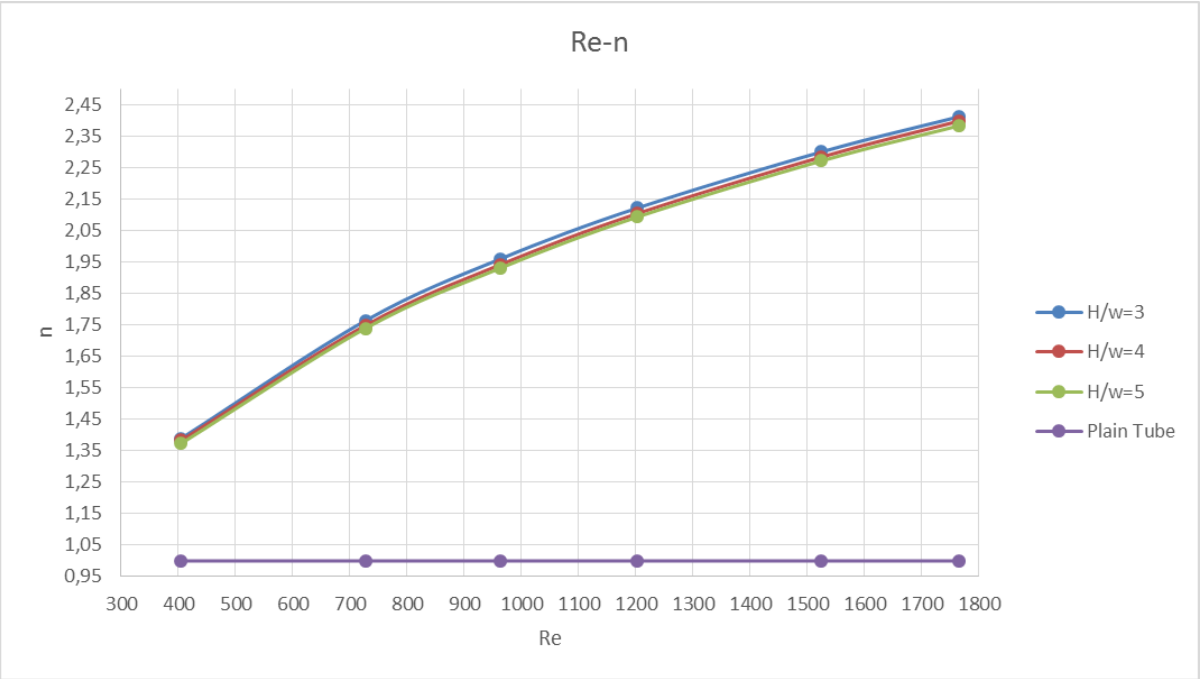

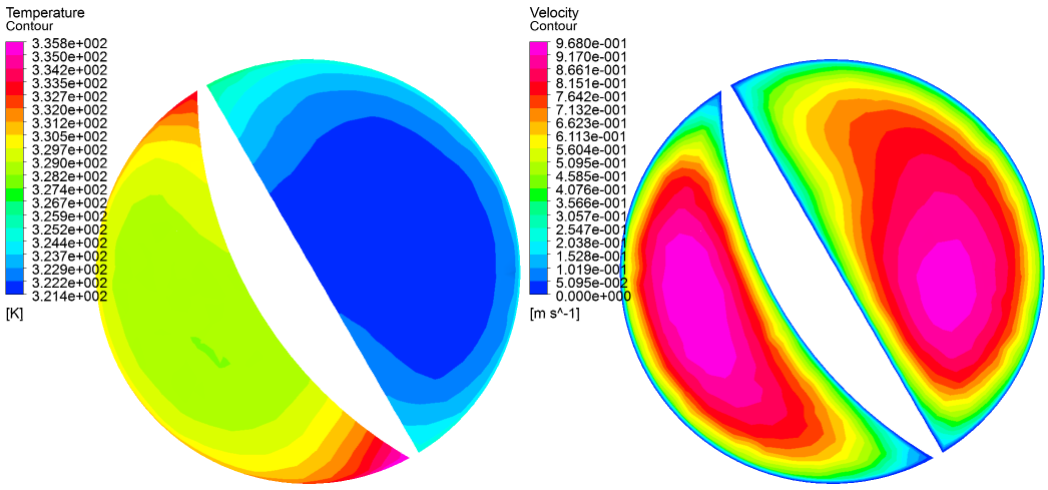

Figure 6. Re- η comparison for bowed twisted tape with different twist ratios.

In Figure 6, Re- η comparison between the plain tube and bowed twisted tape with different twist ratios is given. It is clear in this figure that,

- When Re is increased, n of bowed twisted tape is increased.
- When a twist ratio decreased 5 to 3, n of bowed twisted tape is increased slightly.
- Bowed twisted tape has higher η values than the plain tube with respect to this figure's ranges.

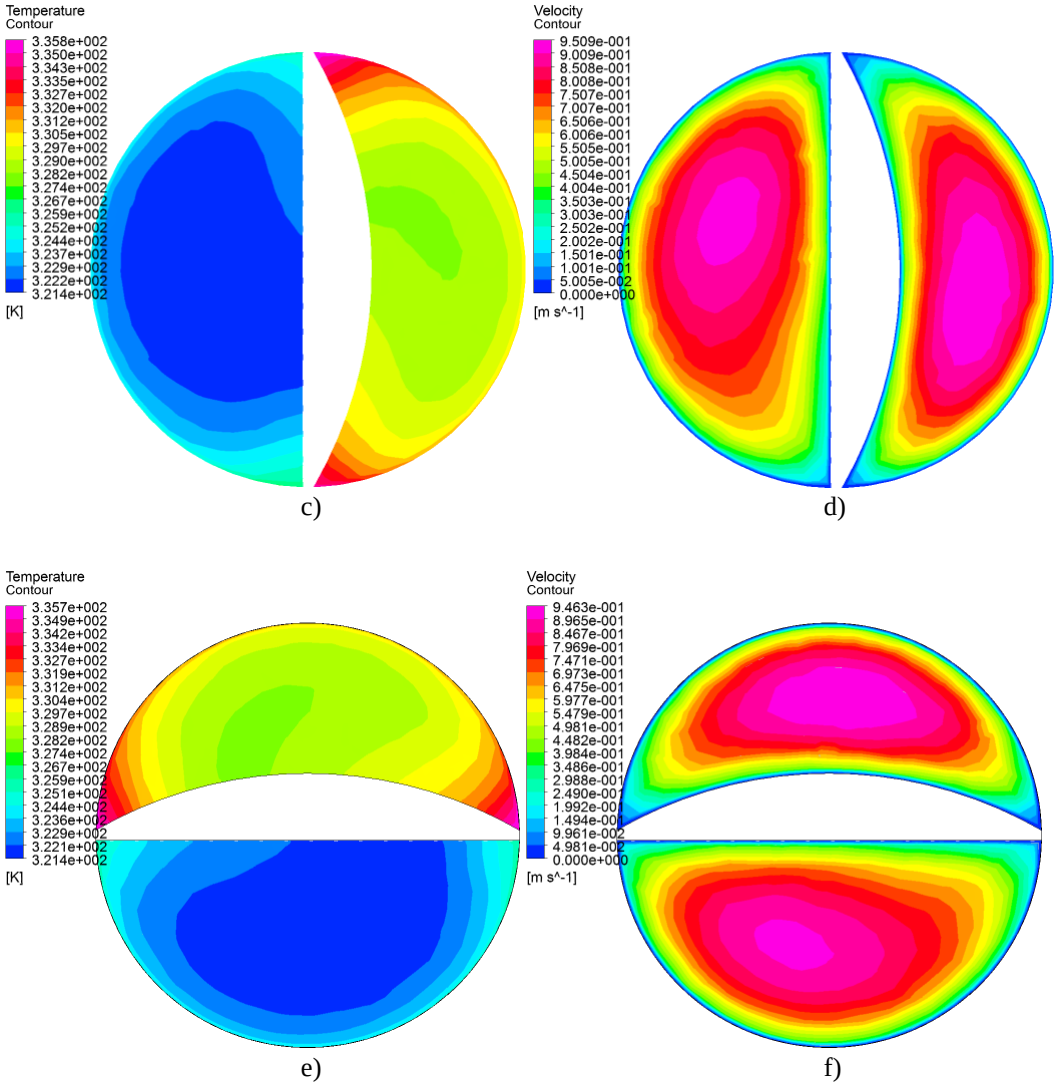

Figure 7. Temperature and velocity contours of bowed twisted tape at 5.5 meters: (a) and (b) for twist ratio 3, (c) and (d) for twist ratio 4, and (e) and (f) for twist ratio 5.

Conclusion

CFD study on heat transfer enhancement in a circular tube equipped with twisted tape insert has been investigated using a unique design named bowed twisted tape. As expected, calculations showed that a kind of twisted tape bowed twisted tape, increased the heat transfer and also friction. In total, by means of the thermal performance factor, although enhancement is observed the results are not satisfying as a kind of twisted tape.

For twist ratio 3, Nu increased by 84,5-279 %, f increased by 134,1-289 % and thermal performance factor increased by 38,9- 141,3 %. For twist ratio 4, Nu increased by 76,9-258,2 %, f increased by 109,3-232,9 % and thermal performance factor increased by 38,3-139,9 %. For twist ratio 5, Nu increased by 72,3-246,3 %, f increased by 97,6-206,4 % and thermal performance factor increased by 37,3-138,4 %.

Nomenclature

Cp : specific heat at constant pressure, J*kg-1*K-1
CR : Clearance ratio
C–CC : Clockwise-Counter clockwise
$Delta_p$: pressure drop between tube entry and exit, N*m-2

The last few years a growing interest in the development of applications implementing ultrafine powders as intermediate or finished products in industries as diverse as chemical, pharmaceutical , cosmetic , food , materials, industry , etc.

Human exposure to ultrafine particles (PUF <100 nm) and nanoparticle has become in recent years an important public health issue. These, in urban areas, can be formed by over 80% fines soot (<1 .mu.m) and ultrafine from combustion of fuels. These particles, emitted particularly by diesel vehicles in the short term gasoline vehicles and district heating, were quickly suspected cause of morbidity and mortality cardiorespiratory observed in epidemiological studies on the effects of the atmospheric pollution.They are mainly responsible for inflammatory responses can aggravate pulmonary diseases such as asthma and chronic obstructive pulmonary disease .

Our work's focuses on characterization of NPs and PUF by Scanning Electronic Microscopy and X-ray diffraction and Raman Microscopy, airborne nanosized particles and their importance to public health in the Workplacee.

CHARACTERIZATION OF PBS FILMS PRODUCED BY CHEMICAL BATH DEPOSITION METHOD

Metin Kul
mkul@anadolu.edu.tr
Department of Physics, Anadolu University, Eskişehir, Turkey

Abstract

Lead sulfide (PbS) films have been deposited onto glass substrates by chemical bath deposition method using aqueous solutions of lead nitrate and thiourea. The deposition was carried out at 30˚C bath temperature. The thickness of the PbS film has been determined to be 874 nm by the weight difference method. The films have been examined to evaluate the structural, morphological and optical properties. X-ray diffraction spectrum showed that the sample was polycrystalline with face-centered cubic phase. The XRD pattern has revealed that there are shifts of the d values (interplanar spacing) for the sample with respect to standard values. The macro strain and dislocation density were estimated for the PbS film. The field emission scanning electron microscopy results confirmed that the sample is uniform and consists of homogenous distribution of cubic crystallites in nanometer dimensions. The band gap of the PbS film has been studied using the optical absorbance measurement as a function of wavelength between 200 and 3000 nm. The direct band gap of the sample is calculated to be 1.28 eV.

CHOOSING THE BEST TRAINING AIRCRAFT FOR A FLIGHT TRAINING ORGANIZATION BY MULTI CRITERIA DECISION MAKING METHODS

Ece YURDUSEVİMLİ
Asuman ÖZGER

Anadolu University, Department of Aircraft Electric & Electronics, Eskişehir- TURKEY

eceyurdusevimli@anadolu.edu.tr
asaracoglu@anadolu.edu.tr

Abstract: In today's world, now it is more important to make fair judgements and give right decisions for companies and organizations. The aim of this paper is to choose the best training aircraft for a flight training organization by using Analytic Hierarchy Process (AHP) and Technique Order Preference by Similarity to the Ideal Solution (TOPSIS). Sensitivity analysis is carried out to see possible consequences. Results show that the best aircraft among alternatives is the Daimond DA 42 VI for the flight training organization.
Keywords: Decision making, MCDM, aircraft.

Introduction

Airline companies and educational institutes are both organizations that should consider undergoing economic status, climate, potential benefits etc. when it comes to purchasing for the company, especially for purchasing on aircrafts. When purchasing for aircrafts, a flight training organization must consider its limited budget, safety of employee and students, technical parameters and specifications that they need and efficiency of the aircraft in general. For significant and reasonable decisions, flight training organizations should analyze these conflicting criteria such as budget and technological features carefully.

In literature search, Esposito et al. (2013), proposed a hybrid model for regional aircraft evaluation, based on the two main approaches, the Analytic Hierarchy Process (AHP) and the Fuzzy Set Theory (FST). They proposed a model that considers not only traditional characteristics (direct and indirect operative costs and technical performance such as the cruise speed) but also includes a variety of aspects whose importance is increasing, such as comfort. Dožić and Kalić (2014), proposed a solution for aircraft type(s) selection problem for known route network and forecasted air travel demand by using the Analytic Hierarchy Process (AHP). They have seen that sensitivity of *CI* and *CR* is significant to the changes of different judgements in the comparison matrix for the first level, while solution (rank of alternatives) sensitivity is almost insignificant to these changes.

Materials and Methods

In this study the best aircraft among alternatives is chosen based on flight training and organizational needs. In order to include basic and needed criteria, both qualitative and quantitative parameters are used. In this context evaluation of two methods proposed in literature the Analytic Hierarchy Process (AHP) and Technique for Order Preference by Similarity to Ideal Solution (TOPSIS) are applied by using Expert Choice, Super Decisions and Microsoft Excel programs.

In AHP method, first, problem should be defined and hierarchical representation of decision system should be formed. This hierarchical form should include overall objective, criterias that will affect the decision and some predetermined alternatives. Second, alternatives and criteria should be pairwise compared. In this step, there are two kinds of pairwise comparisons. One is the pairwise comparison that one should compare the alternatives with respect to the criterias and the other kind of pairwise comparison is the one that one should compare the criterias with respect to the decision objective. After obtaining matrix A from pairwise comparisons between alternatives with respect to the criterias, normalized A matrix is computed. Next, the weight matrix W is computed. This procedure is repeated for criterias too. And than Consistency Ratio (CR) is computed to see if there is any inconsistency. CR≤0,1 is allowed. For further information one can study the papers performed by Thomas L Saaty titled "How to make a decision: The Analytic Hierarchy Process" (Saaty, 1990) and "Decision making with the analytic hierarchy process" (Saaty, 2008).

Saaty and Ozdemir (2003) stated that, when the number of the elements are more than seven, the resulting

 Copyright © International Science and Technology Conference (ISTEC)

incostistency is too small for humans to obtain the element which causes the biggest inconsistency to fix it. So, for AHP method, elements no more than seven are used in this study. Saaty and Sağır Özdemir (2015) also stated that there can be even one judge to evaluate the criteria weights if he/she is experienced and efficient enough for the subject.

TOPSIS method is applied in six steps as follows:
Step 1: Calculate the normalized values r_{ij} and matrix N.

$$r_{ij=x_{ij}}\sqrt{\sum_{i-1}^{m} x_{ij}^2} \quad \text{i=1,…,m} \qquad \text{j=1,…,n}$$

Step 2: Calculate the weighted normalized decision matrix V. Here, w_j is the weight of the j^{th} criteria.

$$V_{ij} = r_{ij} \times w_j \qquad \text{i=1,…,m} \qquad \text{j=1,…,n}$$

Step 3: Determine the ideal and negative ideal solutions, A^* and A^- respectively.

$$A^* = \left\{\left(max_{i\ V_{ij}} \middle| j \in C_b\right), min_{i\ V_{ij}} \middle| j \in C_c\right\} = \{V_j^* | j = 1,2,\dots,m\}$$

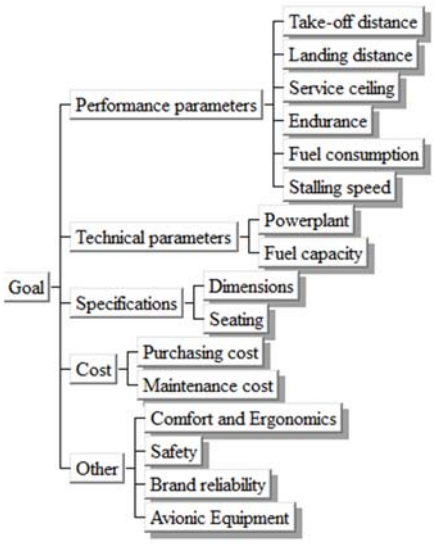
$$A^- = \left\{\left(min_{i\ V_{ij}} \middle| j \in C_b\right), max_{i\ V_{ij}} \middle| j \in C_c\right\} = \{V_j^- | j = 1,2,\dots,m\}$$

Step 4: Calculate the separation measures of each alternative from the positive ideal solution and the negative ideal solution.

$$S_i^* = \sqrt{\sum_{j=1}^{m} \left(V_{ij} - V_j^*\right)^2} \ , j = 1,\dots,m$$

$$S_i^- = \sqrt{\sum_{j=1}^{m} \left(V_{ij} - V_j^-\right)^2} \ , j = 1,\dots,m$$

Step 5: Calculate the relative closeness to the ideal solution.



$$C_i^* = \frac{S_i^- + S_i^*}{S_i^-}$$

Implementation

This study deals with giving the right decision to purchase an aircraft for a flight training organization. Within this context, 3 different types of aircraft, 5 main criteria and 16 sub-criteria are defined both by literature search and an expert's knowledge. In this study the expert is a well experienced aviation theoretical lesson teacher who is also the head of the ground education department in a private flight school.
After determining the goal, criteria and alternatives, the analytic hierarchy structure of the proposed system is set up as shown in Figure 1.

 Copyright © International Science and Technology Conference (ISTEC)

Figure 1. The analytic hierarchy structure of the system

One can also rebuild this hierarchy structure using Super Decisions program for a more relevant image as shown in Figure 2. Here one can see that 3 alternatives are Diamond DA 42 VI, Piper Seneca V and Tecnam P2006T.

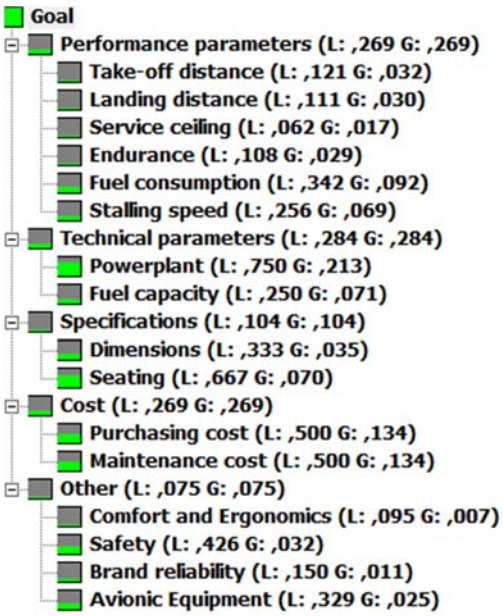


Figure 2. Hierarchy structure of the system by Super Decisions program

After setting up the hierarchy structure, pairwise comparisons are made and final weights of the criteria are obtained as seen in Figure 3.

 Copyright © International Science and Technology Conference (ISTEC)

Figure 3. Final local and global weights of the crtieria

After determining the weights of the criteria by AHP, TOPSIS method is applied. For this purpose, the decision maker rated all alternatives with respect to all criteria using Saaty's fundamental scale. Standard decision matrix is formed and normalized as seen in Table 1.

Table 1: Normalized decision matrix (N)

	C1	C2	C3	C4	C5	C6	C7	C8	C9	C10	C11	C12	C13	C14	C15	C16
A1	0,625	0,514	0,647	0,873	0,436	0,226	0,780	0,408	0,577	0,485	0,588	0,588	0,376	0,577	0,436	0,588
A2	0,625	0,514	0,740	0,436	0,218	0,566	0,390	0,816	0,577	0,728	0,784	0,784	0,847	0,577	0,873	0,784
A3	0,468	0,686	0,185	0,218	0,873	0,793	0,488	0,408	0,577	0,485	0,196	0,196	0,376	0,577	0,218	0,196

Normalized decision matrix is multiplied by the weights of the criteria and positive, negative ideal solutions, separation measures are calculated.

Results and Discussion

At the final step, relative closeness to the ideal solution are calculated and alternatives are lined up with respect to their closeness to the ideal solution as seen in Table 2.

Table 2: Relative closeness of alternatives to the ideal solution.

A1	0,576514
A2	0,475493
A3	0,404159

Here, A1 refers to Diamond DA 42 VI, A2 refers to Piper Seneca V and A3 refers to Tecnam P2006 T. As one can see, the best aircraft is Diamond DA 42 VI among others.

 Copyright © International Science and Technology Conference (ISTEC)

Conclusion

In this paper 2 multi-criteria decision making methods – AHP and MCDM – are applied to the problem titled "choosing the best training aircraft for a flight training organization." As a conclusion, both methods helped the decision maker to make a fair judgement and give the best decision. Here, the best alternative among others is the Diamond DA 42 VI aircraft.

Alkaline keratinases are widely used in several fields including leather processing, detergents, agricultural-animal industry, and production of protein hydrolysates, etc. Although, there are many researches on microbial alkalin keratinase, the studying about enhanced enzyme production with low cost substrat is still continues intensely.

In this study, natural *Bacillus* sp. strain which is the producer of alkali and thermo-stabile keratinase was isolated, identified and developed. Also, medium conditions, biochemical characterization of enzymes and their industrial usability was analyzed. In cloning studies, *Bacillus licheniformis* C11 keratinase gen was cloned into pET22b(+) vector system and transferred to the *E.coli* (*Rosetta-gami (DE3)pLysS*) cell. A 38.5 kDa fusion protein with keratinase activity was purified by affinity chromatography. It was detected that while the reproduction time of recombinant strain decreased, the enzyme yield increased 3.3 times (1728 U/ml). According to the obtained data, native and recombinant keratinases can be used in several industry area including leather, detergents, bioremediation, feed and agriculture etc.

CMAS BASED CERAMICS PRODUCTION USING DOLOMITE, KAOLIN AND ZIRCONIA

Nil Toplan and H. Özkan Toplan

Sakarya University, Engineering Faculty, Metallurgy and Materials Engineering Department, Esentepe Campus, 54187, Sakarya, Turkey

Abstract: CMAS ($CaO-MgO-Al_2O_3-SiO_2$) based ceramics were fabricated by using dolomite, kaoline and zirconia as raw materials. Natural calcia and magnesia containing material (dolomite) and silica and alümina containing kaolin were used to develop a new ceramic of CMAS system. The calculated amounts of oxides for the indicated compositions were ball milled for 3 h using distilled water as the milling media. After drying, the powders pressed in cylindrical mould under the pressure of 300 MPa. The samples were fired in an electric furnace with a heating rate of $10^oC.minute^{-1}$ at 900ºC to 1200ºC for periods of 1, 3, and 5 hours. Then, the fired samples were cooled to room temperature in the furnace. Microstructure of produced CMAS ceramics were investigated and their phases analysis was determined. The effects of ZrO_2 oxide on microstructure and phase structure of CMAS ceramics were also investigated.

Keywords: CMAS ceramics, anorthite, diopside, dolomite, kaoline

Introduction

Glass-ceramic materials, prepared by the controlled crystallization of glasses, have a variety of established uses that depend on their uniform reproducible fine-grained microstructures, absence of porosity and other wide-range of properties, which can be tailored by an adjustment of composition and the heat treatment procedure applied. Recently, glass-ceramics based on chain silicate structures have been developed (Khater, 2010). The glass-ceramics based on CMAS quaternary system, which are mainly produced from inexpensive natural or synthetic materials, such as fly ash, blast furnace slag, basalt, oil shale, granite and tuff, lithium porcelain clay tailings have received increasing attention during the past few decades. Blast furnace (BF) slag is one of the most abundant solid by-products in steel plants. Currently most of BF slag in China has been used for cement manufacturing and civil engineering, and the remaining amount is deposited in landfill. BF slag, which is mainly composed of CaO, SiO_2, Al_2O_3 and MgO, is the excellent raw material for the production of glass-ceramics. Recycling these slags is necessarily beneficial not only for economy, but also for environmental friendly steel plants (Yang et al, 2015). CMAS ceramic is one of the most promising glass–ceramic systems, and has excellent mechanical properties, high abrasive resistance and good chemical resistance due to the precipitation of crystals like diopside [$CaMgSi_2O_6$], anorthite [$CaAl_2Si_2O_8$] and cordierite [$Mg_2Al_4Si_5O_{18}$]. CMAS ceramics have become good candidates for functional applications such as sealant for solid oxide fuel cells, architectural applications such as building materials for interior and exterior walls, and heavy industrial applications such as protective materials for bunker, funnel and chute. As well known, the crystallization of CMAS glass–ceramics is very difficult, and also hard to control, which largely restricts the preparation and application of CMAS glass–ceramics. Sintering process and body crystallization process are two main preparation methods of CMAS glass–ceramics. Sintering process is derived from the sintering of fine ceramics, consisting of glass melting, water quenching, particle molding and high-temperature sintering, while body crystallization process is similar to the production procedures of plate glass, including glass melting, molding, annealing, nucleation and crystallization. In comparison with body crystallization process, it is relatively easy to control the crystallization of CMAS glass, but it is too difficult to obtain the fully dense glass–ceramics, for sintering process. Recently improving the crystallization of CMAS glass by adding nucleation agent has received considerable attentions. However, the present researches mainly focus on the crystallization of CMAS glass–ceramics prepared by sintering process (Yang et al,2014)

 Copyright © International Science and Technology Conference (ISTEC)

Controlled bulk crystallization is the method most frequently used for producing glass-ceramics through controlled crystallization. The study of the CMAS system was also important for understanding the reactions taking place in rocks, blast furnace slags and MgO refractories. In most cases, published phase diagrams are related to equilibrium conditions that are not usually encountered in glass-ceramic preparations. Therefore, it is necessary to determine the relationship between the compositions of glass-ceramics and the crystal phases developed under conditions in which such polycrystalline materials were actually produced. In a previous paper Khater (2006) managed to obtain a glass-ceramic material based on by-pass silica sand and magnesite. From cement kiln dust which made up about 57 wt.% of the batch constituents depending on the composition. Cement kiln dust is generated in the cement kiln and associated equipment. Dust from the raw mix and the surroundings of the plant is normally suppressed with closed systems and through water sprays. During the burning process, the gas flows entrain a substantial quantity of dust that forms part of the kiln exit gasses. The production of cement kiln dust strongly depends upon the chemistry of raw materials, type of process and the design of gas velocities in the kiln. Other factors such as kiln performance and dust collection systems also play vital roles in kiln dust generation. The production of alkaline-earth aluminosilicate glasses in the system CMAS has been broadly investigated in the past decade. Crystalline phases such as cordierite, diopside, wollastonite, mullite, etc., have been precipitated from glasses under controlled conditions resulting in glass-ceramics with attractive dielectric properties and high mechanical and chemical resistance (Khater, 2010).

The CMAS ceramic system has attracted much attention due to its low densification temperature, low thermal expansion coefficient (TCE < 5.10^6 /1C), low dielectric constant ($\varepsilon r<10$) and better chemical durability. To facilitate CMAS glass crystallization different nucleating agents, such as TiO_2, CaF_2, and ZrO_2 have been used. It is well known that the flexural strength and fracture toughness can be improved by precipitating nano-size tetragonal ZrO_2 particles into the bulk glass. However, the pure glass easily bloats or softens during firing, leading to distortion of the components and requires the addition of ceramic fillers (such as alumina, cordierite, and rutile etc.) to eliminate softening at 800–900°C (Wang et al, 2014). Hanning et al (2006) explained that the glass compositions, the kind and content of nucleating agent and the schedule of heat-treatment, all greatly affect the microstructure and properties of glass–ceramics. In this work, sintering behaviors and microstructural properties of CMAS ceramics in the presence of the ZrO_2 nucleation agent was investigated.

Experimental procedures

Kaolin, dolomite, and zirconia were used as starting materials for preparations of CMAS based ceramics. ZrO_2 was added as a nucleation agent after the heat treatment schedule was determined, in attempt to promote the crystallization and improve performance of ceramics. The method of preparation of CMAS ceramics in present study is illustrated in Fig. 1. As shown in Figure the calculated amounts of the starting oxides for the indicated compositions were ball milled for 3 h using distilled water as the milling media and dried than sintering different temperature and times. Table 1 presents the chemical analyses of the raw materials, and Table 2 presents the chemical composition of the two CMAS ceramics. ZrO_2 was added into the CMAS-D ceramics compositon for preparations of CMAS-DZ coded ceramics.

Scanning electron microscopy (SEM, Jeol 6060LV) and energy-dispersive X-ray spectroscopy (EDS) were used to characterization of produced CMAS ceramics microstructure. X-ray diffraction (XRD) analysis was performed with RIGAKU D/Max/2200/PC to determine the crystalline phases occured in the produced CMAS ceramics. The volume density was measured by Archimedes method. The Vickers hardness (H_V) of the samples were measured using a microhardness tester (LEICA VMHT MOT) with a 100 g load, its load time was 15 s along the whole cross-section. Chemical durability of CMAS ceramic specimens was analyzed by measuring weight loss after chemical attacked at 2h later in 10% NaOH solutions at 100ºC.

CMAS-DZ	64		36	5

Results and discussion

Fig. 2 shows the SEM micrographs of two coded ceramic samples crystallized at 1100 °C to 1200° C for 1 and 3 hours. It can be seen that the complex nucleation agents have an important role on the shape of crystals. With the addition of ZrO_2 (CMAS-DZ sample), the crystals irregularly arrange with sheet shape and low crystallinity (Khater, 2010). According to the SEM image of CMAS, a large number of granular crystals and a small quantity of lamellar shape crystal were distributed in the glass matrix after treated at 1100°C. S. Banijamali et al. (2009) explained that sintered CMAS ceramics reveals a coarser microstructure in which the needle-like crystals have been extended from the surface toward the center of glass particles. This behavior has led to the crack-like defects in the middle of particles.

 Copyright © International Science and Technology Conference (ISTEC)

In Fig. 3, the columnar and small granular crystalline phases were distributed in CMAS specimen after crystallization at 1100 °C. It is well known diopside is a columnar crystal in ceramics. Furthermore, the EDS microanalyses were carried out on different areas of CMAS specimens. The magnesium content of 1 coded area is higher than other areas. The aluminium and oxygen content of 4 and 5 areas is apparently higher than 1, 2 and 3 coded areas, which showed that the columnar crystalline phases were diopside. The addition of zirconia which can enhance the heterogeneous nucleation of phases, and limit the growth of long anisotropic anorthite grains which will result in new voids where equiaxed grains are originally located.

(d)

Figure 3. SEM-EDS analysis of (a), (c) CMAS-D and (b), (d) CMAS-DZ samples sintered at 1200°C for 3h

Fig. 4 shows XRD patterns of the CMAS-D and CMAS-DZ coded samples crystallized at 900°C, 1000°C, 1100°C and 1200°C for 3 h. It can be seen that the CMAS-D, and CMAS-DZ samples have the same main crystalline phases, such as diopside and anorthite, their frequency depending largely on the base composition and crystallization parameters. It can be noticed that, with increasing the ZrO_2 content, the intensity of diopside becomes stronger gradually. In the Khater's (2014) X-ray diffraction showed that monoclinic or triclinic wollastonite ($CaSiO_3$), diopside ($CaMgSi_2O_6$) and anorthite ($CaAl_2Si_2O_8$) were the main crystalline phases developed in the CMAS ceramics.

CMAS-DZ ceramics exhibited slightly higher relative density and less porosity than CMAS-D ceramics, which is consistent with the results of Table 3. The corrosion resistance of CMAS ceramics is evaluated from the weight losses after leaching in alkali solution. The results are given in Table 3. Samples weight loss values for CMAS-D ceramics change between the ranges of 2.12 % to 3.73 % and for CMAS-DZ ceramics change between the ranges of 2.02% to 2.98%. It can be seen that, in general, the durability of CMAS ceramic is increased depend on crystallization temperature and adding ZrO_2 nucleating agent.

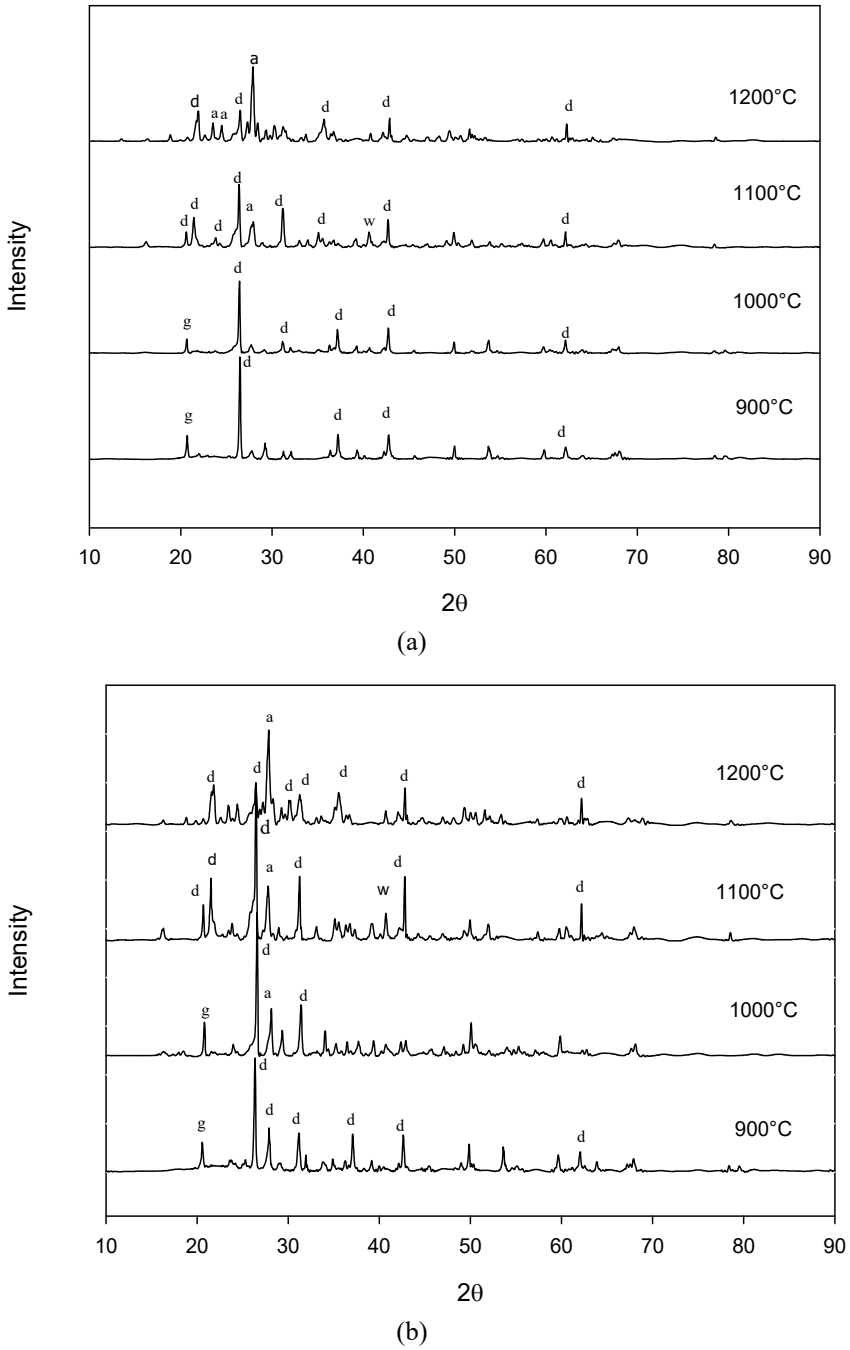

Figure 4. (a) XRD patterns of the CMAS-D and (b) CMAS-DZ samples crystallized at 900°C, 1000°C, 1100°C and 1200°C for 3 h (a:anorthite, d: diopsite, w: wollastonite, g:gehlenite)

Indentation microhardness measured for the obtained CMAS ceramic materials (Table 3) was found to lie in the range 522–844 HV, indicating high abrasion resistance of these materials and making them suitable for many applications under aggressive mechanical conditions. Samples hardness values for CMAS-D ceramics change between 522 HV to 787 HV and for CMAS-DZ ceramics change between 612 HV to 844 HV. The hardness of the samples drops from a value of about HV=844 for CMAS-DZ to about HV=522 for CMAS-D. Vickers hardness of CMAS ceramics were observed to increase with addition of ZrO_2. Average value of HV for the desert sand glass was found to be 6.37 GPa. This value of Vickers microhardness for desert sand glass falls is smaller than in this study results (Choi et al., 2015).

 Copyright © International Science and Technology Conference (ISTEC)

S. Banijamali et al. (2009) chose raw materials from commercial grade calcium carbonate, corundum, silicon oxide, titanium oxide, zirconium oxide and calcium fluoride. The homogenized mixture of raw materials was transferred to a zircon crucible and melted at 1450 °C for 1 h in an electric furnace. The melts were water quenched and the obtained frits were dried and milled to the required particle sizes (<75μm). According to the obtained results, in spite of less crystallization in SZ6 (ZrO_2 containing specimens), this sample shows the highest Vickers hardness and improved chemical resistance rather than fluorine containing specimens.

Tablo 3. Various properties of the CMAS-D and CMAS-DZ ceramics

Sample name	Sintering temperature (°C)	Time (h)	Density (g/cm^3)	Hardness (HV)	Mass loss in NaOH (wt.%)
CMAS-D	1000	1	1.70	522	3.73
		3	-	532	-
		5	1.72	568	-
	1100	1	1.72	570	2.65
		3	1.73	582	-
		5	1.77	612	2.35
	1200	1	1.84	747	2.31
		3	1.92	787	2.12
CMAS-DZ	1000	1	-	612	2.98
		3	1.805	634	-
		5	1.825	673	-
	1100	1	1.845	705	2.5
		3	1.88	736	-
		5	1.95	765	2.33
	1200	1	1.97	827	2.27
		3	1.99	844	2.02

Marques et al. (2010) reported that, the glass-ceramics based on diopside, with excellent mechanical properties, high abrasive resistance and good chemical resistance, were good candidates for decorative materials in construction field.

Conclusions

In the present work, the reported results show that dolomite, kaoline and zirconia can be used to develop a new ceramic of CMAS system. For sintering temperature lower than 1100°C, the CMAS specimen were digested. Diopside and anorthite were found as major crystalline phases. With the raise of sintering temperature, the crystal shape changed from spherical to needle and the crystal size became much larger. Vickers hardness of CMAS ceramics were observed to increase with the addition of ZrO_2.

COMBUSTION OF SILOPI COALS IN A ROTATING HEAD COMBUSTOR

Cengiz ÖNER* and Cumali İLKILIÇ*

*Department of Automotive Engineering, University of Fırat 23119 Elazığ, Turkey.

E-mail: mconer@firat.edu.tr cilkilic@firat.edu.tr

Abstract

In this work, a 40 kW coal combustion system with a rotary chamber, to burn Silopi and Tunçbilek'coal, which usually contain high level of ash, faster than fixed beds was designed and a prototype model was constructed. In the system, coal has been continuously carried by a screw conveyor from an hopper to the cylindrical burner head rotating continuously at a constant speed. As a difference among the previous systems, combustion air was supplied, by an axially-centred air tube carrying screw conveyor, into the air head in radial directions to the coal bed.

In order to evaluate the performance of the system, the effects of feed rates of coal and combustion air, angle of tilt and rotation speed of the burner head on the flue gas compositions and combustion efficiency were investigated.

The results of the experiments showed that Silopi and Tunçbilek coal could be burned with this kind of system in fast, efficient and practical and acceptable atmospheric pollutants levels. It was possible to increase the peak combustion efficiency over 80% by both improving the air supply and agitation of coalbed preventing coking during combustion. As a result, this system could be highly recommended to burn the coals with high swelling properties like asphaltite at a high efficiency.

Keywords: Coking Coal; Asphaltite; Combustion; Agitation; Rotary Chamber

1. Introduction

One of the most important fossil energy sources, coal is available abundantly on the earth and is expected to play a crucial role as a plentiful energy source in the future. When previous coal production and present production levels of visible reserves are taken into consideration, coal is an indispensable energy source with such properties as longer life compared to other fossil fuels, stable prices, and transportation facilities, storing opportunities; furthermore, it is secure in usage facility, easy to present it to consumers and it is continuous. These features will go on having the significant role in respect to sustainable development and confidence in energy in the future as in the past 1,2 as its reserves are larger than that of others such as petroleum and natural gas, as a matter of fact, there is a great deal of finding alternatives to these fuels (3,4). Although coal is mostly used for electric production in the world (approximately 65% of the world coal production), it is also used in domestic heating, iron-steel and cement sectors. Therefore, coal is the most commonly used fuel among all kinds of fuels.

Silopi coal, which are characterized by high sulphur and ash content together with high swelling properties,(5) make the great amount of coals which have over 60 Mt of reserves in South Eastern region of Turkey. Silopi coal being a petroleum originated substance is a hard, blackish material, with a relatively high softening point of about 200–315 ^{0}C and it is mainly composed of hydrocarbons (6,7). Despite asphaltites have the physical appearance of coal; they are derived from crude oil which leaked into inorganic formations. South Eastern region of Turkey has the largest asphaltite deposits, and it is used in domestic heating as the major alternative of lignite around the region (8).

Historically combustion in coal beds was the standard firing technique however, pulverised fuel and fluidised beds are now widely used. The earliest attempt to introduce mechanical stokers first appeard in 1816 (9). Up to the 1960s significant devolopments in stoker firing were carrier out. However, availability of other energy resources slowed down. In the smaller boiler size, as for example in the domestic and small commercial range, there is yet no established alternative to burning fuel in some form of fixed bed. As a result, coals with high swelling properties like asphaltites are not burnt at high efficiency in these coal combustion systems. Moreover, if the coal bed is mixed a lot to break up the coke blocks, the amount of unburnt coal loss falling through the grid becomes more.

 Copyright © International Science and Technology Conference (ISTEC)

Quality of asphaltites is poor in terms of their high ash and sulfur contents, and this leads to form coke blocks when it is burnt in conventional stokers. The plastic layer which is formed on them prevents air to diffuse into the coal particle, thus the air provided for combustion of swollen and coked coal becomes insufficient (10,11,12,13). This problem is partially resolved by shaking the flame bed automatically or by mixing the burning material manually in order to provide continuous air for the surface of unburnt coal. However, these processes are generally not practical. The most influential way to supply a uniform and permeable fuel bed is a continuous fragmentation of coke blocks that have occurred. Nevertheless, very high amount of smog may occur during fragmentation.

Caking coals burning for their passivity, they are not practical shallow beds. Flame bed that problems such as continuous scanning or shaking relieved in a way not practical. During combustion, the coal ash surface prevents the diffusion of oxygen to the grain surfaces. These and strongly caking coal particles tend to agglomerate in a different solution to the problem in the United Kingdom by British Coal Board entitled rotary combustor was developed (10). Since Turkey coal reserves are abudant enough 200 years at the present rate of consuption. The utilisation of caking coals for gasification has declined, hence it is worth while investigating alternative uses of this type of coal. One potantial area is the efficient, enviromentallly clean combustion of coal to hat energy efficient buildings which has tremendous World widwe potential. Our country with a high percentage of ash quickly than fixed deposits of lignite burned to achieve the planned 40 kW rotary combustion chamber coal combustion systems and prototypes were made.

The system is designed to burn coal in a coal bunker to the rear of the hood by rotating worm is moved continuously. The combustion chamber is rotated continuously at a constant speed around its axis. Thus, the removal of coal ash from coal burning surface of the bed and with constant stirring of the coal supplied with air in a radial direction is intended to provide a better contact. In the experiments, the performance of rotary coal combustion chamber, such as combustion efficiency and emission levels of atmospheric pollutants on the basis of criteria have been followed.

2. Materials and method

The system is schematically displayed in Figure 2.1. In this system that is manufactured as a prototype, it is envisaged that the coal whose approximate average thermal value is 5000 kcal/kg is going to be burned at a feeding speed of 7 kg/h, and a power of 40 kW will be obtained. The results of proximate and ultimate analysis of coal used are given in Table 1.

. **Table 1** Analysis of coal used in experiments (wt.%)

Proximate analyze	Asphaltite (Silopi)
Moisture	0.34
Ash	26.17
Volatility Matter	29.59
Fixed Carbon	43.90
LHV (kcal/kg, dry basis)	5000
Ultimate analyze	
C	64.08
H	4.54
S	7.5

For the design of head, the combustion chamber dimensions of previously made coal combustion systems were taken as reference (14). For 40 kW power of, the head was manufactured at a capacity of nearly 40 litres with a 36 cm diameter and 40 cm length. Depending on these head dimensions and bed slope, the bed volume and the coal waiting time on the head were calculated. It was found out that the bed volume was at least 5 dm^3, while it was 20 dm^3 at most; and waiting time was at least 35 minutes, while it was 130 minutes at most. Combustion head was manufactured out of C10 steel the outer diameter of which was 37 cm and the thickness of which was 5 mm. The length, width and height of the body of set-up were 160, 55 and 90 cm and it was manufactured by using the profile materials of 1x30x30 and 1x30x40 mm.

An electric motor with power of 800 W, rotation speed of 900 rpm, mono phase and working at 220V was used. A 20 rpm rotation was obtained from the motor output shaft by passing through couple worm screw system to the motor. 6 Gears the gear number of which are 12, 14, 16, 18, 21 and 24, respectively, were mounted on the motor output shaft, the gears are rotating together with motor shaft. The shaft that gives motion to the head receives its movement from these gears via a chain. The head speed is changed as in speed bikes gears that have 6 different gear numbers on the head moving motor. When the motion is transferred by means of the smallest gear, the head

 Copyright © International Science and Technology Conference (ISTEC)

rotates at 1,6 rpm which is the lowest rotation. In this system, coal is carried from the bunker into the head via a spiral carrier. Considering the size of coal particles to be carried, C10 steel pipe with 10 cm diameter, 120 cm long, and 6 mm thick is used in making the spiral. In the spiral carrier, every foot of which is 11cm, a pipe with 1 inch is used as a shaft. The flow of coal is arranged by means of two pulleys in coal feeding system whose diameters are 30 cm.

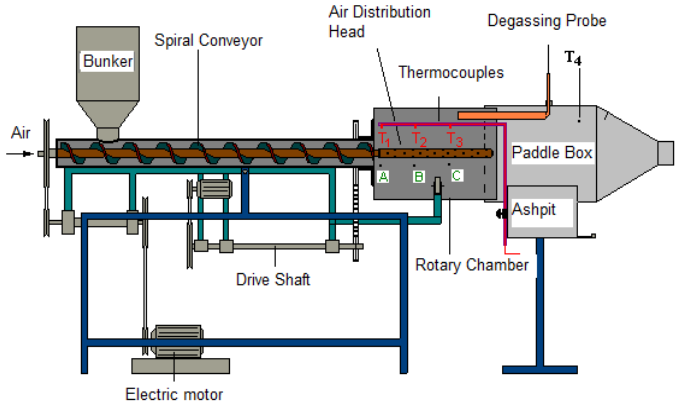

Figure 2.1 Schematic view of coal combustion system with rotating chamber

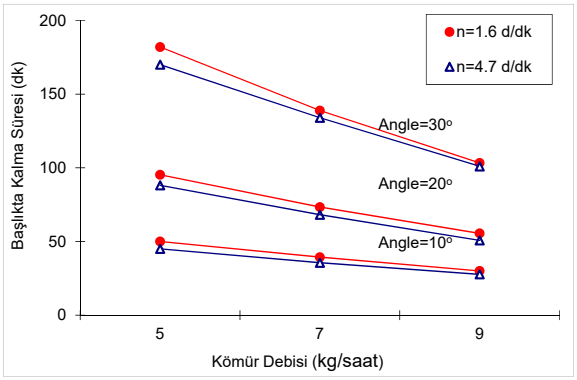
Air delivering head is screwed to the end of shaft and it takes place along the axis of rotating combustion chamber. This head is made of stainless steel with 20 mm diameter and it is screwed to the spiral carrier shaft. Air is dispersed from 24 holes each of which is 3 mm in diameter and which are opened around this air head the inside diameter of which is 14 mm. Hence, air is given into the combustion chamber in radial direction, and with high linear speeds from many points and since the backside of the head is in coal bed, both primary (air that directly sent to bed) and secondary (air that sent to the bed surface to complete burning gaseous released from the bed surface) air are provided by means of the same head. Long air delivery head is made by lengthening short air delivery head (primary) by 10 cm. Furthermore, experiments are repeated with using a flange and an additional air delivery head (secondary) plus flange. The additional air outlets increase air percentage sent to the rotating combustion chamber. The addition of the flange also increases the coal waiting time (residence time) in bed and the bed volume without increasing bed slope more than needed (because in high bed slopes, coal does not mix with air very well as a result of the coal not being mixed sufficiently), this reduces the amount of flammable substance in ash as much as possible.

The air necessary for combustion is provided by a compressor. In order to prevent the fluctuations in air flow and provide air at constant pressure, a pressure regulator is placed in the outlet of compressor. To measure the air flow, an orifice and sloped manometer is used and it was made in according to British BS1042.19 Firstly, air flow was increased at intervals of five minutes by increasing air flow of 10 m^3/h for each time. After approximately 15 minutes, it reached an EAR value of 1, in this case sloped manometer displayed the air flow of 25 m^3/h considering the flow rate of coal. Afterwards, air flow was increased continuously to obtain different EAR values. Air flow rate was increased by rising excessive air from stoichiometric rate until 50% with 10% step increase at each time. Excess Air Ratio (EAR) was calculated by using following equation:EAR=(A/F)actual/(A/F) stoichiometric, where (A/F) actual is a ratio of measured air and fuel consumption while (A/F) stoichiometric is obtained from stoichiometric combustion equation of air and fuel. A digital display Therpa-2000 model 6 channel thermometers equipped with K type (chromel- Alumel) thermocouples that can measure the temperatures between 0–2000 oC was used. It was calibrated according to these thermocouples. Three holes with 2 mm diameter were opened on the head (Figure 2.1, A, B, C holes)

in order to measure char temperatures. T1, T2 and T3 temperatures show the temperatures at the top regions at a distance of 5, 20 and 35 cm from the base in the rotating chamber, while T4 shows the gas temperature going out of the head. When these holes came to the top position due to rotation of the head, the points of thermocouples were extended inside the holes. With the rotation of the head, char temperatures were read in the areas where thermocouples were mounted. Combustion head was cleaned and filled with woods and coal particles until the maximum capacity in order to start combustion, and then ignited.

The amount of unburnt material like C in ash was determined by using fixed weight method. In this method, ash samples were grinned, and then their size was brought to nearly same size. Porcelain crucibles, which were washed and dried at 105 ºC, were brought to a fixed weight in terms of waiting in an oven heated to 700±20 ºC. A sample ash of 10 g was placed on crucibles, and it waited in oven at 700±20 ºC for four hours after brought to a fixed weight in oven at 105 ºC (in this progress, heating and weighing were made for one hour intervals) to remove

 Copyright © International Science and Technology Conference (ISTEC)

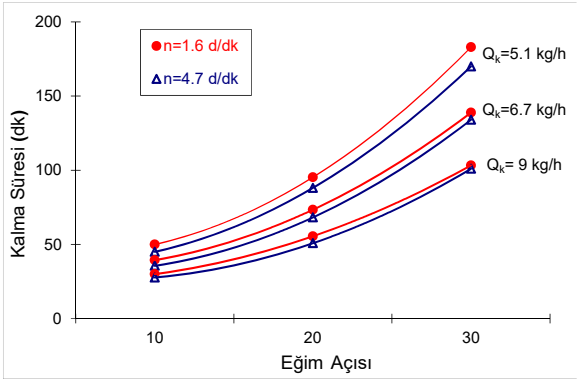


moisture within ash. Finally, the amount of combustible material like Carbon (C) in ash was calculated by following equation % $m_c = (m_2 - m_3)/(m_2 - c)$, where c; the weight of empty crucible, m_2; the total weights of crucible and slag after removal the moisture, and m_3; the total weights of crucible and ash after burnt at 700 ºC.

2.1.Cold Runs

Bifore firing the combustor, cold runs have been undertaken to determine the more importan operating characteristics of the combustor. This vork may be catagorised into, coal flow measurements and air flow measurements. In coal flow measurements residence time of the bed, have been determined as functions of coal flov rate, angle of title of combustor, and speed of rotation.

Althought the coal flow behaviour will be different from that when the coal would actually be burning these measurements could provide sufficient information to enable optimum working conditions to be achived more readily when running hot.



The cold data have been plotted as Figures 2.2 and 2.3, which illustrate the effect of different variables, such as.,coal flow rate, angle of tilt, and retort speed of rotation. A correlation between residance time, coal flow rate, angle of tilt and retort speed of rotation hes been found using a multivarible regressing.

Figures 2.2 The effect of angle of tilt on residence time of coal

As the angle of tilt is insreased, the residence time increases, and this rate of increase becomes more pronounced et the lower coal flow rates (Figures 2.2). Angle of tilt was found tbe most important variable with respect to change in residence time.

The residence time decreases with increasing coal flow rate fort he same angle of tilt (Figures 2.3). Coal flow was found to be the second most important variable. This is olso verified by the regresion analysis. The speed of rotation has only a limited effect on residence time

Figures 2.3 The effect of coal flow rate on mean residence time of coal particle in the rotating retort

2.2.Hot Runs

Hot runs were carried out to the performance of combustor for Slopi coal with regard to variation in the rate of air supply and distribution, the degre of agitation (related to the retort speed of rotation) the degre of agitation (related to retort speed of rotation), and the dept of the bed (by changing the angle of titleof combustor). The monitored

 Copyright © International Science and Technology Conference (ISTEC)

gases were CO concentrations incrased very quickly to a maximum and then decreased sharply to 500 ppm whic councided with the disapperance of flame. Because of chare combustion, the CO_2, concentration does not go to 500 ppm,it is at the higgest level during volatiles combustion and then rapidly decreased to minimum before staying nearly costant minimum of rapid fal approximately coincided with the flame off time. CO exhibits a non-linear trend while, in general, it is high at low coal flow mainly due to low bed-temperature which affects greatly CO formation. For O_2 and CO_2, it is observed an opposite behavior as expected.

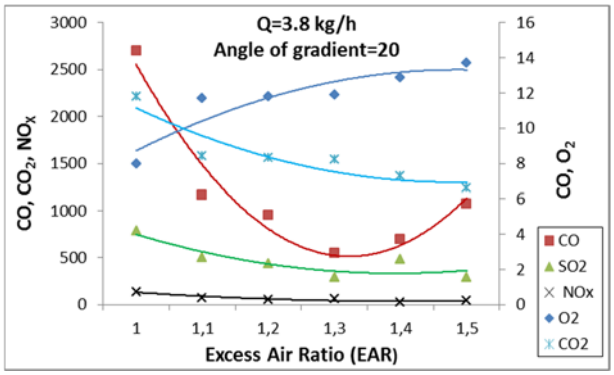


Figure 2.4 The effect of excess air ratio on the flue gas component

Generally, with the increase of EAR and coal flow, O_2 increased while CO_2 reduced, as shown in Figure 2.4. NO_X emissions at bed depths (angle of tilt gradient 20) Figure 2.4 shows the effect of excessair and bed depth on the emissions of NOx for Silopi coal. From the Figure 2.3 it can be deduced that for 20° tilt the NO_x levels are nearly constant at between 0-50% excess air. As the flue gas temparatures were found to be not high at all axcess air, this suggest a relationship betweeen temperature and NO_X (Figure 2.5). The change in temperature distribution on the head as function of excess air ratio (EAR) are shown in (Figure 2.5), where temperatures are measured under stable working conditions at 20° slope of the bed and coal flow of 3.8 kg/h. It is seen that temperatures initially increased at all measurement points with the increase of EAR and rose at its peak value when EAR was around 1.3 and then decreased again, and temperature distribution was homogenous throughout combustion head. This represents that the ignition level is higher in the centre of coal-bed than at the front and rear positions. The lower ignition level at the front arises from the freer air penetration and from relatively smaller quantity of coal-bed to this portion. It can be said that the temperatures on the head did not rise sufficiently, as a result, that surface reaction rates in combustion became important. In such a kind of combustion, oxygen can spread until the coal surfaces inside and when it reaches equilibrium, it is observed that the coal is burnt as a whole and then turns into ash without any shrinkage in the size of coal particle after the occurrence of combustion in the total volume of coal particle. It is seen that the ash formed over the coal particle during combustion became dust after being tapered a lot. This formation strengthens the consideration that combustion occurs at low temperature and depending on the surface reaction speeds. The ash in fine dust is thrown away from the chimney drifting by the air being sent at high speed from the air head on the coal bed. This, however, effects the chimney gas emissions negatively (15).

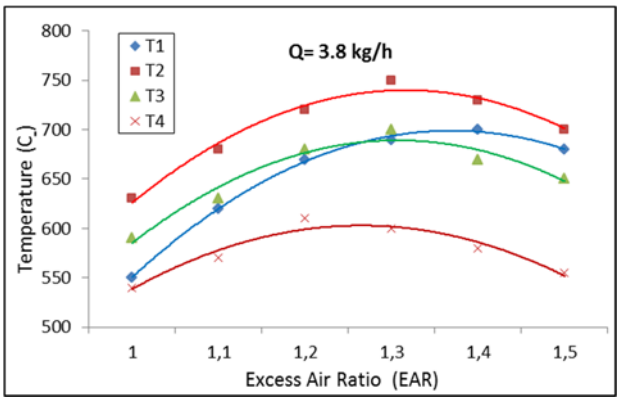

Figure 2.5 The effect of excess air ratio (EAR) on temperatures

Furthermore, NO_x values are low in all cases; this might be due to lower temperature obtained in the combustor with the supply of extra air with secondary air and increase in EAR that lead to dilution. This is in agreement with the other workers (16).

Emissions of NO_x and SO_2 from the combustion of Silopi coals at different EAR are shown in Fig. 2.4. İn general, SO_2 emission decreases as EAR increases. This is due to its sulfur content (Table 1) Excessive increase in air causes the

 Copyright © International Science and Technology Conference (ISTEC)

combustor column to cool and lead to decrease in NO_x, and increase the CO emissions as well, as reported by Varol and Atimtay [Combustion of olive cake and coal in a bubbling fluidized bed with secondary air injection].

During all the runs no smoke was visible and no permanent percentage obscuration was recorded by smıoke meter. Typical smoke meter chart recording gave zero smoke levels except small peaks at startup were obtained

2.3. Combustion Efficienc (%)

Since the CO level in the flue gases was very low, the combustion efficiency was almost entirely based on the combustibles in the ash. Various tests were carried out to assess the combustion efficiency when burning of Slopi coal as a function of throughput and excess air. The typical results in the Figure 2.6 show the effect of the excess air for coal flow rate 3.8 kg/h. The blue lines show the combustion efficiency at various excess air rate suggesting increase in combustion efficiency with increase in excess air and accebtable levels of combustion efficiency can be observed at excess air 1.4 whic is in quite agreement to other work on modern stoker (17)

A relatively axtensive investigation into the amount of combustibles in the residue hes been carried out and the results here are shown as afunction of excess air at 3.8 kg/h coal throughput in Figure 2.5. It is not possible to deduce a definite trend however at high temperature providet a substantial decrease in the loss of combustiblesin the residue.

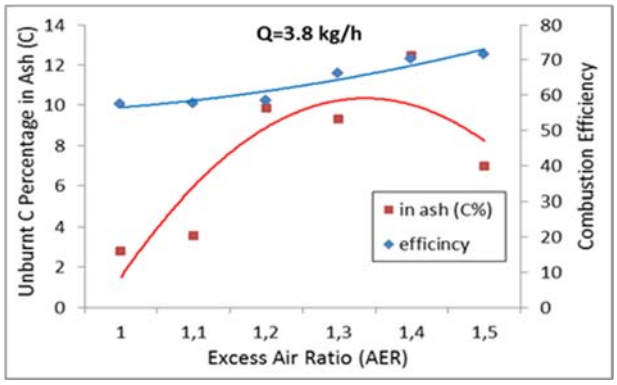

Figure 2.6 The effect of excess air ratio (EAR) on amount of combustibles C and combustion efficiency

In this system whose power is planned to be 40 kW, the optimum feed rate for coal is calculated as 7 kg/h. It is an anticipated result that the heat distribution on the head should be lower at low feeding rates than this feeding rate. In fact, although the first air sent into the bed directly is the most important factor in stable combustion, it is known that a secondary air should be sent onto the bed to complete the combustion of volatile products and gases emitted from the surface of the bed, but it is impossible to calculate the amount of this air theoretically. The premier and secondary air amounts change according to type of coal, combustion system and the way of air distribution.

3. Conclusion

In this study, the combustion of Silopi coals (asphaltites coking coals) was investigated in a rotating head combustor developed for burning the coking coals effectively with air supply arrangements. The main conclusions are as follows

(1) The air distribution characteristics were axperimentally determined without combustion and without coal present. When the air pressure were adjusted from regülatör, the percent reduction on air flow range from 100% to 50%.

(2) Combustion efficiency was found to be a strong function of air distribution throughout the coalbed, combustion chamber temperature, unburnt C percentage in ash and combustion of volatile substance. When the secondary air delivery head was employed, maximum efficiency increased from 60% to 72%. The lowest and highest C percentage in ash was found as 3 % and 9%, respectively.

(3) The C percentage in ash appeared to be high when coal was burnt in combustion chamber having low bed depth, and to enhance their combustion, the waiting time (residence time) of coal was increased by increasing slope but the lengthen of the head length was found to be better than former one when the high carbon coals were burnt.

(4) The shaking the bed prevented agglomeration and coke combining during combustion of coals with properties of high swelling.

 Copyright © International Science and Technology Conference (ISTEC)

(5) The temperature distribution in the head was observed to be uniform in the case of the usage of secondary air delivery head.

(6) Bed height has an effect on the hydrocarbon and NO_X emission. Hydrocarbon falls with increase in depth. On the other hand NO_X rises very slightly with increase in depth.

(7) Higher temperatures in the flue gas lead to high levels of NO_X emission.

(8) Generally, with the increase of EAR and coal flow, O_2 increased while CO_2 reduced

(9) During all the runs no smoke was visible and no permanent percentage obscuration was recorded by smıoke meter.

(10) CO emissions is decreased until EAR reaches a value of 1.3. Further increase of EAR cooled the combustor and caused CO emission to increase.

In this study, it was shown that the swelling coals that were difficult to burn in conventional stokers could be burnt using a rotating head combustor in high efficiencies without any ash problem. In fact, recently, such types of systems have been adapted to boilers, which are widely used in the buildings, to ensure the burning of the coals with high swelling property.

COMPARATIVE EVALUATION OF REPLACEMENT FOUNDRY SAND WITH MINERAL FINE AGGREGATES ON HMA PROPERTIES

Bekir AKTAŞ[1], Şevket ASLAN[2]

[1,2] Department of Civil Engineering, Erciyes University, Kayseri, Turkey

ABSTRACT

In this study the influence of using waste foundry sand (WFS) as replacement for mineral fine aggregates on the Hot Mix Asphalt (HMA) properties is evaluated. An experimental program was conducted on the asphalt concrete samples prepared with 5% replacement of mineral fine aggregates. HMA samples, made of WFS and conventional mineral aggregate, were compared in terms of their Marshall Stability, Flow, Bulk Specific Gravity, Void in Mineral Aggregates and Voids Filled with bitumen in the total mixture properties. The results obtained from the experiments indicate that the replacement of WFS with mineral fine aggregate has a significant potential to use in bituminous hot mixtures.

INTRODUCTION

One of the waste materials having that has a possibility to be used in road construction is waste foundry sand. For metal casting process to make molds and cores, uniform silica sand is used. Usability of foundry sands as an aggregate in road construction field gives the engineers the ability to construct better sustainable structures which is important to reduce their environmental pollution. Recently waste foundry sand has been used as a partial replacement for aggregate in bituminous asphalt mixture. Some states in USA have reported that the use of 8 to 25 % foundry sand is possible HMA to replace conventional aggregate (FHA 2004).

Use of waste foundry sand has a great potential in HMA for positive performance. Especially, the mixture stability, moisture resistance with waste foundry sand can be higher than HMA with conventional sand. In addition, some studies reported that foundry sand added samples demonstrated have increased rutting resistance (Delange et al 2001).

Foundry sands added HMA mixtures have good durability characteristics for weather affect. (Emery 1993). The same equipment and methods are used for foundry sand added HMA production. Regarding to HMA production at the plant, if the foundry sand has less than 5% moisture, it can be dispatch directly into a batch plants pug mill. Likewise, it can also dispatch through a recycled asphalt feed for drum plants where the foundry sand can be further dried, by the already heated conventional aggregates. Generally, foundry sand should be clean of thick coatings of burnt carbon, binders, and mold additives. It can be adhesion problem between the asphalt cement binder and the foundry sand. Clay clumps also can be removed by screening and/or washing. To remove iron and rubbish from the foundry sand, magnets and/or hand separation can be used (D'Allesandro et al 1990). At the drying process the presence of organic binder and bentonite materials can increase the time required. Also, this can increase the load on the hot mix plant dust collection system (Bradshaw et al. 2010).

The aim of this paper is to determine the general mechanistic characteristics of HMA that were made replacement foundry sand with mineral fine aggregates by measuring essential Marshall properties and by performing various laboratory tests. Marshall Stability, Flow, Bulk specific gravity (G_{mb}), Void in Mineral Aggregate (WMA) and Voids Filled with bitumen (VFA) were determined on the Marshall samples made with waste foundry sand and with conventional mineral aggregate added samples.

MATERIALS AND METHODS

Mineral Aggregates

 Copyright © International Science and Technology Conference (ISTEC)

As a mineral aggregate a type of crushed dolomite was used for the coarse and fine aggregates for the asphalt concrete production. The crushed aggregates were produced in the Kayseri, Turkey. The quarry was made the aggregates in fractions 0/5, 5/9.5, 9.5/12.5 and 12.5/19.5 mm.

Waste Foundry Sand

The grain size of waste foundry sand has very uniform distribution. According to sieve analysis 88% percent of waste foundry sand that used in this study is in between #10 (2 mm) and # 200 (0.075 mm) sieve sizes. 11 percent of foundry sand is smaller than #200 sieve size. Particle shape of the foundry sand is typically sub angular to rounded. Foundry sand consists primarily of silica sand which has more than 80% silicon dioxide, coated with a thin film of burnt carbon and residual binder (Du et al 2002). Figure 1 shows a view of foundry sand used in this study.

Figure 1. A picture of waste foundry sand used in mixtures

EXPERIMENTAL WORK

Marshall Test

Foundry sand passing through a #4 sieve were added 5% to mixture instead of mineral aggregates of the same size to evaluate the usability of foundry sand in the binder course of HMA. For each mixture were designed according to Turkish General Directorate of Highways (KTŞ 2016) and the Marshall Mix design (ASTM D 6927) was carried out. Asphalt mixtures with mineral aggregate and foundry sand were prepared with a 3.5, 4.0, 4.5, 5.0, 5.5 and 6.0 percent rate of bitumen content for each dry mixture. Then, the Marshall Stability and flow tests were conducted.

Asphalt mixes with waste foundry sand are designed using standard HMA design method. In this study 50/70 penetration grade asphalt were used with dolomite and foundry sand aggregates for the fabrication of asphalt concrete specimens. The asphalt cement binder was provided from TUPRAS Company in Turkey. The physical properties of the bitumen were determined and controlled according to ASTM standards. Asphalt cement that is used in this research has a penetration grade of 55 (0.1 mm at 25 °C, 100 g & 5 s) and 1.025 g/cm^3 specific gravity. The aggregate gradation for two mixtures was selected in accordance with the guidelines specified by the Turkish General Directorate of Highways, as can be observed from Fig. 2. The total weight of aggregate for the standard Marshall specimens was prepared at 1150 g. and 75 blows were applied on each side to compact the specimens.

 Copyright © International Science and Technology Conference (ISTEC)

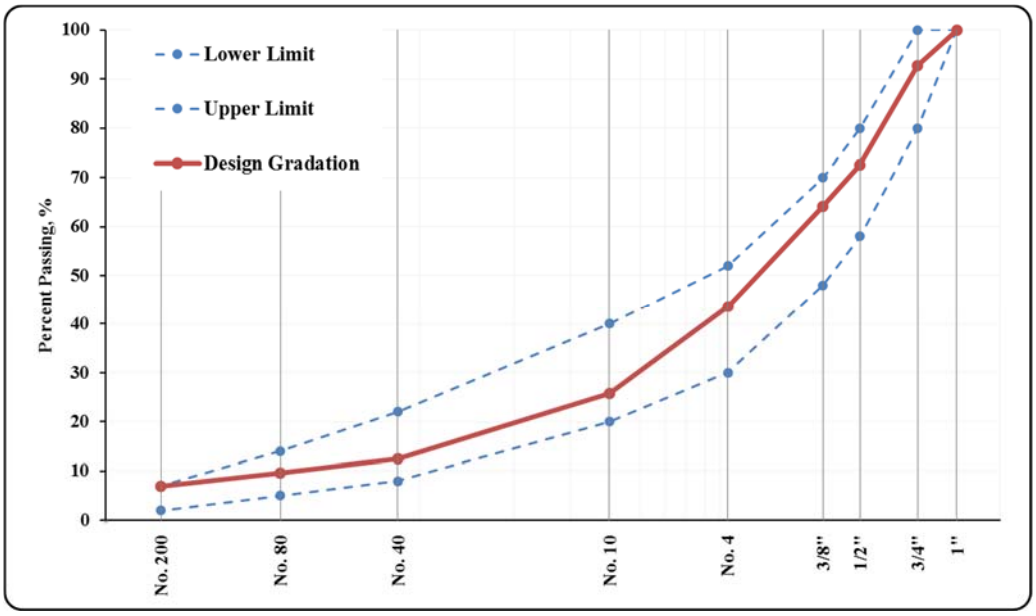

Figure 2. The aggregate gradation for the mixtures

RESULTS

Marshall samples were compacted and tested by employing the asphalt cement content corresponding to maximum stability, maximum Gmb, median of designed limits of percentage air voids in the total mix and median of designed limits of percentage voids filled with bitumen in the total mix. In order to determine the optimum bitumen content for the mix design, the bitumen content corresponding to median of designed limits of percentage air voids is taken.

Fig. 3 shows the Marshall Stability and flow results of HMA made with foundry sand added and mineral aggregates. Structural strength of the compacted HMA determined by Marshall stability. Aggregate properties and gradations affect this strength in the first order with binder. When Fig. 3 is observed, it can be clearly seen that the asphalt concrete stability with foundry sand is higher than the samples which were produced with mineral aggregates at the optimum binder content. Also, the Marshall Stability values of each asphalt concrete sample passed the 750 kgf that is the minimum limit for Turkey roads. The flow value of asphalt concrete is important due the fact that it reflects the plasticity properties and asphalt mixtures flexibility under traffic loads. The Marshall samples corresponding to the deformation of the load are broken; this represents a measure of the flow and flow with the value of the internal friction. Flow has a linear inverse trend relationship with internal friction (Brawn E.R. et al. 2009). Fig 3. Shows the relationship between flow and bitumen content for all mixtures. The results showed that the specimen flow results of the foundry sand added samples are lower than the control samples. Asphalt concrete samples containing waste foundry sand yielded better stability and flow resistance performances.

 Copyright © International Science and Technology Conference (ISTEC)

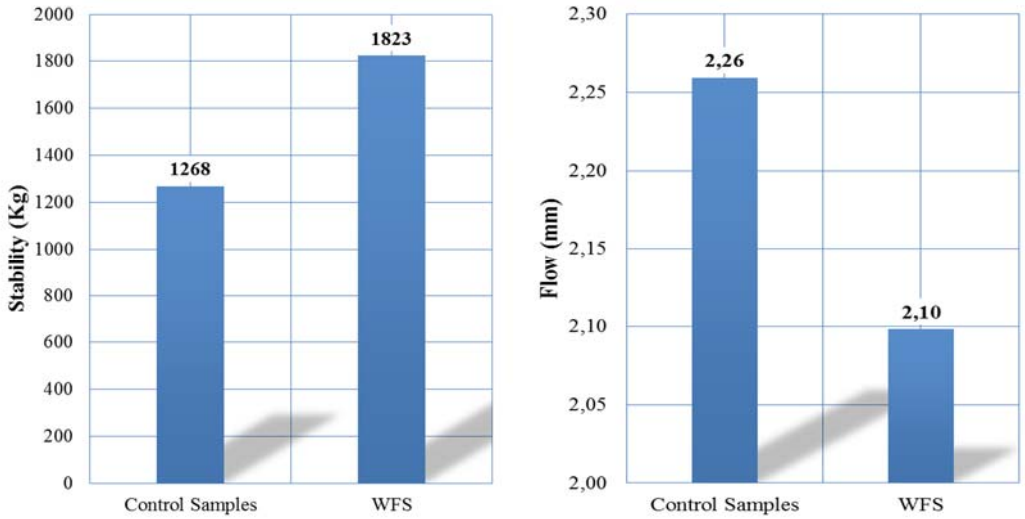

Figure 3. Marshall stability and flow values of asphalt samples at optimum binder content

Figure 4 shows the results of the optimum bitumen content, Gmb, VFA, and VMA of the specimens with foundry sand used and control mixtures. According to these results, it can be seen that the optimum bitumen content of WFS added samples is lower than the control samples. Also, bulk specific gravity increased with the WFS adding to mixture. Regarding to Vf and WMA, it also can be seen that they are slightly decreased with WFS added samples.

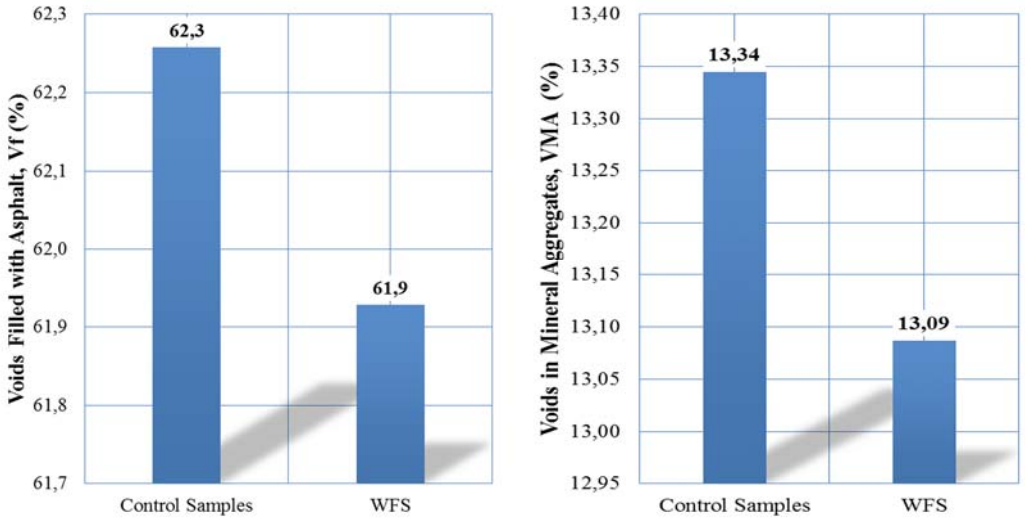

Figure 4b. Vf and VMA results of the samples.

CONCLUSIONS

This study aims to compare and evaluate the influence of using waste foundry sand as a replacement of mineral aggregate in HMA. At the laboratory Marshall tests performed to determine the characteristics of HMA with various bituminous rate. According to the results derived from the laboratory test data, these conclusions can be report: Marshall Stability values significantly increase with WFS addition in the mixture replace of mineral aggregate for optimum bitumen content. Both mixtures pass the Turkish Highway standard criterion (750 kgf) for binder course. Regarding to flow resistance of the samples, asphalt concrete samples containing WFS demonstrated better flow resistance than the control samples. Another important result of this study is optimum binder content decreased with the WFS adding. This study shows that there is high possibility to use waste foundry sand in HMA binder course. Performance tests such as rutting, creep test, dynamic modulus tests etc. would be very beneficial to understand successfully influence of this material in the mixture.

ACKNOWLEGEMENT

This study was supported by the Scientific Research Projects Coordination Department of Erciyes University (Project Number: FBA-2015-5890). Authors of this study express their gratitude to ERÜ/BAP for sponsoring the project.

COMPARATIVELY USE OF TIME SERIES AND ARTIFICIAL INTELLIGENCE METHODS IN THE PREDICTION OF AIR POLLUTANTS

Fatih TAŞPINAR*, Kamran ABDOLLAHI

Duzce University, Department of Environmental Engineering, Düzce, TURKEY
Southern University and A&M College, Urban Forestry Program, Baton Rouge, LA, USA
fatihtaspinar@duzce.edu.tr
kamrana664@cs.com

Abstract: Air pollution is a continuing environmental problem in many part of world which affects welfare adversely. Air pollution monitoring data can thus be used to forecast concentrations of air pollutants for short-term using time series and artificial intelligence approaches. In this paper, time series modelling techniques, auto regressive integrated moving average model and another type of it with exogenous variables (ARIMA and ARIMAX), and artificial neural networks (ANNs) have been comparatively used to model particulate air pollution (PM_{10}) for predicting one-hour ahead concentration of particles in the air. An hourly based data for the years 2015-2016 was composed with including meteorological factors and air particulate concentration. The models were structured with inputting external parameters to simulate air pollution better. ARIMAX(3,1,2) model with R^2 of 0.667 and ANN(5-13-1) model with R^2 of 0.857 produced reasonable predictions over hourly dataset. The best fitting model among these models have been chosen in further tests in the prediction of one-hour ahead PM_{10} concentrations.

Keywords: Air pollution, Time Series Methods, Artificial Neural Networks.

Introduction

Air pollution problem due to particulate matter (PM) is caused by a mixture of organic and inorganic particles which are solid and liquid phase spreading out from variable sources (WHO, 2006; Sfetsos and Vlachogiannis, 2010.) These particles with an aerodynamic diameter less than or equal to 10 µm, namely PM_{10}, arise in the atmosphere mainly from the fuel combustion (Aneja et al., 2001; Kampa, M. and Castanas, 2008; Vahlsing and Smith, 2012). The highest PM_{10} levels are associated to stable meteorological conditions with thermal inversion in urban and industrial areas. Epidemiological studies showed a close relationship between outdoor particulate matter concentration and increased mortality and morbidity (Shang et al., 2013; Pope and Dockery, 2006). High levels of these pollutants can be harmful for goods, and also decrease visibility. The air quality standards are thus set for PM_{10}, declaring hourly, daily and annual limits. According to EU standards for PM_{10}, the annual average limit value of 40 $\mu g.m^{-3}$ and 24-h limit value is declared as 50 $\mu g.m^{-3}$, and also the limit values should not be exceeded by the specified number of times in a year (EC, 2008).

Elevated levels of air pollutants in the air may cause acute or chronic health effects, and even cause premature deaths in the elderly people. The air quality forecasting studies is an important research topic in air pollution science for public health. Many functional alert systems were employed by utilizing statistical and hybrid models, to take precautions before and during air pollution episodes. In this scope, long-term or short-term air pollution forecasting models have been used as an aid for air quality management. Time series models, artificial neural networks (ANNs), multiple linear regression (MLR) and hybrid models are mostly preferred approaches in air quality forecasting researches (Schlink et al., 2003; Niska et al., 2004; Perez and Reyes, 2000). With nonlinear simulation and learning abilities, ANNs, are powerful tools for regression and pattern recognition problems. A real-life problem such as short-term air pollution prediction, covering complex nonlinear relations with meteorological factors, can be handled by ANN models very well. ANNs consist of neurons that are interrelated connections artificial processing units and they can process information by error minimization within a finite computation loop. ANNs can thus be trained to learn a complex relationship between two or more variables recorded in training datasets. Among the available ANNs, the feedforward error backpropagation neural networks are the most employed ANN types, of which inputs has a nonlinear transfer function. By this means, they have been used in many successful studies in local air pollution modelling for forecasting pollutants NO_2, O_3, SO_2, CO and PM_{10} (Kukkonen et al., 2003; Kurt et al. 2008).

 Copyright © International Science and Technology Conference (ISTEC)

Time series modeling approaches for short-term air pollution prediction phenomena are also employed, of which results are comparable to other artificial intelligence methods. They mostly applied on continues time series datasets. These datasets include some degree of randomness, for example, random changes in meteorological parameters due to atmospheric events during diurnal changes and seasonal variations. Some studies have revealed that the air quality data are stochastic time series by making short-term estimations possible by exploring historical data patterns (Kao and Huang, 2000; Horowitz and Barakat, 1979). The most widely employed time series models (TSMs) are the non-seasonal and seasonal autoregressive integrated moving average and a type of them with external parameter models (e.g. ARMA, ARIMA, ARIMAX) in time series analysis (Goyal et al., 2006; Kumar and Goyal, 2011). In the case of conventional air pollutants non-seasonal and seasonal time series models have been successfully applied to monitored datasets that are based on mostly daily or monthly averaged values (Modarres and Dehkordi, 2005, Jian et al., 2012). Generally, the quality of models can vary on individual experience of issue, knowledge of time series analysis methods in the model identification stage. The visualization of time series forecasting plots leads to establish several models for the same dataset and most stable one can used in tests further.

In the present study, an air pollutant, PM_{10}, one-hour ahead concentration prediction of PM_{10} using ARIMA, ARIMAX and ANN based models were studied for the period of 2015-2016. Well-tuned models were then applied in short-term predictions of PM_{10} to determine a model best explains the variance in data with reduced inputs.

Materials and Methods

2.1 Data with explanatory statistics

An hourly dataset for Düzce province in Turkey was composed containing information about local meteorological parameters such as air temperature (AT, °C), wind direction (WD), wind speed (WS, m/s), relative humidity (RH, %) and mass concentration of particulate matter (PM_{10}, $\mu g/m^3$) for the period of 2015-2016. The meteorological data was taken from the General Directorate of Meteorological Affairs of Turkey and PM_{10} data was taken from the Ministry of Environment and Urban Planning, using the online web service of the National Air Quality Monitoring Network of Turkey. Table 1 shows the descriptive statistics of these variables and Fig. 1 visualizes an hourly time series plot for PM_{10} over air temperature.

Table 1: Descriptive statistics of hourly dataset (2015-2016) used for investigation.

	Valid (N)	Min.	Max.	Mean	Median	Mode	Freq. of Mode	25% Perc.	75% Perc.	Range	Std.Dev.
PM_{10}	8782	98.41	60.00	37	121	0.00	891	39	104	891	112.81
AT	8926	16.02	17.00	22	383	-13.00	42	8	23	55	9.82
WD	8926	192.29	201.00	182	71	0.00	359	123	268	359	92.79
WS	8926	0.62	1.00	1	5568	0.00	1	0	1	1	0.48
RH	8926	79.95	88.00	103	1563	12.00	103	63	100	91	22.78

In the hourly dataset, one step forward-lagged set of these variables were constructed for including the prior data from one-hour before. The peak levels of PM_{10} can be seen during winter due to residential heating by fossil fuels such as coal, lignite and wood, particularly at least five months from October to March in contrast to the levels observed during the summer periods. PM_{10} and temperature values were ranged in [0-891] $\mu g/m^3$ and [–13-42] ^0C, respectively. The mean and 75% percentile of PM_{10} level were 98.41±112.81 and 104 $\mu g/m^3$, respectively, however, which is higher than the acceptable limit of 90 $\mu g/m^3$ declared in National Air Quality Standard of Turkey. The statistics showed that the atmosphere over Düzce is highly polluted by particulate matter and the pollution episodes particularly during winter periods can affect human health adversely. Therefore, air pollution forecasting models can serve a tool in identifying emergency periods and short-term pollutant levels.

2.2. Modeling by Time Series Methods and ANNs

By analyzing patterns in historical data, such as trend, seasonality and noise, one can construct regressive models for predicting future data points. TSMs in forecasting are constructed based on historical data pattern in the series. Widely used kinds of TSMs are AR, ARMA, ARIMA, etc. and their multivariate forms such as ARMAX and ARIMAX (Taşpınar et al., 2013; Ibrahim et al., 2009; Suganthi and Samuel, 2012).

 Copyright © International Science and Technology Conference (ISTEC)

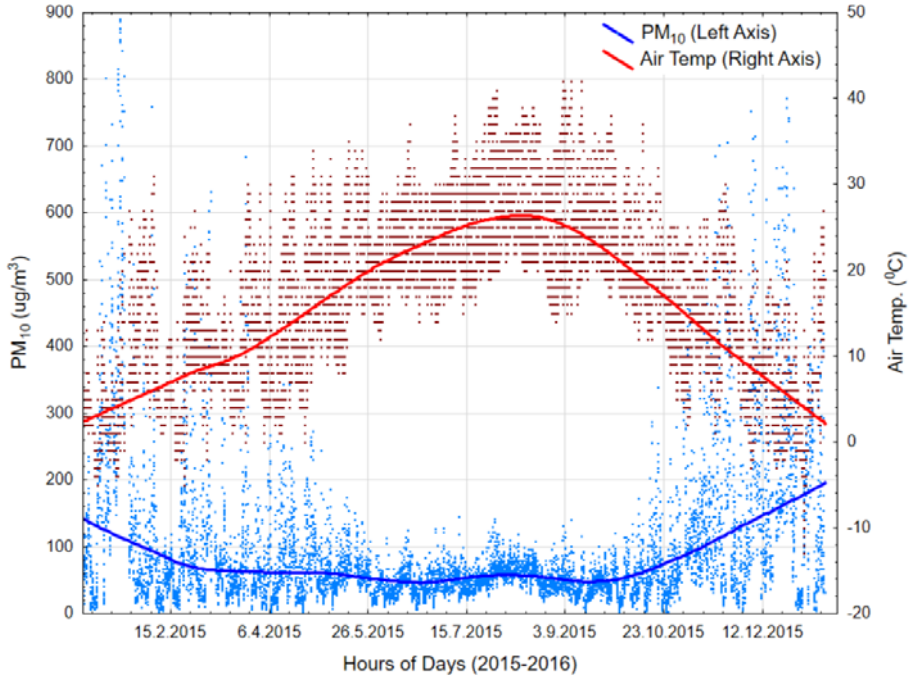

Figure 1. Hourly time series plots of PM_{10} and air temperature for 2015-2016 period.

In order to model one-hour ahead PM_{10} level, ARIMA and ARIMAX models with meteorological factors (AT, WS, WD, RH) were applied on hourly dataset. Based on these variables, the models ARIMA(p,d,q) and ARIMA[X](p,d,q) were examined. The non-negative integer elements p, d and q used in the non-seasonal models refer to the order of autoregressive part (AR(p)) and the order of differencing (I(d)) and moving average (MA(q)) parts of the models, and X refers to exogenous variables such as AT or WS used in this study, respectively. In the construction of models, the order of the model is selected by plotting the autocorrelation function (ACF) for determining the value of q used in MA(q) model and partial autocorrelation function (PACF) for determining the value of p used in AR(p) model. ARIMA model with a single variable and ARIMAX model with multi input-variable can be represented by the following equations, respectively:

$$\hat{y}_t = \mu + \phi_1 y_{t-1} + \ldots + \phi_p y_{t-p} - \theta_1 e_{t-1} - \ldots - \theta_q e_{t-q} \quad (1)$$

$$\hat{y}_t = \beta_0 + \beta_1 X_{1,t} + \beta_2 X_{2,t} + \ldots + \beta_k X_{k,t} + \frac{(1 - \theta_1 B - \theta_2 B^2 - \ldots - \theta_q B^q)}{(1 - \varphi_1 B - \varphi_2 B^2 - \ldots - \varphi_p B^p)} \varepsilon_t \quad (2)$$

where y_t is the t-th observation of the dependent variable, $X_{1,t}$, $X_{2,t}$, …, $X_{k,t}$ are the corresponding observations of the explanatory variables, β_0 is a constant, β_1, β_2, .. , β_k are the parameters of the regression part, and B is the backshift operator ($By_t = y_{t-1}$, $B^2y_t = y_{t-2}$), ε_t is error residuals (~$N(0,\sigma^2)$), $\varnothing_1$, $\varnothing_2$, …, $\varnothing_p$, and θ_1, θ_2,..., θ_q are the weights for the non-seasonal autoregressive and moving average terms, respectively. In order to test the lack of fit of time series models, the Ljung-Box test was applied in model diagnostic and the most suitable model was selected according to normalized Bayesian information criteria (NBIC) (Salcedo et al., 1999; Ljung and Box, 1978).

The artificial neural networks are adaptive nonlinear systems capable to approximate any function. ANNs are used in regression and classification studies in general, in which the inspired model that does not have a clear relationship between its inputs and outputs (Rumelhart et al., 1986). ANNs are built on a network of simple processing elements, namely neurons, that exhibit complex global behavior determined by the connections between the processing elements and element parameters. Generally, ANNs are made up of a number of layers with neurons. The ANN neurons are located in input, hidden and output layers, which is thus called as multi-layer perceptron (MLP) ANN in general (Fig. 2).

 Copyright © International Science and Technology Conference (ISTEC)

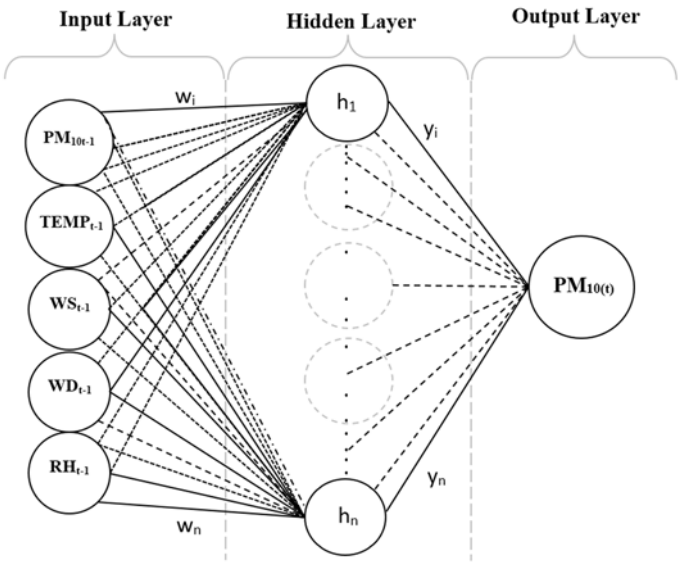

Figure 2. General structure and inputs of ANN model used in hourly PM_{10} modeling

The first layer corresponds to the input variables to the problem with one node for each input variable. The second layer used to capture nonlinear relationships among variables by interconnections. The third layer provides the predicted values. All weights are usually initialized with random values drawn from a standard normal distribution. During an iterative training process, ANN calculates an output o(x) for given inputs and current weights. If the training process is not yet completed, the predicted output (o) will differ from the input (y). An error function, like the root mean squared error (RMSE) which measures the difference between predicted and observed output. Finally, the process stops if a pre-specified criterion is fulfilled such as checking early stopping conditions by calculating global error. A single neuron processes multiple inputs applying an activation function on a linear combination of the inputs as follows:

$$y_i = f\left(\sum_{q=1}^{l} w_{iq}.f\left(\sum_{j=1}^{m}(v_{qj}x_i + b_j)\right) + b_q\right) \tag{3}$$

where x_j is the set of inputs, w_{iq} and v_{qj} ate the synaptic weights connecting the q_{th} input to the j_{th} neuron, b is bias term, f is the activation or transfer function, and y_i is the output of the i_{th} neuron. Weights are the knowledge base of the ANN system, which represents the non-linear properties of the neuron by its activation function. The activation function is usually non-linear, with a sigmoid shape such as logistic or hyperbolic tangent function, respectively, as follows:

$$sig(x) = \frac{1}{1+e^{-X}} \tag{4}$$

$$tanh(x) = \frac{1-e^{-2X}}{1+e^{-2X}} \tag{5}$$

Generally, feedforward MLP networks are trained using error back propagation (BP) algorithm (Lahmiri, 2011), which covers heuristic and numerical optimization algorithms. Heuristic techniques include gradient descent and the resilient algorithm (Dong and Zhou, 2008). So, some parameters such as learning rate, learning momentum, hidden layer neuron count etc. have been determined before training stage and then ANN model should be constructed. The inputs to the ANN models also have to be selected appropriately to better simulate the problem under consideration. Later, these parameters were determined by testing several ANN models on the same dataset.

2.3. Data feature extraction and pre-processing

Time series dataset covering the variables PM_{10}, AT, WD, WS and RH were pre-processed prior to use in the models. Firstly, it's applied to a list-wise local linear regression to fill the missing values up to six cells by columns, but, the bigger missing areas were remained. Thus, the average valid data was about 91% of the entire dataset. When inputting to ANN models, the blank inputs can be skipped, however, TSMs need fully-filled input data. Hence, to execute TSMs on entire dataset, all the blank cells after missing value analysis were filled by the mean of the actual variable. The parameter WD is also converted to wind direction index (WDI) to avoid the discontinuity according to the following expression:

$$WDI = 1 + \sin\left(\mathrm{WD} + \frac{\pi}{4}\right) \tag{6}$$

In order to make input variables intercomparable before executing on the modelling framework, the variables were normalized in the range of 0.05-0.95 using min-max normalization given in Eq. (7) as follows:

$$y' = 0.05 + \frac{(y - y_{\min})}{(y_{\max} - y_{\min})} * 0.95 \tag{7}$$

where y' is the normalized value, y_{min} is minimum value, y_{max} is maximum value and y is the actual value.

Results and Discussion

Time Series Models and Performance Evaluation

Time series model for predicting one-hour ahead PM_{10} level is somewhat difficult comparing to ANN models. Because, tested TSMs are all hourly based which is difficult to handle in determining input lags of external variables. In fact, this problem is valid for ANN models, however, training an ANN model is much more fast and easy over a huge dataset like this.

In order to construct TSMs using ARIMA and ARIMAX methods, firstly ACF and PACF graphs were plotted for at least twenty lags of PM_{10} data. These plots were shown in Fig. 3. ARIMA model that is based on only PM_{10} data is firstly constructed. Since, the data used is based on hourly values, the periodicity is set to 24 in this case.

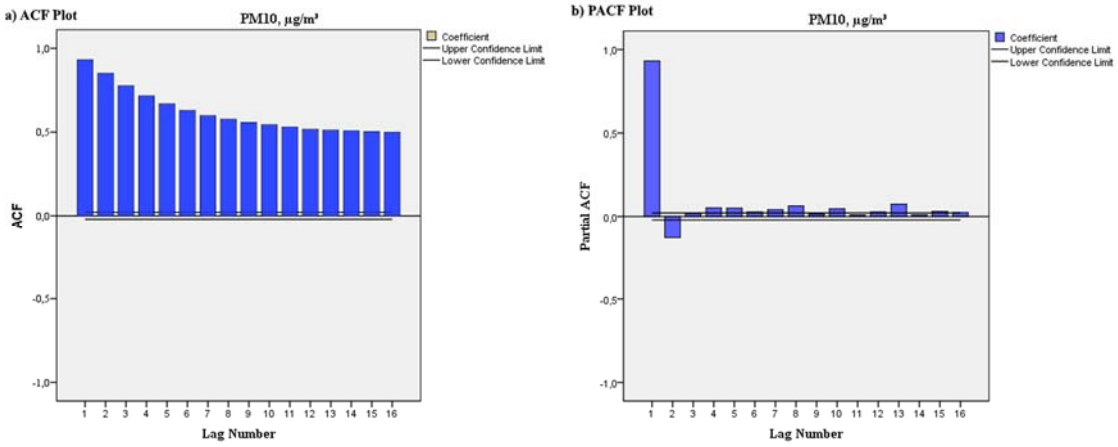

Figure 3. a) ACF and b) PACF plots for hourly PM_{10} data.

In ACF plot given in Fig. 3(a) an exponential decay with many lags over indicates moving average part in the data. PACF plot shows a significant lag at first which is an indication of AR process. Furthermore, the data is nonstationary considering high order lags in ACF plot. Thus, a non-seasonal differencing can be applied, setting parameter d to 1. So, ACF and PCAF plots for one lag non-seasonal differenced data was given in Fig. 4.

 Copyright © International Science and Technology Conference (ISTEC)

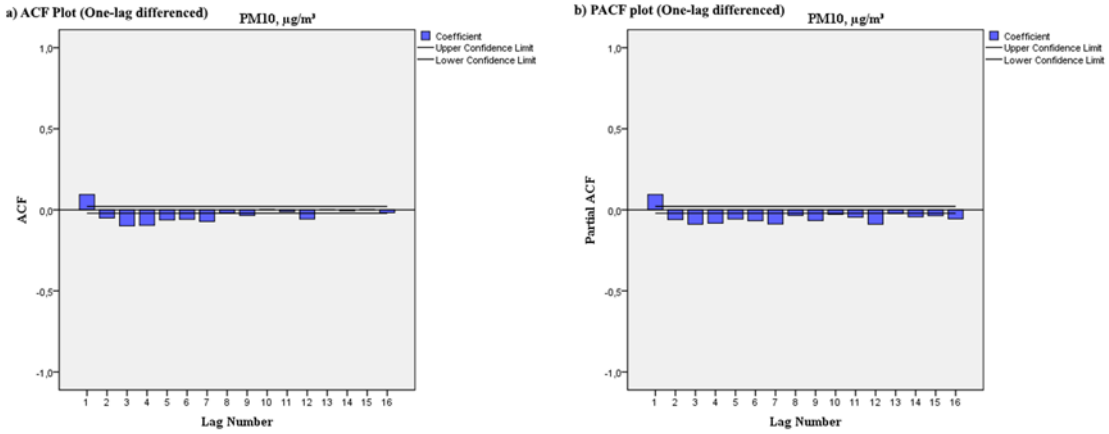

Figure 4. a) ACF and b) PACF plots for one-lag differenced hourly PM_{10} data.

One-lag differenced data shows a stationary character with time. Thus ARIMA model should include I(1) term. However, the degree of AR(p) and MA(q) processes are difficult to determine as periodicity is set to 24, which means many lags may be involved in the models. Here, although ACF plot promotes a clear MA(1) process and PACF plot promotes an AR(1) process at first sight, such ARIMA(1,1,1) model, other significant but negative lags were present in both levels at higher lags. ACF plot shows some significant lags up to 12 lag and then a sharp cut-off is observed. Therefore, we employed some models varying p and q between 1 to 3 to identify the best model without unit roots, comparing their NBIC values. Table 2 shows the models tried and related model performance statistics. Consequently, a trial-and-error work changing these model parameters was resulted in determining ARIMA(3, 1, 2) model including both AR(3) and MA(2) process with the lowest NBIC of 6.607 and R^2 of 0.663. AR lags from 1 to 3 was significant whereas MA lag at level 2 as significant. The parameter estimates of ARIMA(3,1,2) models was tabulated in Table 3 and arranged model equation was then given in Eq. (8).

Table 2: Identified ARIMA models in the prediction of hourly PM_{10} levels and model statistics

Model	NBIC	Stationary-R^2	Significant Lags (at p<0.05)
ARIMA(1,1,1)	0.791	0.549	AR(1), MA(1)
ARIMA(1,1,2)	0.698	0.561	AR(1), MA(1)
ARIMA(2,1,1)	0.692	0.602	AR(1,2), MA(1)
ARIMA(2,1,2)	0.702	0.597	AR(1,2), MA(1)
ARIMA(3,1,1)	0.675	0.653	AR(1,2,3), MA(1)
ARIMA(3,1,2)	*0.607*	*0.663*	AR(1,2,3), MA(2)
ARIMA(3,1,3)	0.670	0.658	AR(1,2,3), MA(2)

Table 3: Parameter estimates of ARIMA(3,1,2) model.

Model Partitions		Parameter Estimate	SE	t	Significance (at p<0.01)
AR	Lag 1	0.218	0.010	21.289	0.000
	Lag 2	0.845	0.005	158.374	0.000
	Lag 3	-0.364	0.010	-35.627	0.000
Differencing Order		1			
MA	Lag 2	0.996	0.002	635.015	0.000

$$PM10_t = 1.218 \cdot PM10_{t-1} - 1.063 \cdot PM10_{t-2} - 0.481 \cdot PM10_{t-3} + 0.364 \cdot PM10_{t-4} + (1 + 0.996.B)\varepsilon_t \quad (8)$$

Estimates of ARIMA(3,1,2) model with upper and lower confidence limits against to original data as time series plot were given in Fig. 5, which shows that estimated points fitted the historical PM_{10}pattern very well. Also, based on this univariate ARIMA(3,1,2) model, an ARIMAX model with the inputs from AT, WS, WD and RH were constructed. These meteorological factors affect PM_{10} level in air in real-life, so this situation can be simulated by an ARIMAX model. ARIMAX models are constructed by transfer functions by calculating weights of external variables. After parameter estimation a model equation can be arranged based on significant lags of variables.

 Copyright © International Science and Technology Conference (ISTEC)

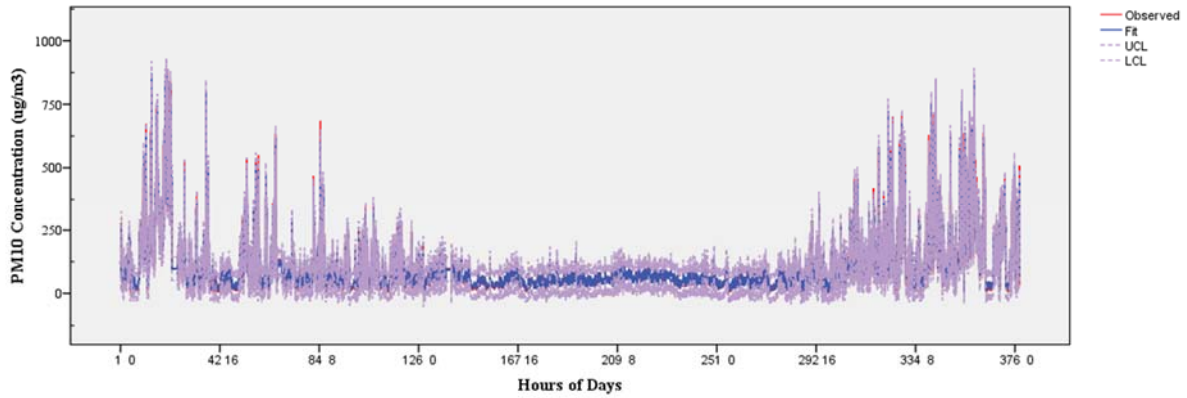

Figure 5. Line plot of the estimates of ARIMA(3,1,2) model with confidence limits against to observed data.

Based on the parameter estimates for ARIMAX(3,1,2) model including the terms from meteorological factors with R^2 of 0.667 and NBIC of 6.607, arranged ARIMAX model equation is given in Eq. (9) as follows:

$$PM10_t = 1.218 \cdot PM10_{t-1} - 1.063 \cdot PM10_{t-2} - 0.481 \cdot PM10_{t-3} + 0.364 \cdot PM10_{t-4} + (1 + 0.996.B) \cdot \varepsilon_t + (AT_t - 0.768 \cdot AT_{t-1}) + (WDI_t - 0.008 \cdot WDI_{t-1}) + ((1 + 9.021 \cdot WS_t) / (1 - 1.193 \cdot WS_{t-1} - 0.552 \cdot WS_{t-2})) + (RH_t - 0.463 \cdot RH_{t-1} - 0.484 \cdot RH_{t-4}) \quad (9)$$

Parameters estimates of ARIMAX model showed that $PM_{10(t)}$ was predicted by using AT at lags 0-1, WDI at lags 0-1, WS at lags 0-2 and RH at lags 0,1,4. Performance of ARIMA and ARIMAX models for one-hour ahead PM10 concentration prediction is very similar, comparing R^2 values. Thus, we selected PM_{10} ARIMAX model with external parameters from meteorological factors as benchmark for further tests.

ANN Models and Performance Evaluation

Designing of ANN models are related to selection of some parameters such as hidden layer neuron count and learning rate. Before construction of ANN model, the entire dataset is divided into training (75%), test (15%) and validation sets (10%). Later, ANN models were designated and model parameters were set. In the present study, an open source library, Fast Artificial Neural Network (*FANN*) implemented by Nissen (2003), was utilized as ANN modeling engine in the prediction of one-hour ahead PM_{10} concentration with lagged input vectors. The input vector includes the first lags of all model inputs as shown in Fig. 2, which can be written as $PM10_t = f_{net}\ (PM10_{t-1}, AT_{t-1}, WD_{t-1}, WS_{t-1}, RH_{t-1})$ model. The *FANN* library offers an automated training method, so-called cascading-training procedure, which provides a way to determine the final neural network structure consists of a number of hidden layers with one shortcut connected neuron in each. Therefore, the ANN model were set by utilizing cascading-training technique of this library.

Feed forward backpropagation type ANN with sigmoid function for transfer functions of input layer and tanh for hidden layer were then determined in training of networks. Maximum number of epochs was set to 1000, applying an early stopping criterion to avoid over fitting or underfitting, setting the validation process at every 10 training epochs. A starting learning rate of 0.45 was gradually decreased by 1.1% at every epoch during the cascading-training procedure, which was resulted in an ANN(5-13-1) model, including 13 hidden layer neuron. Several experiments with different structures were tried as mentioned here, however, ANN(5-13-1) model produced the best error measure and model accuracy with RMSE of 0.478, training R^2 of 0.857 and testing R^2 of 0.841. Also, Index-of-Agreement (IA) that measures prediction errors was calculated to test the quality of fit. IA value of 0.81 obtained with this model, which is close to 1.0, suggested a well agreement with the selected model. Thus, the validation of ANN model did not tend to underfitting or overfitting on average. A performance plot obtained from predicted values from ANN model was visualized in Fig. 6. The performance plot of the results of the best ANN model for the whole dataset is visualized on Fig. 3. The red line indicates an exact fit of R^2=1.0, hashed black line indicates a linear fitting line of R^2=0.857. 95% confidence band limits were also shown in blue-dotted lines, clearly indicating the most of the data points fall in the band limits.

Hourly time series dataset was plotted against to predictions of ANN(5-13-1) model in Fig. 7. All the data is well followed by ANN model, simulating historical pattern of hourly PM_{10} concentration. As it can be seen in Fig. 7 that at some extreme conditions with elevated PM_{10} levels, particularly the levels higher than 550 µg/m^3

 Copyright © International Science and Technology Conference (ISTEC)

observed during strictly calm days. Due to air circulation issues occurred in Duzce province in calm nights during winter periods, extreme conditions can be observed. Therefore, elevated PM_{10} levels mostly occurred winter times with a rate of 2% for levels higher than 500 $\mu g/m^3$. However, most frequent PM_{10} values within a range of $\mu \pm 3\sigma$ were predicted reasonably successfully. Extreme value problem for ANN model is a well-known issue, because neural networks cannot successfully evaluate less trained input values or less frequent data observed at extreme conditions. However, all the ANN models experimented in the tests were very successful in the predictions comparing to TSMs.

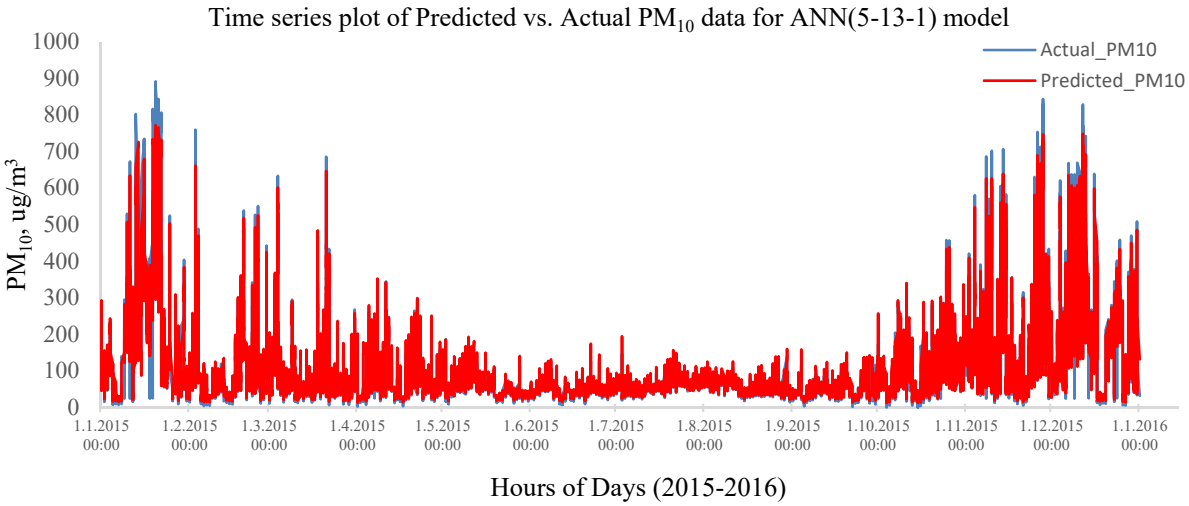

Figure 7. Hourly time series plots for the predictions of the ANN model against to actual data

Conclusion

The present study investigated short-term PM_{10} modelling based on hourly monitoring data of meteorological factors and particle concentrations. In order to obtained a reasonable model for time series data, we have used time series modeling techniques and ANN models. ARIMA and ARIMAX models were applied to data as TSMs. A univariate ARIMA(3,1,2) model were fitted to predicted hourly PM_{10} level one-hour ahead. This model

 Copyright © International Science and Technology Conference (ISTEC)

included AR(3) and MA(2) processes with one lag differentiation, with R2 of 0.663. Based on this model, a multivariate ARIMAX(3,1,2) model fitted by covering the terms from $PM_{10(t-1...t-4)}$, $AT_{(t..t-1)}$, $WDI_{(t..t-1)}$, $WS_{(t..t-2)}$ and $RH_{(t,t-1,t-4)}$ with R^2 of 0.667. Therefore, ARIMAX model is selected as benchmark to compare predictions by ANN model.

ANN models for prediction next-hour PM_{10} level were designed. The best ANN model is in the form of 5-13-1 with 13 hidden neuron in middle layer, with testing R^2 of 0.857. The input vector of ANN was $PM10_{t-1}$, AT_{t-1}, WD_{t-1}, WS_{t-1}, RH_{t-1} and the output was $PM10_t$. Cascading-learning method of FANN library was utilized to determine ANN model parameters such as neuron count and learning rate. ANN model is slightly tended to underpredict mostly at extreme conditions but yielded better prediction results than TSMs in general. On the other hand, ANN model did not tend to overpredict as time series plots indicated. Comparing to TSMs, ANN models were very flexible in handling of model and execution, because TSMs need to be updated with new model residuals before operating on new input data in any new hour. Hence, TSMs are not tolerate any interruption on time scale as they were constructed on sequenced residual data, so their handling in real-life applications are difficult. On the other hand, ANN models obtained after training step can be used on any data with proper input vector. Therefore, we concluded that a real-life application of emergency perception strategy can be designed based on ANN models for hourly PM_{10} prediction. However, to properly tackle with extreme values of air PM_{10} levels observed during pollution episodes in winter periods in particular, some other methods such as time based hybrid models or discrete ANN models for higher levels should be considered.

COMPARISON OF CONVENTIONAL AND MICROWAVE METHOD FOR THE DETERMINATION OF ACTIVATED CARBON PRODUCTION CHARACTERISTICS FROM WILD CHESTNUT SHELL

Esra Altintig
altintig@sakarya.edu.tr

[a]*Department of Chemistry, Faculty of Art and Science, Sakarya University, TR-54187, Sakarya, Turkey*

Activated Carbon is an adsorbent material of which history is based on the ancient times and which cannot be defined with structural formula or chemical analysis and has high level of interior surface area and carbon content with higher application range. Activated carbons can be produced by several kind of agricultural waste materials with carbon content in laboratories. Even though there is not any restrictions about the raw material that will be used, cheap raw materials with high carbon content and lower inorganic structure are being preferred. Recently beside conventional pyrolysis at the activated carbon production, activated carbon was produced with microwave warming as the source of energy. [1, 2, 3].

In this study, comparison is performed with conventional method with the aim of determining the microwave activation method on activated carbon production. The most suitable conditions were determined by examining chemical activation, microwave interaction and parameters which are effective in carbonization phase. Elemental analysis, structural and morphological analysis (FTIR, SEM) surface area and pore distribution analysis were performed for the characterization of the obtained products. As the BET surface area of the activated carbon obtained by the conventional method 986.28 m^2/L, the BET surface area of the activated carbon obtained by microwave activation is calculated as 1034.42 m^2/L. Methylene blue adsorption is examined with the aim of determining the activated carbon produced at the most suitable optimum conditions by the horse chestnut shells. The results has shown that because of the high surface area and meso-porosity content microwave irradiation method is an alternative method which can be used against conventional method for the adsorbent production on the removal of the organic materials which causes contamination in the water.

COMPARISON OF DIFFERENT TEMPORAL DATA WAREHOUSES APPROACHES

Georgia GARANI

Abstract: Data warehouses are mainly used for business data analysis by querying and reporting huge collections of data. For the management of historical data, temporal data warehouses have been developed. Two current approaches for dealing with temporal data in data warehouses are compared in this paper, Object-Relational Temporal Data Warehouse (O-RTDW) model and Starnest Temporal Data Warehouse (S-TDW) model. The O-RTDW model enables data values to be associated with facts, and specifies when facts are valid, thereby providing a complete history of the data values and their changes. To accurately and completely store all data changes, the valid time should be kept at the attribute level. On the other hand, the S-TDW model uses the starnest schema for the modeling of time-varying data in dimensions. The temporal starnest schema expresses naturally hierarchy levels by the clustering of data in nested tables, with result the description of aggregation levels for a dimension in a natural way. By comparing these two temporal data warehouses models, object-oriented and nesting approaches are also compared and evaluated.

Keywords: Data Warehouse, Temporal Data Warehouse, Object-Relational Model, Starnest Schema

Introduction

Data warehouses play a critical part in the success of businesses. Decision support systems, data mining, business analysis, forecasting and product line analysis are all good examples of where data warehouses can be used.
Two IBM researchers, Barry Devlin and Paul Murphy, introduced the term 'Business Data Warehouse' in 1988 (Devlin and Murphy, 1988). It was described as a 'single logical storehouse of all the information used to report on the business'. In 1990, Ralph Kimball introduced Red Brick Warehouse, a database management system specifically for data warehousing. In the following year, 1991, a software for developing a data warehouse was built by Bill Inmon, the Prism Warehouse Manager.
Since then, a data warehouse (DW) is considered to be the main component of every business intelligence environment. It is mainly used for business data analysis by querying and reporting huge collections of data. Data in a DW must be stored in a way that is secure, reliable, easy to retrieve and to manage.
According to Bill Inmon (Inmon, 2002) a DW is "a collection of subject-oriented, integrated, non-volatile and time-variant data to support management's decisions". The non-volatile and time-variant data features of data warehousing suggest that it should allow changes to the data values without overwriting the existing values.
The main characteristics of a DW are given briefly below: A DW stores current and historical data. Stored data cannot change. Insertions, deletions and updates do not take place in a DW. Data is used only for querying and consequently, it is essential that querying performance is as high as possible.
For the management of historical data, temporal DWs have been developed. Temporal DWs use the knowledge obtained from temporal databases for the treatment of time domain. Temporal databases have built-in support for representing and managing information varying over time. They are divided in three categories, valid time databases, transaction time databases and bitemporal databases according to the type of time they support, valid time, transaction time or both respectively. Valid-time expresses the time when a fact is true in the real world and transaction-time represents the time when a fact is current in the database.
Time can be added at the tuple level in a relation and this relation is called tuple timestamping relation or at the attribute level, called attribute timestamping relation, when individual time varying attributes are timestamped. SQL has also been extended to support features introduced in temporal databases.
In this paper, two temporal DWs models are evaluated and compared, the Object-Relational Temporal Data Warehouse (O-RTDW) model and the Starnest Temporal Data Warehouse (S-TDW) model.
The O-RTDW model uses the object-relational approach for the representation of time-varying data. This model inherently groups related facts into a single row, hence allowing changes to the data value and timestamps to be kept together. Dimensions may have levels. Multivalued attributes of data type T_ATOM are used for temporal

 Copyright © International Science and Technology Conference (ISTEC)

support of a level attribute. The levels and dimensions can have many time-varying attributes stored as nested tables.
The S-TDW model uses the starnest schema for storing dimension's hierarchy. The starnest schema proposed in Garani and Helmer (2012) is based on the nested approach, where hierarchies are represented as nested tables. The starnest schema is extended in Garani, Adam and Ventzas (2016) to support time. In the temporal starnest schema every temporal dimension, i.e., dimension table dependent on time, contains time attributes for the support of time. Several queries expressed in SQL are implemented and executed using Oracle 11g in both approaches. Same data and queries are used. Execution time and result data are compared and useful results are obtained.
The remainder of the paper is structured as follows. Firstly, related research work is discussed. Afterwards, the two temporal DW models, O-RTDW model and S-TDW model are presented. The hospital's admission temporal DW case study is described in both models. Implementation issues are discussed and finally, last section concludes the paper.

Related Work

Temporal DWs have been the subject of research in recent years. In what follows, a brief description of research studies on this field is presented.
The term 'slowly changing dimensions' was introduced by Kimball (Kimball, 1996). It was used for storing slowly changing historical data. Three different techniques for dealing with attributes changing over time were proposed, either by overwriting the value, adding a dimension row, or adding a dimension column as well as a number of hybrid methods. In this research work, schema evolution and dimension updates have not been generally considered.
In Bliujute et. al. (1998) the temporal star schema proposed does not include a time dimension. Instead, every row appeared either in fact or dimension tables is timestamped which causes the increase of redundancy.
A bitemporal DW model proposed in Koncilia (2003) is an extended version of the COMET metamodel (Eder, Koncilia & Morzy, 2002). It supports valid time and transaction time both at instance and schema levels. The model allows all possible changes of schema and structure of a DW with the introduction of suitable transformation functions.
Malinowski and Zimanyi (2006) extended the conceptual multidimensional MultiDimER model for supporting valid time and transaction time. The model is suitable for representing time-varying levels, attributes and hierarchies. It distinguishes time variant elements from time invariant elements and treats them separately. The proposed model also supports DW loading time.
The bitemporal versioning of multidimensional schemas is used for defined the conceptual evolution DW model in Rechy-Ramírez and Edgard (2006). The model supports many versions with the same valid time and different transaction times. Sixteen schema evolution operators are defined for dimensions and cubes and a SQL-like language for the proposed model is also presented.
A review of issues associated to temporal data warehousing is presented in Golfarelli and Rizzi (2009). Three different topics are distinguished, handling changes in the DW, handling data changes in the data mart and handling schema changes in the data mart.
A graph based temporal semi-structured DW is presented in Combi, Oliboni & Pozzi (2009) and an appropriate query language for the modeling and querying of temporal data.
A multiversion DW management system called SysVersDW is defined in Turki, Jedidi & Bouaziz (2010). Versioning of schema and instance components is supported in the model. A number of integrity constraints are also included for data and structure consistency. The constraints presented are classified in three classes, structural constraints, temporal constraints and versioning constraints.
A new schema proposed in Garani and Helmer (2012), the starnest schema, is based on the nested approach. It is extended in (Garani, Adam, and Ventzas, 2014) for supporting time. The key component of the temporal starnest schema is the inclusion of time attributes in every dimension table depended on time.
A bitemporal DW model where both valid time and transaction time are attached to attributes is introduced by Atay and Alp in (Atay and Alp, 2016). DW objects and cubes are created with multidimensional bitemporal relational database.

Temporal Data Warehouse Models

For the management of historical data, temporal DWs have been developed for describing information changing over time. Two of the most recent proposed approaches are discussed and compared in this research work, O-RTDW and S-TDW models.

Object-Relational Temporal Data Warehouse (O-RTDW) model

The O-RTDW model uses the specifications provided by the Object-Relational model. It consists of a fact table

 Copyright © International Science and Technology Conference (ISTEC)

and several dimension tables connected to it. A dimension is composed of one or more levels, whereas each level belongs to only one dimension. O-RTDW enables data values to be associated with facts and specifies when facts were valid, thereby providing a complete history of data values and their changes. To accurately and completely store all data changes, the valid time should be kept at the attribute level. Attributes can be temporal or non-temporal. Temporal attributes consist of temporal atoms (T-ATOM). A temporal atom is defined as <valid time, value> where valid time component can be applied as a time point, a time interval, or a temporal element. Therefore, a temporal atom in the form of $<[VT_{lb}, VT_{ub}), V>$ represents valid time lower bound as VT_{lb}, valid time upper bound as VT_{ub} and data value as V, respectively. In Figure 1 the conceptual model for the O-RTDW model is shown.

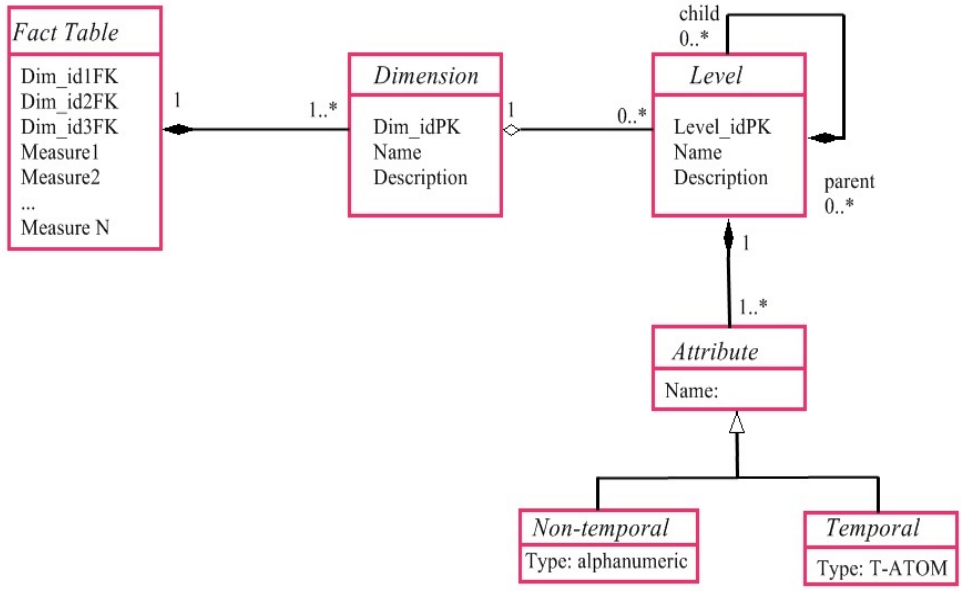

Figure 1. The conceptual model for the O-RTDW

Starnest Temporal Data Warehouse (S-TDW) model

S-TDW model uses the temporal starnest schema (Garani, Adam and Ventzas, 2014) for the modeling of time-varying data in dimensions. The starnest schema forms the integration of the star and snowflake schemas (Garani and Helmer, 2012). It expresses naturally hierarchy levels by the clustering of data in nested tables, with result the description of aggregation levels for a dimension in a natural way. It consists of a temporal fact table and a number of dimension tables. A temporal fact table can be timestamped by adding one or two time attributes representing a time point or a time interval respectively.

Dimension tables can also be timestamped similarly. Timestamped dimension tables are called temporal dimension tables. Temporal dimension tables are nested, since time attributes are inserted in a dimension in a nested way, where more detailed attributes are nested inside less detailed attributes. Therefore, dimension tables are not normalized. In each temporal dimension two valid time attributes are included, the start and stop time points of the corresponding time interval.

The fact table is linked to dimension tables with one to many relationships by foreign key attributes with a reference to the most detailed hierarchical attribute of each dimension. The conceptual model for the S-TDW model is shown in Figure 2.

 Copyright © International Science and Technology Conference (ISTEC)

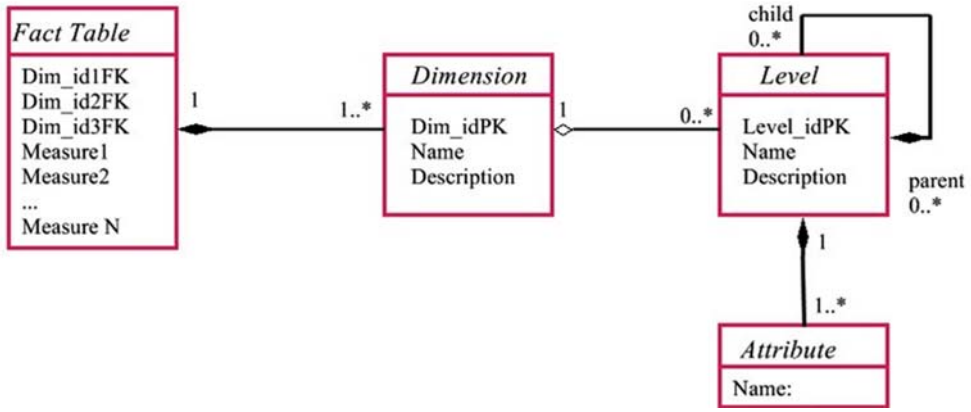

Figure 2. The conceptual model for the S-TDW

The main differences between O-RTDW and S-TDW models are presented in Table 1.

Table 1: The main differences between O-RTDW and S-TDW models

O-RTDW model	S-TDW model
Snowflake schema	Starnest schema
Object-Oriented approach	Nested approach
Temporal atom	Time attribute
Time interval	Time point (Start/Stop)

The Hospital's Admission Temporal Data Warehouse Case Study

A hospital's admission temporal DW has been used for the comparison of O-RTDW and S-TDW models. The hospital's admission temporal DW concerns the admission in the hospital of patients who suffer from different diseases and therefore, have different diagnoses and treatments.

In Figure 3 the schema of the O-RTDW model is shown. The schema is represented in snowflake format where dimension tables are split up into smaller normalized tables that express each dimension's hierarchy. Transitive functional dependencies do not exist.

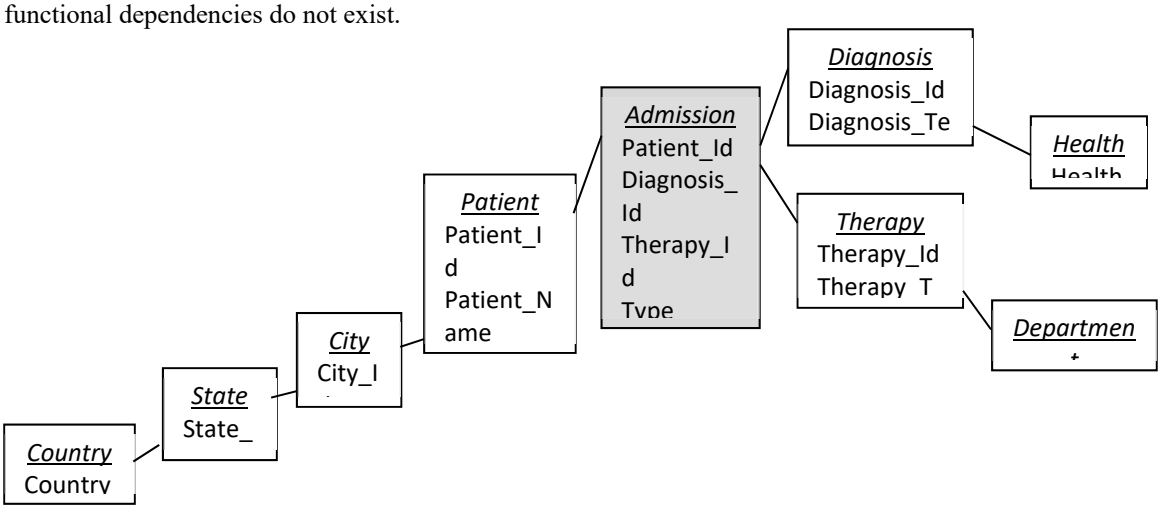

Figure 3. The schema for the O-RTDW model

Figure 4 presents the schema for the S-TDW model of the hospital's admission temporal DW. S-TDW model uses the starnest schema at the logical design. In the starnest schema a dimension's hierarchy is expressed as a nested table where hierarchy levels are expressed naturally and attributes can easily be associated within their corresponding levels. Each dimension table has a hierarchical attribute which is referred to a foreign key attribute of the fact table. The above mentioned hierarchical attribute is located in the most nested level of the dimension table.

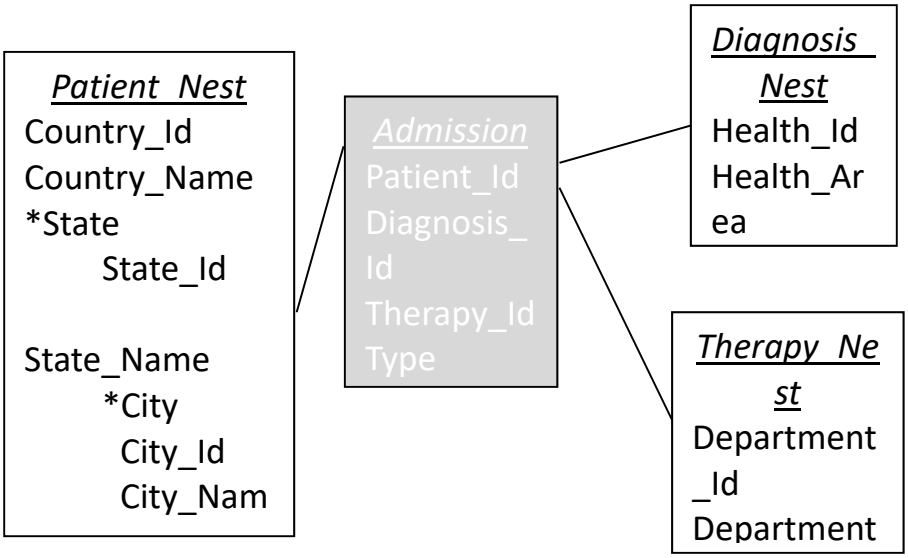

Figure 4. The schema for the S-TDW model

Figure 5 shows an instance of Patient dimension in the O-RTDW model. Address_Temporal attribute, as its name denotes, is temporal. It contains temporal atoms of the form <[VT_{lb}, VT_{ub}), V> where VT_{ub} can be either a time point representing the valid time upper bound of the corresponding time interval or 'now' denoting present time instant which increases as time advances.

PatientID	FirstName	LastName	BirthDate	Gender	Race

Figure 5. An instance of Patient dimension in the O-RTDW model

An instance of Patient dimension in the S-TDW model is presented in Figure 6. Patient dimension is a temporal dimension table since it is dependent on time. It is also nested since hierarchies in dimensions are presented as nested tables. Therefore, a temporal nested dimension table consists of hierarchical attributes, dimensional attributes and time attributes which can also be nested inside less detailed attributes. In Patient dimension *AddressDetails is a temporal nested attribute consisting of three attributes, one atomic, Address and two time attributes, AddressStart and AddressStop indicating the start and stop points of the time interval during which the corresponding address is valid.

Figure 6. An instance of Patient dimension in the S-TDW model

Implementation

All queries have been executed on an Intel(R) Core(TM) i5 processor, running at 2.3 GHz, with 2.5 GB ram memory, under Windows 7 (32bit). The DW was built in Oracle Data Warehouse builder 11.2.0.1 and Oracle SQL Developer 4.0.3 was used.

The hospital's admission temporal DW consists of 9 tables in the O-RTDW model and 4 tables in the S-TDW model. Consequently, the number of joins in the O-RTDW model is much higher than in the S-TDW model. Relationship between a dimension and the number of tables it contains is one-to-one in the S-TDW model compared to one-to-many in the O-RTDW model. Tables in both models do not contain any data redundancy. Implementation of O-RTDW approach is platform independent in comparison to S-TDW approach which is platform dependent. The disk space required is more than three times higher in the O-RTDW approach than the S-TDW approach as it is shown in Table 2. In particular, the total space for the O-RTDW model is 14.3125 Mb in comparison to the S-TDW model where it is 4.1875 Mb.

Similarly, the number of rows is much higher in the O-RTDW approach than in the S-TDW model. Specifically, O-RTDW contains about 200,000 rows while S-TDW contains about 50,000 rows.

Table 2: O-RTDW model

Table name	Schema name	Size (Mb)	Number of rows
ADMISSION_O_CUBE_TAB	Admission	4.0	48,000
ADM_DEPARTMENTS	Department	0.0625	502
THERAPY_DIMENSION_O_TABLE	Therapy	3.0	50,200

```
SELECT F1.Patient_Name, F2.Patient_Name, C1.City_Id, A1.Diagnosis_Id
FROM P_PATIENT_DIMENSION_TABLE P1, Table(P1.State) S1, Table(S1.City) C1, Table(C1.Patient) F1,
P_PATIENT_DIMENSION_TABLE P2, Table(P2.State) S2, Table(S2.City) C2, Table(C2.Patient) F2,
ADMISSION_N_CUBE_TAB A1, ADMISSION_N_CUBE_TAB A2
WHERE   F1.Patient_Id < F2.Patient_Id
AND C1.City_Id = C2.City_Id
AND ((F1.Address_Start <= F2.Address_Start AND F2.Address_Start <= F1.Address_Stop)
    OR (F2.Address_Start <= F1.Address_Start AND F1.Address_Start <= F2.Address_Stop))
AND A1.Patient_Id=F1.Patient_Id
AND A2.Patient_Id = F2.Patient_Id
AND A1.Diagnosis_Id = A2.Diagnosis_Id
```

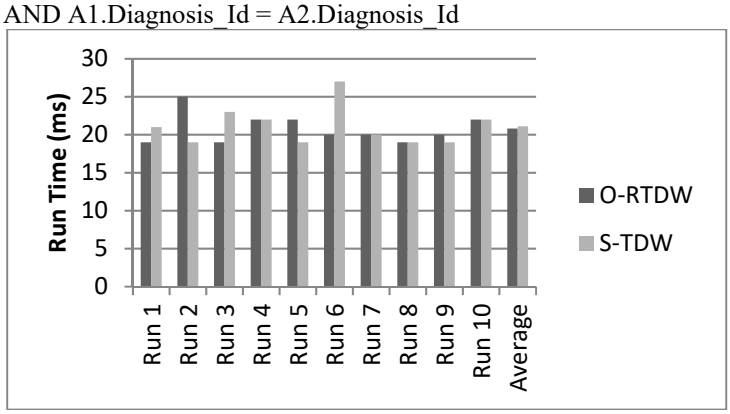

Figure 11. Query 5 run comparison chart

Overall, run times of the two approaches are similar, though S-TDW model is a little bit faster than O-RTDW as shown in Figure 12.

 Copyright © International Science and Technology Conference (ISTEC)

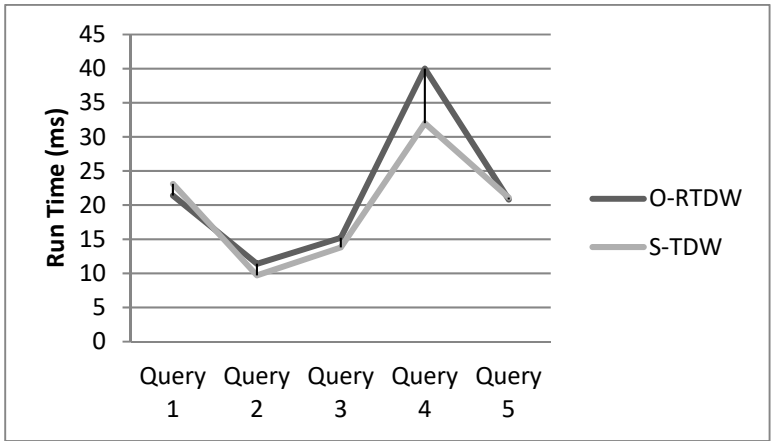

Figure 12. Queries' average run time comparison chart

Conclusion

Two current approaches for dealing with temporal data in DWs have been evaluated and compared in this research work, Object-Relational Temporal Data Warehouse (O-RTDW) model and Starnest Temporal Data Warehouse (S-TDW) model. Results showed that the S-TDW model requires significantly less space and it is a little faster on average than the O-RTDW model.

Future work includes implementation of optimization techniques for efficient evaluation of complex temporal nested queries, and the addition of transaction time to the implemented model.

COMPARISON OF SUGAR AND ORGANIC ACID CONTENTS OF TURKISH ORANGES JUICES*

Serkan SELLI

Cukurova University, Faculty of Agriculture, Department of Food Engineering, 01330, Adana, Turkey

sselli@cu.edu.tr

ABSTRACT: Two different orange juices obtained from *cvs.* Kozan Misket and Kozan Yerli were compared in terms of sugar and organic acid composition. These two parameters are important in determining the ripeness of fruits. Samples were obtained from Cukurova region of Turkey and the analysis was carried out by high-performance liquid chromatographic methods. Four organic acids (citric, ascorbic, malic and succinic acids) and three sugars (sucrose, glucose and fructose) were determined. Sucrose had the majority in sugars in both samples with the concentration of 61.02 g/l in Kozan Misket and 63.23 g/l in Kozan Yerli, respectively. With regard to organic acids, citric acid was found to be present in the largest amounts having concentration of 16.25 g/l in Kozan Misket and 15.90 g/l in Kozan Yerli in both samples.

Keywords: Orange juice, organic acid, sugar, *cv.* Kozan

Introduction

Orange, the third largest produced fruit crop after grape and apple in Turkey, is an important fruit in terms of its high nutritional value and organoleptic properties (Selli, 2011). Turkey has reached an average of 1,277,613 tonnes in orange production according to the data in FAO (FAO, 2014). It is produced mainly in southern and eastern regions of Turkey and Cukurova region is known as the main production area (Kelebek, 2011). In this region, Kozan oranges stand as a native orange variety grown in a large scale. The fruit is generally medium size and has a bright orange flesh (Kelebek, 2009). Kozan oranges are claimed to be of the best quality for processing when harvested in February and March (Selli, 2008). Important parts of oranges are consumed as fresh and the remaining parts are processed into orange juice and concentrated. Organic acids and sugars are in the group of major compounds of oranges varying to the species and environmental conditions. Their concentrations are known to have an important effect on sensory characteristics of oranges and juices (Albertini, 2006). Organic acid is a substantial criterion to ascertain the adulteration in fruits. Citric and malic acids are responsible for the majority of citrus fruits. In addition, benzoic, oxalic and succinic acids were also reported to present in trace amounts (Karadeniz, 2004). Sugars form the greater part of soluble solids in orange juice and it is reported that the sweetness of juice is pertain to the sugar composition (Kelebek, 2009). Glucose, fructose and sucrose are known as main sugars found in orange juices (Albertini, 2006). The aim of this study was to determine and compare these two important parameters in orange juices obtained from *cvs*. Kozan Yerli and Kozan Misket.

Materials and Methods

Kozan Yerli (Figure 1) and Kozan Misket (Figure 2) oranges were obtained from Kozan district of Adana province of Turkey. Oranges were used for each variety with an average of 30 kg and age of the trees as well as the maturity of oranges was paid attention to be similar for picked fruits. Sugar and titration acidity were used in the determination of maturity. The samples were extracted by cutting the fruit in half and carefully hand-squeezing in a household type electric hand juicer (Siemens MC30000, Germany) on the same day of harvesting.

 Copyright © International Science and Technology Conference (ISTEC)

Figure 1. Kozan Yerli oranges

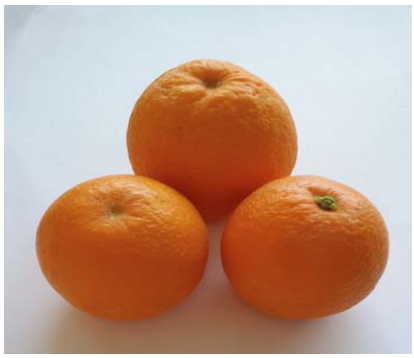

Figure 2. Kozan Misket oranges

Sugar and organic acid analyses of orange juices were carried out according to the methods of Lee and Coates (2000) with a slight modification. 100 ml sample from each variety vas centrifuged at 12000 rot/min and 4ºC, and then supernatants were passed through a 0.45 µm filter. Obtained extract was injected directly to a HPLC (LC-10A HPLC Series, Shimadzu, Kyoto, Japan) including SPD-20A UV/Vis (Shimadzu LC20AD) and RID 10A refractive index detectors. 5 mM sulfuric acid solution was used as mobile phase and flow rate is fixed as 1 ml/min.

External standard method was used in determination of sugar concentrations in samples. Calibration solutions were prepared using five different concentrations of sucrose, glucose and fructose standards and HPLC analyses were carried out. Calibration curves were obtained from the data and with the use of these curves, sugar concentrations of orange juices were determined.

Organic acid analysis was also performed with the same method using citric, ascorbic, malic and succinic acids as standards.

Results and Discussion

Sugar Composition

Sugars are one of the most significant compounds of citrus fruits. Three sugars (sucrose, glucose and fructose) were determined in the samples as displayed in Table 1. Total sugar concentration of Kozan Yerli and Kozan Misket orange juices were 126.52 g/l and 133.44 g/l respectively. Stella et al. (2011) indicated that the total sugar amounts of various ready-to-drink orange juices can change in between 95-165 g glucose/l. As Kelebek (2009) implied, three simple sugars which are sucrose, glucose and fructose are responsible for the main portion of carbohydrates in citrus fruits. It is also pointed out that these sugars form about 80% of the total soluble solids in orange juice. Kozan Yerli orange juices had the sugar composition as sucrose with an amount of 61.02 g/l, glucose with 35.16 g/l and fructose with 30.34 g/l. The sugar concentration of Kozan Misket juices was similar to Kozan Yerli including 63.23 g/l sucrose, 37.45 g/l glucose and 32.76 g/l fructose. Sucrose had the majority in sugars of both samples. As reported, the ratios of sucrose:glucose:fructose are generally about 2:1:1 (Kelebek,

 Copyright © International Science and Technology Conference (ISTEC)

2009). Our results show correlation with this information. As stated in the same study, *cv.* Kozan orange juices were found to have 59.34 g/l sucrose, 32.30 g/l glucose and 28.55 g/l fructose. Another study investigated *cv.* Dortyol orange juices specific to Turkey and determined the sugar composition as 46.60 g/l sucrose, 30.99 g/l glucose and 33.05 g/l fructose (Kelebek, 2011).

Table 1: Sugar composition of Kozan Yerli and Misket orange juices

Sugars	**Kozan Yerli**	**Kozan Misket**	**F**
Sucrose	61.02±0.03	63.23±0.23	*
Glucose	35.16±0.15	37.45±0.02	*
Fructose	30.34±0.16	32.76±0.07	*

Concentrations are given as g/l. *Significance at which means differ as shown by analysis of variance (P<0.05).

Organic Acid Composition

Citrus fruits are known for rich organic acid content. It is also reported that, organic acids and sugar contents are used for the determination of maturity and sensorial quality (Kelebek, 2011). Four organic acids (citric, ascorbic, malic and succinic acids) were separated and identified in both Kozan Yerli and Misket orange juices. As displayed in Table 2, citric acid was found to be present in the largest amounts in both samples having concentration of 16.25 g/l in Kozan Yerli and 15.90 g/l in Kozan Misket. Kelebek (2011) determined the citric acid concentration as 14.22 g/L in Dortyol orange juices. Saavedra (2001) indicated that the citric acid amount change in the range of 8.4-12.6 g/l in freshly hand-squeezed Navelina orange juices. Malic acid followed the lead with an amount of 4.01 g/L and 3.78 g/L in Kozan Yerli and Misket respectively. In the same study of Kelebek (2011), the malic acid concentration is reported to be 3.91 g/L in Dortyol variety. Acidic citrus fruits, especially oranges have high antioxidant activity resulting from the ascorbic acid concentrations. Ascorbic acids are known to be strong antioxidants and used as implication for quality of orange juices (Kelebek, 2011). In the results, Kozan Yerli is shown to have higher ascorbic acid concentration than Kozan Misket with amounts of 0.55 and 0.44 g/l respectively. Reported results show that Navel orange juices also have ascorbic acid in addition to Valencia and Dortyol orange juices. Navel orange juices are stated to have 0.49 g/l ascorbic acid, Dortyol whereas juices have 0.47 g/l and Valencia juices have 0.41 g/l of ascorbic acid (Melendez-Martinez, 2007; Selli, 2011). Ascorbic acid concentrations of different orange juices from Mediterranean region are reported to change between 0.39-0.62 g/l (Melendez-Martinez, 2007).

Table 2: Organic acid composition of samples.

Organic Acids	**Kozan Yerli**	**Kozan Misket**	**F**
Citric Acid	16.25±0.05	15.90±0.13	*
Ascorbic Acid	0.55±0.17	0.44±0.06	NI
Malic Acid	4.01±0.05	3.78±0.13	*
Succinic Acid	1.93	0.88	*

Concentrations are given as g/l. *Significance at which means differ as shown by analysis of variance (P<0.05); NI: Not important in terms of statistical analysis.

Conclusion

In present study, sugar and organic acid compositions of orange juices obtained from *cvs.* Kozan Yerli and Kozan Misket grown in from Cukurova region of Turkey were examined. The results displayed similarity between two varieties. Kozan Yerli had slightly higher organic acid while Kozan Misket had higher sugar concentration. Four organic acids (citric, ascorbic, malic and succinic acids) and three sugars (sucrose, glucose

 Copyright © International Science and Technology Conference (ISTEC)

and fructose) were determined in both varieties. Sucrose had the majority in sugars in both samples with the concentration of 61.02 g/l in Kozan Misket and 63.23 g/l in Kozan Yerli, respectively. In terms of organic acids, citric acid was found to be the abundant compound with a concentration of 16.25 g/l in Kozan Misket and 15.90 g/l in Kozan Yerli in both samples. Malic acid was found to have the second highest concentration in all samples. Organic acid and sugar composition and concentration are important in determination of quality in fruits and juices; hence this research is beneficial about orange juices. However, further investigation is advised.

COMPARISONS OF POLYPROPYLENE COMPOSITES: THE EFFECT OF COUPLING AGENT ON MECHANICAL PROPERTIES

Umit HUNER[1*]

Trakya University, Faculty of Engineering, Department of Mechanical Engineering, Edirne 22030, Turkey

umithuner@trakya.edu.tr

Abstract: The aim of this work is to compare the glass fiber (GF)/polypropylene (PP) and black rice husk (BRH)/black rice husk ash (BRHA)/polypropylene (PP) composites on mechanical properties. Tensile, flexural and falling weight impact test was conducted to investigate the effect of filler content and coupling agent (MAPP) on the mechanical properties of the BRH/BRHA/PP composites. Using a coupling agent, the mechanical properties of glass fiber reinforced material is intended to reach. By incorporating up to 10% (by weight) fillers, the tensile strength of GF/PP increased by 21%, BRH/PP and BRHA/PP were decreased by 20% and 10%, respectively, compare to neat polypropylene. Using MAPP provided to enhance the tensile strength of BRH/PP and BRHA/PP composites. And also the effect of water absorption on GF/BRH/BRHA was investigated. Results showed that increasing BRH and BRHA concentration and increasing water contact time greatly increase water absorption.

Keyword: composites, mechanical properties, FTIR, rice husk, polypropylene

Introduction

In recent years, natural filler have a potential usage for composite production. Cellulosic fibers, like wheat straw, rice husk, flax, wood in their nature, as well as, several waste cellulosic products such as husk, shell flour and wood fiber have been used as reinforcement of different plastic resins. Cellulosic material reinforced plastics, are low cost, light-weighted, have enhanced mechanical properties, and are nonhazardous (Turmanova et al., 2008; Razavi-Nouri et al., 2006; Gupta et al., 2006). Despite the advantages of natural fiber reinforced plastic composites, they have lower impact resistance, lower strength and relatively poor moisture resistance compare to synthetic fiber reinforced composites such as glass fiber reinforced plastics (GFRP) (Lee & Jang, 1999; Rozman et al., 2010). Natural fillers have hydrophilic character in their nature and this cause incompatibility between filler and matrix. Water absorption can cause degeneration of dimensional stability and micro crack can be occurred in structure. This leads to decrease of strength of composite (Arbelaiz et al., 2005; Ershad-Langroudi et al., 2008; Premalal et al., 2002; de Carvalho et al., 2012). Therefore, interface of composite should be improved by chemically or coupling agent. Coupling agent provides to enhance the bonding between filler and matrix. This causes increase of strength and reducing of water absorption value.

Recently publications give information about using of natural fillers as reinforcements in composite applications. Turmanova et al. (2008) studied water absorption and mechanical properties of polypropylene filled raw rice husk and rice husk ash. The mechanical properties like tensile strength and Young's modulus that depend on filler content were determined. They investigated the water absorption and treatment of fillers how changes the mechanical properties. Razavi-Nouri et al. (2006) studied the reinforcing effect of chopped rice husk into polypropylene. And also the effect of coupling agent MAPP was investigated. Arbelaiz et al. (2005) have reported the effects of using different coupling agent for determining the coupling effectiveness for composites. Also they compared the influence of both fiber surface and matrix modification on mechanical properties. Ershad-Langroudi et al. (2008) studied modifying the chopped rice husk reinforced PP by recycled PET. They have investigated the potential usage of rPET on composite production and how can change the mechanical/thermal properties. Two kind of form of natural filler was chosen in this study because of its special properties. Black rice husk and black rice husk ash (obtained burned rice husk). Low cost, low density, high modulus etc. are some of properties that bring about to choose these fillers. In Turkey BRH production is not much but have potential. After harvesting rice husk has no special usage as filler or something like that. Black rice husk is the outer covering of paddy and accounts for 20% of its weight (Ershad-Langroudi et al., 2008). BRHA is form of BRH that is obtained by burning the BRH. It contains higher rate of silica which is usually used as filler. Also using BRHA as reinforcement in certain polymers gives composites with better dimensional stability, toughness, as well as processing properties, and cheap process cost. This characteristic structure may not be used as waste so it should be estimated valuable technical filler.

This study aims to determine physical, mechanical and spectroscopic properties of BRH and BRHA reinforced PP composites. Therefore, tensile, bending tests, water absorption and FT-IR were carried out. The mechanical properties of the composite material obtained with natural fibers compared with neat polypropylene and glass fiber reinforced composite which is quite widely used in composite production. MAPP is used as a coupling agent on natural fiber reinforced PP to enhance the fiber-matrix interface bonding. This study was conducted to determine whether to use natural fibers instead of synthetic fibers. And also which form of rice husk more can be more effective for production compared to glass fiber reinforced composite.

Materials and method

Materials

In this study, the base resin used was S.R.L., a polypropylene homopolymer by ROM Petrol Petrochemicals with density of 0.90 g/cm³ and melt flow index of 9.36 g per 10 min (200 ^{0}C per 2.16 kg load cell). Poly-propylene-grafted maleic anhydride (PP-*g*-MA (Sigma Aldrich), MA content= 1% wt). Chopped glass fiber (E-glass) (PA2-4.5) was supplied by Cam Elyaf A.Ş. It has 10.5 µm diameter and 4.5 mm length (the nominal value from manufacturer's data sheet). And also it was treated by coupling agent silane 0.6%. The lignocellulosic material used as the reinforced filler in the composite was black rice husk (BRH) has been collected from Thrace region in Turkey at 2011 harvest time with moisture content (unseasoned) of 5.88 % according to AACC Method No: 44-15A. Rice husk was burnt in Protherm PLF 120/7 model ashing furnace at 600°C for 6 hours according to AACC Method No: 08-01. Ash content of 77.64% and average particle size of 500 µm were obtained (Anonymous, 2000). As it has been shown table 1, BRHs contain cellulose, hemicelluloses, lignin, waxes, and water-soluble substances (Turmanova et al., 2008).

Composites preparation

Rice husks were dried in a vacuum oven Ecocell 55 at 103 ±2 ^{0}C for 24 h to adjust the moisture content to 1–3% and then stored over desiccant before compounding. For this study moisture content decreased from 5.88% to 1.58%. Figure 1 shows drying and burning process.

%	93,19	3,84	0,87	0,78	0,74	0,58

Water causes lower adhesion between filler and matrix. Therefore, it should be removed from composite structure by drying process. Reinforced plastics granules were produced by single screw extruder (L/D= 28). The extruder has four zones with controlled temperature. The setting for these zones was: Z1 = 160^{0}C, Z2 = 175^{0}C, Z3 = 185^{0}C and Z4 = 185^{o}C. The screw velocity used was 55 rpm. Sheets of dimensions 180x180x4 mm^3 were prepared using a hydraulic press under a pressure of 150 kg cm^2. Tensile strength, elongation at break were recorded and calculated by automatically. And elastic modulus was calculated from tensile test data by manually.

Mechanical properties

Tensile, flexural and impact are used for determining mechanical properties of reinforced plastics. In this study, both, tensile and flexural tests were performed using an Instron Universal Testing Machine Model 8501, equipped with a 500 kg load cell, strain-gauge extensometer (Instron, model 2620) after conditioning at 23 ±2 ^{0}C according to ISO 527 standard and ASTM D790, respectively. The cross-head speed used for the type IA tensile specimens was 5 mm/min. For the Flexural test (three point bending) a specimen with nominal dimensions of 80x10x4 mm^3, a span of 32 mm and a cross-head of 1 mm/min were used (Franco-Herrera & Gonzalez, 2005). Gardner impact test was carried out using a Devostrans Drop Impact Test Machine according to ASTM standard D5420. For the test a specimen with nominal dimensions of 60x60x3.2 mm^3, striker diameter 12.70±0.10 mm and support plate inside diameter 16.26 ±0.025 mm. Three specimens of each sample were tested for tensile and flexural tests, and the average results were reported. Gardner impact test was carried out according to Bruceton Staircase Method by 20 samples for each calculated value.

TABLE 2: Formulations of the Composites in Weight Percent

Sample ID	Ingredients (%)			
	PP	GF	BRH/MAPP	BRHA/MAPP
PP	100	0	0/0	0
PPGF10	90	10	0/0	0
PPGF20	80	20	0/0	0
PPGF30	70	30	0/0	0
PPBRH10	85	0	10/5	0
PPBRH20	75	0	20/5	0
PPBRH30	65	0	30/5	0
PPBRHA10	85	0	0	10/5
PPBRHA20	75	0	0	20/5
PPBRHA30	65	0	0	30/5

Water absorption properties

Water absorption tests were carried out according to the ASTM D 570-98 method. Composite samples were immersed in distilled water in Memmert WBN 22 model water bath at 90 ^{o} C. After that samples were dried an oven for 24 h at 103±2°C. The dried specimens were weighed with a precision of 0.0001 g by Sartorius ED224S

 Copyright © International Science and Technology Conference (ISTEC)

precision balance. The samples were removed from the distilled water, dried with blotting paper, and weight values were determined. Water absorption percent was calculated using the following formula,

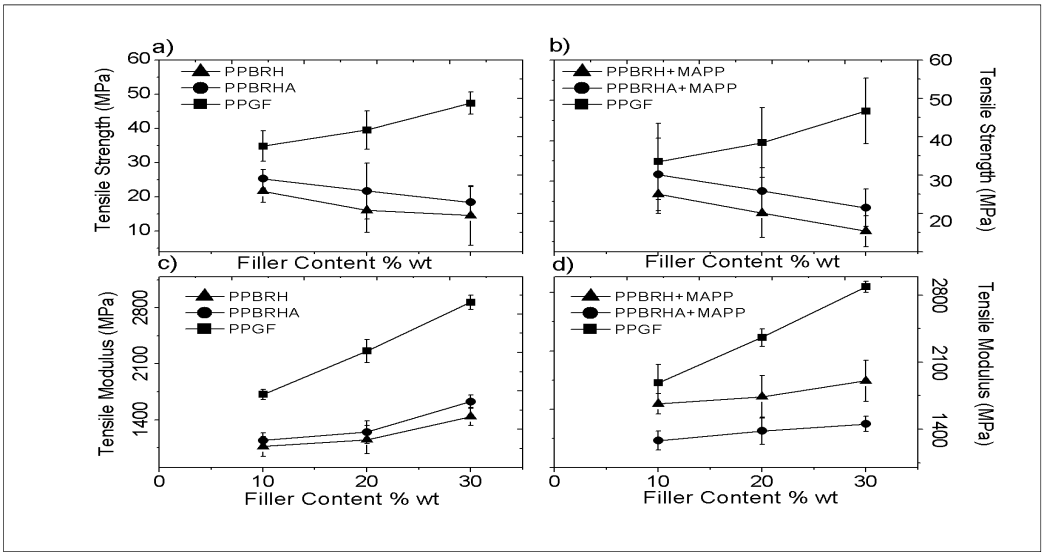
$$M\ (\%) = M_t - M_o / M_o \times 100$$

Where, M_o and M_t denote the oven-dry weight and weight after time t, respectively.

Spectroscopic characterization

Fourier transform infrared (FT-IR) spectroscopy was used to detect the presence of the functional group that exists in rice husk/rice husk ash/glass fibers. The IR spectrometer (Perkin-Elmer spectrum BX, Perkin-Elmer Canada) was used for detecting of spectra of samples. FT-IR spectra of the samples were collected in the range of 4000-400 cm^{-1} with a resolution of 4 cm^{-1}.

Morphological study



SEM was used for detecting morphology of interface of composite materials. SEM micrographs of the surfaces of impact fractured specimens were taken using a ZEISS Evo® LS 10 scanning electron microscope and FEI F50 SEM. The samples were first sputter-coated with a fine layer of gold under vacuum for 60 sec.

Results and discussion

Tensile properties

Tensile strength and modulus of PPGF composites increased by about 70% and 188%, respectively, according to neat PP at 30% filler content. Gupta et al. (2006) has reported that increase of tensile strength and modulus values reached 50% according to neat PP at same filler content. The increase of tensile strength, as a result of glass fiber incorporation, can be attributed to the good stress transfer to the glass fiber by the glass fiber-matrix interface. This good stress transfer from the polymer matrix to glass fibers leads to increase in tensile strength due to the strength of glass fiber. Figure 2 shows tensile strength and modulus of composites that depends on filler contents. Figure 3 depicts one set of BRH/BRHA reinforced composites' stress-strain graphs which have been obtained from test machine software.

The tensile strength of composites that containing PPBRH decrease by increasing filler content. At 20 % filler content, value of tensile strength reached 42% decrease according to neat PP (Tensile strength, 28 MPa). Tensile modulus of PPBRH composite had a small tendency to increase, at 20% filler content obtained value of 7% increase. Turmanova et al. (2008) has reported 14% tensile strength decrease and 5% tensile modulus increase at 20% raw rice husk content. After using MAPP, tensile strength of the PPBRH increased, and the value was obtained to be lower by 20% compared to the neat PP. The tensile modulus of PPBRH changed the upward and increased by 47% compared to reinforced PP. Tensile strength of PPBRHA decreased 21% and modulus increased 20% according to neat PP, at 20% filler content. Similar results have been reported by Turmanova et al. (2008). After incorporating MAPP, the tensile strength of PPBRHA reached similar value with neat PP. The modulus of PPBRHA decreased by 38% compared to PPBRHA without MAPP.

 Copyright © International Science and Technology Conference (ISTEC)

Figure 2. Tensile modulus and strength of composites a) tensile strength of composites depend on filler content, b) tensile strength of composites with %5 MAPP c) tensile modulus of composites depends on filler content d) tensile modulus of composites with %5 MAPP

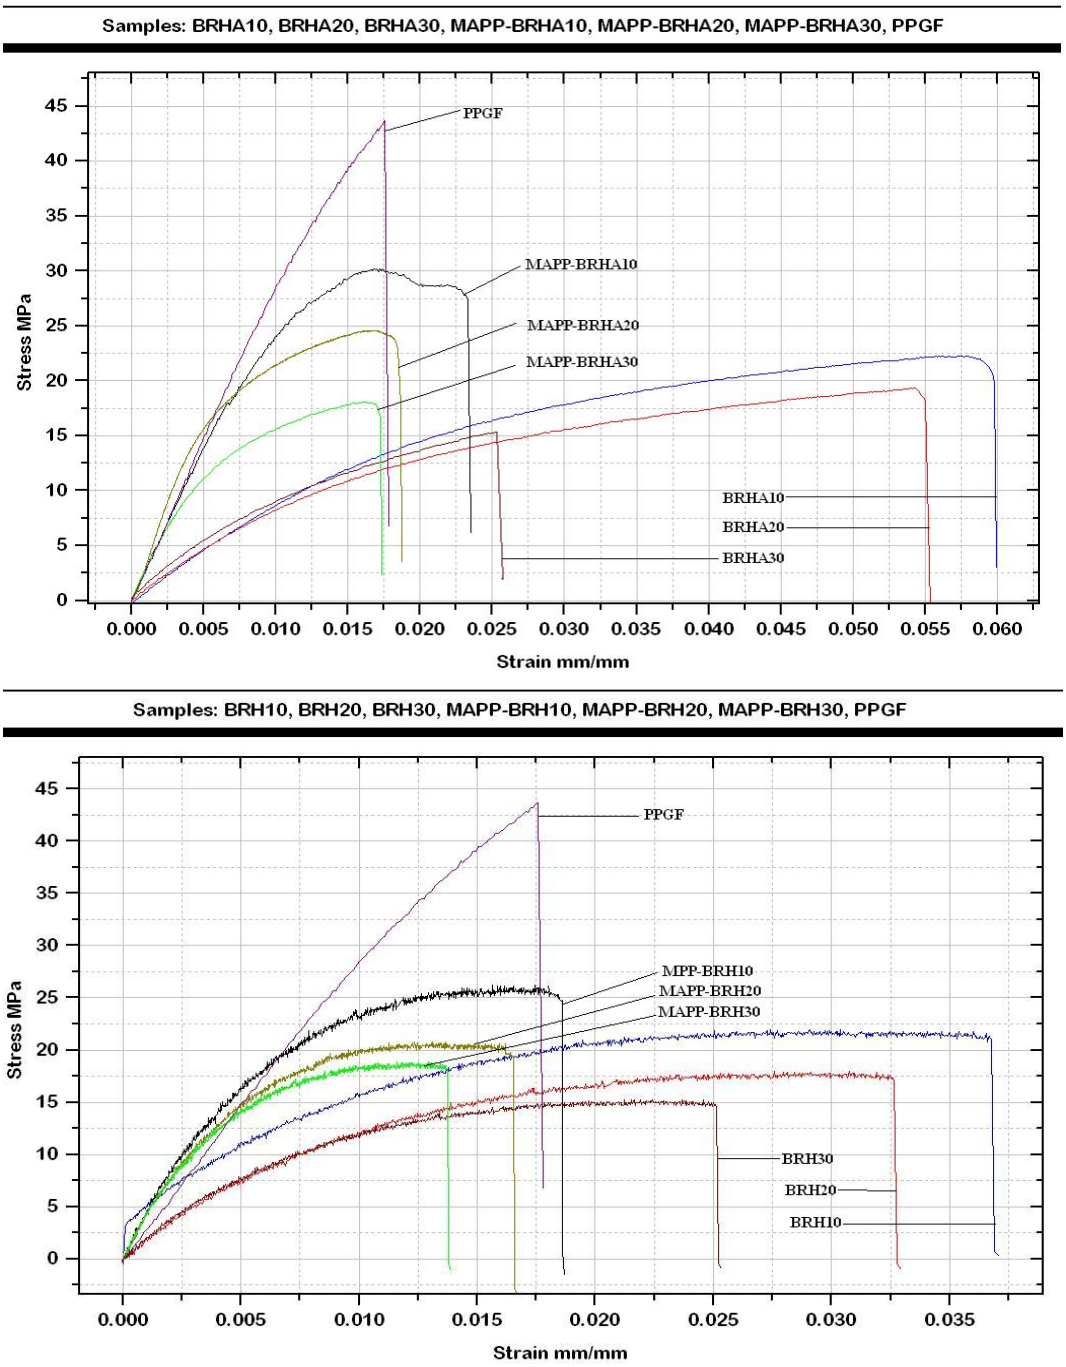


Figure 3. Stress-strain graph of BRH/BRHA composites

PPBRH and PPBRHA composites have lower tensile strength according to neat PP and PPGF composite. This mainly attributed to restricting of stress transfer by interface of composite. Weak adhesion force between filler and matrix cause not good interface bonding. It should be noted that BRHA composites have good dispersion because of its smaller size. And this provides higher strength due to better interaction between filler and matrix compared to BRH composites.

Composites had tensile moduli which tend to increase in all composition. This mainly attributed to presence of rigid filler in their structure. Fillers restrict the free motion of matrix and deformation has been avoided. This caused increase of elastic modulus with increase filler content (Crespo et al., 2008; George et al., 2001). It is

 Copyright © International Science and Technology Conference (ISTEC)

more likely the rice husk/ash acts as stress concentrators in the PP matrix. Therefore, dispersion of fillers can provide reinforcing affect due to having higher modulus than PP matrix.

Flexural Properties

It was found that although the flexural strength of BRH reinforced PP relatively remained constant, in addition to this PPBRHA increased weakly. The flexural modulus of PPBRH and PPBRHA increased by about 44% and 71%, respectively, comparing to the neat PP. Razavi-Nouri et al. (2006) has reported for BRH composites 10% and 45% increase on flexural strength and flexural modulus, respectively. And also Fuad et al. (1995) reached 40% flexural strength value at BRHA composite.

Figure 4 shows comparison of flexural strength and modulus depend on filler content of composites. PPGF composite showed the highest flexural strength and modulus by about 90% and 153%, respectively, comparison to the others. Gupta et al. (2006) has reported 63% and 258% increase for the 30% filler content. Incorporating glass fibers to polymer matrix increases the stiffness of composite. This is mainly attributed to having higher stiffness according to polymer matrix.

The MAPP is a good coupling agent that is physically stronger and has thermally stable bonds, attributed to hydrogen bonding with BRH/BRHA and chain entanglements and co-crystallization with PP (Khalil, 2008). Using MAPP enhanced the compatibility of fiber-matrix and provided to increase flexural strength and modulus. Flexural strength of BRHPP and BRHAPP increased by 10% and 29% compared to neat PP. The flexural modulus of PPBRH and PPBRHA increased by about 94% and 97%, respectively, comparing to the neat PP.

Tension, compression and shear stress occurs during the flexural loading. Failure is mainly attributed to occurring bending and shearing in bending test. Incorporating of glass fiber provides to resist the shearing of composite and this cause an increase of flexural strength (Gupta et al., 2006; Lee & Jang, 1999).

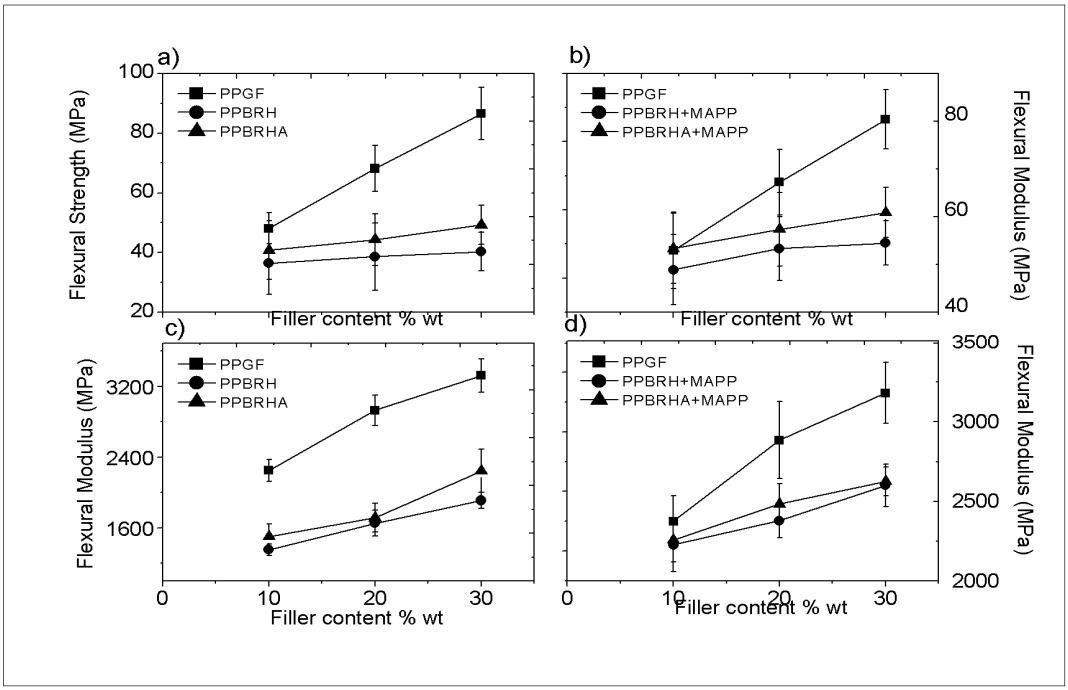

Figure 4. a) Flexural strength depends on filler content b) after using coupling agent, flexural strength-filler content c) flexural modulus without coupling agent d) flexural modulus of composites with coupling agent

Water absorption test results

PP is a non-polar polymer which has less tends to bound with water. In normal conditions, while the PP may contain 0.1% of water; at 90 degrees the water absorption value can reach 0.25 percent. The natural fillers are hydrophilic which restrict of their usage in production. The hydrophilic character of reinforcement in composites causes reduction of mechanical properties. Therefore polymers are required to undergo some operations before the additive into the matrix. Due to the high hydrophilic character of the components of natural fillers water absorption is a severe handicap for some applications of natural fiber polymer composites. Generally speaking, polypropylene hardly absorbs water due to its hydrophobic structure; however, rice husk can absorb water

 Copyright © International Science and Technology Conference (ISTEC)

because of its hydrophilic character (Rozman et al., 2010; Nourbakhsh, et al., 2011; Yang, et al., 2006; Starks & Rowland, 2003; Julson et al., 2009; Jacoby et al., 2001; Thwe & Liao, 2002).

The study reports the effect of filler type and content on water absorption value of composite. Figures 5a reveals that the water absorption increases with increase of natural filler content. And also results showed that increasing BRH and BRHA concentration and increasing water contact time greatly increased water absorption, as it can be seen in Figure 5c. Figures 5b and 5d depicts that the water uptake and BRH filler content. Because of the free OH groups contained in cellulose, PP matrix composite acts as hydrophilic structure. Therefore, the water absorption increases with increasing rate of reinforcements. Similar curves were obtained by Turmanova et al. (2008). MAPP use, while ensuring the improvement of the interface between the reinforcement and the matrix, this improvement causes a lowering of water absorption. Reason behind this is considered to be a change in the diffusion mechanism of natural reinforcements. Water molecules are transferred to micro-gaps in the polymer by diffusion mechanism. In the fiber matrix interface, the water molecules are transferred by capillary action due to the lack of wetting. And also micro cracks can be occurred during production process, this cause water transportation to the gaps. Incorporating MAPP decreases the micro gaps due to enhance the bonding mechanism between filler and matrix. So water absorption value reduces by adding coupling agent.

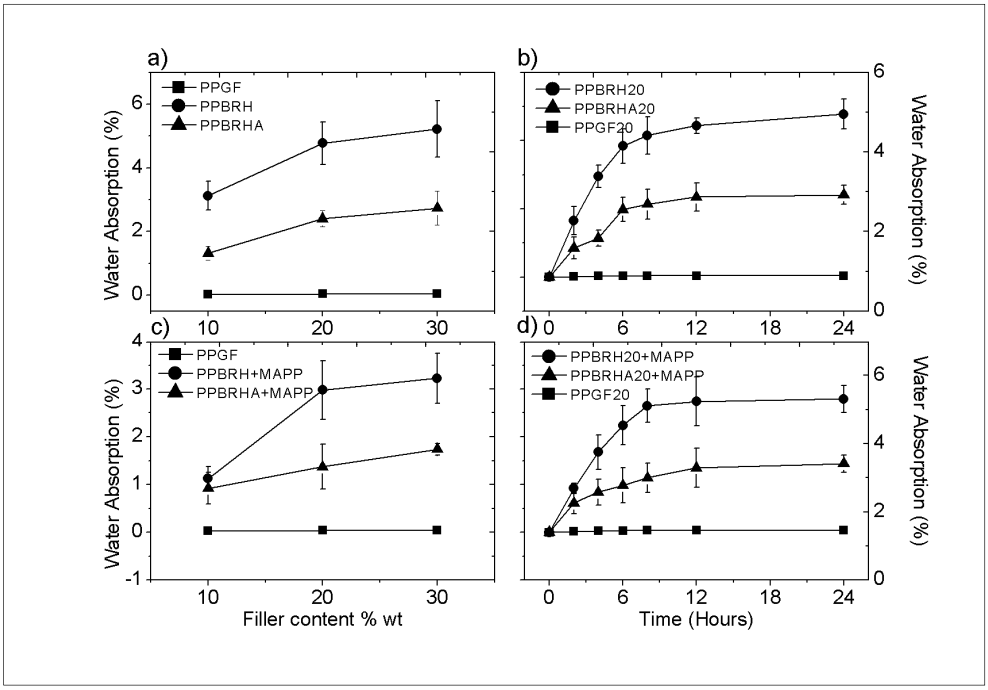

Figure 5. a) Water absorption according to filler content, b) Effect of coupling agent on water absorption, c) water absorption value at 90 ^{0}C, d) Dependences of water absorption after using coupling agent MAPP

It can be seen from Fig. 4c-d BRH20 had the highest water absorption value, PPGF20 had the lowest value. It means that the, PPGF is basically a hydrophobic polymer composite.

Gardner impact properties

Impact failures are the result of rapid crack propagation through the material. The crack's growth rate is inversely proportional to the impact resistance of the material. For a polymer to be considered as having good impact resistance, it should be able to absorb most of the impact energy and slows the rate of crack propagation (Bigg, 1987).

Gardner test is used for determining impact energy required for crack or failure on flat surface. A striker is used for impact by drop weight. Figure 6 shows the impact tester and one of the deformed 20% PPGF sample. The procedure determines the energy (mass x gravity x height) that will cause 50% of the specimens tested to fail. Incorporation of glass fibers provide to increase of impact strength. This is mainly attributed to having higher energy absorb capacity of fibers and it cause less fiber breakage and a higher residual strength to the composite (Gupta et al., 2006). PPGF composite reached maximum impact energy value at 10% filler content according to others. Lee et al. (1999) has reported the maximum impact energy at 20% glass fiber reinforced composite. Increasing glass fiber makes the composite structure more brittle and free motion of matrix chains is restricted by fibers. During the loading, matrix cannot damp the force due to less matrix transport are between fibers. This

 Copyright © International Science and Technology Conference (ISTEC)

causes decrease of impact strength of composite. Some others explained that is mainly attributed to increase in the crystallinity orientation factor of PP by GF.

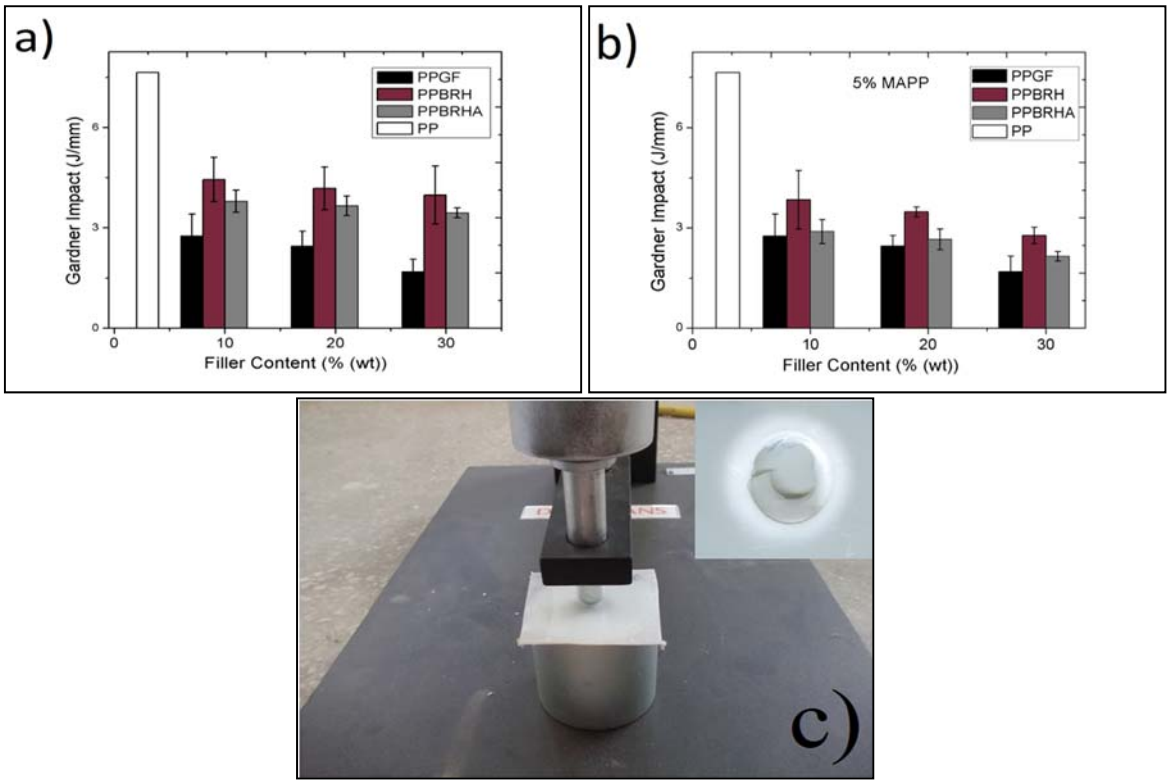

Figure 6. a) Gardner impact energy depend on filler content, b) Gardner impact energy of composites with MAPP c) test set-up

Adding BRH/BRHA filler into the polypropylene causes decrease of the impact strength. Interfacial adhesion effect the impact strength of composite. The weak bonding between filler and matrix cannot handle the energy of impact (Fuad et al., 1995). Crack moves along the weak interface. Polymer matrix cannot block the crack propagation and this cause lower impact strength. Increasing the rate of filler, increases the regions where the weak bonds and cannot prevent crack propagation.

Figure 6a) reveals that the BRH composite have higher impact strength than the BRHA composite. This may be explained higher agglomeration of BRHA that cause restriction of stress transfer to matrix. Agglomeration of the reinforcing particles has been suggested in previous studies by the effect of the adhesion forces within the composite structure (Fuad et al., 1995). BRHA particles make structure more brittle and tend to crack failure. Figure 6b) shows composites including MAPP. Adding MAPP to the structure of composite material makes the structure more brittle. Although, having stronger bond between fillers and matrix, the agglomeration of fillers is not inhibited in the composite structure. During the impact test, external mechanical energy is transferred to brittle structure of matrix and this cause a sudden damage.

Spectroscopic Results

FT-IR gives information about internal structure of composite. These curves present both PP and filler characteristic chemical bands. Figure 7 depicts that the IR spectra of filled PP. 2985-2640 cm^{-1} band give information about symmetric and asymmetric vibration of ethylene, methylene and CH groups (Turmanova et al., 2008). 1436-452 cm^{-1} have number of absorption bands (Hummel & Scholl 1968). The BRH are characterized by band between 3500 and 2700 cm^{-1}. Absorbed water and OH groups can be placed to this band. This band's position gives proof about presence of strong hydrogen bonds. 1600 cm^{-1} and 1500 cm^{-1} band give information about H_2O molecules physically adsorbed onto rice husks and C-H deformation vibrations, respectively. Siloxane bonds (Si-O-Si) bands were placed to peak at 450 cm^{-1}. Si-O network was placed to peaks between 1200 and 700 cm^{-1}. Differences between spectra of BRHA and BRH occurred at the band of 1305 and 450 cm^{-1}. This can be explained with the decrease of organic matter content and its transformation into active carbon (Turmanova et al., 2008). The bands at 1000 and 760 cm^{-1} correspond to the Si–O stretching vibration, and the bending vibration at 450 cm^{-1} appeared sharper as the organic matter was no longer present.

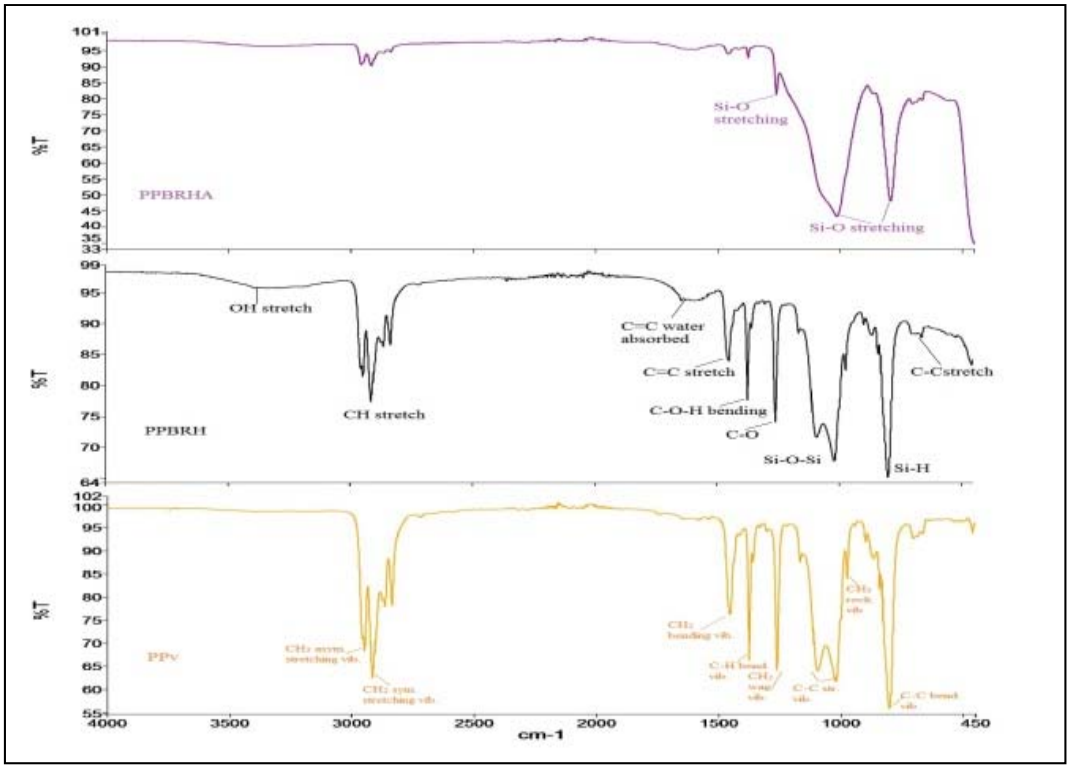

Figure 7. FTIR characterizations of composites

Morphological study of composites

Fig. 8 shows the fracture surfaces of PPGF composite after Gardner impact test. The fracture surface of matrix shows the brittle failure of PP, showing little plastic deformation resulting from fiber end (Fig. 8a). Figure 8b shows that there is a good adhesion between glass fiber and PP matrix. And also location of fibers refers a good dispersion.

Good interfacial adhesion between glass fiber and matrix enhance the stress transfer during the loading. Crack propagation is restricted by glass fiber and this cause increase of strength. Good interface between fiber and matrix also provide increase of energy absorption capacity. During impact loading, fracture propagation can be resisted by fiber-interface-matrix region (Rozman et al., 2010).

Figure 9a shows that BRHA reinforced composite have micro voids between filler and matrix. This causes poor interaction in interface. Fig. 9b reveals that presence of agglomeration on crack surface provides easy crack propagation. And also agglomeration causes lack of interfacial bonding between filler and matrix.

Figure 10a shows location of rice husk in the matrix. Figure 10b reveals that there are micro-cavities between filler and matrix due to the filler have been pulled out from polymer. These cavities result from polar-apolar incompatibility of filler-matrix. This incompatibility cause lower strength and increase of water absorption value.

Conclusion

This study reports about usage of glass fiber and rice husk/ash as reinforcement. Composite materials were prepared by incorporating of glass fiber and rice husk/ash to the PP matrix at the weight rate 10 to 30%. MAPP coupling agents have been successfully used in application as a coupling agent for various fillers. It is observed that the mechanical properties, particularly the strength of the composites are increased when MAPP is added to the system. This is because of the improved surface interaction of filler and polymer in the presence of coupling agents and the transfer of stress from one phase to the other.

The tensile and flexural strength of the glass fiber reinforced composite increased up to 30% fiber content but BRH and BRHA composite's strength decreased by filler content. The tensile and flexural modulus of composites increased with filler content. Increase rate of modulus was occurred in composite of PPGF, PPBRHA and PPBRH, respectively. BRH (10% wt) reinforced PP composite had the maximum impact energy value. Energy value decreased with filler content. The highest water absorption values were obtained in PP composites reinforced by BRH, BRHA and the lowest in glass fiber reinforced composite. Water absorption increased with the increased filler content in BRH and BRHA reinforced composites.

COMPUTERIZED ASSESSMENT OF THE ANNUAL GRADE POINTS OF SECONDARY SCHOOL SEVENTH GRADE STUDENTS IN THE COURSE OF ALGEBRA

Novruz Bashirov
novruz.bashirov@yyu.edu.tr

Development of a computerized assessment program of the annual grade points of secondary school 7th grade students at Azerbaijan in the course of algebra was considered within the scope of this study. This computer program was developed in order to prevent the occurrence of iniquities during the calculation of year-end grade point averages of all students of all grades. The program was written in the programming language of Microsoft Visual Basic 6.0. The questions presented to students by this computer program were selected from their Algebra 7 textbook which they had used along the year. By this computer program, questions from among the questions of algebra course -that would determine the knowledge level of 7th grade students- were selected and they were asked to students again within the program, and the annual grade point averages of students could be clearly calculated by high precision as per the provided answers.

The pH measurements in industry, clinical processes, and environmental monitoring are generally carried out by the use of glass electrodes. Although pH-sensitive glass electrode has distinguished response characteristics and has been in use for such a long period it has certain setbacks such as its high resistance, fragility, its instability in hydrofluoric acid or fluoride solutions and its unsuitability to serve as microelectrode for biological applications. Therefore, it is a promising area of interest to construct new PVC membrane pH electrodes based on macrocyclic compounds. For this purpose, three different pH electrodes were developed with various membrane combinations. Electrode I, II, and III were found to work in wide pH ranges 1.9 – 12.7; 1.7 – 9.5; and 1.9 – 12.4. The response time, lifetime and the selectivity of the electrodes were investigated. They were successfully employed for the determination of pH and acidity in real samples and in HF medium.

CONTRIBUTION OF PRESCHOOL EDUCATION TO SOCIAL CAPITAL GAINS

Helin ERİM ÇETİN
Teacher
Ministry of Education

Eray ÇETİN
Lecturer, Osmaniye Korkut Ata University

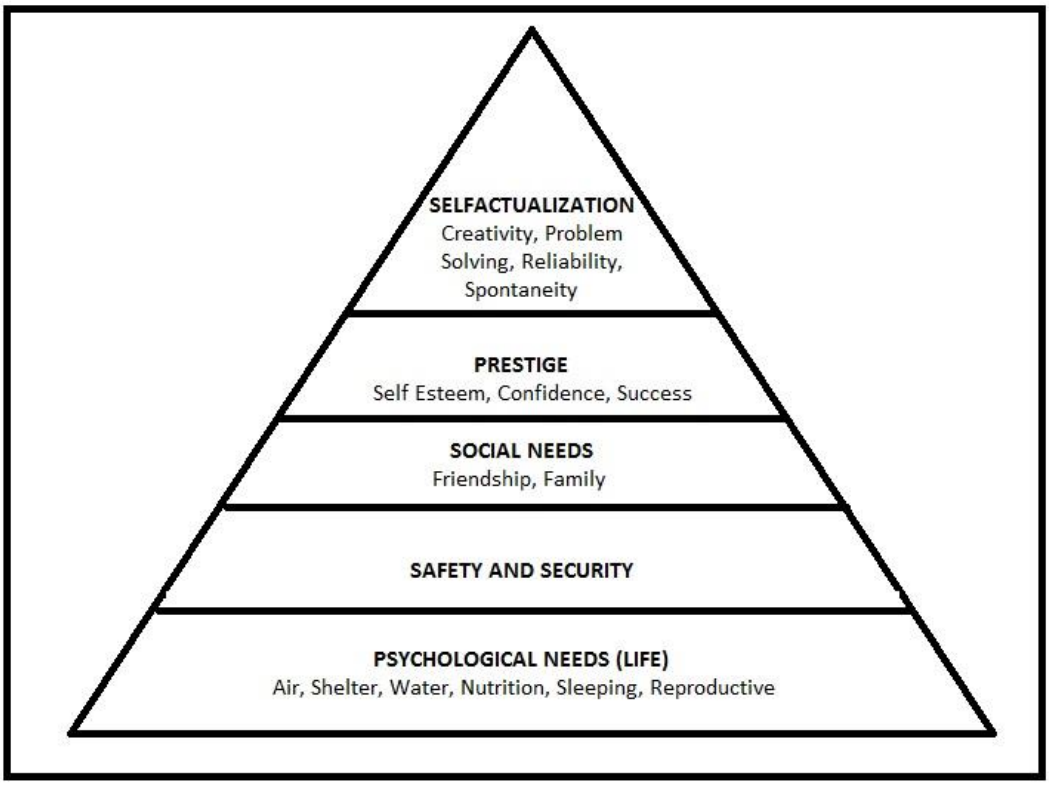
ABSTRACT

Though it is obvious that the achieved high technology and globalizations facilitates human lives today, we live on a world where individuals composing society live away from each other and socialization. It is possible to say that the social order is prone to deteriorate because lives are detached from one another in every aspect; social relationships are experienced through technology without emotions and because individuals cannot reach social capital due to these factors. Lack of social capital ,which realizes interaction among human beings and includes terms like mutual trust, communication, economic and social expectations, poses an important role on the hierarchy of needs as well.

Education, the most crucial factor of social success and development , acts as the most effective key to solve this situation. People socializing in this individual active process and in class dynamics composed through rules that are created considering physical and economic conditions become active individuals who can communicate effectively and are compatible, creative, productive and self-confident. This situation can be solved fundamentally and effectively through preschool education designed to bring up individuals with adequate social capital, for the most critical period of an individual's behavioral development is preschool period.

Keywords: Socialization, Education, Preschool, Social Capital

1. INTRODUCTION



Many changes are being experienced in both economical and social and technological fields in our country as in the whole world. Depending upon development feature, the children coming of individualism and entering into the process of socialization, cannot share an active and social environment within home environment with their parents living as addicted especially to technology. This situation shows the reflections on lives of children who are mirrors of their families in a sad picture as a social problem of today. The parents who are aware of this situation support their children to socialize by sending them Pre-School Educational Institutions where the children from the same age group can communicate with each other as of an early age. When examining Pre-School Educational Institutions whose primary purpose is socialism of children, it is seen that the purposes of these institutions and the purposes of Social Capital are considerably similar and social capital acquisition of children who took education in these Pre-School Educational Institutions are in a size that cannot be ignored.

2. SOCIAL CAPITAL CONCEPT

Human being is born, lives, dies with its basic needs and these needs are always available until it dies. At the same time, its continues this life within a social network. When we think about individual and social life of human being, hierarchy of needs ranged in stages confronts us. Human being whose needs are covered within this hierarchy, grows as an active individual who can establish positive social relations and have positive effects for its circle.

 Copyright © International Science and Technology Conference (ISTEC)

Table-1 Maslow's Hierarchy Pyramid of Needs

Source: (Ünver and Yamaçlı, 2014)

As it is seen in table; vital needs such as air, housing, water, feeding take part in the first step of hierarchy of needs. The person whose these needs are covered then tends to security and safety needs partaking in the second step and wants to cover these. In fact, we can observe that social capital begins to form as of the third step. The person whose vital and safety needs are covered, then covers its social needs. After this stage, respect and self-actualization, namely individual factors appear. Thus, the person who actualizes oneself will reach to a high level of social capital.

There are very different social capital concepts. The most important reason of it is that those who are coming from different disciplines use the social capital concept depending upon different purposes. However, there is an agreement about the emphasis laid on the function of civil norms such as social networks/participant to formal and informal voluntary organizations, understanding, trust, tolerance (Duman and Alacahan, 2011)

If we make a general definition; social capital is the rules, values, attitudes and relation networks which are regulating and managing the relations between people and contributing to economical and social development (Şahin and Ada, 2013)

3. THE DEVELOPMENT OF SOCIAL CAPITAL CONCEPT

The idea of social capital has been entreated for a long time in Europe with the purpose of providing social togetherness in basis and providing economical development in private. The idea of that social relations can be profitable and contributions can be made to these social relations for this purpose, takes part in the basis of this. In this respect, the concept of human capital has appeared in industry for the first time in 1930s, as the thought of preparing a more productive environment by protecting potential conflicts within business (Yarcı, 2011).

The first known usage of "Social capital" concept belongs to Lyda Judsen Hanifan. American reformist, educator Hanifan, developed the concept of social capital in his study named "The Rural School Community Center" performed in 1916, so as to call attention to occurence of a set of goodwill, friendship, sympathy and social relations established in relation to daily lives of people between individuals and families remaining out of economical dimension of capital but contributing to it and creating the social integrity. The concept had not come across for a long time after the first usage in Hanifan's study dated 1916. Second occurence of the concept has come across exactly forthy years later

 Copyright © International Science and Technology Conference (ISTEC)

in 1956 in J. Seeley, A. Sim and E. Loosely's study named "Crestwood Heights: A Study of the Culture of Suburban Life" in which they mentioned the important of social capital in raising of their chief magistrate. (Şan and Şimsek, 2011)

Indeed, while the concepts discussed within the framework of social capital concept have newly come to light; the new one for today's social capital discussions is to comprehend how importance the social capital is for functionality of social life and to conceptualize within this frame (Yarcı, 2011).

4. SOCIAL CAPITAL FORMATION AND PRE-SCHOOL EDUCATION

Educational organizations are people-intensive organizations. In a word, they are organizations in which educational outputs occur as a result of interaction of people. In educational organizations, cognitive activities are mainly conducted differently from business organizations. This situation emphasizes the human factor and increases more the importance of social capital. Even if a lot of variables such as student features, environment conditions, socio-economical states of students, the number of people in family are considered, these cannot explain the differences of success between schools efficiently. (Şahin and Ada, 2013)

We can handle the social capital formation via two different frames. First one of them is social capital acquisition obtained by person from familial and environmental factors; second one is social capital acquisition obtained by person from school education. In relation to family, the factors affecting the social capital acquisition of person are; financial status namely income level of family that the person belongs to, educational status of parents. Apart from these two important factors, some factors such as intra-family communication, the structure of family, the position of family in society are important for social capital formation of person. School period is the period where social capital formation of person gains acceleration and may be person obtains the most important and most basic acquisition throughout its life.

Child interacts with the group via the pre-school education which is the first step that the child meets with the school and socializes in direction of this group's rules. This interaction that the child enters in the early period will create a permanent experience in child's life. In our country, the purposes of pre-school education in Regulation on Pre-School Education Institutions formed depending upon the application of national education, are ranged as follows;

- Providing children to gain body, mind and emotion development and good habits,
- Providing children to speak correctly and well, and therefore providing to express themselves in a more efficient way,
- Bringing children in some emotions such as love, respect, responsibility, tolerance, cooperation, solidarity and sharing,
- Bringing children in attitudes to be able to describe their imaginations, creative and critical thinking skills, communication and emotions

.

In direction of these principles, the children coming from different sociocultural and different socioeconomical structures meet with each other, they experience an effective process between each other with the rules created by considering physical structure and values of the class under the pre-school teacher's guidance.

This interaction bears a considerable resemblance to social capital. When social capital is examined, there are three compounds in direction of the general definition.

- Social networks; who knows who,
- Social norms; formal and informal rules determining how the network members act each other,
- Sanctions; the processes that will provide members to comply with the rules (Kenar, 2004).

 Copyright © International Science and Technology Conference (ISTEC)

SOCIAL NETWORKS (NETWORK; WHO KNOWS WHO)	The children coming to pre-school educational institutions, know each other via entertaining activities. After then, it is measured whether they know their friends or not. Children are informed about different features of their friends in group and it is provided they interiorize these and are guided to act more sensitively about them. In this way, a strong base is prepared for a successful intragroup interaction.
SOCIAL NORMS (FORMAL AND INFORMAL RULES DETERMINING HOW THE NETWORK MEMBERS ACT EACH OTHER)	It is provided that children study within the studies performed under the teacher's guidance in class environment created by considering physical features of group and class without entering each other's application area and restricting each other's application and at the same time coordinately. So as to create and sustain such an efficient learning environment; intraclass rules are created together with the children and it is guided the children to comply with these rules and create a positive and permanent group dynamic.
SANCTIONS (THE PROCESSES THAT WILL PROVIDE MEMBERS TO COMPLY WITH THE RULES)	Physical environment of the class is designed by considering the rules created together with the children. These rules agreed upon orally are symbolized and exhibited visually in the class; it is guided group and individual attitudes to be actualized in frame of created norms. In activities performed during the day, it is provided an appropriate flow for the planning by effectively applying the rules created to protect the class order.

As it is understood from the table, social capital compounds bear a considerable resemblance to pre-school educational applications. The social capital that the person has throughout its life begins as of the moment of person's birth and these acquisition continues along its life. The part of pre-school education in this process is large that cannot be ignored. In this period, the person begins to meet with society and social rules, and increases the size and diversity of its acquisition by taking an active role within society. The experiences which is the most important factor of social capital, obtained by the person in pre-school educational institutions; are quite important because of creating a base for the experiences to be obtained throughout the life.

5. RESULT

Life is a whole of complex networks connected to each other. Socialization is a concept in the world which is continuously changing and developing in all fields, sometimes looses its importance and sometimes does not loose its importance in spite of many concepts whose importances increase. Its importance is high especially for people. The individual entering into a social environment as of its birth, will be in this environment until the end of its life. The individual is born with a lot of needs; physiological needs, safety and security needs, social needs, reputation need and self-actualization need. Social factors come into prominence in the needs after the physiological and basic trust needs are covered; and as long as these needs are covered, social acquisition of individual and accordingly social capital increase. Because the strongest bases are established of social capital whose importance level is so high and the biggest acquisition are gained in pre-school educational institutions; staff of these institutions have to have the awareness of creating a social capital and knowledge about the matter in depth. So as to provide this; it is necessary to do researches about social capital in higher educational institutions where the teachers are trained in the role of being educator taking charge in pre-school education, and provide them to have the necessary equipment by increasing teacher candidates' information levels about this matter in both theoretically and practically.

It should not be forgotten that the individuals comprising a socially strong society must have an efficient social capital. Awareness levels should be high of teachers working in pre-school education where the bases of social capital acquisition are established and they have to guide the individuals by

 Copyright © International Science and Technology Conference (ISTEC)

considering this acquisition in their studies. In these institutions where the most efficient bases of social capital are established, teachers should extend their working area by being aware of this responsibility.

hakanc@akdeniz.edu.tr

Abstract: Budget and time limits are exceeded in Information Technologies Projects which results in being unable to complete them at the desired level or being completely unsuccessful. To prevent these failures and complete the project in the planned way, some definitions were made such as critical success factors. This is a review study which analyzes the research that identifies critical success factors in information technologies project management. These studies were evaluated under two categories consisting of theoretical and experimental. When Critical Success Factors obtained as a result of the study are conducted in information technologies projects, they increase the achievement possibility of these projects and prevent companies and countries from wasting millions of dollars.

Keywords: Information Technologies, Critical Success Factors, Project Management

BİLİŞİM TEKNOLOJİLERİ PROJELERİNDE KRİTİK BAŞARI FAKTÖRLERİ

Öz: Bilişim Teknolojileri Projelerinde bütçe ve süre sınırları aşılarak proje istenen seviyede gerçekleştirilememekte ya da tamamen başarısızlıkla sonuçlanabilmektedir. Bu başarısızlıkların önüne geçebilmek ve projeyi istenilen anlamda tamamlayabilmek için kritik başarı faktörleri gibi bazı tanımlamalar geliştirilmiştir. Bu çalışma bir derleme çalışması olup bilişim teknoloji projelerinde kritik başarı faktörlerini belirleyen çalışmaları ortaya koymaktadır. Yapılan çalışmalar teorik ve deneysel olmak üzere iki kategori altında değerlendirilmiştir. Çalışmalar sonucunda elde edilen Kritik Başarı Faktörleri bilişim teknoloji projelerinde uygulandığında projelerin başarıya ulaşma olasılığının artarak şirketlerin ve ülkelerin milyonlarca dolar kaybetmesinin önüne geçilebilecektir.

Anahtar Kelimeler: Bilişim Teknolojileri, Kritik Başarı Faktörleri, Proje Yönetimi

Giriş

Günlük hayatımızı etkileyen etkenlerden biri haline gelen bilişim teknolojileri, bilginin toplanması, saklanması, işlenmesi, iletilmesi gibi faaliyetleri yürütmemize olanak sağlamaktadır. İşletmeler bilişim teknolojilerini iş süreçlerini hızlandırmada, verilerini kayıt altına alarak ileriye yönelik karar almada, maliyetleri düşürmede ve performansı artırmada aktif olarak kullanmaktadır. Rekabetin üst düzeyde yaşandığı ticari hayatta, işletmeler yeni ürün geliştirme, ürünü piyasa da tutundurma ve sürekliliğini sağlama gibi işlemleri bilişim teknolojilerinin sağladığı esnek hareket edebilme özelliğini kullanarak gerçekleştirmektedirler. İfade edilen bu özelliklerden dolayı bilişim teknolojileri organizasyonların vazgeçilmez bir unsuru haline geldiği gibi üretilen projelerin nerede ise tamamı bilişim teknolojileri ile temas etmektedir.

Uluslararası Standish Grup tarafından yayınlanan CHAOS raporlarını analiz ettiğimizde bilişim teknolojilerinin projelerde uygulanması ile projelerde elde edilen başarı oranlarının 1994-2009 arasında her geçen yıl azda olsa arttığı görülmektedir. 1994 verilerine göre üretilen projelerin yalnızca %16,2'sinin istenilen seviyede tamamlandığı,

 Copyright © International Science and Technology Conference (ISTEC)

%31,1'inin tamamlanmadan projeden vazgeçildiği bildirilmektedir. Ayrıca projelerin %52,7'sininde tahmin edilen maliyetin ve sürenin aşılarak tamamlandığı ifade edilirken, 2009 verilerinde ise başarılı proje oranı %32, Vazgeçilen proje oranı %44 ve başarısızlıkla sonuçlanan proje oranı ise %24'lerde olduğu belirtilmektedir. 2015 yılı verilerine bakıldığında ise 2010'dan itibaren başarılı olan proje oranlarında biraz düşüş yaşarken vazgeçilen proje oranlarında bir artış olmuştur. Buna göre 2015 yılında projelerin %29'unun başarılı olduğu, %52'sinden vazgeçildiği ve %19'unun ise başarısızlık ile sonuçlandığı rapor edilmektedir.

Aynı konu üzerine Gartner Institute'un yapmış olduğu araştırmada bilişim teknolojileri projelerinin %74'ünün başarısız olduğu ya da maliyet/zaman hedeflerini aştığı, %51'nin bütçelerini %200'lere varan oranda aştığı ve ürün olarak ortaya çıkan sonuçların beklentileri %75 oranın da karşılayabildiği rapor edilmiştir (TBD, 2008).

International Data Corporation (IDC) tarafından bilişim teknoloji projelerinin başarısızlık sebepleri üzerine yaptığı araştırmada ise %32 ile Proje Yönetimi Becerilerinin Yetersizliği, %20 ile İletişim Sorunları, %17 ile Doğru tanımlanmamış hedefler, %17 Kapsama Yabancılık ve %14 ile Yeni Teknolojiye Uyum Sorunu bilişim projelerinin başarısızlık sebepleri olarak sıralanmaktadır. Başarısızlık ile sonuçlanan projelerin 2004 yılı öncesinde global ekonomiye yıllık zararı yaklaşık 1 milyar dolar civarındadır (Xia & Lee, 2004). Standish Group 'un 2014 verilerine göre ise sadece Amerika Birleşik Devletlerinde bilişim teknolojileri temelli yıllık projelerde 250 milyar doların üzerinde bir harcama yapılmaktadır.

Projelerde yaşanan bu sıkıntıların temelinde planlama ve kontrol mekanizmalarının etkin bir şekilde yapılamaması gelmektedir. Bu süreçlerin proje paydaşları ile beraber etkin bir şekilde yönetilmesi işlemi proje yönetimi ile sağlanmaktadır (Alıç ve Durdu, 2015). Proje yönetiminde CMMI, PRINCE ve SPICE gibi yol gösterici nitelikte olan metodolojiler kullanılmaktadır. Burada ki amaç projenin planlanmasını, programlanmasını ve kontrolünü sağlamaktır.

Proje Yönetimi

Küresel ilerlemenin temeli haline gelen projeler, kurulmuş ve tanımlanmış bir hedefe ulaşmak için belirli bir zaman süresi içinde sürdürülen faaliyetler bütünüdür (Kerzner, 2006). Proje Yönetim Enstitüsünün tanımına göre proje, "özgün bir ürün, hizmet ya da sonuç yaratmak için yürütülen geçici bir girişimdir" (PMI, 2013). Proje tanımlarını genel bir çerçeveye oturtacak olursak proje, sıradan olmayan orijinal ve bir defaya mahsus belirli zaman, kaynak, bütçe ve performans ile sınırlı çabalar bütünüdür denilebilir.

Bir projeden söz edebilmemiz için proje fikrinin bir yaklaşımının, amacının, içeriğinin, yürütücüsünün, sorumlusunun, süresinin, faaliyetlerinin, planının, kaynağının, bütçesinin ve değerlendirmesinin olması ve çalışmalar haline getirilmesi gerekmektedir. Üretilen proje büyük, küçük veya karmaşık olursa olsun mutlaka bünyesinde amacı, zamanı, özgünlüğü ve kaynağı barındırmalıdır.

Üretilen projelerin başarıya ulaşabilmesi için projeyi oluşturan etkenlerin sistematik bir şekilde planlamasının yapılması gerekmektedir. Planlanma ise proje yönetimi anlayışı ile gerçekleştirilmektedir. Proje yönetimi, varılmak istenen hedefe doğru giderken kullanılan beşeri ve maddi kaynakların planlanması, örgütlenmesi, yürütülmesi ve denetlenmesi çalışmalarıdır (Kutlu, 2001). Proje yönetimi, tanımlanan işi en kısa zamanda, en düşük maliyette ve hedeflenen kalitede gerçekleştirmek demektir.

Proje Yönetiminin temel basamakları;

- Projenin tanımlanması
- Çözüm yöntem(ler)inin saptanması
- Çözümün uygulanması
- Projenin kontrolü

şeklinde ifade edilmektedir. Project Management Institute (PMI) kuruluşu ise proje yönetimini altı temel bölüme ayırmıştır ve bunları ağırlıklandırmıştır. Buna göre; (Project Management Institute, 2013)

- Projenin Başlatılması - %8,5
- Projenin Planlanması- %23,5

Bilişim teknolojilerinin uygulandığı projelerde nokta hedefler ile gerçekleştirilenler arasında uyumun denetlenmesinde en önemli adımlar uygulama ve kontrol adımlarıdır.

Lewis (1995) ise proje yönetim sistemini yedi adımdan oluşturmaktadır. Bu adımlardan herhangi birisinde olumsuzluğun olması durumunda bütün projeyi olumsuz etkileneceğini ifade etmektedir.

Şekil 1. Proje Yönetim Sistemi

Şekil 1'de belirtilen şekilde en önemli basamak insan basamağı olmakla birlikte bütün sistem denetleme basamağı üzerine odaklanmaktadır.

Proje Yönetiminin Tarihçesi

Aşağıdaki açıklamaların ortaya koyacağı gibi, proje yönetiminin geçmişi çok da eskiye dayanmamaktadır. Bununla birlikte bazı çevreler Mısır'ın sulama kanalları ve piramitleri, Çin Seddi, Babil'in Asma Bahçeleri'nin önemli birer proje olduğu görüşündedir. Ancak bu yapıtlarla ilgili proje bilgilerinin korunmamış olmaları nedeniyle "Proje Yönetimi" nin bir disiplin olarak ne zaman ortaya çıktığı konusunda kesin ifadeler söylenememektedir.

Proje yönetimi ile ilgili ilk bilimsel çalışma Frederick Taylor (1856-1915) tarafından 1900'lerin başında başlatılmıştır. Bilimsel olarak yönetim tekniklerinin analiz edilebileceğini ve geliştirilebileceğini göstermiştir. Proje izleme ve değerlendirme yöntemlerinden olan PERT (Program Evaluation and Review Techniques) ve CPM (Critical Path Method) in esasını oluşturan "Gantt Şemaları (grafikleri, çizelgeleri)" nı geliştiren Henry L. Gant (1917) bilimsel yöntem akımının ilklerindendir. Bu yöntemler sayesinde projelerin gidişatlarının izlenmesi kolaylaşmış, "zaman (süre)" daha iyi yönetilmeye başlanmıştır. Kökeninin 1900'lü yıllarının başına kadar gittiği görülmekle birlikte proje yönetiminin 1941 yılında tasarlanan Atom bombasının geliştirildiği Manhattan Projesi ile başladığı kabul edilmektedir. ABD'nin dünyayı hâkimiyetinin altında yatan nedenlerden biri, kritik zamanlarda kritik projelerde başarılı olmasıdır. Proje yönetiminin bugünkü modern formunu almaya başlaması ise daha yenidir.

Türkiye'de proje yönetiminin tarihi 1960'larda inşaat sektörü ile başlamıştır. Savunma sanayinde yaşanan ilerlemeler proje yönetimini kaçınılmaz hale getirmiştir. Bilişim Sektöründe ise inşaat sektörü ile aynı yıllarda proje yönetimi uygulanmaya başlanmıştır.

Proje Yönetiminin Yaygınlaşmasının Nedenleri

Proje yönetiminin son yıllarda yaygınlaşmasının nedenlerinden bazıları aşağıda sıralanmıştır (Duman, 2009).

- İşletmelerde insan kaynağının azalmasına rağmen ortaya konulan işlerin niteliğinde ve kalitesinde artışın sağlanması,
- Projelerin daha kapsamlı olması,
- Küreselleşme kaynaklı gelişen rekabet ortamı,
- İletişimin kolaylaşması,
- Müşterilerin etkisinin artması,
- Çok uluslu işletmelerin ve işlemlerin gelişmesi ile merkezden yönetim isteğinin artması,

Proje Yönetiminde Başarı

- Kurumsal strateji ile uyumlu bir proje yönetim metodolojisinin uygulanmasına
- Bu metodolojiyi uygulayacak beceriye sahip proje yöneticisine
- Proje yönetim felsefesine yatkın organizasyonel yapıya doğrudan bağlıdır.

 Copyright © International Science and Technology Conference (ISTEC)

Projelerin başarılı olmasını sağlayan etmenler incelendiğinde projelerde başarısızlık nedenleri kendiliğinden ortaya çıktığı görülmektedir.

- Kötü tanımlanan hedefler ve ihtiyaçlar
- Proje yönetim metodolojisinin uygulanmayışı veya kötü uygulanması
- Kültürel farklılıklar
- Yönetimin proje ekibini desteklememesi
- Planlama sürecinde yetersizlik, etkisizlik
- Risk yönetimi yapılmaması ya da eksikliği
- Değişiklik yönetimi yapılmaması ya da eksikliği
- Proje yöneticisinin yetersizliği

Projenin Başarısına Etki Eden Faktörler

Proje yönetiminde kaynak kullanımı, bütçeleme, çizelgeleme, iletişim ve problemlerin çözüm önerilerini ilgilendiren kararlar verilecektir. Stratejik amaçlar ve hedefler belirlenerek proje yöneticisi öncelikli olarak kritik işlerin üzerine odaklanır. Kritik olan işlemlerin hangisi veya hangileri olduğu projenin basamaklarına göre değişecektir.

Projenin başarısına etki eden faktörler üzerine birçok çalışma yapılmış olup bu çalışmalardan biride Pinto ve Slevin(1987)'in proje başarısına etki eden faktörleri belirlediği çalışmadır. Çalışmada proje başarı faktörleri 10 madde de sıralamıştır;

1. **Proje amaç ve hedefleri**: Projelerde belirlenen amaçlara ulaşabilmek için hedeflerin ve hedefleri değerlendirmede kullanılan performans kriterlerinin iyi tanımlanmış olması gerekmektedir. Ayrıca proje amaç ve hedefleri misyonu iyi yansıtmalıdır.
2. **Üst Yönetimin Desteği**: Proje süreci içerisin de iç ve dış paydaşların projeyi sahiplenebilmesi için üst yönetimin kuvvetli bir irade göstermesi gerekmektedir. Üst yönetimin desteği proje içinde oluşabilecek belirsizlikleri ve tıkanıkları aşmada önemli etkenlerden birisi olacaktır. Proje yönetimi ile üst yönetimin ahenk içerisinde çalışması projenin başarısını üst seviyelere doğru çıkaracaktır.
3. **Proje Planlaması**: Projenin belirlenen amaç veya amaçlara ulaşabilmesi hedeflere ve performans kriterlerine bağlıdır. Hedeflerin ve performans kriterlerinin işletilmesi planlamanın iyi yapılması ile doğrudan ilgilidir. Bundan dolayı proje başarısını etkileyen faktörlerden en önemlilerinden biriside planlamanın iyi yapılmasına bağlıdır.
4. **Müşteriye Danışma**: Projenin başarıya ulaşıp ulaşmadığının değerlendirecek asıl kişiler projenin faydalanıcısı olan müşterilerdir. Müşterilerin reaksiyonları projenin başarılı olup olmadığının en önemli göstergeleridir. Bundan dolayı müşterilerin istekleri projenin planlama aşamasında amaç ve hedeflerin belirlenmesinde mutlaka değerlendirmeye alınmalıdır. Proje sürecinde ve sonraki revizyonlarda mutlaka müşteriye danışılmalı böylelikle oluşabilecek hatalar minimize edilmeli proje başarısı artırılmalıdır.
5. **Personel ile ilgili konular**: Proje başarısının etkileyen bir diğer faktör ise proje personelinin diğer paydaşlar ile ilişkisidir. Proje personelinin müşteri, şirket içi ve dışı paydaşlar gibi personeller ile ilişkileri iyi organize edilmediğinde ise proje sürecinde motivasyonu aşağılara çekecek ve belirlenen amaç ve hedeflerden sapılarak projenin başarısına olumsuz katkı sağlayacaktır.
6. **Teknik Konular**: Proje içerisinde yer alan personelin yetenekleri doğrultusunda görevlendirilmeleri proje yöneticisinin sorumluluğundadır. Her türlü teknik konuda yaşanabilecek problem veya problemler projenin başarısını etkileyerek olumsuzluklara sebep olabilir.
7. **Müşteri Kabulü**: Projenin başarısının sağlanması asıl değerlendirici olan müşterinin projeyi kabul etme oranına bağlıdır. Müşterinin projeyi kabullenmesi proje süreci içeresinde devamlı olarak müşterinin görüşlerini almak ile doğrudan ilişkilidir.
8. **Proje Kontrolü**: Proje sürecinin değerlendirilmesinde sürekli bilgi akışının önemi yadsınamaz bir gerçekliktir. Geri bildirim olarak ifade edilen projenin sürekli değerlendirilmesi projeyi tehlikeye atacak ya da başarısızlıklara sebep olacak sorunların erken tespit edilmesini sağlamada önemli bir faktördür. Projede ve hedeflerde elde edilen geri bildirimler sonucunda değişiklikler yapılabilir ve böylelikle projenin başarıya ulaşmasında önemli adımlar atılmış olabilir.
9. **İletişim**: Projenin bütün aşamalarında ve katılanlar arasında uyum ve bilgi akışının olması gerekmektedir. Proje çalışmalarında hiyerarşik yapı iyi tanımlanmış ise çalışanlar ve müşteriler arasındaki iletişim daha problemsiz olabilir. Projede kullanılacak iletişim kanalları önceden belirlenmeli ve problem karşısında da alternatif iletişim kanallarını tercih edilmelidir.
10. **Problem giderme**: Projede oluşturulacak olan kontrol paneli ile problem alanlarının tespiti daha kolay olacaktır. Problem teşhisi ve hangi aşamada olduğu ile alakalı tespitler yapılmalıdır. Her türlü sorun ve problem karşısında alternatif planlar yapılmalı ve çözümü için hazırlanan planlar devreye sokulmalıdır, bu şekilde problemlerin çözümü için optimum tasarruf sağlanabilir.

Bilişim Teknolojileri Projelerinde Kritik Başarı Faktörleri

Bilişim teknolojileri projelerinin başarısını artırmak için oluşturulan faktörlere başarı faktörleri denilmektedir (Olson, D.L., 2000). Başarı faktörleri uygulanan projenin türüne göre farklılık gösterebilmektedir. Farklılıklar olsa da projelerde üst yönetimin desteği ve tanımlanan hedef faktörler önemli olarak değerlendirilmektedir.

Kritik başarı faktörleri ve başarı kriterleri birbirinden farklı kavramlar olarak karşımıza çıkmaktadırlar. Başarı kriterleri projenin başarılı ya da başarısız olduğunun değerlendirmesinde kullanılırken başarı faktörleri, projeyi başarıya götüren girdiler olarak tanımlanmaktadır (Davies, 2002). Projelerde başarı kriterleri projenin büyüklüğüne, türüne ve özelliklerine göre farklılık gösterebilmektedir (Westerweld, E., 2003).

Başarılı bir bilişim projesi istenilen nitelikte, istenilen zamanda ve hedeflenen maliyette projenin tamamlanarak beklenilen etkinin oluşturulması ile ortaya çıkar. Bütçe, zaman ve nitelik bilişim projelerinde yer alan üç önemli kavramdır. Bu kavramlarda birbirleri ile sıkı ilişki içerisindedirler. Bunlardan her hangi birinde meydana gelebilecek problem diğerlerini de etkileyecek ve proje olumsuz olacaktır. İstenmeyen bu durumun önüne geçebilmek adına projenin yönetimi önem kazanmaktadır. Proje Yönetim Enstitüsü (PMI) projenin iyi bir şekilde yönetilebilmesi için bir projeyi Zaman, Kapsam, Entegrasyon, Maliyet, Tedarik, Risk, İletişim, İnsan Kaynakları ve Kalite olmak üzere dokuz bilgi alanına ayırmıştır (Milliyet, 2014).

Imtiaz vd. (2013) yapmış olduğu çalışmada 1999-2012 yılları arasında Bilişim Teknoloji Projelerinde kritik başarı faktörlerini konu alan çalışmaların analizini gerçekleştirmişlerdir. Analizler sonucunda kritik başarı faktörü olarak 15 faktör belirlenmiştir. Imtiaz'ın yapmış olduğu çalışma ile araştırmacıların yapmış olduğu çalışmalar birleştirilip Tablo 3'de gösterilmiştir.

Tablo 3. Kritik Başarı Faktörleri ve Yapılan Çalışmalar

Faktörler	Sudhakar (2012)	McLeod ve McDonell (2011)	Fan (2010)	Ding ve Wang (2008)	Biehl (2007)	Chow ve Cao (2008)	Lee ve Kim (2007)	Fortune ve White (2006)	Salmeron (2005)	Jones (2004)	Poon ve Wagner (2001)	Reel (1999)	**Etki Derecesi**

Bilişim Teknolojileri projelerinin kritik başarı faktörlerinin belirlenmesinde farklı çalışmalar yapılmıştır. Çalışmalarda 3 ile 12 faktörden oluşan faktörler belirlenmiştir. Faktörlerin proje başarısına etkilerine bakıldığında 7

Copyright © International Science and Technology Conference (ISTEC)

faktörün Güçlü oranda başarıya etki ettiği, 6 faktörün ise Orta düzeyde etki ettiği ve 2 faktörün ise Zayıf oranda etki ettiği tespit edilmiştir.

Sonuç

Projenin başarıya ulaşması projeyi hazırlayan ve uygulayan kişilerin en öncelikli hedefidir. Fakat gerçek hayatta yapılan her proje tam istenilen boyutta başarıya ulaşamamaktadır. Bu başarısızlık maliyet ve zaman kaybını doğurmaktadır. Araştırmacılar bu oluşan kayıpların önüne geçmek ve projelerin başarı oranlarını artırmak için çeşitli çalışmalar yürüterek standartlar geliştirmişlerdir. Yapılan araştırmalar ve ortaya konulan çalışmalar bilişim teknoloji projelerinin başarıya ulaşması için ilk olarak proje yönetiminde bir standartlaşmanın olması gerektiğini ortaya koymaktadır. Standartlaşma proje yönetimini daha kolay hale getirerek oluşabilecek riskleri düşürmektedir.

Bilişim projelerinin başarısızlık sebeplerine bakıldığında büyük bir çoğunluğunun Proje Yönetimi Becerilerinin Yetersizliğinden kaynaklandığı, sırası ile İletişim Sorunları, Doğru tanımlanmamış hedefler, Kapsama Yabancılık ve Yeni Teknolojiye Uyum Sorunu gibi problemlerin geldiği belirtilmektedir.

Başarılı bir bilişim teknoloji proje çıktısı için ilk önce yönetimin bu projeye inanması ve projenin arkasında durması gerekmektedir. Bu davranış projeyi yürüten uzmanların elini güçlendirirken bazı sorunların doğmadan engellenmesini sağlayacaktır. Proje yönetiminde herkesin alanları ve iş kalemleri net olarak tanımlanarak kimin hangi işlemi ne zaman ve nereye kadar yapacağı mutlaka belirlenmelidir. Projenin etkisini ve niteliğini artırmak için proje çıktısından yararlanacak kullanıcıların istekleri ve önerileri dikkate alınarak proje şekillendirilmelidir. Son olarak proje geri bildirimi proje yürütülürken ve bittikten sonra da devam etmelidir. Bu işlem projenin her zaman daha iyiye gitmesini sağlayacaktır. Tüm bu alınan tedbirlere ve yapılan işlemlere rağmen proje veya projeler başarısız olabilir, fakat projedeki başarısızlık bize hiç göremediğimiz yönleri ve bilgileri de öğreterek yeni projelerin daha sağlam ve başarılı olmasını sağlayabileceği unutulmamalıdır.

CYTOTOXIC AND APOPTOTIC EFFECT OF CHALCONE DERIVATIVE WITH BROMO SUBSTITUENT ON T47D BREAST CANCER CELLS

Retno Arianingrum Arianingrum
arianingrum_uny@yahoo.com

Indyah Sulistyo Arty Arty
Indyah_SA@yahoo.com

Chalcones, a group of aromatic enones, is known have a variety of biological properties, including anticancer. We have synthesized a chalcone derivate 1-(4'-bromophenyl) -3-(4-hydroxy-3-methoxyphenyl)-2-propene-1-on by aldol condensation reaction. The aim of the present study was to evaluate the effect of this compound on cytotoxicity and apoptosis induction of T47D breast cancer cell lines. The cytotoxic properties were determined using MTT [3-4, 5 dimetiltiazol-2-yl)-2,5difeniltetrazoilium bromide] assay. Apoptosis induction was carried out using Annexin-V flowcytometry method, and the observation of protein expression was determined by imunocytochemistry analyses. The result indicated that the compound has cytotoxic effect on T47D cells and was able to induce apoptosis throught decreasing Bcl-2 and increasing Bax.

ÇEVİK YAZILIM GELİŞTİRME YÖNTEMLERİNDE ETKİLİ TEST ARAÇLARI

Ahmet BARAN, Funda AKAR, Fulya ASLAY

Erzincan Üniversitesi, Mühendisik Fakültesi

baran@erzincan.edu.tr, fakar@erzincan.edu.tr, faslay@erzincan.edu.tr

ÖZET : Çevik yazılım geliştirme yöntemleri, son zamanlarda kullanılan ana akım yazılım geliştirme yöntemleridir. Bu yöntemler, tek bir çevrim ile ürünü müşteriye sunmayı hedefleyen geleneksel yazılım geliştirme yöntemlerinin aksine, birçok iterasyon ve artırımlarla ürünü müşteriye, sürekli olarak sunar. Daha hızlı, daha fonksiyonel ve daha kaliteli ürün teslimi amacıyla tercih edilen bu yöntemlerde çeşitli test pratikleri oluşmuştur. Bu çalışmada, önce geleneksel yazılım geliştirme yöntemlerindeki test sorunları özetlenerek, çevik yazılım geliştirme yöntemlerinde kullanılan en iyi test pratikleri araştırması sunulmuş ve yazarların tecrübeleri ile birleştirilerek etkili test pratikleri önerilmiştir. Önerilen test pratiklerinin kullanımı ile daha kaliteli yazılım geliştirme süreçlerinin gerçekleştirileceği öngörülmektedir.

Anahtar Kelimeler: Çevik yazılım geliştirme yöntemleri, Çevik yazılım geliştirme yöntemlerinde test

EFFECTIVE TEST TOOLS IN THE AGILE SOFTWARE DEVELOPMENT METHODS

ABSTRACT: Agile software development methods are mainstream software development methods recently used. These methods, unlike traditional software development methods that offer products to customers with a single cycle, provide a lot of iteration and increment of the product to the customer continuously. In this methods that preferred in order to deliver faster, more functional and better higher quality products, various testing practices are. In this study, initially testing issues in traditional software development methods are summarized next, research of the best testing practices used in agile software development methods in the literature have been presented. Afterwards, effective test practices that have been combined with the best practices and experience of the authors have been proposed. It is predicted that high quality software development process can be carried out using these agile test practices.

Keywords: Agile software development methods, Test on agile software development methods

GİRİŞ

2001 yılında çevik yazılım geliştirme manifestosunun yayınlanmasından sonra; Microsoft, SAP ve Adobe gibi büyük yazılım şirketlerinin de çevik yazılıma adapte olmalarıyla birlikte, çevik yazılım geliştirme, ana akım yazılım geliştirme yöntemi haline gelmiştir (Schmidt, 2016; West ve Grant, 2010) ve 2015 yılı itibarı ile geliştiricilerin %95'i çevik yazılım geliştirme pratiklerini kullanmaktadır (Version One Inc, 2016).

Geliştiricilerin çevik yazılım yöntemlerini tercih etmelerinin birçok nedeni bulunmakla birlikte, yazılım kalitesini artırmak en önemli nedenler arasındadır (Version One Inc, 2016). Geleneksel yazılım geliştirme yöntemlerindeki yazılımın bir kez geliştirilip teslim edilmesine karşın, çevik yazılım geliştirme yöntemlerinde yazılım kısa aralıklarla sürekli geliştirilir ve müşteriye teslim edilir. Bu şekilde çevik yöntemlerde üretilen her artırımsal yazılım paketinin, müşterinin kalite beklentilerini karşılaması ve buna bağlı olarak da sürekli bir yazılım kalite güvencesi sağlanır (Schmidt, 2016).

Müşterilerin kalite beklentilerini sağlayacak "kaliteli bir yazılım ürünü" için, yazılımın olabildiğince "sorunsuz" olması gerekmektedir. Buradaki "sorun" çok geniş bir kavram olup; hatalı ihtiyaç tanımlanması sorunları, müşteri-geliştirici iletişiminden kaynaklı sorunlar, ihtiyaçlardan bilinçli bir biçimde sapma sorunları, mantıksal tasarım sorunları, kodlama sorunları, kodlama yönergelerine ve dökümantasyon ile uyuşmama sorunları, test

 Copyright © International Science and Technology Conference (ISTEC)

sürecinin hızlı geçilmesinden kaynaklanan sorunlar, prosedür sorunları ve dökümantasyon sorunları başlıkları altında özetlenebilir (Galin, 2004).

Bu sorunların çoğunun hafifletilmesi için "yazılım testi" hususu öne çıkmaktadır. Yazılım testi, ürün kalitesini kontrol etmek için uygulanan temel kalite güvence aracıdır (Galin, 2004) ve önemi son zamanlarda giderek artmaktadır. Bilişim endüstrisinin 2012 yılında kalite güvence ve test çalışmalarına ortalama %18 bütçe ayırdığı, 2013'te %23, 2014'de %26 ve 2015'de %35 bütçe ayırdığı raporlanmıştır ve bu oranın 2018'de %40 olacağı tahmin edilmektedir (Capgemini vd., 2015). Test işlemlerini etkili bir şekilde yaparak yukarıdaki sorunların bir çoğu önemli derecede hafifletilebilir; ürün kalitesi, kullanım kalitesi ve veri kalitesi yükseltilebilir; yazılımın fonksiyonelliği, performans etkinliği, uyumluluğu, kullanılabilirliği, güvenilirliği, bakımının sürdürülebilirliği, taşınabilirliği iyileştirilebilir.

Bununla birlikte yazılım testleri için oldukça fazla yöntem ve araç bulunmaktadır (Hariprasath, 2015; Spillner vd., 2014). Her teknik, test nesnesinin özel bir yönünü test etmeye odaklanır. Yine her testin, çeşitli hataları bulmakta güçlü ve zayıf yönleri bulunmaktadır. Tüm hususlara çözüm olabilecek tek bir test tekniği bulunmamaktadır. Bu nedenle değişik nedenlerden kaynaklanabilecek hataları bulabilmek için farklı test tekniklerinin kombinasyonlarının kullanılması gereklidir. Birim testi, entegrasyon testi, sistem testi ve kabul testi standart testler olarak yapılırken, fonksiyonel test ve fonksiyonel olmayan test başlıkları altında onlarca farklı testler yapılabilmektedir. Yine statik test ve dinamik test farklı amaçlarla ve farklı hususlara odaklanan değişik teknikleri uygulayan test yöntemleridir (Spillner vd., 2014).

Her projede tüm bu testlerin uygulanması zorunlu değildir. Fakat her projenin ihtiyaçlarına göre, bahsedilen sorunları minimize edecek, etkili test tekniklerinin sistematik bir stratejiye göre uygulanması gereklidir. Bu çalışmada; çevik yazılım geliştirme yöntemlerinde kullanılan literatürdeki en iyi test pratikleri yazarların tecrübeleri ile birleştirilerek, çevik yazılım süreçlerinde uygulanabilecek etkili bir test stratejisi önerilmiştir.

Bu çalışma dört bölümden oluşmaktadır. İkinci bölümde, geleneksel yazılım geliştirme yöntemlerinin test hususlarındaki problemleri, üçüncü bölümde günümüzde en çok kullanılan çevik yazılım geliştirme yöntemleri tanıtılarak literatürdeki en iyi test pratikleri sunulmuştur. Çalışma, dördüncü bölümdeki sonuç ve öneriler ile sonlanmaktadır.

GELENEKSEL YAZILIM GELİŞTİRME VE TEST

Bu bölümde geleneksel yazılım geliştirme yöntemleri olan Şelale, V-Model, Helezonik Model ve W-Model kısaca tanıtılarak test hususları değerlendirilecektir.

Şelale modelinde (Royce, 1970) ihtiyaçların tanımlanması ve test aşamaları arasında uzun bir geri besleme olması nedeniyle model; değişen iş süreçlerini, değişen fikirleri, unutulan ihtiyaçları ve yanlış anlaşılan ihtiyaçları yönetemez. Bu sorunlar test aşamasında fark edildiğinde uzun zaman ve işgücü kaybına neden olur (Balaji ve Murugaiyan, 2012). Test için gerekli hazırlıklar yapılmadan geliştirme yapılması, sistematik bir testin yapılmasını zorlaştırır (Spillner, 2002). Bir aşamadaki problemler, o aşama boyunca tamamen çözümlenemez. Gerçekte, bir aşamaya ait problemler ancak o aşamadan sonraki aşama/aşamalarda görünür ve bu durum sistemin sorunlu geliştirilmesine neden olur (Balaji ve Murugaiyan, 2012; Christie, 2008). Test personeli tüm geliştirme aşamalarından sonra sürece dâhil olur. Kabul testine kadar olan testlerde müşteri bulunmamaktadır. Süreç içerisinde beklenmeyen bir durum ortaya çıktığında sürecin nasıl cevap vereceği tanımlı değildir (Spillner vd., 2014).

V-Modelinde (Boehm, 1979) testin plansız yapılması sorunu haricinde, şelale modelindeki tüm sorunlar geçerlidir (Spillner, 2002). Bununla birlikte; test planı ve stratejisi, ihtiyaçların tanımlanmasının hemen sonrasında tanımlandığı için, süreç boyunca olabilecek değişimlere adapte olamamaktadır. Testlerin, geliştirme aşamaları ile bire bir ilişkili olduğu varsayılmaktadır. Fakat gerçek hayat uygulamalarında çoğa çok ilişkilerin kurulması gerektiği ile oldukça sık karşılaşılmaktadır. "V" sembolünün sol bacağı ile sağ bacağı arasında kurulmuş olan test bağlantıları belirsizdir (Christie, 2008).

Helezonik (Spiral) modelinde (Boehm, 1988) test planının sistem tasarımından sonra yapılması V-modelindeki erken planlama problemini bir miktar hafifletmektedir (Spillner, 2002). Bununla birlikte, aşamalar ve aşama süreçleri hâlâ lineerdir (Christie, 2008). Son çevrimde Şelale basamaklarının kullanılması nedeniyle, test hâlâ kodlamadan sonra yapılmaktadır (Schwaber, 1997) ve bu durum plansızlık hariç, Şelale modelinin tüm sorunlarını beraber getirmektedir.

 Copyright © International Science and Technology Conference (ISTEC)

W-Modelinde (Herzlich, 1993) analiz ve tasarım aşamaları ile test planlama aşamalarının birlikte yürütülmesine rağmen; hangi süreçlere ne kadar kaynak (zaman, personel)ayrılacağı belirlenmemiştir (Spillner, 2002). Sol bacaktaki test işlemlerinin farklı personel ile gerçekleştirilmek istenirse; ekstra personel çalıştırılmasına ihtiyaç doğurmaktadır. Aynı personel ile gerçekleştirilmek istenirse; kodlamada gecikmelere ya da test dokümanının kısa sürede gözden geçirilmesine neden olabilmektedir (Christie, 2008).

Bu kısıtlar, geleneksel yöntemlerle geliştirilen yazılımların sadece fonksiyonelliğinde sıkıntılara neden olmakla kalmayıp, yazılımların kalitesinde, performansında, uyumluluğunda, kullanılabilirliğinde, güvenilirliğinde, bakımının sürdürülmesinde ve taşınabilmesinde de çeşitli kısıtlara neden olabilmektedir (Balaji ve Murugaiyan, 2012; Jorgensen, 2013; Spillner vd., 2014).

ÇEVİK YAZILIM GELİŞTİRME VE TEST

Yazılım endüstrisinin, bugünün hızlı değişen bilişim dünyasına ayak uydurabilmesini sağlayan yazılım geliştirme yöntemi olan çevik yazılım geliştirme, 2001 yılında 17 yazılım geliştirici tarafından bir manifesto halinde ilkesel olarak yayınlanmıştır. Bu manifestoda

- Süreçler ve araçlardan ziyade bireyler ve etkileşimlere,
- Kapsamlı dökümantasyondan ziyade çalışan yazılıma,
- Sözleşme pazarlıklarından ziyade müşteri ile işbirliğine ,
- Bir plana bağlı kalmaktan ziyade değişime karşılık vermeye

değer vermeye kanaat getirildiği ifade edilmiştir (Beck vd., 2001). Daha önceden bilinen fakat bu manifestoda özetlenen bakış açısının yayınlanmasından itibaren; Uç Programlama (Extreme Programming [XP]), Scrum, Yalın Yazılım Geliştirme (Lean Software Development [LSD]), Kanban, Özellik Güdümlü Programlama (Feature Driven Development [FDD]), Dinamik Sistemler Geliştirme Yöntemi (Dynamic Systems Development Methodology [DSDM]) ve Adaptif Yazılım Geliştirme (Adaptive Software Development [ASD]) ana akım çevik yazılım yöntemleri olarak görülmeye başlanmıştır (Campanelli ve Parreiras, 2015). Bunlarla birlikte, Çevik Modelleme (Agile Modelling [AM]), Crystal ve Çevik Birleşik Süreç (Agile Unified Process [AUP]) yöntemleri tercih edilen diğer çevik yazılım geliştirme yöntemleri olup, bu son grup daha çok proje ve insan gücü yönetimine odaklanmıştır. Bu yüzden bu çalışmada ilk gruptaki 7 çevik yöntem kısaca tanıtılacak ve test pratikleri vurgulanacaktır.

Çevik yazılım geliştirme yöntemleri artırım ve iterasyon temelli yöntemlerdir. Artırım ve iterasyon temelli yöntemler, Şelale geliştirme yöntemini parçalara böler, her bir parça için aynı süreci gerçekleştirir ve geliştirme döngüsünde tekrarlar (Cohen vd., 2004). Artırımsal geliştirme, geliştirme süresini azaltmak amacıyla projeyi eşzamanlı artırımlara böler. Şelale'da olduğu gibi geliştirme başlamadan tüm ihtiyaçlar analiz edilir. Bununla birlikte, ihtiyaçlar fonksiyonel artımlar olacak şekilde parçalara bölünür. Artırımların geliştirilmesi eşzamanlı olduğunda, çok görevlilik mantığı ile proje geliştirme süresi azalır. İteratif geliştirme ise, projeyi çeşitli uzunluklarda iterasyonlara böler. Bu iterasyonların her biri, kullanılabilir ve dökümante edilmiş ürünler üretir. İlk iterasyon en temel ürünü üretmekle başlar ve ardışık her iterasyon ürüne yeni özellikler ekler. Her iterasyonda, o iterasyona ait analiz, tasarım, gerçekleştirme ve test etme işlemleri kendi Şelale süreci içerisinde sürdürülür. İteratif geliştirme, sadece bulunulan iterasyondaki ihtiyaçları karşılayacak değişimler ile ilgilenir. Sonraki iterasyon(lar)da gerekli olacak/olabilecek ihtiyaçlar, iterasyon sırası gelmeden değerlendirmeye alınmaz. Böylece, teknolojinin gelişimi ve/veya müşterinin fikir/istek değişimleri, projenin momentumuna minimum etki eder (Cohen vd., 2004).

Çevik yöntemler olarak adlandırılan bu yöntemler, manifestodan önce de kullanılan yöntemlerdir fakat manifesto ile daha çok kullanılmaya başlanmıştır. (Abrahamsson vd., 2003) bu yöntemlerin manifestoya kadar evrimleşmesini ve (Dingsøyr vd., 2012) ise 2001-2011 arası 10 yılda çevik yöntemlerin gelişimini şematik olarak göstermektedir.

Uç Programlama

XP ihtiyaçların belirsiz ve sıkça değiştiği şartlarda, küçük yazılım takımlarının başarılı bir yazılım geliştirmesine yardımcı olan yazılım mühendisliği pratiklerini ifade eder. Kısa iterasyonlarla (en fazla birkaç ay), küçük sürümler yayınlayarak hızlı geri besleme almak, müşterinin yakın katılımı, sürekli iletişim ve koordinasyon, çift

 Copyright © International Science and Technology Conference (ISTEC)

halinde programlama, sürekli geliştirme, sürekli entegrasyon ve sürekli test bu yöntemin temel karakteristikleridir (Abrahamsson vd., 2003; Beck, 1999; Campanelli ve Parreiras, 2015)

XP'de bileşen (component) testleri programcılar tarafından anlık olarak yapılır. Bu testler bir araya getirilir ve bileşen testlerin tümünden geçmelidir. Test güdümlü geliştirme (Test Driven Development [TDD]) söz konusudur. Bu geliştirme tipinde hangi testlerin geçileceği bilinmeden kod yazılmaya geçilmez. Önce testler hazırlanır, kodlar yazılır ve düzenleme (refactoring) yapılır. Akademik ve endüstriyel çalışmalarda TDD'nin yazılım geliştirme sürecinde yazılım iç kalitesi (internal quality), dış kalitesi (external quality) ve üretkenliğe (productivity) etkileri incelendmiş ve iç kalitede %76 ve dış kalitede %88 avantaj sağladığı rapor edilmiştir (Bissi vd., 2016). Diğer taraftan müşteriler her bir iterasyon için iş odaklı, test edilebilir ve sonucu kestirilebilir fonksiyonel testler hazırlar ve bileşenler bu testlerin tümünden geçmelidir. Bazı durumlarda müşteri geçilemeyen testi çözümlemenin zaman gecikmesi ve maliyete etkisini birlikte değerlendirerek problemin çözümünden bilerek vazgeçebilir. Müşteri tam zamanlı olarak takımla birlikte çalışır. İterasyon sonuç ürünü yeni kod, aktif sisteme saatler geçmeden entegre edilir. Entegrasyon sırasında sistem sıfırdan inşaa edilir ve tüm testler geçilmelidir. Aksi durumda değişikliklerin entegrasyonu iptal edilir ve aktif iterasyona geri dönülerek sorun çözülmeye çalışılır (Beck, 1999). Her entegrasyon testinde tekrar test edilecek hususlar için test otomasyonu yazılması tavsiye edilir.

Scrum

Scrum (Schwaber, 1995), hızla değişen, gereksinimlerin açıkça tanımlanamadığı ve kaotik şartlarda yazılım geliştirme sürecini yönetmek için en çok kullanılan yöntemlerden biridir (Version One Inc, 2016). Esneklik, adaptiflik ve üretkenlik temelli deneysel bir yaklaşım olup, geliştiricileri kendi yöntemlerini kullanmaları konusunda serbest bırakır. Scrum'da karmaşık bir proje, küçük iş parçalarına bölünerek backlog denilen havuza atılır. "Bir iş parçası yeterince küçükse itemin açık, test edilebilir ve mümkün olup olmadığı anlaşılabilir" felsefesine göre değişik büyüklükte parçalar ayrılır. Backlog havuzundaki işler müşteri tarafından öncelik sırasına konulur ve gerektiğinde ekleme, çıkarma ve yeni sıralama yapılabilir. Her bir alt iş sprint adı verilen iterasyon içerisinde yapılır. Sprint süresi, katî olarak sınırlı bir çalışma süresidir. Bir iterasyon için, sprint öncesi planlama toplantısı, sprint ve sprint sonrası değerlendirme toplantısı (toplantılarda da saat sınırı vardır) yapılmakla birlikte, her gün 15 dakikayı geçmeyecek ayaküstü scrum-toplantıları yapılır. Takımlar küçük sayıdadır ve iterasyonlar kısa sürelidir (1-6 hafta). Sprint'ler lineer değildir. Varsa açık (explicit) bilgiler kullanılır, geri kalanı için örtük (tacit) bilgi ve deneme yanılma yöntemi kullanılır. Bu şekilde sprintlerin ilerlemesi ile nihai ürüne ulaşılır.

Scrum yönteminde kısa aralıklı sürüm yayınlanması, düzenli olarak küçük parçaların sisteme eklenmesi anlamına gelmektedir. Bu durum bakımı, testi ve hataların yakalanmasını kolaylaştırmaktadır (Cohen vd., 2004). Sürekli dökümantasyon yapılması, gerek bakımı gerekse testleri kolaylaştırmaktadır. Sürekli test pratiği; big-bang tekniğinin tam tersi şekilde, testi geliştirmenin ana unsurlarından biri haline getirir. Geliştiricilerin hatalarını kodlama aşamasında yakalamasını ve yöneticilerin herhangi bir zamanda demo yapımı veya ürün satmasını mümkün kılar. Müşteri sürekli olarak geliştirme odasında takım ile birlikte çalışır. Test sorumlusu bilgisayar başında demo'yu tanıtır. Müşteri "Tamam" dediğinde, yani yazılım kullanıcı hikayelerinden oluşmuş tüm kabul kriterlerini geçince, kabul söz konusudur. Bitmemiş veya hatalı bileşenler asla kabul edilmez. Bu hususlar, sıfır noktası olmak üzere backlog havuzuna geri konulur (Pichler, 2010).

Yalın Yazılım Geliştirme

Yalın yazılım geliştirmenin en öncelikli felsefesi üretim sürecindeki atıkları (waste) atmaktır. Atık; kısmi yapılmış işler, ekstra yapılan işlemler (bürokrasi gibi), program kusurları, ekstra özellikler, görev değişiklikleri (kişiye verilen iş süresince aradan çıkarılmak üzere başka bir iş verilmesi), beklemeler (özellikle biten bir bileşenin entegrasyon için diğer bir bileşeni beklemesi), hareketlilik (geliştiricinin konsantrasyonunu bozacak durumlar) ve program kusurları gibi müşteri açısından ürünün değerine katkısı olmayan herşeydir (Poppendieck ve Poppendieck, 2003). Bu şekilde sadece müşterinin istediğini karşılayacak ürünü elde etme süreci yürütülmüş olur. Süreç boyunca tüm varsayımlar tekrar tekrar doğrulanır. Bir metrik veya pratik artık geçerli değilse çöpe atılır. Kısa iterasyonlar sonunca geri beslemeler alarak ürün doğrulama (validation) gerçekleştirilir. Kararlar, mümkün olduğunca ertelenir ve alınması gereken son zamanda alınır. Bu şekilde kesinleşmemiş kararlara uygun atık işlemlerle gereksiz yere uğraşılmamış olunur.

Kanban

 Copyright © International Science and Technology Conference (ISTEC)

Kanban, üretim operasyonlarından ödünç alınmış adaptif, görsel ve maliyet odaklı bir tekniktir. Toyota tarafından 1950'lerden beri kullanılmasına rağmen, yazılım geliştirme alanında uygulaması ilk kez, 2004 yılında David J. Anderson tarafından, Microsoft firmasında küçük bir takımla çalışırken yaşanan problemlerin giderilmesi için gerçekleştirilmiştir (Ahmad vd., 2013). Kanban'ın arkasındaki fikir yalın (lean) düşünceden gelmektedir. İş akışını görselleştirmek, üzerinde çalışılan işleri sınırlamak (limit Work In Progress [WIP]) ve döngü süresini ayarlamak Kanban yönteminin ana felsefesidir. Yöntemde yapılan ve yapılacak işler Kanban Board denilen bir tahtada görselleştirilir. Bu şekilde tüm takım ve müşteri; işlerin durumunu, önceliklerini ve darboğazları görerek hareket eder. Bu tahtada soldan sağa; yapılacak işler, yapılmakta olan işler ve testi geçen işler kağıtlara yazılmış şekilde bulunmaktadır. Süreç boyunca bu kağıtlar (yapılacak işlerin anlatıldığı hikayeler) soldan sağa doğru hareket ederler. Bununla birlikte amaçlardan biri WIP'i mümkün olduğunca küçük tutmaktır. Böylece geliştiriciler verilen bir zaman aralığında sadece bir işe odaklanır ve müşteri de o zaman aralığı sonunda ne elde edeceğini bilir. Zaman baskısı konusunda Scrum'dan farklıdır. Kısa geri besleme çevrimleri ile sürece hızlı adapte olmayı hedefler. Kanban kullanmanın anahtar güdüsü zorlayıcı iterasyonlara değil, akışa odaklanmaktır (Ahmad vd., 2013).

Kanban yönteminde program kusurları atık olarak görüldüğünden bunun yok edilmesi (en azından minimum hale getirilmesi) hedeflenmektedir. Program kusurundan kaynaklanan atığın miktarı, kusurun ürüne etkisi ve farkedilememe süresi olarak görülür. Üç dakika içerisinde farkedilmiş bir kritik kusur büyük bir atık kaynağı olarak sayılmaz. Haftalarca farkedilememiş küçük bir kusur ise daha büyük bir atık olarak sayılır. Kusurların etkilerini azaltmanın yolu, oluşur oluşmaz onları bulmaktır. Böylece kusurlar yüzünden harcanan zamanı azaltmak için kod yazarken anında test, sık sık entegrasyon ve mümkün olduğunca çabuk sürüm yayınlanması yapılır (Poppendieck ve Poppendieck, 2003).

Bununla birlikte son zamanlarda Scrum ve Kanban'ın bazı özelliklerinin bir araya getirildiği Scrumban isimli hibrit bir çevik yöntem çalışmalarına rastlanmaktadır. Bu yöntemde Kanban yönteminde olduğu gibi işler yapılacaklar tahtasına alınır ama farklı olarak bazı işler için zaman sınırı olduğunu gösterir farklı renkte kâğıtlar kullanılır (Reddy, 2014).

FDD

FDD, yazılım geliştirme yaşam döngüsünde sadece tasarım ve geliştirme aşamalarını etkileyen çevik ve adaptif bir yazılım geliştirme yöntemidir. Beş adet sıralı ana aktivitesi vardır: tüm sistemi modelleme, özellik listesi hazırlama, özellikleri planlama, özelliğe göre tasarım ve özelliğe göre geliştirme. Sistemin modelleme aşamasında, takım üyeleri ve uzmanlar sistem için bir "yol planı" hazırlar. İkinci aşamada gerekli özellikler tüm tarafların anlayabileceği basitlikte parçalara bölünür. Üçüncü aşamada "tasarım paketleri" adı verilen bu parçalar önceliklendirilir ve her bir parça, bir kaç programcıdan sorumlu bir şef programcıya atanır. Özelliğe göre tasarım aşamasında sürecin iteratif kısmı başlar. Şef programcı kendisine atanmış tasarım paketinden 1-2 hafta içerisinde yapılabilecek bir alt iş seçer. Geliştirme aşamasında bu alt iş yeniden ayrıntılı olarak analiz edilir tasarlanır, kodlanır, test edilir ve entegre edilir (Palmer ve Felsing, 2001). Diğer çevik yöntemlere kıyasla çok büyük ve kritik projelerde kullanılabilmektedir. Tüm süreç boyunca kalite hususuna ağırlık verir.

FDD yönteminde, kod yazıldıktan sonra birim testi ve kod inceleme alt süreçlerine geçilir. Hangisinin önce yapılacağına şef programcı karar verir. Birim testinin nasıl yapılacağına dair sınırlama yoktur. Manuel veya otomasyon aracılığı ile yapılabilir. Kod inceleme FDD için zorunlu bir uygulamadır ve bunun için kod yazma süresinin yaklaşık dörtte biri kadar süre ayrılır. Kod inceleme, iyi bir şekilde yapıldığında test etmekten daha fazla ve çeşitli yazılım kusurlarını bulabilmektedir (McConnell, 2004). Bu inceleme sadece geliştirici tarafından yapılmakla kalmayıp, takım içindeki tecrübeli programcılar tarafından da yapılır. Böylece yeni programcıların gelişmesine yardımcı olacak bir süreç olarak da görülebilir. Bununla birlikte, program kodlarının inceleceğini bilmek, programcıların daha dikkatli ve standartlara uygun kod yazmalarını sağlar. Kod incelemenin formalite seviyesi, iterasyonda geliştirilen özelliğin etki ve karmaşıklığına göre şef programcı tarafından tespit edilir. Önem ve karmaşıklık seviyesi düşük işler şef ve takım tarafından incelendiği halde, daha önemli ve karmaşık kod incelemelerinde diğer şef programcılar ve bazen diğer takımlardan programcılar da davet edilir. Bu şekilde XP programlamada yapılan çift (iki kişi) programlama pratiğinden daha iyi bir sonuç elde edilir. Burada programcıya koda bir süre sonra yeniden bakmasıyla kod optimizasyonu yapma şansı verilmekle birlikte, kodlara farklı gözlerin bakması ve fikir yürütmesi ile çok daha iyi, hızlı ve optimal kodların elde edilmesi mümkün olabilmektedir. Bu aşamalardan sonra eldeki kod, entegrasyona hazır hale gelir (Flora ve Chande, 2014; Palmer ve Felsing, 2001).

 Copyright © International Science and Technology Conference (ISTEC)

DSDM

1994 yılında çok sayıda proje uzmanı tarafından Hızlı Uygulama Geliştirme (Rapid Application Development [RAD]) için kaliteyi hedeflemek amacıyla geliştirilen ve 1995'de (Millington ve Stapleton, 1995) tarafından tanımlanan bir iskelettir (framework) (Flora ve Chande, 2014). İlk çevik yöntem olan bu framework, proje ürün yönetimi yaşam döngüsünün en iyi süreçlerini birleştiren iteratif ve artırımlı bir metodolojidir. Sonuçlara hızlı ve efektif olarak ulaşmayı sağlayarak, zaman, maliyet, risk ve kaliteyi kontrol altında tutup iş faydalarını artırımsal olarak ulaştırmayı sağlamak, stratejik amaçtır. Kullanıcının aktif katılması, takımların güçlendirilmesi (empowering), kaliteyi en iyilemekten ziyade sürümlerin hızlı ulaştırışlması, geliştirme sırasında herhangi bir değişikliğin geri alınabilmesi, en üst seviye ihtiyaçların değişmemesi, tüm paydaşların birlikteliği ve iyi haberleşmesi ile tüm proje boyunca testin yapılması bu yöntemin prensipleridir. Zaman kutuları (Time boxing), MoSCoW, Prototipleme, Test, İmalat ve Modelleme, bu yöntemde kullanılan temel tekniklerdir. Framework dâhilinde ön-proje, fizibilite çalışması, iş çalışması, fonksiyonel model iterasyonu, tasarım ve geliştirme iterasyonu, uygulama ve proje sonu aşamaları gerçekleştirilir (Cohen vd., 2004; Millington ve Stapleton, 1995).

Fonksiyonel model iterasyonunda, dökümanlar gözden geçirilip, prototip sergilenerek ve yazılım parçasının başarılı bir şekilde test edildiği kanıtlanarak, işin doğru yapıldığı (verification) ispat edilir. Burada ürünün fonksiyonelliğe katkısı üzerinde odaklanılır. Fonksiyonel olmayan hususlar, tasarım ve gerçekleştirme aşamalarında test edilir. Kullanıcının aktif katılması, kabul testinin hızlıca geçilmesini sağlar. DSDM test araçlarının kullanımını savunmaktadır. Yakalama ve yeniden oynama (capture and replay) araçları ile testlerin yapılması, kanıtlama için iyi bir yol olmakla birlikte, kağıda geçirilmesinden daha az zahmetli bir işlem olarak görülür. Kod inceleme DSDM'de de önerilen bir pratiktir. Dinamik analiz araçları, demo sırasında dizi boyutları, hafıza kullanımı gibi hususları test etmek için kullanılabilmektedir (Millington ve Stapleton, 1995).

ASD

ASD, yüksek hızlı ve çok değişen internet ekonomisi için geliştirilmiş bir yazılım geliştirme yöntemidir. Yüksek hızlı ve çok değişimli projeler, tahmin edilemez ve geleneksel yöntemlerle işlenemeyecek kadar karmaşıktır. Bu nedenle geliştirme organizasyonunun adaptif olması, yeni değişimlere hızlı cevap vermesi gerekir. Sürekli prototip geliştirerek iteratif ve artırımsal geliştirmeyi teşvik eder. Yöntemde "kaosun sınırında dengeleme" mantığı ile, "yeterli klavuzluk ile projelerin kaosa düşmesi engellenebilir" düşüncesi temeldir. Bu yöntemde proje üç fazda değerlendirilir: tahmin etmek (speculate), işbirliği yapmak (collaborate) ve öğrenmek (learn). Belirsizliğin az olduğu durumlarda yapılan plan yerine, bu yöntemde tahmin yapılır. Birlikte çalışma hızla değişen sistem geliştirmede oldukça önemlidir. Hatalardan bilgi üretme ve geliştirme sırasındaki ihtiyaç değişimlerini sağlamak öğrenme fazıdır. Proje başlama, adaptif çevrim planlama, eşzamanlı özellik geliştirme, kalite gözden geçirme ve final kalite güvence-sürüm yayınlama olmak üzere beş genel adımdan oluşur. Kalite gözden geçirme ile çevrim planlama arasında öğrenme geri beslemesi bulunmaktadır (Highsmith, 2000).

Müşterinin geliştirme aşamasında bulunması ile Ortak Uygulama Geliştirme (Joint Application Development [JAD]) temeldir. Bu durum kabul testini kolayca geçmeyi sağlar. İlk kez tecrübe edilen işler ve araştırma geliştirme faaliyetleri için bu yöntemdeki öğrenme geri beslemesi oldukça önem arz etmektedir. Bu geri besleme ile birlikte ürün testi gerçekleştirilmiş olup, müşterinin bakış açısından ve teknik bakış açısından incelemeler yapılır. Bu incelemeler ile birlikte takım, performansını değerlendirme imkanı bulur. Ayrıca JAD oturumlarında tüm paydaşların projenin anlık durumunu gözden geçirme fırsatı olur (Abrahamsson vd., 2002; Highsmith, 2000).

SONUÇ VE ÖNERİLER

Bu bölümde, çevik yazılım geliştirme yöntemleri ile gerçekleştirilen yazılım geliştirme projelerinde başarı şansını artırabilmek için, literatürdeki ve yazarların tecrübeleri ile elde edilen test pratikleri verilmektedir. Bu kapsamda:

- Projenin tamamı için bir test master test planı ve her entegrasyon seviyesi için bir seviye test planı hazırlanıp, süreçler bu planlara uygun sürdürülmelidir,
- Test bir faz olarak değil, tüm süreç boyunca yürütülecek; planlama, uygulama ve kontrol aşamalarını içeren bir süreç olarak görülmelidir,
- Test özel olarak hazırlanmış test ortamlarında gerçekleştirilmelidir,
- İterasyonlarda test güdümlü hareket edilmelidir,
- Geliştirilen yazılım, hata oluşma durumlarını günlük dosyalarına kaydetmelidir,
- Hem el ile (manuel) hemde otomatik test araçları kullanılmalıdır. Hangi aşamalarda hangisinin kullanılacağını takım lideri ve programcılar birlikte kararlaştırmalıdır,

 Copyright © International Science and Technology Conference (ISTEC)

- Entegrasyonda eksik parçaların fonksiyonunu sağlamak için koçan (stub) yazılım bileşenleri hazırlanmalıdır,
- Test gereksiz bir işlem, vakit kaybı veya sıkıcı bir bürokrasi olarak görülmemeli, projenin gelişimi için bir araç olarak görülmelidir,
- Mümkün olduğunca geliştirme sürecinde takımın aynı fiziksel ortamda bulunması sağlanmalıdır,
- Test sadece test edicilerin (tester) görevi değildir. Tüm ekibin bunun bilincinde olması sağlanmalıdır,
- Testin sadece hatalardan arınmayı ifade etmediği, bakım ve onarımı da kolaylaştırdığı bilinmelidir,
- Dökümantasyon gereğinden ne az, ne de çok olmalıdır. Kağıt kullanımı yanında kayıt ve oynatma araçları kullanımı ihmal edilmemelidir,
- Sık sürüm yayınlama ve müşteri testleri ile geri besleme sağlanması, gereksiz zaman kayıplarını azaltacaktır.
- Test işlemleri sadece hataları düzeltmeyi değil, öğrenmeyi de sağlar,
- Test personeli kritik süreçlere dahil edilmelidir,
- Test sonucu görülebilecek her hata iterasyonu başa döndürmez, durumun kullanıcıların önceliklerine sunulması gerekir,
- Test sonuçlarına göre hata seviyeleri yüksek ise, takımın motivasyonu ve çalışma saatları gibi yönetimsel hususların yeniden gözden geçirilmesi gerekir.

Özet: Onarım, güçlendirme ve depreme karsı takviye amacıyla kullanılan birçok malzeme bulunmaktadır ve bu malzemelerde sürekli performans gelişimi gerçekleşmektedir. Onarım malzemeleri için hasarın yerine, tipine, yapının içinde bulunduğu durabilite ile ilgili koşullara bağlı olarak seçim yapmak gerekir. Seçilen onarım malzemelerinin maliyeti göz önüne alınması gereken önemli bir hususdur. Bu çalışma kapsamında farklı iki adet çimento esaslı tamir harcı üretilerek mekanik ve fiziksel özelliklerine ait deneyler yapılmıştır. Burada seçilen iki adet çimento esaslı tamir harçlarının basınç dayanımlarının benzer olması esas alınmıştır. Deneysel çalışmadan üretilen ürünlerin basınç dayanımı, eğilme dayanımı, yapışma suretiyle oluşmuş bağ dayanımı, aşınma dayanımı ve elastisite modülü deneyleri yapılmıştır. Deneylerden ele edilen sonuçlarının ayrı ayrı maliyetleri analiz edilmiştir.

Anahtar Kelimeler: Hasar, Güçlendirme, Onarım malzemeleri

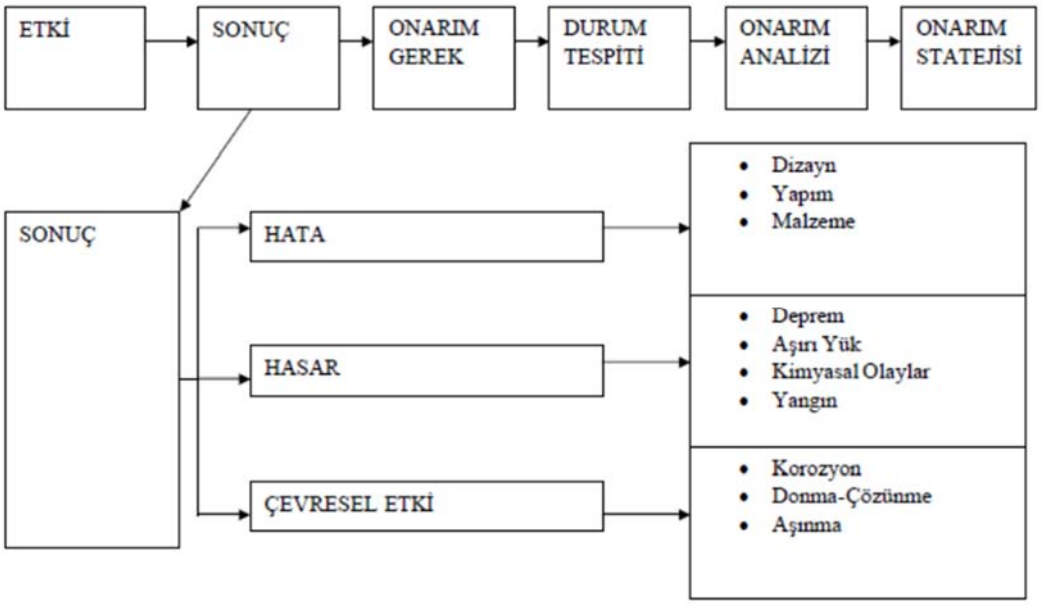
COST ANALYSIS IN TERMS OF PHYSICAL AND MECHANICAL PROPERTIES OF CEMENT BASED REPAIR MORTAR

Abstract: There are many available materials used for repair, retrofit and reinforcement against earthquake purposes in which continous performance improvements are observed. Repairment materials should be chosen considering the location and type of the damage as well as the conditions regarding the durability of the structure. The cost of chosen repairment material is also an important issue that cannot be ignored. In the scope of the experimental study, two different cement based repair mortars were prepared and their mechanical and physical properties have been tested. The two mortars were selected with regard to their compressive strength being similar. The compressive strength, bending strength, adhesion bond strength, abrasion strength and elasticity modules were determined for the prepared materials. In the second part of the experimental study, the test results and costs of these materials were seperately.

Keywords: Damage, Reinforcement, Repairment Materials

Giriş

Günümüzde en yaygın kullanılan yapı malzemesi olan betonarme; atmosferik etkenler, yanlış tasarım, kötü malzeme kullanımı, yapılan hatalı uygulamalar, deprem vb. gibi çok çeşitli nedenlerle hasar görmektedir. Onarım, güçlendirme ve depreme karsı takviye amacıyla kullanılan birçok malzeme bulunmaktadır ve bu malzemelerde sürekli performans gelişimi gerçekleşmektedir. Onarım malzemeleri için hasarın yerine, tipine, yapının içinde bulunduğu durabilite ile ilgili koşullara bağlı olarak seçim yapmak gerekir.



Betondan beklenen 3 temel özellik vardır: İşlenebilirlik, mukavemet ve dayanıklılık. Genel anlamda dayanıklılık, bir yapı malzemesinin, bileşeninin ya da elemanının, kendisi için öngörülen süre içinde, hiçbir aksaklık göstermeden işlevini yerine getirmesi olarak tanımlanabilir. 21. Yüzyılda beton dayanıklılığının gelişimi; özelliklerini kontrol ve optimize ederek dikkatlice seçilmiş malzemelerle ve betonun; karıştırma, ulaşım, yerleştirme ve kürleme koşullarındaki değişkenliğinin azaltılmasıyla sağlanacaktır. Geri beslenme (feedback) yöntemi aracılığıyla ulaşılan bilgi ile uyumlu uygulamaların yapılması ve bunların değerlendirme teknikleri ile kontrol edilmesi, ürün ve yerleştirme hakkında daha fazla otomasyon ve beton ile bulunduğu çevre arasındaki etkileşimin anlaşılmasında kaydedilen ilerlemeler, bu gelişmelerin başardıkları arasında olacaktır. (Tıkalsky, P. J. - Mather, B)

Bir onarım çalışmasının temel amacı; düşük maliyetli ve durabilitesi (dayanıklılığı) yeterli, diğer bir ifadeyle kalıcı bir onarım yapmaktır. Kalıcı onarımları başarabilmek için, bir kompozit sistemin bileşeni olarak onarım sisteminin seçimi ve tasarımını etkileyen faktörlerin göz önüne alınması gereklidir. Burada onarım malzemesi ile mevcut eski beton arasındaki uyum onarım sisteminin en kritik bileşenidir. (Mcdonald, J.E., Vaysburd, A.M

 Copyright © International Science and Technology Conference (ISTEC)

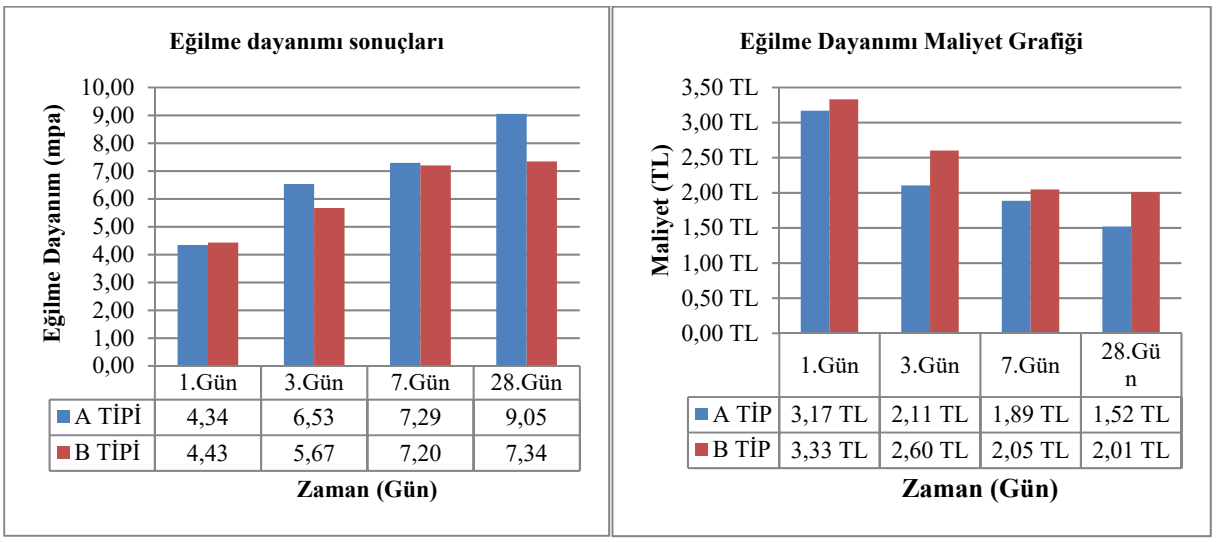
,2002) Onarım harçları değişik etkenler altında hasar görmüş yapı ve yapı elemanlarının özelliklerinin hasar öncesi durumuna getirilmesi ya da özelliklerinin daha da iyileştirilmesi amacı ile kullanılabilir. (Tasdemir, M.A., Ve Özkul, M.H.2003) Onarım malzemesinin eski beton üzerine uygulanması sonrası, yapı elamanının hasar almadan önceki durumuna benzer görünümünü, geometrik yapısını almalı ve bu tür niceliklerini zaman içinde muhafaza etmesi gereklidir. Çimento esaslı onarım malzemelerin büyük bir kısmı, döküm safhasında ve çevre koşullarına göre rötre yaparlar. Hasar görmüş mevcut betonun rötresinin büyük ölçüde tamamlanmış olması göz önüne alındığında, çimento esaslı onarım malzemesinin de rötresinin benzer şekilde mümkün olduğu kadar az olması gerekliliği ortaya çıkmaktadır.

Betonarme bir eleman zaman içerisinde çeşitli iç ve dış etkenlerden ötürü hasara uğrayabilir. Bu hasarlar az da olsa yapı için tehlikelidir ve zamanında onarım ve bakım gerektirmektedirler. Betonda oluşan hasara uygun onarım tipi dikkatlice yapılmalıdır. Şekil 1'de gösterildiği gibi onarımda dikkat edilmesi gereken en önemli hususlar uygun onarım tipinin seçilmesi ve özenle uygulanmasıdır. (B. Nejat,2008)

Şekil 1.Onarım prosedürü

Deneysel Çalışma Ve Deney Sonuçları ile Maliyet Karşılaştırması

Çalışmanın deneysel kısmında çimento esaslı tamir harçlarının standartlara göre istenen fiziksel ve mekanik özelliklerine ilişkin deneyler yapılmıştır. Deneyleri Yapılan iki farklı çimento esaslı tamir harcının deney sonuçları fiyatlara göre karşılaştırmalı olarak incelenmiştir.



Taze tamir harcında kıvam deneyi: Tamir harcı karıştırıldıktan sonra, karışımlar sertleşmeden önce yapılan deneylerdir. Bu deneylerle üretilen harcın beklenen özellikleri sağlayıp sağlamadığı kontrol edilmiştir.

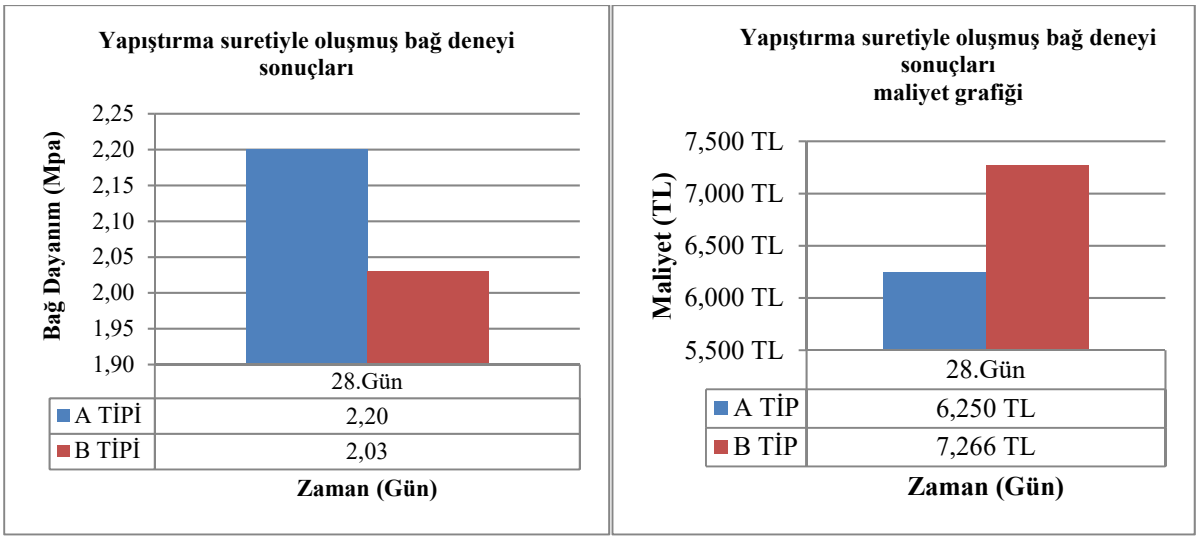
Tablo 1: Taze betonda kıvam deneyi sonuçları

		R_1(cm)	R_2(cm)	R_3(cm)	Ortalama R(cm)	r(cm)	Kıvam
TAMİR HARCI	A Tipi	14,7	14,6	14,6	14,6	10	1,46
	B Tipi	14,4	14,3	14,4	14,4	10	1,44

 Copyright © International Science and Technology Conference (ISTEC)

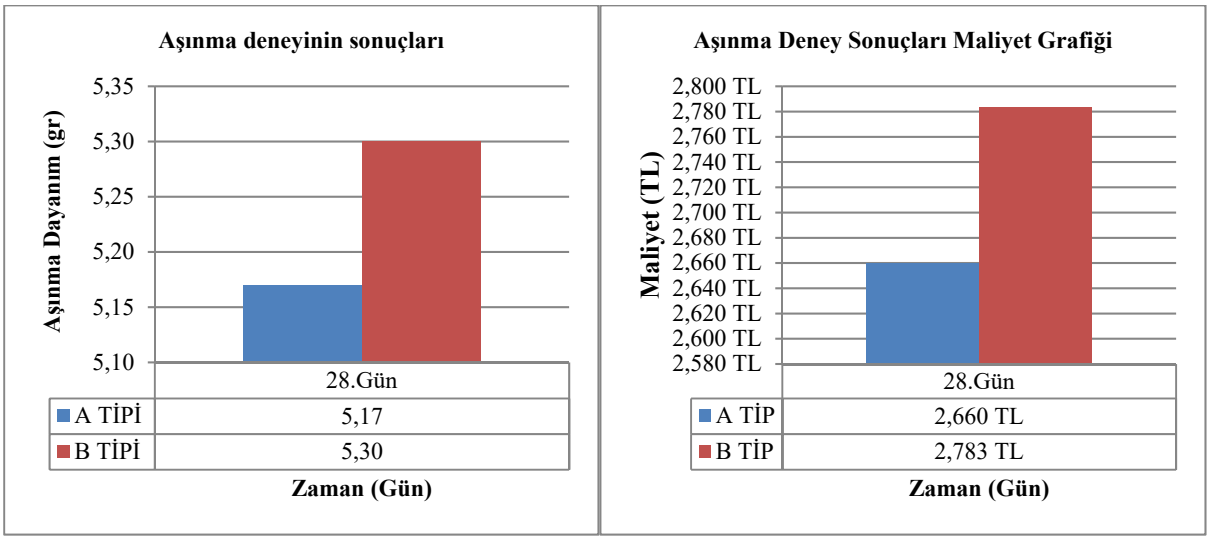
Eğilme dayanımı: Üretilen tamir harcı örneklerin eğilmede çekme dayanımını saptamak için orta noktasından yüklenmiş basit kiriş metodu ile eğilmede çekme tayini deneyi uygulanmıştır. Çıkan sonuçlar ve maliyet grafiği Şekil 2 de gösterilmiştir.

Şekil 2. A ve B Tipi tamir harçlarının eğilme dayanımı sonuçları ve maliyet grafiği



Tamir harcı basınç dayanımın tayini: PC (Polimer harçlar), PCC (Polimer hidrolik çimento harçları) ve HC (Hidrolik harçlar) için deney metodunun prensibi, 40 mm kenar uzunluğuna sahip küp numunelerde basınç dayanmanın tayin edilmesidir. Çıkan sonuçlar ve maliyet grafiği Şekil 3'te gösterilmiştir.

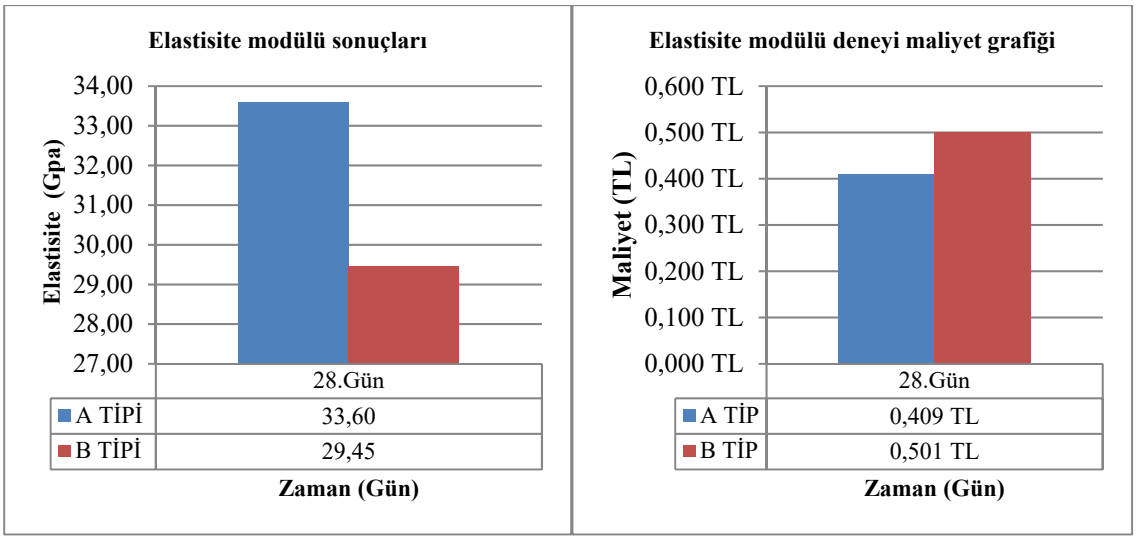
Şekil 3. A ve B Tipi tamir harçlarının basınç dayanımı sonuçları ve maliyet grafiği



Yapıştırma suretiyle oluşmuş bağ deneyi: Bu deney EN 1766'ya göre hazırlanan standart referans beton numuneye uygulanmış tamir harçlarının veya sistemlerinin yapışma dayanımını çekme uygulayarak ölçme işlemidir. Deney metodu, tamir harçlarının veya sistemleri yüzeyine, karot cihazı ile yuva açılarak belirlenmiş alana yapıştırılmış ayak kullanılarak doğrudan çekip çıkarma işlemi uygulanmasıyla gerçekleştirilir. Çıkan sonuçlar ve maliyet grafiği Şekil 4'de gösterilmiştir.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 4. A ve B Tipi tamir harçlarının yapıştırma suretiyle oluşmuş bağ deneyi sonuçları ve maliyet grafiği



Aşınma dayanımı: Deney 100*100 *10 mm kalıblara döküldükten sonra diğer numunelere aynı şartlar altında saklanmıştır.28.gün sonra kürlenmesi tamamlanan numunelerin aşındırma cihazında deneyleri yapılmıştır. İlk olarak hassas terazide tartılan numuneler cihazda 1000 devir döndükten sonra ikinci tartımları alınır ve ilk ölçüm son ölçüm arasındaki fark aşınan miktar olarak kaydedilmiştir. . Çıkan sonuçlar ve maliyet grafiği Şekil 5'te gösterilmiştir.

Şekil 5. A ve B Tipi tamir harçlarının aşınma dayanımı sonuçları ve maliyet grafiği

Elastisite modülü: Deneyin prensibi, en-boy oranı 1:4 olan bir prizma şekilli numuneye kontrollü bir eksenel basınç yükü uygulayarak numunenin sekant modülünün ölçülmesi ve boyuna değiştirmeye yol açan basınç gerilmesinin ilişkilendirilmesidir. . Çıkan sonuçlar ve maliyet grafiği Şekil 6'da gösterilmiştir.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 6. A ve B Tipi tamir harçlarının elastisite modülü sonuçları ve maliyet grafiği

Sonuçlar

Yapılan deneysel çalışmadan elde edilen sonuçlar aşağıdaki gibi özetlenebilir;

- Eğilme dayanımı deneyinde 3, 7.ve 28 günlüklerde A tipi tamir harcı yüksek değer verirken 1.günde B tipi tamir harcı daha yüksek değere kadar çıkmıştır. Eğilme dayanımı deneyinde kürlenme süresi artıkça değerinin arttığı görülmüştür.Eğilme dayanımı deneyinde 28.günlüklerde A tipi tamir harcı yüksek değer vermiştir. Yüksek eğilme dayanım değeri tercih sebebidir.

- Basınç dayanım deneyinde 28.günlüklerde A tipi tamir harcı yüksek değer verdiğinden tercih sebebidir.Basınç dayanım deneyinde maliyet olarak baktığımızda A tipi tamir harcının 7.ve 28. günde daha uygun olduğu, 3.günlüklerde eşit olduğu ve 1.günlüklerde B tipi tamir harcının maliyetinin düşük olduğu görülmüştür.

- Yapışma suretiyle oluşmuş bağ deneyinde A tipi tamir harcının değeri yüksek çıkmıştır. Maliyet açısından A tipi tamir harcının B tipi tamir harcına göre avantajlı olduğu görülmüştür. A tipi tamir harcı bu deneyde mukavemet ve maliyet açısından tercih sebebidir.

- Aşınma dayanımı deneyinde A tipi tamir harcı daha az aşınmıştır. Aynı zamanda maliyet olarak da A tipi tamir harcının düşük olduğu görülmüştür.

- Elastisite modülü deneyinde A tipi tamir harcının sonucu yüksek çıkmıştır.A tipi tamir harcının maliyetinin de düşük olduğu görülmüştür

Özet: Demir çelik sektörü otomotivden, beyaz eşyaya, inşaattan gemiciliğe kadar pek çok sektör için girdi sağladığından, bu sektörde söz sahibi olmak her ülke için önem arz etmektedir. Son yıllarda yaşanan aşırı üretimden dolayı, üretici ülkelerin ihracat yapabilmeleri için daha planlı adım atmaları gerekmektedir. Demir çelik sektöründe lider konumdaki ülkelerden bazıları, diğerleri kadar yüksek üretim kapasitelerine sahip olmasa da; ihraç ettikleri ürün çeşitlerinden elde ettikleri gelirle diğerleriyle yarışabilmektedir. Bu çalışmada, en büyük on demir çelik üretici ülkenin ihracat miktarların gelecek 5 yıl için tahmini gri tahmin yöntemiyle yapılmıştır. Az veriyle doğru tahminler yapabilen gri tahmin yardımıyla ulaşılan sonuçlarla, sektörün geleceğine dair yön verici bilgiler elde etmek amaçlanmıştır.

Anahtar Kelimeler: Demir çelik, ihracat, gri tahmin

Giriş

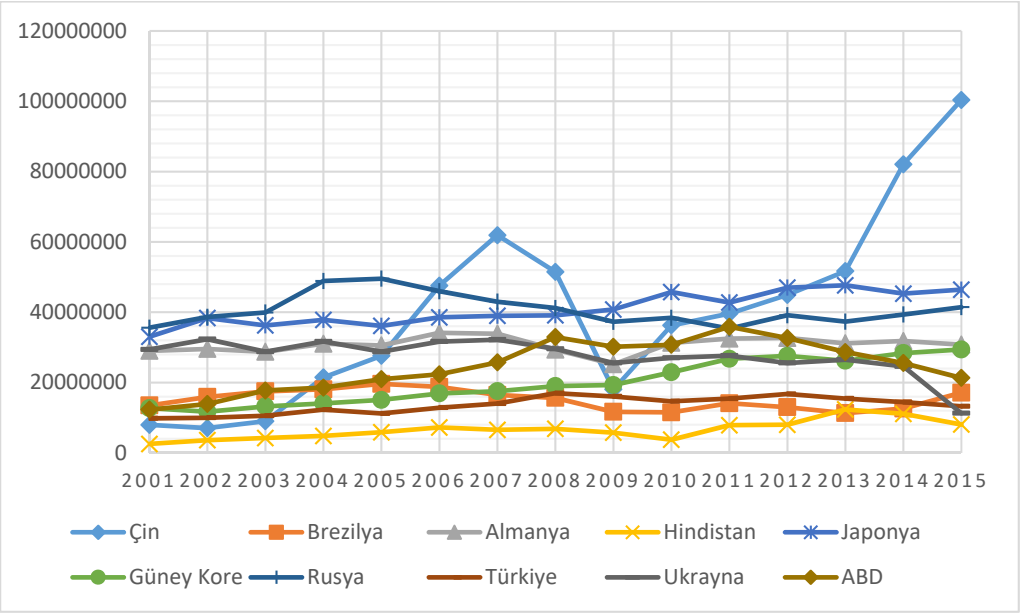
Demir çelik sektörü hemen her alanda gerek hammadde gerek yarı mamul olarak kullanımından dolayı hemen her sektörde önemli bir yere sahiptir. Son yıllarda inşaat ve otomotiv sektörü başta olmak üzere yoğun olarak kullanılmaktadır. Bu özelliğinden dolayı ülkelerin ticaretlerinde de önemli bir rol üstlenmektedir. Ülkelerin bütçelerindeki asıl getiri kaynağı olan ihracat kaleminde mutlaka yer alması gereken demir çelik ürünlerinin istatistiksel olarak incelenmesi ise bir gerekliliktir. Ülkelerin ihracat stratejilerine, özellikle önemli bir alt başlık olan demir çelik ürünleri ihracatına yön verebilmek adına ileriye dönük tahminler de en başta gelen istatistiksel araştırmalardır. Tahminler yardımıyla demir çelik sektöründe daha doğru adımların atılması amaçlanmaktadır. İşte bu çalışmanın amacı da bu konuda destek sağlayıcı olmaktır.

Literatür tarandığında bu alanda Aydemir vd. (2013), inceleme makalelerinde gri modelin kullanıldığı çalışmaları incelemişlerdir. İncelediklerı 1998-2013 yılları arasındaki çalışmalardan bazıları şunlardır: Hsu ve Wen (1998), asya-pasifik bölgesinde bölge uçuş pazarında bulunan on ülke çifti arasındaki havayolu yolcu trafiği tahminlemesi için birinci dereceden tek değişkenli gri sistem modeli GM(1,1) kullandılar. GM(1,1), ARIMA ve çoklu regresyondan daha iyi sonuç vermiştir. Hsu (2003), gri tahminleme yöntemlerini geleneksel yöntemler ile karşılaştırdığı çalışmanın sonucunda, entegre devre sistemleri için talep tahminlemesinde, gri tahminlemenin kısa dönemlik tahminler için daha iyi sonuçlar verdiğini göstermiştir. Yao vd. (2003) elektrik enerjisi tahminlemesi konusunda yaptıkları çalışmada çok kısa dönemler için elektrik talebinin tahminlemesine yönelik gri tabanlı adaptif bir tahmin modeli geliştirmişlerdir. Hsu ve Chen (2003) ise; Tayvan'ın enerji talebi için geliştirdikleri gri tabanlı tahminleyici ile daha iyi tahminleme doğruluğu elde etmişlerdir. Chiou vd. (2004) ise, Tayvan donanması yedek parça stoklarının kontrolü için yaptıkları çalışmada, sadece talep miktarını belirlemek için gri tahminleme modeli ile malzeme gereksinimi üzerinde bir çalışma yapmışlardır. Askari ve Askari (2011) ise, gri zaman serisi modeli olarak altın fiyatlarının tahminlenmesi üzerine bir çalışma yapmışlardır. Sonuçta, geliştirilen gri yöntemin daha iyi olduğunu sayısal bir örnek ile göstermişlerdir.

Ayrıca Ma vd. (2013) yüksek doğruluk veren gri tahmin ve parçacık sürü algoritmasıyla optimize edilmiş kayan mekanizmalı bir hibrit oluşturarak Çin'in demir cevheri ithalatı ve toplam tüketimini gelecek 5 yıl için tahmin etmişlerdir. Akay ve Atak (2007) ile Boran (2014), farklı çalışmalarda Türkiye'nin elektrik ihtiyacı ve doğalgaz tüketimini kayan mekanizmalı gri tahmin modeliyle tahminlemişlerdir. Pi vd. (2010) yaptıkları çalışmada Çin'in 1984-2006 yılları arasındaki enerji ihtiyacı ve üretim verilerini kullanarak 2007-2015 yılları için tahminler yapmışlardır. Bunun için 3-nokta ortalaması teknolojisi ve artık modifikasyonu yöntemleriyle iyileştirdikleri gri tahmin

 Copyright © International Science and Technology Conference (ISTEC)

modelini kullanmışlardır. Yin ve Tang (2013) ise yaptıkları çalışmayla gri tahmin modellerinin, Çin'in eksik ve tutarsız meslek verileriyle bile tahminde iyi sonuçlar verdiğini göstermişlerdir. Çin'deki 1998-2006 yıllarına ait toplam enerji, kömürden elde edilen ve temiz enerji kaynağı tüketim verilerini kullanarak yaptığı tahminleme çalışmasında Feng vd. (2012) gri tahmin modeli kullanmıştır. Hamzaçebi ve Es (2014), çalışmalarında gri tahmin modelinden daha iyi sonuçlar elde etmek amacıyla optimize gri tahmin yöntemini kullanmışlardır. Bu yöntemle 2013-2025 yılları için yıllık elektrik tüketimini tahmin etmişlerdir.



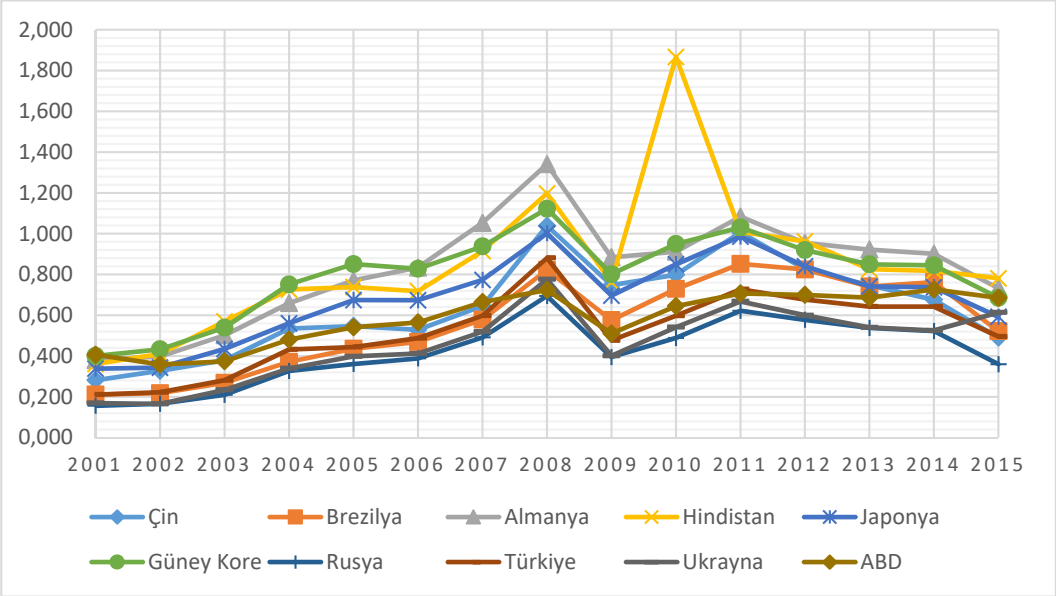
Materyal ve Metot

Çalışmada kullanılan veriler, Dünya Ticaret Örgütü - DTÖ (World Trade Organisation)'nün istatistik sitesinden elde edilmiştir. En çok üretim yapan ülkelerin sıralaması için, Dünya Çelik Birliği – worldsteel'in sıralaması referans alınmıştır.

Tablo 1: En çok demir çelik üretimi yapan ülkeler listesi

	2015 Yılı Üretim Miktarı (ton)	2015 Yılı İhracat Miktarı (ton)	2015 Yılı Birim Kazanç ($/ton)
1	Çin	Çin	Hindistan
2	Japonya	Japonya	Almanya
3	Hindistan	Rusya	Güney Kore
4	ABD	Almanya	ABD
5	Rusya	Güney Kore	Ukrayna
6	Güney Kore	ABD	Japonya
7	Almanya	Brezilya	Brezilya
8	Brezilya	Türkiye	Türkiye
9	Türkiye	Ukrayna	Çin
10	Ukrayna	Hindistan	Rusya

Tahmin için kullanılan ilk 10 ülkenin ihracat rakamları, 2001-2015 yıllarına ait demir çelik ürünleri ihracat verileridir. Veri olarak kullanılan ihracat rakamları ton cinsinden ihracat miktarıdır. Bu verilerin grafiği Şekil 1'de görülmektedir. Miktar olarak en çok üretim yapan ülke Çin'dir. Grafik incelenirse, miktar olarak en çok dalgalanma görülen veri de Çin'e aittir. Bunun dışında son yıllarda ABD, Ukrayna ve Hindistan'ın ihracatında düşüş görülmektedir.



Şekil 1. Demir çelik üreticisi ilk 10 ülkenin ihracat miktarları (ton)

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 2. Demir çelik üreticisi ilk 10 ülkenin ihracat miktarlarının değerleri ($-Amerikan doları)

Şekil 2'de yer alan ihracatın maddi değeri incelendiğinde Çin yine en yüksek ihracat değerine sahiptir. Daha düşük miktarlarda ihracat yapmasına rağmen, daha fazla maddi değerde ihracat yapan Güney Kore ve Almanya üst sıralarda yer almaktadır. Bu şekilde az ihracat yaparak, özellikle katma değeri yüksek ürün ihraç ederek, yüksek kazanç elde eden ülkelerin birim kazançlarının grafiği Şekil 3'de görülebilir. Birim kazancı en yüksek olan ülkeler ise Hindistan, Almanya ve Güney Kore'dir. Yüksek miktarlarda üretim ve ihracat yapan Çin ise bu ülkeler arasında birim kazanç olarak çok altlarda yer almaktadır.

Şekil 3. Demir çelik üreticisi ilk 10 ülkenin ihracattan elde ettiği birim kazançlar ($/ton)

Çalışmada 2016-2020 yıllarına ait 5 yıllık tahmin yapılmıştır. Tahmin için, Deng'in «Gri Tahmin» metodu tercih edilmiş, bu işlem için Matlab R2015a programında yazılan kodlar kullanılmıştır.

 Copyright © International Science and Technology Conference (ISTEC)

Gri sistem teorisi (GST - Grey System Theory) bir sistem teorisi olarak 1980'li yıllarda geliştirilmiştir. 1982 yılında Julong Deng tarafından yayınlanan "Gri Sistemlerin Kontrol Problemleri (Control problems of grey systems)" başlıklı makale (Deng, 1982), GST'nin bahsedildiği ilk makaledir.

Belirsizliğin ve eksik bilginin olduğu durumlarda anlamlı sonuçlar elde etmenin zorluğuna karşın, bunu sağlayabilme yeteneği nedeniyle tercih edilen bir çözüm teorisi olarak karşımıza çıkmaktadır (Deng, 1989). GST'ye dayanan gri tahmin (GP - Grey Prediction) yöntemi genellikle tek faktörlü, kısa dönemli ve eksik veri içeren sistemlerin tahminlemesinde kullanılmaktadır. GM(1,1) modelinde bütün veriler tahmin için kullanılır.

GP yönteminde, n değişkenli birinci dereceden bir model GM(1,n) şeklinde ifade edilirken, tek değişkenli birinci dereceden bir model ise GM(1,1) şeklinde gösterilmektedir. GM(1,1) modeli için gerekli adımlar şunlardır (Akay & Atak, 2007):

a. Adım 1: n terimli orijinal zaman serisi,

$$x^{(0)} = (x^{(0)}(1), x^{(0)}(2), x^{(0)}(3), ..., x^{(0)}(n))$$

şeklinde tanımlanırsa, düzensiz $x^{(0)}$ serisinin monoton artan $x^{(1)}$=($x^{(1)}(1)$, $x^{(1)}(2)$,…, $x^{(1)}(n)$) serisine dönüştürülmesi, AGO (Accumulated Generating Operator) kullanılarak yapılır. $x^{(1)}$ serisi ise

$$x^{(1)}(k) = \sum_{i=1}^{k} x^{(0)}(i)$$

denklemi ile hesaplanır. Eşitlikteki k (k=2,3,…,n) zaman periyodunu göstermektedir.

b. Adım 2: GM(1,1) için, birinci-derece gri diferansiyel denklemi,

$$x^{(0)}(k) + az^{(1)}(k) = b$$

olarak yazılırken, denklemdeki $z^{(1)}$ ise

$$z^{(1)}(k) = 0.5x^{(1)}(k) + 0.5x^{(1)}(k-1)$$

şeklinde hesaplanarak diferansiyel denkleme dahil edilir. Diferansiyel denklemde yer alan *a* gelişme katsayısı, *b* ise yön verici katsayı olarak nitelendirilir.

GM(1,1) modeliyle tahmin yapılabilmesi için, gri diferansiyel denklemi sağlayan *a* ve *b* değerlerinin tahmin edilmesi gerekmektedir. Bu tahmin işlemi için en küçük ortalama kareler tahmin yöntemine başvurulmaktadır. Buna göre $[a\ b]^T$ matrisi

$$\begin{bmatrix} a \\ b \end{bmatrix} = \left[B^T B\right]^{-1} B^T Y$$

denklemine göre hesaplanır. Burada

$$B = \begin{bmatrix} -z^{(1)}(2) & 1 \\ -z^{(1)}(3) & 1 \\ \cdots & 1 \\ -z^{(1)}(n) & 1 \end{bmatrix}$$

ve

$$Y = \begin{bmatrix} x^{(0)}(2) \\ x^{(0)}(3) \\ \cdots \\ x^{(0)}(n) \end{bmatrix}$$

 Copyright © International Science and Technology Conference (ISTEC)

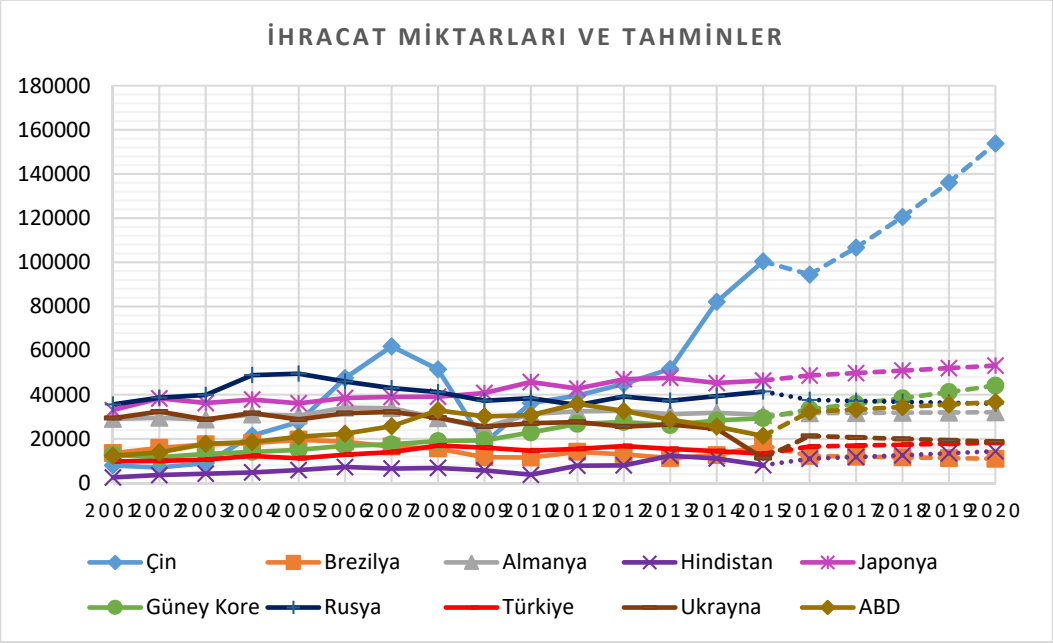
olarak denkleme dahil edilir.

c. Adım 3: *a* ve *b* katsayılarının tahmini değerleri hesaplandıktan sonra, gri diferansiyel denklemde yerleştirilip çözülerek gelecek değer tahminlerinde kullanılacak olan GP denklemi elde edilir:

$$\hat{x}^{(1)}(k+1)=\left[x^{(1)}(0)-\frac{b}{a}\right]e^{-ak}+\frac{b}{a}$$

Buradaki $\hat{x}^{(1)}(k+1)$, periyot k+1'deki $x^{(1)}(k)$ için tahmin değeridir. Zaman serisi $x^{(0)}(k)$ için hesaplanacak tahmin değerleri serisi ise, $\hat{x}^{(1)}(k+1)$ için ˆIAGO (Inverse Accumulated Generating Operator) uygulanmasıyla elde edilir. k=2,3,…,n için tahmin değerleri

$$\hat{x}^{(0)}(k)=\hat{x}^{(1)}(k)-\hat{x}^{(1)}(k-1)$$



olarak belirlenir.

Bulgular

Çalışmada tercih edilen gri tahmin yönteminin veriler için uygun olup olmadığı test edildiğinde, sadece Çin'in verilerinin uygun olmadığı görülmüştür. Deng'in makalesinde (Deng, 1989) önerdiği testlere göre Çin'in verileri aşırı iniş çıkışlı yapısından dolayı gri tahmin yöntemine uygun değildir. Buna rağmen Çin'in ihracatı için gri tahmin kullanılarak tahmin yapılmıştır. Diğer ülkelerin verileri ise gri tahmine uygundur.

Çin'in ihracatındaki artışın devam edeceği öngörülmektedir. 2016 yılı için bir düşüş ve sonrasında yükseliş öngörülse de, modele uyumsuzluğu sebebiyle tahminin MAPE oranı %46 civarında düşük bir seviyede kalmıştır. Çin harici diğer ülkelerde tahminlerin MAPE oranları %20'nin altında kalmış, bazılarında ise %10'un altında iyi sonuçlar elde edilmiştir.

Rusya, Brezilya ve Ukrayna'nın ihracatında düşüş beklenmektedir. Almanya ve Türkiye'nin ihracat miktarının ise neredeyse değişmeden kalacağı öngörülmektedir. Diğer ülkeler olan Hindistan, Japonya, Güney Kore ve ABD'nin ihracatlarında ise Çin'deki kadar yüksek oranda olmasa da artış beklenmektedir.

Şekil 4. Demir çelik üreticisi ilk 10 ülkenin ihracat miktarları (2001-2015) ve gelecek dönem tahminleri (2016-2020)

 Copyright © International Science and Technology Conference (ISTEC)

Sonuç

Son yıllarda Çin'in yüksek üretim ve ihraç miktarları demir çelik piyasasında fiyatların düşmesine neden olmuştur. Her ne kadar çalışmada kullanılan yönteme uymasa da Çin'in ihracatının artması beklenmektedir. Diğer ülkelerin ise üretimlerini ve buna bağlı ihracatlarını Çin kadar artıramayacakları görülebilmektedir. Bu sebeple üretim ve dolayısıyla ihracatını Çin kadar artıramayan ülkelerin, Çin'in sebep olduğu düşük fiyat ortamında ihracat yapabilmeleri için alternatif stratejilere yönelmeleri gerekmektedir. Türkiye'nin ve diğer ülkelerin; Hindistan, Almanya ve Güney Kore'nin yaptığı gibi katma değeri yüksek, az miktarda satışla yüksek gelir getiren ürünlere yönelmeleri doğru bir strateji olacaktır. Bu sebeple birim getirisi yüksek ürünlerle ilgili yapılacak çalışmaların sektöre faydalı olacağı görülmektedir.

DESIGN AND SIMULATION OF AN ELECTRIC VEHICLE DRIVEN BY SERIES DC MOTOR USING THE EUDC CITY CYCLE

Hakan Suvak
hakansuvak@gmail.com

Kemal Erşan
kersan@gazi.edu.tr

Today,the efficient use of energyhas gained importance. Savings from efficient use of energy is provided. Designers and users are referred to use more efficient energy system and resources. In this present study, the design, modeling and simulation of an electric vehiclecommonly being started to be used in twenty-first century have been carried out. In modeling, the dimensions of a vehicle suitable for use and the technical features of an electric motor used in today's electric vehicle technology have been take into consideration. The vehicle ismodeledusingthe EUDC (Extra Urban Driving Cycle)citycyclesimulations were performed. The cyclefor movement of the vehicle duringup to maximum 18kW power and 531Nm of torquethat needs account. The maximum current value that will meet the torque and power values were determined as 156.A. Also In this performed Matlab environment study, the characteristics of electric motor and vehicle movement are described.

ABSTRACT

Increase in electrical energy consumption and continuously expansion of electrical power grid result in increasing the fault current level in the grid. In order to clear these increased faults, circuit breakers and similar protection devices are not providing the required limitation. For the grid to continue proper functioning, fault currents have to be limited to the level which the protection devices are able to clear.

Fault current limiters are expected to consume minimum energy during the normal operation so that they become invisible in the grid. To ensure that, for example saturated core fault current limiters needed to be in saturated condition continuously. In this way, they are invisible with little energy consumption in saturated region during the normal operation. However, continuously saturating the cores causes continuous energy consumption from a DC supply or need to have superconducting cables. These requirements cause operating and/or installation costs to increase. This study aims to eliminate the need of the saturated cores by using the type of cores which are able to operate in the low initial permeability region. From the literature search; it was determined that SAE 1020 low carbon steel indicates low initial permeability region having constant magnetic flux density for low magnetic field intensity values. This material has been inspected to have enough initial permeability window for normal operation. For this reason, the design simulation has been carried using required shape, dimensions and associated parameters. When simulation results are inspected, it was determined that the design simulation supports the argument.

DESIGNING AND IMPLEMENTATION OF OUTDOOR TRANSFORMER SECURITY SYSTEM

Uğur Fidan, Naim Karasekreter

Afyon Kocatepe University, Engineering Faculty, Afyonkarahisar – Türkiye

ufidan@aku.edu.tr, karasekreter@aku.edu.tr

Abstract: In agriculture, quality and high productivity depend on irrigation of crops in dry months. Pressurized irrigation methods are preferred due to both natural water resources more efficiently as well as better quality agricultural production. This situation brings with it the demand for electricity at irrigation. For this reason, the farmers are in need of transformers supplied with their own resources owned or state. During unirrigated winter months, states cut the energy of electrical transformers to eliminate or minimize energy losses occurred in transmission lines. However, this condition has created serious problems in the transformer security. In the previous studies, it is seen that many products have used GSM / GPRS communications technology taken their energy from network or solar panels connected to transformer. But, common feature of these products is a system that triggered by latching of lid in the protection provided region and then generating alarm. In this study, it is focused on the designing of security system triggered in the case of unauthorized persons to start approaching or leaving the transformer pole and this is the only possible by using system integrated outdoor PIR (Passive Infrared Sensor) sensors. In addition, developed Transformer Security System (TSS) uses both GPRS and MMS infrastructure. In sleep mode, TSS register the GPRS network in 4 seconds by receiving from the Passive Infrared Detector (PIR) and taking 5 seconds during video recording with audio and visual stimuli. After then, with alarm status information and image recording is transferred to the central monitoring software. As a result, security in the field of medium voltage electrical transformer is provided by using M2M technology and the continuity of the structure of interconnected power lines are protected.

Keywords: Agricultural Irrigation, Electric Transformer, M2M, GSM/TCIP

Introduction

Agriculture is among the most important source of income for many countries in the world are located in the first row. In agriculture, the quality and high yield depends on irrigated crop in arid last month (Schultz, 1964). In agricultural irrigation systems, pressure irrigation methods are preferred due to both more efficiently in natural water using and more quality in agricultural production (Nakayama, 1991). This situation brings with it the demand for electricity for irrigation. For this reason, the farmers are in need of transformers supplied with their own resources owned or state. During unirrigated winter months, states cut the energy of electrical transformers to eliminate or minimize energy losses occurred in transmission lines (Patterson, 1996). This situation is created serious security holes in the transformers. In addition, harm is not just to stay with stolen material, but also it leads to an explosion of the transformer when it is energized (Bisak, 1991). Considering the studies conducted on the subject, short message services provided by the GSM operators are used in the study for remote monitoring of transformer substations to security purposes (Bekiroglu, 2009).The general characteristics of security system using GSM/GPRS communication are products taking their energy from connected to the network or solar panels and it works with the snapping of a cover in the provided protection region (Korkmaz, 2007). Eventually, in the case of attempt to steal the system becomes active and provides notification center or person. But if the transformer is reached the system is disabled by cutting the cables connected to latch. The limited capabilities of existing solutions and not respond to the needs required different solution approaches. In this study, it is focused on the design and implementation of a system triggered in case of the approach to non-authorized persons transformer pole and start out directly. This is the only possible by using system integrated outdoor PIR (Passive Infrared Sensor) sensors. Developed transformer Security System (TSS) uses both GPRS and MMS infrastructure. The purpose of this study is to provide the ensuring security in the field of medium voltage electrical transformer using M2M technology (Wu, 2011) for agricultural purposes and protecting the sustainability of the interconnected structure in power lines.

Materials and Methods

Passive Infrared Sensor (PIR) Sensor

Passive Infrared Sensor (PIR) is a kind of sensor can detect infrared radiation depending on the body temperature and translated into an electrical signal with the helping of lens. Physically, all objects having a temperature greater than absolute zero point (-273 centigrade degree) radiate energy according to their temperature. These rays moves strongly up to a certain distance and when entered the sensor's detection distance these emissions are converted into an electrical signal detecting by pyrocell (Hong, 2013). These sensors (general operating principle is shown in Figure 1) are categorized as two main groups; open and indoor area motion sensors. The indoor motion sensor has less sensitivity, detection angle and distance according the outdoor motion sensors. Outdoor motion sensors are commonly used in military border security system, fire alarm / warning systems and open area security systems. Considering the usage areas, it is appears to be important because of their properties such as the sensitivity of detection distance, animal distinguish and energy consumption. The sensing distance and operational stability of PIR sensors depend on the geometric shape of used Fresnel lens, focus distance between the lens and IR filter, the quality of IR filter, pyroelectric material and the stability of the amplifier and comparator circuit. The stability and distance of sensor is provided by the distance and placement angle between the Fresnel lens and pyroelectric sensor is adjusted in accordance with lens law.

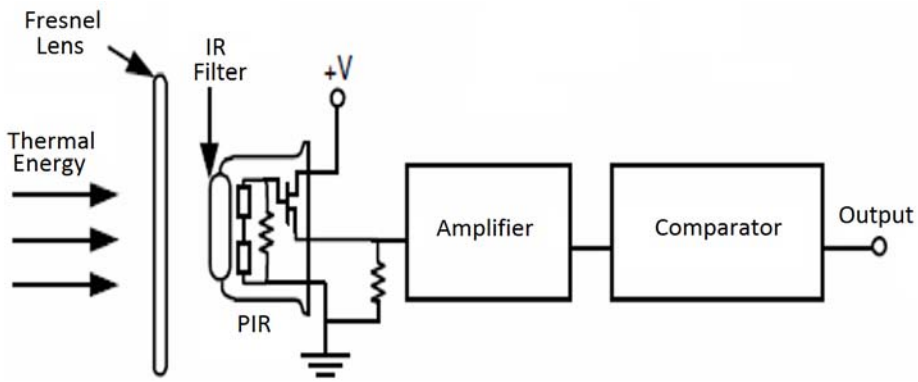

Figure 1. Operational principle of PIR Sensor

Transformer Security System

In the transformer security system (Figure 2), non-authorized persons input to the transformer pole when PIR sensor generates a warning sign. With taken this signal, video or photo of environment is taken and stored in external memory unit. Thanks to the communication unit on the system, the information is transmitted to main server locating in the monitoring center by establishing TCP/IP links over the GPRS/GSM line. The work integrity of the electrical transformer is checked using central monitoring unit or mobile devices by police and private security firms with individual users.

 Copyright © International Science and Technology Conference (ISTEC)

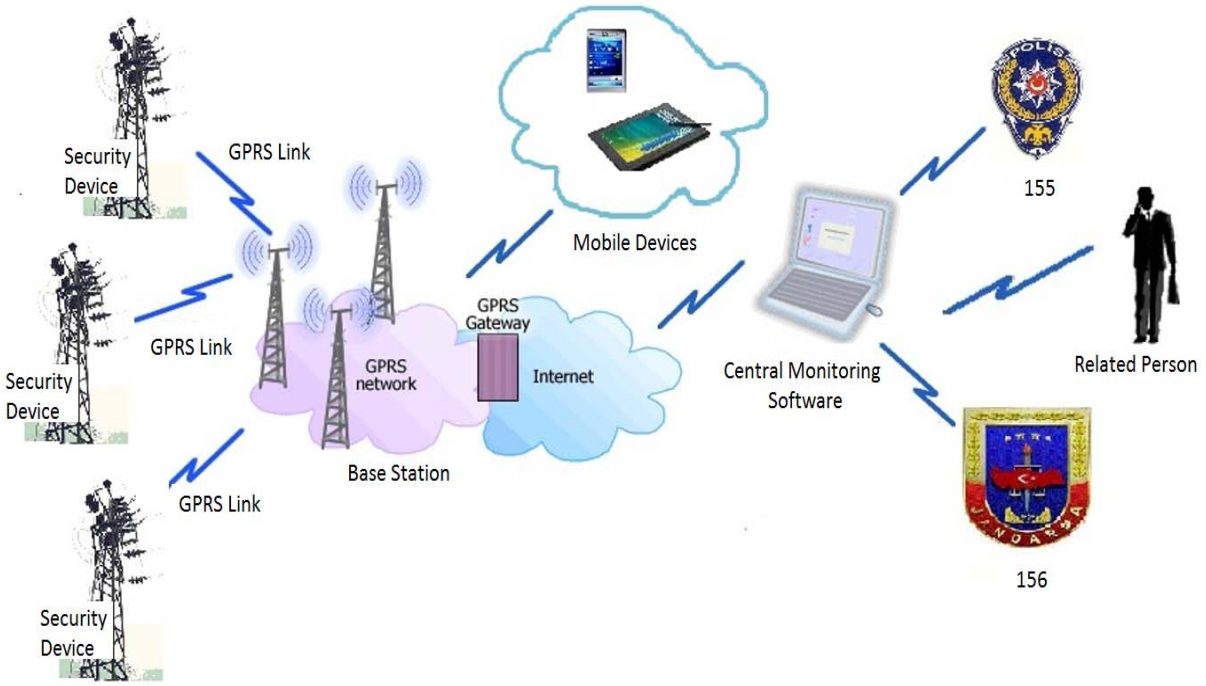

Figure 2. Transformer Security System

The working principle of Transformer Security System

The flow diagram of microcontroller software of TSS software is shown in Figure 3. After energizing the device, all elements included in the motion sensor and communication units are activated. Using GPS system device transmits information to monitoring center by taking information of coordinates and so ready for use. When alarm signal is came from the PIR sensor, videos / photos of environment are taken by activating IR illumination. The captured video or photo is stored in the external/internal memory unit. Then taken alarm information and video or photo is transmitted to server over the GSM/GPRS transmission line by connecting TCP/IP connection. When data transmission is performed successfully, the check information send by server is received and do not sent back. If data transmission is not performed successfully the error information is sent to the device by server. The device taken error information repeats transmission processing three times until it completes successfully. Alarm information received by successful software is displayed on the map in accordance with the coordinates of device. Alarm sending device can be controlled by an operator controlling system in the monitoring unit. In this control, it can be activated or passive by checking lighting on the device, audio devices or any mechanisms that can be added later. Alarm sending device without active or becomes inactive is also passed to state to produce a new alarm whether sleep mode taken out of event of alarm. As soon as the alarm generated by device is transmitted to center, if the connection has trouble for any reason, alarm information is stored in internal/external memory unit. When the device can also connect with the center, it transmits stored alarm information to center and a defined GSM number as MMS message.

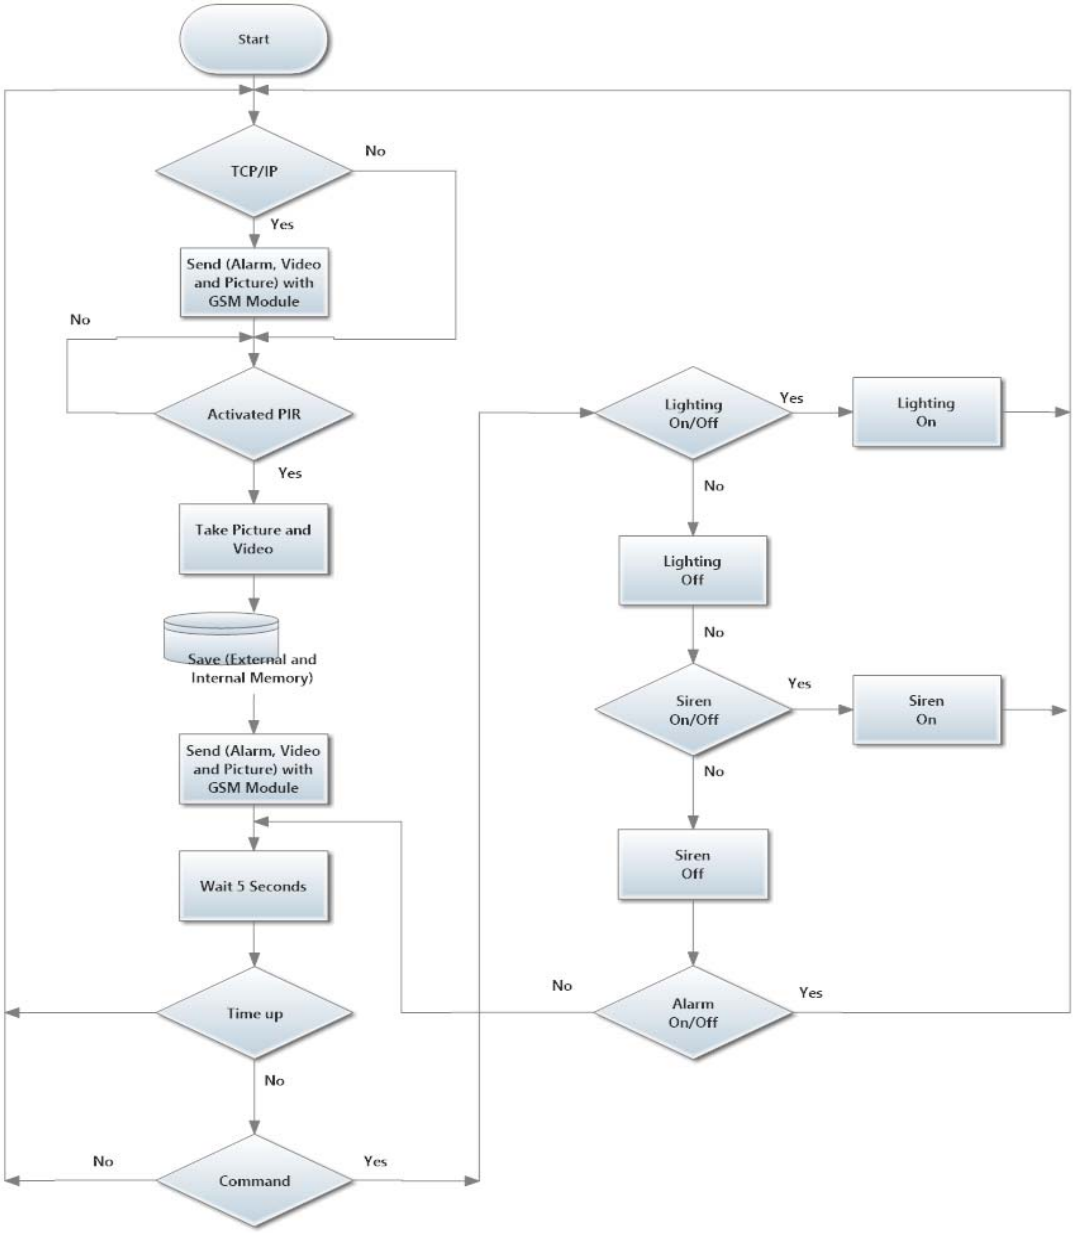

Figure 3. Flow diagram of system.

Results and Discussion

The features and hardware of designed outdoor security system are shown Figure 4. The device can be positioned in one or more points, produced alarm/warning and alerts with the helping of battery, taken photos or videos of environment and it is ready to communicate to introduced or will be introduced GSM number obtained all information via MMS. After energizing device, all elements on device are activated. After performing the task, device goes into sleep mode until the next warning sign. In this way, the device can be operated continuously for 3 years without being connected to any source of energy.

Technical Specifications

- IP65 Protection
- 25 Meters Sensing Distance
- Sensitivity to 40kg and Over Bodies
- GSM / GPRS / GPS Communication Unit
- $3.3V_{DC}$ - $4.1V_{DC}$ Operating Range
- Sleep Mode
- Audible Warning
- Projector
- Night Vision Lighting
- External MMC Memory

Figure 4. Outdoor Security System

The interface of central monitoring software monitored devices from hardware is shown in Figure 5. At the point where the device is located when its position is changed or theft, notification is given to individual users and central monitoring instantaneously and this notification has taken coordinates at the certain time intervals and moving device information 7/24 monitoring of electrical transformer is provided with the monitoring software within the visual and audio stimuli .

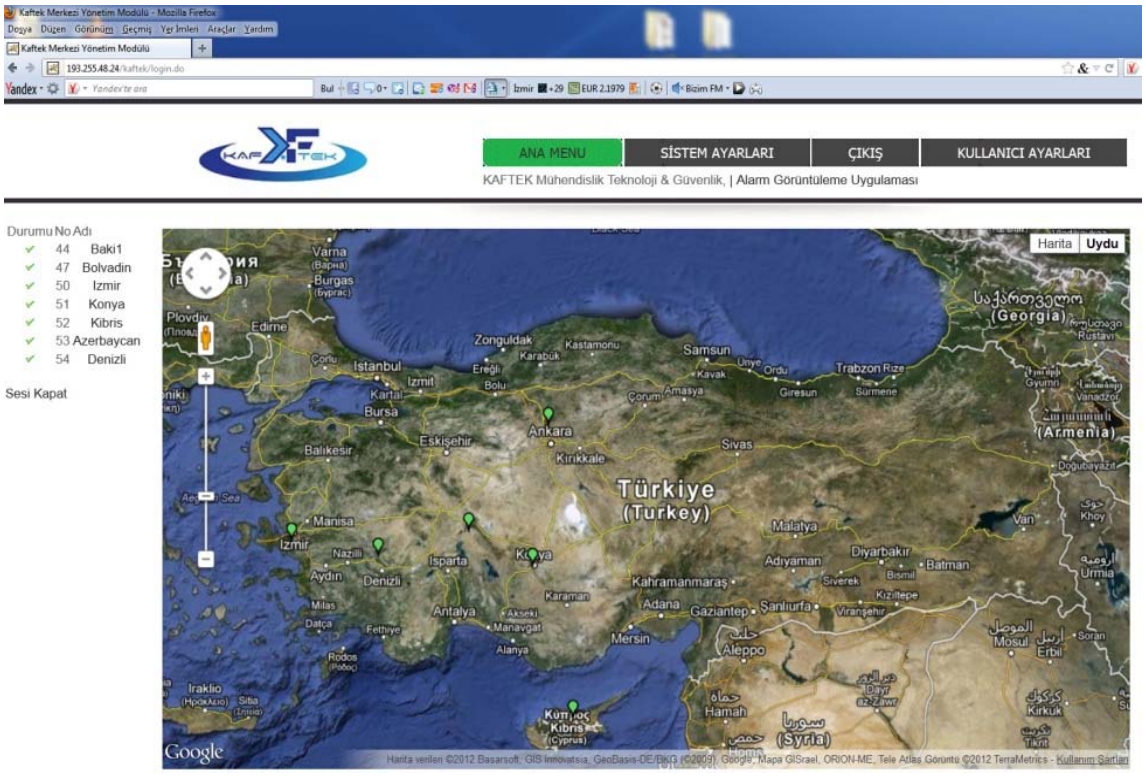

Figure 5. Central Monitoring Software

 Copyright © International Science and Technology Conference (ISTEC)

Alarm and images of performed system with taken data are shown in Figure 6. In sleep mode, TSS register on GPRS networks in 4 seconds by receiving warn sign from Passive Infrared (PIR) detector and is taken video record of environment with visual and audio stimuli for 5 seconds. Status information with alarm and image recording are transferred to the software of central monitoring. In this process, if the fails to record the GPRS network it is provided uninterrupted transmission of the data to the monitoring center through SMS. When analyzed images, they have shown to be very successful to distinguish the environment and people. But at night times, it is not achieved the desired distinctiveness from the night images with IR illumination. Finally, it is determined that IR filter should be used in night to get quality image appropriate wavelength in camera.

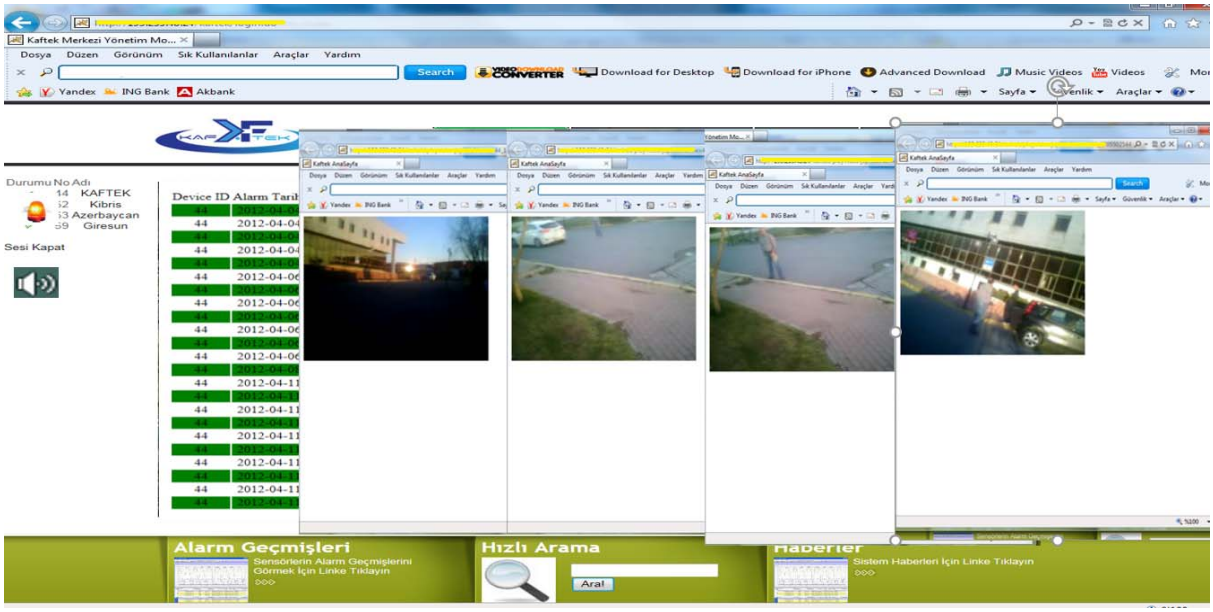

Figure 6. Integrated Test System

Conclusion

Agriculture plays a key role in many countries economy in the world. In agriculture effectively productivity depends on irrigation of crops in dry last month. For this reason, during unirrigated winter months, states cut the energy of electrical transformers to eliminate or minimize energy losses occurred in transmission lines. In this case, it has created serious vulnerability in transformers. The cooling oil and copper cables used in transformer attracts thieves due to higher selling prices. Performed transformer security systems use both GPS and MMS infrastructure. As a result, in this study a new monitoring system is realized for maintaining to continuity of the structure of interconnected power lines and security in the field of medium voltage electrical transformer used for agricultural purposes using M2M technology. The images are recorded in the server from the device that carries the distinction of being evidence in judicial review cases and with the lack of evidence, judicial process will provide the binding decisions faster. In the future studies, it will be continued in monitoring different species in their habitat and safety issues in the military field.

DETECTING CELLS USING IMAGE SEGMENTATION OF THE CERVICAL CANCER IMAGES TAKEN FROM SCANNING ELECTRON MICROSCOPE

Sevcan AYTAÇ KORKMAZ

Fırat University, Department of Electronic Technology, Elazığ- TURKEY

sevcanaytackorkmaz@gmail.com

Abstract: In this study, Matlab basic cell processes have implemented normal, benign and malign cervical cells taken from the Scanning Electron Microscope. These matlab basic cell process are binary gradient mask, dilated gradient mask, binary image with filled holes, cleared border, segmented, and outlined original. According to the results obtained after these operations, a difference has observed for malign image in images obtained from binary gradient mask, dilated gradient mask process. White space that is obtained after binary gradient mask and dilated gradient mask process applied to the malignant images were found to be much more than normal and benign images.

Keywords: Cervical Cancer, Matlab Basic Cell Process

Introduction

Cervical cancer is said that almost 288,000 deaths each year all over the world is the second most common cancer among women (Grubisic G, Klaric P, Jokanovic L, Soljacic Vranes H, Grbavac I, Bolanca I. 2009). cancer morbidity and mortality was determined 27 or earlier cancer can be reduced in the continuous case. In particular, such as the Pap smear for cervical cancer can be reduced. (Costa S, Negri G, Sideri M, Santini D, Martinelli G, Venturoli S, et al. 2007). Liquid-based cytology helps to reduce the percentage of 70-80 percent mortality of cervical cancer (Hanley KZ, Tadros TS, Briones AJ, Birdsong GG, Mosunjac MB.2009). The most important advantage of this test is simple and is the least invasive (Hoda RS, Colello C, Roddy M, Houser PM. 2005). These tests are effective and successful, although from what was expressed as the detection of preinvasive cervical lesions are located an average sensitivity of 55% (Saslow D, Runowicz CD, Solomon D, Moscicki AB, Smith RA, Eyre HJ, et al. 2002). invasive carcinoma detection accuracy is not perfect and show the different ranges of between 55% and 80% indifferent research (Benoit AG, Krepart GV, Lotocki RJ.1984). According to data provided by the American Cancer Society, about 3.6 million are classified as suspicious histological tests in the United States each year (Soost HJ, Lange HJ, Lehmacher W, Ruffing-Kullmann B.1991). .

There are only 8% of women are preinvasive lesions and invasive carcinoma during tissue biopsy 0.4%. 95% of the true negatives and provide relatively high (Nanda K,McCrory DC,Myers ER, Bastian LA, Hasselblad V, Hickey JD, et al.2000). Therefore, a more accurate by eliminating the additional steps of test criteria biopsy and colposcopy, HPV DNA screening can reduce the cost and patient discomfort. In this study is a developed different solution using Scanning Electron Microscopy (SEM) images. In this study, Matlab basic cell processes have implemented normal, benign and malign cervical cells taken from the Scanning Electron Microscope. These matlab basic cell process are binary gradient mask, dilated gradient mask, binary image with filled holes, cleared border, segmented, and outlined original.

Materials and Methods

Image segmentation is the first step of the automatic picture pattern recognition and image analysis problems (Costa S, Negri G, Sideri M, Santini D, Martinelli G, Venturoli S, et al. 2007). Segmentation is the separation to constituent parts of image (Hoda RS, Colello C, Roddy M, Houser PM. 2005). The image segmentation process aiming grouped according to common characteristics of pixels, is intended to be a minimum of diversity in accordance with the criteria selected group obtained. In the literature, there are many segmentation algorithms. The most commonly used algorithms are algorithms such as Fuzzy c Means, K-means, such as Watershed. Proposed system used in this study is show in Figure 1. Segmentation used in this study was performed in stage 6.

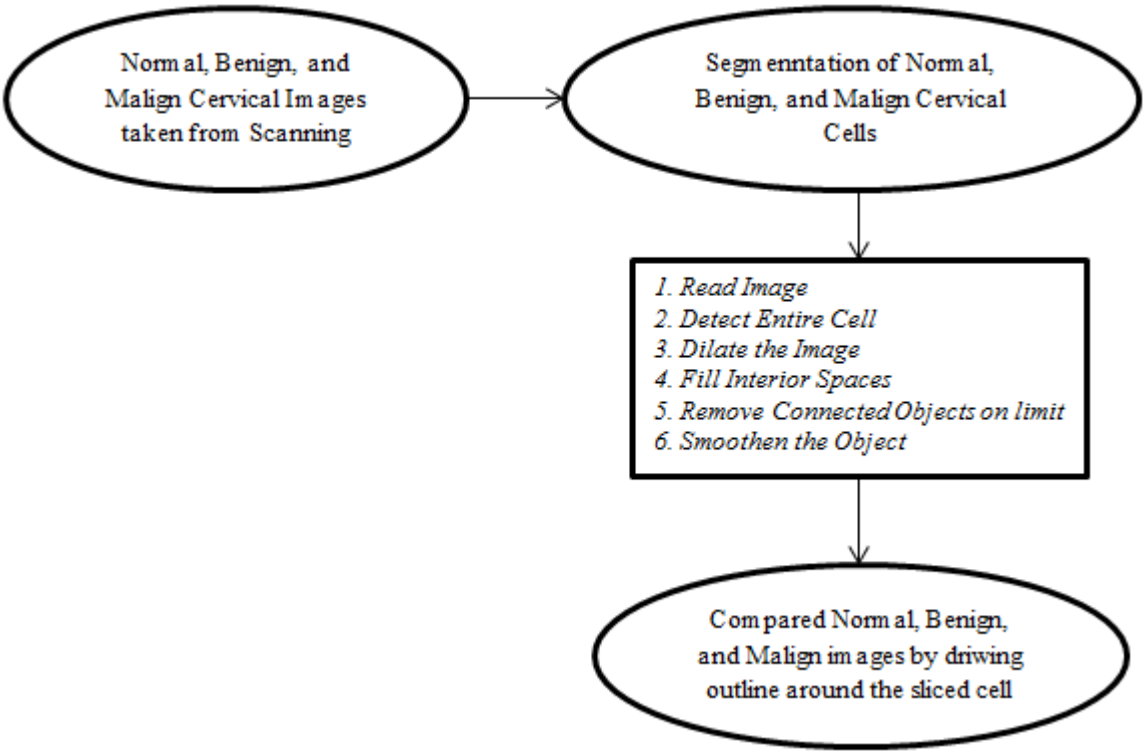

Figure 1. Proposed system in this study

Stage 1. Read Image

Read in the normal.tif, benign.tif, and malign.tif images, which are images of a cervical cancer cell (Mathworks. 1994-2016).

Stage 2. Detect Entire Cell

Cells are present in images. These images will detect cells. In other words, it is segmentation. Parts Separated image differs greatly in contrast to those in the background image. Changes in contrast can be determined by operators that calculate the gradient of an image. The gradient image can be calculated and a threshold can be implemented to create a binary mask containing the segmented cell. First, in this study is used edge and the Sobel operator to calculate the threshold value. Then, binary masks with threshold and edge cells are taken again (Mathworks. 1994-2016).

Stage 3. Dilate the Image

Binary gradient mask illustrates the route of high contrast in the image. These routes are not fairly that has strengthened the outline of the object of interest. Compared to the original image, the gradient of the line can be seen in the space surrounding the masked object. These linear gaps will lose if the Sobel image is expanded using linear structuring elements. The binary gradient mask is expanded using the vertical structuring element followed by the horizontal structuring element. The imdilate function is expanded the image (Mathworks. 1994-2016).

Stage 4. Fill Interior Spaces

It shows quite a nice gradient mask expanded cell lines, but they are still holes in the interior of the cell (Mathworks. 1994-2016).

 Copyright © International Science and Technology Conference (ISTEC)

Stage 5. Remove Connected Objects on limit

The cell shas been successfully segmented. Any objects that are ligated to the border of the image can be eliminated using the imclearlimit function. The connectivity in the limit function was set to 4 to eliminate diagonal connections (Mathworks. 1994-2016).

Stage 6. Smoothen the Object

Finally, the image is shown for a smoother more natural look of the piece object. Cervical cancer images are created the diamond structuring element using the streel function. An alternate method for demonstrate the sliced object would be settle an outline around the sliced cell. The outline is composed by the bwperim function (Mathworks. 1994-2016).

Results and Discussion

In this study is a developed different solution using Scanning Electron Microscopy (SEM) images. In this study, Matlab basic cell processes have implemented normal, benign and malign cervical cells taken from the Scanning Electron Microscope. These matlab basic cell process are binary gradient mask, dilated gradient mask, binary image with filled holes, cleared border, segmented, and outlined original. According to the results obtained after these operations, a difference has observed for malign image in images obtained from binary gradient mask, dilated gradient mask process. White space that is obtained after binary gradient mask and dilated gradient mask process applied to the malignant images were found to be much more than normal and benign images.

Abstract: In the literature, studies in security field get important day by day. As a result of this situation the importance of image processing is also increasing. As an example, today, 100 hours of video streams are uploaded to Youtube per minute averagely. For this reason, processes like tracking, detecting and counting are getting important for both people and objects. There are different types of algorithms for all of these processes. Mean Shift Algorithm which is used in this paper is widely used in tracking. In this study, a video stream is captured from a definite camera. In this video stream, a person who is dressed in one color from top to toe and who is separated clearly from single color background is walking for a while and then he/she suddenly falls. After that, the person gets up and continues walking. Mean Shift Algorithm is used for tracking and detecting the falling moment of the person. Running Average Background Substraction Algorithm is used to find the location of the walking person. OpenCv 2.4.5 library is used for applying Mean Shift Algorithm. Finally success rate of Mean Shift Algorithm is measured.

Keywords: Mean Shift Algorithm, Running Average, falling person, detection, image processing.

1.Introduction

Image processing is the concept of processing of digital images and forming new images for special purpose. A lot of algorithms are developed in the field of image processing. One of these algorithms is Mean-Shift Algorithm (MSA). It is simple as well as stable. So it has important success in object tracking. MSA is a recursive procedure. It finds local extreme of a similarity measure between the color histograms or kernel density estimates of target image. Its application areas are computer vision, cluster analysis and image processing.

In recent years, a great deal of implementations using MSA have been proposed. In[1], detecting text in image was used with texture-based method. Textural properties of the text was indicated by Support Vector Machines (SVM). Then, MSA was continuously applied to text area. In this study, there was combination of MSA and SVM. But this method faced a problem classification of low contrast images or small size text.

In[2], It was provided appropriate generalization of MSA acts as if k-means clustering algorithm in special cases. Cluster analysis is treated as a deterministic problem of finding a fixed point of mean shift that characterizes the data. Applications of Clustering and Hough transform were shown. MSA was considered as an evolutionary strategy.

 Copyright © International Science and Technology Conference (ISTEC)

In[3], problem of selecting appropriate scale using MSA was handled for blob tracking. Detection of blob scale using differantial scale-space filters was started with Lindeberg theory. To analysis mode at this scale-space, an efficient mean-shift prosedure was identified. Each mode represented position of location and scale of the blob. Finally two stage mean-shift algorithm was realised.

In[4], mean-shift based space analysis technique was developed. Combination of discrete data and recursive mean-shift procedure and advantage of identificatin modes of the density was proved. Relation with mean-shift procedure was realised from Nadaraya-Watson estimator to Kernal regresssion.

In[5], a video was captured from moving camera and a real-time tracking was realised. Tracking process was applied with MSA. The algorithm found which position is the most probable for tracking of target object in current frame. Difference between target object and target candidates was stated with metric derived. Theorical analysis of this approach was demonstrated.

In[6], a novel, simple computing and distinctive similarity scale was proposed. The novel similarity scale helped MSA for tracking of more general motion. Gauss transform was used to reduce the copmputation complexity. So, very effecient and stable algorithm was realised. This algorithm was tested on several image sequences and stable and reliable results were achieved.

Human tracking process in video streams is still a difficult problem. There were many unsuccessful stuation of MSA in human tracking. In[7], mean-shift tracking approach was presented against to the unsuccessful stuation. This study presented a solution to occlusion pedestrians problem.

The main objective of this paper is to implement detecting of a person's falling moment. In this paper, a video stream is captured from fixed camera to implement MSA. In the video stream, there is a person who is dressed in one color from top to toe and separated clearly from single color and fixed background. The person is walking for a whike in a certain direction and suddenly falls. Then the person gets up and continues walking. Background substruction operation is generally done for motion detection in video stream is captured from fixed camera. Running average algorithm is used for background substraction. Then MSA is used, for tracking and detecting. The application is realised Microsoft Visual Studio environment using OpenCV library and the success rate of the application is measured.

The rest of the paper is organized as follows : materials and methods, running average algorithm, mean-shift and cam-shift algorithms, results and discussion and conlusion.

2.Materials and Methods

Flowchart of this application is given in Figure 1. First of all, histogram is calculated. Hue value of HSV color space is used to calculate histogram. Then, running average algorithm is used for background substraction operation. MSA is used iteratively for tracking and detecting of falling moment. Number of frame controls the iteration. Finally, cam-shift algorithm is applied for detecting changeble size of the tracked person.

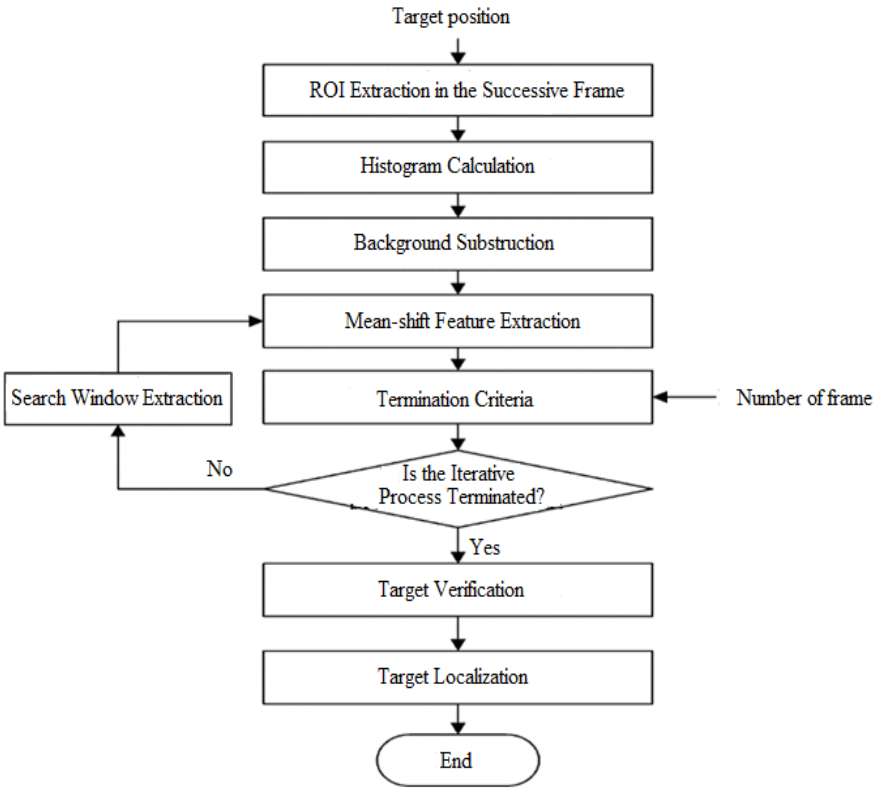

Figure 1: Flowchart of detecting of a person's falling moment with mean shift algorithm.

2.1 Running Average Algorithm

Background subtraction can be named Foreground Detection Technique. Background subtraction is a widely used approach for detecting moving objects in videos from static camera [8] and it provides important cues in computer vision such as

- surveillance tracking
- human poses estimation.

But, background subtraction is generally based on a static background, is not applicable in real environments. Wind, rain or illumination changes brought by weather, static backgrounds methods have difficulties with outdoor scenes.

Purpose of the running average algorithm is to keep the dynamic of the background image[9]. So, in this study, running average algorithm is selected for background substraction.

Background is calculated by equation 1.

$$B_{(t+1)} + 1(x,y) = (1-\alpha) * B_t(x,y) + \alpha * F_t(x,y) \quad (1)$$

α:learning rate

F_t(x,y): Funtion used to obtain a background image (must be the gray level) of any pixel values.

B_t (x,y): Any the pixel value of the background image of the previous image.

$B_{(t+1)}$(x,y) : Has been obtained any pixel values of the background image for the current image.

The problem arises when processing for the first two images. So, we start with the second image frame. The first image as the background for the second image frame.

 Copyright © International Science and Technology Conference (ISTEC)

2.2 Mean-Shift Algorithm

Tracked object is considered as a set of points in MSA. The set of points is histogram of pixel or histogram backprojection on image frame. Maximum pixel intensity is claculated within determined a small window or a cycle. First case is shown by blue cycle and named C1, center of C1 is C1_o are shown in Figure 2. Intensity center of blue cycle(C1_r) is calculated. C1_o and C1_r are checked. If they are not overlap, C1_o is shifted toward C1_r. New center is computed again.

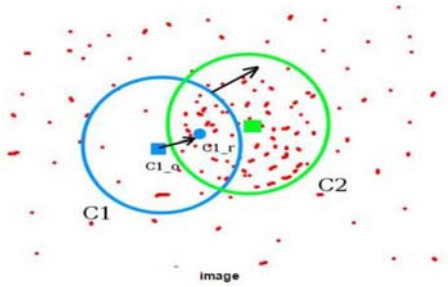

Figure 2: Example cycle to explain mean-shift algoritm[10].

As long as overlaping does not occur, cycle shifting process is continues. When overlap is realised, distribution maximum pixel is found. Green cycle is named C2 which is stable for video streams. When the object moves, histogram changes. Finally, MSA runs iteratively to determine maximum point. Target object must be determined for using this algorithm and histogram extraction must be performed. Backproject can be calculated for each image frame. RGB color space is converted to HSV color space. Hue value of HSV color space is only used. Noise pixels are ignored by InRange() function.

2.3 Cam-Shift Algorithm

When working with MSA, the object is tracked same size window all time. When the object is closed to camera or moved away from camera size of the object changes and problem occurs. Tracked object and track window must be changeable. MSA is working with camShift() function in Opencv library. Firstly MSA is applied. Track window is updated by equation (2) [10].

$$s = 2x\sqrt{\frac{M_{00}}{256}} \tag{2}$$

MSA is applied between new window and previous window. This operation continues as long as operlap is realised. Cam-Shift Algorithm is same with Mean-Shift Algorithm in Opencv library. The only difference between them is track window's being changeable or not.

3.Results and Discussion

A video stream which is has a resolution of 240x320 pixels and duration of 67 seconds is captured from a fixed camera to implement MSA. Unsuccessful results are obtained only during 17 seconds. The person is in the track window in 7 seconds of the 17 unsuccessful seconds. But track window size is larger than size of the person. Although the person is not seen in rest of the 10 seconds, the algorithm finds histogram value same as the person's histogram in the video stream, then tracking process continues. These results imply that 75 percent success rate is obtained. 5 best and worst image results are demonstrated in Table 1.

 Copyright © International Science and Technology Conference (ISTEC)

Table 1: Good (left column) and bad (right column) results.

Good Results	Bad Results
	

MSA is successful on detecting of person's falling time. Reason of unsuccessful results is shadow of the moving person. When shadow occures, the algorithm calculates histogram of the person and the shadow together. Because shadow is dark and person dresses in dark color.

4.Conclusion

We have observed that as long as size of tracked object is stable and is moving through certain direction, success rate can be higher. When we are faced such a problem, cam-shift algorithm is engaged. We have observed that change of lightening affects success rate. We have considered that results can be much better on better lightening environment. Cam-shift algorithm works successfully on tracking and detecting operation regardless of the person position. Since size of tracked object is calculated dynamically. When color difference between background and tracked object is higher, success rate is getting higher.

 Copyright © International Science and Technology Conference (ISTEC)

We have also observed that MSA is very successful using histogram value for tracking process. In the future work, success rate of the MSA can be increased by using together different color spaces such as gray, binary, RGB for calculating histogram.

DETECTION THE CERVICAL CANCER

Sevcan Aytac Korkmaz
sevcanaytackorkmaz@gmail.com

Abstract: The aim of this article is to provide early detection of cervical cancer by using both Atomic Force Microscope (AFM) and Scanning Electron Microscope (SEM) images of the same patient. When the studies in the literature are examined, it is seen thatthe AFM and SEM images of the same patient are not used together for early diagnosis of cervical cancer. AFM and SEM images can be limited when using only one of them for the early detection of the cervical cancer. Therefore, multi-modality solutions which give more accuracy results than single solutions have been realized in this paper. 3x180 AFM and 3x180 SEM image sets have been taken from Firat University Science Faculty Nanotechnology and Scanning Electron Laboratories, respectively. Optimum attribute space has been obtained by Discrete Wavelet Transform (DWT) method applying to the 3x180 AFM and SEM images.

DETERMINATION OF BORON IN HAZELNUT VARIETIES WITH THE ADDITION OF SORBITOL BY USING ICP-OES AND ULTRASONIC NEBULIZATION AFTER MICROWAVE DIGESTION SYSTEM

Mustafa Şahin DÜNDAR, Hüseyin ALTUNDAĞ, Gülşah TUNCA

e-mail: dundar@sakarya.edu.tr

Abstract: Turkey is generally origin of hazelnut for cultivated and wild varieties and has suitable ecological conditions for growing up high quality hazelnut varieties. Also hazelnut is very important commercial product for Turkey and is widely used in the food industry (1,2). Boron is an essential nutrient for plants and an essential element for many organisms, but can be toxic to aquatic and terrestrial organisms above certain concentrations (3). The aim of this research, Boron content of four varieties of Hazelnut (*Corylus avellana L.)* from Sakarya were determined by using inductively coupled plasma optical emission spectrometry (ICP-OES) with ultrasonic nebulization (USN). This method based on microwave digestion system and reduced memory effect of Boron by using sorbitol. Different conditions were optimized for this method. Four hazelnut varieties, eight soil samples and certificated referance material (NIM-GBW10012) were analyzed. Results revealed that the Turkish hazelnut is a good natural source of boron. The obtained results will be presented in International Science and Technology Conference (ISTEC 2016).

DETERMINATION OF CONTROL LIMITS FOR ASH CONTENT OF CLEAN COARSE COAL PROCESSED BY HEAVY MEDIUM DRUM

Adem TAŞDEMİR

Eskişehir Osmangazi University, Department of Mining Engineering, Eskişehir-TURKEY

atasdem@ogu.edu.tr

Abstract: In this research, control limits of the ash content of clean coarse coal product (+18 mm) produced by a heavy medium drum at a coal preparation plant in Turkey was investigated. The importance of data normality and data independence to detect correct control limits of process control chart were shown for ash content of coal product. One year ash data obtained in 2010 which had non-normal distribution and autocorrelated were found to obey lognormal distribution well and ARIMA(1,0,1) model was the best model to remove autocorrelation. Assuming normal distribution and independence, the control limits of ash content were determined as UCL=16.97, CL=12.85, LCL=8.74 with original ash data. When considering only data non-normality and ignoring autocorrelation, the ash control limits were detected as UCL=17.49, CL=12.72, LCL=9.25. On the other hand, the control limits of ash content were implemented as UCL=19.56, CL=12.72, LCL=8.27 if we consider both lognormal distribution and autocorrelation by ARIMA(1,0,1) model. In addition, number of out-of-control points for ARIMA residual chart considering both data non-normality and auto-correlation were less than those obtained by control chart using original data.

Keywords: Non-normality, Autocorrelation, coal preparation, heavy medium drum, ARIMA chart

Introduction

Process control charts (SPCs) are widely used method to monitor and to control of a quality characteristic during an industrial production stage. Control charts provide to monitor the continuous variations in the process and can be applied and interpreted easily (Montgomery, 2011). Its application is based on two basic assumptions. These assumptions are that the data investigated obey normal distribution and independent, i.e not autocorrelated. However, these assumptions should be taken into account and verified prior to generate control charts. How data normality and autocorrelation affect the performance of control charts have been revealed in many scientific papers (Stoumbos and Reynolds, 2000; Castagliola, and Tsung, 2005; Alwan and Roberts, 1988; Bisgaard and Külahçı, 2005; Wheeler, 1991; Srinivasan, 2001; Vermat, 2006; Borror et. al., 1999; Montgomery, 2011; Montgomery, and Runger, 1997; Chou et. al., 1998; Reynolds and Lu, 1997; Lu and Reynolds, 1999; Zhang, 1997; Testik, 2005; Smeti, et. al., 2006, Psarakis and Papaleonida, 2007). It was reported in these works that, if the assumptions are not verified, the control limits determined would not be represent the process correctly and therefore, the resulted SPCs are interpreted wrong by the applicants and incorrect decisions are given about the process. If either of these assumptions is not confirmed, control limits estimated based on original data may not correctly capture the true unusual points. Hence, estimated control limits calculated by verifying assumptions would be incorrect and as a result control charts could be interpreted wrong in terms of their control limits and hence out of control points.
To avoid these mistakes, the data should be checked for data normality and autocorrelation.

This research aimed to determine the control limits in terms of ash content for +18 mm clean coarse coal produced by heavy dense drum device. The application of SPC charts on coal production have carried out by some researchers (Elevli, 2006; Elevli and Behdioğlu, 2006; Deniz and Umucu, 2013). Some studies have also shown that both data normality and autocorrelation affect SPC results seriously in mining and mineral processing applications (Bhattacherjee and Samanta, 2002; Samanta and Bhattacherjee, 2001 and 2004; Elevli et. al., 2009; Taşdemir, 2012 and 2013; Taşdemir and Kowalczuk, 2014)

The statistical properties of ash content data used in this research were investigated in detail by Taşdemir (2016a) and determined that the data obey to log normal distribution well instead of normal distribution and also not independent, i.e. autocorrelated. The autocorrelation between consequent ash content data was modelled best by ARIMA(1,0,1) model to achieve data independence (Taşdemir, 2016a). The control limits of SPC under data normality and independence assumptions and also under verification of these assumptions were presented and compared. As a result, correct control limits considering data normality and autocorrelation for the ash content of

 Copyright © International Science and Technology Conference (ISTEC)

+18 mm clean coal produced by heavy medium drum were determined and the correct out of control points were found by ARIMA residual chart.

Materials and Methods

To determine the control limits of ash content for +18 mm coarse clean coals data produced by heavy medium drum, daily data which were obtained in the year of 2010 were supplied by Ege Linyitleri İşletmesi (ELİ) from the Dereköy coal preparation plant in Soma, Turkey. This coal preparation plant has about 4.8 million ton/year coal production capacity. Fig. 1 shows the simplified flowheet of it from Şengül (2008) (Taşdemir, 2016a and 2016b). Rather detailed information about the production stage were given at the first part of this study (Taşdemir, 2016a) and also in (Taşdemir, 2016b). The +18 mm clean coarse coals are floated in the first compartment of the drum and it is shown with a star symbol in Fig. 1. Totally 335 ash content data obtained from the production in 2010 were used in order to determine its control limits.

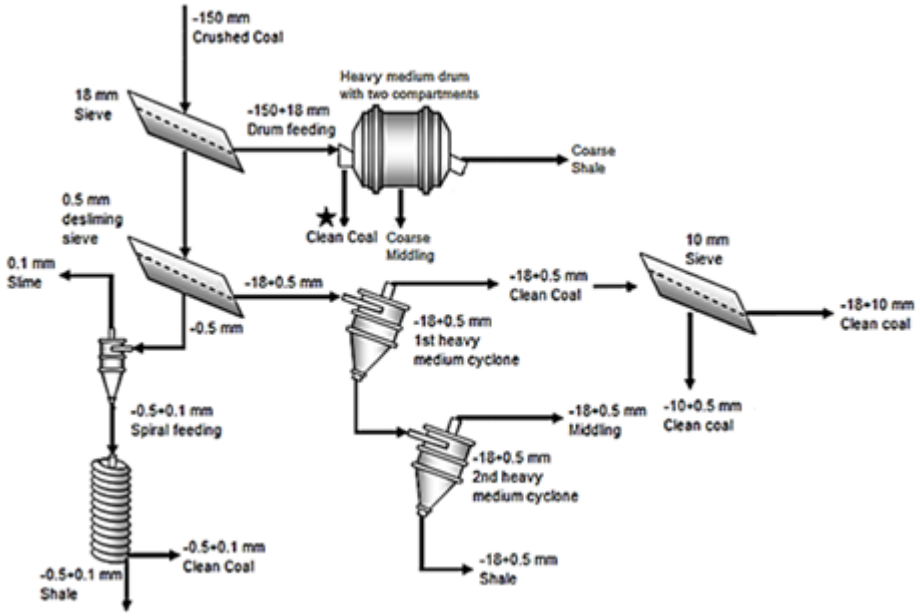

Figure 1. Modified flowsheet of Dereköy coal washing plant from Şengül (2008) and the +18 mm coarse clean coal product of heavy medium drum shown with a star symbol.

During the determination of the control limits of SPC charts, trial versions of Statgraphics XV and Minitab 16.0 softwares were used and SPC charts were generated. The data were found to obey lognormal distribution well to achieve data normality and the ARIMA(1,0,1)time series model was determined the best model based on its lowest AIC (Akaike Information Criterion) to remove autocorrelation (Taşdemir, 2016a). More detailed information for the determination of ARIMA time series models were already documented very well by Box and Jenkins (1976), Montgomery et al., (2008) and Montgomery & Runger (2011).

In this paper, the SPC charts generated under assumptions and verification conditions were presented in order to show the differences of results in terms of control limits and number of out of control points by using the data properties from Taşdemir (2016a).

Results and Discussion

Summary of statistical properties of ash content data

As stated above section, the ash content data have not obeyed normal distribution and lognormal distribution was suitable to make distribution normal (Taşdemir, 2016a). Fig. 2 compares the probability plots of normal and log transformed ash content data with resulted Anderson darling (AD) normality test statistics. The *p* value of normal distribution is very smaller than 0.05 (<0.005) indicating that the ash content data were not normally distributed. On the other hand, *p* value of log transformed ash content data distribution is 0.176 *(p>0.05)* showing that the data are represented by log normal distribution well after logarithmic transformation

 Copyright © International Science and Technology Conference (ISTEC)

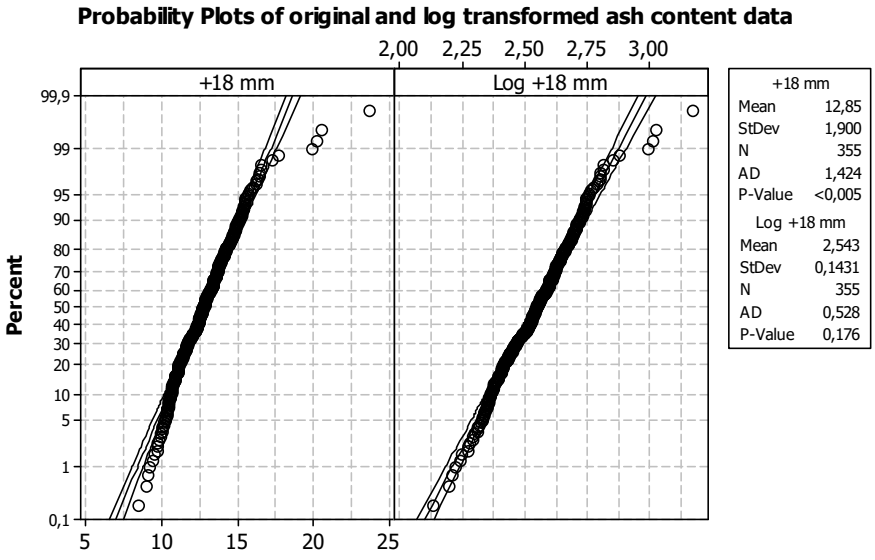

Figure 2. Probability plots of original and log transformed ash content data

Parameters of ARIMA time series model for log-transformed ash content data

After achieving data normality by log transformation, The log transformed ash content of +18 mm clean coal produced by heavy medium drum was found to be modelled by ARIMA(1,0,1) or ARMA(1,1) model well (Taşdemir, 2016a) and the details of model determination can be found there. Table 1 summarizes the ARIMA(1,0,1) model parameters.

Table 1: ARIMA(1,0,1) model summary for log-transformed ash content data (Taşdemir, 2016a)

Parameter	*Estimate*	*Stnd. Error*	*t*	*p value*
AR(1), ϕ	0.7688	0.074445	10.3271	0.000000
MA(1), θ	0.4609	0.102183	4.51042	0.000009
Mean, μ_0	2.5428	0.015762	161.324	0.000000
Constant, δ	0.5879			
WNV*, σ_a^2	0.0166			

*: white noise variance

The ARIMA (1,0,1) time series model is modelled by Eq. 1 as given the following (Castagliola and Tsung, 2005):

$$X_t = (1-\phi)\mu_0 + \phi X_{t-1} + \theta a_{t-1} + a_t \quad (1)$$

Where X_t is the observation at time t=1, 2, ,…, a_t is the random noise or white noise at time =1, 2, ,… which is assumed to have mean of zero (0) and standard deviation of σ_a, ϕ is the autoregressive parameter of the model which corresponds to p term in the model, θ is moving average parameter which corresponds to q term in the model and μ_0 is the nominal mean of the process (Castagliola and Tsung, 2005). The constant, δ, parameter in the model was calculated from $(1-\phi)\mu_0$.

By using these parameters, following ARIMA(1,0,1) time series model determined for the log transformed ash content of +18 mm clean coal produced by heavy medium drum is given in following Eq. 2 (Taşdemir, 2016a):

$$X_t = 0.5879 + 0.7688X_{t-1} + 0.4609a_{t-1} + a_t \quad (2)$$

Where, X_t is the log transformed ash content value at time, a_t is the random noise which have distribution of $N(0, 0.1289)$.

 Copyright © International Science and Technology Conference (ISTEC)

Control limits under data assumptions

Table 2 summarizes the individual chart (I-chart) parameters obtained for the original ash content of +18 mm coarse coal under data assumptions, i.e. without data transformation and independence verification. Process sigma (σ) in Table 2 was estimated from average moving range ($\overline{MR}$) for the sample size of 2. The generated SPC and control limits under these assumptions is presented in Fig. 3. According to the Fig. 3, upper control limit (UCL) and lower control limit (LCL) were determined as 16.97 and 8.74 respectively while centre line was 12.85 which corresponded the mean of ash content data. Six points are out of control limits from UCL and one point is below the LCL.

If we assume that the ash content data had normal distribution and not autocorrelated, the observations of 31, 32, 53, 214, 347 and 348 were beyond the $+3\sigma$ while observation 208 was below the -3σ (Fig. 3).

Table 2: I-chart parameters of original ash content data of +18 mm clean coarse product by heavy medium drum

I-Chart Parameters	*Values*
$UCL=+3\sigma$	16.97
$CL=\ \bar{X}$	12.85
$LCL=-3\sigma$	8.74
$\sigma(\overline{MR}/1.128)$	1.37
$\overline{MR}$	1.55

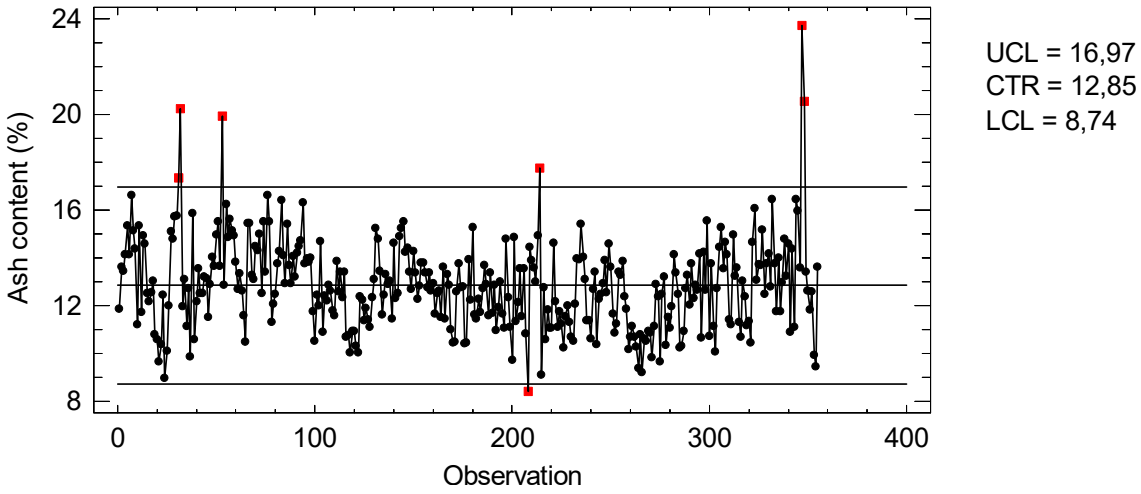

Figure 3. I-chart under normality and autocorrelation assumptions and its control limits

Control limits under verification of data normality and autocorrelation assumption

I-chart parameters after verifying the data normality by log transformation are presented in Table 2 with the corresponding original and transformed metric values. As presented in Fig. 2, the mean of log transformed ash content corresponded to 2.543 in transformed metric. Therefore, back transformed mean of ash content was equal to 12.72 in original metric.

Fig. 4 presents the control limits of ash content on SPC chart generated after data normality as in transformed metric in Fig. 4a and its back transformed metric, i.e. original unit in Fig. 4b. After log transformation, upper control limit (UCL), center line (CL) or (CTR) and lower control limit (LCL) are found as 2.86, 2.54 and 2.22 in logarithmic scale respectively. Since the log transformed values may not be meaningful or not be preferred, back transformed control limits are shown in Fig. 4b which shows the same out of control points with Fig. 4a. As seen in Fig. 4b, UCL and LCL are determined as 17.49 and 9.25 respectively. Compared to Fig. 3, the control limits are very different when the data normality is taken into account and data independence is just assumed. Larger control limits are obtained when data normality is achieved. Total number of out of control limits which beyond control limits are nine, five of them are beyond the UCL and four of them are below the LCL. These unusual points in Fig. 4a and 4b are different from the ones which are obtained in Fig. 3. The observations of 32, 53, 214, 347 and 348 are beyond $+3\sigma$ while observations of 24, 208, 215 and 266 are below -3σ.

Table 2: I-chart parameters of original ash content data of +18 mm clean coarse product by heavy medium drum

Period	*Transformed metric*	*Original metric*
$UCL=+3\sigma$	2.86	17.49
$CL=\ \bar{X}$	2.54	12.72
$LCL=-3\sigma$	2.22	9.25

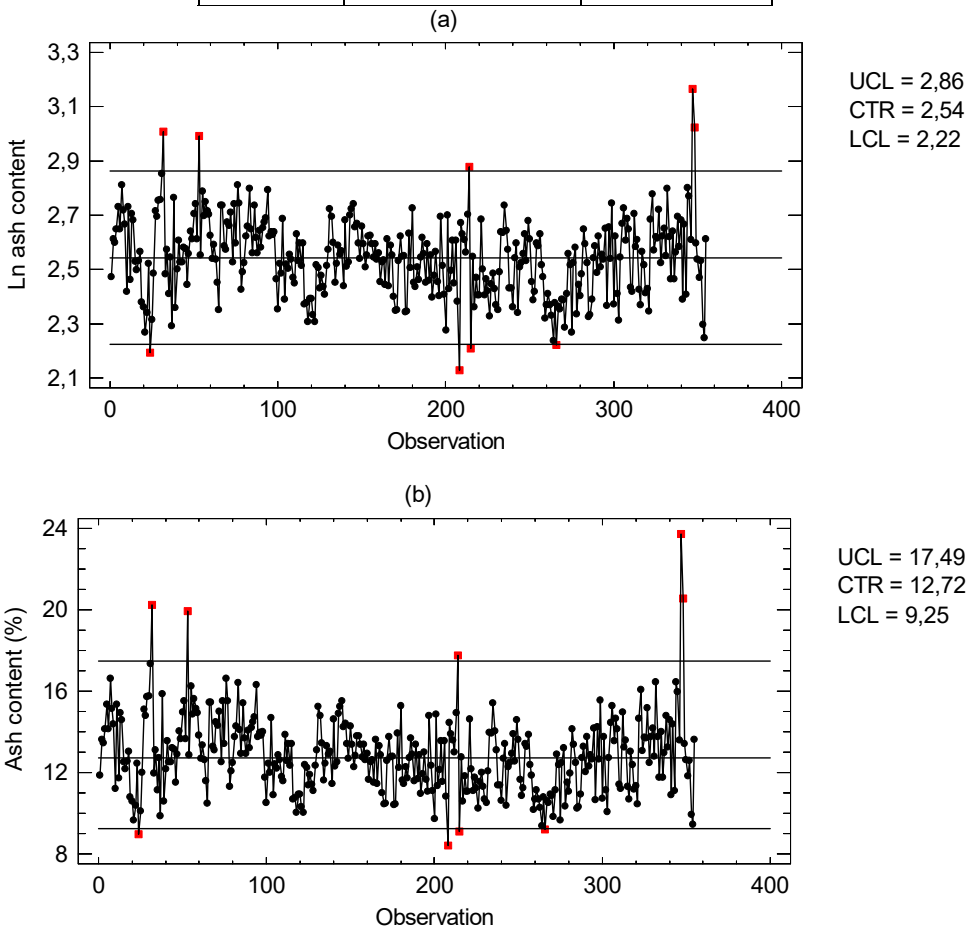

Figure 4. I-chart under normality verification and autocorrelation assumptions in transformed metric (a) and its back-transformed values of control limits in original metric (b)

Control limits under verification of both data normality and autocorrrelation

As stated above, data autocorrelation of log transformed ash content was removed successfully by ARIMA(1,0,1) time series model. While implementing control limits of SPC chart while considering autocorrelation, the process sigma, σ_x, was estimated from the both white noise or random shock and fitted ARIMA(1,0,1) model parameters (Table 1) for +18 mm clean coal product of heavy dense drum. In this chart, center line (CL) was estimated from the following formula;

$$CL = \mu_0 = \frac{\delta}{1-\phi} \tag{3}$$

The CL in Eq. 3 was determined from the parameters of ARIMA(1,0,1) model given in Table 1. Then, the control limits of data, UCL and LCL are drawn around centerline (CL) located at μ_0 by using the process sigma, σ_x;

$$\mu_0 \pm 3\sigma_x \tag{4}$$

The relation between the variance, σ_x^2, of the ARIMA(1,0,1) process, X_t, and the variation, σ_a^2, of the random noise, a_t, is calculated from the following Eq. 5 (Castagliola and Tsung, 2005):

 Copyright © International Science and Technology Conference (ISTEC)

$$\sigma_x^2 = \frac{1+\theta^2-2\phi\theta}{1-\phi^2}\sigma_a^2 \quad (5)$$

The variance of random shocks, σ_a^2, i.e. white noise variance in Eq. 5 can be estimated by both the mean squared error (*MSE*) of fitted AR(2) model and the mean range ($\overline{MR}$) of residuals (Polhemus, 2005). By solving Eq. 5, the variances of log-transformed ash content is $\sigma_x^2 = 1.2318\sigma_a^2$ which means that it is about 1.23 times larger than the residual white noise variance.

The ARIMA(1,0,1) chart parameters where the random noise variance (σ_a^2) is estimated from the average moving range of ARIMA(1,0,1) residuals ($\overline{MR}$) and then process sigma (σ_x) was calculated by Eq. 5 was given in Table 3. The generated control charts are presented for log transformed metric in Fig. 5a and for back transformed metric in Fig. 5b.

Table 3: ARIMA chart parameters when the white noise variance, σ_a^2 was calculated by average moving range of ARIMA(1,0,1) residuals ($\overline{MR}$))

Period	*Transformed metric*	*Original metric*
$UCL=+3\sigma_x$	2.95	19.14
$CL=\ \mu_0$	2.54	12.72
$LCL=-3\sigma_x$	2.14	8.45

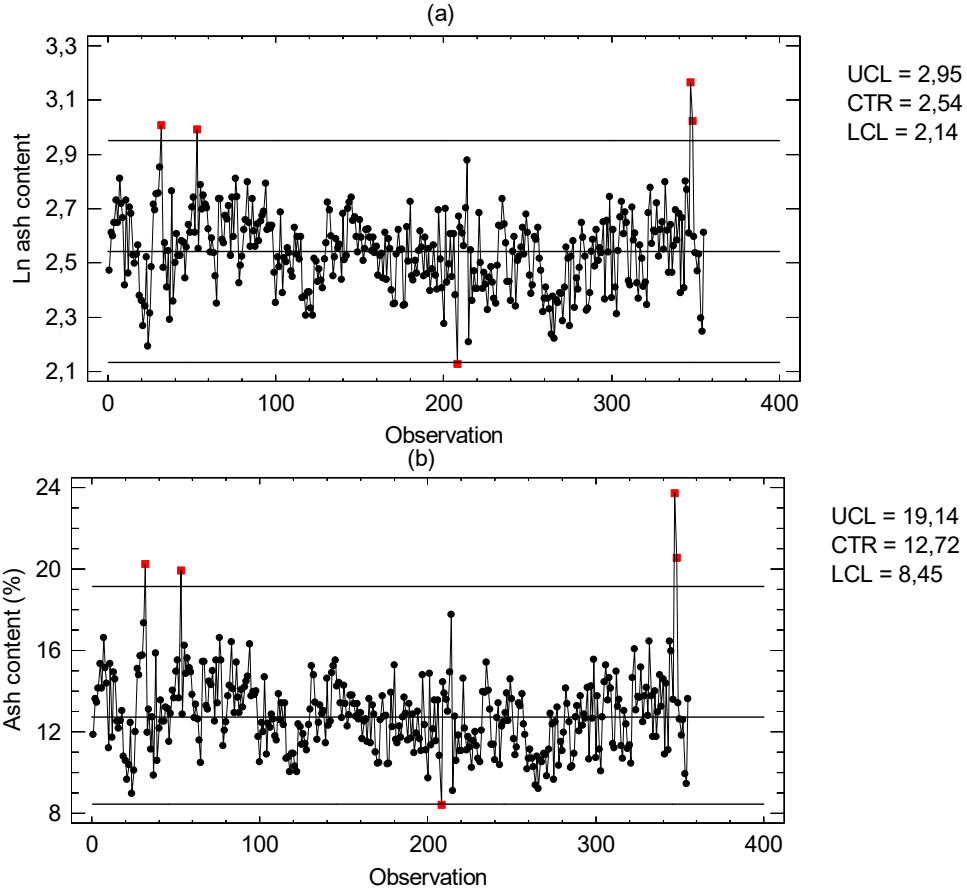

Figure 5. I-chart under normality and autocorrelation verification in transformed metric (a) and its back-transformed values of control limits in original metric (b) (white noise variance, σ_a^2 was calculated by average moving range of ARIMA(1,0,1) residuals ($\overline{MR}$))

Fig. 5a and 5b show the control limits of ash content where both normality and autocorrelation are verified. Compared to Fig 5 with Fig. 3 and Fig. 4, both control limits and out of control points are very different since the data normality and autocorrelation are taken into account when determining the control limits of ash content. The

 Copyright © International Science and Technology Conference (ISTEC)

UCL and LCL were determined as 19.14 and 8.45 respectively when the data normality and autocorrelation are verified. The observations of 32, 53, 347 and 348 are beyond the $+3\sigma_x$ while the observation 208 was below the $-3\sigma_x$.
Table 4 shows the control limits of ash content determined for the ARIMA chart parameters when where white noise variance, σ_a^2 was calculated by the mean squared error, *MSE* to determine the process sigma, σ_x. The control limits of generated chart are considered as long term monitoring of the process (Polhemus, 2005). Polhemus (2005) indicates that this control limits are used to determine the process deviations from long-term mean more than expected given the dynamics of the process.

The control limits of ARIMA chart constructed in Fig. 6 shows the long term control limits for the +18 mm clean coarse coal by heavy dense drum. In this chart, process sigma, σ_x was estimated by Eq. 5 and white noise variance, σ_a^2 was calculated by *MSE* of ARIMA(1,0,1) model which was determined as σ_a = 0.1289 and given in Table 1 (Taşdemir, 2016a). As seen from the charts in Fig. 6a and 6b are considerably wider bounds than the charts in Fig. 5 and Fig. 4 since the estimated process σ_x is a function of both white noise or random shock and fitted ARIMA(1,0,1) model parameters (Table 1).
The UCL and LCL were determined as 19.56 and 8.27 for long term control limits. Total number of unusual points was four which are all beyond the UCL which corresponds to observations of 32, 53, 347 and 348.

Table 4: ARIMA chart parameters when white noise variance, σ_a^2 was calculated by *MSE* of ARIMA(1,0,1)

Period	*Transformed metric*	*Original metric*
UCL=$+3\sigma_x$	2.97	19.56
CL= μ_0	2.54	12.72
LCL=$-3\sigma_x$	2.11	8.27

ARIMA residual chart of log-transformed ash content data

The ARIMA residuals charts were generated for several conditions to detect real uncontrolled points of ash data. The ARIMA residuals were obtained from the difference between actual log transformed ash values and their forecasted values determined by ARIMA(1,0,1) model. The residuals, a_t, were calculated by rewriting the Eq. 2 as the following:

$$a_t = X_t - 0.5879 - 0.7688X_{t-1} - 0.4609a_{t-1} \quad (6)$$

Since a_t was determined to be independent and identically distributed (*i.i.d*) normal (0, σ_a), control limits of residuals, i.e., UCL and LCL which are drawn around centerline (CL) of zero (0) were calculated by the following Eq. 7 (Castagliola and Tsung, 2005):

$$0 + \pm 3\sigma_a \quad (7)$$

The resulted ARIMA residual chart obtained for ash content is shown in Fig. 7. As seen in Fig. 7, number of points beyond $\pm 3\sigma_a$ limits are 3 which corresponds to observations of 53, 215 and 347. Since the aim is to reduce the ash content as soon as possible during the coal washing process, the out of point beyond LCL (observation 215) cannot be considered uncontrolled process point actually. Therefore, the process can be considered out of control for the 53rd and 347th days in terms of ash content and was in control for the rest days in 2010 based on the ARIMA residuals chart given in Fig. 7.

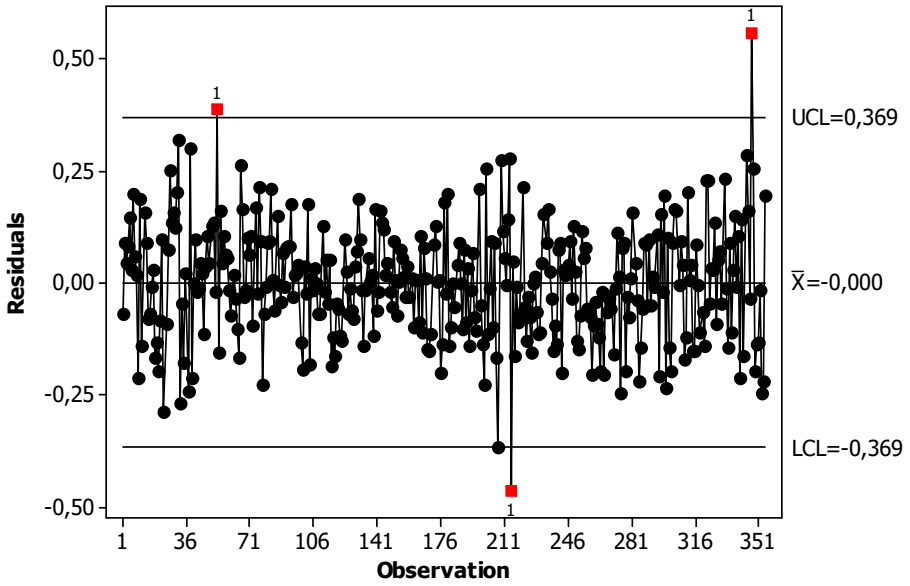

Figure 7. ARIMA residuals chart of ash content data

Conclusions

Control limits ıf ash content for the +18 mm clean coarse coal product produced by heavy medium drum was determined under data normality and data verification conditions. It was shown that the number of total out of control points were different if the assumptions were taken into account or not. In order to give right decision in monitoring and control of a process variable in terms of ash content, both data normality and autocorrelation should be verified prior to application of SPC charts. These can be done for the +18 mm clean coarse coal data by applying log transformation first to achieve data normality and then removing autocorrelation by ARIMA(1,0,1) time series model. Long term control limits were determined as 19.56 for the upper control limit and 8.27 for the lower control limit while center line was 12.72. Only two points were out of control which were determined by the ARIMA residuals chart in 2010 in terms of ash content. This result was different from the ones which were calculated by only assuming data normality and autocorrelation without verifying them.

DETERMINATION OF NATURAL REGENERATION SUCCESS OF BLACK PINE (PINUS NIGRA ARNOLD. SUBSP. PALLASIANA (LAMB.) HOLMBOE) AND ECONOMIC ANALYSES IN THE YENICE FOREST DISTRICT IN TURKEY

Ersin Güngör
ersingngr@yahoo.com

In this research was determined success of natural regeneration of black pine forests and economical analyses of natural regeneration practices in Yenice Forest District in Turkey. In this context first of all, natural regeneration areas of black pine were determined by made on between 2005-2014 in Yenice district. Later, sampling plots were given as 20x20m in the natural regeneration areas and amount, height, root collar diameter, number of buds, length of branch, thichness of branch were determined in the sampling plots of black pine juvenilities in research area. On the other hand economic analyses were made of natural regeneration applications in Yenice district. In this reason, Net Present Value (NPV), Internal Rate of Return (IRR) and Cost-Benefit Analyses were made. According to results obtained from sampling plots and economical analyses, the success of natural regeneration practices are changed between 90.2% and 97.8% and natural regeneration applications were determined as a high econimal benefits and rate of return and many benefits of these regeneration applications respect to the sustainability of forest and environmental management

DETERMINATION OF PLATINUM LEVELS IN FOOD SAMPLES BY ICP-MS AFTER PRE-CONCENTRATION

Uyan Yuksel
uyanyuksel@gmail.com

In recent years, there has been increased concern about the effects of noble metals such a platinum on human health. Platinum has been used as a catalytic converter material for the refinement of automobile exhaust gases. Although the benefits of car catalysts are indisputable, highly toxic elements including Pt, Rh and Pd are released into the atmosphere. Platinum content of road dusts can be soluble, and it enters the waters, sediments, soil and finally, the food chain. In this context , levels of platinum in food samples which had been collected in Siirt region where south-east of Turkey has been determinated. Total 40 samples, contain vegetables and animal origin food. After microwave acid digestion, samples had been subjected to pre-concentration process. Pre-concentrated samples were analysed by ICP-MS. The analytical method was verified by using certified standard material.

DETERMINATION OF SURFACE CHARACTERISTIC OF ATMOSPHERIC PRESSURE PLASMA MODIFIED POLYMERIC ULTRAFILTRATION MEMBRANE VIA CONTACT ANGLE MEASUREMENTS

Irem Damar Huner[a*] and Hacı Ali Gulec[a]

[a]Trakya University, Engineering Faculty, Department of Food Engineering, 22180 Edirne, Turkey

irem_damar@hotmail.com

Abstract: The aim of this study was to improve the surface hydrophilicity of ultrafiltration membrane (UP150, PES, MWCO; 150 kDa) by using atmospheric pressure argon plasma jet (APAPlJ) modification system. Argon was selected as a precursor gas and three different distances between nozzle and substrate surface (25-30-35 mm) and three different exposure period (1-5-10 times) was applied during APAPlJ modifications. The effect of APAPlJ modifications on the membrane surface evaluated by contact angle measurements, surface free energy (SFE) method and xVDLO theory. APAPlJ modification was able to change membrane surface properties. More hydrophilic surface properties were obtained by APAPlJ modifications using 25 mm of distance of nozzle to substrate surface and 5 times of exposure period. Under these conditions, the water contact angle was decreased from 63.5 to 34.6°. The base component of SFE was increased 5 times and Giwi value was increased from -45.0 to 28.7 mJm^{-2}.

Keywords: Ultrafiltration membrane, atmospheric pressure argon plasma jet, modification, contact angle measurement, SFE, xVDLO theory

Introduction

The membrane separation processes is widely used today for separation of wide varying mixtures, purification and concentration of valuable components from industrial wastewater in petrochemical (Ravanchia et al., 2009), textile (Ciardelli et al., 2000), and food (Baldasso et al., 2011; Onsekizoglu 2013) industries. Especially, polimeric commercial membranes such as polyethersulfone (PES), polysulfone (PS), polyvinylidene fluoride (PVDF) are widely used in the pressure-driven membrane processes due to their high thermal, mechanical and chemical resistance (Mulder, 1996) However, they have hydrophobic surface properties, so that it severely limits its long-term membrane separation processes. Therefore, they need to surface modification to enhance hydrophilicity (Demirci et al., 2014).

Plasma modification is one of the modification method to change surface properties of membrane. It has many important advantages such as uniformity, reproducibility, short reaction time, and environmental safety. Plasmas, often considered as the fourth state of matter, are composed of an ionized gas containing a mixture of ions, electrons, neutral and excited molecules, and photons (Kull et al., 2005; Gulec et al., 2006). Plasma treatments can alter the surface energy of most polymers, changing their surface polarity, wettability, and adhesive characteristics without affecting the overall bulk properties. Helium, oxygen, nitrogen, argon plasma are used to modify polymeric membrane surfaces from hydrophobic to hydrophilic increasing the surface polar groups (Saxena et al., 2009). In addition, the changes in the polymeric surface depend directly on the plasma treatment conditions (Wavhal and Fisher, 2005).

The hydrophobicity or hydrophilicity of a solid surface can be determined by contact angle measurement which is a simple, useful and very sensitive method (Gulec et al., 2006). The surface free energy (SFE) and SFE components of membrane can be calculated with different approaches such as Zisman Plot, Equation of State, Fowkes/WORK, Wu and van Oss, Good and Chaudhury. van Oss, Good and Chaudhury's acid–base method is widely used by researchers, because it provide more detailed information about electron-acceptor and electron–donor interactions through membrane and test liquid interface (Cantin et al., 2006; Zenkiewicz, 2007; Damar Huner and Gulec, 2016). xVDLO theory is also used to evaluate interaction between foulant and membrane and it shows surface characteristic and fouling tendency of membrane surface (Subhi et al., 2012; Zuo and Wang, 2013).

 Copyright © International Science and Technology Conference (ISTEC)

Steen et al. (2002) reported that low temperature H_2O plasma treatment improved the hidrophilicity of PES membrane. Their study revealed that the contatct angle of unmodified membrane decreased from 69.5 to nearly 0°. They obtained highly hydrophilic surface. Saxena et al. (2009) used argon–oxygen ($Ar–O_2$) plasma to modify the PES membrane. Unmodified PES membrane water contact angle value degreased from 56.9 to 8.6° by using $Ar–O_2$ plasma (%60 O_2 concentration) at 10 min exposure time. These results clearly demonstrated that the plasma treated PES membrane was more hydrophilic surface. Wavhal et al. (2002) modified PES membranes using low temperature Ar plasma, followed by grafting of hydrophilic monomers in the vapor phase. After 90 s plasma treatment, water contact angle of PES decreased from 90 to 40°. In literature, there is limited investigation report about the PES membrane modification using atmospheric pressure plasma jet (APAPlJ) system. And also, this study contributes by using contact angle measurement to determine surface hydrophilicity.

The objective of this study was to improve the surface hydrophilicity of UP150 PES ultrafiltration membrane, by using atmospheric pressure argon plasma jet (APAPlJ) modification system. Initially, different APAPlJ parameters (plasma treatment period: 1, 5 and 10 times, distance between nozzle and membrane surface: 25, 30, 35 mm) were used. The effects of APAPlJ modification on the membrane surface were determined using contact angle measurements. Surface free energy of unmodified and APAPlJ modified membrane were calculated using acid-base methods. The hydrophobicity/hydrophilicity characteristic of membrane was evaluated accordingly xVDLO theory.

Material and Methods

Material

Flat sheet commercial polyethersulfone ultrafiltration membrane (UP150) was used. Specific properties of the ultrafiltration (UF) membrane are summarized in Table 1. Before the plasma treatments and contact angle measurements, membrane was cut into rectangular shapes having size of 76 x 20 mm manually and they were fixed to glass support with double-sided tape.

Table 1: Specific properties of commercial microfiltration membrane

Supplier	Membranes	Material	MWCO (KDa)	Maximum Temperature	pH	Permeability (L m^{-2} $h^{-1}$$bar^{-1}$)
Microdyn-Nadir	UP150	PES	150	95 °C	0–14	286[a]

[a]: according to the indicative properties by the membrane manufacturer

Atmospheric pressure plasma jet system

The atmospheric pressure plasma jet system (OpenAir) manufactured by PlasmaTreat GmbH (Steinhagen, Germany). OpenAir plasma system (Fig. 1.) is equipped with plasma rotary jet (nozzle-RD2004), metallic carrier platform (10 x 20 cm) which allows x-direction of the moving at a parallel speed of 0 to 60 m min^{-1}, manual y-direction of moving column adjust the distance between substrate and nozzle, and plasma generator (FG5001). The membrane was placed in a distance of 25, 30 and 35 mm to the nozzle on metallic carrier platform that was moved with a speed of 1.5 m min^{-1}. Three different treatment times (1, 5, 10 times) were chosen for the plasma surface modification. The precursor gases to be used for plasma modification were selected argon at an input pressure of 3 bar. UP150 membrane was soaked ultra-pure water at 24 h to ensure wetting of membrane structure before and after modification.

Contact angle measurements

Theta Optical Tensiometer (KSV Attension Instruments, Helsinki, Finland) was to measure the contact angle. It was equipped with an automated droplet dispenser, a high speed digital camera (60 fps), and image analysis software (OneAttension). OneAttension used Young-Laplace three-phase system consisting of standard test liquid, solid surface and air for contact angle determination (Fig. 2.). Contact angles measurement was performed by sessile drop technique using three standard liquid (ultra-pure water, formamide, diiodomethane). The droplet volume of standard liquids was 2.5 µl and the drop image was captured during 60 s. The contact angle measurements were performed at 5 random locations at room temperature (25 ± 3 ºC).

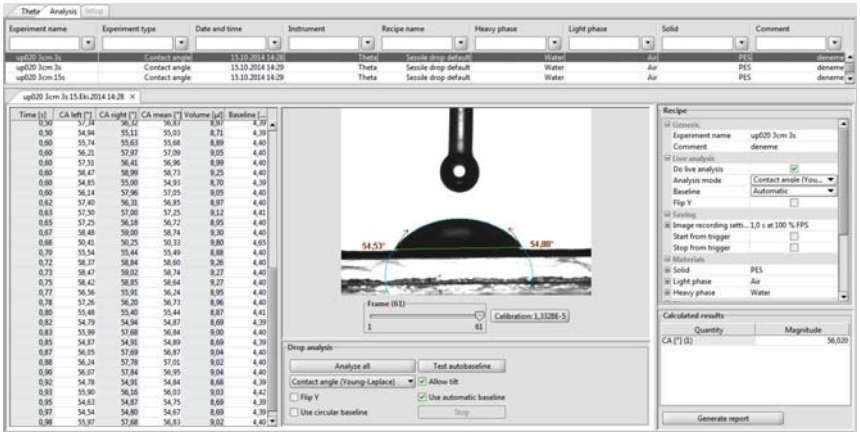

Figure 2. Contact angle in a three-phase system consisting of solid surface, liquid, and air (from OneAttention software)

Calculation of surface free energy

Surface free energy of membrane was calculated van Oss, Good and Chaudhury's acid–base method (van Oss et al., 1988). The surface free energy (SFE) was the sum of two components (Eq. 1), Lifshitsz van der Waals interactions (LW) and Lewis acid–base interactions (AB) according to this method. While, γ^{LW} represents apolar interactions such as London dispersion forces, dipole-dipole Debye and Keesom interactions, γ^{AB} also mentioned as the "polar component" contains, hydrogen bonding, π bonding and ligand formation (Cantin et al., 2006; Rieke 1997).

$$\gamma_{SV}^{TOT} = \gamma_{SV}^{LW} + \gamma_{SV}^{AB} \quad (1)$$

Lewis acid–base interactions are divided within itself, including the electron acceptor (Lewis acid, γ_i^+) and electron donor (Lewis base, γ_i^-) components and expressed as a geometric mean of acid and base force components.

$$\gamma_i^{AB} = 2\sqrt{\gamma_i^+ \gamma_i^-} \quad (2)$$

The solid-liquid interface tension can be expressed as

$$\gamma_{SL} = \gamma_{SV} + \gamma_{LV} - 2\left[\sqrt{\gamma_{SV}^{LW}\gamma_{LV}^{LW}} + \sqrt{\gamma_{SV}^+\gamma_{LV}^-} + \sqrt{\gamma_{SV}^-\gamma_{LV}^+}\right] \quad (3)$$

Combining this equation with Young-Dupre equation (Eq. 3) obtains van Oss, Good and Chaudhury's acid–base equation. The SFE of unmodified and modified membranes was calculated by this equation.

$$\gamma_{LV}(1 + \cos\theta) = 2\left[\sqrt{\gamma_{SV}^{LW}\gamma_{LV}^{LW}} + \sqrt{\gamma_{SV}^+\gamma_{LV}^-} + \sqrt{\gamma_{SV}^-\gamma_{LV}^+}\right] \quad (4)$$

At least 3 different standard liquids of known surface tension components are needed to determine the unknown surface free energy components ($\gamma_{SV}^+, \gamma_{SV}^-, \gamma_{SV}^{LW}$) of the membrane surface. Generally, to solve the equation should be used one dispersive and two polar liquid. In this study, polar liquids ultrapure water, formamide; and non-polar liquid diiodomethane were used as a standard liquid (Table 2).

 Copyright © International Science and Technology Conference (ISTEC)

Table 2: Specific properties of the test liquids used in this study (OneAttention software)

	γ^{tot} [mN/m]	γ^{d} [mN/m]	γ^{+} [mN/m]	γ^{-} [mN/m]	g [g/cm^3]	Ŋ [mPa.s]	T [°C]	Mw [gmol]
Water	72.80	21.80	25.50	25.50	0.998	1.00	20.00	18.01
Formamide	58.00	39.00	2.28	39.60	1.133	3.30	20.00	45.04
Diiodomethane	50.80	50.80	0.00	0.00	3.325	2.80	25.00	267.84

xVDLO theory

In this study, Derjaguin, Landau, Verwey and Overbeek (xDLVO) theory was used to determination of hydrophilicity and hydrophobicity of membrane surface after plasma modification. According to, the total free energy of cohesion (ΔG_{iwi}^{Tot}) between foulant (i) and water (w) is the sum of apolar Lifshitz–van der Waals (LW) and polar acid–base (AB) forces (van Oss, 1993). ΔG_{iwi}^{Tot} can be written as

$$\Delta G_{iwi}^{Tot} = -2\left[\left((\gamma_i^{LW})^{\frac{1}{2}} - (\gamma_w^{LW})^{\frac{1}{2}}\right)^2 + 2\left((\gamma_i^{+}\gamma_i^{-})^{\frac{1}{2}} + (\gamma_w^{+}\gamma_w^{-})^{\frac{1}{2}} - (\gamma_i^{+}\gamma_w^{-})^{\frac{1}{2}} - (\gamma_w^{+}\gamma_i^{-})^{\frac{1}{2}}\right)\right] \quad (5)$$

If ΔG_{iwi}^{Tot} is lower than zero ($\Delta Giwi < 0$), the membrane is considered hydrophobic surface properties. In contrast, if ΔG_{iwi}^{Tot} is larger than zero ($\Delta Giwi > 0$), the membrane shows hydrophilic properties and has less fouling tendency (Subhi et al., 2012; Zuo and Wang, 2013).

Results and Discussion

Contact angle measurements

The aim of this study was to investigate the influence of the treatment parameters on the hydrophilicity and hydrophobicity properties of the membrane surface. The surface properties of the unmodified and APAPlJ modified membranes were characterized by contact angle measurements. Three different treatment times (1-5-10 times) and three different distances between nozzle and membrane surface (25-30-35 mm) were chosen as plasma treatment conditions.

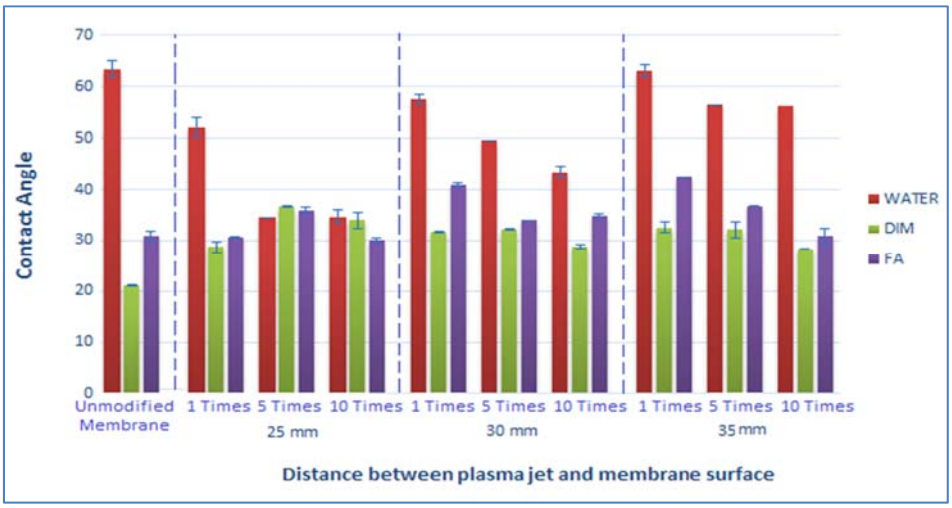

Figure 3. The contact angle measurements according to plasma jet modification conditions

If the water contact angle (θw) is higher than 65°, the surface is considered hydrophobic and if θw is lower than 65°, it is considered hydrophilic (Sadiki et al., 2014). According to the results presented in Fig. 3., θw showed that unmodified UP150 PES membrane has moderately hydrophobic surface (θw = 63.5 ± 1.6°). Similar results were reported by Steen et al., (2002); Kim et al., (2009). They were evaluated the hydrophobic character of the PES membrane (θw = 69.5°, θw = 69.0° respectively).

 Copyright © International Science and Technology Conference (ISTEC)

The contact angle results of unmodified membrane were changed depending on plasma treatment conditions (Fig. 3.). The results revealed that, θw decreased with plasma treatment in all parameters. However, a slight decrease of θw was observed at the distance of 30 and 35 mm. In addition, θw decreased with increasing treatment times for the same distances. This can be attributed to high interaction between plasma ions and membrane surface with increasing treatment times. For plasma treatment, the lowest θw (θw =34.6±0.0°) was obtained at the distance of 25 mm and 5 times treatment (Fig. 4.).

Although, many other studies explained that the surface hydrophilicity related to the water contact angle value (Steen et al., 2002; Wavhal et al., 2002), diiodomethane and formamide contact angle values also can give an information about hydrophilicity. The surface hydrophilicity increases with decreased formamide contact angle (θf) and increased diiodomethane contact angle (θd). In this study, while θd increased in all plasma treatment conditions, the significant increase was observed at 25 mm 5 times (θd =36.6±0.1°). The lowest contact angle of formamide was obtained at 25 mm distance 10 times (θf =30.1±0.5°).

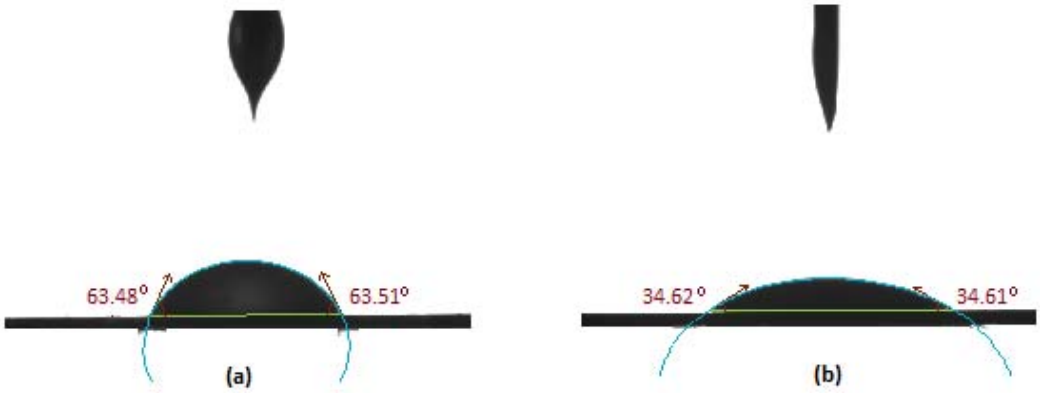

Figure 4: Water droplet image on UP150 PES unmodified (a) and APAPlJ modified membrane 5 times at 25 mm (b)

Saxena et al. (2009) used argon–oxygen (Ar–O2) plasma to modify PES membranes. They found that the contact angle decreases from 57.0° (untreated membrane) to 8.6° (Ar–O2 plasma treated membrane). Their study revealed that higher exposure time increases the hydrophilicity. Contrarily, in this study, the highest exposure period (10 times) did not decrease the water contact angle value as in 5 times treatment condition. This was mainly attributed to using only argon as a precursor gas in this study.

Calculation of surface free energy

The surface free energy was calculated from acid-base method. Total (γ_S^{tot}), disperse (γ_S^d), polar (γ_S^p), acid (γ_S^+) and base (γ_S^-) components of unmodified and modified membrane were given Table 3.

Table 3: The SFE components of unmodified and APAPlJM membrane

Distance (mm)	Times	γ_S^{tot} [mJm^{-2}]	γ_S^d (γ_S^{LW}) [mJm^{-2}]	γ_S^p (γ_S^{AB}) [mJm^{-2}]	γ_S^+ [mJm^{-2}]	γ_S^- [mJm^{-2}]

According to van Oss, Good and Chaudhury's method, especially higher base component value (γ_S^-) shows hydrophilicity character of surface (Sadiki et al., 2014). The results presented in Table 3, the γ_S^- component of

 Copyright © International Science and Technology Conference (ISTEC)

SFE of UP150 showed a significant increase at 25 mm distance and 5 times treatment conditions. The γ_S^d component decreased from 47.6 to 41.3 mJ m^{-2} at the same treatment conditions. These results clearly indicated that APAPlJ modified membrane had more hydrophilic surface than unmodified membrane.

xDVLO theory

xVDLO theory was performed to state the change of surface hydrophilicity. While positive Giwi value indicates the hydrophilic surface, negative Giwi value refers hydrophobic surface properties. The effects of plasma modification on Giwi value were evaluated by MINITAB and presented in three dimensional graphs (Fig. 5.).

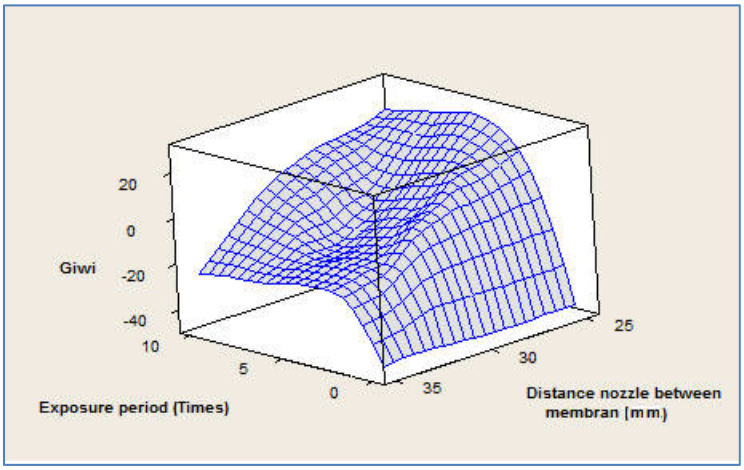

Figure 5: 3D graph depicts exposure period - distance nozzle to membrane surface - Giwi value

As shown in Fig. 2, Giwi value of unmodified membrane was lower than zero (Giwi=-45.8), it had a hydrophobic surface. While the treatment provided a positive effect on hydrophilicity of membrane in exposure period at 35 mm distance, Giwi did not take a positive value for this condition. This may be attributed to the weak interaction between the ions and electrons generated by plasma and the membrane surface. In contrast to this, the ions and electrons generated by plasma reacted easily with reactive groups on PES membrane surface at 25 mm distance. The highest positive value (Giwi=28.7) which indicates the hydrophilic property was observed at 5 times of exposure period and 25 mm of distance.

Conclusion

The main goal of this study was to determine change of hydrophilicity of UP150 PES membrane surface under various APAPlJ treatment conditions. The contact angle measurements, SFE method and xVLDO theory were used to evaluate the APAPlJ modification effect on the UP150 PES membrane surface. The results revealed that the use of APAPlJ to modify the PES membrane is an effective way to improve its surface hydrophilicity. The more hydrophilic surface properties (the lowest water contact angle, the highest base value of SFE and the highest Giwi value) were obtained by APAPlJ modifications using 25 mm of distance between nozzle and substrate surface and 5 times of exposure period.

DEVELOPING AN RESILIENT MODULUS ESTIMATION MODEL FOR GRANULAR ROAD MATERIALS

Altan Yilmaz
altanyilmaz@mehmetakif.edu.tr

This paper demonstrates the applicability of the regression methodology to estimate resilient modulus of pavement layers using the results of triaxial resilient modulus tests. This methodology is proposed as an alternative to conventional nonlinear constitutive relationships.

Resilient modulus is an important design parameter for highway pavement structures because it represents the structural strength of pavement layers. In triaxial test, aggregate samples collected from seven different part of central Anatolia. All the aggregate sources are igneous rock (basalt, and trachy-basalt)

In the regression model three aggregate physical properties, three mixture properties and two loading factors (totally 8 variables) are used as input parameters and the resilient modulus of aggregate mixture (cylindrical sample) obtained as output. To compare the effectiveness of the new method coefficients for the Uzan constitutive model are also determined for laboratory test and compared with the approach described in this paper. Predicted resilient modulus values from each approach are separately compared with R^2 and Standard error to evaluate their efficiency and reliability in terms of resilient response prediction.

Performance parameters of R^2:0,98 and Standard eror:10,51 has been obtained from model prediction. These results are quite sufficient, regression model assume the resilient response like a function by using the stated material parameters. So this approach makes possible to estimate the resilient modulus of the different aggregates samples in real-time.

DEVELOPMENT AND EVALUATION OF WEB-BASED PRECONCEPTION HEALTH PROMOTION PROGRAM FOR COUPLE TO BE MARRIED

Nam Joo Je

poo4757@naver.com

So Yeong Choe

css4214@gnu.ac.kr

This study was done to develop a web-based preconception health promotion program to improve perceived benefits of reproductive health behavior, to reduce perceived barriers and to improve preconception health promotion awareness in couple to be married. Participants were assigned to the experiment group (n=26 couple) or control group (n=25 couple).A web-based preconception health promotion program comprised of a six hour web-based lecture was given to an experimental group for four weeks. Results showed for the two groups, 1) a significant difference in preconception health promotion awareness in men (F=18.49, p<.001) in women (F=36.93, p<.001). 2) a significant difference perceived benefits in men (F=6.24, p=.003) , in women (F=6.38, p=.004). 3) a significant difference perceived barriers in men (F=3.64, p=.030), in women (F=11.36, p<.001). 4) a significant difference perceived self efficacy in men (F=12.16, p<.001), but no significant difference in women (F=1.93, p=.166). 5) a significant difference health promoting behavior in men (F=16.31, p<.001), in women (F=10.99, p=.001). This study through the above results shows that the web-based preconception health promotion programis an effective nursing intervention in couple to be married. Therefore, web-based preconception health promotion program can be useful for encouraging couple to be married' health-promoting behavior.

DEVELOPMENT OF THE MOBILE SERVICE ROBOT EQUIPPED WITH MULTIPLE SENSORS FOR HUMAN DETECTION AND TRACKING

Chantri Polprasert
jim.chantri@gmail.com

Soravit Premanan
chantri@g.swu.ac.th

In this paper, we develop a mobile service robot with multiple sensors to navigate to and track human who commands the robot by applause sound in the environment with noise and obstacles. The robot uses a microphone and a camera to locate the human who applauds and proceeds to the target. An ultra-sonic sensor positioned at the front of the robot is used for collision detection. We use dsPIC microcontroller to generate PWM pulses controlling the speed of 2 DC motors to turn and move the robot to the human who applauded. The robot detects the applause sound by analyzing the spectrum of the incoming acoustic signal. Once the applause sound is detected, the robot exercises the camera to look for human who applauded by detecting human's face using Viola-Jones algorithms and the color of the target's dress. Then, the robot moves to the person who applauded where the Kanade–Lucas–Tomasi (KLT) algorithm is used to track the human face and re-align the robot if the tracked human face is shifted from the center of the camera or that human moves away from the current position. While moving, the robot senses the environment using the ultrasonic sensor to avoid collision with any obstacles. Without sunlight reflection, the robot successfully reaches the human who applauded without colliding with any obstacles. The average time to reach the target is 37.78 seconds when the target is 4 meters away from the robot. Future work will focus on reducing the impact of sunlight reflection impeding a camera to accurately detect the human's face.

DİN VE TOPLUMSAL CİNSİYET KISKACINDA DEĞİŞEN KADIN ALGILARI: BIR TİPOLOJİ DENEMESİ

Asım Yapıcı

Çukurova Üniversitesi İlahiyat Fakültesi Adana-Turkiye

asimyapici@cu.edu.tr

Abstract: Bu araştırmada üniversiteli gençlerin İslam dininde ve günümüz Türk toplumunda kadının yeri ve değeri konusunda ne düşündükleri tespite çalışılmıştır. Nitel bir yöntemin kullanıldığı bu araştırmada veriler, Çukurova üniversitesinin farklı bölümlerde öğrenim gören 374 öğrenci üzerinde yürütülen açık uçlu sorulardan oluşan anketle toplanmıştır. Elde edilen bulgular içerik analizi ile çözümlenmiş, kümeleme analizi ile gruplandırılarak bir tipoloji oluşturulmaya çalışılmıştır. Ulaşılan sonuçlara göre gençler İslam'da kadının yeri ve değeri konusunda *taklidî teslimiyetçiler*, *tahkiki tasdikçiler*, *dinin özü ile geleneği farklı algılayanlar, inançlı sorgulayıcılar, suskunlar, kararsızlık-çelişki yaşayanlar, taklidî eleştiriciler* ve *tahkiki eleştiriciler olmak üzere sekiz temel kategori içinde toplanmıştır.* Günümüzde kadının durumu hakkında ise *tamamen olumsuz görenler, genelleme yapmaktan kaçınanalar, kısmen olumlu görenler, tam eşitliğin gerçekleştiğini düşünenler* olmak üzere dört temel tip ortaya çıkmıştır.

Anahtar Kelimeler: Din, İslam, Kadın, Erkek, Toplumsal Cinsiyet

Giriş

Bilindiği üzere geleneksellikten modernliğe geçiş sürecinde *dinin kökeni ve fonksiyonları, dinsel bilginin değeri, dinin birey ve toplumla ilişkisi* gibi pek çok husus tartışmaya açılmıştır (Yapıcı, 2016). Bu süreçte toplumsal cinsiyet açısından *din ve kadın* meselesi de üzerinde en çok durulan ve en çok tartışılan konuların başında yer almıştır (Badinter, 1991).

Hristiyan Avrupa bir yandan kendi ürettiği değerler çerçevesinde modernizmin öncülüğünü yaparken, bir yandan da Batılı olmayan toplumların modernleşme sürecine uyum sağlayıp sağlayamayacaklarını tartışmaya açmıştır. Hristiyan Avrupa özellikle İslam dünyasına hem oryantalist bir bakışla eleştirilerde bulunmuş hem de modernleşme yolunda çeşitli reçeteler sunmuştur. İslam dininin gelişmeye ve modernleşmeye engel olduğu yönünde Batı'da ortaya çıkan düşünceler, Müslümanların "*gerici*", "*şiddet taraftarı*", "*fanatik*", "*kadını ezen*", "*kendinden olmayana yaşama şansı tanımayan*" ve "*asla tamamen modernleşemeyecek*" topluluklar olarak algılanmasına yol açmıştır (Köylü, 2001; Yapıcı, 2004; Yapıcı & Albayrak, 2002). Batılılaşmanın ve modernleşmenin değer yüklü tanımlanması meselesine bir de İslam dünyasının "*kültürel gecikmişliği*" (bkz. Ogburn, 1955) eklenince "*geri kalmış Müslüman*" imajı sürekli yeniden üretilmiştir. İslam dininin algılanmasından kaynaklanan çeşitli sıkıntılarla birlikte, *çok eşlilik*, *kadınları tek sözle boşama*, *kadınları eve hapsetme*, *evlenene kadar kızların bekâretini koruması yönündeki dinsel ve toplumsal talepler*, *erkeğe nispetle kadının mirastan yarım pay alması, şahitlikte kadının yarım kabul edilmesi, kadının dövülmesi* vb. dinsel ve kültürel kabuller, Batı'da, olumsuz Müslüman imajının katılaşarak devam etmesine zemin hazırlamıştır (Yapıcı, 2016).

Batı kendi geliştirdiği değer yargıları çerçevesinde bir kadın anlayışı ve modeli sunarken Türkiye dâhil, İslam dünyasında kadın meselesi genelde ön yargılı bir biçimde çözümlenmeye çalışılmıştır. Çünkü Türkiye başta olmak üzere Müslüman toplumlarda hem moderniteyi hem de gelenekselliği savunanlar çoğu kere kendilerini kadın üstünden tanımlamaktadır. Bu durum tarihin ve dinin ideolojik bir okumaya tabi tutulmasından beslenmektedir.

Türkiye'de bazı yazar ve araştırmacılar "*oryantalist bakış*" açısını benimseyerek Batılı bakış açısıyla hareket etmişler ve kadın meselesini bu bağlamda ele almışlardır. Bunlar, genellikle dinle ve gelenekle hesaplaşmak isteyen ve epistemik anlamda bilgiyi Batı'da üretildiği şekliyle benimseyenlerdir. Arsel (1997) ve Alkan'ın (1981) çalışması bu çerçevede değerlendirilebilir. Feminist bakış açısından hareket eden Berktay (2000) anaerkil toplumsal-dinsel sistem hariç politeist ve monoteist tüm inanç sistemlerini ataerkil olmakla ve kadını ezmekle itham etmektedir. Sabbah'ın (1995) feminist yaklaşımı daha ziyade psikanalitik bir modelden hareket etmektedir. Feminist yazarlardan Mernissi (1995; 1998) tarihi ve dini gelenekle ciddi bir şekilde hesaplaşma eğilimindedir. Kuşkusuz burada söz konusu edilen feminist anlayışlar da temelde oryantalisttir. Merkezî tutumlarını din oluşturan ve dünya görüşleri dinsel bir temele dayanan bir kısım yazarlar ise tamamen Kur'an ve

 Copyright © International Science and Technology Conference (ISTEC)

güvenilir Hadisler üzerinden metinsel çözümlemeler yaparak ve birkaç tekil örneklemi ön plana çıkararak İslam öncesi ezilen kadının İslam ile özgürlüğüne kavuştuğunu ve neredeyse erkeklerle aynı haklara sahip olduğunu söylemektedirler (Aktaş, 1985; Ateş, 2001; Topaloğlu, 2001; Wedud-Muhsin, 2005). Temelde kutsal metinlerden hareket eden bu yazarlar, kısmen geleneği eleştirmekle birlikte, İslam'ı adeta tarih dışı bir şekilde ele almışlardır. *İslamcı bakış* olarak da adlandırılan bu yaklaşım, büyük ölçüde, kimliği koruma arzusundan beslenmektedir. Bir yönüyle bu kapsamda değerlendirilse de, gelenekle yoğun bir şekilde hesaplaşma gayretinde olan, fakat zaman zaman *tarihselcilikle tarihsiciliğin* iç içe girdiği Şefkatli-Tuksal (2001) ve Öztürk'ün (2004; 2012) çalışmalarında da oryantalist yaklaşımın etkilerini bulabilmek mümkündür. Müslüman duyarlılığı ile tarihçi bilimselliği arasında sıkışmış bir karakter arz eden Savaş'ın (1992; 1996; 2004) araştırmalarında Kur'an ve bilhassa Hz. Peygamber dönemi uygulamaları ön plana çıkarılarak sorunun asıl kaynağının Hz. Peygamber'den sonraki dönemde aranması gerektiği vurgulanmaktadır. Şişman'ın (2006) İslamî hassasiyet ile emperyalist modernite anlayışına eleştirici bir tavır takınması *post-modern* bir karakter arz etmektedir. Gerek oryantalist, gerek feminist gerekse İslamcı yaklaşımı yetersiz bulan Kandiyoti'nin (1997) problemi ele alış biçimi ise *sosyolojik*tir. Çünkü o, kadının durumunu tartışırken dinin önemini kabul etmekle birlikte, konuyu sadece dine indirgememekte; gelenek, kimlik ve toplumsal dönüşümleri hesaba katarak problemi analize çalışmaktadır. Yapıcı'nın (2016) yaklaşımı da bu kapsamda değerlendirilebilir. Bu noktada şu hususu özellikle vurgulamak gerekir: Kadın ve din konusu nasıl bir bakış açısıyla ele alınırsa alınsın ideolojik yaklaşımlar ve dinsel farklılıklar, yani araştırmacının dünya görüşü ve din anlayışı onun hem "*ne*" söyleyeceğine ve hem de "*ne*"yi "*nasıl*" söyleyeceğini etkilemektedir.

Dinlerin "*gerçekliği yorumlama*", "*kimliğin tanımını yaparak bireyi oraya yerleştirme*", "*günlük hayat için bir rehber sunma*" (Luckmann, 2003) ve "*toplumun ve kültürün yapısal açıdan devamlılığını sağlama*" (Mardin, 1995) olmak üzere dört temel işlevi vardır. Bu anlamda dinler mensuplarına bir algı kalıbı veren, bir referans çerçevesi sağlayan, bunu da kutsalla ilişkili olarak yapan sistemler olarak değerlendirebilir (Wach, 1995; Günay, 1998). Dinler, tanrı ve insan anlayışına bağlı olarak kendilerine has bir dünya görüşü oluştururken içinde geliştikleri sosyokültürel yapıyla karşılıklı ilişki (etkileşim) içerisine girerler. Bir yandan sosyokültürel yapıyı ve inanan bireyi biçimlendirmeye çalışan dinler bir yandan da mevcut sosyokültürel yapıdan etkilenmektedirler (Zuckerman, 2006). Özellikle İbrahimî gelenek içerisinde yer alan Yahudilik, Hıristiyanlık ve İslamiyet, ataerkil bir yapılanmayı ön plana çıkarttıkları ya da böyle bir toplumsal yapı da geliştikleri için, söz konusu her üç dinde de kadınlara yönelik tutumlarda erkek hâkim bir yaklaşım baskın hale gelmiştir (Yapıcı, 2016). Ancak her ne kadar bu üç dinsel sistem ataerkil yapıyı ön planda tutsa da bunların ataerkillik anlayışları ve kadına bakışları arasında önemli farklılıklar vardır.

Hz. Muhammed döneminde üç temel kadın modeli ile karşılaşmak mümkündür (Yapıcı, 2016: 76).

Hz. Hatice Modeli: Bu modeldeki kadın, ticaret hayatında aktif, sosyal statüsü yüksek bir kadındır. Eşinin kendi üstüne evlenmesine müsaade etmemiş (Hz. Peygamber Hz. Hatice ile evliyken ikinci bir evlilik daha yapmamıştır), hatta sevdiği erkekle (Hz. Muhammed'le) evlenebilmek için olağanüstü bir çaba sarf etmiştir. Evlendikten sonra da eşi tarafından korunmaktan öte eşini koruma altına alan güçlü kadın tipini temsil etmektedir. Kuşkusuz Hz. Hatice kocasına eş, çocuklarına da anne olarak ataerkil toplumsal yapı içerisinde yer almaktadır. Ancak burada katı değil, yumuşak ve ılımlı bir atacıllık söz konusudur.

Hz. Aişe Modeli: Özellikle dinî bilimlerde oldukça gelişmiş, Hz. Peygamber'in vefatından sonra erkek sahabelerle dinî konularda tartışmalara giren, sosyal ve siyasî oluşumlar yaratmaya çalışan ya da bazı oluşumlar içinde yer alan, hem Hz. Peygamber zamanında hem de onun vefatından sonra savaşlara katılan; sosyal, siyasal, askerî ve ilmî alanda son derece aktif bir kadındır. Hz. Ali'ye karşı olan mücadelesinde adeta "sivil itaatsizlik" örneği gösteren Hz. Aişe dışa dönük bir kişiliğe sahiptir. Eşini çok seven, eşi tarafından da çok sevilen bir kadındır. Yerine göre nazlı yerine göre kıskançtır.

Hz. Fatıma Modeli: Genellikle eşi ve çocuklarıyla ilgilenen, yani kocasına eş çocuklarına ana olmayı ön planda tutan bir kadını temsil etmektedir. Hz. Peygamber'in vefatından sonra halifelik ve Hz. Peygamber'in mirası konusunda Hz. Ebubekir'le küçük bir tartışma yaşasa da, neticede durumu kabullenen içe dönük, genellikle sessiz ve kendi halinde bir kadındır.

Aslında burada söz konusu edilen her üç kadın tipini Hz. Peygamber dönemindeki kadınlar arasında yaygın olarak görmek mümkündür. Bununla birlikte şu hususu vurgulamak gerekir: Katı ataerkil düzeni o günün şartlarında "ılımlı bir ataerkilliğe" dönüştürme hususunda İslamiyet'in yaptığı reform niteliğindeki girişimler dinin kurumsallaşmasıyla birlikte yavaş yavaş farklı bir görünüm kazanmıştır. Kadın haklarının zaman içerisinde daha da gelişmesi gerekirken kadının denetlenmesi ve ikincilleştirilmesi adeta kurumsallaşmıştır. Bu süreçte din

 Copyright © International Science and Technology Conference (ISTEC)

ilimlerinde erkeklerin ön plana çıkması ve iktidarda olanların bilgiyi üretmesi nedeniyle kadının "ne"liği ve "nasıl"lığı tartışmaları sadece erkekler tarafından yapılmıştır.

Yöntem ve Araştırma

Bu araştırmada iki soruya cevap aranmıştır:
a) İslam'da kadının yeri ve değeri konusunda gençler ne/neler düşünmektedir?
b) Günümüzde kadının durumu nasıl anlaşılmakta ve nasıl değerlendirilmektedir?

Araştırmanın evreni Çukurova Üniversitesi öğrencileridir. Kesitsel olarak planlanan araştırmada örneklem rastlantısal yöntemle seçilmiş, Eğitim, Ziraat, Tıp, Mimarlık, Mühendislik, İlahiyat başta olmak üzere farklı fakültelerden toplam 374 öğrenci üzerinde uygulama yapılmıştır. Örneklemin % 51.9'u (n: 194) kadın; % 48.1'i (n: 180) erkektir. Araştırmaya katılanların yaş aralığı 17-29; yaş ortalaması 20.88'dir (ss. 2.08).

Nitel bir yöntemin kullanıldığı bu araştırmada üniversiteli gençlerin toplumsal cinsiyet stereotipleri tespite çalışılmıştır. Bu bağlamda: "İslam'da kadının yeri ve değeri konusunda gençler ne/neler düşünmektedir?", "Günümüzde kadının durumu nasıl anlaşılmakta ve nasıl değerlendirilmektedir?" sorularına cevap aranmıştır. Elde edilen bulgular içerik analizi ile çözümlenmiş, kümeleme analizi ile gruplandırılarak bir tipoloji oluşturulmaya çalışılmıştır.

Bulgular

Üniversite Öğrencilerine Göre İslam'da Kadının Statüsü

"İslam'da kadının yeri ve değeri" konusunda ileri sürülen görüşlerin farklı referanslara dayandığı görülmektedir. Öğrencilerin büyük bölümü İslam'ın kadına hem ontolojik anlamda, hem de sosyal hayatta çok önemli bir yer verdiği kanaatindedir. Ancak İslam'ın kadına bakışı ve kadının erkeğe göre nerede durduğu konusunda farklı ifadelerle karşılaşılmaktadır. Bazı öğrenciler: "*İslam kadını erkekle eşit hale getirmiştir.*" derken, bazıları: "*O günün şartlarında neredeyse erkeğe yaklaştırmış.*" demekte, bir kısmı da: "*İslam ilke olarak kadına değer verip onu yüceltmek istemiştir.*" şeklinde, pratiği değil ilkeyi ön plana çıkartmaktadır. Bu düşüncedeki öğrencilerin en çok vurguladığı husus Hz. Muhammed'in"*Cennet annelerin ayakları altındadır"* anlamındaki hadisidir. Bir nevi ataerkil kültürün kadın deyince akla getirdiği çocuk doğurma ve anne(lik) imgesi dinsel motiflerden de destek alarak devam etmektedir. Bu durum hem erkekler hem de kızlar tarafından benimsenmiş bir algılama biçimidir. İslam'ın mevcut şartlarda kadına en iyi imkanı sunduğunu düşünen gençler genellikle kendilerini "*inanan*" ve "*dindar*" olarak tanımlayan Sünnilerdir. Aynı şekilde, dindar Aleviler arasında az da olsa böyle düşünenler görülmektedir. Esasen bu tur düşüncelerin altında dinin mensuplarına sağladığı dünya görüsünün etkilerini güçlü bir şekilde bulmak mümkündür. Ayrıca bu tür açıklama yapanların dinsel kimlikleri çoğu kere cinsel kimliklerinin önüne geçmiştir. Gençlerin bir kısmı İslam'da kadın ve erkeğin eşit olmadığını, kadının alt statüde kaldığını, ikincilleştirildiğini "*çok eşlilik*", "*şahitlik*" ve "*miras*" gibi konuları gündeme getirerek ortaya koymaya çalışmaktadır. Kendilerini "*inançsız*", "*şüpheci*" ve "*sadece inanan*"olarak tanımlayanlar, mezhepleri hakkında ise genellikle "*kültürel Sünnîyim*", "*ailem Sünnî*", "*Alevîyim*" ve "*hiçbir mezhebe mensup değilim*"diyenler, İslam"ın kadınlara yönelik tutumu konusunda eleştirici bir yaklaşım içerisindedirler. Bununla birlikte "*inançları kuvvetli birisiyim" ve "dinimi yaşamaya gayret ediyorum*" diyen kız ve erkek öğrencilerden de bu tür tepkiler yükselmektedir. İnançlı olduğunu söyleyenler daha yumuşak bir üslupla, kendilerini inançsız ve şüpheci olarak tanıtanlar ise göreceli olarak daha sert bir üslupla düşüncelerini dile getirmektedirler. Burada ise geleneğin ve dinin algılanışına yönelik tepkileri bulmak mümkündür. Kendilerini inançlı ve dindar olarak tanımlamakla birlikte dinin kadını ikincilleştirdiğini söylemeye çalışan kız öğrenciler cinsel kimlikleriyle dinsel kimlikleri arasında sıkışma ve bocalama yaşamaktadır.

Gençlerin İslam'da kadının yeri ve değeri konusunda yaptıkları açıklamalardan hareketle onları sekiz farklı tip içinde değerlendirmek mümkündür:

a) Taklidî Teslimiyetçiler: İslam'da kadının konumunun iyi ve değerli olduğunu söyleyen ancak düşüncelerini gerekçelendirmeyenler bu kategoridedir (% 26.4). Bunlar "İslam'da ve Kur'an-ı Kerim'de kadınla ilgili söylenen her şey doğrudur." diyerek sorgulamadan, şüphe etmeden, doğrudan inanma eğilimi göstermektedir Taklidi teslimiyetçiler kendilerini inanan ve kesin inançlı olarak tanımlamaktadır. Bu anlamda onların dini hassasiyetleri yüksektir. Bu kategorideki öğrencilerin büyük çoğunluğu Sünnîdir. Az da olsa Alevi gençlerden de bu yaklaşımı benimseyenlere rastlanmaktadır. Taklidi teslimiyetçiler kapsamındaki kız öğrenciler dinsel kimlikleri ile cinsel kimlikleri, erkek öğrenciler ise geleneksel dini inançlarıyla modernite arasında çatışma yaşamamaktadırlar.

b) Tahkikî Tasdikçiler: Üniversiteli gençler arasında İslam'da kadın konusunu kendilerini ikna edecek düzeyde araştıran, buradan hareketle "işte tüm bu nedenlerden dolayı kadın yüksek bir statüye sahiptir" diyenler tahkiki

 Copyright © International Science and Technology Conference (ISTEC)

tasdikçiler grubuna girmektedir (% 17.8). Bunları "*farkındalık kazanmış inançlılar*" diye adlandırmak da mümkündür. Tahkiki tasdikçiler "İslam, Cahiliyye döneminde ezilen kadını kurtarmıştır." "İslam geldiğinde Doğu Roma ve Sasani İmparatorluklarında kadın aşağılık bir varlık olarak kabul ediliyor ve eziliyordu, işte İslam ezilen kadını yüceltmiştir." "Judeo-Kristiyan gelenek kadını ikincilleştirmişti, İslam kadını yeniden layık olduğu statüye çıkartmıştır" vb. açıklamalarla görüşlerini delillendirmeye çalışmaktadır. Genellikle kendilerini "inançlı ve Sünni" olarak tanımlayan öğrenciler arasında gözlenen bu tür ifadelere nadiren "inançlı ve Alevi" gençler de katılmaktadır. Dini kimlikleriyle barışık ve dini hassasiyetleri yüksek gençler arasında yaygın olan bu tutum örtük ama özgüvenli bir şekilde meydan okuyucudur.

c) Dinin Özü ile Geleneği Farklı Algılayanlar: Bu gruptaki öğrenciler, İslam ile Müslümanı, gerçek din ile algılanan dini, asıl İslam ile kültürel İslam'ı birbirinden ayırarak bu sorunu çözme gayretindedirler (% 18.2). Bu gençler "Hangi İslam?" sorusunu ön plana çıkartmaktadır. İslam'ın ontolojik olarak kadını yücelttiği, ancak tarihsel süreçteki sosyolojik gelişmelerin kadınların aleyhine olduğunu söylemektedirler. Tarihsel süreçte Müslümanların yaptıkları hataları din olarak İslam'a yüklemenin yanlış olduğunu düşünmektedirler. Kadın konusunda sekülarist ve feminist yaklaşımların dine yönelik eleştirilerini bilen ve bundan rahatsızlık duyan gençler "asr-ı saadet" üzerinden oluşturdukları "Kur'an İslamı" kavramıyla bilişsel dengelerini sağlamaya çalışmaktadırlar. Bu görüşteki gençler dini kimlikleriyle barışık fakat yaşadıkları dini sosyokültürel yapıyı sorgulama eğilimindedirler. Hem "İnançlı Sünni" hem de "inançlı Alevi" gençler arasında bu görüş sıklıkla dile getirilmiştir.

d) İnançlı Sorgulayıcılar: Dini kimlik ve inançlarıyla modernite ve seküler yaşam bicimi arasında sıkışmışlık yaşadıkları halde, son tahlilde inançları lehine bir tutum ve kanaat oluşturmuşlardır (% 11.6). Bunlar kendi içinde "kısmi eşitlikçiler" ve "dargın inançlılar" şeklinde iki kısma ayrılmaktadır."Kısmi eşitlikçiler" İslam'da kadın ve erkeğin kısmen eşit olduğunu bunun da her iki cinsiyetin yaratılış özelliklerinden kaynaklandığını düşünmektedir."Dargın inanclılar" ise kısmi eşitlik söyleminden ciddi şekilde rahatsızlık duymaktadır. İnançları ile modern dünyanın kadın söylemi arasında sıkışmış bir ruh hali içinde yaşadıkları çatışmalarla baş etmeye çalışmaktadırlar. İnançlı sorgulayıcılık eğilimi kendilerini "dindar", "inançlı ama ibadetlerini yapmayan", "inançlarını yaşamak isteyen", "dinle pek ilgisi olmayan" şeklinde tanımlayan Sünni gençler arasında daha fazla gözlenmektedir.

e) Suskunlar: Bunlar, İslam'da kadının yeri ve statüsü hakkında açıklama yapmaktan kaçınanlardır (% 5.2). Bu kategori kendi içinde "*ilgisizler*" ve "*yanlış yorum yapmaktan sakınanlar"* olmak üzere iki kısımda değerlendirilebilir. İlgisizler hem genel anlamda dini konuları hem de özelde İslam'da kadının yeri ve değeri meselesini pek önemsemeyenlerdir. Yanlış yorum yapmaktan sakınanalar ise mevcut bilgilerine güvenmeyenlerdir. Bunlar, kadın konusunda din ile modernite arasındaki gerilimi görmezden gelerek, bir nevi bastırma mekanizması kullanarak kendilerini rahatlatmaya çalışmış olabilirler. Suskunlar kategorisinde yer alan gençler kendilerini tanımlarken "Sünni", "inançlı", "inançlarını yaşamayan", "dinle ilgilenmeyen", "sadece Tanrı'ya inanan" vb. ifadeler kullanmaktadır.

f) Kararsızlık ve Çelişki Yaşayanlar: Bunlar, İslam'da kadının yeri ve değeri konusunda "bu konuda kafam karışık", "kararsızım", "çözemediğim bir şeyler var" diyenlerdir (% 2.1). Anlaşıldığı kadarıyla bunlar, İslam'da kadının yeri ve değeri konusunda henüz tam bir kanaate ulaşamamıştır. Bilişsel çelişkileri çözümlenmemiş, düşünceleri billurlaşmamıştır. Kararsızlık ve çelişki içinde olanlar yaşadıkları krizin çözümünü ertelemiş bir görüntü arz etmektedirler. Bu kategoride öğrencilerin tamamı kendilerini inançlı ve Sünni olarak tanımlamıştır.

g) Taklidî Eleştiriciler*:* Bunlar, herhangi bir açıklama ve gerekçe göstermeden "İslam'da kadın ikinci sınıftır", "geri plandadır", "ezilmiştir" vb. görüşler ileri sürmektedirler (% 8.6). Kendilerini "inançlı ama dine ilgisiz", "inanç konusunda şüpheci", "dini konuları sorgulayıcı" ve "ateist" olarak tanımlayan taklidi eleştiriciler için İslam dini prestijli bir sosyal kimlik sunmamaktadır. Taklidi eleştiricilerden bir kısmı da kendilerini kültürel anlamda Sünni ve Alevi diye tanımlamaktadır. Dinle bağlantıları çok zayıf veya tamamen kopuk olan bu öğrenciler kadın konusunda modernist, sekülarist ve feminist söylemi paylaşmaktadır.

h) Tahkikî Eleştiriciler: Bunlar, İslam'da erkeğin kadından açıkça üstün olduğu, her iki cinsiyet arasında eşitliğin olmadığı, kadının ezildiği, sömürüldüğü vb. görüşleri birtakım delillerle gerekçelendirme gayreti içindedirler (% 10.1). İslam'da çok eşliliğin olduğu, sınırsız cariye ile cinsellik yaşandığı, iki kadının şahitliğinin bir erkeğin şahitliğine denk sayıldığı, mirastan kadının yarım pay aldığı, gerektiğinde erkeğin kadını dövebileceğini gibi uygulamaları görüşlerine delil getiren tahkiki eleştiriciler tüm bunların modern dünya ile bağdaşmadığı kanaatindedir. Bu görüştekiler kendilerini ateist, hümanist, deist, dine ilgisiz, inanan ancak mezhepleri kabul etmeyen şeklinde tanımlamaktadırlar. Tahkiki eleştiricilerin büyük çoğunluğu Alevidir. Az da

 Copyright © International Science and Technology Conference (ISTEC)

olsa Sünni öğrencilerden arasında da bu tür görüşlere sahip olanlara rastlanmıştır. Bunlarda da modernist, sekülarist ve feministler ön plandadır.

Üniversiteli Gençlere Göre Günümüzde Kadının Konumu
"Günümüzde kadının durumu nasıldır?" sorusuna verilen cevaplar dört farklı kategoride toplanabilir:

a) Tamamen Olumsuz Görenler: Gençlerin büyük bir çoğunluğu günümüzde kadınların hâlâ ikinci sınıf insan muamelesi gördüğü, ezildiği, aşağılandığı, horlandığı, hatta dövüldüğünü söylemektedir (% 74.1). Dini inanç, dini pratik ve dini kimlik bakımından birbirinden çok farklı olan gençlerin yaklaşık ¾'ü bu kanaattedir. Bu noktada şu hususu belirtmek gerekir: Günümüzde kadının ikincilleştirildiğini söyleyenlerin gerekçeleri birbirinden farklıdır. Bir kısım gençler bu durumu ülkenin doğusunda yaşamaya bağlarken, bir kısmı eğitimsizliğe, bir kısmı geri kalmışlık olgusuna, bir kısmı da dinsel temelli kültürel geleneklere atıf yapmaktadır. Bu bağlamda bazı gençler günümüzde kadının ezilen taraf olmasından bizzat İslam'ı ve Kur'an-ı Kerim'i sorumlu tutarken, bazıları ise egemen güçlerin ve erkeklerin İslam'ı ve Kur'an-ı Kerim'i kendilerince algılayarak kadını ezmeye çalıştıklarını söylemektedir. "İslam'ın verdiği hakları erkekler kendi çıkarları doğrultusunda engellemiştir." diyenler de oldukça çok sayıdadır. Günümüzde kadının cinsel bir meta olarak kullanıldığı iddiası sıklıkla dile getirilmektedir. Bunun sorumlusu olarak geleneği ve dini gösterenler olduğu gibi tam tersine seküler-modern hayatı suçlayanlara da rastlanmaktadır.

b) Genelleme Yapmaktan Kaçınanalar: Bunlar "Türkiye'de kadının durumu ve konumu tek boyutlu değil", "genelleme yapmak hatalı olur" düşüncesindedirler (% 11.3). Bunlara göre kent ya da köyde yaşamakla birlikte toplumun dindarlık, eğitim, entelektüellik, modernleşme ve sosyoekonomik düzeyleri kadına bakış farklılaştırmaktadır.

c) Kısmen Olumlu Görenler: Bunlar, kadın ve erkek ilişkilerinde henüz tam bir eşitlik sağlanamadığını, bununla birlikte eskiye nazaran kısmi bir iyileşme olduğunu söylemektedirler (% 8.2).

d) Tam Eşitliğin Gerçekleştiğini Düşünenler: Bunlar her konuda eşitliğin sağlandığını, dahası kadının bunu yoğun mücadelelerle başardığını düşünenlerdir (% 6.4). Bu düşüncede olanlar eğitim, meslek, kariyer ve ekonomik özgürlük kavramları sıklıkla kullanmaktadır.

Tartışma ve Sonuç
İslam'da kadının yeri ve değeri konusunda yaptıkları açıklamalardan hareketle gençlerin sekiz farklı tipte toplandığı tespit edilmiştir. Bunlar, *taklidî teslimiyetçiler*, *tahkiki tasdikçiler*, *dinin özü ile geleneği farklı algılayanlar, inançlı sorgulayıcılar, suskunlar, kararsızlık- çelişki yaşayanlar, taklidî eleştiriciler ve tahkiki eleştiricileri*dir. Öğrencilerin inanma, inanmama, şüpheci olma durumu ve mezhebi eğilimleri bu sınıflamada etkindir. Dindar insanlar muhafazakâr bir eğilim göstererek kadını "korunmaya muhtaç", "kocasına eş", "çocuklarına ana" olarak tanımlama alışkanlıklarını sürdürmektedir. Dinsel inançların etkisini üzerlerinde daha az hissedenlerden de bu tür açıklamalar gelmektedir. Bu durum kültürün kadına biçtiği rollerin erkekler ve kadınlar tarafından içselleştirildiği, mevcut cinsiyet şemalarının içeriğinin dinsel algılar ve kültürel kalıplar tarafından doldurulduğu anlamı taşımaktadır. Kız öğrencilerin cevaplarında kadın kimliğine yönelik bu yöndeki tanımlamalar *kadının temelde bir kimlik krizi değil, değer ve statü krizi yaşadığı*, bunun da yerine göre kadının kendisini ezik hissetmesine sebep olduğu şeklinde değerlendirilebilir. İşte bu noktada şu hususu önemle vurgulamak gerekir. Dinler, dindar insanlara doğrudan dinsel bir dünya görüşü sunduğu gibi, dindar olmayanlara da kültür ve gelenekle eklemlenerek ve sürekli yeniden üretilerek yarı dinsel bir dünya görüşü sunmaktadır. Öğrencilerin bazıları dünya görüşlerinin dinî temelli olduğunun farkına varmakta, bazıları ise bunu kabul etmeyerek dinsel temelli kültürel yargıları bireysel tercihleri olarak ifade etmektedirler. Ataerkil kültürün etkisiyle dinsel bir renge bürünmüş olan cinsiyet ön yargılarının kadın ve erkek tanımlamalarında doğrudan akla gelmemesi, modernleşme süreci ile birlikte ataerkil yapının ciddi bir yumuşama gösterdiği şeklinde yorumlanabilir. Esasen yapılan pek çok alan araştırmasında bu durumu görmek mümkündür (Akyüz, 2003; Karaman, 2003; Özbekoğlu, 2010; Demez, 2005; Topcuoğlu ve ark. 2010; Kahraman, 2010). Bu çerçevede erkek öğrenciler örtük bir şekilde daha katı ataerkil bir yapının özlemini çekseler de, kız öğrenciler adeta "*kadını birey olarak algılamak şartıyla*"kültürün kendilerine biçtiği *annelik*, *ev işleri*, *çocuk büyütme* vb. rolleri yerine getirebileceklerini söylemektedirler. Hatta *kocaları tarafından korunma* ve *kendi şereflerini kocalarının şerefi olarak algılama*ları yönündeki ifadeler kızların, bireysel gelişimlerine izin verildiği oranda ataerkil kültürün taleplerini yerine getirmekte bir sakınca görmedikleri şeklinde değerlendirilebilir. Başka çalışmalarda tespit edildiği üzere kadınların erkekleri ataerkil kültürün tanımladığı erkeksi rollerle algılaması (Vatandaş, 2007; Pınar, Taşkın & Eroğlu, 2008; Ersoy, 2009; Özbekoğlu, 2010) bu bağlamda değerlendirilebilir. Gençler bir yandan dinin kendilerine sunduğu izafet çerçevesi ile kadını algılamaya çalışırken, hatta İslam'ın görüsünü kendilerince rasyonalize edip meşrulaştırmak isterken, bir yandan da özellikle inançlı ve dindar kız öğrencilerin

 Copyright © International Science and Technology Conference (ISTEC)

iç dünyalarında burukluk hissettikleri görülmektedir. Onlar adeta: "*Biz inanan insanlar olarak dinin bizi erkek karşısında ikincilleştirmesini istemiyoruz, belki din böyle demiyor, ama toplum bizi dinsel bir baskıyla aşağı bir statüye yerleştiriyor, bu da bizi rahatsız ediyor."* demektedirler. Başka bir deyişle özellikle inanan ve dini değerleri kuvvetlice benimseyenler hem dinden uzaklaşmamak hem de kadınlık kimliklerini bireysel olarak yaşamak istemektedirler. Bu ise kadın konusunda İslam dinine dayalı ataerkil yorumların yeniden gözden geçirilmesi anlamına gelmektedir.

Günümüzde kadınların konumu ve değeri meselesinde yapılan açıklamalar dört farklı tipte göstermektedir: Bunlar, *tamamen olumsuz görenler*, *genelleme yapmaktan kaçınanalar, kısmen olumlu görenler* ve *tam eşitliğin gerçekleştiğini düşünenler*dir. Gençlerin günümüzde kadının konumuna yönelik açıklamaları literatürle uyumludur (Karaman, 2003; Vefikuluçay-Yılmaz ve ark., 2009; Topçuoğlu ve ark, 2010; Akşit, Şenturk, Küçükural & Cengiz, 2012). Yapılan açıklamalara bakılacak olursa kadının ikincilleştirilerek ezilmesi temelde ataerkil kodlarla ve stereotiplerle algılanmasından kaynaklanmaktadır. Burada da en çok dikkati çeken hususlar, kadının sadece evi idare eden doğurgan bir anne, erkeğin cinsel ihtiyaçlarını karşılayan bir eş ya da partner ve namusunu koruması gereken bir varlık olarak algılanmasıdır. Bu arada modern dünyanın kadını özgürleştirme adı altında kullandığı ve cinsel bir metaya dönüştürdüğü de vurgulanan hususlardandır.

DÜZCE KENT ATMOSFERİNDE PM_{10} FRAKSİYONLARINDA ELEMENTAL KARBON SEVİYELERİNİN İNCELENMESİ

Seda ASLAN KILAVUZ[1], Zehra BOZKURT[2], Melek KELEŞ[3], Fatma ÖZTÜRK[3]
[1]: Kocaeli Üniversitesi, Çevre Mühendisliği Bölümü
[2]: Düzce Üniversitesi Çevre Mühendisliği Bölümü
[3]: Bolu Abant İzzet Baysal Üniversitesi Çevre Mühendisliği Bölümü

Bu çalışmada Türkiye'nin Düzce ili kentsel atmosferinde, PM_{10} fraksiyonunda EC seviyelerinin ve mevsimsel değişimlerinin ortaya konması amaçlanmıştır. Düzce Türkiyenin Kuzey Batısında yer almaktadır ve etrafının yaklaşık %85'ini çevreleyen dağ ve tepelerden oluşan bir jeolojik yapısı vardır. Bu nedenle Düzce kent merkezine doğru rüzgar akışı engellenmektedir buna bağlı olarak kent merkezinde hava kirleticileri çok fazla dağılamamakta ve yüksek seviyede hava kirleticileri gözlenmektedir. Bu çalışmada Türkiye'nin Düzce ili kentsel atmosferinde, PM_{10} partiküllerinde EC seviyelerinin ve mevsimsel değişimlerinin ortaya konması amaçlanmıştır. Bu amaçla 2015 yılı içerisinde yaz ve kış aylarında yüksek hacimli örnekleyiciler ile kuvars filtreler üzerine toplanan PM_{10} örneklerinde, termal-optik karbon aerosol analizörü kullanılarak EC seviyeleri ölçülmüş ve mevsimsel değişimleri incelenmiştir. Elde edilen verilere göre Düzce kent merkezinde EC seviyelerinin 0.85 $\mu g/m^3$ ile 5.75 $\mu g/m^3$ arasında değiştiği ve ortalama EC konsantrasyonunun 1.82 $\mu g/m^3$ olduğu görülmüştür. Aerosollerdeki EC seviyelerinin mevsimsel farklılıklar gösterdiği ve kış aylarındaki ortalama EC konsantrasyonlarının yaz aylarına oranla yaklaşık olarak 2 kat fazla olduğu ortaya konmuştur. En yüksek konsantrasyonlar Şubat ayında elde edilmiştir. Elde edilen ortalama konsantrasyonlar Dünya'nın diğer bölgelerinde elde edilen verilerle karşılaştırılabilir düzeyde bulunmuştur.
Anahtar kelimeler: Elemental Karbon, PM_{10}, Hava kirliliği

1. GİRİŞ

Şehirleşme ve endüstriyel faaliyetlerin artmasıyla birlikte artan antropojenik faaliyetler sonucunda şehir merkezlerinde yoğun hava kirliliği meydana gelmektedir (Grigoratos vd., 2014; Rodriguez Martin vd.,2015). Artan kirlilik ile beraber kent merkezlerinde özellikle partikül madde konsantrasyonları yükselmiştir. Özellikle PM 10 ve PM 2.5'un kent merkezlerinde insanlar üzerinde ciddi sağlık etkilerine neden olduğu yapılan çaçışmalarla ortaya konmuştur (Heninrich ve Salama, 2007; Ho vd., 2007). PM'in miktarı ile birlikte kompozisyonu da sağlık etkilerinin daha iyi anlaşılabilmesi açısından çok önemlidir (Samek, 2009). Partikül madde kompozisyonunu organikler ve inorganik olmak üzere birçok bileşen oluşturmaktadır. (Patearaki vd., 2012). Yanma kaynaklı oluşan partikül maddelerinin % 60'ını organik karbon (OC) ve %10'unu ise elemental karbon (EC) oluşturmaktadır (Masiello, 2004).

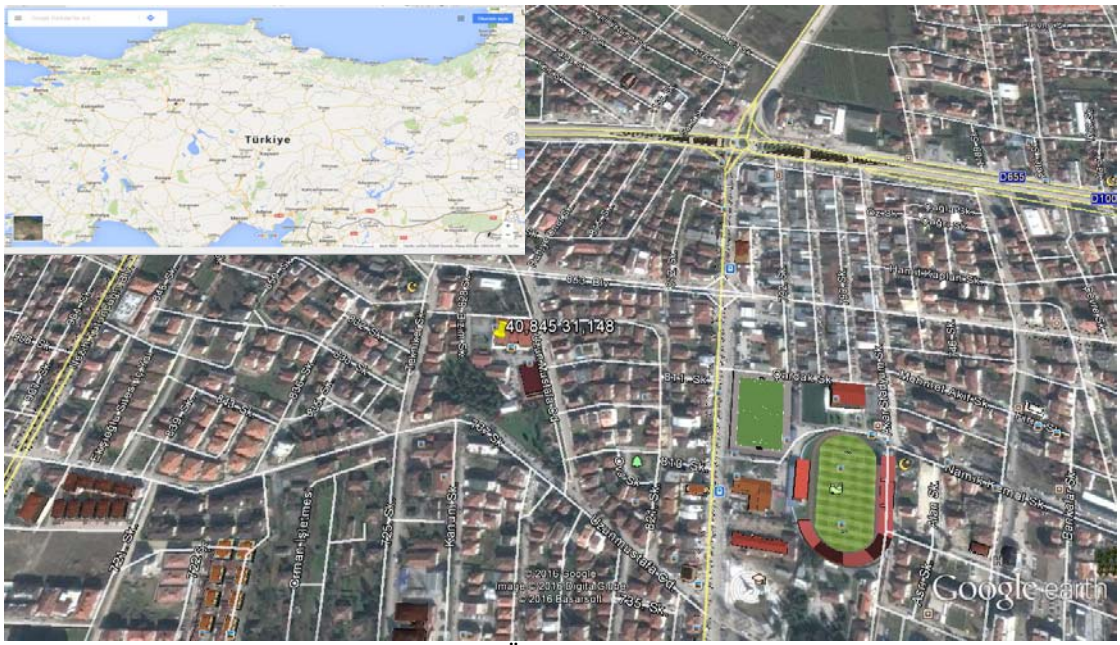
Atmosferde askıda halde bulunan partiküllerdeki elemental karbon (EC) sağlık, havadaki görüş mesafesi ve iklim etkileri açısından önemli rol oynamaktadır. Genellikle optik türevli ve ışığı absorplayan siyah karbon ile (black carbon-BC) eşdeğer kabul edilen EC'nun bölgesel düzeyde havanın ısınmasına neden olduğu bilinmektedir. Bu nedenle atmosferik kararlılığı ve dikey karışımı değiştirmekte ve büyük ölçekli sirkülasyonla birlikte hidrolojik çevrimi etkilemektedir Streets et al., 2003;
Bond et al., 2004; Haywood et al., 1997; Myhre et al., 1998;). Atmosferdeki elemental karbon daha çok fosil yakıtların ve biyokütlenin yakılması sonucu oluşan emisyonlardan kaynaklanmaktadır (Kondo vd., 2006). Bu nedenle özellikle kent atmosferindeki EC'nun en önemli kaynakları başta trafik olmak üzere fosil yakıtların kullanıldığı evsel ısınma olduğu söylenebilir (Ramanathan vd., 2001; Han vd., 2009). Atmosferdeki EC seviyeleri ile ilgili Dünya'da özellikle Çin'de ve Hindistan'da bir çok çalışma yapılmış olmasına rağmen Türkiye'de çok sınırlı sayıda çalışma yapılmıştır. Dolayısıyla Türkiye için önemli bir veri eksikliği söz konusudur. Bu nedenle bu çalışmada Türkiye'nin Düzce ili kentsel atmosferinde, PM_{10} fraksiyonunda EC seviyelerinin ve mevsimsel değişimlerinin ortaya konması amaçlanmıştır.

2. MATERYAL VE METOT

Örnekleme Bölgesi:

Çalışmada örneklemeler Düzce kent merkezinde bulunan Düzce Üniversitesi Meslek Yüksekokulunda gerçekleştirilmiştir (Şekil 1). Düzce, 40° 49. 8' kuzey enleminde 31° 10. 2' doğu boylamında bulunan,

 Copyright © International Science and Technology Conference (ISTEC)



Türkiye'nin kuzey-batısında yer alan bir ildir. İlin topografyası genellikle dağlık ve tepelik (yaklaşık %85) olarak tanımlanır. İlin yüz ölçümü 2.574 km2, nüfusu 355.545 kişidir. İlin nüfusu yüz ölçümüne oranla düşüktür. Düzce merkezinde hakim rüzgar akışı etrafını çevreleyen dağ ve tepeler tarafından engellenmektedir. Bu nedenle özellikle ilin merkezinde kirleticiler dağılamamakta ve yüksek seviyelerde maruziyet gerçekleşmektedir. Düzce'de hava, sıcaklık inversiyonu nedeniyle Ekim ayından Mart ayına kadar, kış aylarında yaklaşık altı ay sislidir. Şehir merkezinin üzerinde düşük inversiyon tabakası hem kış ve hem de yaz mevsiminde görülebilmektedir.

Örnekleme Yöntemi

Bu çalışmada Thermo marka yüksek hacimli hava örnekleyicisi kullanılmıştır. Cihazda PM10 başlığı bulunmaktadır. PM10 örnekleri Palm marka tissuequartz filtre üzerine toplanmıştır. Örnekleme süresi 24 saat olarak belirlenmiştir. Örnekleme sırasında cihazın hava akış debisi 1,13 m3/dk olarak ayarlanmıştır. Örneklemeden önce quartz filtreler sabit tartıma gelinceye kadar, 24 saat sabit sıcaklık ve nem koşullarının sağlandığı desikatörlerde bekletilerek tartılmıştır. Örnekleme sonrasında quartz filtreler uygun koşullarda laboratuara taşınarak 24 saat süresince desikatörde bekletilmiş ve son tartımları alınmıştır. EC analizleri için 1cm^2'lik filtre parçaları kesilmiştir. Kış örneklemeleri Ocak-Mart 2015 tarihleri arasında, yaz örneklemeleri Haziran-Ağustos 2015 tarihleri arasında günlük olarak yapılmıştır.

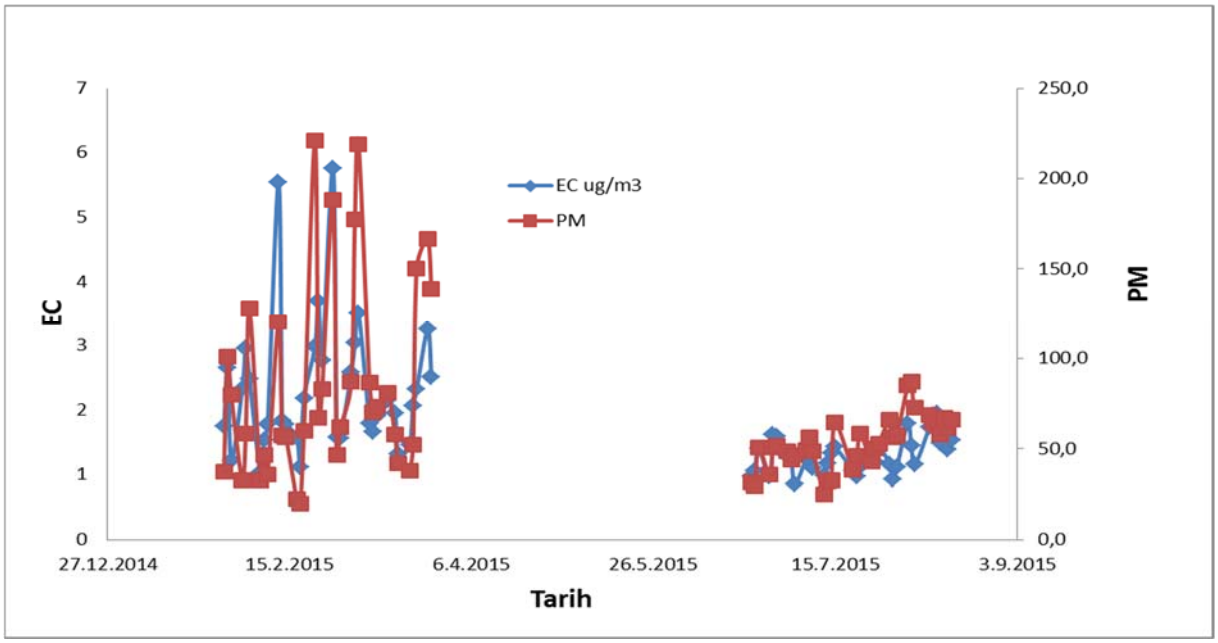
Bu çalışmada PM10 örneklerinde EC/OC analizleri Sunset Lab. (Oregon, ABD) temin edilen "termal-optik karbon aerosol analizörü" kullanılarak yapılmıştır.

Standart büyüklükte kesilen PM yüklü kuvars filtreler analizörün kuvars fırınına yerleştirilmektedir. Daha sonra fırının sıcaklığı belli seviyelere çıkarılarak filtre üzerindeki karbon bileşiklerinin ayrılması sağlanır ve FID dedektörü ile EC ve OC belirlenir. Analizörde taşıyıcı gaz olarak helyum ve helyum/oksijen gazları karışımları kullanılmaktadır.

Şekil 1. Örnekleme bölgesi

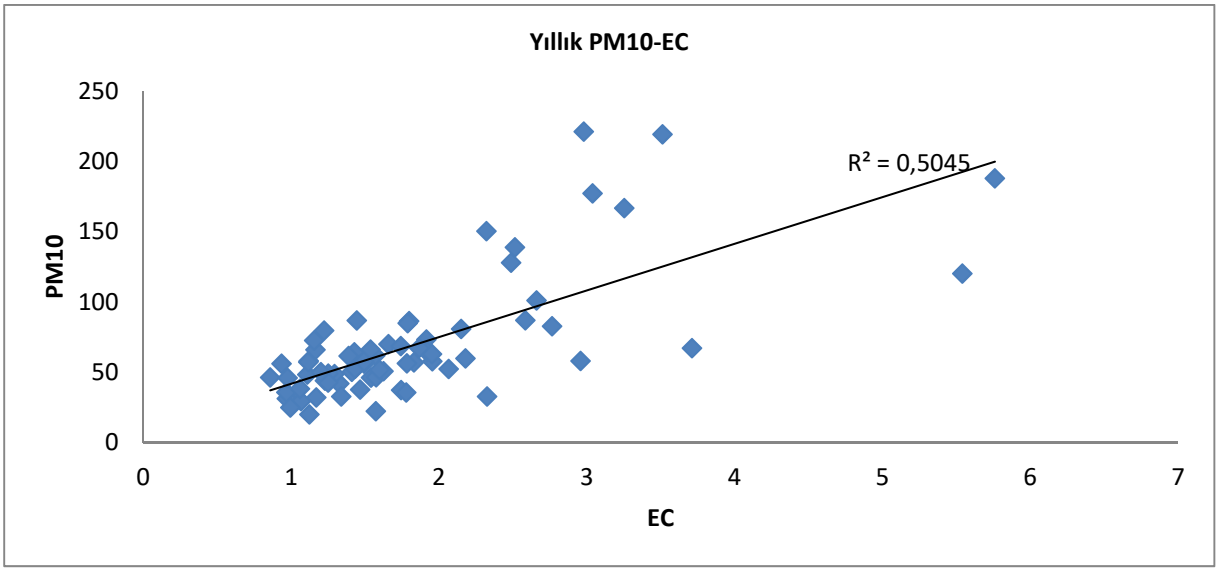
3. BULGULAR VE TARTIŞMA

3.1 EC ve PM seviyeleri



Kent merkezinde toplanana PM10 aerosol örneklerinde ölçülen EC ve PM10 konsantrasyonları Tablo 1 ve Şekil 2'de verilmiştir. Buna göre yıllık ortalama PM10 miktarı ortalama 70 µg/m^3 olarak belirlenmiştir. Bu değer "Hava Kalitesi Değerlendirme ve Yönetimi Yönetmeliği" nde belirtilen sınır değeri aşmaktadır. EC

 Copyright © International Science and Technology Conference (ISTEC)

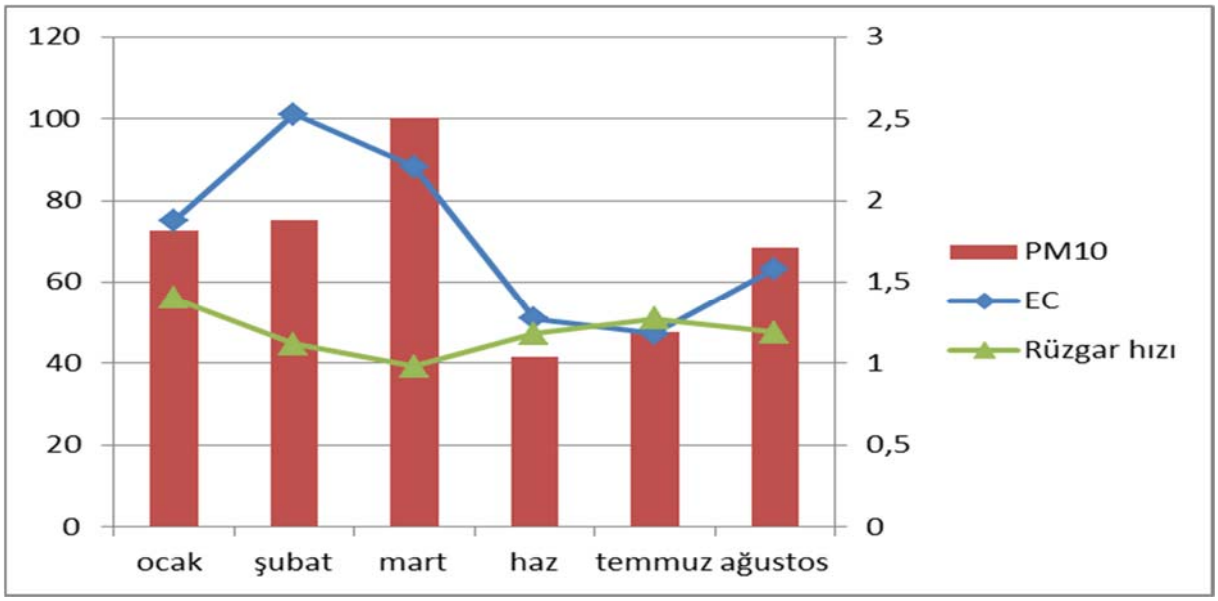


konsantrasyonu ise 0.86 ile 5.76 µg/m^3 aralığında belirlenmiştir. EC'ye ilişkin bir limit değer bulunmamaktaadır. Yıllık ortalama EC değeri PM10'un yaklaşık %10'nu oluşturmaktadır. Şekil 2 incelendiğinde PM10 ve EC konsantrasyonlarının benzr trend gösterdiği görülmektedir. Şekil 3'de ise EC ve PM10 knsantrasyonları arasında pozitif korelasyon bulunmuştur. R^2 değeri 0,5 olarak elde edilmiştir. EC ve PM10 konsantrasyonları arasındaki korelasyon daha önceden yapılan birçok çalışmada benzer şekilde bulunmuştur.

Tablo 1. Düzce kent merkezinde ölçülen PM10 ve EC konsantrasyonları (µg/m^3)

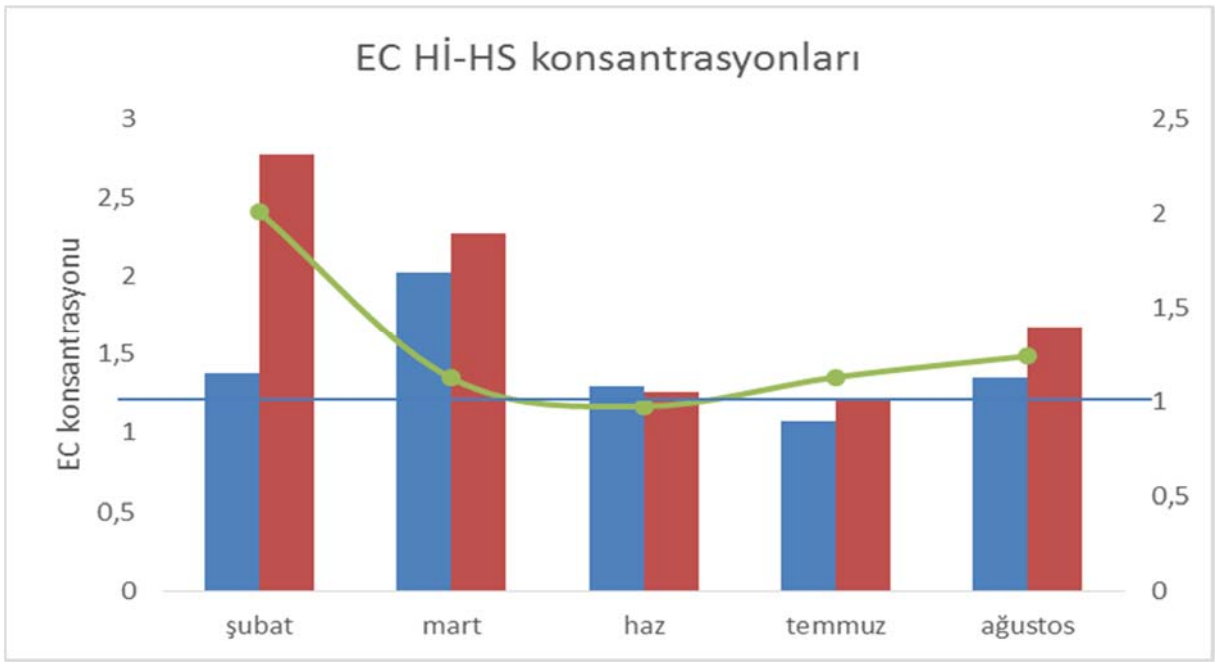
33	Yıllık Ort.	Medyan	SS	Yaz Ort.	Kış Ort.	Y/K	Min	Max
PM10	69,41	57,65	43,11	53,16	85,67	0,62	20,13	221,18
EC	1,83	1,57	0,92	1,32	2,33	0,57	0,86	5,76
%EC/PM10	2,96	2,74	1,17	2,60	3,32	0,78	1,35	7,07

Şekil 2. EC ve PM10 konsantrasyonlarının zamansal dağılımı



Şekil 3. EC ve PM10 konsantrasyonlarının korelasyon eğrisi

 Copyright © International Science and Technology Conference (ISTEC)



3.2. Mevsimsel Değişimler

Aylık ortalama EC ve PM konsantrasyonları Şekil 4'de verilmiştir. Şekil incelendiğinde en yüksek konsantrasyonların kış aylarında olduğu görülmektedir.. Kış aylarında gerek trafiğin daha yoğun olması gerekse ısınmadan dolayı fosil yakıt kullanımının artması sonucunda atmosferdeki EC konsantrasyonları da artmaktadır. Dolayısıyla Düzce'de elde edilen EC konsantrasyonlarının mevsimsel değişimi yakıt tüketimi ve trafiğe bağlı olarak arttığı söylenebilir. Öte yandan en yüksek ortalama konsantrasyonların mart ayında elde edildiği görülmektedir. Grafikte rüzgar eğrisine bakıldığında en düşük ortalama rüzgar hızının (m/sn) mart ayında olduğu görülmektedir. Atmosferdeki kirleticiler rüzgar hızı arttıkça daha fazla dağılmakta ve havadaki miktarları azalmaktadır. Dolayısıyla mart ayında elde edilen daha yüksek konsantrasyonlar trafikle ve ısınma ile birlikte rüzgar hızı ile de açıklanabilir.

Şekil 4. EC, PM ve rüzgar hızının aylık değişimi

Şekil 5'de EC konsantrasyonlarının hafta içi ve hafta sonu konsantrasyonları görülmektedir. Grafik incelendiğinde hafta içi konsantrasyonlarının hafta sonuna göre daha yüksek olduğu görülmektedir.

Şekil 5. Hafta içi vehafta sonu günlerinde EC konsantrasyonları

 Copyright © International Science and Technology Conference (ISTEC)

3.3. EC Konsantrasyonlarını Meteorolojik Parametrelerle İlişkisi

Tablo 2'de Düzce'de ortalama meteorolojik veriler görülmektedir. Veriler incelendiğinde Düzce'de kış aylarında ortalama sıaklığı 7ºC civarında, yaz aylarında ise 24 ºC olduğu görülmektedi.r karışım yüksekliği ve rüzgar hızının ise yaz ve kış aylarında birbiine oldukça yakın olduğu ve kısmen yüksek olduğu görülmektedir. Ortalama rüzgar hızının 2 m/sn.'nin altında olduğu görülmektedir. Düşük rüzgar hızından dolayı Düzce'de kirletici konsantrasyonları kent merkezinde yoğunlaşmakta ve dağılamamaktadır.

Örnekleme periyodu	Ortalama Bağıl Nem (%)	Ortalama Rüzgar Hızı (m/s)	Maksimum Rüzgar Hızı (m/s)	Sıcaklık (Cº)	Ortalama Yağış (mm)	Toplam Yağış(mm)	Karışım Yüksekliği(m)	Basınç (hPa)
28.01-26.03/2015	76,4	1,08	5,4	7,2	3,1	109	404	1000
22.07-16.08/2015	68,5	1,23	6,5	24	1,6	54,3	654	995,5

Şekil 6'da EC konsantrasyonları ile karışım yüksekliği ve rüzgar hızının ilişkisi görülmektedir. Bilindiği gibi karışım yüksekliği ve rüzgar hızı arttıkça kirletici konsantrasyonları azalmaktadır. Düzce'de elde edilen EC konsantrasyonlarının bu iki parametreyle ilişkisi incelendiğinde konsantrasyonların beklendiği üzere karışım yüksekliği ve rüzgar hızıyla azaldığı görülmektedir. Ancak her iki meteorolojik parametre değerlerinin yıl boyunca çok fazla değişiklik göstermemesi nedeniyle kısmi bir azalma görülmektedir.

Şekil 6. EC konsantrasyonlarının rüzgar hızı ve karışım yüksekliği ile değişimi

3.4. EC Konsantrasyonlarının Literatürle Karşılaştırılması

Tablo 3'de bu çalışmada elde edilen EC konsantrasyonları ile Dünya'nın çeşitli yerlerinde yapılan çalışmalarda elde edilen EC konsantrasyonları verilmiştir. Tablo incelendiğinde Düzce'de elde edilen konsantrasyonların genel olarak diğer çalışmalara göre daha düşük olduğu görülmektedir. Ancak Tokyo ve Baltimore gibi büyük kentlere çok yakın seviyelerde bulunmuştur. Yüksek EC konsantrasyonların daha çok yoğun nüfusa sahip Çin, Hindistan gibi ülkelerde elde edildiği görülmektedir. Öte yandan bu çalışmada elde edilen en yüksek konsantrasyonlar 5 µg m^{-3} civarında olup Çin ve Hindistan'da elde edilen verilere oldukça yakındır. Dolayısıyla Düzce'de EC seviyelerinin zaman zaman dikkat çeken boyutlara ulaştığı söylenebilir.

4. SONUÇ VE ÖNERİLER

Bu çalışmada elde edilen verilere göre özetle aşağıdaki sonuçlar ortaya konmuştur.

- Düzce atmosferinde PM10 fraksiyonlarında EC konsantrasyonları 0,86 ile 5,76 µg m^{-3} arasında bulunmuştur
- Kış aylarındaki EC konsantrasyonları yaz aylarına göre daha yüksek bulunmuştur
- EC ile PM10 konsantrasyonları arasında pozitif bir korelasyon bulunmuştur ve EC konsantrasyonu PM10'un yaklaşık %3'ünü oluşturmaktadır.
- EC'nin hafta içi konsantrasyonları hafta sonuna göre daha yüksek bulunmuştur
- EC konsantrasyonları rüzgar hızı ve karışım yüksekliğinin artışıyla azalmaktadır
- Düzce'deki EC konsantrasyonları Hindistan, Çin ve Kore'ye göre düşük olmakla birlikte Amerika'nın bazı bölgeleri ve Tokyo ile aynı seviyede belirlenmiştir

Öneriler:

- Bu çalışmada sınırlı sayıda örnek alınmıştır, ilerleyen çalışmalarda daha fazla sayıda örneklemeler yapılarak tüm yıla ait EC değerleri ortaya konmalıdır
- Her ne kadar Çin, Hindistan gibi ülkelere göre EC konsantrasyonları daha düşük olsa da Tokyo gibi yoğun nüfuslu kentlerle aynı seviyelerde bulunmuştur. Düzce Tokyo ile karşılaştırıldığında nüfusu az ve küçük bir şehirdir. Bu nedenle hava kalitesi açısından kirli olduğu söylenebilir. PM10 değerlerinin de çoğu kez sınır değeri aşması bunun bir göstergesidir. Bu nedenle yerel yönetimlerin yapılan bu çalışmaları dikkate alarak hava kalitesinin iyileştirilmesi için önlemler alması gerekmektedir
- Bu çalışma PM10 fraksiyonundaki aerosol örnekleriyle yapılmıştır. EC antropojenik bir kirletici olması ve daha çok ince partiküllerde bulunması nedeniyle, ilerleyen çalışmalarda PM2.5 aerosollerinde de EC konsantrasyonları belirlenmelidir.

DÜZCE YÖRESİ DOĞU KAYINI MEŞCERELERİNDE ARALAMA ŞİDDETİNİN ÖLÜ ÖRTÜ DİNAMİĞİNE KISA SÜRELİ ETKİLERİ

Ali Kemal ÖZBAYRAM

Düzce Üniversitesi, Orman Fakültesi, Orman Mühendisliği Bölümü, Düzce (Türkiye)
alikemal288@hotmail.com

Özet: Orman ölü örtüsü orman ekosistemin en önemli dinamik bileşenlerinden biridir. Yetişme ortamı özellikleri, ağaç türü-karışımı ve silvikültürel aktiviteler ölü örtü üretimini önemli şekilde etkileyebilmektedir. En önemli silvikütürel aktivitelerden biri olan aralamalar orman altında mikro-klimayı ve ölü örtü miktarını değiştirebilmektedir. Bu çalışmada, Düzce (Türkiye) yöresindeki doğu kayını meşcerelerinde ölü örtü miktarının belirlenmesi ve farklı şiddette aralamanın ölü örtü miktarı üzerine kısa süreli etkileri araştırılmıştır. Düzce yöresindeki Asar ve Darıyeri sahalarında 2009 yılında aralama denemeleri kurulmuş, üç tekrarlı rastlantısal blok desenine göre üç farklı şiddette aralamalar uygulanmıştır. Aralama öncesi ve aralamadan bir yıl sonra her iki sahadaki parsellerde 10 tekrarlı olarak yaprak, dal ve çürüntü miktarları ayrılarak ölü örtü ölçümleri yapılmıştır. Araştırma sonuçlarına göre, aralamadan önce ölü örtü miktarı Asarda 7.5 ton ha^{-1}, Darıyeri'nde ise 12.3 ton ha^{-1} bulunmuştur. Aralamadan bir yıl sonra aralanan parsellerde toplam ölü örtü miktarı artmıştır. Her iki deneme de yaprak ölü örtü miktarı aralanan parsellerde azalırken, dal ölü örtüsü artış göstermiştir. Çürüntü ölü örtü ise aralamadan etkilenmemiştir. Aralama öncesi olduğu gibi aralamadan bir yıl sonrada çürüntü ölü örtü>yaprak ölü örtü ilişkisi devam etmiştir. Sonuç olarak, doğu kayını meşcerelerinde uygulanan aralamalar kısa vadeli olarak ölü örtü dinamiğini etkilemiştir. Aralamanın ölü örtü dinamiğine etkilerini tam olarak anlamak için uzun süreli çalışmalara ihtiyaç vardır.

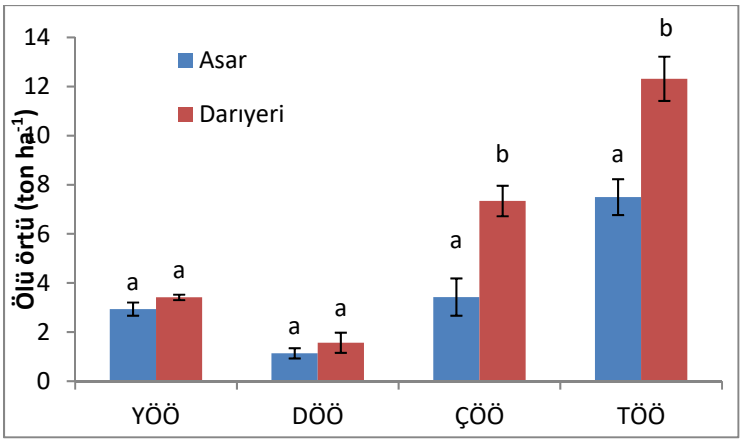
Anahtar Kelimeler: aralama, doğu kayını, Düzce, ölü örtü

Giriş

Doğu kayını (*Fagus orientalis* Lipsky), ülkemizdeki yapraklı türler arasında yayılış alanı (1.9 mil. ha) ve ağaç serveti (264 mil. m^3) bakımından ilk sırada gelmektedir (OGM, 2006). Düzce doğu kayının optimal yayılış yaptığı yörelerden birisidir. Orman ölü örtüsü (ÖÖ) orman ekosisteminin en belirgin özelliklerinden biridir. Ormanda toprak üstünde yatan ve çoğunluğunu yıllık yaprak dökümünün oluşturduğu organik maddelerin bütününe ÖÖ denilir. ÖÖ, yapraklar, ibneler, tomurcuk pulları, dal parçaları v.s. bitki örtüsü (flora) ve küçük ve büyük hayvanların artıklarını içermektedir. ÖÖ tam olarak oluştuğunda yaprak tabakası, çürüntü tabakası ve humus tabakası olmak üzere üç kısımdan oluşmaktadır (Irmak, 1966). ÖÖ ve onun ayrışma ürünleri toprak minerallerinin ayrışmasında, kırıntılı bir toprak strüktürünün oluşumunda rol oynar ve toprak genetiğini etkiler. Diğer yandan ağaçlar tarafından alınan besin maddeleri yıllık yaprak dökümü ve dal düşürmesi ile tekrar toprağa geri döner. Bundan dolayı ÖÖ mineral madde döngüsünü sağlayan önemli bir kaynaktır (Karaöz, 1991). Ayrıca ÖÖ topraktaki omurgalı veya omurgasız küçük canlılara besin kaynağı, bitkilere su ve besin maddesi sağlamaktadır. Türkiye'de değişik türlerde ÖÖ miktarının belirlenmesi ve ayrışması üzerine çalışmalar bulunmaktadır (Arol, 1959; Irmak, 1966; Kantarcı, 1979; Çepel ve Tekerek, 1980; Karaöz, 1988; Karaöz, 1991; Karatepe, 2004; Yener, 2006; Sariyildiz ve Küçük, 2008; Sargıncı, 2014). Faklı yörelerdeki doğu kayını meşcerelerinde yapılan üç farklı çalışmada ÖÖ miktarı 6.7 ton ha^{-1} ile 36.5 ton ha^{-1} arasında değiştiği belirtilmektedir (Arol, 1959; Karaöz, 1988; Yener, 2006; Sargıncı, 2014). ÖÖ miktarı ve ayrışması üzerine çevresel koşullar (Trofymow ve diğ., 2002; Kurz-Besson ve diğ., 2005), mikro organizmalar ve toprak faunası aktivitesi (Neely ve diğ., 1991; Cox ve diğ., 2001) ve ölü örtü kalitesi (Swift ve diğ., 1979; Heal ve diğ., 1997) etkilidir. Birçok çalışma göstermektedir ki, topoğrafya özellikleri (bakı ve yükseklik) (Barnes ve diğ., 1997) ve silvikültürel müdahaleler (Smethurst ve Nambiar, 1990; Martin ve diğ., 2001) çevresel koşulları değiştirebilmektedir. Topografik özelliklerinin ölü örtü ve ayrışma üzerine yaptığı olumlu veya olumsuz etkiyi konu alan sınırlı sayıda çalışma mevcuttur (Mudrick ve diğ., 1994; Vitousek ve diğ., 1994; Scowcroft ve diğ., 2000; Karatepe, 2004; Yener, 2006; Sariyildiz ve Küçük, 2008; Sargıncı, 2014). En önemli silvikültürel müdahalelerden biri olan aralama (Saatçioğlu, 1971), mikro-klimayı değiştirdiği için ölü örtü ayrışmasını

 Copyright © International Science and Technology Conference (ISTEC)

hızlandırmakta (Smith ve diğ., 1997) ve orman verimliliğini (Çiçek ve diğ., 2013; Özbayram, 2015) artırabilmektedir. Bazı ekosistemlerde bakım kesimleri ölü örtü ayrışmasını geriletebilmekte (Cortina ve Vallejo, 1994), bazı durumlarda ise iklim etkisi silvikültürel etkinin önüne geçebilmektedir (Tolunay, 2003). Maalesef, Türkiye'de tür bazında aralamanın ÖÖ miktarına ve değişimine etkisi hakkında çok az bilgiye sahibiz. Bu çalışmanın amacı Düzce yöresinde iki farklı sahada, saf ve doğal DK meşcerelerindeki ölü örtü miktarlarını belirlemek ve aralamanın ölü örtüye etkisinin bir yıllık sonuçlarını değerlendirmektir.



Materyal ve Yöntem

Deneme sahası Düzce ili Kaynaşlı ilçesi sınırları içerisinde Darıyeri ve Asar yöresinde doğal ve saf doğu kayını (*Fagus orientalis* Lipsky.) meşcerelerinde 2009 yılında üç tekrarlı rastlantısal blok deneme desenine göre kurulmuştur. Her denemede 625 m^2 alana sahip 9 parsel bulunmaktadır. Aynı yıl üç farklı şiddette (göğüs yüzeyinin kontrolde %0; mutedilde % 30'u, kuvvetlide % 48'i çıkarıldı) aralama uygulandı. Aralama öncesi Asar denemesi 28 yaşında, 1350 m rakımda, % 26 eğime sahip ve kuzey bakıda yer alırken, Darıyeri denemesi ise 43 yaşında, 630 m rakımda, % 19 eğim ve kuzey bakıda bulunmaktadır. Uzun yıllar ortalamasına göre (1975-2009), Asar ve Darıyeri'nde yıllık toplam yağış sırasıyla 1465 mm ve 1050 mm ve iki denemede de yıllık yağışın % 39'u vejetasyon döneminde (Nisan-Eylül) düşmektedir. Uzun yıllar ortalama sıcaklık Asar ve Darıyeri'nde sırasıyla 7.0 °C ve 10.6 °C'dir. Walter yöntemine göre her iki yörede de kurak dönem bulunmamaktadır. İlk ÖÖ ölçümü aralamadan önce (2009 yılında) tüm parsellerde, Şubat ayında, ikinci ölçüm ise aralamadan 1 yıl sonra 2010 Şubat ayında ölçülmüştür. Her denemede 9 parsel olmak üzere toplamda 18 deneme parselinde 180 alt örnekleme ile ÖÖ ölçümü yapılmıştır. Alt örnekleme parselin merkezinde, diğerleri merkezin 5 m kuzeyinde, doğusunda, güneyinde ve batısında, kalan 5 örnekleme noktası ise rastgele seçilmek suretiyle parsel içerisinde ÖÖ ölçümleri gerçekleştirilmiştir. Örneklerin alınmasında 25x25 cm boyutunda (625 cm^2) ve 15 cm derinliğinde keskin ağızlı demir çerçeve kullanılmıştır. Uygulamada keskin ağızlı metal çerçeve üstten bastırılmak suretiyle organik tabakayı kesmesi ve mineral toprağa saplanması sağlanmıştır. Daha sonra çerçeve içerisine giren ölü örtü, yaprak, dal ve çürüntü şeklinde ayrılmış ve farklı şekilde torbalanarak laboratuvara getirilmiştir. Laboratuvara getirilen ölü örtü örnekleri serilerek hava kurusu hale gelmesi beklendikten sonra, tüm örnekler fırında 70 ºC' de 48 saat kurumaya terk edilmiştir. Fırın kurusu hale getirilen örnekler zaman kaybetmeden 0,01 gr hassasiyetindeki dijital terazide tartılarak fırın kurusu ağırlıkları belirlenmiştir. Yaprak, dal ve çürüntü ağırlıkları belirlenen örnekler hektara çevirme katsayısı ile çarpılarak hektardaki (ton ha^{-1}) miktarları bulunmuştur. Verilerin istatistiki analizi için SPSS v.22 paket programından yararlanılmıştır. Denemelerin aralama öncesi yaprak ölü örtüsü (YAÖ), dal ölü örtüsü (DÖÖ), çürüntü ölü örtüsü (ÇÖÖ) ve toplam ölü örtü (TÖÖ) miktarlarının karşılaştırılması bağımsız örneklem t-testi ile yapılmıştır. Her iki denemede de aralamanın YÖÖ, DÖÖ, ÇÖÖ ve TÖÖ miktarlarına etkileri deneme desenine uygun şekilde varyans analizi (ANOVA) ile bakılmıştır. Ortalamaların karşılaştırılmasında D*uncan* testinden yararlanılmıştır ($P<0.05$).

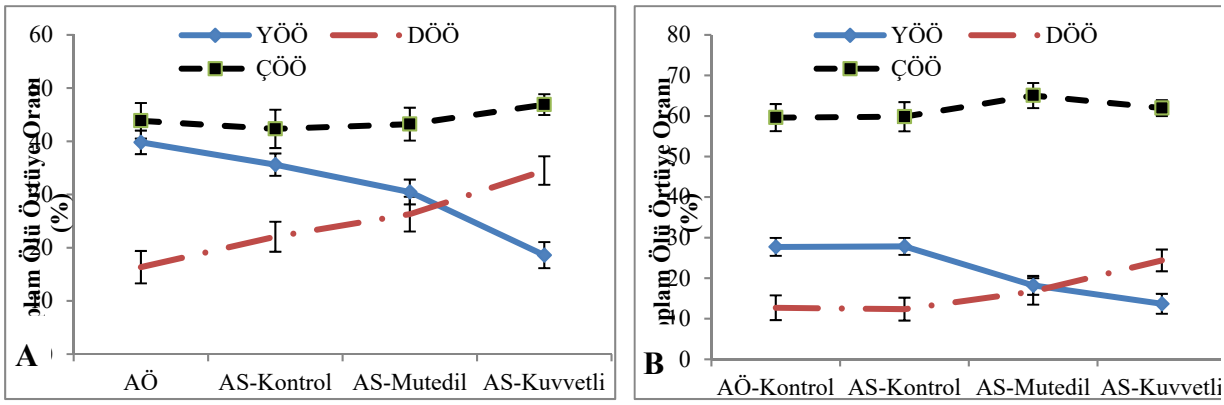
Bulgular ve Tartışma

Aralama öncesi TÖÖ miktarı bakımından iki denemede kendi içerisinde homojendir ($P<0.05$). Aralama öncesi Darıyeri TÖÖ (12.3 ton ha^{-1}) Asar TÖÖ'den (7.5 ton ha^{-1}) % 64 daha yüksek bulunmuştur (Şekil1). Bu fark çürüntü ölü örtü (ÇÖÖ) den kaynaklandığı söylenebilir (Şekil 1). Çünkü YÖÖ ve DÖÖ miktarları her iki denemede de aynıdır ($P<0.05$; Şekil 1). Darıyeri, Asar denemesinden 700 m daha alt rakımda yer aldığından ortalama sıcaklık daha yüksektir. Böylece ayrışan ölü örtü miktarı daha fazla olabilir. Nitekim yapılmış çalışmalarda yükseklik arttıkça ayrışmanın azaldığı ve bunun nedeni düşen ortam sıcaklığı olduğu yönündedir (Piene ve Cleve, 1978; Çepel ve Tekerek, 1980; Mudrick ve diğ., 1994; Yener, 2006; Sariyildiz ve Küçük, 2008).

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 1. Asar ve Darıyeri denemelerinde aralama öncesi yaprak ölü örtüsü (YAÖ), dal ölü örtüsü (DÖÖ), çürüntü ölü örtüsü (ÇÖÖ) ve toplam ölü örtü (TÖÖ) miktarları. Barlar standart hatayı göstermektedir. Aynı harfle gösterilen ölü örtü miktarları 0.05 düzeyinde farksızdır.

Asar denemesinde YÖÖ, DÖÖ ve ÇÖÖ miktarlarının TÖÖ'ye oranı sırasıyla % 40, % 16 ve % 44 iken, Darıyeri'nde ise sırasıyla % 28, % 12 ve % 60'dır. Yani, iki denemede de TÖÖ içerisinde ÇÖÖ miktarının oranı daha yüksektir (Şekil 1). Benzer sonuç Yener (2006) tarafından Sinop yöresindeki doğu kayınında bulunmuştur. Yener (2006), ölü örtü içerisinde ÇÖÖ miktarının YÖÖ miktarından yüksek olduğunu bildirmektedir.



Aralamadan bir yıl sonra, Asar denemesinde kuvvetli işlemde YÖÖ miktarı % 46 oranında azalmıştır ($P<0.001$; Tablo 1). Kontrol ve mutedil parsellerdeki YÖÖ miktarları aynı (2.87 ton ha^{-1}) ve aralama öncesi değere (2.93 ton ha^{-1}) oldukça yakındır. Darıyeri denemesinde ise aralama şiddetine bağlı olarak YÖÖ miktarı azalmaktadır (Tablo 1). Aralama sonrası kontrol YÖÖ değeri aralama öncesi değere oldukça yakın iken, aralama sonrası YÖÖ değeri mutedilde %26, kuvvetlide ise % 45 daha düşüktür. Diğer bir ifadeyle, kuvvetli aralanan parsellerde YÖÖ miktarı daha keskin şekilde azalmıştır. Bu, kuvvetli işlemde daha fazla galip ve müşterek galip ağaçlar kesildiği için yüksek döküntü oluşturan kaynakların azalmasına bağlanabilir. Mutedilde ise ılımlı aralama yapıldığı ve üst tabakadaki ağaçlardan ziyade ara tabakaya müdahale edildiğinden YÖÖ miktarı kuvvetli işlemdeki kadar düşmemiştir. Benzer sonuçlar farklı türde yapılan birçok çalışmada belirtilmektedir (Çepel ve diğ., 1988; Trofymow ve diğ., 1991; Prescott, 1997; Roig ve diğ., 2005; Blanco ve diğ., 2006, 2008; Kunhamu ve diğ., 2009). Roig ve diğ. (2005), Blanco ve diğ. (2006) ve Kunhamu ve diğ. (2009) aralamaların şiddetine bağlı olarak yıllık döküntü miktarının (özellikle yaprak/ibre döküntüsünün) azaldığını belirtmektedirler. Diğer taraftan her iki denemede de aralama sonrası YÖÖ'nün TÖÖ'ye oranı giderek azalması, literatürü desteklemektedir. (Şekil2).

Tablo 1. Aralama şiddetinin yaprak ölü örtüsü (YAÖ), dal ölü örtüsü (DÖÖ), çürüntü ölü örtüsü (ÇÖÖ) ve toplam ölü örtü (TÖÖ) miktarına etkisi. Her deneme içerisinde aynı sütunda aynı harfle gösterilen veriler benzerdir ($P>0.05$).

Deneme Sahası	İşlem	YÖÖ	DÖÖ	ÇÖÖ	TÖÖ
Asar	Kontrol	2,86 b ±0,23	1,77 a ±0,28	3,42 a ±0,37	8,05 a ±0,48
	Mutedil	2,87 b ±0,16	2,67 ab ±0,48	4,21 a ±0,41	9,74 b ±0,75
	Kuvvetli	1,55 a ±0,11	3,68 b ±0,55	4,61 a ±0,41	9,84 b ±0,78
Darıyeri	Kontrol	3,37 c ±0,19	1,50 a ±0,24	7,25 a ±0,49	12,12 a ±0,34
	Mutedil	2,49 b ±0,14	2,43 ab ±0,40	9,27 a a±0,70	14,18 ab ±0,88
	Kuvvetli	1,85 a ±0,19	3,59 b ±0,63	8,96 a ±0,80	14,40 b ±0,88

Aralama sonrası dal ölü örtüsü (DÖÖ) her iki denemede en yüksek kuvvetli işlemde bulunmuştur ($P<0.01$). Kontrol ile mutedil işlemler benzer DÖÖ miktarına sahiptir ($P>0.05$). İki denemede de DÖÖ nün TÖÖ'ye oranı aralanan parsellerde artmaktadır (Şekil 2). Normalde kontrol parsellerinde rekabet daha yüksek olduğundan dal düşürme miktarının yüksek olması, buna bağlı olarak DÖÖ miktarının daha yüksek olması beklenirdi. Ancak, aralama sonrası DÖÖ'nün artması, aralama ile kesilen ağaçların ince dallarının sahada bırakılmasından kaynaklandığı düşünülebilir. Çünkü her iki deneme de aynı şekilde aralamadan sonra DÖÖ artmaktadır (Şekil 2). Ayrıca her iki denemede benzer aralama şiddeti uygulandığından, denemelerdeki aralanan parseller birbirine yakın DÖÖ miktarına sahiptir (Tablo 1).

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 2. Asar (B) ve Darıyeri (B) denemelerinde yaprak ölü örtüsü (YAÖ), dal ölü örtüsü (DÖÖ) ve çürüntü ölü örtüsü (ÇÖÖ)'nün toplam ölü örtüye oranının aralama öncesi (AÖ) ve aralama sonrası (AS) işlemlere göre değişimi.

İki denemede de aralamanın ÇÖÖ miktarına etkisi önemsizdir (P>0.05). Aralama öncesi gibi, aralama sonrası ÇÖÖ miktarı Darıyeri denemesinde Asardan yaklaşık iki kat daha yüksektir (Tablo 1). Deneme sahaları arasındaki ÇÖÖ farkı yetişme ortamı özelliklerinden kaynaklanıyor olabilir. Nitekim yükseklik arttıkça sıcaklık düşmekte ve yağış artmasına bağlı olarak ayrışma yavaşlayabilmektedir (Yener, 2006; Sariyildiz ve Küçük, 2008). Her iki denemede de ÇÖÖ miktarının TÖÖ'deki oranı önemli düzeyde değişmemiştir (Şekil 2). İki denemede de mutedil ve kuvvetli işlemlerde aralamayla ağaç sayısı azalmasına bağlı YÖÖ'de azalma olmasına rağmen, ÇÖÖ miktarında aralama öncesine göre önemli değişiklik olmamıştır. Bunun nedeni araştırma süresinin kısa olmasından kaynaklanabilir. Nitekim aralama çürümeyi (ayrışmayı) hızlandırdığı yönünde birçok çalışma vardır (Piene ve Cleve, 1978; Prescott ve diğ., 2000; Thibodeau ve diğ., 2000; Kunhamu ve diğ., 2009). Örneğin Prescott ve diğ. (2000) aralamanın ÖÖ miktarını iki yıl içinde %10 azalttığını belirtmektedir.

Kontrole göre aralanan parsellerde TÖÖ miktarı artmıştır (Tablo 1). Asar denemesinde TÖÖ aralanan parsellerde benzer ve kontrolden % 22 daha yüksektir. Darıyeri denemesinde ise kuvvetli işlemde TÖÖ kontrolden % 19 daha yüksektir. Kuvvetli işlemlerdeki TÖÖ artması aralama sonrası DÖÖ miktarının artmasıyla sıkı ilişki içerisindedir. Diğer yandan, TÖÖ miktarı aralama öncesi gibi aralamadan sonra da Darıyeri'nde daha yüksektir. Bu, Darıyeri denemesinde meşcere yaşının daha yüksek olmasına bağlı olabilir. Nitekim Yener (2006) doğu kayınında meşcere yaşı artıkça ölü örtü miktarının arttığını belirtmişlerdir. Aralama öncesi TÖÖ miktarı 7.5 ile 12.3 ton ha^{-1} arasında, aralama sonrasında ise ortalama olarak 8.0 ile 14.4 ton ha^{-1} arasında değişmektedir. Bu değerler daha önce Türkiye'de doğu kayınında ölçülen TÖÖ miktarlarına oldukça yakındır (Arol, 1959; Karaöz, 1988; Yener, 2006; Sargıncı, 2014).

Sonuç

Aralama öncesi TÖÖ miktarı Asarda 7.5 ton ha^{-1} iken Darıyeri'nde 12.3 ton ha^{-1}olarak bulunmuştur. Aralama öncesi denemeler arası YÖÖ ve DÖÖ miktarları benzer iken, ÇÖÖ ve TÖÖ miktarları Darıyeri'nde daha yüksektir. Aralamadan 1 yıl sonra TÖÖ miktarları artmış, Asarda 8.0 ile 9.8 ton ha^{-1} arasında, Darıyeri'nde ise 12.1-14.4 ton ha^{-1} arasında değişmektedir. Ayrıca aralamadan bir yıl sonra kuvvetli işlemde YÖÖ miktarı her iki denemede de yaklaşık % 45 azalmıştır. Ancak DÖÖ ve TÖÖ miktarları aralamadan 1 yıl sonra kuvvetli işlemde artmıştır. Ancak her iki denemede de ÇÖÖ miktarı aralamadan 1 yıl sonra işlemler arasında değişmemiştir. Aralama öncesi ÇÖÖ-YÖÖ farkı aralamadan sonra daha da artmıştır.

ÖÖ dinamik bir yapıdır. Yıldan yıla, iklimden iklime değişebilmektedir. Aralamanın ÖÖ miktarına ve ayrışmaya etkisini tam olarak anlayabilmek için uzun süreli çalışmaların sonuçlarına ihtiyaç vardır. Bu nedenle aralamanın ÖÖ miktarına ve ayrışma üzerine uzun yıllar etkileri araştırılmalıdır. Ayrıca farklı yetişme ortamlarındaki doğu kayınında yapılacak aralamaların ÖÖ miktarına etkileri ile bu sonuçlar kıyaslanabilir.

Abstract: High-entropy $Al_xCoCrFeMo_{0.5}Ni$ (x=0-2) alloys are prepared by the vacuum arc melting and casting method. The effects of Al content on the microstructure, hardness and wear resistance of the high-entropy alloys (HEAs) are investigated. The HEAs were characterized for phase content by X-ray diffractometer (XRD) and morphology by scanning electron microscope (SEM). Wear tests were performed under dry friction conditions with WC balls at a 5 N normal load and sliding speed of 5 $cm \cdot s^{-1}$ in a ball-on-disc geometry. The worn surfaces of the samples were also examined by SEM to identify the wear mechanism. The hardness starts from 328 HV, at x=0, reach to the maximum, 710 HV, at x=1.0 and then declines to 684 HV, at x=2.0. On the other hand, the wear resistance of HEAs gradually increases with the increasing aluminum content. The correlation between composition, microstructure, hardness and wear properties of these alloys is detailed discussed with in this study.

Keywords: High Entropy Alloys, Wear, Hardness

Introduction

HEAs are the new field of materials science, which are defined as more than five major elements in equi-atomic or near equi-atomic compositions with each elemental concentration between 5 at% and 35 at% (Yeh et al., 2004). In this way, these alloys are perfectly form disordered solid solutions due to the higher mixing entropy (Yeh, 2006). However, many experimental studies show that the intermetallics and ordered solid solutions besides the simple solid solutions can be found in HEAs. Although, the formation of these phases is a contrast to the origin of HEAs, controlling the formation and the amount of phases is crucially important to the design of HEAs according to the desired application. Since its discovery, HEAs have been extensively investigated for the many applications due to their exceptionally high strength and hardness, good wear and corrosion resistance and high-temperature strength properties (Wu, 2006; Mary, 2015).

The AlCoCrFeMoNi system is one of them that has potential for structural and tool industries. The effects of the elements Co, Fe, Cr, Al, Ni and Mo contents on the microstructure of the AlCoCrFeMoNi HEAs that have been widely studied by Hsu et al. (2010a, 2010b, 2011, 2013a, 2013b) and Zhu et al. (2010). The alloy system exhibits the face-centered cubic (FCC), body-centered cubic (BCC), ordered body-centered cubic (B2) and body-centered tetragonal (σ) phases for the various contents. The BCC and B2 phases are promoted by Al, where Co and Ni promoted FCC, Cr and Mo promoted σ, and Fe inhibited the σ phase in alloy system (Hsu et al., 2013c).

To investigate the mechanical properties of alloys, commonly hot-hardness measurements were performed by the same groups while wear behavior only examined for the $AlCoCrFe_xMo_{0.5}Ni$ HEAs, where x changes between the 0.6-2.0 in molar ratio. Both hardness and wear resistance declines as the Fe content increases that is related to the decreased volume fraction of the σ phase in structure. From the examination of worn surface and worn debris, they found that the wear mechanism of alloys is abrasion (Hsu et al., 2010b).

In HEAs, wear is an important phenomena and gives a good indication for the aforementioned potential applications. Thus, the purpose of this paper is to elucidate the effect of aluminium on wear behavior related with microstructural and compositional phase changes in alloys.

Materials and Methods

$Al_xCoCrFeMo_{0.5}Ni$ high-entropy alloys with different aluminium contents (x = 0-2.0 molar ratio) (these alloys are designated: Al0.0, Al0.5, Al1.0, Al1.5, Al2.0) were prepared by the vacuum arc melting and casting method in high purity argon atmosphere. The purity of each constituent elements were above 99.95%. For the chemical homogeneity of alloys, the melting procedure was repeated at least four times. As-cast microstructures and phases of the alloys were characterized with SEM (ZEISS SUPRA 50 VP) and XRD (Panalytical EMPYREAN). Microhardness measurements (Future Tech FM-700) were performed with a load of 100 g and duration time of 10

 Copyright © International Science and Technology Conference (ISTEC)

s. Sample surfaces were polished with the standard metallographic procedure. The wear behavior of the alloys under the dry sliding condition was examined using ball-on-disk testing machine (CSM Instrument) according to ASTM G99 standard. The 3mm WC ball was used as the counter body with a normal load of 5N. The rotation diameter, sliding speed and sliding distance were 5 mm, 5 $cm \cdot s^{-1}$, 100 m, respectively. After the wear tests, specific wear rates of the alloys were calculated from track profiles, which measured with a surface profilometer (Mitutoyo SJ-400) and rear tracks were also examined by SEM.

Results and Discussion

XRD patterns of the alloys are presented in Fig. 1. Alloys with different aluminum content show different phases, including FCC, BCC, B2 and σ. XRD examination of alloys indicated that Al0.0 and Al0.5 alloys consist of the FCC and σ phases. The addition of aluminium to the alloys causes formation of the B2 phase, while the FCC phase totally disappeared when aluminium content higher than x=0.5. Also, the BCC phase appeared in Al1.5 alloy. The σ phase, which exists in all alloys except the Al2.0 alloy that contains only the B2 and BCC phases. This trend can be explained by Al acts as a stabilizer of the BCC and B2 phase [Hsu et al., 2013a], and also increasing the aluminum content hinders the formation of σ phase in alloy.

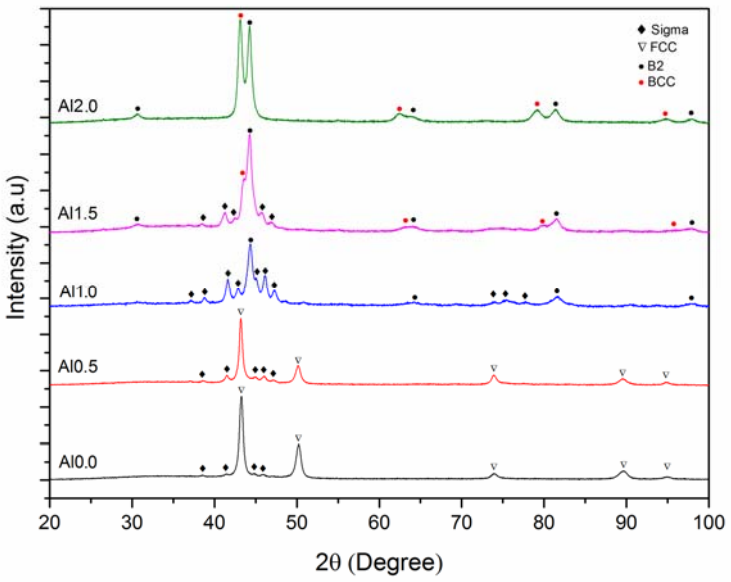

Figure 1. XRD patterns of as-cast $Al_xCoCrFeMo_{0.5}Ni$ alloys.

Fig. 2. presents the microstructures of as-cast $Al_xCoCrFeMo_{0.5}Ni$ alloys. The observed phases in microstructures are labelled on SEM images based on XRD analysis. Also, this is supported from hardness measurements. The Al0.0, Al0.5, Al1.5 and Al2.0 alloys exhibit a dendritic structure, while the Al1.0 alloy has a equiaxial grain structure with visible grain boundaries, where richer σ phase.

Fig. 3. shows the hardness and specific wear rate of alloys as a function of Al content. The hardness of alloys starts from 328 HV, at x=0, reach to the maximum, 710 HV, at x=1.0 and then declines to 684 HV, at x=2.0. Hardness value of alloys is fairly consistent with a presented phases in the structure. Although the Al0 and Al0.5 alloys, which consist of the same phase crystal structures, the hardness of Al0.5 higher than the Al0 alloy due to difference in amount and distribution of the σ phase. The hardness is the maximum in Al1.0 alloy resulting from the formation of a harder the B2 phase. In Al1.5 and Al2.0 alloys hardness slightly decrease compared to the Al1.0 alloy. This is linked with decreasing amount of the σ phase. Also, hardness of phases can be ranked as follows σ>B2>BCC>FCC in alloy system.

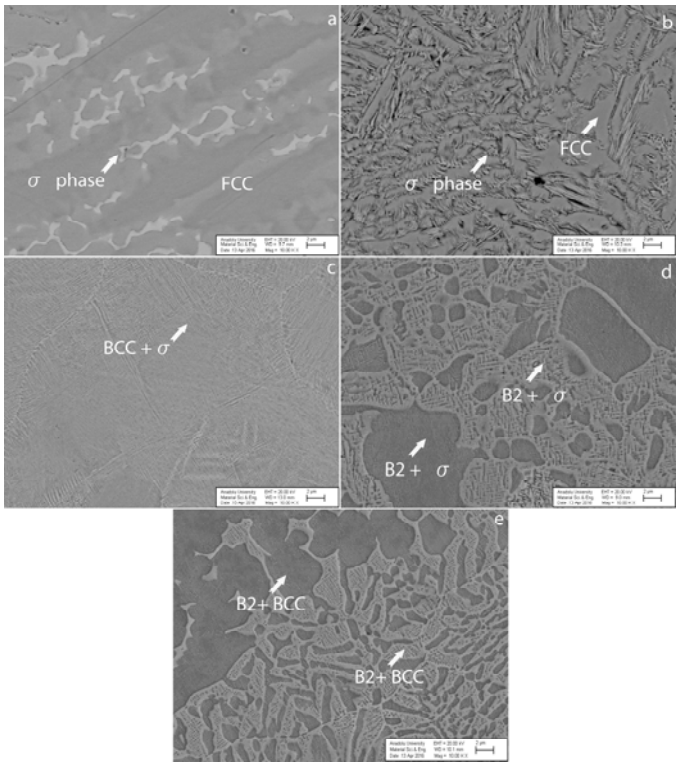

Figure 2. SEM images of as-cast $Al_xCoCrFeMo_{0.5}Ni$ alloys (a) x=0.0, (b) x=0.5, (c) x=1.0, (d) x=1.5, (e) x=2.0.

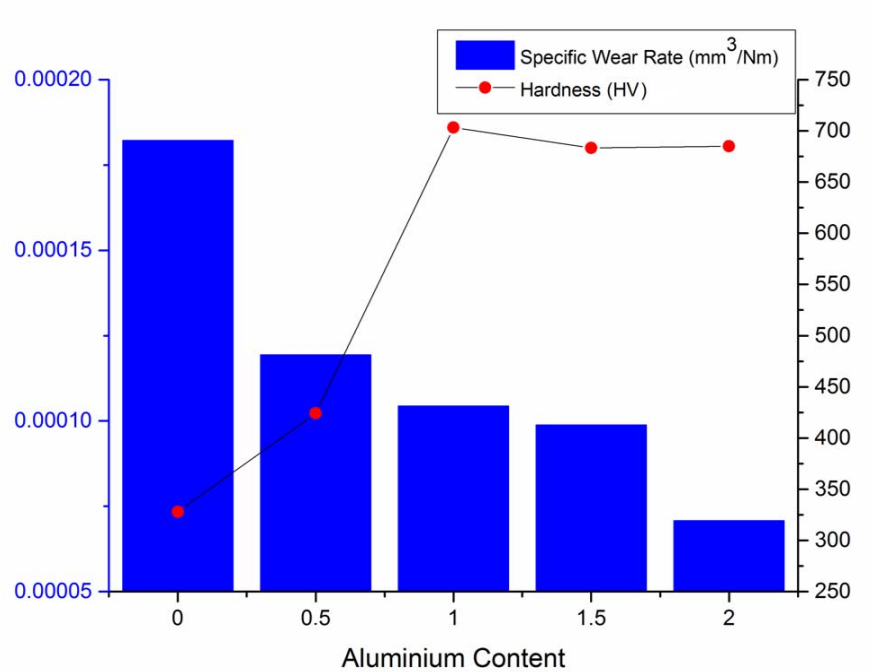

Figure 3. Hardness values of $Al_xCoCrFeMo_{0.5}Ni$ alloys plotted with obtained specific wear rate by wear track profile analysis.

To better understand the wear mechanism for the $Al_xCoCrFeMo_{0.5}Ni$ alloys in dry-sliding conditions, SEM analysis was carried out after wear tests. Fig. 4 presents the worn surfaces and debris of the alloys. Fig. 4 a and b shows the wear surface of the Al0.0 and Al0.5 alloys. The worn surface of these alloys is similar, appearing delamination without oxides. This finding is reasonable since delamination wear is a typical mechanism for ductile metals and Al0.0 and Al0.5 alloys are contained ductile FCC phase [Wu et al., 2006]. In sharp contrast to the wear surfaces of these two alloys, abrasive scratches and significant oxidation features are observed on the worn surfaces of Al1.0, Al1.5 and Al2.0 (Fig. 4 c, d and e) alloys. The dominant wear mechanism was abrasion and oxidation for these alloys.

 Copyright © International Science and Technology Conference (ISTEC)

Fig. 5 displays the wear tracks of alloys. It can be seen from Fig. 5 that the wear tracks of Al0.0 were significantly wide, showing a severe wear occurred in the sliding process. Clearly, the alloys which contain Al exhibited much lower wear rates compared to the Al0.0 alloy.
The highest wear resistance was obtained with the Al2.0 alloy, followed by the Al1.5, Al1.0 and Al0.5, respectively.

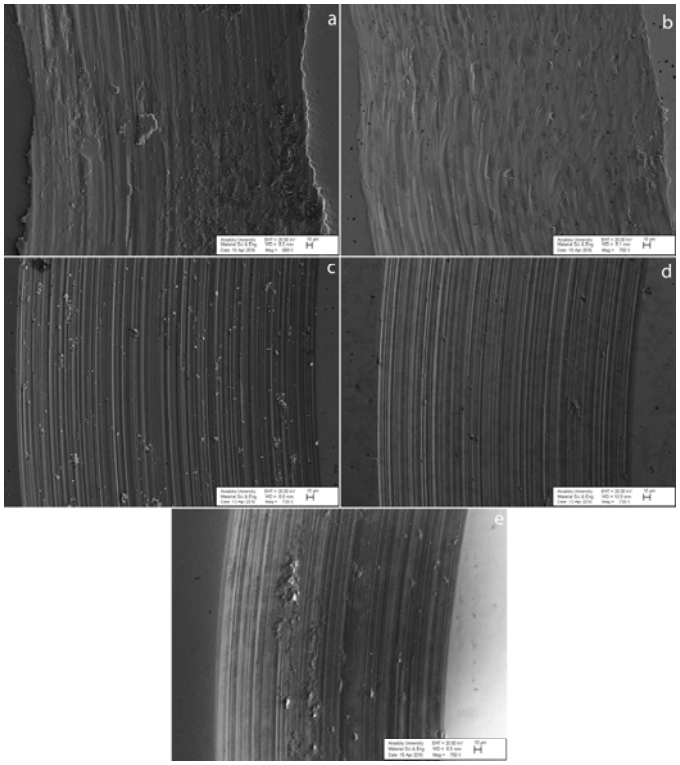

Figure 4. SEM images of worn surface of as-cast $Al_xCoCrFeMo_{0.5}Ni$ alloys (a) x=0.0, (b) x=0.5, (c) x=1.0, (d) x=1.5, (e) x=2.0.

Conclusion

High entropy $Al_xCoCrFeMo_{0.5}Ni$ alloys in different aluminum contents (x=0-2) were successfully produced by vacuum arc melting and casting method. The aluminum content greatly affected the wear performance due to bringing in microstructural and compositional phase changes in alloys. The Al1.0 alloy composed of the B2 and the σ phases has the highest hardness of 710 HV, while the lowest specific wear rate was found 0.00007 mm^3/Nm in the Al2.0 alloy composed of the BCC and B2 phases. Thus, controlling the number and amount of phases was highly important to achieve desired wear performance from HEAs.

Abstract: Cylindirical Al-2Mn-5Si (wt.%) samples were prepared by melting weighed quantities of Al, Mn and Si (high purity >99.99 %) in a graphite crucible placed into a vacuum melting atmosphere. After allowing time for melt to become homogeneous, the molten alloy was poured into 10 graphite crucibles (250 mm in length 4 mm ID and 6.35 mm OD) in a hot filling furnace and then directionally solidified upward with different growth rate ranges (8.30–978 μm/s) at a constant temperature gradient G (4.90 K/mm) in the Bridgman-type growth apparatus. The values of dendritic spacing were measured from longitudinal and transverse sections of the samples. The dependence of dendritic spacing on the growth rate was determined by using linear regression analysis. The microhardness and tensile strength of the studied alloy also were measured from directionally solidified samples. The dependency of the microhardness and tensile strength for directionally solidified Al-2Mn-5Si alloy on the growth rate were investigated and the relationships between them were experimentally obtained by using regression analysis. The results obtained in present work were compared with the previous experimental researches and it was found that the experimental results in this work are in good agreement with the similar works in the literature for binary and ternary alloys.

EFFECT OF LIMITING CURRENT DENSITY (LCD) IN HEAVY METAL REMOVAL BY ELECTRODIALYSIS SYSTEMS

Elif Oztekin, Sureyya Altin

Bulent Ecevit University, Department of Environmental Engineering, Zonguldak.

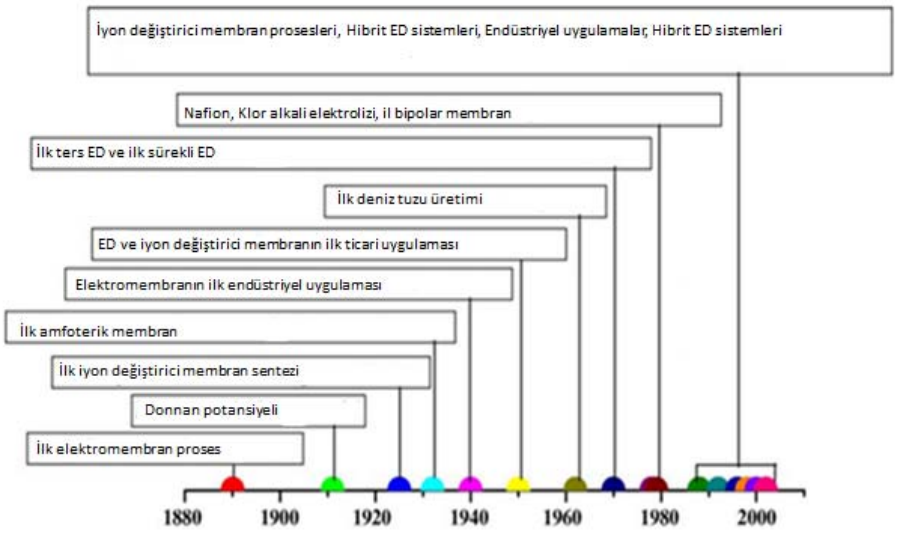
Abstract: Heavy metals are one of the major contaminants in receiving waters from manufacturing processes such as metal and plastic coating, petroleum refineries, battery industries, electronic industry, mining, smelting, electroplating industries. They can cause serious damages to human health and the environment. Heavy metals are non-biodegradable and highly toxic in nature. Thus they can be accumulative in the ecosystems and human bodies even at low concentrations. Therefore, the treatment of wastewaters for removal of such metals is very important before discharging.

Several methods commonly used for the removal of heavy metals from wastewater such as solvent extraction, chemical precipitation, filtration, coagulation/flocculation, ion exchange, membrane filtration, and adsorption. However the conventional processes have many disadvantageous such as high energy requirements, sludge problems, secondary pollutions, high capital and regeneration costs, long operation time, use of chemicals. Thus more effective treatment technologies are required for heavy metal removal or reuse such as electromembrane processes.

Electrodialysis (ED) is an electromembrane separation process which has ion exchange membranes to separate ions from the solution under the electric field. ED system has some advantages in comparison with other conventional treatment system such as chemical and temperature stability of membranes, no adding chemical, low pretreatment requirements, high water recovery.

ED system consist one or more anion (AEM) exchange membranes and cation exchange membranes (CEM) which are fixed between two electrodes the anode and the cathode. Under the influence of a electrical potential difference between the anode and the cathode, the cations migrate to the cathode and the anions migrate to the anode. However, cation exchange membranes are negatively charged and anion exchange membranes are positively charged so the flow of ions is selectively blocked. The result is the ions are depleted in some compartments (dilute) and concentrated in the contiguous compartment (concentrate). After a while a concentration gradient occurs on the boundary layers of ED membrane and the current density close to the maximum value that call as the limiting current density (LCD)

ED system performance depends on several phenomena such as limiting current density (LCD), ionic mobility, applied potential, flow rate, feed concentration, ED cell construction, membrane structure etc. LCD is one of the most important parameter for determining the current utilization in the ED process and measured using the current–voltage relationship. When the current density reaches to the LCD or exceeds, the electrical resistance in the dilute solution drastically increases, the water decomposition occurs and pH of the system changes. Thus detection of LCD is required for designing an efficient electrodialysis system.



The purpose of this research was to investigate the limiting current density of the electrodialysis system by current-voltage curves and explore the effect of feed heavy metal concentration and flow rate on LCD variance.

Keywords: Concentration Polarization, Current–Voltage Curve, Electrodialysis, Heavy Metal Removal, Limiting Current Density.

Giriş

İyon değiştirici membranların kullanıldığı elektrodiyaliz sistemleri, önemi gittikçe artan membran proseslerinden birisidir. Tuzsuzlaştırma, atıksu arıtımı, ultra saf su eldesi, seyreltik çözeltilerin konsantre hale getirilmesi, tuzlarından asit ve alkali çözeltilerin eldesi gibi bir çok alanda yaygın olarak kullanılmaktadır. Aynı zamanda peynir altı suyu, organik asit ve şeker deminerilasyonunda, amino asit ve kan arıtımında, mineral asit konsantre hale getirilmesinde de yaygın olarak kullanılmaktadır. İyon değiştirici membranların kullanım alanları ve gelişimi tablo 1'de verilmiştir. Bu metodun çevre dostu olması nedeni ile gelecekteki uygulamalarda da umut vaadedici olduğu bilinmektedir (Sadrzadeh and et al., 2007).

Şekil 1. ED sistemlerinin yıllara göre gelişimi (Xu and et al., 2005)

Elektrodiyaliz teknolojisinin ilk ticari kullanımı 1950 yıllarında tuzlu suların ekonomik olarak tuzsuzlaştırılması amacı ile olmuştur. ED sistemleri Amerika ve Avrupa'da yaygın olarak tuz gideriminde kullanılmaktadır (Bernardes and et al., 2014).

Elekrtodiyaliz Sistemleri

Elektrodiyaliz, endüstriyel olarak kullanılan ilk iyon değiştirici membrandır. ED sisteminde anyonik ve katyonik membranlar hücre içinde anot ve katot arasında sıralanmıştır. Sisteme elektrik akımı verildiğinde çözelti sisteme pompalanır. Çözeltideki pozitif yüklü katyonlar katota doğru ve anyonlar anota doğru hareket ederler. Katyonlar, negatif yüklü katyon değiştirici membranlardan kolaylıkla geçerler ancak pozitif yüklü anyon değiştirici membranlardan geçemezler. Benzer durum anyon değiştirici membranlar için de geçerlidir. Böylece hücrede seyreltik ve derişik bölmeler oluşur (Abou-Shady and et al., 2012, Baker, 2012, Káňavová and et al., 2014, Václavík and et al., 2015).

Bir katyon değiştirici membran, bir konsantre hücre, bir anyon değiştirici membran ve bir seyreltik bölme, bir hücre çiftini oluşturmaktadır. Endüstriyel büyüklükteki bir ED hücresi elektrotlar arasında sıralanmış 100-200 hücre çiftinden oluşmaktadır. Çeşitli boşluklar ve plaka olarak bilinen hücre yapısı pratik uygulamalarda kullanılmaktadır. Boşluklar membranları ayırmanın yanında hücre içindeki çözeltinin iki farklı akımın karışmasını da sağlar (Strathmann, 2010).

Elektriksel iletkenlik, pH, elektrolit konsantrasyonu, elektrik akımı veya uygulanan potansiyel, ED sisteminin en temel kontrol parametreleri olarak sayılabilmektedir. Ancak sistemin teknik olarak yüksek verimde kullanabilmek için öncelikle iyon değiştirici membranların davranışlarının, yapısının, kararlılığının, iletkenlik ve seçiciliğinin iyi anlaşılması gerekmektedir. Sınırlayıcı akım değeri ve konsantrasyon polarizasyonu gibi daha özel durumlar da oldukça önemlidir. Tüm bu parametreler sistemi etkilemekte ve elde edilen verime yansımaktadır. Literatürde yapılan çalışmalara gör iyon değiştirici membranların kullanıldığı sistemlere ait uygulama alanları, gelişme durumu ve başlıca avantaj- dezavantajları aşağıdaki tabloda verilmiştir.

Tablo 1: İyon değiştirici membran uygulamaları, gelişimi, avantaj ve dezavantajları (Xu, 2005)

Uygulamalar	Proses Gelişim Durumu	Avantajlar	Uygulama problemleri
Bipolar membranlar ile ED Uygun tuzlardan mineral asit ve baz eldesi	Pilot ölçekli tesisler	Düşük enerji gereksinimi	Ürün kontaminasyonu ve düşük akım kullanımından dolayı oluşan düşük membran seçiciliği
Fermentasyon proseslerinden organik asit üretimi veya geri kazanımı	Ticari ve pilot tesisler	Basit proses, düşük enerji	Yetersiz membran kararlılığı ve tıkanma sorunu
SO_2 gazı giderimi	Yaygın pilot tesis çalışmaları	Az tuz üretiminden dolayı tuzun giderim maliyetinin düşmesi	Yüksek yatırım maliyeti,
H_2SO_4 ve NaOH geri kazanımı	Laboratuar, pilot ölçekli ve bazı ticari tesisler	Geri kazanılan ürün tehlikeli değildir, kimyasal olarak kullanılabilir ve maliyeti düşürür	Uzun dönem içinde deneyimlenmemiştir ve membran kararlılığı çok iyi değildir, membran tıkanmaları yüksek maliyete neden olur
Çelik işleme çözeltilerinden HF ve HNO_3 geri kazanımı	Ticari tesisler	Asit geri kazanımı ile maliyette artış ve tuz gideriminde azalma	Karmaşık proses, yüksek yatırım maliyeti
Gıda endüstrisi	Laboratuar ve pilot ölçekli tesisler	Daha az yan ürün, daha az kimyasal ve tuz üretimi ve bertarafında azalma	Uygulama azlığı, proses ve yatırım maliyeti
Enerji depolama ve çevrimi	Sadece teorik	Ekonomik avantajlar	Deneysel veri yok
Metanolden NaOH üretimi	Laboratuar testleri	Diğer yöntemlerden daha ekonomik	Uzun dönemli çalışmalar yok
EDI- Ultra saf su üretimi	Ticari tesisler	Yan ürünleri olmayan sürekli proses, yüksek verim	Yüksek yatırım maliyeti, atık bertarafı, Ön arıtma
EED-Membran Elektrolizi	Ticari tesisler	Sürekli proses, yüksek verim	Yüksek yatırım maliyeti, membran kararlılığı ve seçiciliği
ED- İçme sularında denitrifikasyon	Pilot ölçekli tesisler ve bazı ticari tesisler	Sürekli proses, yüksek verim	Membran kararlılığı ve seçiciliği, proses karmaşıklığı
ED ve filtrasyon- atık geri dönüşümü	Ticari tesisler	Sürekli proses, daha birleşik bir sistem	Karmaşık bir proses

Farklı sektörlerde yaygın olarak kullanılan ED sisteminde elde edilen giderim verimi birçok parametreye bağlıdır. Bu parametreler aşağıdaki şekilde sıralanabilir;

- Sınırlayıcı akım yoğunluğu
- pH
- Bakır konsantrasyonu
- Akış hızı
- Elektrolit çözeltisi ve türü

Bu çalışmada ED sistemlerini etkileyen parametrelerden sınırlayıcı akım yoğunluğunun (LCD) tanımı yapılacak, yapılan çalışmalardan bahsedilecek ve gerçekleştirilmiş olan deneysel çalışmamızdaki değerler tartışılacaktır.

Sınırlayıcı Akım Yoğunluğu

Akım yoğunluğu, her santimetrekareye düşen amper cinsinden elektriksel akı miktarı olarak nitelendirilmektedir. Akım her bir iyonun hareketliliği için gereklidir ve aynı zamanda iyonların çözeltideki serbest hareket etme oranları sınırlayıcı faktördür. Çözeltideki iyon hareketi ile membrandaki iyon hareketi denge halindedir. Akım yoğunluğu; akış hızı, sıcaklık ve iyon türüne bağlıdır. Akım yoğunluğunun artması ile çözeltideki iyonların

 Copyright © International Science and Technology Conference (ISTEC)

membran boyunca olan hareketi, çözelti boyunca olan hareketlerinden daha hızlı olur. Çözelti iyon bakımından tükenmiş hale gelir ve bu durum su moleküllerini etkiler. Voltajın daha da arttırılması ile su H^+ ve OH^- iyonlarına ayrılır. Bu durum polarizasyon noktası olarak adlandırılır ve seyreltik bölmede meydana gelir. Polarizasyon meydana geldiğinde seyreltik bölmede pH değeri değişir. H^+ ve OH^- iyonları katyon ve anyon değiştirici membranlara doğru hareket eder. OH^- iyonları konsantre bölmedeki pozitif yüklü iyonlarla birleşme eğilimindedir. Bu birleşme sonucunda sistemde çökelmeler meydana gelebilmektedir. Ayrıca istenen ürün H^+ ve OH^- iyonları olmadığı halde transfer edileceklerinden dolayı sistem verimi de düşer. Akımdaki ek artışlar, polarizasyon alanındaki verimi daha da düşürür (AWWA, 1995).

Sistemdeki iyon transfer hızı elektrotlar arasındaki elektriksel akıma bağlıdır. Bu nedenle genellikle yüksek akım yoğunluğunda çalışılmak istenmektedir. Sistemde uygulanan voltaj (V) ve akım (I) arasındaki ilişki Ohm kanunu ile açıklanabilir;

$$V=I \times R \qquad \text{(Eşitlik 1)}$$

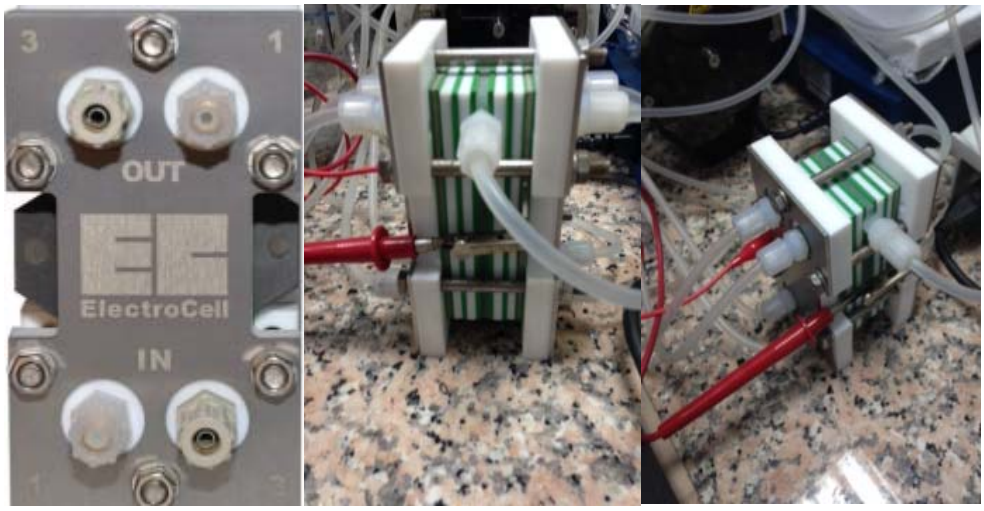
Eşitlikte R ile gösterilen elektriksel dirençtir, hücredeki iyon değiştirici membran ve konsantre veya seyreltik bölmedeki toplam direnci gösterir. İyonların transferi, membran boyunca gerçekleşen transfer hızı ile sınırlıdır. Belirli akım değerlerinde membran boyunca olan transfer hızı, membran yüzeyindeki difüzyon tabakasındakinden daha hızlı olur. Bu elektriksel akım değeri sınırlayıcı akım yoğunluğu olarak adlandırılır. Sınırlayıcı akım yoğunluğuna ulaşılması ile katyon değiştirici membranların yüzeyindeki katyonlar veya anyon değiştirici membranlar yüzeyindeki anyonlar sıfıra ulaşır. Seyreltik bölmedeki elektriksel direnç iyon tükenmesi sonucu hızla artar. Bu bölgede Ohm kanunu geçerliliğini yitirir (Natália and et al., 2013).

Şekil 2. Tipik akım-voltaj eğrisi

İyon değiştirici membranlara ait tipik bir akım-voltaj eğrisi yukarıdaki şekilde görüldüğü üzere üç bölgeye ayrılabilmektedir. Ohmik bölge denilen ilk bölgede akım yoğunluğu, Ohm kanununa uygun olarak elektriksel potansiyel fark ile orantılıdır. Akım yoğunluğunun artması ile membran yüzeylerindeki iyon konsantrasyonları sıfıra ulaşır. Bu bölge sınırlayıcı akım yoğunluğu bölgesidir. Sınırlayıcı akım yoğunluğu tüm iyonların transferi için önemlidir. Bu durumu takip eden üçüncü bölme ise akım-voltaj eğrisi tekrar artar ancak eğim ilk bölmeye göre daha düşüktür (Choi and et al., 2001). Sınırlayıcı akım yoğunluğu deneysel verilerden elde edilen akım-voltaj grafiği ile bulunabilmektedir (Natália and et al., 2013).

ED sistemi sınırlayıcı akım yoğunluğuna ulaştığında, sisteme uygulanan voltaj ve dolayısıyla akım yoğunluğu ne kadar artırılırsa artırılsın, sistemde iyon taşınım hızı ve membranların etrafındaki akım sabit kalır. Bu noktadan sonra sistemde yapılan tüm iş, sıcaklık artışı ve enerji kaybı olarak sisteme yansır. Sınırlayıcı akım yoğunluğu sabit bir sayı değildir. ED prosesinin yapısına ve işletim koşullarına göre değişmektedir. Eğer ED prosesinde

 Copyright © International Science and Technology Conference (ISTEC)

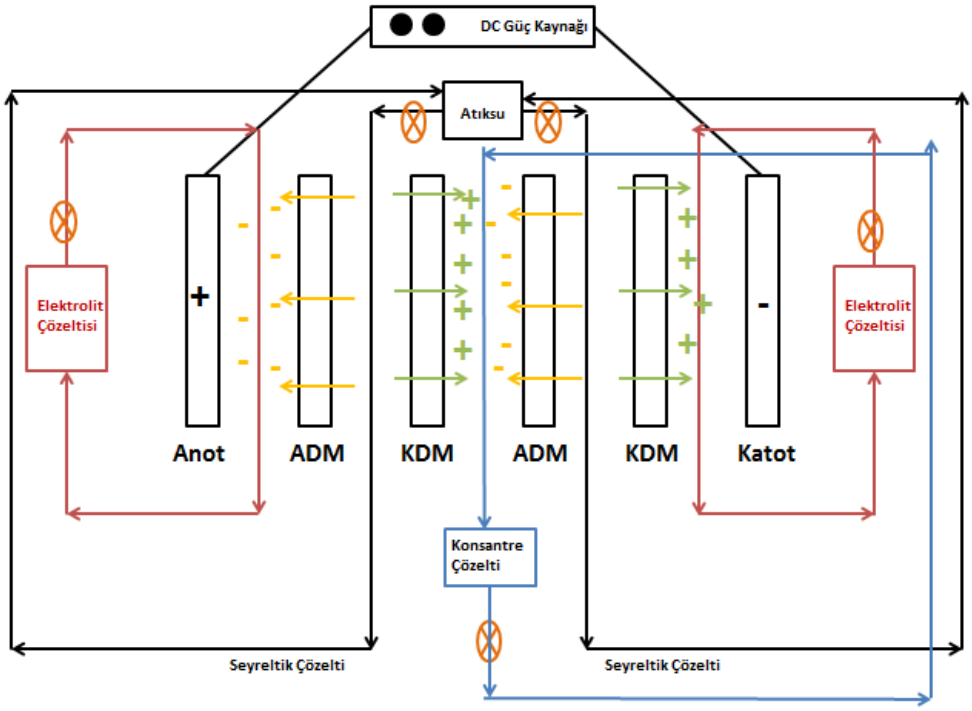


akım yoğunluğu aşılırsa, sistemin elektriksel direnci artarken proses verimi hızlı bir şekilde düşer. Buna ek olarak suyun hidrojen ve hidroksitlere parçalanması meydana gelir ve bu durum membran yüzeyindeki çözeltinin pH değerini değiştirir. Bu durum metal hidroksitlerin membran yüzeyinde birikmesi gibi ek işletme sorunlarına yol açar. Eğer membranlar yeteri kadar asidik veya alkali ortama dirençli değil ise, bozulmaya başlayabilir (Bernardes and et al., 2014, Marder and Pérez Herranz, 2014).

Gherasim and et al. (2014) elektrodiyaliz ile kurşun giderim yaptıkları çalışmada akım yoğunluğunun bulunması için öncelikle sınırlayıcı akım yoğunluğu deneylerini tamamlamıştır. Yaptıkları çalışmada kullanılan konsantrasyon 25-2000ml/L Pb aralığında olup akım ve voltaj arasında lineer bir ilişki ortaya çıkmıştır. Bu nedenle akım – voltaj eğrisi ohmik bölgede kalmış ve uygulanan 0-30 V aralığında sınırlayıcı akım yoğunluğuna ulaşılamamıştır. Böylece 25-2000mg/L aralığındaki konsantrasyonlarda ED prosesi sınırlayıcı akım yoğunluğunun altında çalıştırılmıştır. Aynı zamanda çözelti konsantrasyonu azaldıkça sınırlayıcı akım yoğunluğunun azaldığı bilinmektedir ve ayrıca pratikte de ED sistemlerinde kullanılan akım sınırlayıcı akım yoğunluğunun altındadır. Bu çalışmada oldukça seyreltik besleme sularından(5mg/L Pb) yüksek giderim verimi (0,5mg/L Pb) elde edilmesi amaçlanmıştır. Bu gibi aşırı seyreltik çözeltilerde sınırlayıcı akım yoğunluğuna ulaşılma durumu ile karşılanır ve bu da istenmeyen suyun parçalanması olayına neden olur. Bu durum ise akım veriminde azalma ve enerji gereksiniminde artışa neden olur. Sonuç olarak ED prosesler için seyreltik çözeltilerde giderim verimi önemli olduğu kadar enerji kullanımı da oldukça önemlidir (Gherasim and et al., 2014).

ED sistemindek sınırlayıcı akım yoğunluğu membran ve boşluk yapısına bağlı olduğu gibi bunun yanında çözeltinin iletkenliği, sıcaklığı gibi farklı fizikokimyasal yapısına da bağlıdır (Novalic and et al., 1995).

Deneysel Düzenek



Yapılan çalışmada beş bölmeli, laboratuar ölçekli bir elektrodiyaliz hücresi kullanılmaktadır. Ticari olarak temin edilen bu elektrodiyaliz hücresi anot, katod, iki anyon ve iki katyon değiştrici membranlardan meydana gelmiştir. Platinyum kaplı titanyum elektrotlar hücrenin en dış bölmesinde yer almıştır. Elektrik akımını sağlayabilmek için bir doğru akım güç kaynağı, sistemin akım ve voltajını ölçebilmek için bir multimetre kullanılmıştır. Sistemin pH değişimi, bir pH metre ile, iletkenlik değeri ise iletkenlik ölçer ile ölçülmüş ve alınan örneklerde ağır metal analizi atomik absorpsiyon spektrofotometresinde yapılmıştır.

Şekil 3. ED hücresi giriş ve çıkış yapıları

ED hücresinde kullanılan anyon ve katyon değiştirici membranlar da ticari olarak temin edilmiş olan Nafion 117 Katyon Değişim Membran ve Neosapta AEM Anyon Değişim Membranı olarak belirlenmiştir. Tüm bu membranlar farklı bölmelerle birbirinden ayrılmakta ve bir anyon değiştirici, bir katyon değiştirici membran şeklinde sıralanmıştır. Ticari olarak temin edilen ED hücresi aşağıdaki şekilde gösterilmiştir.

(ADM: Anyon değiştirici membran, KDM: Katyon değiştirici membran)

ED Sistemi için LCD Çalışması

Akım-voltaj karakterinin belirlenmesi tüm sistemin LCD hesabı için çok önemlidir. Akım -voltaj eğrilerinde kararlı durum 3 bölme gösterir. Düşük akımlarda akım yoğunluğu ve voltaj arasında lineer bir değişim vardır. İkinci bölgede akım, voltajla birlikte yavaş artış halindedir ve sonunda sınırlayıcı akıma ulaşır. Bu sınır geçtiği bölgede ise akım yoğunluğu uygulanan voltaj ile tekrar artmaya başlar. Sisteme elektriksel potansiyel farkı uygulandığında elektriksel akımla birlikte aynı veya karşı yükteki iyonların hareketliliği başlar. Membrandan iyonların geçmesi ve engellenmesi ile bazı bölmelerde iyon birikirken, bazı bölmelerde iyon azalması meydana gelir. Bu durum akım-voltaj eğrilerindeki eğimlerle de gözlemlenir (Valerdi-Pérez and Ibáñez-Mengual, 2001).Yapılan birçok çalışmada sınırlayıcı akımın bulunmasında akım-voltaj eğrisinden yararlanılmıştır.

ED sistemi için farklı konsantrasyonlarda LCD çalışması yapılmıştır. Bu nedenle çeşitli konsantrasyonlarda (100ppm, 125ppm, 150 ppm, 175 ppm, 200 ppm ve 250 ppm) Cu^{+2} içeren çözeltiler hazırlanmış ve 165 dk boyunca her 5 dk'da voltaj arttırılarak akım değerleri kaydedilmiştir ve 15dk'da bir numune alınmıştır. 0-60V aralığında çalışma tamamlanmış ve aşağıdaki voltaj-akım eğrileri oluşturulmuştur.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 5. Farklı konsantrasyonlarda elde edilen voltaj-akım eğrileri-LCD çalışması

Grafiklerden görüldüğü üzere tüm konsantrasyonlarda artan voltajla birlikte akım lineer olarak artmış ve bir süre sonra bu artışın eğimi azalmıştır. Azalmanın başladığı nokta sınırlayıcı akım yoğunluğu olarak adlandırılmaktadır. Tüm bunlar dikkate alındığında ED sistemi için sınırlayıcı akım yoğunluğu; 100 ppm için 25 V, 125 ppm için 30V, 150 V için 35V, 175 ppm için 40V, 200 ppm için 45V, 250 ppm için 45 V olarak belirlenmiştir. Konsantrasyon azaldıkça sınırlayıcı akım değeri de azalmıştır ve bu durum literatürle de desteklenmiştir.

Tablo 2: ED Sisteminde Konsantrasyona Göre LCD Değeri

Konsantrasyon	LCD Değeri (Voltaj)
100 ppm	25 V
125 ppm	30 V
150 ppm	35 V
175 ppm	40 V
200 ppm	45 V
250 ppm	45 V

LCD değerleri genellikle daha düşük konsantrasyonlarda 30V'u gösterdiği için LCD değeri 30V olarak belirlenmiştir. Sonraki çalışmalarda kullanılan optimum voltaj değeri etkisinin belirlenmesinde 3 ayrı voltaj bu LCD değerine göre belirlenmiştir. Literatürdeki bilgilere göre LCD değerinin genellikle %100, %85 ve %75 değerleri alınarak sisteme voltajın etkisinin belirlenmesi çalışmaları yapılmaktadır.

Lee and et al. (2006) yaptıkları çalışmada sınırlayıcı akım yoğunluğunun seyreltik bölmedeki iyon konsantrasyonunun artması ile arttığını belirtmişlerdir. Ayrıca çalışmaya göre sınırlayıcı akım yoğunluğu kullanılan elektrolit çözeltisinin konsantrasyonu ile de lineer olarak artış göstermiştir.

LCD değeri sabit bir değer değildir. LCD değeri çalışma parametreleri ve işletme süresine göre değişebilir. Nataraj and et al. (2007) yaptıkları çalışma için en düşük sınırlayıcı değer 50 V için 10mA/cm^2 bulunmuştur. Seyreltik bölmedeki elektriksel iletkenlik zamanla azalmıştır. 40 ve 50 V değerlerinde seyreltik bölmedeki seyrelme ile elektriksel iletkenlik sürekli bir azalma göstermiştir. Ancak sadece 60 V için iletkenlik farklı bir davranış göstermiş, başlangıç değerinin üzerine çıkmıştır. Bu durum çalışmadaki meydana gelen ozmotik basınç ile açıklanmıştır. Aynı zamanda çözünmüş olabilmesi de iletkenliği yükseltmiş olabilmektedir. Ancak işlem sonucunda 60 V değerindeki yüksek transfer sayesinde düşük iletkenlik (0.084 µS) elde edilmiştir.

Sonuç ve Tartışma

ED sisteminin ekonomik olarak kullanılması için sınırlayıcı akım bulunması gereken oldukça önemli bir parametredir. LCD genellikle Voltaj-akım eğrileri oluşturularak bulunur. İyon değiştirici membranlarda konsantrasyon polarizasyonuna ait klasik teoride, voltaj-akım eğrileri 3 bölümde incelenir. Düşük akımlarda akım ve voltaj artışı arasında lineer bir ilişki vardır. İkinci aşamada ise akımın voltajla değişimi çok yavaştır

 Copyright © International Science and Technology Conference (ISTEC)

hatta akımın değişmediği gözlemlenebilir. Bu bölge sınırlayıcı akım yoğunluğu olarak adlandırılır. Son bölgede ise sınırlayıcı akımın aşıldığı bölmedir. Akım, artan voltajla tekrar artışa geçer (Meng and et al., 2005).

ED sistemi sınırlayıcı akım yoğunluğuna ulaştığında, sisteme uygulanan voltaj ve dolayısıyla akım yoğunluğu ne kadar artırılırsa artırılsın, sistemde iyon taşınım hızı ve membranların etrafındaki akım sabit kalır. Bu noktadan sonra sistemde yapılan tüm iş, sıcaklık artışı ve enerji kaybı olarak sisteme yansır. Sınırlayıcı akım yoğunluğu sabit bir sayı değildir. ED prosesinin yapısına ve işletim koşullarına göre değişmektedir. Eğer ED prosesinde akım yoğunluğu aşılırsa, sistemin elektriksel direnci artarken proses verimi hızlı bir şekilde düşer. Buna ek olarak suyun hidrojen ve hidroksitlere parçalanması meydana gelir ve bu durum membran yüzeyindeki çözeltinin pH değerini değiştirir. Bu durum metal hidroksitlerin membran yüzeyinde birikmesi gibi ek işletme sorunlarına yol açar. Eğer membranlar yeteri kadar asidik veya alkali ortama dirençli değil ise, bozulmaya başlayabilir (Bernardes and et al., 2014, Marder and Pérez Herranz, 2014).

Sınırlayıcı akım yoğunluğunun belirlenmesinin, ED sistem verimine olumlu etkisi oldukça fazladır. Bu nedenle elektrodiyaliz sistemlerde LCD değerinin öncelikli olarak belirlenmesi gerekmektedir. Sistemin daha verimli, daha ekonomik ve daha uzun ömürlü çalışması bu duruma bağlıdır. Sisteme uygulanacak voltaj, LCD değerine göre belirlenerek diğer parametrelerin optimizasyonuna geçilebilir. Bu sistem için uygulanan şartlarda LCD değeri 30 V olarak belirlenmiştir. Sistemin verimliliğinin düşmemesi için uygulanacak voltaj değeri LCD değerine göre belirlenecek, LCD değerinin %100, 85 ve 75'i alınarak sisteme uygulanacak optimum voltaj bulunacaktır. Bu çalışmada da yapıldığı gibi voltaj-akım eğrileri sınırlayıcı akım yoğunluğunun bulunmasında hızlı ve pratik bir yöntemdir.

EFFECT OF LITHIUM DOPING ON THE STRUCTURAL AND OPTICAL PROPERTIES OF CDS FILMS USED AS WINDOW LAYER IN SOLAR CELLS

Tülay Hurma
tulayozer@anadolu.edu.tr

CdS and CdS:Li films have been deposited by ultrasonic spray pyrolysis method. Three different atomic ratios of LiCl were used as a dopant element. The effect of lithium incorporation on structural and optical properties of CdS films has been investigated. XRD spectra show that the crystalline quality decreased with incorporation of small amount of lithium in the spraying solution. The crystallite sizes were calculated to be in the range of 60-85 nm. The SEM measurements showed that the surface morphology of the films was affected from the Li incorporation. All the films exhibit the Raman peaks centered around 120, 298 and 590 $cm^{-1}$and the peak profiles are almost symmetric. The optical band gap and Urbach energy values of these films were determined. The maximum transmittance is found to be almost 80% for the visible region. The optical properties of Li doped CdS films changed compared to undoped CdS film.

EFFECT OF THINNING INTENSITY ON THE STEM FORM OF NARROW-LEAVED ASH

Ali Kemal Özbayram
alikemal288@hotmail.com

Narrow-leaved ash (*Fraxinus angustifolia* Vahl.) is getting more and more important in European forestry for its valuable wood and fast growing ability. Mean annual increment can reach at about 15 and 25 m^3 ha^{-1} in natural stands and plantations, respectively. Most of the stands dominated by narrow-leaved ash have been converted to pure ash plantations for the past forty years in Turkey. However there is limited information about silvicultural treatments, especially on thinning regime, used in these plantations. This study started in 2005 and three thinning intensities (control: 0%; moderate: 19%; heavy: 28% of basal area removed) were applied in narrow-leaved ash plantations in Adapazarı, Turkey. Six years growth results of the study were published. However, the effects of thinning on stem form have not been investigated. In spite of many thinning studies about the effects of thinning intensities on growth variables, the effects of thinning intensity on stem form is very limited. Possible changes in stem form by thinning are very important in silvicultural practice. This study was carried out the mentioned thinning experiment and seven-year's results of thinning intensity on stem form were investigated. For this purpose, a total of 27 sample trees were harvested and stem cross-sectional samples (disk) were taken for stem analysis. In each plot, two of the three trees (dominant or co-dominant) represented the mean basal area tree and another tree (dominant) were represented the largest 100 trees/ha in plots. All disks samples were brought to the laboratory, and annual ring counting and measurements were carried out on them. Numerical definition of stem form as diameter decrease, stem form factor, taper coefficient and height-diameter ratio were calculated for each tree using stem analyses data, and stem forms were compared to thinning intensity. Thus, change of stem form according to treatments before thinning and seven years after thinning was evaluated.

Abstract: Cutting and grinding wheels which are used with manual or stationary engine are designed to rotate at very high speeds. Therefore, once cutting and grinding wheels are broken in use, they cause loss of life and property such as serious injuries and damage of products. In addition, corneal injuries may occur due to foreign object or metal particles scattered by cutting or grinding machine and equipment. In this study, 520 workers have been exposed to foreign object scattered by grinding machine. Changes in the structure of the cornea have been analyzed. It was obtained that corneal foreign bodies have been diagnosed in 325 (%62.5) workers, since; they didn't use safety goggles. However 195 (37.5%) workers stated that they used safety goggles. Consequently, as usage rate of safety goggle increased, diagnosis of corneal foreign body showed a decreasing tendency.

Keywords: Cutting and grinding wheels, Corneal injuries, Safety goggles.

Introduction

Grinding is material removal processes from surfaces with the help of grinding wheel. Measurement precisions on the hardened or only surface-hardened parts are provided by grinding. Grinding can be used in order to polish surfaces of work pieces (Hacıfazlıoğlu, 2009).

When grinding wheel come into contact with the workpiece, each grain of grinding wheel in the cutting position begins to remove material (Demir, 2000). Throughout cutting, the dulled or loosen grains of grinding wheel are scattered with chips due to pressure of grinding wheel. Providing it is fulfilled all the conditions necessary for a good grinding, the quality of the surface will be clean and smooth (Atasoy, 2012).

As all cutters used in machining, grinding wheels are also dulled with time. The dulling of abrasive wheels builds up over time. Therefore, pores in the abrasive wheels are filled with time. Consequently, cutting of abrasive wheels will be difficult, since; surfaces of grinding wheel have porous structure. When pore of grinding wheels is filled, surface of abrasive wheels is gotten slippery. Under these conditions, surface quality will not be good to cut the materials and combustion zones occur on surfaces (Atav, 1970).

While grinding wheel turns around own axis with a certain cutting speed, the workpiece passes with a certain speed under the grinding wheel. This situation is known as feed rate of grinding wheel. The cutting speed of grinding wheel is chosen between 25 and 30 m/s in order to make a good grinding under the normal conditions. Cutting speed of grinding wheel depends on the type of the selected materials (Şahin, 2002). Values of Cutting speed affect rotation speed of grinding wheels. Grinding can lead to the emergence of various powder components. It is obvious that the arising metal powder can damage the vital organs. Metal particles scattered from cutting and grinding can cause severe corneal structure disorders.

During grinding and cutting, since; metal particles which are separated off from samples are in direct contact with the eyes, it can damage the eyes directly in case of any accident. This situation may reach dangerous levels.

Figure 1. Worker grinding without protective goggles.

Occupational accidents are an unexpected condition. This causes loss of property, damage or halt of production by effecting and leading to injury, disability or death of worker (Macedo, 2005). Corneal foreign bodies are a common cause of minor work accidents depending on grinding and cutting (Kanoff, 2010). Corneal injuries are not fatal, but it can cause loss of labor (Şahin, 1978).

In this study, effect on the corneal structure of the metal particles scattered from cutting and grinding and the usage of personal safety goggles were investigated experimentally.

Materials and Methods

520 workers who applied to Adıyaman University education and research hospital emergency department with complaint of sight disorder between January 1st 2013 and January 1st 2016. All workers were underwent a detailed ophthalmological examination with a silt lamp bio microscope in polyclinic. It was used for corneal anesthesia topical anesthetic drops. Metal particles were removed by using a 20 gauge needle. A topical antibiotic treatment was prescribed after the metal particles were removed. Statistical analyses were performed with Statistical Program for Social Science 15.0 (SPSS Inc., Chicago, and ABD).

These workers were scanned retrospectively in database of hospital to find their application numbers in the recent 4 year. In this study, workers were scanned backward-information. Workers were classified as first application, 2-5 applications, 5-10 applications and more than 10 applications according to their applications number in order to determine the importance of protective goggles.

Results and Discussion

The mean age of the worker included in this study was 38.2±13.6 years (range: 18-72 years). 98.46% (n=512) of the patients were male and 1.53% (n=8) female. There were 102 worker (19.62%) in first application group, 172 worker (33.07%) in 2-5 applications group, 72 worker (13.85%) in 5-10 applications group and 174 worker (33.46%) in more than 10 applications (max 15) group.

Table 1. Number of applications, patients and usage of goggles.

Interval	Protective Goggles (+)	Protective Goggles (-)	Total
1 Application	30	72	102
2-5 Application	56	116	172
5-10 Application	37	35	72
10 More applications	72	102	174
Total	195	325	520

 Copyright © International Science and Technology Conference (ISTEC)

Safety goggle usage ratio was 29,41% in first application group, 32,55% in 2-5 applications group, 51,38% in 5-10 applications group and 41,37% in more than 10 applications group. Metal particles were removed from cornea in 520 patients safely.

It was found that large numbers of workers who applied with the metal particles scattered from cutting and grinding to clinic didn't use safety goggles, whereas the other workers in safety goggles-using group used insufficient protection.

Considering the large number of the worker in a short period as one month and repetitive applications, workplaces and education about health, risk and safety in these places seem insufficient and require immediate action. Work safety inspections, occupational and safety educations are unsatisfactory. Some precaution must be taken against chemical mechanical and thermal irritants before process. In the course of grinding and cutting, workers should wear protective goggles. Thereby, the contact of the metal parts with eyes will be blocked.

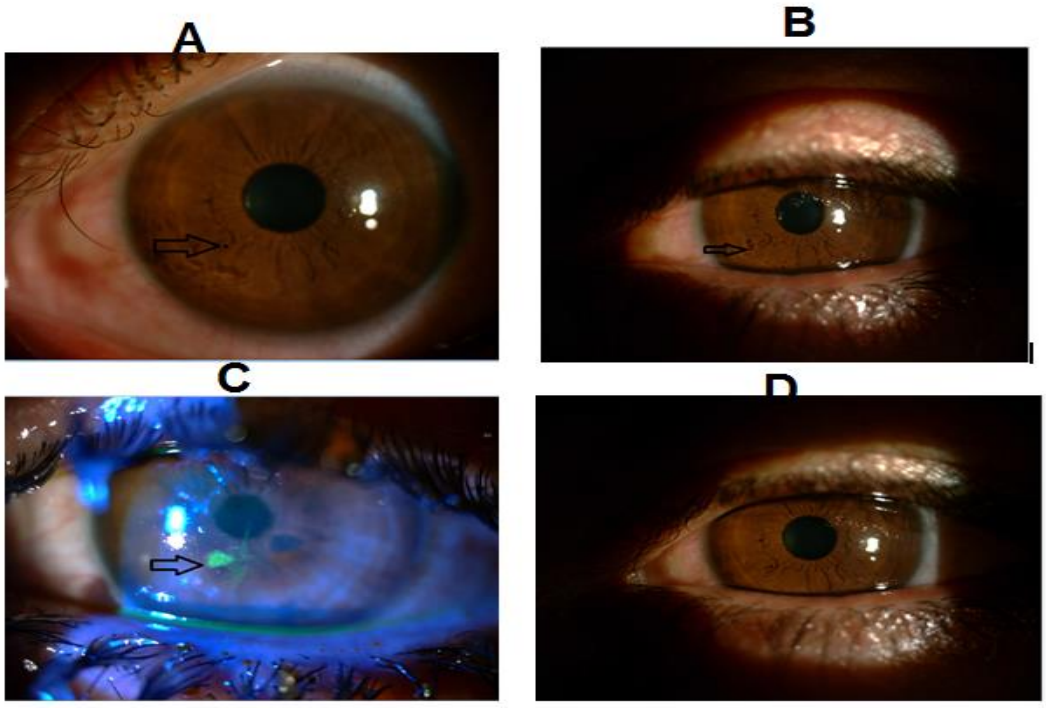

Figure 2. Effect on the corneal structure of the metal particles scattered from cutting and grinding
A: before treatment,
B: After removal of the metal particle,
C: The performed by fluorescent staining after the removal of metal particle,
D: 1 week after treatment.

Conclusion

The environment of the grinding zone should be covered with protective panels or curtains to protect worker from hazardous particles. Panels should be made from portable materials. However, in case plastic curtains or panels are used, curtains and panels should be kept away from grinding zone. Workers should be educated in this direction and take precautions. Effect on the corneal structure of the metal particles scattered from cutting and grinding can be prevented. Finally, the metal particles scattered from cutting and grinding cause to work force loss and treatment costs.

EFFECTS OF CHEMICAL MODIFICATION ON WOOD PROPERTIES

Suat ALTUN

Karabuk University, Department of Industrial Design Engineering, Karabuk- TURKEY

saltun@karabuk.edu.tr

Abstract: Chemical modification can be used to improve the properties of wood. Effect of melamine formaldehyde modification on the physical and mechanical properties of Scots pine and Chestnut was investigated in this study. Wood samples were impregnated with melamine formaldehyde (MF) resin under 3 bar pressure for 10 or 30 min and were cured at a temperature of 150 °C for 20 min in an oven. Weight percent gain, water uptake, volumetric swelling, Brinell hardness, modulus of rupture and modulus of elasticity values of the samples were determined according to relevant standards. Modification with MF reduced the water uptake and the volumetric swelling of the woods. Anti-swelling efficiency of the modification were approximately 66 % and 57 % in chestnut and scots pine, respectively. MOE increased in scots pine (3% - 17 %) while unchanged in chestnut but MOR decreased significantly by modification in both chestnut (2.5% - 17.9%) and scots pine (26.2% - 32.7%). Also, MF modification increased the Brinell hardness of the wood, slightly.

Keywords: Wood modification, Melamine formaldehyde, Physical and mechanical properties

Introduction

Wood has many desirable characteristics required for a variety of end uses such as construction, furniture, and tools. However, wood also has properties that, in relation to specific applications, can be regarded as disadvantages. One main disadvantage of wood is its inherent moisture sensitivity, a major cause for fungal decay, mold growth and dimensional instability, resulting in decreased service life as well as costly maintenance (Gindl et al. 2003; Epmeier et al. 2004). Therefore, suitable technologies are needed to improve woods' properties, i.e., the dimensional stability, durability, mechanical strength, and hardness, to meet specific end-use requirements (Cai 2007; Hochmanska et al. 2014). Different methods, involved chemical and thermal modification, have been developed over many years to overcome these disadvantages. Major research approach has been carried out to improve physical properties. Physical properties could be improved, but the mechanical properties of wood decrease during the modification process (Poncsak et al. 2006; Gündüz and Aydemir 2009). Chemical modification of wood can be defined as a process of bonding a reactive chemical to a reactive part of a cell wall polymer to form a covalent bond between them (Rowell 2006).

The treatment of wood, with different types of chemicals or resins, has been widely studied with the end goal of enhancement. Melamine formaldehyde (MF) and phenol formaldehyde (PF) are two common resins for wood-related applications. Melamine formaldehyde (MF) resin, commonly used in thermosetting, has applications in coatings, adhesives, and both paper and textile treatments (Pittman et al. 1994). Various types and grades of MF resin are available for the impregnation of wood. Gindl et al. (2003) examined the factors were selected that influenced the uptake of MF resin into the cell wall of softwood. Impregnation of solid wood with water-soluble MF resin has led to a significant improvement in the surface hardness (Miroy et al. 1995; Gindl et al. 2004) and the modulus of elasticity (MOE) (Deka and Saikia 2000; Deka et al. 2007). Epmeier et al. (2003) and Deka et al. (2007) reported that modification of wood with MF has led to a decrease in swelling (30% - 75%) and equilibrium moisture of content (EMC) (20%) of the wood. Although many studies have been focused on MF modification, it has not been widely applied in an industrial setting because of its higher cost than other polymerizable monomers and pre-polymers (Deka et al. 2007). Epmeier et al. (2004) compared the physical and mechanical properties of 9 different modified woods and reported that the acetylation and furfurylation were the most effective modification methods for achieving a high dimensional and stiffness stability and a low EMC.

The main purpose of this study is improving the properties of wood by using chemical modification to produce value-added material. To achieve this purpose, the effects of melamine-formaldehyde (MF) modification on the physical and mechanical properties of Scots pine and Chestnut wood was investigated.

Materials and Methods

Materials

Scots pine (*Pinus silvestris* L.) (SP) and chestnut (*Castenea sativa* Mill.)(CH) were used as wood material in this experiment. Commercially available melamine formaldehyde resin (Almin-65), provided by the Gentaş Kimya Inc., Tuzla, Turkey, was used for the modification. The properties of the resin are given in Table 1, based on the manufacturer's information.

Table 1: Properties of Melamine Formaldehyde Resin

Appearence	Clear, colorless liquid
Solid content % weight	51±1
Viscosity (sn F.C.4 20 °C)	15 - 20
pH(20 °C)	9.6 - 10.5
Dansity (g/cm3 20 °C)	1.220 - 1.240
Water tolerance (20 °C)	1/1,0 - 1/2,0
Gel time (min. 130 °C)	35.00 - 40.00

Methods

Wood samples cut into dimensions according to relevant standard and were acclimatized before testing at a temperature of 20 ± 3 °C and a relative humidity (RH) of 65%. The weight and the volume of the samples were determined. Then the samples were oven-dried at a temperature of 103 ± 2 °C and the oven-dried densities were calculated before chemical modification.

Melamine formaldehyde resin was used in two grades. One group was modified with melamine formaldehyde resin which was diluted by 50% with distilled water (MFW) while the other group was modified with MF without further modification. Impregnation was performed in a stainless steel vacuum chamber at 3 bar pressure for 10 or 30 minutes and impregnated samples cured in an oven at a temperature of 150 °C for 20 minutes. The impregnation was performed separately for each treatment level and a new resin solution was used for each of the different variations. Before physical and mechanical analysis testing, the samples were cut into various dimensions, according to the specifications of the testing standard. Ten replicates were prepared for each experiment, and the samples were acclimatized at a temperature of 20 ± 3 °C and a RH of 65%. The experimental design was given in Table 2, and the modification process was summarized in Figure 1.

Table 2: Experimental design

Modification groups (Codes)	Wood species	Chemical	Distilled water	Impregnation duration (min)	Pressure	Number of samples
SP-C	Scots pine	Control	-	-	-	10
SP-MF-10		MF	-	10	3 bar	10
SP-MF-30			-	30	3 bar	10
SP-MFW-10		MFW	% 50	10	3 bar	10
SP-MFW-30			% 50	30	3 bar	10
CH-C	Chestnut	Control	-	-	-	10
CH-MF-10		MF	-	10	3 bar	10
CH-MF-30			-	30	3 bar	10
CH-MFW-10		MFW	% 50	10	3 bar	10
CH-MFW-30			% 50	30	3 bar	10

The oven-dry densities of the samples, before and after the modification treatment, were determined according to the testing standard, TS 2472 (1976). The weight percent gain (WPG) of the samples was calculated according to the following equation:

$$WPG = \frac{m_i - m_0}{m_0} \times 100 \quad (1)$$

 Copyright © International Science and Technology Conference (ISTEC)

where m_o is the oven-dry weight of the samples before the modification in grams and m_j is the oven-dry weight of the samples after the modification in grams.

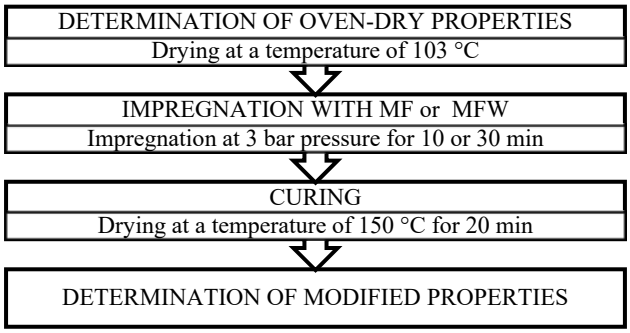

Figure 1: Chemical modification process

To determine the effect of the modification on the dimensional stability, the water uptake (WU), swelling (S), and anti-swelling efficiency (ASE) values of the samples were determined. According to the testing standard, TS 4086 (1983), 20 × 20 × 30 mm (T×R×L) samples were immersed in distilled water for 4 wk. After immersion, the dimension and the weight of the samples were recorded, and the dimensional stability values were calculated according to equations 2 through 4:

$$WU = \frac{m_w - m_i}{m_i} X100 \quad (2)$$

where m_w is the weight of the samples after water immersion in grams and m_i is the oven-dry weight of the samples after the modification in grams;

$$S = \frac{V_W - V_i}{V_i} X100 \quad (3)$$

where V_w is the volume of the samples after water immersion in cm^3 and V_i is the oven-dry volume of the samples in cm^3; and

$$ASE = \frac{S_m - S_u}{S_u} X100 \quad (4)$$

where S_m is the swelling ratio of the modified samples as a percentage and S_u is the swelling ratio of the unmodified samples as a percentage.

The mechanical properties of the MF modified samples, including the modulus of rupture (MOR), modulus of elasticity (MOE), and Brinell hardness (BH) were determined according to the TS 2474 (1976), TS 2478 (1976), and TS 2479 (1976) testing standards, respectively.

The data were analyzed statistically using an SPSS software system (SPSS17, IBM Corp., Armonk, NY). An analysis of variance (ANOVA) model was used to determine the effect of the MF resins on the mechanical and physical properties of wood. Duncan's multiple range tests were used for pairwise comparisons when the overall ANOVA model was significant. Data for Scots pine and chestnut woods were analyzed using separate models.

Results and Discussion

The oven-dry densities of the MF modified wood, and the change as a percentage compared to the unmodified control samples were given in Table 3. Modification with MF or MFW increased the oven-dry density of the both wood species. The highest density increase was determined as 27.2% in Scots pine modified with MFW for 30 min. The density increase in Scots pine were higher than that of chestnut and the change increased with the increasing impregnation duration. Modification with MFW resulted in a higher density increase than modification with MF.

The weight of the samples before and after modification, and WPG values of the modification were shown in Table 4. The WPG values varied from 17.83% to 46.53%. Although the greatest WPG was observed in modification with MFW for 10 min (46.53%), there was no statistically significant difference between the 10-

 Copyright © International Science and Technology Conference (ISTEC)

min and 30-min impregnation durations in Scots pine. It has been found that WPG alters more chestnut than Scots pine. This could be attributed to the relatively low permeability of chestnut. Dieste et al. (2013) noted that the average water vapor permeability of chestnut was lower than that of pine, and this low permeability is attributed to the wood extractives, which reduce the void space and hindered condensation. Chestnut wood has different vapor sorption and vapor permeability than conifers normally used in construction.

Table3: The oven-dry densities of the modified woods

Wood species	Chemical	Distilled water	Impregnation duration (min)	Oven-dry density (g/cm^3)	Change (%)
Scots pine	Control	-	-	0.451	-
	MF	-	10	0.514	14.0
		-	30	0.541	20.1
	MFW	50%	10	0.529	17.4
		50%	30	0.573	27.2
Chestnut	Control	-	-	0.539	-
	MF	-	10	0.592	9.8
		-	30	0.621	15.3
	MFW	50%	10	0.603	12.0
		50%	30	0.614	13.9

WPG were higher in MFW than MF in both wood species. These results showed that MF or MFW impregnated both the cell lumens and the cell walls. It was reported that an aqueous melamine formaldehyde solution can penetrate the secondary cell wall of Scots pine or larch wood (Gindl et al. 2002) and the amorphous region of cellulose fibrils (Hua et al. 1987).

Table 5: Water uptake values of modified and unmodified wood

Modification groups	Water Uptake (%)	Change (%)	HG
SP-C	82.1	-	a

The WU values of the modified with MF and MFW, and unmodified wood were given in Table 5. Reductions in the WU varied from 11.9% to 36.5%. The average decrease in the WU in modified chestnut was about 35%, and there was no statistically difference between them except in modified with MF for 10 min (30.3%). But the difference among the modified pine groups was more evident. It was determined that the impregnation duration was quite effective on the WU in Scots pine; longer impregnation duration caused about twice a decrease.

The volumetric swelling and the ASE values of the modified wood were shown in Table 6. Modification with MF or MFW decreased the volumetric swelling of Scots pine and chestnut. The ASE values of the MFW-modified samples were higher than that of MF-modified samples. Deka et al. (2007) reported a 17.5% increase in ASE for MF-modified Norway spruce. In this study, higher ASE values of 57% and 67.5% for MFW-modified Scots pine and chestnut, respectively, were achieved. Deka et.al. (2007) indicated that this dimensional stability might be due to blocking of water accessible OH groups of wood component with MF resin, which was perceived even after repeated wetting and drying of wood. Since, the MF resin caused volumetric swelling of wood (Militz et al, 1997), it could be inferred that the resin could easily penetrate the wood substrate to reach OH groups of the cell wall components for dimensional stability.

Table 6: Volumetric swelling and ASE values of the modified wood

MOR: Modulus of rupture; MOE: Modulus of elasticity
HG: Homogenity groups. Means within a column with different subscripts differ ($P < 0.05$)

The mechanical properties of the modified wood were determined and the results were summarized in Table 7. Modification with MF or MFW reduced the modulus of rupture (MOR) more in Scots pine than chestnut. The decrease in MOR was approximately 30% compared to unmodified Scots pine and there was no statistically

 Copyright © International Science and Technology Conference (ISTEC)

significant difference among the modified groups. Decrease in MOR were varied by 2.5% to 17.9% in modified chestnut and there was no statistical difference among the modified groups except samples modified with MF for 10 min. Epmeier et al. (2003) reported an approximately 10% increase in MOR with the methylated melamine formaldehyde resin modification; however, acetylation and furfurylation were not significant. The reduction in the MOR of the MFW-modified samples was higher than that of the MF-modified samples. This reduction in the MOR might be caused by high temperature of the curing step of the modification process. A high treatment temperature causes strength loss in wood (Thermowood 2003;Lekounougou and Kocaefe 2014). Therefore, the process values must be selected carefully when exploiting heat in wood modification. Winandy and Rowell (2013) stated that the bending strength depends on many properties, like specific gravity and Weigl et al. (2012) found that the bending strength reduction is aligned with hemicelluloses degradation.

Modification with MF or MFW increased the MOE of the Scots pine. The highest increase was observed in samples modified with MF for 30 min as 17.3%. The increase was relatively low in the other groups and there was no statistically difference among them. Modification with MF or MFW slightly changed the MOE of the chestnut and there was no statistically difference compared to unmodified samples (p=0.264). Epmeier et al. (2004) indicated that although the MOE was affected by a change of density, an increase in density caused by chemical modification does not affect the MOE in the same manner.

Although chemical modification with MF and MFW slightly increased the HBR (Table 8), it was found that this increase was statistically insignificant. Gindl et al.(2002), Epmeier et al. (2003), Lande et al. (2004), and Deka et al. (2007) reported that the hardness of the wood notably increased by chemical modification at high weight percent gain levels. Deka et al. (2007) inferred that resin's adherence and/or reaction on the surface of treated wood caused increase in surface hardness considerably.

Table 8: Brinell hardness of the modified wood

Modification groups	HB N/mm^2	HG
SP-C	1,49	P=0.368
SP-MF-10	1,76	
SP-MF-30	1,63	
SP-MFW-10	1,49	
SP-MFW-30	1,57	
CH-C	2,93	P=0.107
CH-MF-10	3,23	
CH-MF-30	3,13	
CH-MFW-10	3,05	
CH-MFW-30	2,64	

Conclusion

Certain physical and mechanical properties of the wood modified with melamine formaldehyde (MF), and melamine formaldehyde diluted with water (MFW) were investigated. The results show that chemical modification affects the properties of wood in different ways. Based on the findings of this study, conclusions given below can be inferred:

- Chemical modification with MF increased the density of both Scots pine and chestnut,
- WPG values and density increase were higher in samples modified with MF diluted with water,
- Longer impregnation time resulted higher WPG and density increase,
- Modification with MF or MFW decreased the water uptake and swelling of wood significantly,
- ASE of the modification were higher in chestnut than that of Scots pine. ASE of the modification with MFW were higher than that of modification with pure MF. Approximately 55% and 65% ASE were determined in Scots pine and chestnut modified with MFW, respectively.
- Modification with MF or MFW decreased the MOR of Scots pine, significantly. (30%) Decrease in MOR were relatively lower in chestnut (17%).
- Modification did not affect the MOE in chestnut, significantly (p=0.264). But, modification with MF increased the MOE in Scots pine (10%-17%).
- Modification with MF or MFW did not affect the HB of the wood, significantly.

Abstract: Alloying elements in aluminium have further been improving the strength and stiffness properties that provide superior compared to other metals. Especially the alloying of copper, silicon and manganese in aluminium alloys improves the casting ability, as well asincrease strength and stiffness properties. In the literature, it is the attention that the especially studies on eutectic composition are abundant. Because the eutectic composition has a lower melting point than the melting point of the other elements, both obtains two separate solid phases from a single liquid phase and aluminium alloys increasing of fluidity. In this work, in order to investigate the effect of copper content on the microstructure and mechanical properties of the Al-Mn eutectic alloy, 5 percentby weight of copper was added to the base alloy. Al–2Mn–5Cu (wt.%) alloys were prepared in a graphite crucible under vacuum atmosphere. The samples were directionally solidified upward at a constant temperature gradient (7.1 K/mm) and different growth rates (from 8.3 µm/s to 978 µm/s) by using a Bridgman type directional solidification furnace. The primary dendrite arm spacing, microhardness and tensile strength of alloys were measured from directionally solidified samples. The effects of copper content on the microstructure and mechanical properties of Al–Mn eutectic alloys were investigated and the relationships between them were experimentally obtained. The results obtained in the present work were compared with the previous experimental results.

Can Bülent Fidan
cbfidan@karabuk.edu.tr

Artificial Neural Networks (ANNs) consist of inputs, outputs and neurons which are classified as input layer, hidden layer and output layer. Neurons keep the weights to get desirable output. Neurons are trained using some techniques and methods to set optimal weights. This paper shows the effects of the count of hidden neurons on ANNs performance and training time.

EĞİTİLEBİLİR ZİHİN ENGELLİ ÇOCUKLARDA DRAMA YOLUYLA YAPILAN EĞİTİM PROGRAMIN ZİHİN KURAMI BECERİLERİ ÜZERİNE ETKİLERİ

THE EFFECTS OF EDUCATİONAL DRAMA ON THEORY OF MİND SKİLLS İN EDUCABLE İNTELLECTUAL DİSABİLİTY STUDENTS

Yard.Doç.Dr.Oktay Taymaz Sarı

Marmara Üniversitesi Atatürk Eğitim Fakültesi Özel Eğitim Bölümü

Abstract The aim of this research was to investigate the effect of educational drama on theory of mind skills in 29 *educable intellectual disability* students aged 16-19 years from government high schools located in Istanbul, Turkey. The research was designed in experimental model which was based on pre-test and post-test. To evaluate the theory of mind skills in *educable intellectual disability* students by applying the Sally Ann (Wimmer ve Perner, 1983; Leslie ve Frith, 1988); "Smarties" test (Perner, Leekam, ve Wimmer, 1987), Chocolate bar test (Flobbe, Verbrugge, Hendriks, ve Krämer, 2008) and "Strange Stories Test" (Happé, 1994) that were translated and adapted to the Turkish language by Girli (2010). During the application of programme, all students had been applied drama activities related to selected words for 3 months. Prior results obtained from some other researches supported the results of the present study. Later research should be done with large group and different educational drama programmes. The present research offers hope for fallowing research in the future. The topic should also be examined with different age groups and variables. *The results of this study indicated* that *educable intellectual disability* students were promoted their theory of mind skills by using drama programme

Keywords: Theory of mind / educable intellectual disability / Drama

Özet: Bu araştırmanın amacı 16-19 yaş arası eğitilebilir zihin engelli bireylere drama yoluyla yapılan eğitimin zihin kuramı üzerindeki etkilerini araştırmaktır. Araştırma yarı deneysel olarak desenlenmiştir. Araştırmada Sally Ann (Wimmer & Perner, 1983; Leslie & Frith, 1988); "Smarties" test (Perner, Leekam, & Wimmer, 1987), Chocolate bar test (Flobbe, Verbrugge, Hendriks, & Krämer, 2008) and "Strange Stories Test" (Happé, 1994) Girli(2010) tarafından Türkçeye adapte edilmiş testler uygulanmıştır. Uygulama süresince katılımcılar üç ay boyunca araştırmaya katılmışlardır. Araştırma sonunda elde edilen bulgularda eğitilebilir zihin engelli bireylerde drama programıyla zihin kuramı yetilerinin desteklendiği sonucuna ulaşılmıştır.

Anahtar Sözcükler: Zihin Kuramı-Eğitilebilir Zihin Engelli-Drama

Giriş

Zihin kuramı, çocuğun kendi düşüncesi ile başkasının düşüncesini ayrı olduğunu anlama yeteneği ve kapsamlı bileşenleri olan sosyal anlamayı içermektedir (Premack ve Woodruff,1978). Başkalarının düşüncelerini, inançlarını, istek ve duygularını, mecazları, imaları anlama ve hatırlama çocukların sosyal gelişiminde çok önemlidir (Frith, Happe ve Siddons, 1994). Yüz ifadelerini gözlemleme, vücut dili ve bilinçli hareketler (kendi hareketlerinin başkalarının davranışları üzerindeki etkisi), bireylerin başka insanların aldatmaca davranışlarını tahmin etmelerini sağlayan stratejileri içermektedir (Smith, 2009; Sayın ve Candansayar 2008; Wellman, Cross ve Watson, 2001).

*Bu araştırma Marmara Üniversitesi Bilimsel Araştırma Birimi tarafından desteklenmiştir

Normal gelişim gösteren çocuklarda en geç 3-4 yaşından itibaren en basit zihin kuramı yetenekleri kendiliğinden kazanılmaya başlanır ve gelişimin en hızlı olduğu zaman 4-6 yaş olarak belirtilir (Perner, Leekam ve Wimmer, 1987; Wimmer ve Perner, 1983; Hoogewes, 2004; Frith ve Frith, 2005). Zihin kuramının temel gelişiminin tamamlanması ise 11-12 yaşlarına kadar sürebilir (Frith ve Frith, 2005; Korkmaz, 2005; Perner, Leekam ve Wimmer, 1987; Wimmer ve Perner, 1983).

Zihinsel Engellilik, gelişim süreci içerisinde genel zihinsel işlevlerde normallerden önemli derecede gerilik, bunun yanında uyumsal davranışlardan (iletişim, öz bakım, ev yaşamı, sosyal beceriler, toplumsal yararlılık, kendini yönetme, sağlık ve güvenlik, işlevsel akademik beceriler, boş zaman ve iş) iki ya da daha fazlasında sınırlılık gösterme durumudur (Eripek, 1996).

Zihinsel engelli çocukların, dikkat süreleri çok kısa olduğu görülmektedir. Algılamaları basit düzeyde olduğu, kavramları anlamakta güçlük çektikleri, duygu ve düşüncelerini açıkça ifade edemedikleri, etkinliklerde çabuk yoruldukları bilinmektedir. Taklit yetenekleri iyi olmakla birlikte soyut kavramları geç ve zor anlayıp kavramaktadırlar. Yeni durumlara uymada zorluk çektikleri, algılarının, kavramlarının ve tepkilerinin basit olduğu gözlenmektedir (Akkök, 1991). Eğitilebilir zihin engelli çocukların toplumun içinde bulunma diğer bireylerle ilişki içinde olma durumları orta ve ağır derecedeki çocuklara oranla çok daha yüksektir. Bu nedenle de toplumda varlıklarını devam ettirmede diğer bireylerin davranışlarını yorumlamaları, niyetlerini algılamaları önemlidir.

Zihinsel Engelli çocuklarda zihin kuramı ile ilgili yapılan çalışmalar çoğunlukla otizmli çocuklarla karşılaştırma şeklinde deşelenmiştir. Bu alanda zihinsel engellilerde zihin kuramı gelişimi ile ilgili çalışmalar ilk kez Baron-Cohen (1985) tarafından desenlemiştir. Araştırmasında, aynı zekâ yaşındaki Down sendromlu, otizmli ve normal çocuklara test düzeneklerini uyguladıklarında normal ve Down Sendromlu çocukların doğru düşünce stratejisine sahip olabildikleri halde otizmli çocukların başkasının düşüncesin fark edemedikleri dolayısıyla doğru sonuca varamadıkları sonucuna ulaşmışlardır.

Happe (1994) çalışmasında doğal ve karmaşık olarak hazırlanmış hikâyelerle yanlış inanış ve ikinci yanlış inanış testi uygulamıştır. Otizmli katılımcılar, zihinsel engelli ve normal gelişim gösteren katılımcılarla karşılaştırıldıklarında hikaye kahramanlarının mecazi anlamdaki konuşmalarından anlam çıkarmada yetersiz bir performans gösterdikleri belirlenmiştir.

Cobos ve Castro, (2010)'ın yaptıkları araştırmada yetişkin down sendromlu bireylere daha önceden yaşamadıkları değişik durumlarla ilgili hikâyelerden test edilmişlerdir. Katılımcılarda bu hikâyelerde kahramanın seçenekleri ve seçeneklerin ardından yaptıkları ile ilgili değerlendirme yapmaları istenmiştir. Çalışmanın ikinci kısmında ise karakterleri tercihleri konusunda uygun olan bölgeye yerleştirmeleri istenmiştir. Katılımcıların kahramanlarının durumlarıyla ilgili tercihleri kendi tercihleri ve kahramanın tercihleri ayırmada güçlük çektikleri ve yavaş hareket ettikleri gözlemlenmiştir.

Atasoy (2008) çalışmasında Sally-Ann ve Bonibon testi (MveM Testi) kullanmıştır. Çalışmasında normal gelişim gösteren çocukların Sally-Ann testinden %78.3 'ü geçerken (54 çocuk) ,%21.7 (15 çocuk) kalmıştır. Bonibon Testinde de %88.4 'u (61 çocuk) testi geçerken, %11.58 (8 çocuk) kalmıştır. Zihinsel engelli çocuklar ise Sally-Ann testinde %34.3 'ü (15 çocuk) geçerken %65.7'si (44 çocuk) başarısız olmuştur. Bonibon testinde ise % 58.2 (39 çocuk) geçerken %24.18 (28 çocuk) başarısız olmuştur.

Zihin engelli bireylerin olayları yorumlayabilmeleri için gerçek yaşamdaki benzerlikleri fark etmeleri önemlidir. Bu anlamda günlük yaşamda karşılaştıkları durumları canlandırması gereklidir.

Drama tekniği, tüm yaşlarda ve sınıf seviyelerinde kullanılabilmektedir. Küçük çocuklar da drama çalışmalarında başarılı olabilmektedirler. Gerek çocuk gerekse yetişkin eğitimi alanlarında yapılan çalışmalarda drama uygulamalarının yapıldığı görülmektedir.

Drama, çocuğun kendini başkalarının yerine koyarak çok yönlü gelişmesi, kendini tanıması, kendini ifade edebilmesi, kendinde bulunan özelliklerle başkalarını karşılaştırabilmeyi sağlaması ve yaparak-yaşayarak öğrenme bakımından en etkili eğitim yöntemlerinden biridir. Drama, çocuğun sosyal çevresindeki yaşantılar

*Bu araştırma Marmara Üniversitesi Bilimsel Araştırma Birimi tarafından desteklenmiştir

 Copyright © International Science and Technology Conference (ISTEC)

yoluyla edinilen bilgileri kazandırılması ve olumlu değişmeler sağlanması amacıyla da kullanılmaktadır (Gönen ve Dalkılıç, 2002).

Zihinsel engelli çocukların da diğer normal çocuklarda olduğu gibi gerçek hayatı model alarak oyunlarına yansıtmakta olduklarını ifade etmektedir. Drama da çocuğu yönlendirmek için zihinsel engelli çocuğu tanımak ve özelliklerini bilmek çok önemlidir. Drama da zihinsel engelli çocuktan geri iletim beklenenden daha sonra alınabilir. Drama uygulamalarında zihinsel engelli çocuğun diğer çocuklardan daha çok yardıma ve güdülenmeye ve daha fazla ve sık tekrara ihtiyacı olabilir (Bayhan, 1995).

Drama etkinlikleri konusunda belirleyici olan, çocuğun engel türüne göre, dikkat süresi, sözel anlatım becerileri, algılama kapasitesi ve bedensel hareket yeteneğidir. Drama etkinlikleri hazırlanırken çocukların özel yetenekleri ve sorunları dikkate alınmalıdır (Önder, 2001).

Zihin engelli lise seviyesinde olan gençler günlük yaşamda sosyal ortamlarda yoğun bir şekilde bulunmaktadırlar. Zihin engelli gençlerin toplum ortamlarında karşılarındaki kişilerin niyetlerin anlamaları ve kendilerini ona göre düzenlemeleri sağlıklı ilişki kurma ve kendilerini koruma adına çok önemlidir. Bu araştırmada zihin engelli gençlere drama yoluyla zihin kuramı becerilerin geliştirme için desenlenen eğitim programının etkililiği araştırılmaktadır.

Yöntem

Araştırma Modeli

Bu çalışmada, yarı-deneysel araştırma yönteminin tek grup öntest-sontest modeli kullanılmıştır. Yarı-deneysel araştırmalar, rastlantısal olmadan desenlenen çalışmalardır. Rastlantısal desenlenen araştırmalarla ortak yanı, uygulama ve sonuç arasındaki bağlantı ve uygulamanın etkililiğini araştırmasıdır. Bu araştırma deseni ile yapılan çalışmalar, bazı kaynaklarda "önce-sonra müdahaleli çalışmalar" olarak da geçmektedir (Yeniova ve Aşçıoğlu, 2006).

Araştırmanın Bağımlı ve Bağımsız Değişkenleri

Bu çalışmadaki bağımsız değişken, zihinsel engelli öğrencilerle gerçekleştirilen etkinlikler (drama ve okuma) olarak planlanmıştır. Bağımlı değişkenler ise bu etkinliklerin zihin kuramı üzerindeki etkisidir

Katılımcılar

Çalışmaya, İstanbul sınırları içerisindeki resmi bir Özel Eğitim Mesleki Eğitim Merkezinde eğitimlerine devam eden 29 zihinsel engellilik tanısı almış özel gereksinimle öğrencilerdir.

Araştırma Süreci

Araştırmada araştırma yapılan okula staj için giden altı öğretmen adayına zihin kuramına yönelik içeriği olan hikaye kitapları ile zihin kuramı hakkında dört oturumluk bir eğitim verilmiştir. Eğitimin ardından araştırmacı gözetiminde iki grubu 9 bir grubu 11 kişiye uygulama yapılmıştır. Çalışma üç ay (12 oturum) uygulama evresinden oluşmuştur.

Drama yapmadan önce okul öncesinde kişisel gelişim ile ilgili Muge Yukay Yuksel tarafından yayınlanan kitaplardan zihin kuramına uygun olan 12 hikâye seçilmiştir. Hikâyelerin kahramanlarının kullanacağı malzemeler ve isimlikler önceden hazırlanmıştır. Hikâyelerin öncelikle çocuklar tarafından okunup anlaşılması sağlanmıştır. Ardından katılımcılarla drama çalışması yapılmıştır.

Sally-Ann (Birinci Düzey Zihin Kuramı Testi)

Yanlış inanç testi olarak, 1983 yılında Wimmer ve Perner tarafından okul öncesi ve okul çağı çocuklarında kullanmak amacıyla geliştirilmiş (Wimmer, Perner, 1983), Baron- Cohen ve diğ. (1985) tarafından değiştirilmiştir (Baron- Cohen, Leslie, Frtih, 1985). Türkçe'ye uyarlamasını Alev Girli ve Deniz Tekin yapmıştır. Bireysel olarak uygulanan bu testin, zaman sınırlaması yoktur. 5 karelik resimli öykülerden oluşmaktadır (Bayraklı, Çelik, Diken, Kaner, 2012).

Birinci düzey ZK testi olarak bilinen Sally ve Anne Testi'nde; katılımcının bir nesnenin durumundaki bir değişikliği, hikayedeki bir karakterin bildiğini, ama diğer kişinin bunu bilmediğini anlaması ve diğer kişinin eylemini bu ayrıma dayanarak öngörebilme becerisi değerlendirilmektedir (Bora, 2009).

Girli ve Tekin'in (2010) yaptığı çalışmada güvenirlik Kuder-Richardson testi ile (KR-21) hesaplanmıştır. Sally-Anne testi için KR-21 değeri. 78 olarak bulunmuştur.

Çikolata Testi (Zihin Kuramı Testi) Flobbe, Verbrugge, Hendriks, ve Krämer (2008) tarafından geliştirilmiş (Girli, Tekin, 2010, s.1947), Türkçe'ye uyarlaması Alev Girli ve Deniz Tekin tarafından yapılmıştır. Test 5 karttan oluşmaktadır. Testin uygulanması sırasında herhangi bir süre sınırlaması yoktur (Bayraklı, Çelik, Diken, Kaner).

Türkiye uyarlamasında, karakterlerin ismi Türkçe'de yaygın kullanılan Arda ve Ceren şeklinde değiştirilerek, Türkçe' ye çevrilip geçerlilik ve güvenirlik çalışması yapılan formu kullanılmıştır. İçerisinde kutu ve çekmecenin olduğu pencereli bir odada Ceren ve Arda isimli iki çocuk bulunmaktadır. Arda'nın annesi odaya girerek Ardaya çikolata vermekte, Arda çikolatayı çekmeceye koyarak odadan çıkmaktadır. Arda odadan ayrıldıktan sonra, Ceren çikolatayı çekmeceden alıp kutunun içine koymakta ve bu sırada Arda pencereden gizlice odayı izlemektedir. Sonrasında, Arda tekrar odaya girmekte ve çikolatasını almak istemektedir. Araştırmacı tarafından katılımcıya, "Ceren, Arda'nın ilk nereye bakacağını düşünüyor?" şeklinde ikinci derece inanç sorusu ve "Arda ilk nereye bakacak?" şeklinde kontrol sorusu sorulur ve kaydedilir (Girli, Tekin, 2010).

Girli ve Tekin'in (2010) yaptığı çalışmada güvenirlik Kuder-Richardson testi ile (KR-21) hesaplanmıştır. Çikolata testi için KR-21 değeri. 84 olarak bulunmuştur.

Bonibon Testi (İkinci Düzey Zihin Kuramı Testi- M ve M) (Smarties Testi)

Bonibon Testi, Hogrefe, Wimmer ve Perner tarafından (1986) geliştirilmiş, Girli ve Tekin (2010) tarafından Türkçe'ye çevrilip geçerlilik ve güvenirlik çalışması yapılmıştır. Türkçe formunda, MveM ya da Smarties markalı şeker paketi yerine, Türkiye'de yaygın kullanımı olan Bonibon markalı şeker kutusu kullanılmıştır (Girli, Tekin, 2010).

Girli ve Tekin'in (2010) yaptığı çalışmada güvenirlik Kuder-Richardson testi ile (KR-21) hesaplanmıştır. Bonibon testi için KR-21 değeri. 82 olarak bulunmuştur.

Dondurma Kamyonu Testi (İce-Cream Truck Task)

Dondurma Kamyonu Testi" (Perner ve Wimmer 1985) İkinci aşama yanlış kanı atfı (Second order false belief) görevinde ise bireyin anlatılan hikâyede yer alan iki kahramanın zihinsel durumlarının ne olabileceğini tahmin etmesi istenmektedir (Baron-Cohen, 2000). İnsanların sadece gerçek olan durumla ilgili inançlarının olabileceğine değil aynı zamanda başkalarının inançlarıyla ilgili de inanç geliştirebilmeleri anlamına gelmektedir. İkinci derece inanç testleri Perner ve Wimmer tarafından (1985) tarafından araştırılmıştır. Ölçeğin Türkçeye uyarlanması Girli ve Tekin tarafından 2010 yılında yapılmıştır (Girli ve Tekin'in çalışmasında "kilise" yerine "okul" ifadesi kullanılmıştır).

Verilerin Analizi

Bulgular

Tablo 1 Öğrencilerin cinsiyet ve yaşına ilişkin betimsel istatistikler

Cinsiyet	n	%	Ortalama Yaş (range)
Kız	11	37,9	17,7±1,1 (16-19)
Erkek	18	62,1	17,3±1,2 (15-20)
Toplam	29	100,0	17,5±1,2 (15-20)

Çalışmaya katılan öğrencilerin %37,9'u kız ve %62,1'i erkektir. Kızların yaşları 16 ile 19 arasında değişmekte olup ortalama yaşları 17,1±1,1'dir, erkeklerin ise yaşları 15 ile 20 arasında değişmekte olup ortalama yaşları 17,3±1,2'dir. Genel yaş ortalaması ise 17,5±1,2'dir

Tablo 2 Öğrencilerin ilk ve son uygulama Zihin Kuramı puanlarına ilişkin betimsel istatistikler (N=29)

Test	İlk Uygulama				Son Uygulama			
	Min.	Maks.	$\overline{X}$	ss	Min.	Maks.	$\overline{X}$	ss
Sally Testi	0	3	1,97	1,12	0	3	2,34	0,86
Bonibon Testi	0	3	1,83	1,14	0	3	2,31	0,85
Yer Değiştirme Testi	0	2	1,24	0,79	0	2	1,55	0,74
Dondurma Testi	0	2	1,07	0,84	0	2	1,66	0,61
Toplam Puan	0	10	6,10	2,96	2	10	7,86	2,34

Öğrencilerin zihin kuramı ilk ve son performanslarına ilişkin puanlarının ortalamasına bakıldığında tüm testlerden ve toplam puanlarında son uygulama lehine bir artış olduğu görülmektedir. Öğrencilerin hikayelere ilişkin testlerde son uygulama sonrası daha başarılı sonuçlar elde ettikleri görülmektedir. Bu farkların anlamlı olup olmadığı ilişkili gruplar t-testi ile incelenmiş ve sonuçları aşağıda, Tablo 3'de özetlemiştir.

*Bu araştırma Marmara Üniversitesi Bilimsel Araştırma Birimi tarafından desteklenmiştir

Toplam Puan (son)	**29**	**7,86**	**2,34**			

**Fark p<.05 ve **fark p<.001 düzeyinde anlamlıdır.*

Tablo 3'den de görüleceği üzere, öğrencilerin ilk ve son uygulama zihin kuramı hikayeleri ve toplam puanları arasında anlamlı fark olduğu bulunmuştur. Buna göre ;Öğrencilerin ilk Sally-Anne Testi puanları ile son uygulama puanları arasında anlamlı bir fark olup bu fark son uygulama puanları lehinedir [$t_{(28)}$=3,02 ve p<,05]. Gruplara ait ortalama puanlara bakıldığında, öğrencilerin Sally-Anne hikaye testi son uygulama puanları daha yüksektir ($\overline{X}_{\text{İlk uygulama}}$=1,97 ve $\overline{X}_{\text{Son uygulama}}$=2,34).

Öğrencilerin ilk Bonibon Testi puanları ile son uygulama puanları arasında anlamlı bir fark olup bu fark yine son uygulama puanları lehinedir [$t_{(28)}$=3,31 ve p<,05]. Gruplara ait ortalama puanlara bakıldığında, öğrencilerin Bonibon Testi son uygulama puanları daha yüksektir ($\overline{X}_{\text{İlk uygulama}}$=1,83 ve $\overline{X}_{\text{Son uygulama}}$=2,31).

Öğrencilerin ilk Yer Değiştirme Testi puanları ile son uygulama puanları arasında anlamlı bir fark olup bu fark yine son uygulama puanları lehinedir [$t_{(28)}$=2,07 ve p<,05]. Gruplara ait ortalama puanlara bakıldığında, öğrencilerin Yer Değiştirme Testi son uygulama puanları daha yüksektir ($\overline{X}_{\text{İlk uygulama}}$=1,24 ve $\overline{X}_{\text{Son uygulama}}$=1,55).

Öğrencilerin ilk Dondurma Testi puanları ile son uygulama puanları arasında anlamlı bir fark olup bu fark yine son uygulama puanları lehinedir [$t_{(28)}$=4,31 ve p<,001]. Gruplara ait ortalama puanlara bakıldığında, öğrencilerin Dondurma Testi son uygulama puanları daha yüksektir ($\overline{X}_{\text{İlk uygulama}}$=1,07 ve $\overline{X}_{\text{Son uygulama}}$=1,66).

Son olarak, öğrencilerin ilk zihin kuramı toplam puanları ile son uygulama puanları arasında anlamlı bir fark olup bu fark yine son uygulama puanları lehinedir [$t_{(28)}$=5,93 ve p<,05]. Gruplara ait ortalama puanlara bakıldığında, öğrencilerin zihin kuramı son uygulama toplam puanları daha yüksektir ($\overline{X}_{\text{İlk uygulama}}$=6,10 ve $\overline{X}_{\text{Son uygulama}}$=7,86).

Tartışma ve Yorum

Bu çalışmada 16-19 yaş gençlerine drama yoluyla verilen zihin kuramı becerilerini geliştirmeye dönük 12 oturumluk eğitimlerin sonucunda da şu sonuçlara ulaşılmıştır. Deney grubundaki gençlerin ön -test ve son -test puanlarının ilişkili grup t testi sonuçları incelendiğinde deney grubundaki çocukların zihin kuramı becerileri destekleme drama Programı öncesinde ve sonrasında artış olduğu görülmektedir ($\overline{X}_{\text{İlk uygulama}}$=6,10 ve $\overline{X}_{\text{Son uygulama}}$=7,86). Yapılan t testi neticesinde bu artışın istatistiksel açıdan anlamlı olduğu saptanmıştır (p<,05). Bu alanda yapılan araştırma sonuçlarıyla örtüşmektedir (Ozonoff, ve Miller, 1995; Newton, ve Jenvey, 2011; Goldstein, ve Winner, 2011; Goldstein, ve Winner, 2012; Mathersul, McDonald ve Rushby, 2013).

Eğitebilir zihin engelli gençler topluma adapte olmaya en yakın gruplardan biridir. Daha çok sosyal yaşamın içinde bulunmalarından dolayı zihin kuramı becerilerin geliştirilmesi yaşamlarını kolaylaştıracaktır. Bu becerilerin geliştirilmesi için drama yoluyla yapılan çalışmaların etkililiğini sunduğumuz çalışmanın, yarı deneysel bir çalışma olması, kontrol grubunun bulunmaması araştırmanın eksikliklerinden biri olarak belirtilebilir.

Araştırma sonuçlarında tüm uygulanan testlerde eğitim –öncesi ve sonrası becerilerde artış görülmüştür. Ancak uygulamanın içeriğinde yer alan hikâyelerin okul öncesi döneme ait olması aslında bu çalışmaların çok daha yoğun yapılması gerekliliğinin de bir göstergesidir. Drama da uygulanan senaryoların sistemli olarak zorlaştırılması gençlerin zihin kuramı yetilerinin de gelişimine olumlu yönde katkıda bulunacaktır.

Sonuç olarak, zihin engelli gençlere sağlanan yaşantılar zihin kuramı gelişiminde etkili olmaktadır. Bu noktada zihin engelli gençlere zengin uyarıcı çevre olanakları ve bu olanakları içeren eğitim programları sağlanması bu gelişim sürecini önemli ölçüde etkilemektedir. Bu çalışmada da zihin engelli gençlere drama yoluyla verilen eğitim programının gençlerin zihin kuramı becerileri üzerinde olumlu etkiye sahip olduğu belirlenmiştir. Özellikle toplumla iç içe olan gençlerin varlıklarını sağlıklı şekilde devam ettirmeleri açısından çok önemlidir. Bu çalışmanın zihin kuramı becerilerini içeren bir eğitim programını içinde bulundurması nedeni ile alan yazınına katkı sağlaması beklenmedir. Bütün bu nedenlerle ilerleyen yıllarda bu ve benzeri çalışmaların yapılarak zihin engelli gençlerin desteklenmesi önerilmektedir.

Teşekkür

Bu araştırmanın yapılması sürecinde çalışmaya katılan tüm öğrencilerime ve Marmara Üniversitesi Bilimsel Araştırma Birimine teşekkürlerimi sunarım.

EĞİTİM ÖRGÜTLERİNDEKİ DEĞİŞİM SÜRECİNCE YAŞANAN SORUNLARIN İNCELENMESİ

Yaşar Adıgüzelli
yasaradiguzelli36@hotmail.com

Değişim evrensel bir kuraldır. İnsanlar değişir, iklimler değişir, toplumların yaşam biçimi değişir. Değişime duyulan ihtiyaç gelişimden kaynaklanmaktadır. Hiyeroglif yazıdan e-mail ile iletişim sistemine, fermandan internet ilanlarına geçiş bu gelişmelere örnektir. Sürekli değişim içinde olan çağımızda varlığını sürdürmek ve gelişebilmek için her örgüt planlı ve başarılı bir değişim süreci geçirmek durumundadır, hatta bu değişim süreçlerini sürekli bir hale getirmesi gerekmektedir. Bu bağlamda hızlı değişimle birlikte ortaya çıkan bunalım yaşadığımız çağın en önemli özelliğidir.

Eğitim reformunun uygulayıcısı olacak öğretmenler ve onların reforma yaklaşımı, stratejik rolleri nedeniyle değişimin sonuçlarını doğrudan etkilemektedir. Öğretmenlerin eğitim reformunu nasıl algıladığı ve uyguladığı aslında reformun hedeflerine ulaşıp ulaşmadığı sorusuna yanıt verebilir. Yapılan çalışmalar eğitimde değişimin uzun bir süreç gerektirdiği ve özellikle uygulama noktasında problemlerle karşılaştığını göstermektedir. Özellikle değişimin karar alıcılar tarafından uygulayıcılara dayatıldığı geleneksel reform yaklaşımlarında reform hareketlerinin başarısız olmasının öncelikli nedeninin öğretmenler olduğu düşünülmektedir. Bu bağlamda öğretmenlerin değişim karşısındaki tutum ve yaklaşımlarının neler olduğu ve bunların nedenlerinin ortaya çıkarılması reform sürecini anlamamıza yardımcıolmaktadır.

Eğitim örgütleri yapısı itibari ile sürekliliğini sürdürmek ve toplumun kendisinden beklediği durumlara, kendi koyduğu örgütsel hedefler doğrultusunda ulaşmaya çalışmaktır. Eğitim örgütleri kendi içinde ve dışında meydana gelen değişimi doğru okuyabildiği sürece bu hedeflere ulaşabilir. Değişimin eğitimde yarattığı sancılı durumlarla baş edebilmesi de değişimin zamanını ve yönünü etkileyen en önemli değişkendir. Değişimin örgütlerde sebep olduğu, direnç mekanizmaları ve oluşturduğu problemlerle başa çıkabilmesi ve bu çatışma ve kriz durumundan daha güçlü çıkabilmesi için de uygulanacak stratejiler bir ülkenin geleceğine etki eden eğitim örgütleri için hayati öneme sahiptir.

Bu araştırmanın temel amacı eğitim örgütlerinde değişim sürecinde yaşanan sorunların incelmesidir.

Araştırma betimsel tarama yöntemi kullanılmıştır. Veri toplama aracı olarak anket kullanılmıştır. Anket iki bölümden oluşmaktadır. Birinci bölüm kişisel bilgiler, ikinci bölüm değişimle ilgili maddelerden oluşmaktadır. Değişimle ilgili maddeler örgütsel değişimin nedenleri, örgütsel değişim engelleri, örgütsel değişime hazırl olma faktörlerinden oluşmaktadır. Araştırmanın bulgularının analizi devam etmektedir.

Abstract: Al-2Mn-5Fe alloy (wt.%) was prepared in a graphite crucible under vacuum atmosphere. Al-2Mn-5Fe alloy melt was first obtained in a hot filling furnace and then directionally solidified upward with different growth rate ranges (8.3–978 μm/s) at a constant temperature gradient (6.7 K/mm) in the Bridgman-type directional solidification furnace. Variations of electrical resistivity () for casting samples with the temperature in the range of 287-574 K were also measured by using a standard dc four-point probe technique. The enthalpy of fusion and specific heat for same alloys were determined by means of differential scanning calorimeter (DSC) from heating trace during the transformation from solid to liquid.

ELECTRONIC FLIGHT BAG IN THE OPERATION OF AIRLINE COMPANIES: APPLICATION IN TURKEY

Savaş Ateş
ssates@anadolu.edu.tr

Electronic Flight Bag (EFB) is a kind of technology which is using paperless flight operation in the airplane. Using of EFB aims to increase efficiency of the aviation companies. In the scope of this research, the advantages to airline companies and the procedures of EFB using in the flight operations are investigated.
In the first part of the paper, the concept of efficiency and requirements of flight operations planning procedure are investigated with literature review. In the second part, electronic flight bag is defined with the properties, types, services, and using conditions. In the last part, the efficiency of EFB using is estimated with the data which collected from semi structured interview method. Research is completed with 6 different participation of airlines companies from Turkey. In the result of the paper, the time saving of the data updating process is found as one of the advantages of the EFB. Moreover, the companies gets time saving with faster aircraft turnaround.

handesarmasik@mersin.edu.tr

Özden Işiktaş
oisiktas@mu.edu.tr

Relation of colour and music was researched by many scientists and artist since Pythagoras and has still been researching. Because, there are seven colours in chromatic spectrum corresponding to seven musical note and frequencies of colors and musical notes coincide with each other. If we consider that education system has been developing by transferring to digital environments in our era, coherence of music and colour relation has become important for preparing educational software. In this paper, by submitting the relation of music and colour, we aim to inform the designers about these two elements which are required for effective educational software.

EMPIRICAL MODELING OF EXCHANGE RATE RETURNS

Rozana LIKO, Artion KASHURI, Miftar RAMOSACO

University "Ismail Qemali" of Vlora, Department of Mathematics, ALBANIA

rozanaliko86@gmail.com, artionkashuri@gmail.com, miftar.ramosaco@gmail.com

Abstract: This study investigate exchange rate volatility of EURO/ALL daily exchange rate using autoregressive conditional heteroscedasticity (ARCH) model and generalized autoregressive conditional heteroscedasticity (GARCH) model. Daily percentage return of the EURO/ALL exchange rate is used, which cover a period from 5 January 2010 to 30 December 2015. In order to capture the financial stylized fact of return both symmetric and asymmetric models are employed. According to AIC and SIC the EGARCH(2, 3) is identified as the best fitted model. The results also indicate volatility clustering, persistence of volatility and laverage effect of exchange rate returns.

Keywords: Generalized Autoregressive Conditional Heteroscedasticity, Exchange Rate Returns, Volatility Persistence, Laverage Effect

Introduction

Since the adoption of the floating exchange rate regime the behavior of exchange rate has been investigated by many researches. Modeling and forecasting the exchange rate volatility is a crucial area because the foreign exchange volatility is an important determinant for pricing of currency derivative. Exchange rate volatility is a measure of the fluctuation in an exchange rate, and it is also known as a measure of risk (Abdalla 2012).

Volatility has some commonly characteristics observed, referred as stylized facts. First, high volatility is follows by high volatility and low volatility follows by low volatility, i.e. volatility acts in clusters. Second volatility is often stationary, i.e. volatility does not diverge to infinity. In financial market volatility tend to be higher after depreciation, referred as leverage effect. This means that volatility is higher after negative shocks that after positive shocks of the same magnitude (Tsay, 2010). Various models are introduced to model the volatility of exchange rate. One such a model is introduced by Engle (1982) named autoregressive conditional heteroscedasticity model (ARCH). This model is generalized by Bollerslev (1986) into GARCH models. Nelson (1991) proposes the exponential GARCH (EGARCH) model which allow for asymmetric effect between positive and negative asset returns. Another model which allow for asymmetric is the threshold GARCH model (TGARCH), proposed by Zakoian(1994). This model allows having differential impacts on conditional variance of the past shocks.

This study examines the exchange rate volatility model of daily percentage return of EURO exchange rate against Albanian Lekë (EURO/ALL) using both symmetric and asymmetric GARCH model.

Materials and Methods

Data

The data consist of daily nominal exchange of Euro against Albanian Lekë. The time series cover the period from 5 January 2010 to 30 December 2015, i.e. 1511 observations. The data set is obtain from Bank of Albania (http://www.bankofalbania.org/), the monetary authority of Albania, which applies a free fluctuation regime, i.e. the currency is determined according to the foreign exchange markets. The percentage return of the exchange rate is calculated as, $r_t = 100 * (\ln(y_t) - \ln(y_{t-1}))$ where y_t is the exchange rate at time moment t and y_{t-1} is the exchange rate at time moment $t-1$.

Unit root test

The foundation of a time series is stationarity or weakly stationarity. Weakly stationarity implied that the two first moments of the series do not depend on time. In order to check for stationarity we use Augmented Dicker Fuller (ADF) test and Philip Perrons (PP) test. The null hypothesis of ADF test is the existence of unit root against the alternative hypothesis of no unit root. The null hypothesis is rejected if the test statistic is greater than the critical

 Copyright © International Science and Technology Conference (ISTEC)

value. The PP test is similar to the ADF test, but correct for any serial correlation and heteroscedasticity in the errors terms. The null hypothesis of PP test is rejected if the test statistic is greater than the critical value.

Test of Heteroscedasticity

In order to apply the GARCH model first we examine the residual of the mean equation for heteroscedasticity, known as ARCH effects, by using ARCH-LM test and Ljung-Box statistic.

The ARCH-LM test is used to test the presence of conditional heteroscedasticity by regressed the squared residual on q lag. The null hypothesis of the test is no heteroscedasticity in the model residual versus the alternative hypothesis of heteroscedasticity in the model residual. The test statistic is

$$LM = NR^2,$$

where N is the number of observation and R^2 the coefficient of determination of the residual regression. The null hypothesis is rejected if the p-value is less that the significance level.

Ljung–Box Q statistic test the joint hypothesis that the autocorrelation coefficients up to lag q are equal to zero on the squared residual series. This test is defined as

$$\mathrm{Q} = \mathrm{N}(\mathrm{N}+2)\sum_{\mathrm{i}=1}^{\mathrm{q}} \frac{\rho_{\mathrm{i}}^2}{\mathrm{N}-\mathrm{i}} \sim \chi^2(\mathrm{k}),$$

where ρ_{i}^2 are the autocorrelation on lag q. The null hypothesis, that the autocorrelation function of the series is zero, is rejected if the p-value of the test is less than the significance level.

Volatility models

The autoregressive conditional heteroscedasticity (ARCH) model violated this conditions assumed that variance of the residual of the mean equation fluctuate on time. ARCH(p) model is defined as follows

$$\sigma_t^2 = \alpha_0 + \alpha_1\varepsilon_{t-1}^2 + \alpha_2\varepsilon_{t-2}^2 + \cdots + \alpha_p\varepsilon_{t-p}^2$$

Bollerslev(1986) developed the ARCH model into GARCH model, which allow the conditional variance to depend not only by the squared residuals of mean equation but even by the previous own lags. The GARCH(p, q) model is

$$\varepsilon_t = \sigma_t a_t, \quad \sigma_t^2 = \alpha_0 + \sum_{i=1}^{p}\alpha_i\varepsilon_{t-i}^2 + \sum_{j=1}^{q}\beta_j\sigma_{t-j}^2, \ \alpha_0 > 0, \alpha_i \geq 0, \beta_i \geq 0 \text{ and } \sum(\alpha_i + \beta_i) < 1.$$

Nelson (1991) proposes the exponential GARCH model. The EGARCH (p, q) models is define as follows

$$\ln(\sigma_t^2) = \alpha_0 + \sum_{i=1}^{p}\alpha_i\left|\frac{\varepsilon_{t-i}}{\sigma_{t-i}} - \sqrt{\frac{2}{\pi}}\right| + \sum_{i=1}^{q}\beta_i\ln(\sigma_{t-i}^2) + \sum_{j=1}^{r}\gamma_j\frac{\varepsilon_{t-j}}{\sigma_{t-i}}$$

This model allowed capturing asymmetric effects of positive and negative shocks of the same magnitude.

A model commonly used to handle leverage effects is the Threshold GARCH (TGARCH) model proposed by Zakoian(1994). A TGARCH(p,q) model is as follows

$$\sigma_t^2 = \alpha_0 + \sum_{i=1}^{q}(\alpha_i + \gamma_i d_{t-i})\varepsilon_{t-i}^2 + \sum_{j=1}^{p}\beta_j\sigma_{t-j}^2,$$

where d_{t-i} is an indicator for negative ε_{t-i}, i.e. $d_{t-i} = \begin{cases} 1, & \varepsilon_{t-i} > 0 \\ 0, & \varepsilon_{t-i} \leq 0 \end{cases}$.

Test of Asymmetry

Before applied any asymmetric model we investigate for laverage effect by using sign and size bias test for asymmetry in volatility proposed by Engle and Ng (1993). Define S_{t-1}^- as an indicator dummy that takes the value 1 if $\hat{\varepsilon}_{t-1} < 0$ and zero otherwise and $S_{t-1}^+ = 1 - S_{t-1}^-$. A joint test for sign and size bias based on the regression

$$\hat{\varepsilon}_t^2 = \phi_0 + \phi_1 S_{t-1}^- + \phi_2 S_{t-1}^-\varepsilon_{t-1} + \phi_3 S_{t-1}^+\varepsilon_{t-1} + \upsilon_t$$

Significance of ϕ_1 indicates the presence of sign bias, where positive and negative shocks have differing impacts upon future volatility, meaning that the variance of returns is high after a negative returns that a positive return. On the other hand, the significance of ϕ_2 or ϕ_3 would suggest the presence of size bias, where not only the sign but the magnitude of the shock is important, meaning that the variance is higher after a large return that a small return. A joint test statistic is formulated in the standard fashion by calculating TR^2 from the regression which will asymptotically follow a χ^2 distribution with 3 degrees of freedom under the null hypothesis of no asymmetric effects, i.e. $\phi_1 = \phi_2 = \phi_3 = 0$.

 Copyright © International Science and Technology Conference (ISTEC)

Results and Discussion

As showed by Table 1, the kurtosis 3.742 shows that the Euro/All exchange rate series is leptokurtic and the distribution is negatively skewed. Jarque –Bera statistic of 200.772 support the non-normality of the distributions at 1% significance value, since p-val. 0.000. To better perform a statistical interpretation of daily exchange rate we calculate the daily percentage return of the EURO/ALL exchange rate and check the stationarity of this series by applying ADF- test and PP-test. Both tests indicate that the data are stationarity, as showed in Table 3.

According to the AIC and SIC values we fit an AR(2) model as mean equation, see table 4. By Figure 3 one can observe the volatility clustering of the residual of AR(2) model, meaning that high volatility tends to be followed by high volatility and low volatility tend to be followed by low volatility. We tests for heteroscedasticity on the residual of the AR(2) model by performing ARCH LM and Ljung-Box statistic. Both tests strongly suggests for heteroscedasticity on the residual of the mean equation, see table 6 and table 7.

We perform several ARCH model and according to AIC and SIC ARCH(5) model was selected the best, see table 8. The variance equation, table 9, indicates that the squared residues are significant at 5% level. We estimate GARCH(1,3) model as the best GARCH model, see table 10. One can observe that the sum of α_i and β_i is less than one, see table 11, which implied persistence of volatility in daily exchange rate. This means that the new shocks will last for a long period in daily exchange rate.

In order to investigate for asymmetric effects in volatility sing and size bias test was performed, results of which are presented in table 12. The significance of ϕ_1 indicates that the variance of returns is high after a negative returns that a positive return. The significance of negative size bias, ϕ_2, suggests that a negative return has a larger effects that positive return. Also, since ϕ_2 is negative this implied that volatility increase more after a negative shock that after a positive shock. These results indicate that asymmetric volatility models are more suitable for capturing the volatility process of the return. So we estimates EGARCH and TGARCH model, selectin the EGARCH(2,3) model and TGARCH(3,3) as the bests model according by AIC and SIC values, see table 13 and 15. From table 14 and 16 we can see that the coefficients of the variance equations of EGARCH(2,3) model and TGARCH(3,3) model are all significant at 1% level. Since the laverage parameter, γ, is negative in EGARCH(2,3) model and positive in TGARCH(3,3) model, then there is evidence of laverage effects in the asymmetric models. Meaning that the impacts of negative shocks overcome that of positive shocks. The impact of negative shock is 0.768218 in EGARCH(2,3) model and 0.790884 in TGARCH(3,3) model, while the impact of positive shock is 0.466974 in EGARCH(2,3) model and 0.51418 in TGARCH(3,3) model.

The best of overall models according to AIC AND SIC value results to be that EGARCH(2,3) model, see table 17, and checking the model by ARCH-LM test, Ljung-Box test of standardized residual and squared standardized residual the model turns to be adequate.

Conclusion

In this paper we investigate the model of volatility of Euro/ALL exchange rate return. The data set consists from 5 January 2010 to 30 December 2015. Some autoregressive conditional heteroscedasticity model are employs, such as the ARCH, GARCH, TGARCH and EGARCH. The coefficients of the estimated model are all significant at 5% level, except for the constant in the mean equations. The GARCH model shows persistence volatility, which mean that the new shocks will last for a long period in daily exchange rate. Sing and size bias test indicate for asymmetric effects in volatility. The asymmetric models conduct shows evidence of leverage effects, meaning that the impacts of negative shocks overcome that of positive shocks. The EGARCH(2,3) model was selected as the best model for the data set.

ENVIRONMENTAL EDUCATION AND EDUCATIONAL BEHAVIOR

Turana NASIBOVA

Baku Modern School/International, English Department, Baku- Azerbaijan

turanamustafagizi@yahoo.com

Abstract: Educational behavior is one of the most common problems of modern educational system. Nowadays, schools try to combine education with behavioral management. Therefore all topics are taught at school should be focused on improving kids behavior and preparing them for future life .One of the main purpose of this article is to develop student`s ability to make a choice. For the future they can be career and college ready students. A lesson based on Science topic which is given as an example to explain application of educational behavior in depth. Students were given chance to choose one type of profession and put into life.
Science-is systematic knowledge of the physical or material world gained through observation and experimentation. When we say Science we can not to mention GEOSCIENTISTS.
There are types of scientists such as Hydrologist, Seismologist, Soil Scientist, Petroleum Geologist, Atmospheric Scientist, Structural Geologist and Volcanologist. Each of these jobs have their own interesting sides.

Generally while I was teaching these information for students, before if they wanted just to be only the professions which they knew like lawyer, teacher, doctor, judge, fire fighter now they have a range of jobs which they know and want to choose as their future profession. I can ensure that students have learned a lot of new things about these professions and even they have found out that each of this profession has its own benefit.
I have taught this lesson to the children and they collected data from the information which I have given to them. They came to the conclusion that professions, I mean each person`s career must be chosen from the childhood. Also each person must choose the profession which he or she likes. Profession which is called "Soil Scientist" really took my interest. I have a country house , but I have never planted in our garden anything.
Soil Science gave me information about how to make a homemade garden. I pretended myself as a home gardener and used compost in garden beds to enrich the soil with humus are large and healthy. Since then I have planted our vegetables and all staff like that in our garden. So, this way I have motivated myself.

Keywords: Key words: behavior, respect the planet Earth, motivational learning, responsibility, project work.

Introduction

There are types of scientists such as Hydrologist, Seismologist, Soil Scientist, Petroleum Geologist, Atmospheric Scientist, Structural Geologist and Volcanologist. Each of these jobs have their own interesting sides.

Hydrologists- Gather and evaluate meteorological data to predict a drought. Help create environmentally responsible water usage regulations for communities along a major river. Help create environmentally responsible water usage regulations for communities along a major river Collect and analyze water and mud samples to determine levels of pollutants in a water system Predict whether snow pack levels on a mountain range will cause flooding in the spring.

Seismologists -study the genesis and propagation of seismic (earthquake) waves in geologic materials, both in the Earth or through laboratory experiments. They study the composition of soils on Mars to determine what elements they contain. Chemically evaluate soil nutrient levels in a farming community to determine what crops would grow best there. Analyze soil from an archeological site to determine how the landscape previously looked. Help determine the likelihood of future soil erosion in an area, given soil composition and placement.

Petroleum geologist- Petroleum Geology plays an important role in today's society. Petroleum Geologists are the men and women who know how to read the story told by the very earth beneath our feet in order to find oil and

 Copyright © International Science and Technology Conference (ISTEC)

natural gas, which are vital resources in our lives. Politics and prices often overshadow the story of what happens before the oil and gas ever reaches the headlines.

Marine biologist- research how ocean acidification is affecting marine organisms. They discover new compounds to make medications by studying novel marine bacteria. Help the seafood industry provide consumers with sustainable food choices. Also, they Tag and track whales to learn more about their behavior.

Atmospheric scientist- studies the scientific and mathematical aspects of the Earth`s atmosphere, climate and weather. They develop reports, forecasts, and climate change research from their analysis of weather and climate data. Most atmospheric scientists work indoors in weather stations, offices, or laboratories. Occasionally, they do fieldwork, which means working outdoors to examine the weather.

Volcanologist- frequently visit volcanoes, especially active ones, to observe volcanic eruptions, collect rock and lava samples. Volcanologists study volcanoes in order to better predict eruptions. There is currently no way to predict volcanic eruptions. Predicting eruptions, like predicting earthquakes, can save a lot of lives. Being a volcanologist is one of the most dangerous scientific professions there is. Many volcanologists have died because of sudden eruptions while they were studying volcanoes.

Structural geologist- structural geologists now study the distortions of rocks in general. Commonly investigated structural forms or shapes lead to a comparison of observed features and, eventually, to the classification of related types. Comparative structural geology, concerned with large external features, contrasts with theoretical and experimental approaches, which employ the microscopic study of mineral grains in deformed rocks. Oil and coal geologists employ structural geology in their daily work, especially in petroleum exploration to detect structural traps that can hold petroleum.

Generally while I was teaching these information for students , before if they wanted just to be only the professions which they knew like lawyer, teacher, doctor, judge, fire fighter now they have a range of jobs which they know and want to choose as their future profession. I can ensure that students have learned a lot of new things about these professions and even they have found out that each of this profession has its own benefit.

If you are a marine geologist you sure work with acoustic engineers to develop sonar instruments that allow you to see underwater structures by bouncing sound waves off rock formations. Sonar can show the size and location of volcanoes and canyons in deep water. Marine geologists use these data to map the bottom of the ocean, one of the most geologically active regions on Earth.

If you are an Atmospheric Scientist then, you depend on a whole family of engineers to develop the instrumentation to help you gather the data you need to learn about atmospheric phenomena.

If you are a Seismologist then you use seismographs and computer programs to find and monitor fault lines. This is such an exciting process.

If you are a Hydrologist , then you measure the quantity and quality of drinking water lakes, rivers, and wells. Isn`t it wonderful to save water? Isn`t it wonderful to know that each person looks after water?

If you are a Soil Scientist then you are a kind of a person who really loves nature. For instance, many gardeners improve their garden soil with compost. Composting is a way to produce humus. With a little simple home engineering, you can make a compost bin. Toss in vegetable waste from the kitchen, lawn and plant clippings, dead leaves, and other plant material. As bacteria and fungi decompose the organic material, it slowly changes into pure dark brown humus. The humus can be worked into soil to enrich its fertility.

If you are a Volcanologist then you study volcanoes and possible volcanic regions. You determine if geothermal engineers might tap this heat source to generate electricity. Being volcanologist is so exciting!

If you are a Structural Geologist then you can record the shape of Earth`s Surface also study the massive forces that produce earthquakes and create mountains.

 Copyright © International Science and Technology Conference (ISTEC)

I have taught this lesson to the children and they collected data from the information which I have given to them. They came to the conclusion that professions , I mean each person`s career must be chosen from the childhood. Also each person must choose the profession which he or she likes. Profession which is called "Soil Scientist" really took my interest. I have a country house , but I have never planted in our garden anything.

Soil Science gave me information about how to make a homemade garden. I pretended myself as a home gardener and used compost in garden beds to enrich the soil with humus are large and healthy. Since then I have planted our vegetables and all staff like that in our garden. Second profession which I was interested was Hydrologist. They monitor Earth1s fresh Water. This is a very responsible job. As I understand it is so nice to know that there is enough fresh water in the world. I mean we know that in some countries there is a lack of fresh water. Countries in Africa ,struggle by not having fresh water. That is why group of people should think about how to enrich the amount of water or to think how they can enlarge this process.

Third profession which made me to think is petroleum geologist. They explore Earth for deposits of oil and natural gas. They attempt to find the particular rock formations deep underground that contain these resources to produce petroleum. To tell the truth this is also very responsible job.Scientists must be so careful that they should not let the petrol to spread into the water. We should not throw anything to anywhere in the street or into water.

Being scientist is great!

Materials and Methods

Environmental behavior is very important for children`s future development because the behavior should be taught from early years. As a teacher I know that, general introduction should start from early years and soon further it must be developed. Materials which the children have used for doing the investigations were absolutely productive. They have used from Rocks , Soils and Landforms Foss Resource books ,interactive smart board lessons in order to realize their investigations.

Results and Discussion

I hope I'm doing this right. I understand that there are many simple things you can do to save planet Earth! Ask your parents to help you plant a tree. Trees and plants help to absorb the carbon dioxide in the Earth`s atmosphere.
Save water .Something as simple as turning off the water while brushing your teeth makes a huge difference for Plant Earth. Doing this one thing helps you save up to 25 gallons of water a month!
This all helps students to understand the professions such as Soil Scientist or Hydrologist better, because at the end they understand the result of these professions.
The discussion was with the fourth grade teacher Marly Reyes who has been teaching for six years. She has been teaching the Earth Science integrated with English .She exclaims that she has taught to her students about ecology and with her students they have asked themselves:"What can we do to save the environment? Students came up with different ideas. They wrote argumentative speeches and they tried to educate and convince others to do something about these issues. They have become more conscious about what they can do about reusing and not to litter in the streets, to plant a tree at home even it is just a small plant and one or single tree that they know that they have made the difference and they tired to educate and convince others to do something about these issues. They have become more conscious about what they can do about reusing and not litter

Conclusion

The students came to the conclusion that whatever they do in order to save the earth starts from the educational behavior.

ENVIRONMENTAL MANAGEMENT SYSTEMS FOR PORT AREAS

Veysel TATAR

Artvin Coruh University, Department of Transportation, Artvin- Turkey

vtatar@artvin.edu.tr

Abstract: This paper is a report the two main environmental management system (EMS) standards EMAS and ISO 14001 environmental performance indicator for port industry. The European Union (EU) is considered by some to have the most extensive environmental laws of any international organization. Protection of the environment is a well-established policy in the European Union. The environment has become a critical issue in business today. Since the applications of logistics are generally positive for the efficiency of transport systems, it has been suggested that logistics are environmentally friendly. Therefore organizations systematic environmental programs are planned and documented way to manage the case.

Keywords: Environmental management systems, EMAS, ISO 14001

Introduction

Europe constitutes the densest port regions worldwide. It has more than 1200 commercial seaports along the 70,000 km of coastal zone, and over 200 ports in its inland waterways. According to the latest 2011 figures, more than 60,000 merchant ships called at European ports, which represented approximately 3.7 billion tonnes of cargo. Bulk carriers accounted for 70% of it, container ships 18% and Ro–Ro vessels 7%, the rest being other general cargo. A total number of 385 million passengers pass by ports every year and about 1.5 million of workers are employed directly in European ports (EC, 2013).

Environmental Management Systems (EMS) consists of a collection of internal policies, assessments, plans and implementation actions (Coglianese, & Nash, 2001). The ISO 14000 series of standards or the International Standard for Environment was released in September 1996 and comprises of two main parts: (i) specification with guidance for use and (ii) general guidelines or principles, systems and supporting techniques (Zutshi & Sohal, 2004). The reactive (or traditional) safety management approach is useful when dealing with technological failures, or unusual events (ICAO, 2013). An environmental management system helps organizations identify, manage, monitor and control their environmental issues in a “holistic” manner (ISO, 2015). The international standard ISO 14001 designed by the private body called International Organization for Standardization (ISO), and the Eco Management and Audit Scheme (EMAS) regulated by the European Regulation EC 1221/2009 (Testa et al., 2014). Port areas are hazardous areas of intense intermodal consideration as all the transport modes coalesce there. In most cases port areas are situated next to urban areas and/or other areas of special environmental attention due to the presence of protected species or even due to recreational purposes. Environmental Management System specifically for ports that can also be used by companies. Port development indicators are also included in operational indicators and they relate to operations carried out at sea, on land or both, be planned and executed with careful consideration of their environmental impacts (Puig, Wooldridge, & Darbra, 2014).

Environmental Management

Environmental management system has become one of the main tools used by companies to handle the environmental aspects and the impacts that their activities have on the environment. The first version of ISO 14001 (Environmental Management System: Requirements with guidance for use), the EMS standard from the International Organization for Standardization (ISO) was launched in 1996 (Lucila M. S. Campos, 2012). The ISO 14000 family of standards provides practical tools for companies and organizations of all kinds looking to manage their environmental responsibilities. Voluntary standards such as ISO 14001 were developed to overcome weaknesses in traditional regulatory instruments (McGuire, 2014). EMAS and ISO 14001. These schemes provide a third-party guarantee of environmental “excellence”, which is able to give an advantaged position (with respect to their competitors) to those organizations that, by adopting EMAS or ISO 14001, commit themselves to improve the environmental performance (Iraldo, Testa, & Frey, 2009). In 1987, the World Commission on the Environment and Development of the United Nations published the report “Our Common Future” in which sustainable development is defined as the principle of “meeting the needs of the present without compromising the ability of

 Copyright © International Science and Technology Conference (ISTEC)

future generations to meet their own needs" (To & Lee, 2014). ISO 14001 or EMAS, provide benefits on environmental and economic performances (Fresner & Engelhardt, 2004). Effective port environmental management needs to take into account the potential impacts on the environment, mitigating options, methods of prediction, information on environmental indicators and legislation (PPRISM, 2012). The ECOPORTS project also develops tools that will help port administrations to put the recommendations of the 2001 Environmental Review into action (for instance, the Port Environmental Review System (PERS) can be used as a standard for the implementation of these recommendations) (ESPO 2003). In 1974, the European Commission set up a Port Working Group, consisting of port authority representatives from Europe's major ports. Early 1993, the European Sea Ports Organisation was born out of this working group, as an independent lobby for seaport interests (ESPO, 2012). As part of the Environmental Performance Review, the environmental priorities of the sector have been redefined. Priority issues change their ranking with time but certain components retain their significance for the sector (ESPO, 2013).

In 1994, the Europen Sea Ports Organisation (ESPO) published its first Europen Enviromental Code Of Practise. This code was intended to be an expression of the collective commitment of the European port administrations to environmental improvement (Hooydonk, 2006). ISO 14001:2015 specifies the requirements for an environmental management system that an organization can use to enhance its environmental performance (ISO, 2015).

ISO 14001-EMAS

The ISO 14001 is an international environmental standard that specifies requirements related to an EMS to allow the organization to devise its policy and objectives while considering the legal requirements and information concerning significant environmental impacts (L. M. S. Campos, Heizen, Verdinelli, & Miguel, 2015). One of the most widely used voluntary approaches involves the adoption of the certified environmental management system (EMS) called ISO 14001 (Arimura, Darnall, Ganguli, & Katayama, 2016). There are two main reference standards that set requirements for an EMS: the international standard ISO 14001 designed by the private body called International Organization for Standardization (ISO), and the Eco Management and Audit Scheme (EMAS) regulated by the European Regulation EC 1221/2009 (Testa et al., 2014). The first step aims at testing if EMAS and, more in general, an Environmental Management System, are really able to produce an improvement in environmental performance as perceived by the organization. The second step aims at investigating if and how this performance, especially when strengthened by a third-party registration such as EMAS, can really give an organization better position on the four most important competitive leverages: innovation, marketing, productivity and intangible assets (Fig. 1) (Iraldo et al., 2009).

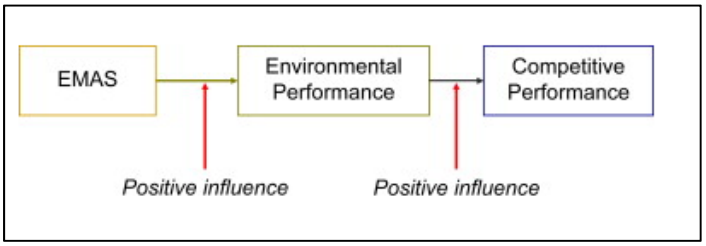

Figure1. The conceptual framework.

The Self Diagnosis Method

The Self Diagnosis Method (SDM) is designed to support port managers in their efforts to regularly review the environmental management performance in their port. The diagnosis generated through this analysis can determine both the enabling factors and the barriers to the implementation of effective environmental management systems (Romero, Asmus, Milanelli, Buruaem, & Abessa, 2014). The SDM should be a practical first step towards meeting ISO 14001 and/or EMAS. The presence of important ISO 14001 and EMAS requirements has been reviewed. The structure of the new version of the SDM is practically parallel to the order of the standard ISO 14001 (Table 1) (Darbra, Ronza, Casal, Stojanovic, & Wooldridge, 2004).

Results and Discussion

The first remark to be made is that all the priorities of the 2013 top-10 remain in the top-10 of 2016. There are just some variations in the ordering of the priority items. The relationship with the local community, port development and water quality primarily appear to be gaining importance. On the other hand, the handling of port waste, and dredging appear to move down the top-10 scale. Air quality remains the number one priority of the European ports, as in 2013. This is fully in line with the maintenance of air quality as a top priority also of the EU policy agenda and the various ongoing policy initiatives that include the implementation of the Sulphur Directive and the ongoing political process on the air quality package. Energy consumption becomes the second priority issue of the European ports. Since 2009, the importance of energy consumption has raised year over year as. One of the reasons for this increase is, of course, the direct link between energy consumption, and the carbon footprint of the ports and Climate Change. Noise is the third concern by priority and its importance has also grown smoothly since 2004. The relationship with local community climbs at the number four of priorities as the ports grant their license to operate and to grow from their local communities. Another interesting fact is that there are three issues that have appeared consistently in the priority list of the port sector over the last 20 years, although they are not in the top positions of the table 2. These issues are port development (land), dredging operations and dust (ESPO, 2016).

7	Contaminated land	Hazardous cargo	Energy consumption	Dredging: operations	Port development (land related)
8	Habitat loss / degradation	Bunkering	Dust	Dust	Water quality
9	Traffic volume	Port Development (land)	Port Development (water)	Port development (land)	Dust
10	Industrial effluent	Ship discharge (bilge)	Port Development (land)	Water quality	Dredging: operations

A set of 10 key management indicators has been developed for this purpose in cooperation between ESPO, EcoPorts and PORTOPIA. These have also been monitored back in 2013 and the 2016 review comes to update the figures and to show their evolution. Table 3 below shows the percentage of positive responses to each of these 10 indicators in the review of 2013 and 2016, so that the variations over time are demonstrated Clear positive trends can be demonstrated over time for the majority (7/10) of the selected indicators while one stays stable and 2 decline. The rise in the percentage of ports that are certified by a recognised Environmental Management System (EMS), such as ISO 14001, PERS and/or EMAS, from 54 to 70 % between 2013 and 2016 is particularly impressive. On the other hand the results show an 11 % decrease in the percentage of ports that have an environmental training programme for their employees and this clearly requires further investigation by ESPO. The results demonstrate that the big majority of European ports have implemented an Environmental Policy (92 %), maintain actual inventories of applicable environmental legislation (90%) and of their significant environmental aspects (89%), define objectives and targets for environmental improvement (89%), have documented environmental responsibilities of key personnel (85%) and monitor their environmental impact (82%). The trends are also positive on communicating efforts with 2 out of 3 of the respondent ports producing a publically available environmental report on a regular basis. The table 4 below shows the Environmental Management Index of European ports in 2013 and in 2016 respectively. The evolution confirms the positive trends identified. (ESPO/EcoPorts, 2016).

As stated above, the overall improvement over time of European ports in environmental management is well demonstrated by the increase in the percentage of ports that achieve certification under one or more of the established environmental management systems (EMS). A total of 64 ports out of the 91 that contributed to the review are EMS certified, being 46 of 5 them under ISO 14001, 5 under EMAS and 26 under the EcoPorts Port Environmental Review System (PERS) as shown in the following figure 2. Some ports are certified under more than one system (ESPO/EcoPorts, 2016).

The products currently provided by ECOPORTS gradually lead to the level required to attain ISO 14001 or EMAS certification (Fig. 3), although all of them may also be considered as tools that stand on their own.(Darbra et al., 2004).

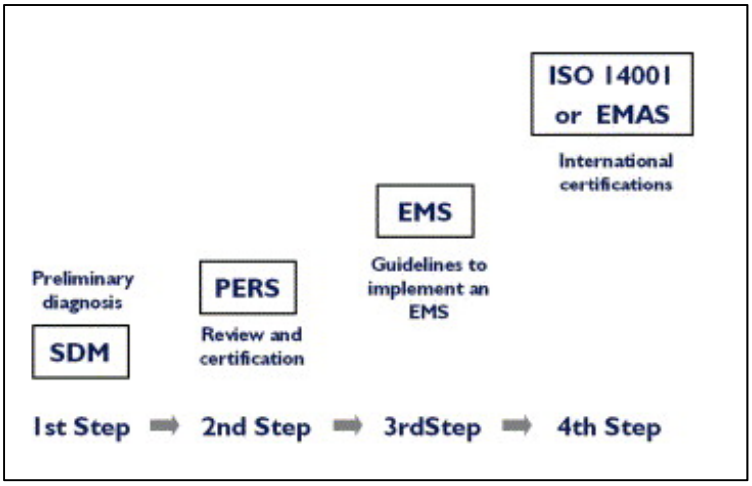

Figure 3. Diagram showing the relationship between the ECOPORTS tools and the international standards.

Conclusion

The vital importance of the ports industry for EU trade is demonstrated by the statistics: the maritime sector is responsible for over two thirds (70%) of all trade between the Community and the rest of the world, as well as 41% of goods traffic within the Community (Short Sea Shipping). Ports are the gateway for the movement of millions of passengers each year and a wide range of goods (including vehicles, fresh food, steel, timber, building materials, machinery and manufactured goods) and raw materials (oil, petroleum, chemicals, ores, grain and animal feedstuffs) which are needed to fuel the European Union's economy (ESPO, 2004). The EC PORTOPIA project has gained data and insight on Environmental Performance Indicators for inland ports (Seguí, Puig, Quintieri, Wooldridge, & Darbra, 2016).

A sustainable port is one in which the port authority together with port users, proactively and responsibly develops

and operates, based on an economic green growth strategy, on the working with nature philosophy and on stakeholder anticipation, starting from a long term vision on the area in which it is located and from its privileged position within the logistic chain, thus assuring development that anticipates on the needs of future generations, for their own benefit and the prosperity of the region that it serves (Vellinga, 2013). Among various motivations for green activities, the rise of environmental awareness can be critical to the development of a firm's green strategies (Luan, Tien, & Chen, 2016).

Maritime ports, especially those connected with or situated far inland in estuaries connected with navigable inland waterways and railways, can also play a significant role in reducing CO_2 emissions, but will also have to face the effects of climate change (EC, 2011). International Maritime Organization (IMO) has recognized that provision of reception facilities is crucial for effective MARPOL implementation, and the Marine Environment Protection Committee (MEPC) has strongly encouraged Member States, particularly those Parties to MARPOL as port States, to fulfil their treaty obligations on providing adequate reception facilities. MARPOL Annex VI, first adopted in 1997, limits the main air pollutants contained in ships exhaust gas, including sulphur oxides (SO_X) and nitrous oxides (NO_X), and prohibits deliberate emissions of ozone depleting substances (IMO, 2011).

Implementing ISO 14001can be time-consuming and incur some initial costs but the benefits outweigh the expense (Davies, 2005). Future research should deeply measure how certified organizations implement the requirements included in the environmental management system standards such as EMAS and ISO 14001.

EVALUATION OF ARASTAS AND BAZAARS OF OTTOMAN CITIES WITHIN THE CONTEXT OF CONSTRUCTION MATERIALS AND ARCHITECTURAL TYPOLOGIES

[1]Özlem ATALAN, [2]Hasan Şahan AREL

[1]Dr., Isık University, Faculty of Architecture and Design, Department of Architecture, oatalan@hotmail.com

[2] Dr.,sahanarel@gmail.com

Abstract

In Anatolian cities of the Ottoman period, such as the inns, bedestens (covered bazaars), arastas, bazaars, grand bazaars and stores formed the commercial centers. These commercial structures with different functions were the main components forming the fabric of the commercial districts. These commercial centers also contained major public buildings, such as mosques and baths. Depending on the size of a city or town, the number of these structures could vary greatly. All of the buildings located in the center were important facilities, contributing economic, social and distinctive features to an Anatolian city or town. In this study, the "Arasta" and "Bazaar" in historical cities located on the axes of important trade routes in Anatolia were investigated. In addition, the conceptual and architectural differences of arastas and bazaars from inns and bedestens, which are major commercial structures, were investigated. The structures were selected from the cities of İstanbul, Bursa, Edirne, Hatay, and Konya, which were located on the important trade routes of the time. Especially, construction and material techniques, plan and façade typologies of these structures, built in the 15th and 16th centuries, were evaluated, as were the common and distinctive features of the various cities.

Keywords: Historic Commercial Buildings, Arasta, Ottoman Bazaar, Bazaar, Grand Bazaar, Long Bazaar

Introduction

In the Ottoman cities, commercial buildings were not separated from religious buildings. During the process of establishing commercial districts, religious and cultural buildings, such as mosques and madrasas, were constructed within the same urban texture as commercial buildings, such as inns, bedestens, and baths. The commercial organization became prevalent as trade developed over time, and streets consisting of buildings involved in similar businesses were formed in the commercial districts. In these streets, bazaars and small shops that were run by a variety of professional groups were aligned in rows. From the center of the commercial area to the outer castle walls, the buildings for various occupations were arranged in an orderly manner. Workshops such as tanneries, felting shops, dyehouses, smithies, boiler smiths, and tinner shops were located in the outer ring of the commercial district. In the commercial districts, it is seen that the production areas of commercial goods were planned close to the commercial buildings where these goods were sold. This orderly arrangement led to workplaces being located in the streets extending from the center to the castle, and even to the emergence of "long bazaars," which were often seen in the Ottoman cities (Kuban, 1968; Can, 1995; Şahinalp&Günal, 2012;Akar, 2009; Saoud, 2002; Erzen, 1991; Kuban, 1968; Günal&Şahinalp, 2012). The Ottoman-era arastas and bazaars show interesting features in terms of their inner-city locations and architectural properties. These structures, referred to by different names, will be evaluated in the same category because all of them have a similar architectural scheme. In this study, the "arasta" and "bazaar" structures in the cities located on three major trade axes during the Ottoman period will be studied and compared. The following were selected: the ***Selimiye Arasta (Edirne***), the ***Ali Pasha Bazaar (Edirne)***, the ***Spice Bazaar (İstanbul)***, the ***Suleymaniye Tiryaki Bazaar (İstanbul)***, the ***Havsa Sokullu Mehmed Pasha Arasta (Edirne)***, the ***Ilgın Mustafa Pasha Bazaar (Konya)***, the ***Payas Sokullu Mehmed Pasha Arasta (Hatay)***, the ***Hisar Mosque Bazaar (İzmir)***,and the ***Shadirvan Mosque Bazaar (İzmir)*** **(**Figure 1**).**These will be examined and evaluated, especially in terms of their designs and plan schemes. Typological evaluations will be made on the basis of the common and distinctive features of these structures in general (Ataman, 2000; Erdoğan&Kuter, 2010).

Figure 1.The Arasta and Bazaar Structures located on major trade axes during the Ottoman Period (Yıldırım, 2014).

The 16th Century Commercial Buildings: Arastas and Bazaars

The word "arasta" means a bazaar, military bazaar, or mobile bazaar established in the military area where similar types of goods are sold. The structure of an arasta consists of shops arranged on opposite sides; sometimes it has an open top, or is covered with a vault in the center. The structure can be also built as a part of a külliye (a complex of buildings) (Hasol, 1995;Özdeş, 1998:7). In the definition of Sözen and Tanyeli (1986), an "arasta" is "a type of structure with an open or covered top in the Ottoman architecture, where a series of shops is located on an axis, sometimes side by side or sometimes on opposite sides"(Kuban, 2009). The word "bazaar" is derived from the root of the Persian term "Cıhar-Suk," which means "four streets." The bazaar structures are described as areas with open or covered tops, surrounded by shops on both sides, suitable for shopping (Özdeş, 1998:7). However, a bazaar can also be defined as a region which has a bedesten (covered bazaar) in the center and is surrounded by shops of different groups of tradesmen, workshops, an inn, a bath-house, a soup kitchen, a mosque, and a hospital (İnalcık, 1997:120). According to this definition, a bazaar can be described as a region with a commercial focus, in which people living in and around the city meet their social and economic needs and public and business areas are included (Kejanlı, 2010; Dumont &Georgeon, 1999; Faroqhi, 2000).

Figure 2. Shops in the Spice Bazaar, İstanbul (www.misircarsisi.org)

Figure 3. The Suleymaniye Tiryaki Bazaar (http://www.discoverislamicart.org/)

Evaluation of Arastas and Bazaars within the Context of Construction Materials and Architectural Typologies

In many cities of Anatolia, arasta and bazaar buildings attract attention with their substantial masonry masses extending in a longitudinal direction, containing wooden shops in the center of the commercial area. These buildings were built with a stone masonry wall construction system. The tops of these buildings, which were generally built in a single-storey and lengthwise rectangular plan, are closed and the roofs are covered with lead. Some bazaars were located beneath mosques and sometimes designed with an open top, in such a way as to face a street or a passage. By building shops around the shops located on the outer ring, the commercial streets were emphasized. Some bazaars and arastas, on the other hand, were built in the form of a complex and the two main walls of the building were built adjacent to the structures.

According to the location of the building, entrance gates are usually seen on two sides. These gates can be flashy, high, and with gem embellishments. In general, it is seen that the arasta and bazaar gates are sometimes made of iron, and sometimes of wood with ornaments (Cezar, 1985; Yenen, 1987; İntepe, 2005).

Figure 4. The Sokullu Mehmed Pasha Caravanserai, Inn and Arasta; Hatay Payas (http://www.hatay.bel.tr/)

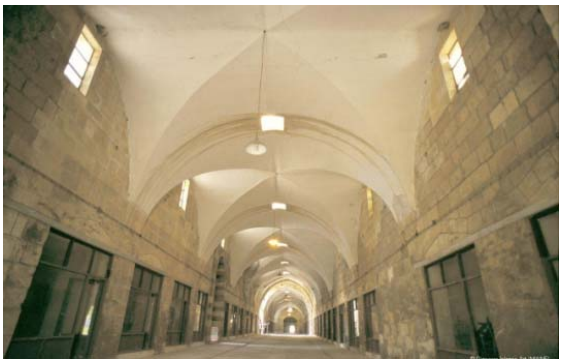

Figure 5. The cross-vaulted interior corridor of the arasta (http://www.discoverislamicart.org/)

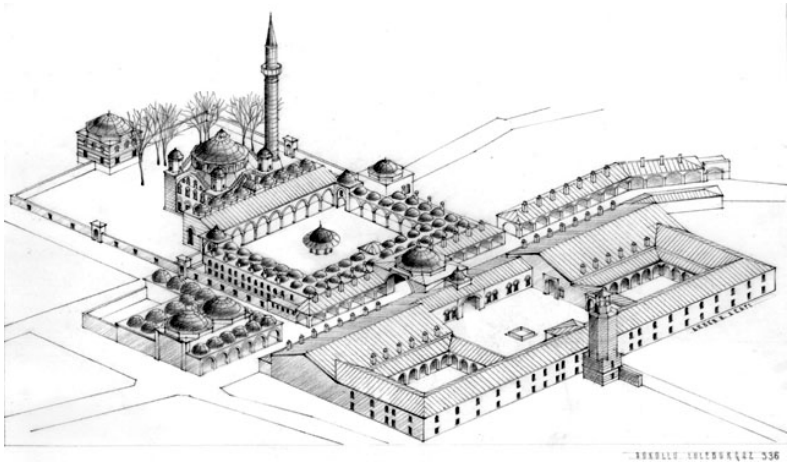

Figure 6.The Lüle Burgaz Sokullu Mehmed Pasha Caravanserai, Inn and Arasta (http://luleburgaz.blogcu.com)

Figure 7.The Ilgın Lala Mustafa Pasha Complex; Ilgın Konya (Genç, 2015)

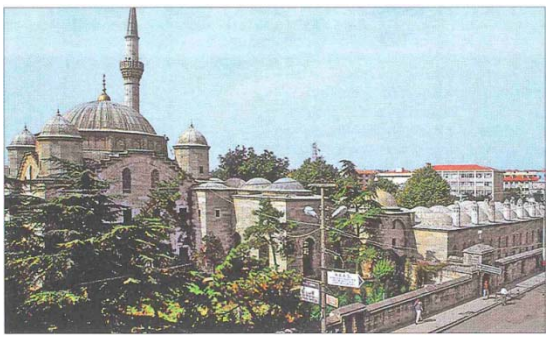

Figure 8. The Sokullu Mehmed Pasha Complex (Islam Encyclopedia, 2009)

Most of the arastas and bazaars that are regarded as dating from the 16th century were built by Sinan, the Architect, and the Sultan's society of architects. Moreover, the distinctive features of these buildings are largely similar due to the facilities of the era and the available construction materials. In the plan schemes of the arastas and bazaars, no development over time is seen. However, it can be said that the cities' needs, depending on their size, had an impact on the size of the plan schemes of these buildings.

As it can be seen in Table 1, in general, the arastas and bazaars of the middle or the end of the 16th century can be separated into two types according to their designs and plans, in order to avoid any conceptual confusion.

- **Type 1. Open-top bazaars and arastas with shops facing the street or passage**

These can be described as bazaars which were built on the ground floor, consisting of a single row of shops facing the street or passage. Sometimes the ground floor of a mosque was planned to be completely filled with bazaar stores. The Tiryaki bazaar in Suleymaniye İstanbul (Figure 2) and the Shadirvan Bazaar (Figure 9.) Hisar Bazaar in İzmir (Figure 10), , can be given as examples of this type of bazaar (Ersoy, 1991; Atay, 1999; Beyru, 1973).

 Copyright © International Science and Technology Conference (ISTEC)

Figure 9. Hisar Mosque and Bazaar in Kemeraltı İzmir

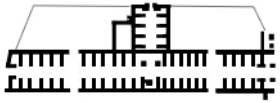
Figure 10. The Shadirvan Mosque, Kemeraltı İzmir (Canbalaban, 2006)

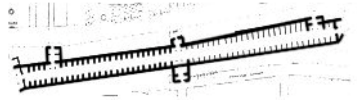
In some parts of The Sokullu Mehmed Pasha Complex (Lüleburgaz, Figure 11), the Sokullu Mehmed Pasha Bazaar (Havsa, Edirne, Figure 8) and the Lala Mustafa Pasha Bazaar (Ilgın, Konya, Figure 7), a plan type is seen where the middle passage was planned with an open top and the shops were designed in opposing longitudinal rows. There is a prayer dome in the center of the sections of these types of structures that are called "arastas" or "bazaars." The prayer dome is a space that is erected with walls, under which one can pass through arches and with a dome in the center. It connects two spaces together (Ramazanoğlu, 2008). The shops in these structures each have an area of approximately 20 m^2 or more. The middle passage corridor is about 8–9 meters wide in these structures.

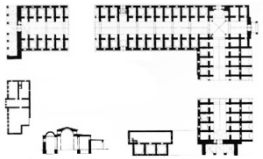
Fig. 11.The Lüleburgaz Sokullu Mehmed Pasha Complex, the Prayer Dome and the Shops (http://mimariforum.com)

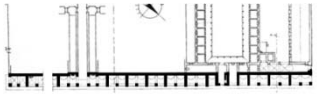
Fig. 12. Ali Paşa Bazaar, Edirne (http://wikimapia.org/)

Fig. 13.Selimiye Arastas, Edirne (http://www.kadimdostlar.com/)









Type 2. Covered bazaars and arastas with shops facing the corridor (longitudinal rectangular, L- or T-planned)

This type consists of rows of shops aligned on both sides of a corridor with a covered top. The Ali Pasha Bazaar (Edirne) (Figure 12), the Selimiye Arasta (Edirne) (Figure 13), the Spice Bazaar (İstanbul), (Figure 2) the Sokullu Mehmed Pasha Arasta (Payas, Hatay) (Figure 4 and Figure 5), and the Lala Mustafa Pasha Bazaar (Ilgın, Konya) (Figure 7) are examples of this type.

 Copyright © International Science and Technology Conference (ISTEC)

There is a prayer dome in the center of the Sokullu Mehmed Pasha Arasta (Payas, Hatay), but there is also a central passage/corridor covered with cross-vaults in this structure. This type of central corridor with a covered top can be compared to the Sokullu Mehmed Pasha Complex (Lüleburgaz) or the demolished Sokullu Mehmed Pasha Complex (Havsa, Edirne) (Ramazanoğlu, 2008). The size of the shops in these structures is approximately between 10–20 m^2. There are no external shops. While the roofs of the shops are low, the roof of the central corridor is cross-vaulted and high. On the walls that result from the difference in height between the shops and the central corridor, windows were cut and illumination of the central corridor was achieved. The central passage corridor in these structures is approximately 6 meters wide. In some structures, those buildings that were built as simple bedestens (covered bazaars) containing shops may also be called “arastas” or “bazaars.” In this study, these types of structures were considered bedestens, and were not included in the typology of arastas or bazaars (Pakalın,1983).

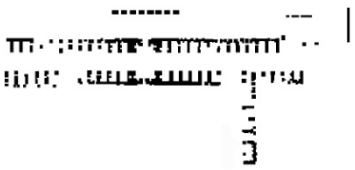
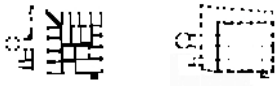
	Building Name and Location	**Year of Construction / Commissioned by and Built by**	**Plan type and Architectural Distinctive Features**	**Material and Buildings**	**Internal/ External Shops and Corridor width (approx.)**	**Plan scheme** (Özdeş, 1998).
Building 1	The Selimiye Arasta Edirne (Located on the İstanbul-Aleppo-Damascus-Hejaz way)	Commissioned by Murad III and built by Davud Agha the Architect (Özdeş, 1998).	T-plan type, single-row shops.	Stone /Brick Masonry System	Internal shops are 16–20 m^2 No external shops, Corridor is 6m.	
Building 2	The Ali Pasha Bazaar Edirne	1569/ Commissioned by Murad III and built by Sinan the Architect (Özdeş, 1998).	There are longitudinal, single-row shops on either side.	Stone / Brick Masonry System	Internal shops are 10–20 m^2 No external shops, Corridor is 6m.	
Building 3	The Spice Bazaar İstanbul	1660/ Commissioned by Sultan Turhan and built by Kasım Agha (Özdeş, 1998).	There are single-row shops on either side in an L-plan type. There is a dome at the intersection point of the vaults in the center.	Stone / Brick Masonry System	Internal shops are 20 m^2, No external shops, Corridor is6m.	
Building 4	The Suleymaniyah Tiryaki Bazaar İstanbul	Built by Sinan the Architect in the years 1550–1557(Özdeş, 1998).	Single-row shops face the street.(Shops downstairs, madrasa upstairs above the shops)	Stone / Masonry System	No internal shops, External shops are 20 m^2, No Corridor	

Copyright © International Science and Technology Conference (ISTEC)

Building 5	The Ilgın Mustafa Pasha Bazaar Konya	In 1576, it was commissioned by Lala Mustafa Pasha. It is mentioned among the works built by Sinan the Architect. The Arasta is thought to have been built along with the inn in 1584. The Arasta, which consists of two sections, open and closed, was partially restored to its original state by building on the foundations in 1960 (Genç, 2015).	Entirely covering the north of the Complex, the north side of the Arasta faces the main street, its east and west are adjacent to the road, and its south is adjacent to the inn and the soup kitchen. There is a barrel vault roof above the center of the rectangular shops that face each other.	Stone / Brick Masonry System	Internal shops are 16 m^2 No external shops, Corridor is 6 m. .	
Building 6	The Sokullu Mehmed Pasha Arasta Payas/ Hatay (A Menzil Complex located on the İstanbul-Aleppo-Damascus-Hejaz way. There is an arasta in the center of the Complex in the north-south direction)	In 1574, it was commissioned by Selim II and built by Sinan the Architect. In the Complex, buildings for accommodation, such as the caravanserai, soup kitchen, and guest rooms were located to the east of the Arasta, whereas facilities for worship, education, and cleaning purposes, such as the mosque, primary school, madrasa, and bath were located on the west side.	The "Arasta" was built adjacent to the inn structure. The arasta, with anarea of 115 × 15 meters, consists of 48 shops located on opposite sides of a corridor covered with a cross-vault, also including a prayer dome in the center. The roof cover is a hipped roof.	Stone / Brick Masonry System	Internal shops are 10–12 m^2 Corridor is approx.8 meters.	
Structure 7	The Sokullu Mehmed Pasha Complex Havsa/ Edirne	In the years 1576–77, a Complex consisting of mosque, madrasa, arasta, inn, soup kitchen, double bath, lodge, bridge, fountain, and primary school was commissioned by Sokullu Mehmed Pasha. It was built with the cooperation of the Sultan's Society of Architects and Sinan the Architect (Islam Encyclopedia,2009) The parts of the Complex, the mosque, the prayer dome of the arasta, the bath, its alcove wall, prayer-room/lodge, and corner fountain have survived to the present day.	There is a prayer dome in the space into which the doors of the arasta, the mosque, and the inn open. The other parts of the Complex, such as the arasta, inn, soup kitchen, guest rooms, madrasa, bridge, founding and primary school have not reached the present day. As understood from the traces, the arasta included rows of shops on either side. The rectangular-planned arasta provided a structural and functional connection between the building masses. The top of the central corridor was open (IslamEncyclopedia,2009)	Stone / Brick Masonry System	Destroyed, Corridor approx. 9 meters.	

Copyright © International Science and Technology Conference (ISTEC)





Building 8	The Sokullu Mehmed Pasha Complex and bazaar Lüleburgaz	It is believed that it was commissioned by Sokullu Mehmed Pasha in the years 1559–1570. The design and construction of the complex were carried out by Sinan and the Sultan's Society of Architects, under the sultan's directorship. The historical İstanbul-Edirne-Central Europe road passes through it(Islam Encyclopedia, 2009).	What has survived from the arasta located in the complex are dilapidated shops, whose number has been reduced by half, and the prayer dome. The arasta is adjacent to the north wing of the madrasa, and consists of shops built on both sides of a road extending in an east-west direction. The arasta, consisting of 59 shops built on both sides and a prayer dome, forms the spine of the complex. There are shops lined up in single rows longitudinally. The top of the central corridor is open.	Stone / Brick Masonry System	Shops are mostly destroyed. Internal shops are approx. 10–12 m^2 Corridor is about 8 meters. The corridor is rather wide, as a road passes between the shops.	
Building 9	The Hisar Mosque Bazaar İzmir	It is written in some sources that it was transformed from a Latin Church, and that this was done by Aydınoğlu Özdemiroğlu (Molla) Yakup Beyin 1597–1598. The same sources also state that this transformed mosque was demolished by Timur in 1402. (http://www.izmirkulturturizm.gov.tr/). According to an inscription on the gate of the mosque, it was repaired in H.1298 (1881) (Özdeş, 1998).	There are shops in rows added next to the mosque. The shops of the bazaar are open to the streets and the courtyard surrounding the mosque.	Cut-rubble stone Masonry System	There are shops of various sizes.	
Building 10	The Shadirvan Mosque Bazaar İzmir	This mosque, which is located on the Old Inner Harbor shore inside the Historical İzmir Kemeraltı Bazaar, took its name from the eight-columned shadirvan beside and under it. Therefore, it is referred to as the Shadirvan Mosque and Bazaar. It was built in 1636 and restored in 1815 (Özdeş, 1998).	There are shops under the mosque. The shops located on the ground floor face the streets and the passage around the mosque.	Cut-rubble stone Masonry System	There are shops of various sizes.	

Table 1. Systematic evaluation of building materials and typologies of Arastas and Bazaars

Discussions and Results

Arastas and the bazaars, located in the Ottoman trade routes, have been built in the 17th and 16th centuries. 10 important structure of them, located in this trade route and examine the scope of the this research, contribution of the architecture of Arastas and bazaars.

When examining the plan schemes of arastas and covered bazaars in, it is seen that single-row shops face each other on either side. There is a high vault above the central corridor, which usually extends longitudinally. There may be a dome in the midpoint of the longitudinally extending corridor, or at the intersection of the corridors. These domes functioned as prayer dome in some arastas.

For example, it is seen that some buildings, such as the Spice Bazaar (İstanbul), the Selimiye Bazaar (Edirne),and the Tokat Bazaar, were planned with a central dome over the central aisle. There is, again, a prayer dome at the center of the Sokullu Mehmed Pasha arastas (Lüleburgaz, Edirne, Hatay).

The sizes of the shops that are located on opposite sides, as required by plan schemes in arastas, bazaars, and covered bazaars, vary between 10 and 20 m^2.For example, while the widths of the shops in the Niğde Covered Bazaar range between 2 and 2.5 m, the widths of the shops are 3.75 m in the Ali Pasha Bazaar (Edirne) by Sinan, and 3 m in the Payas Covered Bazaar. When we look at the Edirne arasta, it is seen that the façades of the shops vary between 3 and 4m in width. The internal shops face the corridor. External shops are not included in most arastas. The width of the corridors is usually 6 meters wide. The shops are closed, with arched doorways. In some arastas and bazaars, there may be divisions for sales stands without any doors. The cross-vault or the dome can be seen from each shop individually.

The construction technique in the arastas, bazaars, and covered bazaars, and the commercial structures investigated, is, in general, masonry; the construction material is usually stone and brick, and sometimes only stone. Security concerns dictated the use of this construction technique. Sometimes, since these structures operated as banks and stock bazaars, as in bedestens, and valuable goods were sold, stored and exhibited in these places, the walls of these structures were made relatively thick, and the windows were located quite high and secured with iron grates. When we look at the architectural characteristics and construction techniques of arastas, bazaars, and covered bazaars, it is seen that these structures were built with a one- or two-storey, stone/brick masonry system.

EVALUATION OF THE EFFECTS OF SOME COMPOUNDS ON DILL CATALASE ACTIVITY

Gulnur Arabaci
garabaci@sakarya.edu.tr

Catalases (hydrogen peroxide oxidoreductase, EC 1.11.1.6) involve elimination of hydrogen peroxide to water and oxygen widely distributed in nature and found in different organisms such as bacteria, plants, and animals. Plant catalases are involved in anti-oxidative defense system where found in different cellular compartment such as peroxisome, chloroplast and mitochondria. Hydrogen peroxide can easily penetrate though the membrane of organelles in plant cells and cause to the oxidative stress. Catalase can act as an anti-oxidative enzyme to detoxify H2O2. In the present study, catalase enzyme was isolated and characterized from dill (*Anethum graveolens* L.) plant grown in Sakarya, Turkey and the effects of some compounds such as amino acids and metals were investigated on dill catalase activity. The results showed that L-Cysteine, L-Histidine, L-Tyrosine, KCN and some heavy metals such as Pb+2, Hg+2, and Sn+2 had inhibitory effect on dill catalase activity. Zn+2, Mn+2 and Fe+2 metals increased the enzyme activity. The results obtained suggest that these unique properties of the enzyme are important for understanding of the natural function of catalase enzyme in dill plant.
This research was financed by Scientific Research Foundation of Sakarya University, Turkey (Project No.BAP 2016-02-04-026).

EVALUATION OF THE ENVIRONMENTAL IMPACTS OF RENEWABLE ENERGY SOURCED ELECTRIC PRODUCTION FOR THE PROVINCE OF SINOP/ TURKEY

Yalçın ALCAN

Vocational School, Department of Electric and Energy, Sinop Uni., 57000, Sinop, TURKEY

yalcinalcan@sinop.edu.tr

Abstract: This paper is a report on the findings of a study conducted on a graduate level virtual conference summer school course. Discourse analysis techniques were used to examine the resulting transcript of texts for evidence of a democratic discourse within a community of learners. Findings indicate that gender is not masked in the text driven discussions on the Internet. Distinctive discursive styles are often sex class linked. Like face to face or classroom contexts, status is accorded unequally within discourse communities. Participants are not equal and are not equally attended or responded to. Educators need to take a serious and wary approach to accepting claims of ensured democratic participation in computer mediated communication formatted classes.

Keywords: Gendered Voices, Teacher, Virtual Conference

1. Introduction

Demand for energy is increasing day by day in our country and worldwide due to many factors, such as population growth, industrialization, technological progress, more people live in the city (Mann and Teilmann, 2013). From the perspective of our country, our energy production from domestic sources cannot meet the energy that we consume (Yüksel, 2010). In order to get to the level of the industrialized countries in the development process of our country, the need to increase energy production and energy consumption compared to the current situation (Acaroğlu, 2013). In developed countries, there have been made investments at a great rate in renewable energy sources, to meet the energy demand of electricity production and to minimize the damage to the environment (Kenisarina et al. 2006). Adding essence and affordable, environment- friendly alternative energy sources to our energy production policy, it is an inevitable necessity to reduce our dependence foreign countries (Yüksel and Kaygusuz, 2011). In addition, national and international legal and statutory contracts are also supportive of this orientation (Anonim1, 2016). It makes attractive alternative energy sources that they are unlimited, renewable and not cause environmental pollution. As a result of these developments in the energy sector in our country, a large number of theoretical and practical studies have been made on environmentally friendly energy sources (Akdağ and Güler 2010). Wind energy is the energy source that in the focus of this studies (İlkiliç, 2012). Wind energy stands out in terms of more economical, easy installation and operation of power plants when compared with other forms of energy (Güler, 2009). Researchers have done a lot of work for the regions where they thought it was the wind potential in sub-issues such as, cost, environmental impacts and site selection (Özgener, 2010). In our country, with increase of the support in the wind energy field of, increasing numbers of new wind power plants have been established every day without huge installed power capacities. In Turkey, annual production capacity of wind energy is 11 552 GWh at the end of 2015. The installed capacity of wind power plants in operation by the end of the year 2015 4.503 MW (Anonim2, 2016).

In this study it was analyzed and evaluated of the possible environmental impact of a wind energy power generation system with taking into account recent data that may be established in Sinop.

2. Evaluating The Environmental Impact Of The Wind Energy Plant For Sinop City

2.1 Electric Energy Production and Consumption in Sinop

Altınkaya, First Energy, Boyabat, Erfelek and Ayancık HPP plants provide the electricity for Sinop. Installed capacity of these HPPs except for Altınkaya HPP is 543 MW. Annual electricity production of these plants is 872 GW (Anonim3, 2016). Electricity distribution in the region is executed by a privileged company called Yesilirmak Electricity Distribution Co. (YEDAS). As seen in Table 1, electricity energy consumption in Turkey is increasing every year.

 Copyright © International Science and Technology Conference (ISTEC)

Table 1. Electric Energy Consumption in Turkey (2010-2014) (Anonim4, 2016).

Year	Government	Industrial	Commercial	Household	Illumination	Other	Total (GWh)
2010	4,1	46,1	16,1	24,1	2,2	7,4	172.051
2011	3,9	47,3	16,4	23,8	2,1	6,5	186.100
2012	4,5	47,4	16,3	23,3	2,0	6,5	194.923
2013	4,1	47,1	18,9	22,7	1,9	5,3	198.045
2014	3,9	47,2	19,2	22,3	1,9	5,5	207.375

When Table 2 is examined, the consumption of electric energy in Sinop has been increasing every year as much as in Turkey general.

Table 2. Electric Energy Consumption in Sinop (2010-2014) (Anonim4, 2016).

Year	2010	2011	2012	2013	2014
Net Consumption (MWh)					
Household	106.853	119.894	127.491	128.209	136.943
Commercial and Public Services	65.414	71.266	73.438	78.980	94.977
Industrial	84.461	105.494	83.722	77.167	71.727
Agricultural Irrigation	605	1.293	1.269	1.732	1.894
Other	11.058	21.404	21.164	19.925	22.482
Total (MWh)	268.391	319.351	307.083	306.013	328.022
Number of Subscribers					
	133.231	135.808	140.564	144.845	149.699
Loss-Theft Rate (%)					
	14,9	11,1	9,7	8,4	7,5

The total number of subscribers was 154 225 in Sinop in 2015. The total power consumption was 339.499.562 kWh. Sold energy was 312.784.282 kWh (Anonim5, 2016). According to these data, theft-loss rate was 7.87% in Sinop.

2.2. Wind Energy in Sinop

Sinop is a city established in Mid- Black Sea region in north Anatolia at the narrowest part of Boztepe peninsula. Its location serves as a transition zone of between the West and the East of Black Sea region. The city is situated between 41.2 to 43.5 34.5 to 35.5 meridians and parallels. The city has a total border of 475 kilometers with 300 kilometers inland border and 175 kilometers marine border (Anonim6, 2016). Sinop is a city in the Central Black Sea Region with an average height of approximately 200 m. The height of the Küre Mountains, located behind the coast, is above 1500 meters. Seasonal temperature difference is not high in Sinop. The long term average temperature in the coastal towns of Sinop is 13-15◦C and 12◦-14◦C in the inland towns. Main wind direction is northwest (mistral) and the long term average wind speed is 3,5 m / sec. In inner parts, the dominant wind direction is west and the wind blows softer than the coastal winds with an average of 1.0m / s to 2.0 m / s . The population of Sinop is 204 133 (Anonim6, 2016). In Table 3, Sinop wind intensity and speed at a height of 50 meters have been shown. In addition, the total power capacity of the wind power plant that may be installed has been given. For an economic wind power plant (WPP) investment, a wind speed of 7 m / s or more is required. As seen in Table 3, dominant wind speed is between 6.8 and 7.5 m / s in Sinop; thus, it can be argued that it would be an economic investment

 Copyright © International Science and Technology Conference (ISTEC)

Table 3. Wind Power Plant Power Capacity that may be installed in Sinop (Anonim8, 2013).

50 m Wind Power (W/m^2)	50 m Wind Speed (m/s)	Total Area (km^2)	Total Power Capasity (MW)
300-400	6,8- 7,5	289,63	1.448.16
400-500	7,5- 8,1	8,59	42,96
500-600	8,1- 8,6	0,00	0,00
600-800	8,6-9,5	0,00	0,00
> 800	> 9,5	0,00	0,00
		298,22	1.491.12

2.3. Environmental Impact Assessment (EIA)

It is important to have an understanding of environmental issues in order to suggest solutions for these problems. Environmental impact assessment reports may suggest ideas on how to suggest solutions for environmental issues. These reports determine the possible positive and negative effects of environment-related plans and projects. EIA reports benefit from the studies on evaluation and supervision methods and measures to be taken so that environmental damage will be minimized (Anonim9, 2016). The power plants are used to produce electricity energy through energy conversion. In this conversion process, these power plants can have both positive and negative effects on environment. Wind power plants have positive aspects such as not polluting the air. Attention should be paid to location selection, field conditions, noise sequence, visual pollution and impacts on bird mortality in the wind power plants planning process.

2.3.1. Air Pollution Concerns

Industrialization, increasing number of motor vehicles, urban life and many other factors lead to increased air pollution. Moreover, in Turkey, coal-based thermal power plants operate on high sulphur brown coal. They are constructed via old-fashioned techniques. The absence of filter system or efficiency causes problematic sulphur dioxide (SO_2) emissions. These facilities are considered high level pollutants in power generation facilities category. Therefore, there are specific emission limit values decreed by environmental legislations (Yüksel and Sandalcı, 2011). In Table 4, the limit values by the International Air Quality Index have been given. This table is categorized according to airborne pollution levels in different colours. For example purple colour illustrates that there is a health emergency status and that this status is more likely to affect the entire population.

Air Quality Index (AQI) Values	Levels of Health Concern	Colors
When the AQI is in this range:	*..air quality conditions are:*	*...as symbolized by this color:*
0 to 50	Good	Green
51 to 100	Moderate	Yellow
101 to 150	Unhealthy for Sensitive Groups	Orange
151 to 200	Unhealthy	Red
201 to 300	Very Unhealthy	Purple
301 to 500	Hazardous	Maroon

Table 4. EPA (Environmental Protection Agency), International Air Quality Index (Anonim10, 2016).

 Copyright © International Science and Technology Conference (ISTEC)

Air Quality Index Levels of Health Concern	Numerical Value	Meaning
Good	0 to 50	Air quality is considered satisfactory, and air pollution poses little or no risk.
Moderate	51 to 100	Air quality is acceptable; however, for some pollutants there may be a moderate health concern for a very small number of people who are unusually sensitive to air pollution.
Unhealthy for Sensitive Groups	101 to 150	Members of sensitive groups may experience health effects. The general public is not likely to be affected.
Unhealthy	151 to 200	Everyone may begin to experience health effects; members of sensitive groups may experience more serious health effects.
Very Unhealthy	201 to 300	Health warnings of emergency conditions. The entire population is more likely to be affected.
Hazardous	301 to 500	Health alert: everyone may experience more serious health effects.

Table 4. EPA (Environmental Protection Agency), International Air Quality Index (Anonim10, 2016).

Air pollution reduces the quality of life by affecting human health directly or indirectly. There is an air quality monitoring station in the central town of Sinop. At the station, PM_{10}, $S0_2$, relative humidity, relative temperature, wind direction and speed, air pressure values are measured regularly. In Figure 1, airborne pollutants PM_{10} and SO_2 values from the previous year in Sinop are provided. Natural gas is not available in Sinop yet. Coal is used for heating. Therefore, air pollution in winter has usually been observed to increase due to coal use for heating.

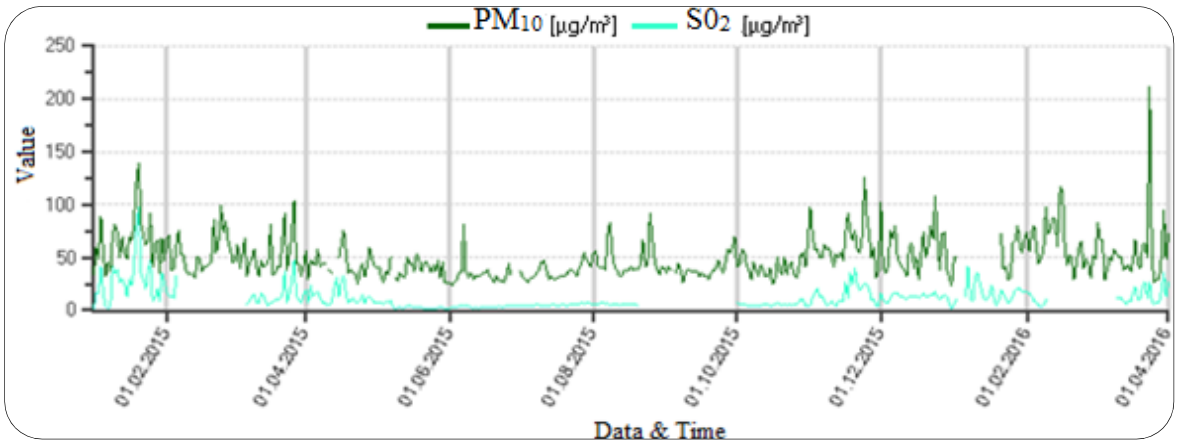

Figure 1. 2015 Air Quality Measurement Station Locations and Measured Parameters in Sinop (Anonim11, 2016).

Wind energy is one of the renewable energy sources and has a positive impact on the environment. Wind turbines are extremely important for reducing CO2 emissions. In table 5, it is shown that the harmful gas emissions into the atmosphere from wind energy production can be prevented by using 1 kW of energy.

Table 5. Prevention of emissions by 1kW wind power generation (Anonim11, 2016).

Emission Type	Quantity(gr)
Carbon dioxide (CO2)	0,7
Sulfur dioxide (SO2)	7,1
Nitrogen dioxide (NOx)	2,8
Carbon monoxide (CO2)	0,9

 Copyright © International Science and Technology Conference (ISTEC)

For example, wind power plant's contribution to the reduction of 1 MW carbon dioxide emissions has been calculated considering the wind data from Sinop province. As a result, it is seen that 1 MW Suzlon S64 / 1000 brand wind turbine produces 2,844,492.38614521 kWh of energy per year. Fossil fuels lead to an emission of 0.7 kg CO2 to produce 1 kWh energy. Therefore, using the above mentioned turbine, approximately 2.8 GWh energy may annually be produced and emission of 2000 tons of CO2 may be prevented. On the other hand, one acre (0.404 acres) forest (plant) clears 5 tons of CO2 from the atmosphere per year. Thus, generating energy with a 1 MW turbine, 400 acre forest (wooded with 152 000 trees) is equivalent with CO2 (2000 tons / 5 (tons / acre) = 400 acre = 162 acres) cleaning job (Özkaya et al.,2008, Özgener, 2002).

2.3.2 Noise Concerns

Noise is a major problem that results from unwanted sounds in their environment. Noise pollution is one of the environmental problems that are caused by factors such as development of technology, rapid population growth, unplanned urbanization and industrialization. There are different opinions about the noise from the wind power plants. Some argue that the quality of life in the city is affected adversely by wind turbines and it is disruptive for human health. Some others state that two types of wind turbine noise occur- mechanical noise and aerodynamic noise- and noise pollution is at a high level (Anicica et al., 2006). Many experimental and theoretical studies have been made in order to minimize the noise (Leea and Leeb 2016). According to the data, the noise level is 45 dB, 250 metres away from of a wind turbine. Insomnia is caused when the noise is beyond this level. Therefore, the distance between wind turbines and residential units should be arranged to be less than 500 m. In addition noise problems can be reduced significantly using insulation materials. Two locations in Sinop are suitable to install a wind power plant. These locations are outside the residential area. Thus, it can be argued that the wind turbine in the province of Sinop do not create a negative environmental impact in terms of noise level (Özkaya et al.,2008).

2.3.3. Bird mortality and Habitat Effects of Wind Turbines

In many countries around the world, projects and policies have been developed to rapidly increase the share of renewable energy sources in energy production in recent years. Wind power plants stand out among the renewable energy sources in the world with its increased production volumes with low costs, easy installation and operation (Dai et al., 2015, Dennis and Leung, 2012). However, the adverse environmental impact has been also increased together with the increase of electricity generation from wind energy. The disadvantages of wind turbines include impact on bird mortality and habitat (McDonald et al. 2009). In many countries around the world and in Turkey, various studies have been carried out in order to eliminate these problems (Larsen et al. 2007). In addition, some studies have been carried out to compare the impact on nature and bird mortality caused by wind energy production and fossil fuel energy production technologies (Sovacool, 2009).

In these studies have shown that the adverse impact on nature caused by wind energy production is significantly less than the adverse impact on nature caused by fossil fuel power plants. Sinop covers an area of 586 200 hectares. 37% of the 217 276 hectares of land is arable except meadows and pastures. Agriculture can be done on a total of 91 865 hectares of this area. The remaining 56% of non-agricultural areas are forested. 6% is settlement area and 1% is pastures and meadows. Available land for agriculture is rugged, very fragmented and 86 % of land is susceptible to water erosion (Anonim7, 2016). Sarıkum zone is located within the area of nature protection in Sinop. It is an area of 785 hectares, 20 kilometres from the city centre. Sarıkum Lake hosts various ecosystems and habitats. It is a convenient place for feeding and wintering for birds. RES map in Figure 2, there is also Sarıkum in areas cannot be established seen by grey colour. Short-term migration of various species of birds are seen every month.

7 m / s wind speed or over is required for an economic WPP investment. As can be seen in Table 3, dominant wind speed is between 6.8 to 7.5 in Sinop, WPP can be said to be an economic investment (Anonim8, 2013). When the wind speed at 50 m height and at the distribution of power are considered, the effect can be seen in the total number km^2 In the framework of this effect is shown in the total number of MW wind power plant can be built. As a result, the idea of wind power plant construction in Sinop is not been considered as a drawback in terms of bird mortality and agricultural areas.

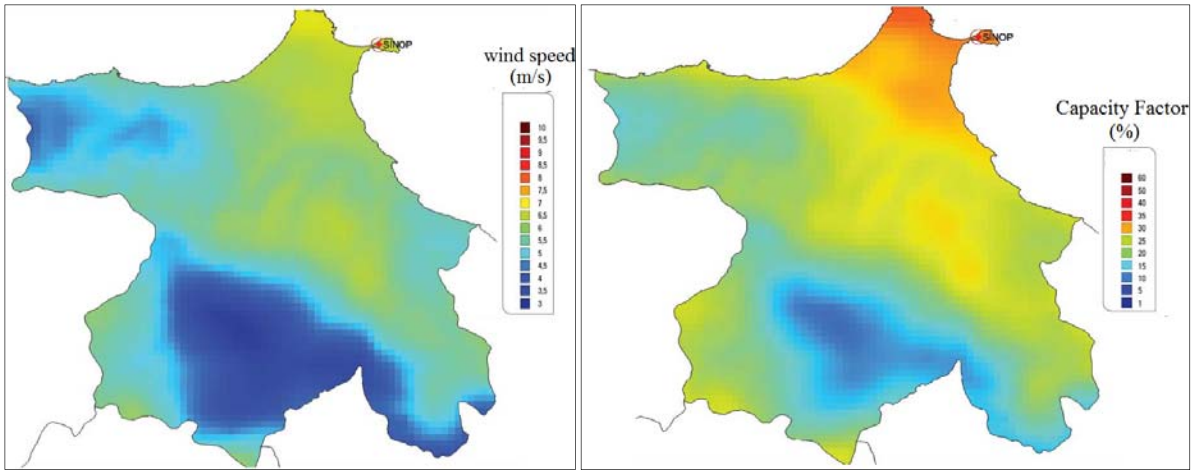

Figure 2. Sinop wind resource information.

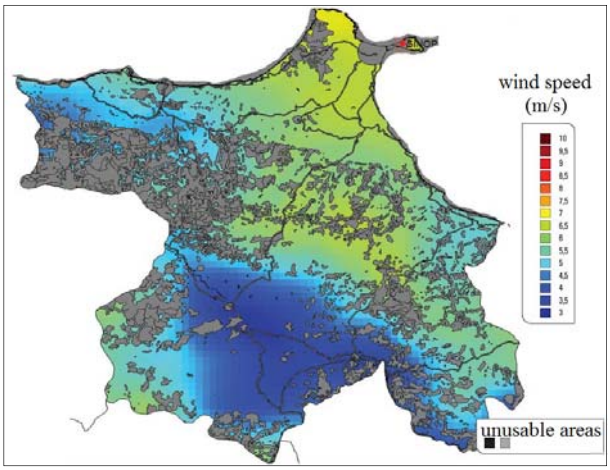

Figure 2. Sinop wind resource information.

Conclusions

Wind energy is a renewable alternative energy source that can meet growing energy needs in the world and in Turkey. Wind energy is indispensable, because it is an environmentally friendly and infinite source of energy that does not release emissions into the atmosphere.

Among the factors that are taken into account for a possible project of a wind power plant in Sinop environmental impact assessment; location selection, space requirements, air pollution, noise effect, impact of turbine presence or absence on habitat, bird migration routes and impact on the natural conservation areas can be listed. This study also provides an environmental impact evaluation for Sinop Province.

A wind speed of 7 m / s or over is required for an economic WPP investment. When the wind atlas prepared for the province of Sinop is examined, it can be assumed that the wind speed in Sinop is at a suitable level that can support an economic WPP investment. Today, any such investment has not been made yet. The region should benefit from this environmentally friendly and renewable energy sources as soon as possible.

Based on wind data from the province of Sinop, the construction of a possible 1 MW wind power plant will contribute 2.8 GWh per year to electricity production. Moreover, the wind power plant will help prevent approximately 2,000 tons of carbon dioxide emission per year.

 Copyright © International Science and Technology Conference (ISTEC)

In Sinop, air pollution is seen especially in winter due to absence of natural gas heating infrastructure and coal use for heating. In this regard, WPPs are promising because they don't cause air pollution.

The effect of the construction of a possible WPP on migratory birds should not be ignored. Therefore, taking into account WPP numbers of operations and migration time of birds at Sarıkum Lake, which is an important bird migration area in Sinop peninsula, will be helpful in preventing potential losses. It is expected that, if these studies done, harmful effects of WPPs on the environment will be eliminated.

Priority should be given to methods of electricity generation with renewable energy technologies as an alternative to nuclear and thermal power plants being considered to be established in Sinop.

EVALUATION OF VIRTUAL REALITY APPLICATIONS IN THE FIELD OF SPECIAL EDUCATION

Onur Özdemir
onur.ozdemir@marmara.edu.tr

Dilek Erbaş
dilek.erbas@marmara.edu.tr

Şerife Yücesoy Özkan
syucesoy@anadolu.edu.tr

The term virtual reality represents environments generated in computers with graphical and sound applications. These environments can be a simulation of outside world as well as unreal environments or objects. Virtual reality, which has been discussed in the computer sciences since 1970's, has become more accessible with the advances in technology. Applications are used extensively with desktop computer monitors or accessories strapped to head. Virtual reality has a history of 20 years in the field of special education. These applications can be used in teaching various academic, social and daily skills. In the current study, the aim is a systematic study of special education practices based on virtual reality. In this regard studies with intellectual disability, autism, learning disability, physical disability and hearing disability participant groups are evaluated. Based on the defined keywords, studies which met the criterions were included in the study. Findings were evaluated on the basis of participant characteristics, used virtual reality applications and outputs. A discussion is also presented for specialists, teachers who intend to use these applications.

Keywords: special education, virtual reality, educational technologies

EXPERIMENTAL AND COMPUTATIONAL STUDIES (DENSITY FUNCTIONAL THEORY) ON 2,5-BIS(1-NAPHTHYL)-1,3,4-OXADIAZOLE MOLECULE

Mustafa Kurt
mkurt55@gmail.com

Mustafa Çevik
mistikcevik@gmail.com

The theoretical and experimental vibrational spectra of 2,5-bis(1-naphthyl)-1,3,4-oxadiazole molecule were studied. In this study, geometrical optimization and vibrational frequencies of 2,5-bis(1-naphthyl)-1,3,4-oxadiazole was studied by utilizing DFT/B3LYP with 6-311 G(d,p) basis set. The Fourier Transform Infrared (FT-IR / 4000-400 cm^{-1}) spectra of the studied molecule was recorded in solid phase. The electronic properties like the Highest Occupied Molecular Orbital (HOMO) energies, the Lowest Unoccupied Molecular Orbital (LUMO) energies and Molecular Electrostatic Potential (MEP) analysis were reported.

EXPLORING DYNAMICS OF MULTIGRADE TEACHING IN PRIMARY SCHOOLS IN RURAL PAKISTAN

Zahida Mansoor
zahida.mansoor@nu.edu.pk

Summaira Sarfraz
sumaira.sarfraz@nu.edu.pk

Raheela Tariq
raheela.tariq@nu.edu.pk

The study aims to explore the English language teaching strategies practiced by primary school teachers in multi-grade classrooms in rural Pakistan. One teacher schools are common and instruction by necessity often take place in settings with students across two or more different grades being taught by a single teacher. Multi-grade schooling is not accepted as a distinct unit and schools are presumed to be teaching under a mono-grade system, but in reality a number of primary classes are conducted as multigrade. The emphasis of teacher training on mono-grade pedagogies in addition to many of the teachers opting to work in urban areas has created a situation where the alternative to multigrade schooling is no schooling at all. For the purpose of the study the data was collected from two rural multi-grade schools using teacher observations and document analysis. The findings of the study show that the multi-grade teaching does not merely recompense for the inadequate number of teachers in a school, but also makes the teachers' tasks more creative and radical. The thoughtful modification of classroom materials, lesson plans and teaching techniques used by these teachers provides scaffolds to increasing students' language learning achievements. The study also highlights the role of the Education department; in providing appropriate training to the teachers for effective implementation of multigrade teaching approaches in order to raise the quality of teaching and learning at the primary school level.

Özet: Evsel ve endüstriyel atıkların çevreye vermiş olduğu zararları azaltmak ve sürdürülebilir bir çevre koruma sistemi oluşturmak amacıyla tüm dünyada bütün sektörlerde önleyici çalışmalar hız kazanmıştır. Günümüzde çimentoya dayalı sektörlerin çevreye vermiş olduğu zararları azaltmak amacıyla, alternatif bağlayıcı elde etme çalışmaları da devam etmektedir. Uçucu kül ve yüksek fırın cürufu gibi yapısında Al_2SiO_3, SiO_2 ve CaO içeren endüstriyel atıklardan alkali aktivatörler kullanılarak kuvvetli bağlayıcı elde etmek mümkündür. Bu çalışmada, Kütahya Tunçbilek Termik Santrali'nden sağlanan, sepere edilmiş F tipi uçucu kül; ağırlıkça %14 Na içeren, silikat modülü Ms=0,2 olan, $nSiO_2Na_2O$ ve NaOH karışımı aktivatör ile aktive edilmiştir. Su/bağlayıcı oranı % 35 ve bağlayıcı/kum oranı 1/2,5 olacak şekilde optimizasyon yapılmıştır. Tüm karışımlarda standart CEN kumu kullanılarak alkali aktive edilmiş 40mm×40mm×160mm prizma harç numuneler üretilmiştir. Numunelere, 50°C, 60°C, 70°C, 80°C, 90°C ve 100 °C de 48 saat süreyle ısıl işlem uygulanmıştır. Isıl işlemden çıkarılan numuneler, 28 günü tamamlayacak şekilde ±22 °C oda sıcaklığında, havada kür edilmiştir. 28 gün sonunda 2,9 Mpa ile 8,51 MPa arasında değişen eğilme dayanımları, 7,63Mpa ile 50,64 MPa arasında değişen basınç dayanımları tespit edilmiştir. Karşılaştırma numunesi olarak; CEMI 42,5 portland çimentosu ile 1/3 bağlayıcı/kum ve 0,50 su/bağlayıcı içeren harç numuneler hazırlanıp 28 gün standart su küründe bekletilmiştir. Daha sonra tüm numuneler, 200°C, 400°C, 600°C ve 800°C yüksek sıcaklığa maruz bırakılmıştır. Numunelerin sıcaklık öncesi ve sonrası ağırlıkları, ultrases geçiş hızları, eğilme ve basınç dayanımları incelenmiştir. Sonuç olarak, farklı sıcaklıklarda alkali aktive edilmiş harçların yüksek sıcaklık sonundaki eğilme ve basınç dayanımı değerlerinin, çimento bağlayıcılı kontrol numunelerine kıyasla daha yüksek olduğu gözlenmiştir.

GİRİŞ

Çimento, yapı sektörüne girdiği 19. yüzyıldan günümüze kadar, en yaygın, en çok kullanılan bağlayıcı yapı malzemesidir. Hammaddesinin kolay temin edilebilmesi, dayanım ve dayanıklılığı yüksek beton üretimindeki özelliği, üretim sektörünün dünya genelinde yaygınlığı ve ekonomisi, dikkate alındığında çimentonun ilerleyen yıllarda kolay vazgeçilebilecek bir yapı malzemesi olmadığı düşünülmektedir.

2014 yılı itibariyle dünya genelinde çimento üretiminin 4,3 milyar tona ulaştığı belirtilmektedir. 2014 yılı itibariyle Türkiye, 2014 yılı itibariyle yıllık 71,2 milyon ton çimento üretimiyle dünya genelinde 7. sırada yer almaktadır (Cembureau, 2014). Çimento üretiminde 2014 yılı itibariyle, yıllık yaklaşık 320 milyon ton üretimiyle Asya ülkeleri önde gelirken, yıllık yaklaşık 90 milyon ton üretimle Avrupa ülkeleri son sırayı almaktadır. Çimento üretimi sırasında klinker, döner fırınlarda yaklaşık 1450 ºC'de pişirilmektedir. Bu kadar yüksek bir sıcaklığa erişmek için de yüksek miktarda enerjiye ihtiyaç

 Copyright © International Science and Technology Conference (ISTEC)

duyulmaktadır. Yani çimento üretimi enerjiye bağımlı sektördür. Elektrik ve yakıt olmak üzere, çimento maliyetinin %59,1'ini enerji kalemi oluşturmaktadır (SGM, 2015).

Çimento üretimi sırasında havaya karbondioksit (CO_2) gazı çıkmaktadır. 1 ton çimento üretimi sırasında atmosfere yaklaşık 900 kg CO_2 salınımı gerçekleşmektedir. Dünyada 30 gigametrik ton CO_2 salınımın %5'i, çimento sektöründen kaynaklanmaktadır (Benhelal, 2013). Türkiye'de 2014 yılı çimento üretiminin yaklaşık 69,7 milyon ton olduğu ve önümüzdeki yıllarda bu miktarın artacağı düşünüldüğünde, atmosfere salınan CO_2 ve diğer gazların her geçen gün çevreye vereceği zararın artacağı kaçınılmazdır (SGM, 2015).

Kömürle çalışan termik santrallerde bacadan uzaklaşan ve uçucu kül olarak tanımlananan önemli atık malzeme, yanma nedeniyle baca tarafından çekilen gazlarla birlikte yukarıya sürüklenen çok ince kül parçacıklarıdır. Bu ince kül parçacıkları elektro filtrelerde yakalanmakta, baca gazları ile atmosfere çıkışları önlenmektedir (Ünal, 2004)

Uçucu kül ve yüksek fırın cürufu gibi yapısında Al_2O_3, SiO_2 ve CaO içeren amorf malzemelerden alkali aktivatörler kullanılarak kuvvetli bir bağlayıcı madde üretimi mümkündür. Alüminosilikat uçucu küllerin aktivatörlerle reaksiyonu sonucunda "geopolimer" adı verilen amorf yapıdaki inorganik polimerler oluşurken, yüksek fırın cürufunun reaksiyonu sonucunda kalsiyum silikat hidrat (C-S-H) jeline benzer hidrate kalsiyum silikat oluşmaktadır. Alkali aktivasyonu ile üretilen bağlayıcıların kullanımı, yüksek mekanik performans, düşük enerji giderleri, düşük kirletici gaz salınımları (CO_2, SO_2, NOx vb.) ve çevrenin daha az tahribi gibi avantajlar sunmaktadır. Ayrıca, büyük ölçüde atık malzemelerin kullanımıyla, atıkların çevreye verdiği zararlar ve depolama sorunları önemli ölçüde azalacaktır (Aydın 2010).

Bu çalışmada, Kütahya Tunçbilek Termik Santrali'nden sağlanan, sepere edilmiş F tipi uçucu kül; ağırlıkça %14 Na içeren, silikat modülü Ms=0,2 olan, nSiO2Na2O ve NaOH karışımı aktivatör ile aktive edilerek geopolimer harç numuneler üretilmiştir. Numunelere, 50°C, 60°C, 70°C, 80°C, 90°C ve 100 °C de 48 saat süreyle ısıl işlem uygulanmıştır. Isıl işlemden çıkarılan numuneler, 28 günü tamamlayacak şekilde ±22 °C oda sıcaklığında, havada kür edilmiştir. Karşılaştırma numunesi olarak; CEMI 42,5 portland çimentosu ile 1/3 bağlayıcı/kum ve 0,50 su/bağlayıcı içeren harç numuneler hazırlanıp 28 gün standart su küründe bekletilmiştir. Daha sonra tüm numuneler, 200°C, 400°C, 600°C ve 800°C yüksek sıcaklığa maruz bırakılmıştır. Numunelerin sıcaklık öncesi ve sonrası ağırlıkları, ultrases geçiş hızları, eğilme ve basınç dayanımları incelenmiştir.

Materyal ve Yöntemler

Deneysel çalışmada kullanılan sodyum hidroksitin (NaOH) kimyasal kompozisyonu Çizelge 1'de verilmiştir.

Çizelge 1. NaOH'un kimyasal kompozisyonu

Kimyasal Adı	Sodyum Hidroksit (Kostik)
Kimyasal Formülü	NaOH

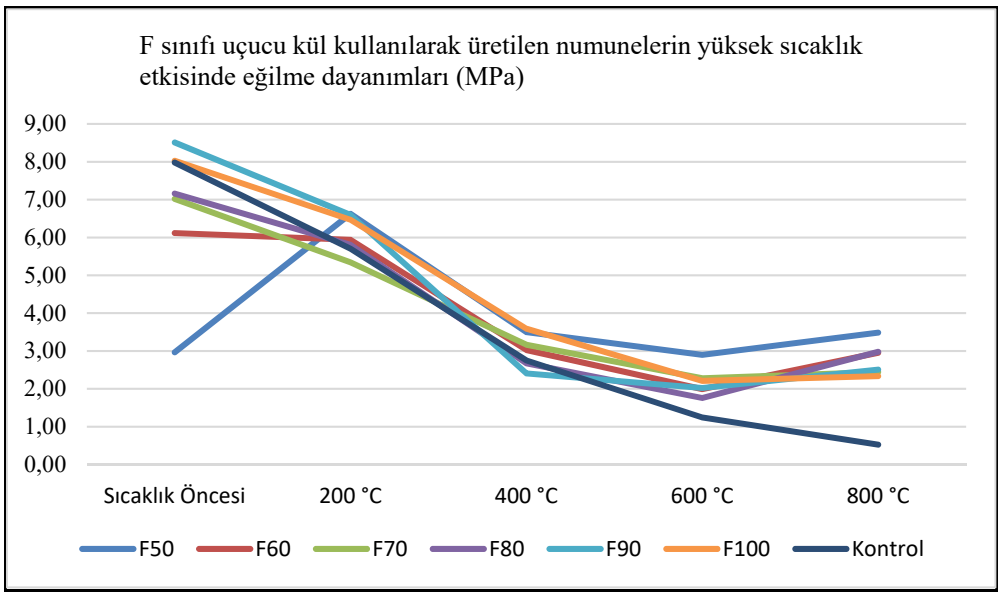
TS EN 1363-2 yangına dayanıklılık deneyleri standardına uygun olarak yapılan deney kapsamında, 40x40x160 mm boyutlarında alkali aktive edilmiş prizma numuneler üretilmiştir. Numunelerin yüksek sıcaklık öncesi eğilme ve basınç dayanımları ölçülmüştür. Üretilen numuneler 1 saat boyunca ayrı ayrı 200 ºC, 400 ºC, 600 ºC ve 800 ºC'deki sıcaklığa maruz bırakılmıştır. Yüksek sıcaklık fırınında ısı artış hızı 7 °C/dk. olarak tespit edilmiştir.Yüksek sıcaklığa maruz bırakılan numuneler daha sonra, 24 saat oda sıcaklığında soğuması için laboratuvar ortamında bekletilmiştir.Yüksek sıcaklığa maruz kalmış numunelerin eğilme ve basınç dayanımımı değerleri test edilerek, sıcaklık öncesi dayanımları ile karşılaştırma yapılmıştır.

Numunelerin yüksek sıcaklık öncesi ve sonrasında, eğilme dayanımları aşağıdaki Çizelge 7'de verilmiştir.



Çizelge 7. F sınıfı uçucu kül kullanılarak üretilen numunelerin yüksek sıcaklık etkisinde eğilme dayanımları

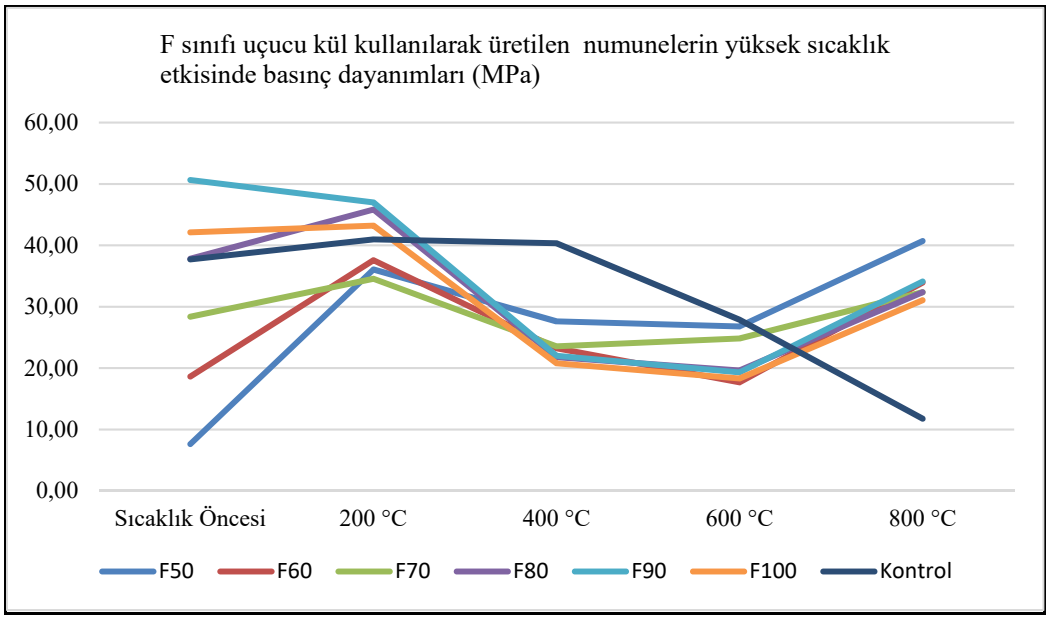
Eğilme Dayanımları (MPa)							
Sıcaklık	F50	F60	F70	F80	F90	F100	Kontrol
Sıcaklık Öncesi	2,96	6,12	7,02	7,16	8,51	8,03	7,98
200 °C	6,63	5,94	5,34	5,80	6,59	6,47	5,70
400 °C	3,50	3,02	3,16	2,67	2,41	3,59	2,75
600 °C	2,90	1,99	2,28	1,76	2,02	2,21	1,24
800 °C	3,48	2,95	2,45	2,98	2,51	2,34	0,52

Numunelerin yüksek sıcaklık öncesi ve sonrası eğilme dayanımları incelendiğinde, sıcaklık öncesi eğilme dayanımı en düşük olan F50 numunesinin, 200 °C, 400 °C, 600 °C ve 800 °C' yüksek sıcaklık sonrası eğilme dayanımları diğer çimentosuz numunelerden ve kontrol numunesinden daha yüksek bir değere ulaşmıştır. Bütün numunelerin eğilme dayanımları düşerken F50 numunesinin eğilme dayanımı artmıştır. Ayrıca F sınıfı uçucu külle üretilmiş çimentosuz numunelerin tamamının 800 ºC yüksek sıcaklığa maruz kaldıktan sonraki eğilme dayanımları kontrol numunesine kıyasla daha fazladır. Numunelerin yüksek sıcaklık öncesi ve sonrasında, eğilme dayanımları Şekil 1'de grafiksel olarak gösterilmiştir.

 Copyright © International Science and Technology Conference (ISTEC)

F50 numunesi, sıcaklık öncesi 2,96 MPa eğilme dayanımına sahipken, 200 °C sıcaklık sonrası eğilme dayanımı 6,63 MPa ulaşmış, 800 °C sıcaklık sonrası ise 3,48 MPa eğilme dayanımı değerine ulaşmıştır. F100 numunesi sıcaklık öncesi 8,03 MPa eğilme dayanımına sahipken 800 °C sıcaklık sonrası %70,8 dayanım kaybederek, 2,34 MPa eğilme dayanımı göstermiştir. Kontrol numunesi ise sıcaklık öncesi 7,98 MPa eğilme dayanımına sahipken, 800 °C sıcalık sonrası %93,48 dayanım kaybederek 0,52 MPa eğilme dayanımı göstermiştir. Genel olarak F sınıfı uçucu kül kullanılarak üretilen çimentosuz numunelerin yüksek sıcaklık karşısındaki dayanıklılıkları, kontrol numunelerine göre daha fazladır.

Şekil 1. F sınıfı uçucu kül kullanılarak üretilen numunelerin yüksek sıcaklık etkisinde eğilme dayanımları



Numunelerin yüksek sıcaklık öncesi ve sonrasında, basınç dayanımları Çizelge 8'de listelenmiştir.

Çizelge 8. F sınıfı uçucu kül kullanılarak üretilen numunelerin yüksek sıcaklık etkisinde basınç dayanımları

Basınç dayanımları (MPa)							
Sıcaklık	F50	F60	F70	F80	F90	F100	Kontrol
Sıcaklık Öncesi	7,63	18,63	28,38	37,81	50,64	42,11	37,70
200 °C	36,05	37,57	34,55	45,83	47,00	43,21	40,97
400 °C	27,61	23,24	23,54	21,77	22,01	20,77	40,33
600 °C	26,77	17,67	24,81	19,61	19,29	18,30	27,86
800 °C	40,70	33,94	32,35	32,35	34,11	31,06	11,75

F sınıfı uçucu külle üretilen çimentosuz numunelerin yüksek sıcaklık etkisi sonundaki basınç dayanımları, çimentolu kontrol numunesinin basınç dayanımından yüksektir. 50 °C, 60 °C ve 70 °C'de kür edilerek üretilmiş çimentosuz numunelerin yüksek 800 °C yüksek sıcaklık etkisinden sonra basınç dayanımları artmıştır. 800 °C yüksek sıcaklık etkisinden sonra F50 numunesinin basınç dayanımı 7,63 MPa'dan 40,70 MPa'a, F60 numunesinin basınç dayanımı 18,63 MPa'dan 33,94 MPa'a, F70 numunesinin basınç dayanımı 28,38 MPa'dan 32,35 MPa 'a artış göstermiştir. 800 °C yüksek sıcaklık etkisinden sonra F90 numunesi %16,64, F100 numunesi % 26,31 basınç dayanımı kaybı gösterirken, kontrol numunesi % 68,83 dayanım kaybetmiştir. Genel olarak, F sınıfı uçucu kül kullanılarak üretilen çimentosuz numunelerin yüksek sıcaklık etkisindeki dayanıklılıkları, kontrol numunelerine kıyasla daha iyidir.

Şekil 2. F sınıfı uçucu kül kullanılarak üretilen numunelerin yüksek sıcaklık etkisinde basınç dayanımları

SONUÇ

F Sınıfı uçucu kül kullanılarak üretilen alkali active edilmiş harç numunelerden 50 ºC, 60 ºC ve 70 ºC' de sıcaklık kürü uygulanarak üretilen numunelerde 800 ºC yüksek sıcaklık etkisi sonucunda eğilme ve basınç dayanımlarında artış gözlenmiştir. Diğer sıcaklık gruplarında kür edilenlerin ise yüksek sıcaklık etkisi sonundaki performansları çimento bağlayıcılı numunelerden daha iyi olduğu gözlenmiştir. Sonuç olarak alkali aktive edilmiş harçlar yüksek sıcaklık etkisine maruz yerlerde yapı malzemesi olarak kullanılabilir.

FACTORS PROMOTING *STAPHYLOCOCCUS AUERUS* DISINFECTION BY TiO_2, SiO_2 AND AG NANOPARTICLES

Merve ÖZKALELİ and Ayça ERDEM*

Akdeniz University, Department of Environmental Engineering, Antalya, Turkey

ayerdem@akdeniz.edu.tr

Abstract: The use of conventional disinfection products and methods in drinking water treatment continue to fail in many undeveloped countries. Those applications need to be re-evaluated and innovative approaches to be considered to enhance the reliability and robustness of disinfection while avoiding disinfection byproducts (DBPs) formation. The rapid growth in nanotechnology has prompted significant interest in the environmental applications of nanoparticles (NPs). In order to understand the antibacterial effect of NPs, *Staphylococcus aureus* treated with TiO_2, SiO_2 and Ag NPs were studied under ambient conditions. The results indicated that the most bactericidal effect with specific die-off rates of 0,003 L/mg (TiO_2 NPs) and 0,002 L/mg (Ag NPs) were defined in the absence and the presence of photoactivation, respectively. Moreover, as ionic strength of the test media increases from 10 to 100 mM, NP-NP and NP-bacteria interactions were negatively affected.

Keywords: Disinfection, TiO_2, SiO_2, Ag, Nanoparticles, *Staphylococcus aureus*

Introduction

Among many pathogenic bacteria, *Staphylococcus aureus* are highly infectious and are commonly cause infectious diseases and gastrointestinal illness in humans (Lowy 1998, Kadariya 2014). To overcome the potential serious consequences of those infectious pathogens, new technologies and materials for disinfection purposes have been prompted (Hu 2006, Parnia 2009, Oliveira 2014). The conventional disinfectants (i.e. chlorine, ozone, chlorine dioxide and chloramines) known to produce carcinogenic disinfection byproducts (DBPs) (Nieuwenhuijsen 2000, Krasner 2009). Advanced oxidation processes (AOPs) can be applied to reduce the formation of DBPs, to inactivate water pathogens and to mineralize the refractory organic compounds (Chong 2010). Among these AOPs, heterogeneous photocatalysis employing semiconductor nanoparticles (TiO_2, ZnO, Fe_2O_3, etc. NPs) has been highly effective on disinfecting the pathogenic bacteria. Matsunaga et al. (1985) reported for the first time that TiO_2 photocatalyst could kill bacterial cells in water by illumination, which could generate reactive oxygen species (ROS) in water medium. Since then, numerous photocatalytic disinfection studies under UV light (Wei 1994, Christensen 2003, Gogniat 2006, Bonetta 2013) and fewer studies under solar light (Hu 2007, Helali 2014) using TiO_2 photocatalyst studies have been reported. In addition to those studies, TiO_2 NPs (Shah 2008, Xing 2012, Barnes 2013), TiO_2 thin films (Kambala 2009), Ni doped TiO_2 NPs (Yadav 2014), Fe doped Ti-CNTs (Latif 2014), Ce_2O_3/ TiO_2 composites (Hassan 2012), Ag doped TiO_2 NPs (Kowal 2011), and Al_2O_3-TiO_2-Ag composites (Tartanson 2014) Ag-SiO_2 composite films (Lei 2014), Ag-SiO_2 particles (Sotiriou 2010), and polymer coated Ag NPs (Vukoje 2014), and nano-Ag ions (Feng 2000, Kim 2007, Jung 2008, Sotiriou 2010) were employed to inactivate *S. aureus* and other bacteria.

This study reveals the disinfection efficiency of TiO_2, SiO_2 and Ag NPs on Gram-positive *S. aureus*. The objectives of this study were to determine (a) the antibacterial NP concentrations, (b) whether ionic strength of the suspensions affects antibacterial activity, and (c) whether inactivation of bacteria occurs in the absence of light.

Materials and Methods

Culture of microorganisms: The Gram (+) *Staphylococcus aureus* (ATCC 43300) were cultivated in 100 mL of Luria-Bertani (LB) broth at 37°C on a rotary shaker (150 rpm) for 18 h. The cultures with an initial population of $10^6 \pm 10^2$ CFU mL^{-1} were used in the experiments.

Nanoparticles: Commercially obtained TiO_2, SiO_2 and Ag NPs were used in the experiments (Table 1). A 1000 mg/L stock suspension for each NP was prepared in 0, 10, 50 and 100 mM of deionized water using Na_2HPO_4, KH_2PO_4, NH_4Cl, and NaCl immediately before the experiments. The final concentrations of 10, 100 and 500 mg L^{-1} NPs were prepared by serially diluting of the stock suspensions having different ionic strength. All

 Copyright © International Science and Technology Conference (ISTEC)

experiments were conducted in continuously shaken aqueous slurry solutions to ensure mixing and to prevent settling of the NPs. The bacteria were added to the suspensions immediately prior to the disinfection runs.

Table 1. Nanoparticles used in the experiments.

Nanoparticle	Particle Size (nm)	Surface Area (BET, m^2g^{-1})	Physical appearance
TiO_2 (Anatase)	32	45	White powder
SiO_2	10 - 20	NA	White powder
n-Ag	20 - 40	NA	Black powder

Exposure experiments: To determine the effect of particle concentration and ionic strength of the test media on the survival of bacteria, dose-response experiments were conducted. Forty five mLs of NP solutions and 5 mL of bacteria prepared in 0, 10, 50 and 100 mM sterile test media were added to each beaker to make initial NP concentrations of 0, 10, 100, and 500 mg L^{-1}. Four artificial light sources (color temperature of 4300 K, and total light intensity of 7000 lux), mimicking the spectrum of natural solar light, were placed 30 cm above the orbital shaker to produce light intensity of *2.1 W* cm^{-2}. The temperature inside the cabinet was maintained at 25.0 ± 1.5◦C. The shaker was set to mix at 150 rpm throughout all experiments. All antibacterial tests were triplicated in presence and absence of light lasted 1 h.

End point test: The numbers of viable cells were determined by LB agar plating. The plates were incubated at 37°C for 24 h, and then the colony counting was done using Lassany model digital colony counter. The survival fractions (N/N_0) and the specific die-off rates (k', Eq 1) (Erdem 2015) were calculated by the following equation:

$$k'\,(L\,mg^{-1}) = \frac{-\ln(N/N_0)}{C} \qquad \text{(Eq 1)}$$

where N_0 (CFU, colony forming unit) is the population of the control cultures, N (CFU) is the population of the NP exposed cultures after 1 h in presence and absence of light, and C (mg L^{-1}) is the NP concentration.

Results and Discussion

Four different NP concentrations (10, 100, 500 and 1000 mgL^{-1}), and light (light intensity: *2.1 W* cm^{-2}) condition were used to evaluate the effect of NP concentration and light on the survival of *S. aureus*, and the results are shown in Table 2. Regardless of NP type, both NP concentration increment and changing the light condition from dark to light increased the mortality rate of the bacteria when 10 mM ionic strength of test media was used. However, the most effective antibacterial impact was observed when 1000 mg L^{-1} of TiO_2 NPs were used in presence of light. In absence of light, when NP concentration increased, the most increase in mortality rates were observed as 57 % (500 mg L^{-1}), 47 % (500 mg L^{-1}) and 40% (1000 mg L^{-1}) in TiO_2, n-Ag and SiO_2 NP setups, respectively. The effects of SiO_2 on bacterial viability were as low as 40 and 56% in absence and presence of light, respectively. TiO_2 NPs were more effective on the *S. aureus* bacteria than n-Ag and SiO_2 NPs in both absence and presence of light.

Table 2. The effect of nanoparticle concentration on the survival of *S. aureus* in absence and presence of light. (Ionic strength: 10 mM, light intensity: *2.1 W* cm^{-2})

NP Concentration (mgL^{-1})	Death (%)					
	TiO_2		SiO_2		Nano-Ag	
	Dark	Light	Dark	Light	Dark	Light
10	13	75	32	33	32	41
100	45	57	27	30	34	49
500	57	76	23	52	47	75
1000	47	93	40	56	32	47

Figure 1 shows the survival ratios of the *S. aureus* treated with TiO_2, SiO_2 and Ag NPs under dark (a) and light (b) conditions. At each concentration of NPs, k' was determined by Eq 1 for both dark/light conditions and ionic strength condition, and k' values were averaged (k'_{ave}), where lower k'_{ave} value means higher antibacterial effect. In absence of light, the lowest k'_{ave} values of TiO_2, SiO_2 and n-Ag NPs were calculated as 0.003 L mg^{-1} (0 mM), 0.010 L mg^{-1} (10 mM) and 0.004 L mg^{-1} (50 mM), respectively. The lowest k'_{ave} values of 0.004 L mg^{-1} (50 mM), 0.010 L mg^{-1} (100 mM) and 0.002 L mg^{-1} (10 mM) were calculated when bacteria were exposed to TiO_2, SiO_2 and n-Ag NPs, respectively. The results in Figure 1 show that *S. aureus* was sensitive when lower ionic strength media was used in absence of light. One possible explanation for higher bacterial sensitivity in absence

 Copyright © International Science and Technology Conference (ISTEC)

of light may be linked to the release of metal ions or NP-specific mechanisms (Cumberland 2009; Gottschalk 2011; Dobias 2013).

Figure 1. The effect of ionic strength and TiO_2, SiO_2 and Ag nanoparticle concentrations on *S. aureus* under dark (a) and light (b) conditions.

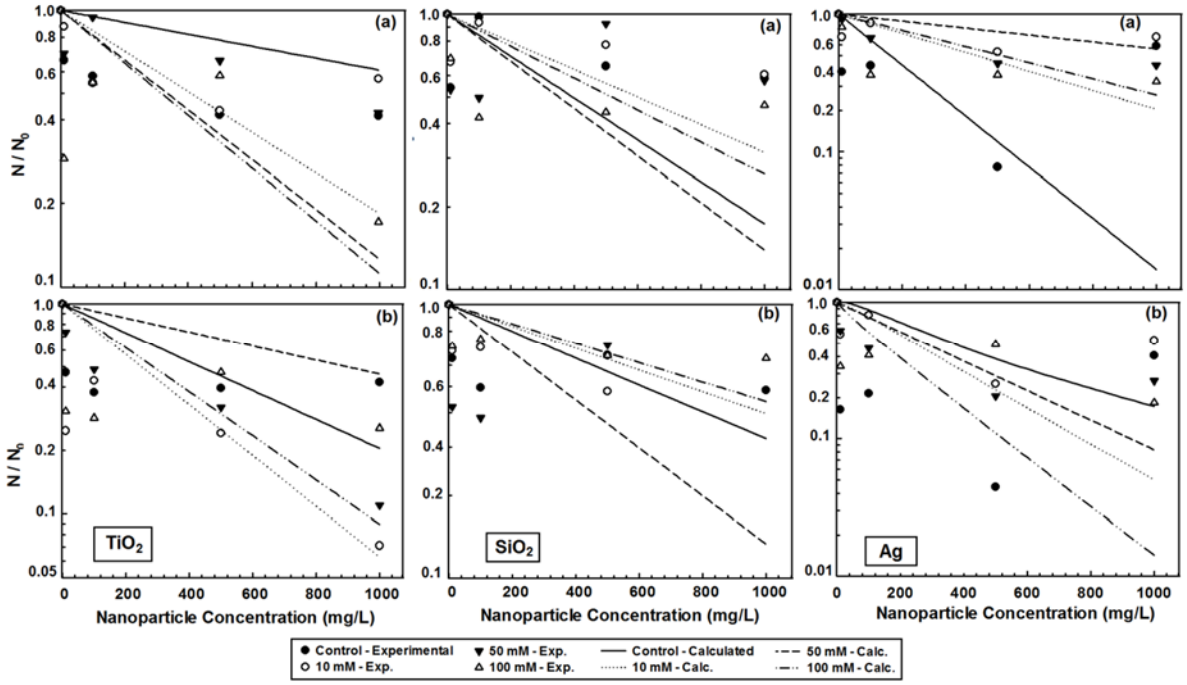

Figure 1 also shows the curve fits obtained from the calculated survival fractions. In order to implement those values, experimentally verified k'_{ave} values were used in Eq 1 and then the calculated survival fractions were estimated. R^2 values were presented in order to correspond the curve fits with experimental results. Highest correspondence ($R^2 = 0.9194$) was observed when *S. aureus* was exposed to TiO_2 NPs under dark, while lowest correspondence ($R^2 = 0.5625$) was observed when SiO_2 NPs were employed. In presence of light, lowest R^2 value of 0.4626 was calculated from bacteria- SiO_2 NPs reactions and highest R^2 value of 0.9563 was observed when *S. aureus* was exposed to nano-Ag particles.

Conclusion

In order to define the factors promoting the disinfection of the *S. aureus* specific die-off rates of the NPs were calculated and were used in this study. It was clearly revealed that TiO_2, SiO_2 and Ag NPs promoted the inactivation of *S. aureus* and the bacteria showed higher sensitivity to TiO_2 and Ag NPs than SiO_2 NPs in both absence and presence of light conditions. However, aggregation/agglomeration of the NPs in water negates inhibition process. Therefore, dispersion of NPs need to be considered. Moreover due to the conduction of the experiments in a relatively clean laboratory conditions, the sustainability of antimicrobial activities of NPs in natural or waste water need to be clarified. Therefore, more research to further assess the applicability and sustainability of NPs in disinfection processes.

FAILURE CHARACTERISTICS OF GLASS-FIBER / EPOXY COMPOSITE JOINT STRUCTURES EXPOSED TO ACCELERATED AGING PROCESS

İbrahim Fadıl SoykÖk
ifsoykok@gmail.com

Ahmet Murat Pınar
ahmet.pinar@cbu.edu.tr

Ibrahim Aydın
ibrahim.aydin@cbu.edu.tr

Estimating the long term life performance of joints is one of the major issues in structural composite design. Accelerated aging in hot and wet environment can be used to evaluate the failure behaviour of adhesively bonded joints which can be considered as the most vulnerable part of composite structures especially exposed to continuous harsh conditions during operating life. The current experimental work is about the post-exposure changes in tensile properties of bonded single lap joints between glass fiber / epoxy composites with [0/90/45/-45]s fibre orientations. The joints formed with Loctite Hysol-9466 epoxy adhesive were kept in purified hot water for one and two weeks time periods at 50, 70, and 90 °C immersing temperatures, each of which was practiced separately. Both water temperature and exposure time are found to be explicitly effective on specific properties such as load-displacement characteristics, failure loads and failure modes. Moisture absorption phenomenon which is most responsible for the observed degradation of maximum failure load and distance to failure values, was found to be more destructive at higher temperatures and prolonged immersion times.

mustafaerkan.turan@cbu.edu.tr

Özet: Bu çalışmada, üçgen, dikdörtgen ve trapez kesitli kaplamalı açık kanal kesitlerinin inşaat maliyetini minimum yapacak kesit değişkenlerinin (şev eğimi, taban genişliği, akım derinliği gibi) en uygun değerleri araştırılmıştır. Amaç fonksiyonu maliyet fonksiyonu olan ve kısıtı uniform akım olarak oluşturulan bir optimizasyon modeli ele alınmıştır. Problemin çözümünde daha önce bu amaçla kullanılmayan ateş böceği algoritması ve av arama algoritması kullanılmış ve elde edilen sonuçlar literatür ile karşılaştırılarak önerilen optimizasyon algoritmalarının performansları değerlendirilmiştir.

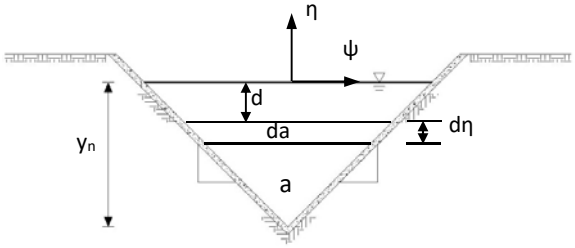
Anahtar Kelimeler: Açık Kanal, Optimizasyon, Ateş Böceği Algoritması, Av Arama Algoritması

Abstract: In this study, triangular, rectangular and trapezoidal lined open channel cross sections' variables, such as side slope, bottom width, flow depth, are investigated for minimizing channel cost. An optimization model that has cost function as an objective function and subject to a uniform flow is considered. Firefly algorithm and hunting search algorithm which are not used before for solving this optimization model are used and obtained results are compared with results in literature.

Keywords: Open Channel, Optimization, Firefly Algorithm, Hunting Search Algorithm

Giriş

Açık kanallar su kaynakları sistemlerinde kullanılan suyu serbest yüzeyli olarak ileten önemli iletim yapılarındandır. Sulama, drenaj ve hidroelektrik gibi sistemlerin unsurlarından biri olarak kullanılmaktadırlar.



Her mühendislik projesinde maliyetin azaltılması için gerekli çalışmalar yapılmaktadır. Bir açık kanal projesi ele alındığında maliyetinin azaltılması amacıyla en uygun güzergâh seçiminden sonra açık kanalın geometrisi de göz önüne alınarak maliyeti en küçükleyecek kesit değişkelerinin değerleri aranmaktadır.

Bu amaçla problem bir optimizasyon problemine dönüştürülerek çözüm aranmaktadır. Literatürde farklı kesit geometrileri ve farklı amaç fonksiyonları için çalışmalar bulunaktadır (Swamee ve ark. 2000; Aksoy ve Altan-Sakarya 2006; Turan ve Yurdusev, 2011).

Bu çalışmada, inşaat maliyetini minimum yapacak farklı geometrilere sahip açık kanal kesit değişkenlerinin (şev eğimi, taban genişliği, akım derinliği gibi) en uygun değerleri araştırılmıştır. Problem, uniform akım şartları için kanal kaplama ve kazı maliyeti içeren amaç fonksiyonuna sahip bir optimizasyon problemi olarak ele alınmıştır. Problemin çözümünde daha önce bu problemin çözümünde kullanılmayan ateş böceği algoritması ve av arama algoritması kullanılmış ve elde edilen sonuçlar literatür ile karşılaştırılarak önerilen optimizasyon algoritmalarının performansları değerlendirilmiştir.

Yöntem

Bu çalışmada ele alınan açık kanal kesit optimizasyon problemi maliyet amaç fonksiyonu minimizasyonu ve akım şartı kısıt fonksiyonundan oluşmaktadır. Karar değişkenleri, kenar eğimi, kanal genişliği ve akım derinliği gibi kanal kesitine ait büyüklüklerdir. Herhangi bir tipik kanal kesiti için geometrik değişkenler Şekil 1'de verilmiştir.

Şekil 1: Tipik Kanal Kesiti

 Copyright © International Science and Technology Conference (ISTEC)

Aynı zemin koşullarında, farklı sebeplerden dolayı derinlik ile kazı maliyetinin arttığı kabul edilebilir. Bu etkiyi de dikkate alarak kaplama yapılan bir kanal kesiti için maliyet fonksiyonu aşağıdaki gibi yazılabilir.

$$C = \beta_L P + +\beta_E A + \beta_A \int_0^A a \ d\eta \quad (1)$$

Burada β_L birim kaplama maliyeti TL/L^2, β_E birim kazı maliyeti TL/L^3, β_A her birim derinlik için ek kazı maliyeti TL/L^4, a η derinliğinde akım alanı, P ıslak çevre, A ıslak alan ve L uzunluk olarak ifade edilmektedir.

Açık kanal akımının genellikle uniform olduğu kabul edilebilir. Bu akım şartının sağlanması için bir uniform akım denkleminin problemin kısıt fonksiyonu olarak eklenmesi gerekmektedir. Bu çalışmada Manning uniform akım denklemi kullanılmış ve denklemi aşağıda verilmiştir.

$$Q = \frac{1}{n} A R^{2/3} S^{1/2} \quad (2)$$

Burada n, Manning pürüzlülük katsayısı, A, ıslak alan, R, hidrolik yarıçap ve S, kanal eğimini ifade etmektedir.

Yukarıda verilen ifadeler kullanılarak herhangi bir açık kanal kesiti için optimizasyon problemi aşağıdaki gibi tanımlanabilir.

$$\min \ C = \beta_L P + +\beta_E A + \beta_A \int_0^A a \ d\eta \quad (3)$$

$$Q - \frac{1}{n} A R^{2/3} S^{1/2} = 0 \quad (4)$$

Literatürde daha önceden verilen sonuçların karşılaştırılabilmesi açısından optimizasyon problemi boyutsuz terimler tanımlanarak aşağıdaki gibi tekrar düzenlenmiştir. Bu amaçla önce uzunluk ölçeği (λ) Denklem 5' te tanımlanmıştır.

$$\lambda = \left(\frac{Qn}{S^{1/2}}\right)^{3/8} \quad (5)$$

Daha sonra tanımlanan uzunluk ölçeği (λ) kullanılarak optimizasyon problemindeki boyutlu terimler Denklem 6 ile Denklem 13' e kadar verilen işlemler ile boyutsuz hale getirilmişlerdir.

$$C_* = C/\beta_E \lambda^2 \quad (6)$$

$$\beta_{L_*} = \beta_L/\beta_E \lambda \quad (7)$$

$$\beta_{A_*} = \beta_A \lambda/\beta_E \quad (8)$$

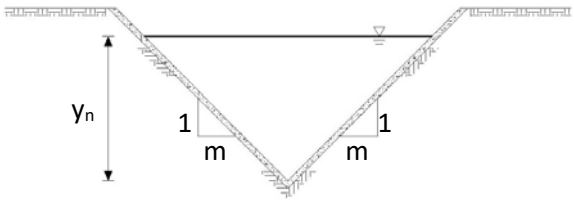
$$A_* = A/\lambda^2 \quad (9)$$

$$P_* = P/\lambda \quad (10)$$

$$b_* = b/\lambda \quad (11)$$

$$y_{n_*} = y_n/\lambda \quad (12)$$

$$r_* = r/\lambda \quad (13)$$



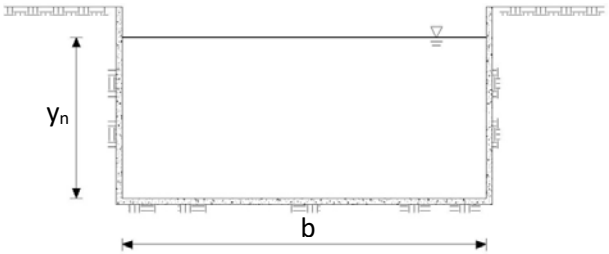
Burada "*" boyutsuz terimleri ifade etmektedir. Tanımlanan boyutsuz terimlerin kullanılması ile optimizasyon probleminin boyutsuz hali aşağıdaki gibi elde edilir.

$$\min \ C_* = \beta_{L_*} P_* + A_* + \frac{\beta_{A_*} \int_0^{y_n} a \ d\eta}{\lambda^3} \quad (14)$$

$$1 - A_*^{5/3} P_*^{-2/3} = 0 \quad (15)$$

 Copyright © International Science and Technology Conference (ISTEC)

Denklem 14 ve Denklem 15' te genel halde verilen optimizasyon modeli üçgen, dikdörtgen ve trapez açık kanal kesitleri için ayrı ayrı düzenlemiştir. Şekil 2' de verilen üçgen açık kanal kesiti için optimizasyon modeli Denklem 16 ve Denklem 17' de verilmektedir.

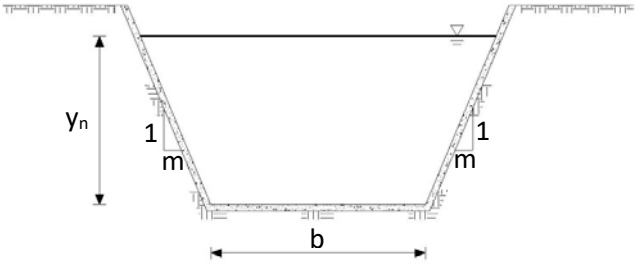


Şekil 2: Üçgen Açık Kanal Kesiti

$$\min\ C_* = 2\beta_{L_*} y_{n_*}\sqrt{1+m^2} + m y_{n_*}^2 + \frac{\beta_{A_*} m y_{n_*}^3}{3} \tag{16}$$

$$1 - \frac{\left(m y_{n_*}^2\right)^{5/3}}{\left(2y_{n_*}\sqrt{1+m^2}\right)^{2/3}} = 0 \tag{17}$$

Şekil 3' te verilen dikdörtgen açık kanal kesiti için optimizasyon modeli Denklem 18 ve Denklem 19' da verilmektedir.



Şekil 3: Dikdörtgen Açık Kanal Kesiti

$$\min\ C_* = \beta_{L_*}\left(2y_{n_*} + b_*\right) + b_* y_{n_*} + \frac{\beta_{A_*} b_* y_{n_*}^2}{2} \tag{18}$$

$$1 - \frac{\left(b_* y_{n_*}\right)^{5/3}}{\left(2y_{n_*} + b_*\right)^{2/3}} = 0 \tag{19}$$

Şekil 4' te verilen trapez açık kanal kesiti için optimizasyon modeli Denklem 20 ve Denklem 21' de verilmektedir.

Şekil 4: Dikdörtgen Açık Kanal Kesiti

$$\min\ C_* = \beta_{L_*}\left(2y_{n_*}\sqrt{1+m^2} + b_*\right) + \left(b_* y_{n_*} + m y_{n_*}^2\right) + \beta_{A_*}\left(\frac{b_* y_{n_*}^2}{2} + \frac{m y_{n_*}^3}{3}\right) \tag{20}$$

$$1 - \frac{\left(b_* y_{n_*} + m y_{n_*}^2\right)^{5/3}}{\left(2y_{n_*}\sqrt{1+m^2} + b_*\right)^{2/3}} = 0 \tag{21}$$

Açık kanal kesitleri için verilen optimizasyon modellerinde y_{n_*} su derinliğini, m şev eğimini, b_* kanal taban genişliğini ifade etmektedir

Ateş Böceği Algoritması

Ateş Böceği Algoritması 2007 yılında Xin-She Yang tarafından geliştirilmiştir. Ateş böceklerinin sosyal davranışlarından esinlenilerek geliştirilmiş sürü tabanlı bir optimizasyon algoritmasıdır.

Ateş böceklerinin büyük bir kısmı çiftleşmek, avlanmak, korunmak amacıyla kısa süreli ritmik ani ışıklar yaymaktadırlar. Biyolojik olarak üretilen bu ışık ile bütün ateş böcekleri belli bir uzaklık limitinde görünür olmaktadırlar ve bu onların haberleşmesini sağmaktadır. Ayrıca ışık yoğunluğu da önemli bir rol oynamakta ve ışık yoğunluğu mesafenin (r) karesi ile ters orantılı olarak azalmaktadır.

Algoritmanın temelini ateş böceklerinin en parlak ateş böceğine doğru hareket edeceği kabulü oluşturmaktadır. Her bir ateş böceği problemin öneri bir çözümünü oluşturmaktadır. Amaç fonksiyonu değerine göre ateş böceklerinin parlaklıkları hesaplanmaktır. Çözüme yakın ateş böceği daha parlak kabul edilmekte ve diğer ateş böcekleri parlak olan ateş böceğine doğru hareket etmektedirler. Böylece optimum çözüm aranmaktadır.

Algoritmada bazı kabuller yapılmıştır. Bütün ateşböcekleri uniseks olarak kabul edilerek birbirlerini çekmeleri sağlanmıştır. Parlak olan ateş böceği diğer ateş böceklerine için daha çekici hale gelmektedir. Son olarak bir ateş böceği kendisinden daha parlak bir ateşböceğine doğru gidecektir.

Bir ateş böceğinin kendisinden daha parlak bir ateşböceğine doğru hareketi Denklem 22 ile ifade edilmektedir.

$$x_i' = x_i + \beta_0 e^{-\gamma r^2}\left(x_j - x_i\right) + \alpha\varepsilon_i \tag{22}$$

Denklem 22' de r ateş böcekleri arasındaki mesafeyi ifade etmektedir ve Denklem 23 ile hesaplanmaktadır.

$$r_{ij} = \sqrt{\sum_{k=1}^{d}\left(x_{i,k} - x_{j,k}\right)^2} \tag{23}$$

β_0, γ ve α ise algoritmanın kontrol parametrelerini ifade etmektedir (Yang, 2013).

Av Arama Algoritması

Av Arama Algoritması 2009 yılında Oftadeh ve arkadaşları tarafından geliştirilmiştir. Algoritma, hayvanların grup olarak avlanmasından esinlenilerek geliştirilmiş bir sürü tabanlı optimizasyon algoritmasıdır.

Aslanlar, kurtlar ve yunuslar gibi hayvanlar av bulup yakalamak amacıyla sürü halinde avlanmaktadırlar. Sürünün avı yakalamak için belli stratejileri vardır. Öncelikle sürü ava göre konumlanmaktadır. Avlanma sırasında da grubun her bir üyesi kendi konumunu diğer üyelerin konumuna göre değiştirmektedir. Eğer av sürüden kaçarsa, sürüdekiler avı tekrar kuşatmak için konumlarını değiştirirler.

Algoritmanın işleyişi sürüdeki avcıların daha iyi konumdakine, yani lider avcıya doğru hareket edeceği kabulüne dayanmaktadır. Sürüdeki her bir avcı problemin öneri bir çözümünü oluşturmaktadır. Amaç fonksiyonunun değerine göre sürünün lideri avcı bulunmaktadır. Sürüdeki diğer avcılar da lider avcıya doğru hareket etmektedirler. Böylece optimum çözüm aranmaktadır.

Sürüdeki bir avcının lidere doğru hareketi Denklem 24 ile hesaplanmaktadır.

$$x_i' = x_i + rand \times MML \times (x_i^L - x_i) \tag{24}$$

Burada, rand 0 ile 1 arasında rastgele sayıyı, MML ise lidere doğru maksimum hareket değerini ifade etmektedir. Bir sonraki adımda avcılar sürüye göre Denklem 25 ile tanımlanan işlemler ile konumlarını güncellemektedirler.

$$x_i' \leftarrow \begin{cases} x_i' \in \{x_i^1, x_i^2, \ldots, x_i^{HGS}\} & HGCR \;\; olasılığı \;\; ile \\ x_i' = x_i \pm Ra & (1 - HGCR) \;\; olasılığı \;\; ile \end{cases} \tag{25}$$

 Copyright © International Science and Technology Conference (ISTEC)

$$Ra(it) = Ra_{min}(x_{max} - x_{min}) exp\left(\frac{Ln\left(\frac{Ra_{max}}{Ra_{min}}\right) it}{itm}\right) \quad (26)$$

Burada HCGR avcı gurubu değerlendirme oranını, x_{max} ve x_{min} x değişkeninin alabileceği maksimum ve minimum değerlerini, Ra rastgele yarıçap mesafesini, Ra_{max} ve Ra_{min} Ra'nın alabileceği maksimum ve minimum değerleri ve itm maksimum iterasyon sayısını ifade etmektedir.

Son olarak ise çözümde yerel optimum noktalardan kaçınmak için Denklem 27 ile sürü kendini yeniden organize eder.

$$x_i' = x_i^L \pm rand \times (x_{max} - x_{min}) \times \alpha \times exp(-\beta \times EN) \quad (27)$$

Burada, EN yeniden organizasyon sayısını, α ve β pozitif reel sayıları ifade etmektedir (Oftadeh ve Mahjoob 2010).

Uygulama

Ateş böceği ve av arama algoritması için optimizasyon probleminin çözümüne başlamadan önce sahip oldukları kontrol parametrelerinin belirlenmesi gereklidir. Bu parametreler algoritmanın optimum çözümü bulmasını ve çözüme yakınsama hızını etkilemektedirler. Ateş böceği algoritması için seçilen kontrol parametre değerleri Tablo 1' de, av arama algoritması için seçilen kontrol parametre değerleri Tablo 2' de verilmiştir.

Tablo 1: Ateş Böceği Algoritması için seçilen kontrol parametreleri

Kontrol Parametresi	Değer
Ateş Böceği Sayısı	40
Minimum Beta	0,2
Maksimum Beta	1
Alfa	0,5
Gama	1
Maksimum İterasyon Sayısı	1000

Tablo 2: Av Arama Algoritması için seçilen kontrol parametreleri

Kontrol Parametresi	Değer
Avcı Sayısı	40
Lidere doğru maksimum ilerleyiş	0,05
Avcı grubu dikkate alma oranı	5000
Maksimum Ra	0,01
Minimum Ra	0,0000001
Alfa	1,2
Beta	0,02
Maksimum İterasyon Sayısı	1000

Uygulamada iki farklı durum incelenmiş ve literatürde daha önce elde edilen sonuçlar ile karşılaştırılmıştır. Ayrıca ilk durumda elde edilen sonuçlar için ateş böceği algoritması ile av arama algoritması yakınsama hızı açısından birbirleri ile karşılaştırılmıştır.

Birinci durumda ek kazı maliyeti dikkate alınmayarak maliyet fonksiyonun sadece birim kaplama maliyeti ve kazı maliyetinden meydana geldiği kabul edilmektedir. Başka bir deyişle Denklem 14' te verilen ifadede yer alan β_A katsayının değeri sıfır olmuştur. Bu durum için literatürde bulunan sonuçlar ile bu çalışmada tüm kesitler için elde edilen sonuçlar Tablo 3' te verilmektedir. Tablo 3' te verilen LM (Lagrange Multipliers) Lagrange çarpanları yöntemini, DEA (Differential Evolution Algorithm) diferansiyel gelişim algoritmasını, BA (Bees Algorithm) arı algoritmasını, ABC (Artificial Bee Colony) yapay arı kolonisi algoritması, MHBMO (Modified Honey Bee Mating Optimization) modifiyeli bal arısı çiftleşme algoritmasını, FF (Firefly Algortihm) ateş böceği algoritmasını, HuS (Hunting Search) av arama alritmasını ifade etmektedir.

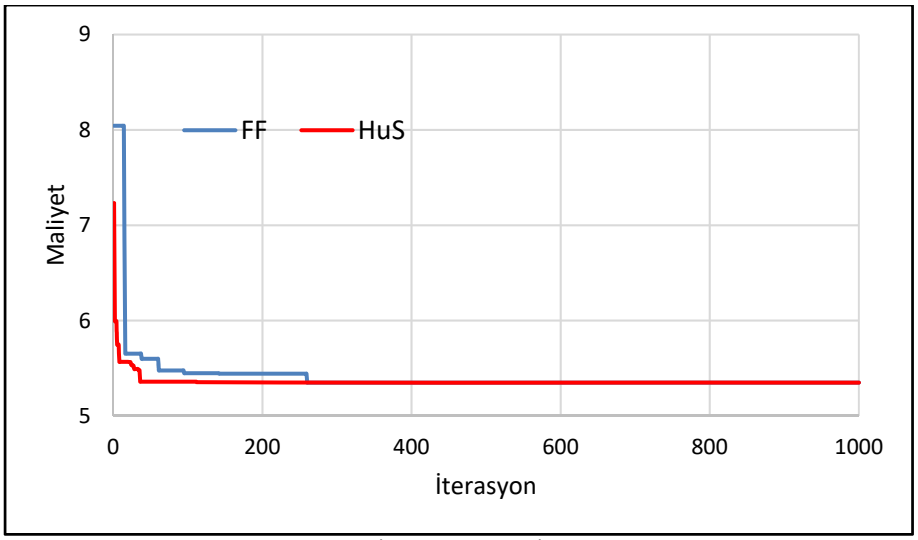
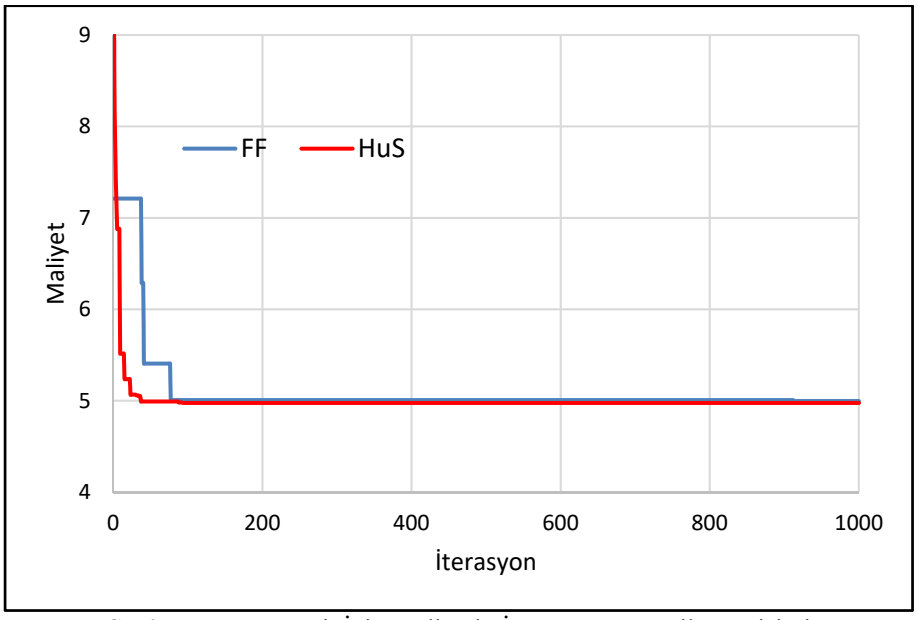
HuS		0,962824	0,577662	1,128858	4,975106



Tablo 3 incelendiğinde listelenen algoritmaların her kesit için benzer performansa sahip oldukları görülmektedir. En düşük maliyet fonksiyonu değerine üç kesitte arı algoritmasının sahip olduğu görülmektedir. Bu çalışma kapsamında ele alınan iki algoritmadan ateş böceği algoritmasının sahip olduğu kontrol parametresi değerlerine göre en büyük maliyet fonksiyon değerlerine sahip olduğu görülmektedir. Av arama algoritması ise arı algoritmasına daha yakın sonuçlar elde etmiştir.

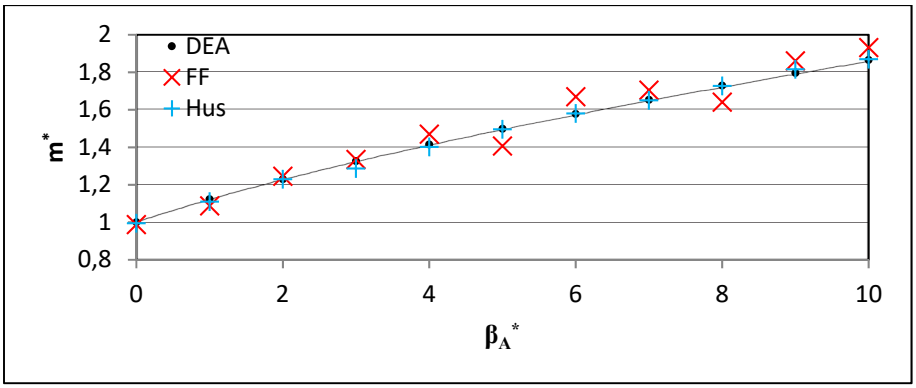
Ek kazı maliyetinin dikkate alınmadığı birinci durum için ayrıca her kesit için ateş böceği algoritması ve av arama algoritması yakınsama hızlarını gösteren grafikler Şekil 5'ten Şekil 7' ye kadar verilmiştir.



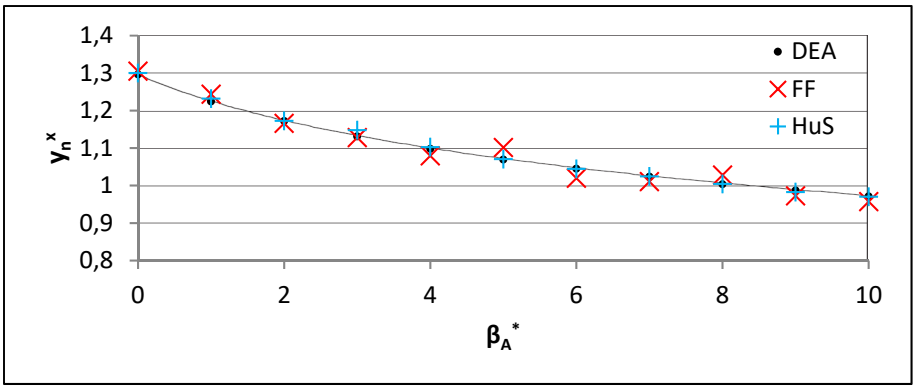
Şekil 5: Üçgen Kesit İçin Maliyetin İterasyon Sayısı ile Değişimi

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 6: – Dikdörtgen Kesit İçin Maliyetin İterasyon Sayısı ile Değişimi



Şekil 7: Trapez Kesit İçin Maliyetin İterasyon Sayısı ile Değişimi



Yukarıda verilen grafikler incelendiğinde av arama algoritmasının üç açık kanal kesiti için de sonuca daha hızlı yakınsadığı görülmektedir. Ateş böceği algoritmasında sekiz yüz iterasyondan sonra bile değişim gözlenirken av arama algoritmasında değişimin ilk yüz iterasyonda tamamlanmış olduğu görülmektedir.

Ek kazı maliyetinin dikkate alındığı ikinci durumda literatürde sonuçların sadece üçgen kesit için olmasından dolayı bu kesit için çözüm yapılmıştır. Üçgen kesite ait değişkenler olan m şev eğimi ve y_n^* boyutsuz su derinliğinin optimum değerleri faklı β_A^* ve β_L^* değeri için hesaplanmıştır. Elde edilen sonuçlar grafik olarak Şekil 78 ve Şekil 9'de verilmiştir.

Şekil 7 ve Şekil 8' de ikinci durum için ateş böceği ve av arama algoritmasından elde edilen sonuç ile diferansiyel gelişim algoritması sonuçları verilmektedir. Grafikler incelendiğinde ateş böceği algoritması sonuçlarının diğer algoritmalardan elde edilen sonuçlara göre uyumsuz olduğu bunun yanında av arama algoritması ile diferansiyel gelişim algoritması sonuçlarının birbirleriyle daha uyumlu olduğu görülmektedir.

Sonuç

Bu çalışmada üçgen dikdörtgen ve trapez kaplamalı açık kanal kesitlerinin optimizasyonu yapılmıştır. Optimizasyon modelinin çözümünde ateş böceği ve av arama algoritması kullanılmış ve sonuçlar literatür ile karşılaştırılmıştır.

Sonuç olarak iki algoritmanın da açık kanal kesit optimizasyonu probleminde kullanılabileceği görülmüştür. Av arama algoritması ile hem optimizasyon probleminin çözümünde ateş böceği algoritmasına göre daha iyi sonuçlar elde edilmiş hem de yakınsama hızı konusunda daha iyi sonuçlar elde edilmiştir.

Sonuçların literatürle karşılatılması ile daha önceki çalışmalarda daha düşük maliyet değerlerine ulaşılabildiği görülmüştür.

Özet: Betonun ana bileşenlerinden olan çimentonun karışımdaki oranı hacimce %13, ağırlıkça %15'tir. Bu değerlerle çimento beton maliyetinde büyük bir yer tutmaktadır. Çimento üretimi sırasında ortama CO_2 gaz çıkışı olmaktadır. Dolayısıyla çimentonun çevreye verdiği zarar da küçümsenemeyecek kadar fazladır. Ayrıca çimento betonun özağırlığını ve maliyetini de arttırmaktadır. Söz konusu çalışmada çimentonun tüm bu dezavantajlarını azaltabilmek adına kullanılan çimento hacmini küçültmek hedeflenmiştir. Bu amaçla çimento hacmi ile çevresel bir atık olan uçucu kül hacmi yer değiştirilmiştir. % 25, % 33 ve % 50 uçucu kül kullanım oranları baz alınarak betonarme bir kiriş tasarlanmıştır. Bu kiriş ANSYS Sonlu Elemanlar Programında eğilmeye maruz bırakılmıştır. Sonucunda yüklemeler altında oluşan çatlaklar ve gerilme değerleri karşılaştırılmıştır. Sonuç olarak uçucu kül kullanımının betonarme davranış üzerinde olumsuzluk yaratacak bir etkisinin olmadığı ve kullanımının çevreye ve ekonomiye fayda sağladığı ortaya konulmuştur.

Anahtar Kelimeler: Betonarme kiriş, Çatlak, Sonlu Elemanlar, Uçucu kül.

Giriş

Günümüzde beton, çimento, uygun granülometride agrega, su ve ihtiyaca göre ilave edilen uygun katkı maddelerinden oluşmaktadır. Teknolojinin gelişmesiyle beraber beton karışımına giren malzemeler araştırılmaya ve yeni özel karışımlı betonlar üretilmeye başlanmıştır. Burada amaç; ilave katkılar üreterek veya hâlihazırda bulunan malzemeleri kullanarak, ihtiyaca göre beton dayanımını ve/veya durabilitesini arttırmak, yapının ağırlığını veya maliyetini düşürmektir. Betonun ana bileşenlerinden olan çimentonun karışımdaki oranı hacimce %13, ağırlıkça %15'tir (Doğangün, 2007). Bu değerlerle çimento beton maliyetinde büyük bir yer tutmaktadır. 1 ton çimento üretimi sırasında yaklaşık olarak 1 ton CO_2 gazının açığa çıktığı düşünülecek olursa, çimentonun çevreye verdiği zarar azımsanmayacak kadar fazladır (Roumain ve Sarkar, 2000). Bu sebeple günümüzde çimentonun puzolanik malzemelerle yer değiştirmesi ile hem daha ekonomik hem de çevreye daha duyarlı beton üretimi yapılabilmektedir. Uçucu kül de son yıllarda kullanım alanının genişlediği çevresel bir atıktır. Uçucu külün betonun durabilitesini arttırmasının yanı sıra çimento hacmi ile değiştirildiğinde beton ağırlığını düşürdüğü yönünde çalışmalar da mevcuttur (Zandi, 2012). Söz konusu çalışmada, uçucu külün yapısal elemanlarda kullanılmasının yaygınlaştırılması hedeflenmektedir. Kullanılan farklı uçucu kül miktarlarındaki C30 beton sınıfı hedefli uçucu küllü numuneler hazırlanarak basınç deneyine tabi tutulmuştur. Elde edilen karakteristik beton basınç dayanımları, gerilme-şekil değiştirme ilişkileri göz önünde tutularak ANSYS sonlu elmanlar programında betonarme kirişler tasarlanmış ve kirişlerde farklı etriye aralıkları da değişken olarak seçilerek uçucu kül oranı ve etriye aralıklarının betonarme davranışa etkileri ortaya konulmuştur.

Deneylerde Kullanılan Malzemeler

Türkiye'de 12 adet faaliyet gösteren termik santral bulunmaktadır. Türkiye'deki elektrik üretiminin büyük bir bölümü bu termik santrallerden elde edilmektedir. Santrallerde yakıt olarak kullanılan kömür neticesinde de değişik özelliklerde kül ve cüruf açığa çıkmaktadır. Endüstrinin diğer kollarında yararlanılamayan linyit

 Copyright © International Science and Technology Conference (ISTEC)

kömürlerinin gelecekte termik santrallerde kullanılacak olduğu da düşünülünce, bu yıllık üretim miktarının gelecekte artacağı ortadadır. Bu sebeple santrallerden elde edilen endüstriyel atıklardan faydalanma yolları araştırılmıştır. Atık maddeleri tekrar kazanmak amacıyla, bu tip endüstriyel atıklar betonda katkı maddesi olarak kullanılmaya başlanmıştır. Söz konusu çalışmada kullanılan uçucu kül Zonguldak Çatalağzı Termik Santrali (ÇATES)'den temin edilmiştir.

Uçucu kül sınıflandırılmasında kimyasal bileşen yüzdesi esas alınarak ASTM C 618 ve TS EN 197-1 standartları baz alınmaktadır. Buna göre uçucu küller ASTM C 618'e göre C ve F sınıfı olmak üzere iki sınıfa; TS EN 197-1 göre ise kalkersi (W) ve silissi (V) olmak üzere ikişer gruba ayrılmaktadır. Türkiye Çimento Müstahsilleri Birliği tarafından 2009 yılında yayınlanmış kitapta, Türkiye'deki 11 adet termik santralde 5 gün süre ile elde edilen uçucu kül numunelerinin ham olarak laboratuvarda kimyasal, mineralojik, morfolojik, fiziksel ve mekanik özelliklerini inceleyerek gerekli yorumlama ve sınıflandırmalar yapılmıştır. Bu kaynağa göre, ÇATES'ten elde edilen uçucu külün kimyasal bileşim açısından bileşen yüzdelerinin birbirine çok yakın olması sebebiyle, bu santralden uniform özellikte kül elde edilebileceği belirtilmiştir. Ayrıca reaktif kireç miktarının %10'un altında olması nedeniyle TS EN 197-1 standardına göre V sınıfına girdiği belirtilmiştir. ASTM C 618 standardına göre ise SiO_2+Al_2O_3+Fe_2O_3 değerinin %70'in üzerinde olması ve CaO miktarının da %10'dan az olması sebebiyle F sınıfına girdiği belirtilmiştir. SiO_2+Al_2O_3+Fe_2O_3 değerinin %70'in üzerinde olması nedeniyle de TS 639'da istenen şartlara uyduğu ve SO_3 ile serbest kireç yüzdelerinin sırasıyla % 0.08 ve % 0.13 olduğu için TS EN 450 standardında istenilen koşulları sağladığı belirtilmiştir. Bu sonuçlar dâhilinde de ÇATES uçucu külünün dört standartta da kimyasal bileşen bazında istenilen koşullara tamamen uygun bir kül olduğu vurgulanmıştır. Tablo 1 ve 2'de ÇATES uçucu külünün kimyasal analiz sonuçları verilmiştir.

Tablo 1.ÇATES uçucu külünün kimyasal analiz sonuçları(Türker vd., 2009).

ÇATES uçucu külün morfolojik incelemesi sonucunda ise çoğunluğun 1-20 µm arasında tam küresel tanecikler

 Copyright © International Science and Technology Conference (ISTEC)

olmakla birlikte yarı köşeli taneciklerden oluştuğu belirtilmiştir (Şekil 1).

Şekil 1. ÇATES uçucu külünün yüzey yapısına ait fotoğraf (Türker vd., 2009).

Karışımda kullanılan uçucu kül F Sınıfı olmakla birlikte %25,33 ve 50 oranında çimento hacmi ile yerdeğiştirilmiştir. Çimento sınıfı CEM-1 42.5 R tipi Portland çimentosudur. Kimyasal katkı olarak, çimento ağırlığının %1.2 si oranında süper akışkanlaştırıcı kullanılmıştır.

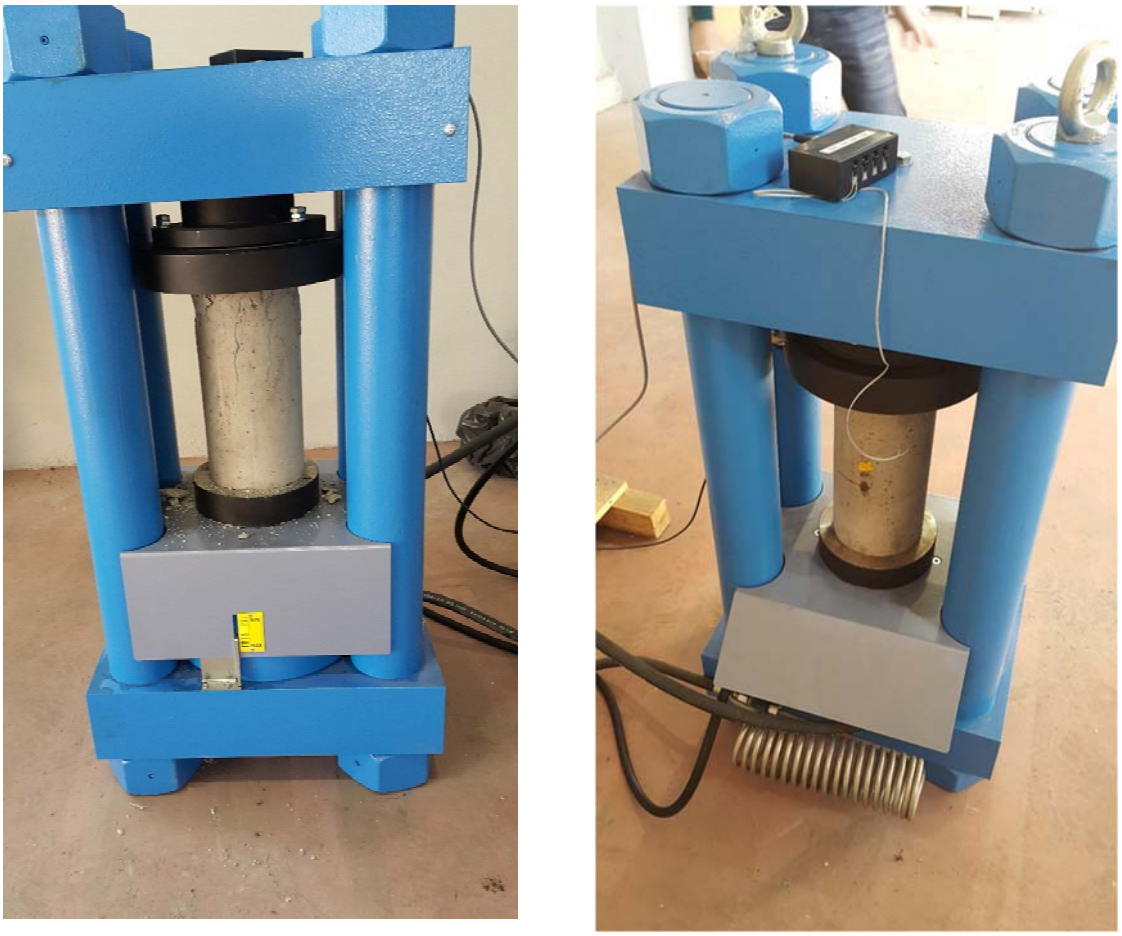
Beton Üretimi

Beton üretiminde karışıma girecek agrega, su ve çimento önceden tartılıp hazırlanmıştır. Betonu karıştırmak için kullanılacak olan düşey eksenli betoniyer nemlendirilmiştir. Agregalar, çimento ve uçucu kül önceden tartılarak betoniyere konulmuştur. Hazırlanan kuru karışım kısa bir süre döndürülerek homojen bir karışım olması sağlanmıştır. (Şekil 2). Daha sonra betoniyerdeki karışıma gerekli su, süper akışkanlaştırıcı ile birlikte katılarak karıştırılmaya devam edilmiştir.

Şekil 2. Karışımda kullanılan uçucu kül ve beton harcı.

Hazırlanan betona öncelikle kıvamını belirleyebilmek için slump deneyi yapılarak kıvam sınıfı doğrulanmıştır. Hazırlanan her farklı karışımdan üçer adet silindir numune alınmıştır (Şekil 3).

 Copyright © International Science and Technology Conference (ISTEC)



Şekil 3. Kalıplara yerleştirilen numuneler.

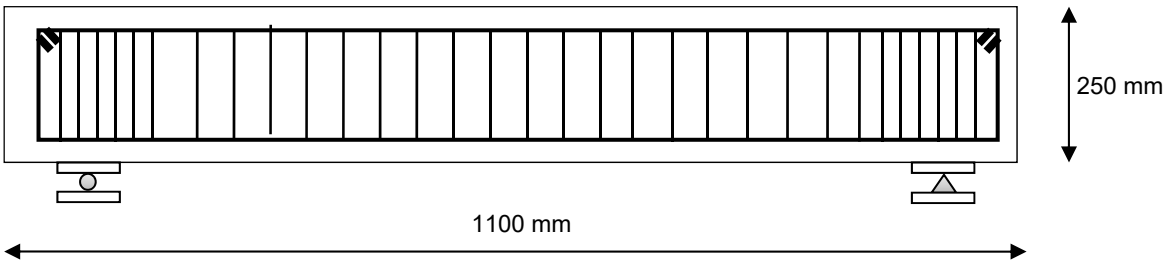
Üretimden bir gün sonra ise beton numuneler kalıplarından çıkartılarak, deneylerin yapılacağı 28.güne kadar sıcaklığı 20±2 °C olan kür havuzunda standart suda saklanmıştır. Kür havuzunda saklanan silindir numuneler 28. günde kalıplardan çıkartılmıştır. Numunelere basınç deneyi uygulanırken yük altındaki gerilme-şekil değiştirme ilişkisini elde edebilmek amacıyla numunelerin orta noktalarına birim deformasyon ölçerler yapıştırılmış ve birim deformasyon ölçer Data-Logger'a bağlanarak diğer ucu da presin ilgili kanalına bağlanmıştır. Numuneler basınç yükü altında kırılarak gerekli okumalar kayıt altına alınmıştır (Şekil 4, 5).

Şekil 4. Numunelere birim deformasyon ölçer yapıştırılması.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 5. Basınç deneyi yapılması.

Burada betonun yük altındaki gerilme- şekil değiştirme ilişkisini elde etmek istenmesindeki amaç ANSYS programında uçucu küllü beton davranışını modelleyebilmektir. Beton davranış modeli olarak William Wranke modeli kullanılmıştır. Elde edilen sonuçlara göre saptanan farklı kül oranlarındaki beton basınç dayanımları Tablo 3'de verilmiş olup, çalışmanın beton basınç dayanımı değerlerini oluşturmuştur.



Tablo 3. Numunelerin William Wranke Modeli'ne göre basınç dayanımları.

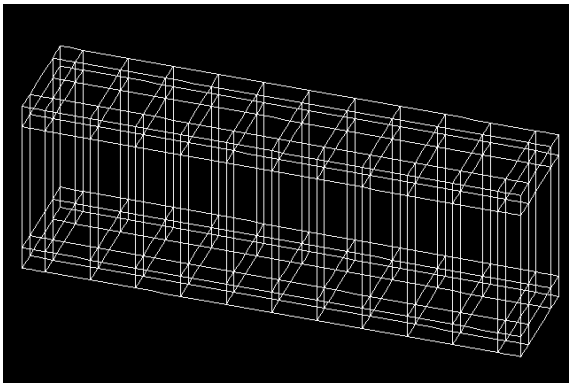
Analitik Çalışma

Söz konusu çalışmada eğilme etkisi altında kirişin yapısal davranışını incelemek için kurulan senaryolar kapsamında ANSYS sonlu elmanlar programında modellenecek olan betonarme kirişin eni 125 mm, boyu 1100 mm ve yüksekliği de 250 mm olarak seçilmiştir. Kabuk beton kalınlığı da 25 mm olarak alınmıştır.
Modellenen kirişin şematik planı Şekil 6'da verilmiştir. Kirişlerde 2Ø10 üst, 2Ø10 alt boyuna donatıları kullanılmıştır. Seyrek etriye adımlı modelde 20 cm (200 mm) aralıklı, sık etriye adımlı modelde ise 10 cm (100 mm) aralıklı olarak Ø8'lik etriyeler ile kiriş sarılmıştır.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 6. Kiriş Ebatları

Bu kapsamda araştırılmak istenen betondaki uçucu kül miktarının ve kesitteki etriye sıklığının betonarme kirişlerde davranışı nasıl etkilediğidir. Araştırma kapsamındaki değişken parametreler uçucu kül oranı ve yapısal davranış açısından etriye sıklığı ile sağlanacak olan kesitteki donatı oranıdır. Modellemeleri yapılacak olan kiriş tiplerine ait özellikler Tablo 4'de verilmiştir.



Tablo 4. Kiriş Donatı ve Uçucu Kül Detayları

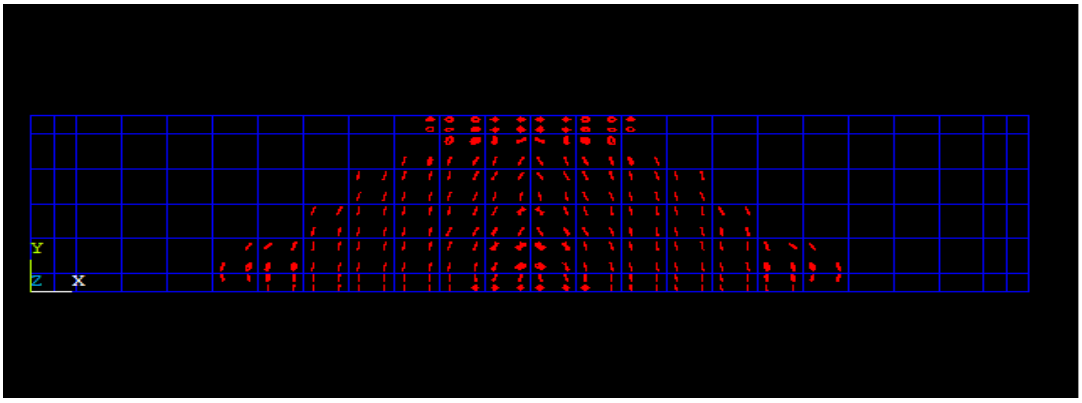
Etriye Düzeni	**%25 Uçucu Küllü Beton**	**%33 Uçucu Küllü Beton**	**%50 Uçucu Küllü Beton**
Seyrek Etriye Adımlı	M-1	M-2	M-3
Sık Etriye Adımlı	M-4	M-5	M-6

Tablo 4 incelenecek olursa, söz konusu çalışma, etriye düzenine göre seyrek etriye adımlı ve sık etriye adımlı olmak üzere iki; malzeme özelliklerine göre %25, 33 ve 50 oranlı uçucu küle sahip beton olmak üzere üç farklı malzeme parametresine sahiptir. Toplamda ise 6 adet kiriş modeli mevcuttur.

Modelleme ve Analiz

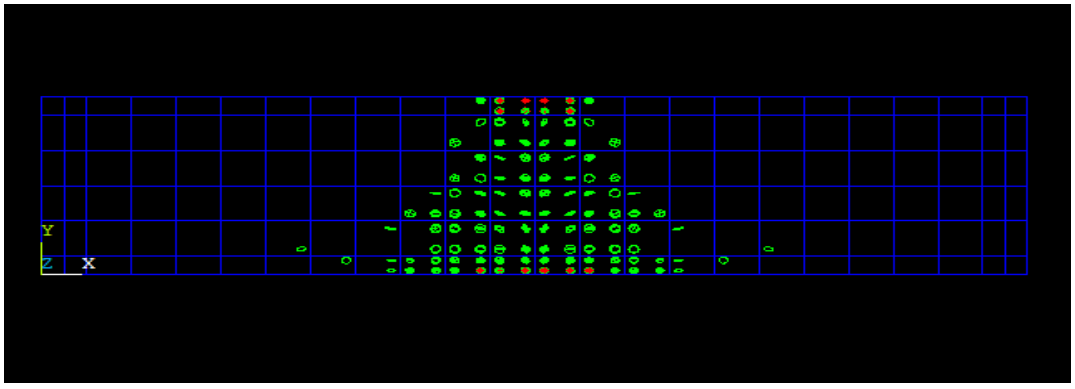
Modelleme için ANSYS programı kullanılmıştır. ANSYS ilk olarak Turner ve arkadaşları tarafından ortaya sunulan Sonlu Eleman Analizleri (Finite Element Analyse) (FEA) yöntemi programı olarak ortaya çıkmıştır (1956). Yaklaşık çözümler için güçlü bir hesaplama tekniği olan ANSYS dünya çapında simülasyonlar için araştırmacılar tarafından kullanılan mühendislik yazılımıdır.
ANSYS sonlu eleman modelinde, modeller komut istemi hat girişi veya grafik kullanıcı ara yüzü (GUI) kullanılarak oluşturulabilir. Bu uygulamada, modeli oluşturmak için grafik ekran (GUI) kullanılmıştır.
Beton kiriş modelinde katı hacim için SOLID65, donatılarda ise LINK8 çubuk modeli kullanılmıştır. Bütün senaryolar malzeme modelleri ve etriye adımlarına göre tek tek kurulmuştur (Şekil 7).

Şekil 7. Sık etriye adımlı modele ait üç boyutlu boyuna donatı ve etriye yerleşimi.



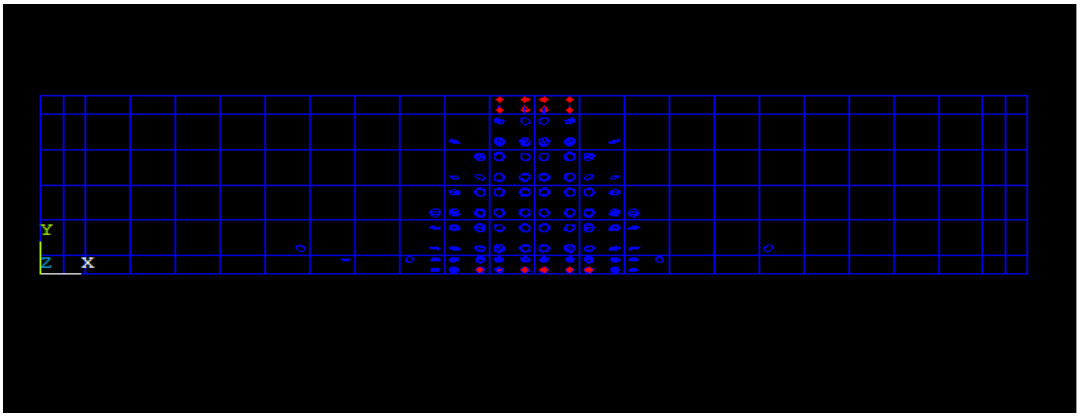
Tasarlanan modeller ANSYS programında 100 kN'luk tekil yükleme yapıldıktan sonra grafik ekrandan çağırılarak analiz sonuçları (çatlaklar, deformasyon, sehim) incelenmiştir. Analiz sonrası oluşan çatlakların sırasını programdan birincil, ikincil, üçüncül ve toplam çatlak olarak izlemek mümkün olmakla birlikte Şekil 8,

 Copyright © International Science and Technology Conference (ISTEC)



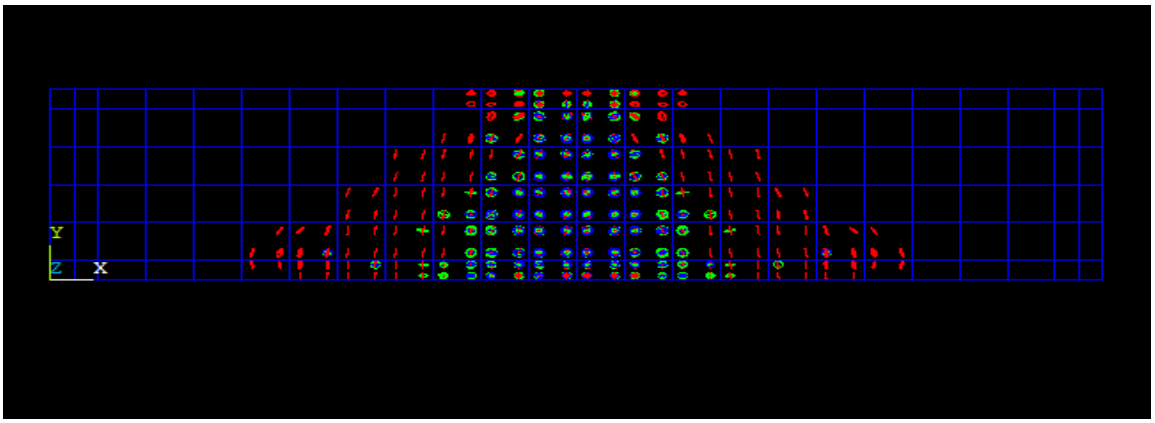
9, 10'da %25 uçucu küllü sık etriye adımlı kirişlerde gerçekleşen çatlak sıraları gösterilmiştir. Diğer uçucu kül oranlarında ise çatlakların toplamını ifade eden çatlak değişimleri verilmiştir. Çalışmada malzeme ve etriye aralığı olmak üzere 2 ana parametre bulunduğundan çatlak sonuçları seyrek ve sık etriye adımlı olmak üzere iki başlık altında özetlenmiştir.

Sık Etriye Adımlı Modellere Ait Analizler Sonucu Oluşan Çatlaklar

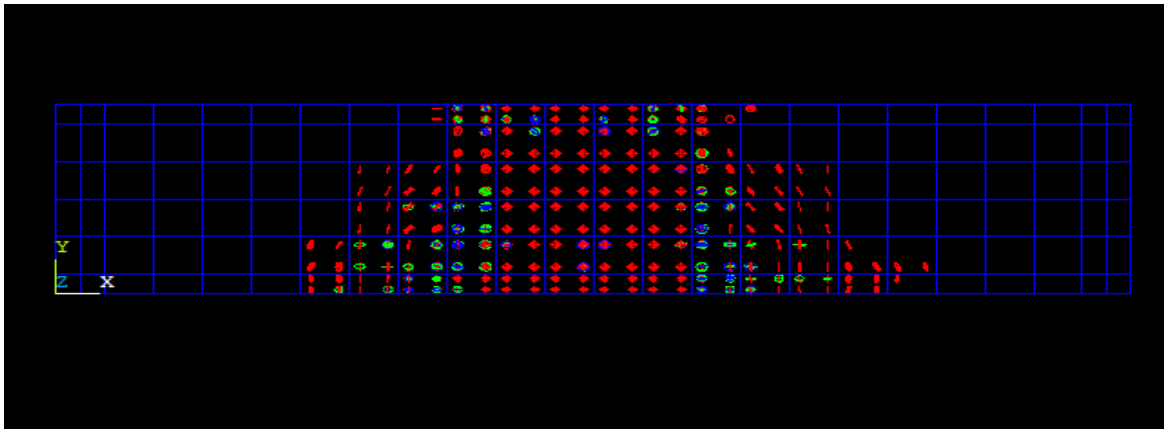


Sık etriye adımlı modellere ait çatlak oluşumları Şekil 8-13'de görülmektedir. %25 uçucu küllü sık etriye adımlı kirişlerde oluşan çatlaklar ise sırasıyla Şekil 8-11'de verilmiştir. Burada birincil çatlaklar kesitin ilk zorlanmaya başladığı liflerde mesnetlere yakın ve ağırlıklı olarak yükün uygulandığı orta bölgede çıkmıştır. Yükün etkisi arttıkça da kesit zorlandığı için çatlak şekilleri artmış ve derinleşmiştir.
Uçucu kül oranının arttığı Şekil 11, 12, 13 incelendiğinde ise ikincil ve üçüncül çatlakların değiştiği görülmektedir. Bu da kül artışının dayanımı az da olsa zayıflattığını ortaya koymaktadır.

Şekil 8. %25 uçucu küle sahip sık etriye adımlı modelin birincil çatlakları



Şekil 9. %25 uçucu küle sahip sık etriye adımlı modelin ikincil çatlakları

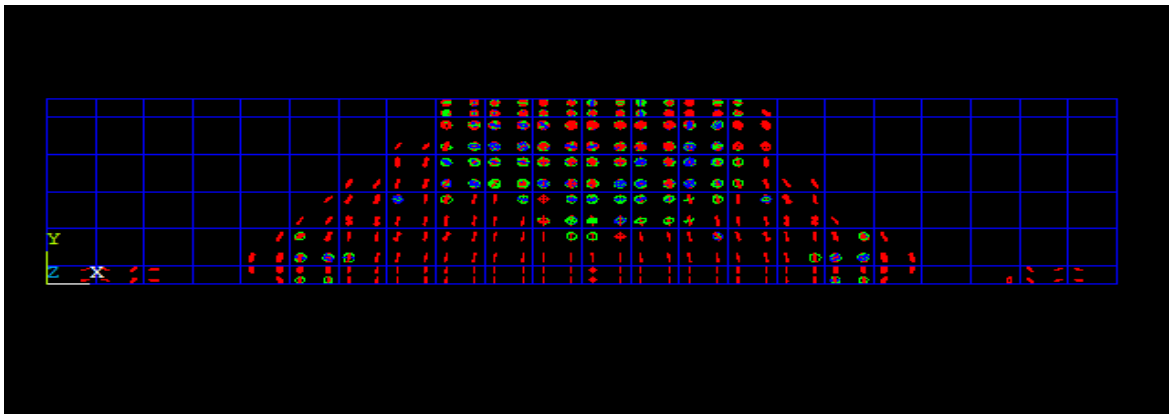


Şekil 10. %25 uçucu küle sahip sık etriye adımlı modelin üçüncül çatlakları

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 11. %25 uçucu küle sahip sık etriye adımlı modelde oluşan tüm çatlaklar

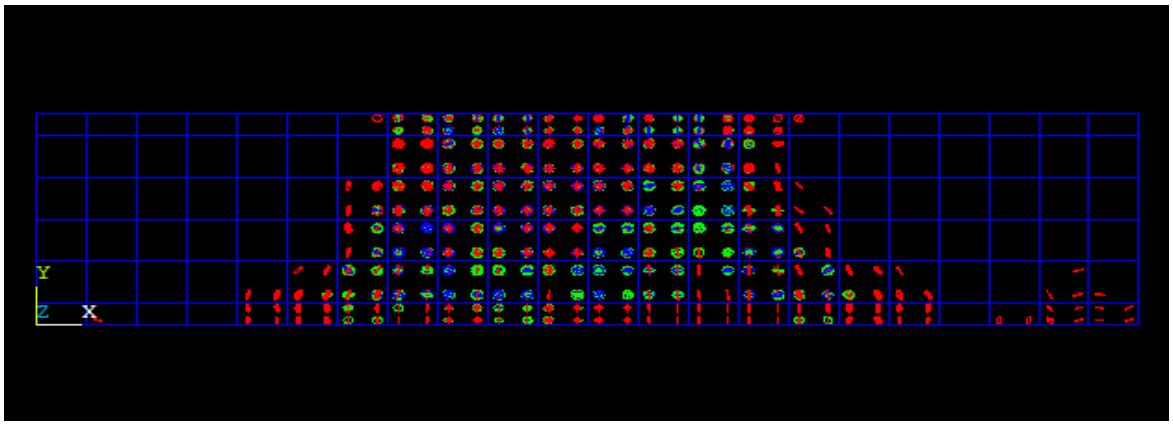
Şekil 12. %33 uçucu küle sahip sık etriye adımlı modelde oluşan tüm çatlaklar



Şekil 13. %50 uçucu küle sahip sık etriye adımlı modelde oluşan tüm çatlaklar

 Copyright © International Science and Technology Conference (ISTEC)

Seyrek Etriye Adımlı Modellere Ait Analizler Sonucu Oluşan Çatlaklar



Seyrek etriye adımlı modellere ait çatlak oluşumları Şekil 14-16'da görülmektedir.
Şekiller incelendiğinde yine uçucu kül oran artışının çatlak oluşumunu olumsuz yönde etkilediği görülmektedir. Ayrıca uçucu kül oranı sabit tutulduğunda, etriye adımının azaltılmasının davranışı olumsuz yönde etkilediği de açıkça görülmektedir(Şekil 13,16).

Şekil 14. %25 uçucu küle sahip seyrek etriye adımlı modelde oluşan tüm çatlaklar

Şekil 1. %33 uçucu küle sahip seyrek etriye adımlı modelde oluşan tüm çatlaklar

Şekil 16. %50 uçucu küle sahip seyrek etriye adımlı modelde oluşan tüm çatlaklar

 Copyright © International Science and Technology Conference (ISTEC)

Sonuçlar

Sonuç olarak meydana gelen bu çatlaklar genel olarak kirişin orta bölgesinde, momentin ve sehimin maksimum olduğu bölgelerde yoğunlaşmıştır.
Uçucu kül oranı sabit tutulduğunda(%50) etriye adımının artması ile çatlak dağılımı ve sayısının arttığı gözlemlenmiştir (Şekil 13, Şekil 16).
Etriye adımı sabit tutulup uçucu kül oranı arttırıldığında ise çatlakların daha az sayıda fakat daha derin şekilde oluştuğu gözlemlenmiştir. Bu davranışa sebep olarak uçucu kül artışı ile betonun çekme ve basınç dayanımının azalması gösterilebilir (Şekil 14, Şekil 15).
Çimento içerisindeki uçucu kül betonun dayanımını ve maliyetini belirli oranda düşürmektedir. Bu durum ekonomiklik ve çevre kirliliği açısından sağlıklı olmasına rağmen belirli oranların üzerinde kullanılan uçucu küller dayanımın ve mukavemetinin azalması sebebi ile yapısal açıdan sakıncalı olabilir. Fakat literatürde uçucu kül ile geleneksel beton davranışının benzer olduğu vurgulanmaktadır (Arezoumandi vd. 2013). Dolayısıyla bilinçli bir tüketimle çevresel bir atık olan uçucu kül kullanımı teşvik edilmelidir.

FEN BİLGİSİ ÖĞRETMEN ADAYLARININ BİLİMSEL HİPOTEZ, TEORİ VE YASAYA YÖNELİK GÖRÜŞLERİ

Doç. Dr. Bülent AYDOĞDU*, İlkay ERSÖZ**

* Afyon Kocatepe Üniversitesi, Eğitim Fakültesi, baydogdu@aku.edu.tr

** Afyon Kocatepe Üniversitesi, Eğitim Fakültesi, ilkayersoz1995@gmail.com

Özet: Bu çalışmanın amacı, fen bilgisi öğretmen adaylarının bilimsel hipotez, teori ve yasa kavramlarına yönelik görüşlerini belirlemek ve öğretmen adaylarında oluşabilecek kavram yanılgılarını ortaya çıkarmaktır. Çalışmanın örneklemini Afyon Kocatepe Üniversitesi, Eğitim Fakültesi Fen Bilgisi Öğretmenliği programında okuyan 180 öğretmen adayı oluşturmaktadır. Veri toplamak aracı olarak; araştırmacılar tarafından geliştirilen bilimsel hipotez, teori ve yasa kavramları ile ilgili açık uçlu sorular kullanılmıştır. Çalışmadan elde edilen veriler betimsel analize tabi tutulmuştur. Çalışmanın sonucu fen bilgisi öğretmen adaylarının bazılarının bilimsel hipotez, teori ve yasa kavramlarına yönelik yanlış anlamalara sahip oldukları görülmüştür. Ayrıca bilimsel hipotez, teori ve yasa arasında hiyerarşik bir ilişkinin olduğunu düşündükleri tespit edilmiştir. Bunlara ilave olarak bazı fen bilgisi öğretmen adaylarının bilimsel bir yasanın kesin ve değişmez olduğunu düşündükleri belirlenmiştir.

Özet

Günümüzde sosyo-bilimsel konular üzerine daha fazla yer verildiği görülmüştür. Bu çalışmada, fen bilimleri öğretmenlerinin almış sosyo-bilimsel konulara bakış açıları detaylı olarak incelenmiştir.. Araştırmada, nitel araştırma desenlerinden olgu bilim deseni kullanılmıştır. Araştırmanın amacı, fen bilimleri öğretmenlerinin sosyo-bilimsel konular hakkındaki görüşlerini belirlemektir. Araştırmanın katılımcılarını, 2015-2016 eğitim öğretim yılı bahar döneminde 4 farklı ilkokulda görev yapan 12 fen bilgisi öğretmeni oluşturmaktadır. Araştırmanın katılımcılarının belirlenmesinde amaçlı örnekleme yöntemlerinden maksimum çeşitlilik örneklemesi kullanılmıştır. Araştırmada veriler, araştırmacılar tarafından geliştirilen ve açık uçlu sorulardan oluşan "Yarı Yapılandırılmış Görüşme Formu" ile nitel araştırma yöntemi kapsamındaki görüşme tekniklerinden biri olan odak grup görüşmesi tekniği kullanılarak toplanmıştır. Araştırmada, Fen Bilimleri öğretmenlerinin yaparak yaşayarak öğrenilen bir ders olmasından ve günlük yaşamdan ilişki kurularak işlemesinden dolayı Fen Bilimleri dersinin beceri kazandırmada çok önemli bir ders olduğunu belirttikleri sonucuna ulaşılmıştır. Ayrıca öğretmenlerin sosyo-bilimsel konuları kazandırmada öğretmen, aile, okul, öğrenci, program, eğitim sistemi, okul yönetimi ve çevrenin etkili olduğu belirtilmiştir.

- gmehmetay@gmail.com

ABSTRACT: Reducing effect of wear and friction is an important research area in machine design. In order to reduce these effects; lubrication, heat treatments and coatings are used on machine parts. Hard coatings are used in wear intensive environments and Plasma Transferred Arc (PTA) Coating is an innovative hard coating method. PTA coatings are used in applications such as automotive valves, glass and ceramic molds and plastic extrusion dies. PTA coating properties are gained from coating powder, thus coating powder research is an important aspect. In this study microstructure and wear behavior of AISI 4140 steel surface coated by Boron Carbide was inspected. Two different mixtures was prepared, Ekabor II ™ powder that contains Boron Carbide and pure Boron Carbide was mixed with a Nickel base to produce two different coating powder recipes. Wear tests were conducted on a Ball-on-Disk device with circular geometry. Optical and Electron Microscopy was used to characterize microstructure of coating layer formed on the surface of AISI 4140.

Key Words: Boron Carbide, PTA, Tribology, Ball-on-Disk

1. Introduction

Industrial applications cause friction and wear on parts. An important research field is the reduction of wear and friction. Lubrication is the first method used to reduce friction and wear. When lubrication cannot achieve required properties surface modification techniques are used. An important surface modification technique is Plasma Transferred Arc (PTA) coating that can reach high temperatures up to 30000K and has a relatively ease of use (Liu, Liu, Xu, & Yang, 2010). Low thermal stress on material, high coating thickness and high energy density makes PTA coatings a suitable method for glass and ceramic molds, automative valves, petro-chemical vanes, lamination cylinders, plastic extrusion molds and plastic extrusion screws (Gatto, Bassoli, & Fornari, 2004). PTA coating powders are composed of a base and additional materials. Base powders are usually composed of Cobalt and Nickel powders, where as WC, NiCrWC, Cr3C2, TiC and VC additives are used on steel to achieve required properties (Deuis, Yellup, & Subramanian, 1998).

In this study effect of B4C addition on PTA coatings was examined. Two different B4C sources were used and their effect on coating properties were inspected. Coating samples than tested on Ball-on-Disk machine. Both wear test samples and metallography samples were inspected by SEM and EDS.

2. Materials and Methods

In this study Ekabor II (that contains 5% B_4C, 5% KBF_4 and 90% SiC (Suwattananont, n.d.)) or Boron Carbide (B_4C) was mixed with Nickel in weight ratios given at Table 1 to produce PTA powder. The coating powder produced was put on a channel prepared on 100x40x20mm AISI 4140 steel with 1 mm depth and 3 mm width. A binding agent was used for binding powder to sample surface and samples were left to dry for 24 hours in a shaded moisture controlled environment. PTA coating is conducted at 100A current with a 3mm electrode and working distance of 4mm after 24 hour period and samples were preheated at 300°C. Argon was used as shielding and plasma gas at 25 l/min and 1.0 l/min flow rates respectively.

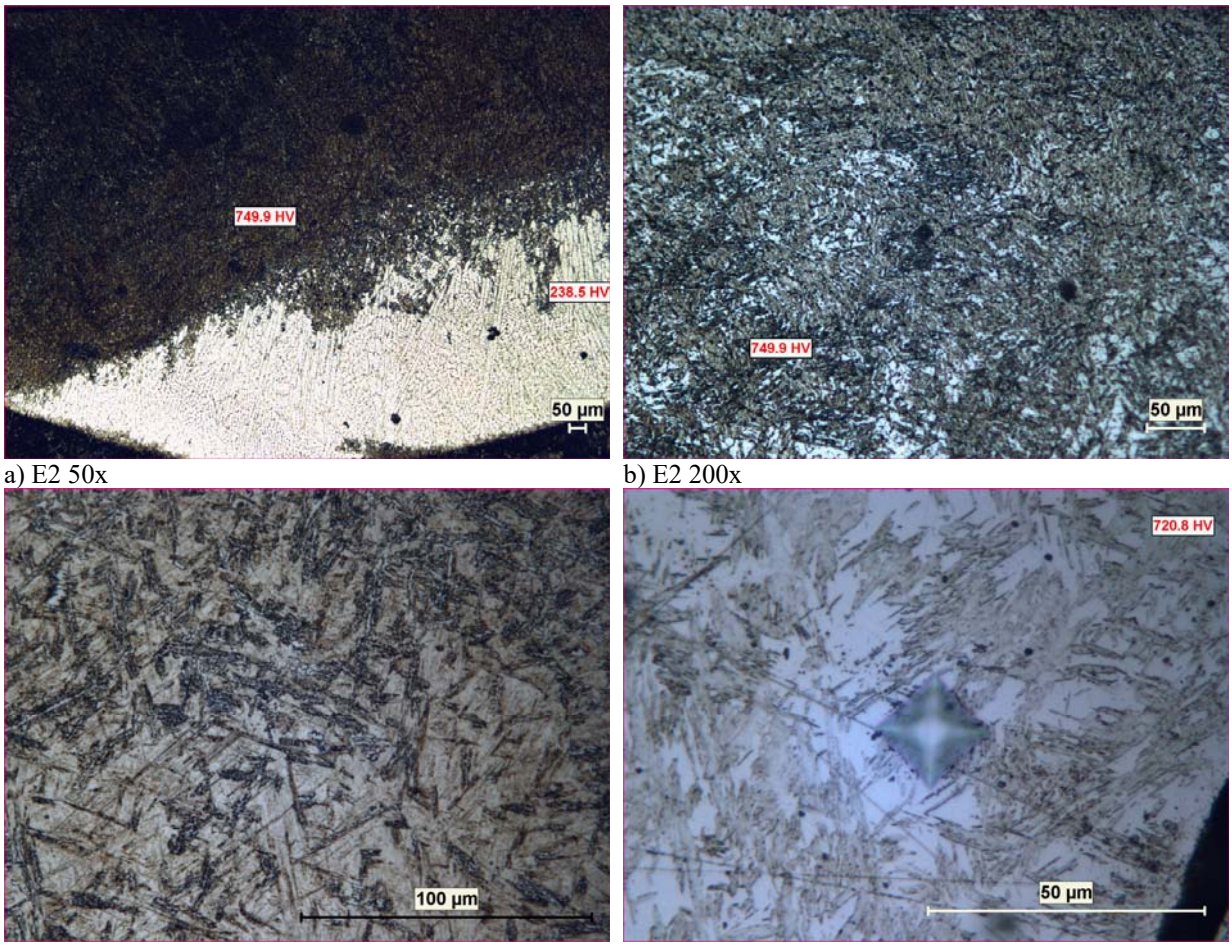
Table 1 PTA Powder Mixtures

Cross sections of PTA coated samples were taken for metallography analysis. Metallography specimens were prepared by standard sample preparation techniques and etched with 2% Nital etchant for 40s.

Ball-on-Disc wear tests were conducted on CSM tribometer at 3N load, 2.5 cm/s speed for 80m. Samples surfaces were prepared to 0.6µm average surface roughness prior to test. Counterpart for Ball-on-Disc tests were 3mm diameter WC balls and all tests were conducted at 25ºC ambient temperature and 35% relative humidity. In order to calculate specific wear rate wear track profiles were measured using Mutitoyo SJ-400 surface profilometer. Ball-on-Disc test results were analyzed using trib R package developed by authors (AY, 2015).

3. Results and Discussion

3.1 Microstructure



In order to understand coating a panoramic image of etched samples were obtained. As can be seen from **Figure *1***, coating produced different phase structures. These phases have varying hardness.

Figure 1. Panoramic view of D1

Figure *2* a, shows hardness values of different phases differ between 750HV and 240 HV. As seen in **Figure *2*** b, c and d; high hardness phases have more dendritic formations.

a) E2 50x b) E2 200x

c) C1 500x d) D3 1000x

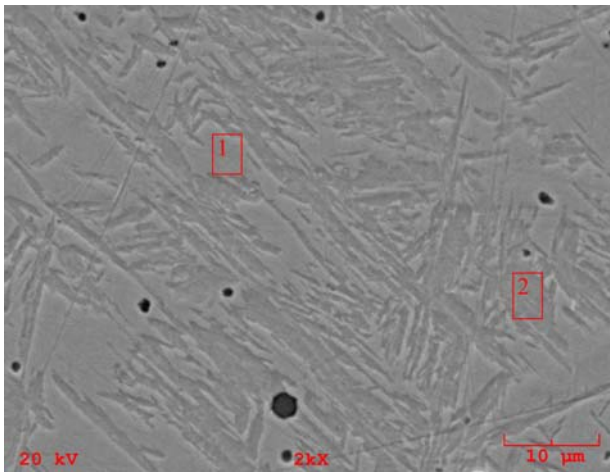

Figure 2. Samples etched with Nital 2% 40s

SEM and EDS analysis of samples were conducted. As a representation SEM images and EDS results of sample D3 is given at **Figure *3*** and **Figure *4*** respectively. SEM results show there are dendritic formations and carbide phases. EDS analysis determines Cr and Mn from substrate mixed into the coating.

Figure 4. EDS Analysis of sample D3

3.2 Ball-on-Disk Test

The results of ball-on-disk tests were analyzed using trib on R. Coefficient of friction and wear track volumes of samples are given at **Figure *5***. The sample with the least amount of wear track volume, C4 has the highest CoF.

a) Coefficient of Friction of Samples b) Wear Track Volume of Samples

Figure 5. Coefficient of Friction and Wear Track Volume

In order to understand wear characteristics, change in friction force with respect to distance graph given at **Figure *6*** should be inspected. As seen from figure C4 sample that contains 4% Ekabor II and was prepared at mill reached steady state around 30m like the other samples but then friction force started to increase. As seen from **Figure *7*** C4 has the smallest wear track of all samples.

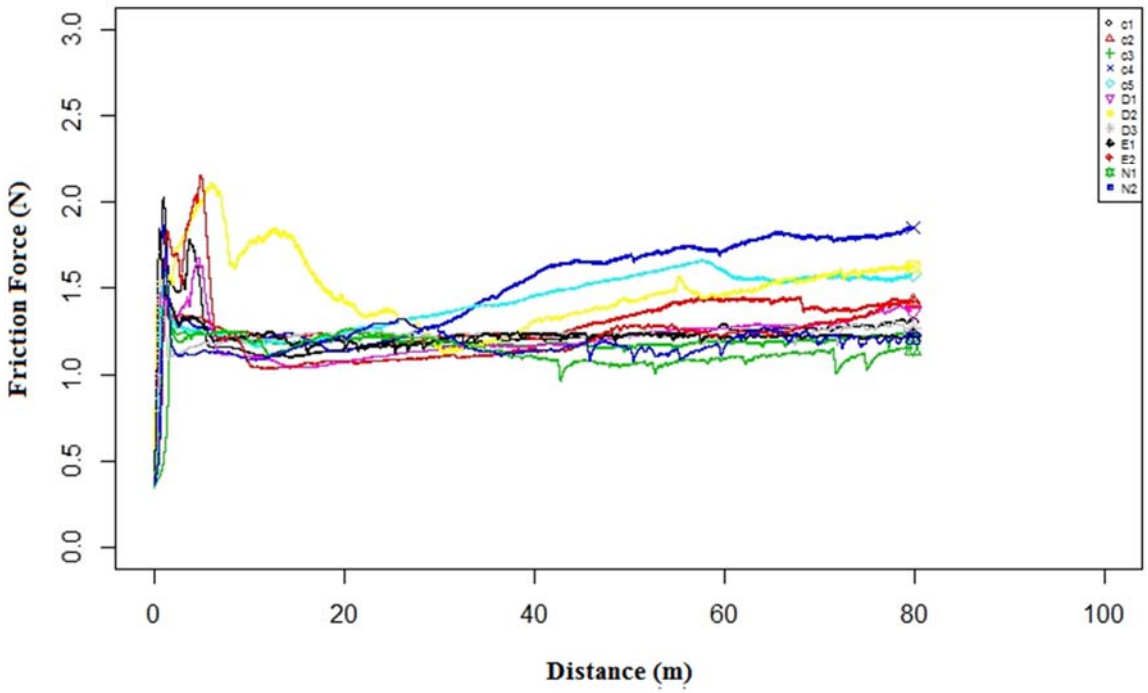

Figure 6. Friction Force vs Distance graph

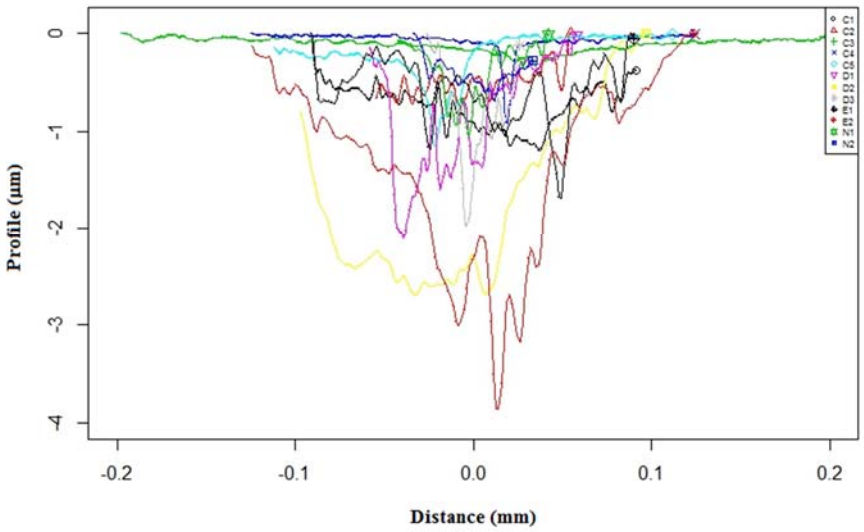

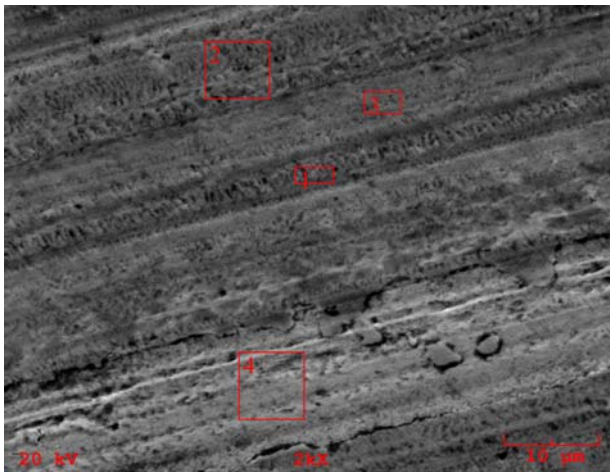

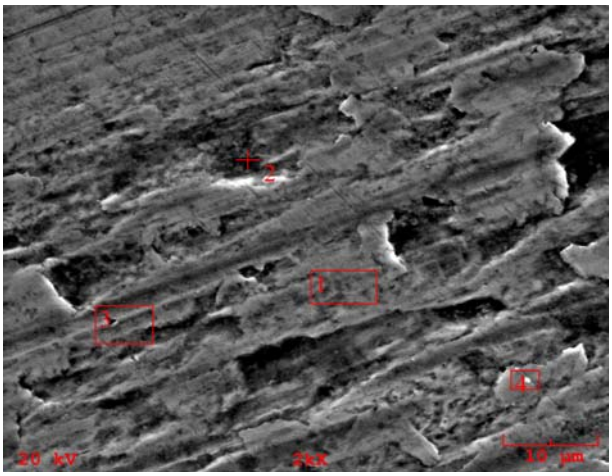

Figure 7. Wear Track Profile

So as to understand wear mechanism SEM and EDS analysis of wear tracks of samples were conducted. C4 shown adhesive and abrasive wear behavior and as seen from **Figure *8***. D3 however show mostly abrasive wear as seen at **Figure *9***.

Figure 9. SEM and EDS analysis of D3 Wear Track

High percentage of Tungsten (W) content in EDS results show that there exists higher adhesive wear on samples. This is the result of two mechanisms working on samples. First the wetting angle of Nickel to Tungsten is 0 (de Macedo, da Silva, & de Melo, 2003). Zero wetting angle means Nickel will coat WC if melts while wear tests. In studies conducted on WC cutting tools on Nickel alloys it was found that WC diffuses to Nickel and tool wear is observed (Xue & Chen, 2011), (Liao & Shiue, 1996). A study on NiCrSiB coating found that Nickel adheres to WC and hard carbides or borides remove that layer of Nickel and cause adhesion (da Silva & D'Oliveira, 2016). These studies confirm that adhesive wear is main wear mechanism on these samples.

In order to understand the relations between wear track volume, coefficient of friction and mixture ratio a 3d graphic was plotted. As seen from **Figure *10***, 2 samples are out of pattern. Those were E2 (6% B4C) and D2 (10% Ekabor II ™). These are result of increased abrasive wear on samples. Adhesive wear generated particles and those particles act as third body and caused an increase in abrasive wear.

 Copyright © International Science and Technology Conference (ISTEC)

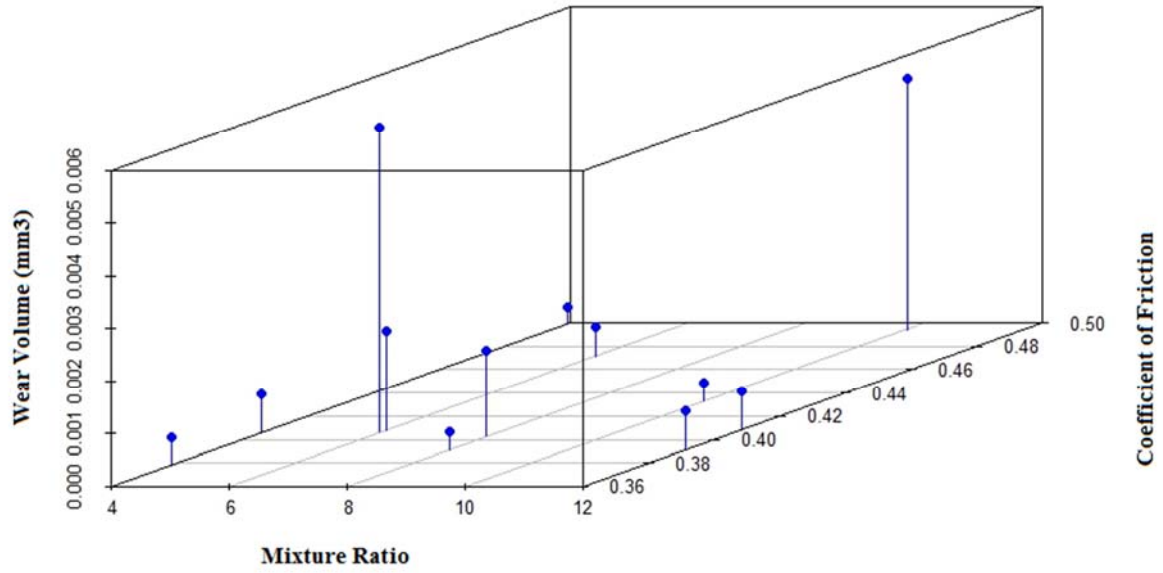

Figure 10. 3D plot of variables.

Inspecting Coefficient of Friction versus Wear Volume Plot at **Figure *11*** shows that N1, N2, C3, E1 and D3 result in best Coefficient of Friction and Wear Volume.

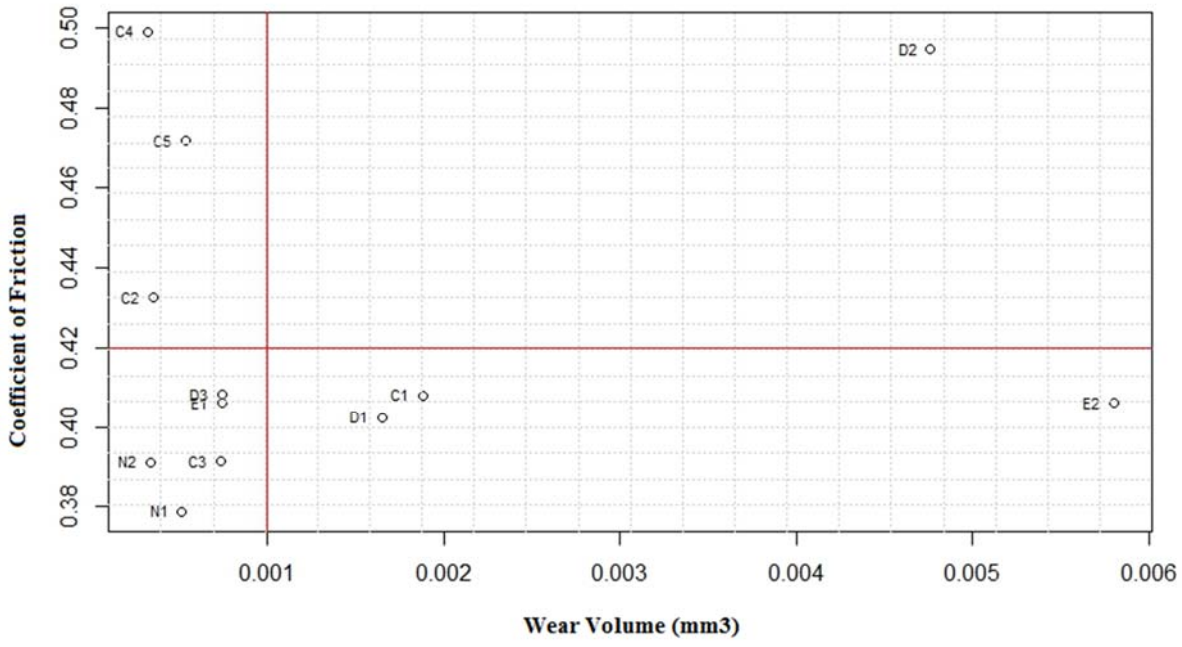

Figure 11. Coefficient of Friction versus Wear Volume Plot

Conclusion

 Copyright © International Science and Technology Conference (ISTEC)

The results show that

- Although B4C in coating increased surface properties, more than 4% B4C causes a decrease in surface properties, thus should be avoided.
- Nickel base shouldn't be used for low temperature environments because of adhesive wear properties. Thus Nickel base should be used in high temperature environments where Nickel Oxides can form.

FRICTION WELDING OF AL 7075 ALLOY AND 316 L STAINLESS STEEL

Osman TORUN

Afyon Kocatepe University, Bolvadin Vocational School, Afyonkarahisar, Turkey

otorun@aku.edu.tr

Abstract: Friction welding of Al 7075-T6 alloy and 316 L stainless steel carried out for different times under a constant friction and forging pressure, a forging time, rotational speeds. Microstructures of the welds were examined by scanning electron microscopy and optical microscopy. The results showed that all of the welded samples were free of any or crack along the weld interface. The chemical compositions of the interface of the welded joints were determined by using energy dispersive spectroscopy. The micro hardness of the welded samples was measured. The strength of the welds was determined by the shear tests. It was observed that the shear strength of the welds depended on the welding time. The maximum shear strength was 210, 7 MPa.

Keywords: Al7075, 316 L Stainless steel, Friction welding

Introduction

Cr–Ni austenitic stainless steels, especially, AISI 316 exhibit considerably better corrosion resistance than martensitic or ferritic steels and also have excellent strength and oxidation resistance at elevated temperatures (Kumar 2014, Kumar 2015, Marshal 1984, Oshima 2007). The fusion weld of these steels is usually the part of a system with reduced corrosion resistance and low-temperature toughness, and therefore in many cases it is the limiting factor for material application. The heat of fusion welding also leads to grain coarsening in the heat-affected zone and solidification cracking in the weld metal of stainless steels (ASM Handbook 1999). Aluminum is currently the most widely used metallic material besides steel. The mechanical characteristics of aluminum offer an increasing application field, especially where lightweight constructions are required (Kurt 2007, Lugscheider 1995) Al 7075-T6 alloy which is used in this study has low specific weight, high strength-to-weight ratio, as well as high electrical and thermal conductivity.

Friction welding is well known among solid-state welding methods and used for welding similar and dissimilar materials (Satyanarayana 2005, Torun 2011, Çelikyürek 201, Ates 2007). This method is very useful for the welding of dissimilar combination, and the welding process is easily automated. Also, this welding method has several advantages over fusion welding methods such as high energy efficiency, narrower heat affected zone (HAZ), and low welding cost. In particular, the friction welding is able to easily produce joints with high reliability; it is widely used in the automobile industry and applied to fabricate important parts such as drive shafts and engine valves. Moreover, this welding method can also provide the joint of dissimilar combination as well as the circular pipe. Some researchers have reported that the mechanical and metallurgical properties of the friction-welded joints of circular pipes of dissimilar combination show desirable characteristic (Wang 1975, Maalekian 2007, Kimura 2016)

Materials and Methods

Al 7075-T6 alloy and AISI 316 L stainless steel were received from a private company. The cylindrical samples 50 mm in length and 8 mm in diameter were machined from 316 L stainless steel and Al 7075-T6 alloy. The friction welding experiments were carried out by a continuous-drive friction welding machine for different times under a constant friction and forging pressure, a forging time and a rotational speed (Table 1). After welding, the welded samples were cut perpendicular to the welding interface. The surfaces of the welded samples were ground with 1200 grinding paper and polished with 1 µm diamond paste, then 316 L sides of welded samples were etched with a mixture of H2O (30 ml), HNO3 (30 ml), HCl (20 ml) and HF (20 ml) and The Al 7075-T6 sides were etched with Keller. The microstructures were observed with light microscopy and scanning electron microscopy (SEM). The chemical compositions of the weld zone and the base alloys were determined using energy dispersive spectroscopy (EDS). Microhardness values were measured to both sides from center of the

Table 1. Parameters of the friction welding.

Friction Speed, rmp	Friction Pressure, (MPa)	Forging Pressure (MPa)	Friction Time (s)	Forging Time (s)	Burn-off (mm)
1000	50	100	6	10	0,4
1000	50	100	8	10	0,9
1000	50	100	10	10	1,5
1000	50	100	12	10	2,2

welded samples by means of Vickers indenter with a load of 100 g. Shear tests were performed to determine the strength of the weld interface using an electromechanical universal test machine (Shimadzu AG-IS-250) at room temperature. A specially designed specimen holder was used to measure the shear strength. Three samples were tested for each welding condition.

Results and Discussion

Optical micrograph of the sample welded for 10 s is presented in Fig. 1. All of the welded samples were of sound quality, and they did not exhibit any pores or crack formation along the weld interface. Three main regions are observable on the Al 7075 side of the interface of all of the welded samples: a dynamically recrystallized zone with very fine grains (DRX), thermo-mechanically affected zone (TMAZ) and heat affected zone (HAZ) (Fig. 1a) (Khalid 2010). The width of the DRX for all of the welded samples was approximately 250-330µm. The micrographs demonstrated a slight variation in the width of DRX independent on the friction time. There was not any change on the 316 L stainless steel side (Fig. 1b).

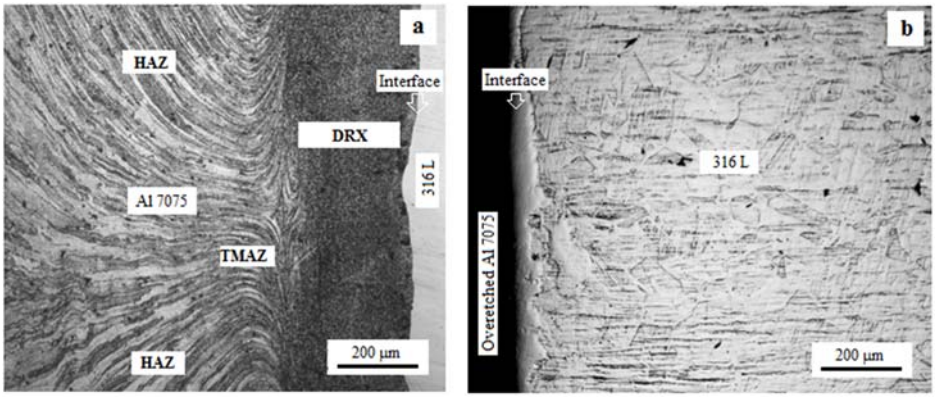

Figure 1.Optical micrograph of the sample welded for 10 s.

SEM micrograph and EDS analysis for welded samples for 10 s are shown in Fig. 2. It cannot be clearly observed that a diffusion zone at the weld interface for all of the welded samples (Fig 2a). However, EDS analysis results showed that there was a diffusion zone at the weld interface all the welded samples (Fig. 2b).

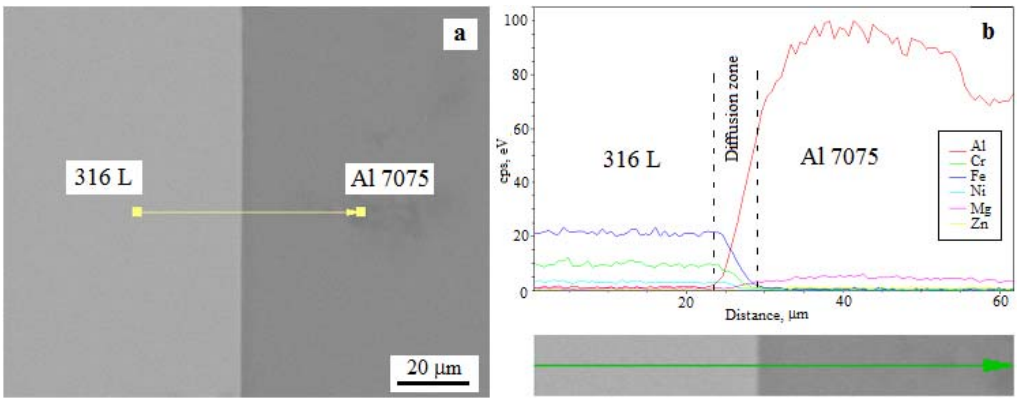

Figure 2.SEM micrograph and EDS analysis of welded samples for 10 s.

 Copyright © International Science and Technology Conference (ISTEC)

The diffusion zone present at the weld interface consists of Fe, Al, Cr, Ni, Mg atoms. The diffusion zone is rich in Fe and Al atoms and has lower amounts of Cr, Ni and Mg atoms.

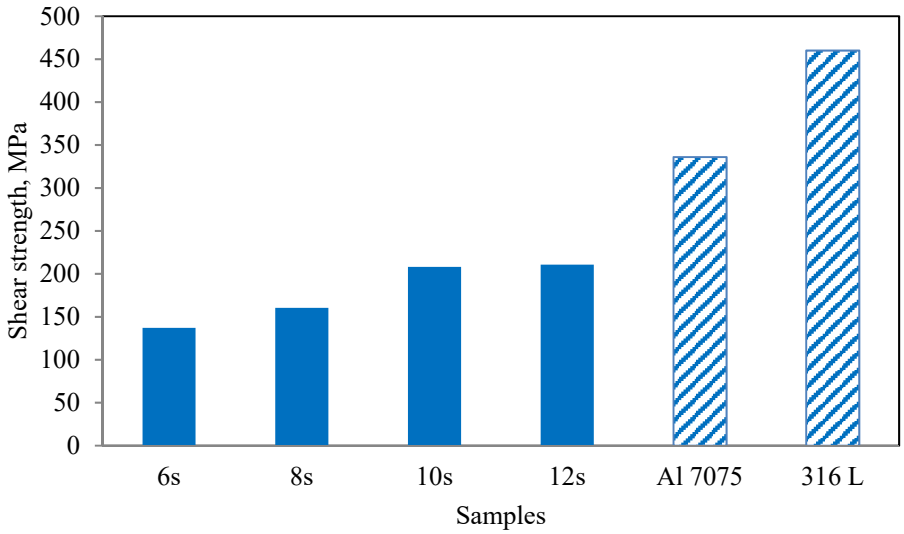

Figure 3.The shear strengths of the welds and the base alloys.

The shear strengths of the welds and the base alloys are shown in Fig. 3. The results showed that the values of the shear strength of the welded samples increase with increase in friction time. Under these experimental conditions, it can be said that the shear strength of welds was dependent on the friction time. This observation indicates that the increase in the shear strength is related to the magnitude of the accumulated heat input, which depends on the friction time. Especially, 6 s and 8 s friction times were not high enough to produce the required heat for the friction welding, compared with the 10 and 12 s treatments. Microhardness values were measured in the direction from the center of the weld to both sides of the welded samples. The micro hardness profiles for all of the friction welding times were found to be similar. Fig. 4 shows the hardness values obtained from all welded samples.

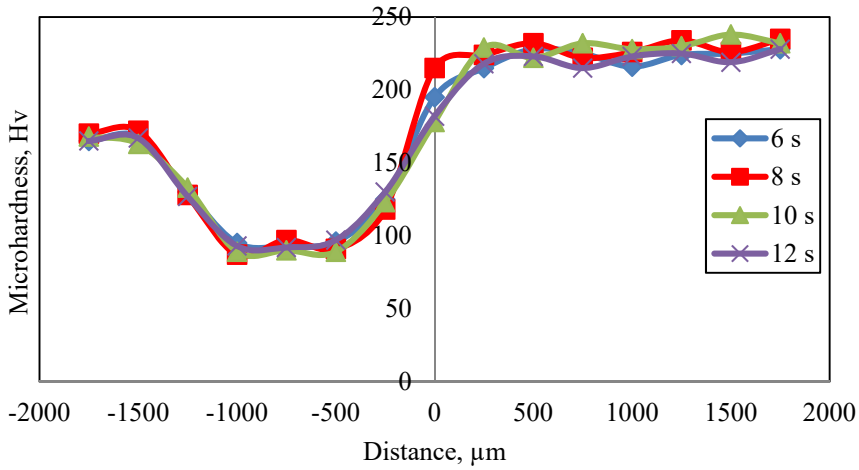

Figure 4. The hardness values obtained from all welded samples.

The hardness of the DRX, HAZ and TMAZ is lower than that of the base alloy on the Al7075-T6 side. The DRX hardness is not as low as the HAZ/TMAZ because of its extremely fine grained microstructure. The drop in HAZ and TMAZ can be explained based on strengthening precipitation. Al 7075 base metal in T6 condition contains a large number of submicroscopic Mg_2Zn and AlCuMg precipitate particles, which confer high strength and

 Copyright © International Science and Technology Conference (ISTEC)

hardness to the alloy. During friction welding, The HAZ/ TMAZ experiences high enough temperatures for causing dissolution or coarsening of these strengthening precipitates. During cooling, the cooling rates are high enough to allow any reprecipitation of these strengthening phases. Therefore, the HAZ/ TMAZ hardness is lower than the base alloy harness (Khalid 2010). There was not any change on hardness of 316 L stainless steel side.

Conclusion

Al 7075-T6 alloy and 316 L stainless steel were welded by friction welding methods. All of the welded samples were of sound quality, and they did not exhibit any pores or crack formation along the weld interface. The friction time play an important role in flash formation and welds shear strength. The welds shear strength samples and burn-off increase with increase in the friction time. After welding, while three different zone observed in the Al 7075-T6 side, there was not any difference on the 316 L stainless steel side. The hardness profiles for all friction time are similar. It was observed that Al 7075-T6 side has different hardness values.

FRICTION WELDING OF THE AISI316 STAINLESS STEEL TO COMMERCIALLY PURE COPPER

İbrahim Çelikyürek
cibrahim@ogu.edu.tr

The AISI316 stainless steel was bonded with commercially pure Copper by friction welding process. The welding process was carried out by continuous drive friction welding machine. The friction time was used as friction welding parameter, and the effects of the friction time on the microstructure and mechanical properties of the welding interface were investigated. Characterization of welding interface microstructure and fractured surfaces of joints was carried out by optical microscopy and scanning electron microscopy. Microstructural investigations revealed that the welding interfaces have a smooth and continues morphology. The micro hardness' and shear strengths of the base materials and the welding interfaces were measured in order to determine the mechanical properties of joints. The results showed that the welding interface microstructure and strength was affected by the friction time.

FUTURE APPLICATION OF THE MOTION THREADED MECHANISM

Vladimír Andrlík
vladimir.andrlik@fs.cvut.cz

Lucie Drahorádová
lucie.drahoradova@fs.cvut.cz

This paper introduces the linear motion drives, mainly lead screw, ball screw and a new innovative idea – motion threaded mechanism. The motion threaded mechanism is linear motion screw with rolling elements, sheaves. Presumptive advantages in comparison with the ball screw are smooth and silent movement, possibility of high threaded pitch, possibility of variable threaded pitch (variable linear motion), simple and flexible construction and cheap production. A disadvantage is low load capacity. These and other qualities have to be confirmed by testing and simulations. Future application is very wide. It is possible to use it in all production industries, health care, military, research equipment, automatic home equipment and so on.

GEOGRİD DONATILI ŞEV DOLGUSUNUN STABİLİTE ANALİZİ

Zülküf KAYA, Erdal UNCUOĞLU, Hacı Bekir KARA, Aykut EROL

Erciyes University, Engineering Faculty, Department of Civil Engineering, Kayseri - Turkey

zkaya@erciyes.edu.tr

Özet: Geogrid malzemeler zemin içerisindeki çekme yüklerini alarak zeminin taşıma kapasitesini arttırmakta ve oluşması muhtemel farklı oturmaları azaltabilmektedir. Geogrid donatılı dolgular özellikle yol dolguları ile otoyol kenarlarında yapılan şevlerde yaygın olarak kullanılmaktadır. Gerekli olması durumunda, yapı temelleri kontrollü sıkıştırılmış dolgu tabakları üzerine de oturabilmektedir. Bu çalışmada; Kayseri (Türkiye) ilinde yer alan ve temel alanının yaklaşık üçte birlik kısmının 70º'lik şev açısına sahip kontrollü sıkıştırılmış gegrid donatılı dolgu üzerine oturduğu10 katlı bir yapının dolgu şevinin stabilitesi MiraSlope ve PLAXIS 3D programları kullanılarak analiz edilmiştir. Limit denge yöntemine dayalı analiz yapan MiraSlope programı yardımı ile kullanılacak gogrid donatının boyu, tabaka sayısı ve tabakalar arası mesafesi belirlenmiştir. Daha sonra elde edilen stabil sistemin yapı ile etkileşimi ve deformasyon analizleri de sonlu elemanlar yöntemine dayalı analizler yapan Plaxis 3D programı kullanılarak araştırılmıştır.

Anahtar Kelime: Geogrid, Dolgu Şevi, MiraSlope, Plaxis 3D

Abstract: Geogrid materials receiving tensile strengths in soil increase the bearing capacity of soils and decrease probable different settlement. Geogrid reinforced fillings especially are widely applied at the road embankment and slopes made in highway edges. If it is necessary, foundations of building can be sit on layer of controlled compacted earthfill. In this study, the stability of geogrid reinforced embankment slope which has a slope angle of 70 degree has been analyzed using the MiraSlope and Plaxis 3D softwares. In the analyses, the load of a ten-storey building was considered as a surcharge pressure acting on the surface of geogrid reinforced embankment. The approximately one-third of the foundation base placed on the controlled compacted filling. The properties related with the geogrids such as the lengths of the geogrids, the vertical distances between the geogrid layers and the number of geogrid layers have been determined using the MiraSlope software based on the limit equilibrium method. The deformation analyses of the system have been performed using the Plaxis 3D software based on finite element method.

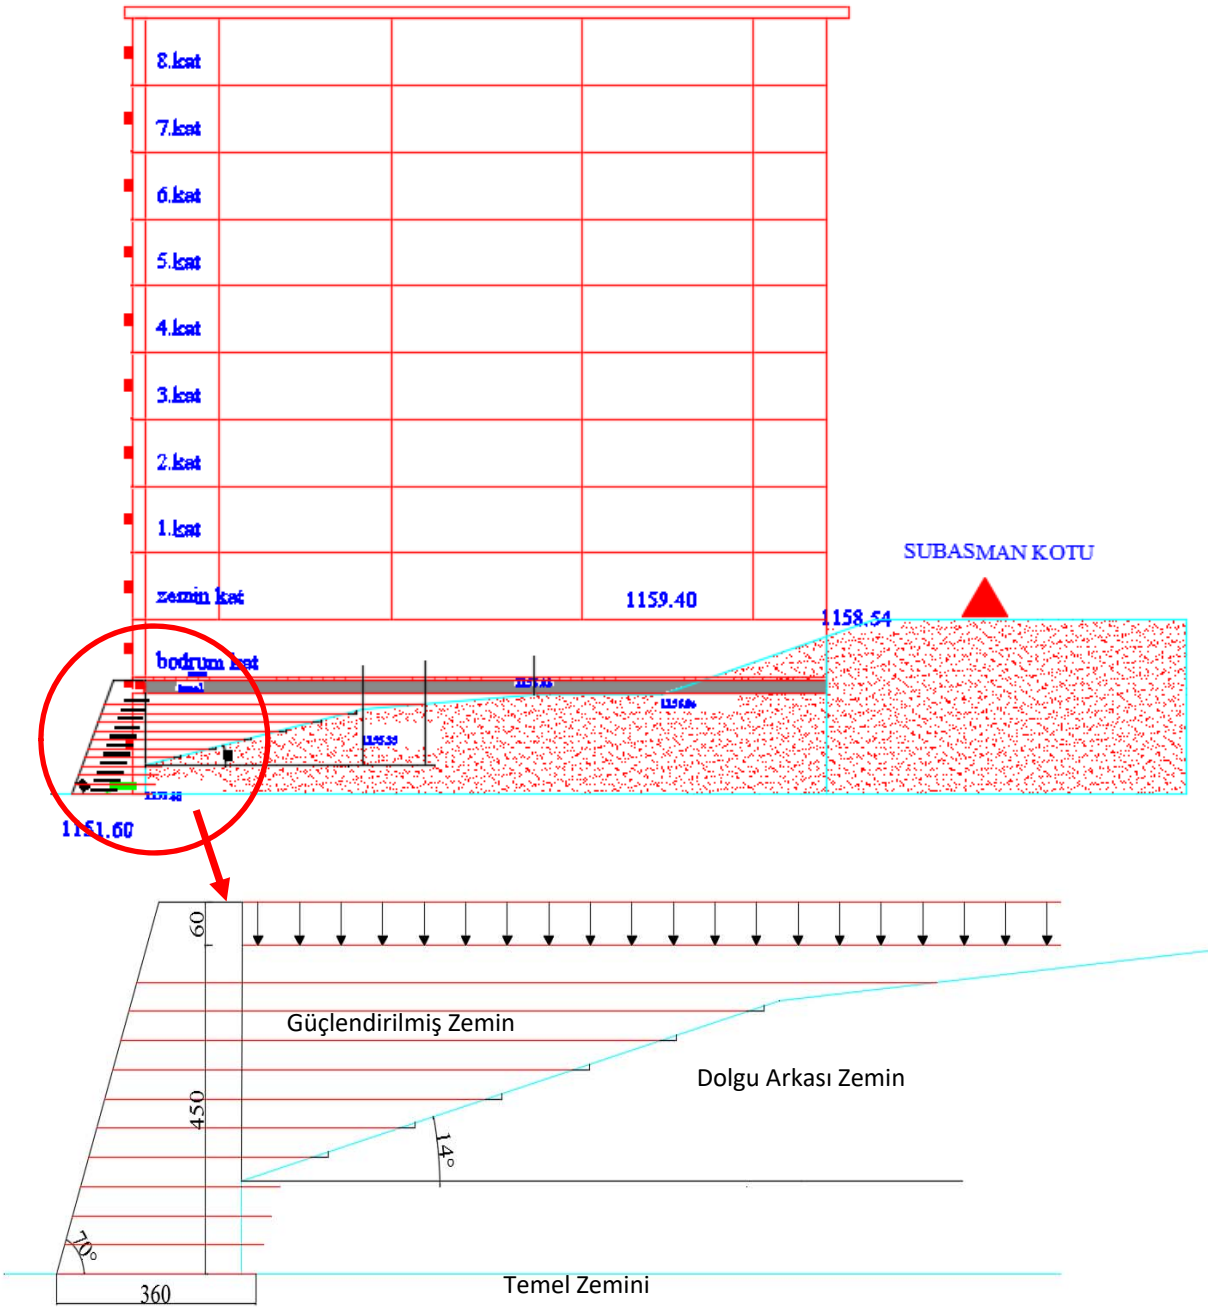
Keywords: Geogrid, Embankment Slope, MiraSlope, Plaxis 3D

Giriş

Son yıllarda geosentetik malzemelerin zemin iyileştirme uygulamalarında kullanımı artmaktadır. Geosentetikler, örgülü ve örgüsüz geotekstiller, geogrid,geomembran, geonet, geohücre ve geokomposit olarak sınıflandırılabilir (Karagül, 2015).

Geogridler, yüksek çekme mukavemetleri ve uzun ömürleri sayesinde donatılı duvar olarak ve zemin iyileştirilmelerinde yaygın olarak kullanılmaktadır. Zayıf zemin tabakaları üzerine dolgu yapılması durumunda dolgu ile zayıf zemin tabakaları arasında ve yüksekliği fazla olan dolgu imalatlarında kullanılabilmektedir. Geogrid malzemeler zemin içerisindeki çekme yüklerini alarak zeminin taşıma kapasitesini arttırmakta ve oluşması muhtemel farklı oturmaları azaltabilmektedir (Karagül, 2015).

Bu çalışmada; Kayseri (Türkiye) ilinde yer alan ve temel alanının yaklaşık üçte birlik kısmının 70o'lik şev açısına sahip kontrollü sıkıştırılmış gegrid donatılı dolgu üzerineoturduğu10 katlı bir yapınındolgu şevinin stabilitesiMiraSlope ve PLAXIS 3D programları kullanılarak analiz edilmiştir.MiraSlope programı yardımı ile kullanılacak gogrid donatının boyu, tabaka sayısı ve tabakalar arası mesafe belirlendikten sonra elde edilen stabil sistemin yapı ile etkileşimi ve deformasyon analizleri Plaxis 3D programı kullanılarak araştırılmıştır.



Miraslope Programi İle Analiz

Yapılan analizlerde MiraSlopeVersion1.0 yazılımı (limit denge yaklaşımı) kullanılmış olup analizlerde kullanılan geometri ve yükleme bilgileri (yapı-zemin kesiti) Şekil 1'de verilmiştir. Arazi araştırmalarında yol kotundan itibaren (1151.60) 15.0 m derinlik boyunca yer altı su seviyesine rastlanılmamıştır. Yapıdan zemine aktarılan

Geogrid Donatılı Dolgu

Bodrum, zemin ve sekiz normal kattan oluşan bir yapı inşa edilecek olup, yapı temel taban alanı 25.0 x 32.0 m = 800.0 m²'dir. Yapı temeli, 60 cm kalınlığında radye temel olarak tasarlanmıştır. Yapı temelinin oturacağı alanda yer alan doğal eğim nedeni ile temelin uzun kenar doğrultusundaki yaklaşık olarak üçte birlik kısmı doğal zemin kotuna göre yaklaşık olarak 4.50 m yukarıda yer aldığından mevcut durumda boşta kalmaktadır. Bu amaçla; radye temelin boşta olan kısmının oturacağı bir temel zemini oluşturmakamacıyla yol kotundan itibaren yaklaşık olarak 4.50 m yükseklikte 70° eğime sahip geogrid donatılı kontrollü sıkıştırılmış bir dolgu inşa edilmesi planlanmış ve temel tabanının tamamının aynı kot seviyesinde zemine bastırılması amaçlanmıştır.

Plaxis 3D 2012 kullanılarak gerçekleştirilen üç boyutlu non-lineer sonlu eleman analizleri ile söz konusu yapının inşası ile birlikte geogrid donatılı dolguda meydana gelebilecek deformasyon davranışlarının nasıl oluşacağı ve büyüklükleri ile bu deformasyon davranışları sonucunda yapı temelinde oluşacak kesit tesirleri incelenmiştir.

Yapı temel zemini sarı, beyaz ve gri pomza içeren tüf birim olduğu ve kalınlığının değişken olmakla birlikte 20.0 m'ye kadar devam ettiği belirlenmiştir. Başakpınar tüf birimi; orta derecede bozulmuş, sert, kırıklı ve çatlaklı yapıya sahip, orta derecede ayrışmış düşük dayanımlı volkanik kayaç olarak tanımlanmıştır. Laboratuvar deney sonuçları söz konusu tüf birimin ortalama doğal birim hacim ağırlığının γ_n = 23.0kN/m³ ve en düşük serbest basınç mukavemeti (q_u) değerinin de 321.50 kg_f/cm^2 olduğu belirlenmiştir (Kaygısız, 2010). Söz konusu alanda yapılan sondaj çalışmalarında yer altı suyuna rastlanmamıştır.

Sayısal analiz çalışmalarında kullanılan Başakpınar Tüf biriminin davranışının modellenmesi için gerekli parametreler (elastisite modülü, E, ve poisson oranı, ν) söz konusu alan ile ilgili yapılmış tezçalışmasından alınmıştır (Kaygısız, 2010). Çalışmada kullanılan geogrid "Miragrid 3XT" olup geogrid malzeme eksenelrijitlik değeri "Miragrid 3XT" geogridine ait mukavemet ve deformasyon değerleri kullanılarak hesaplanmıştır.

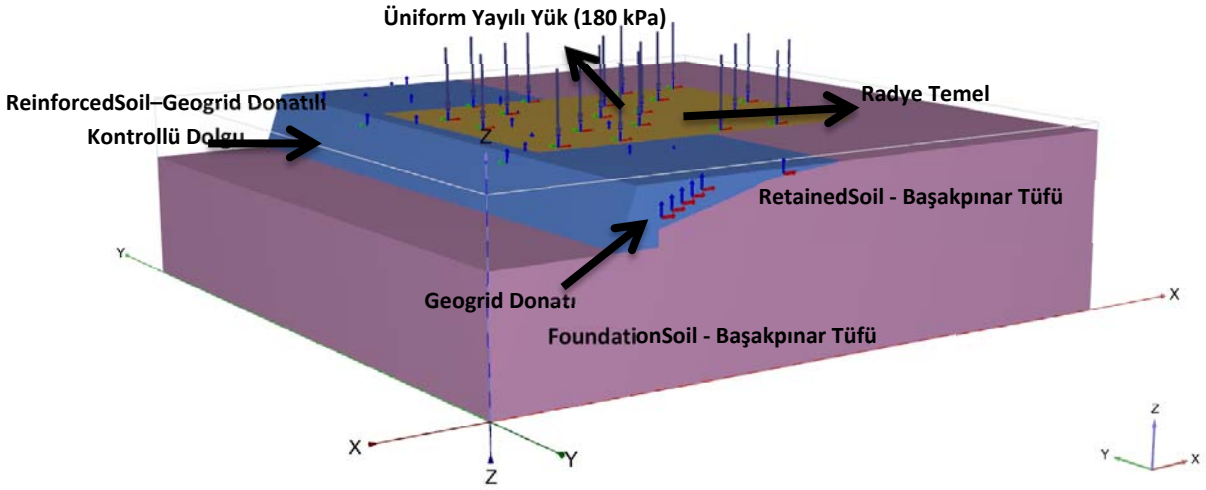
Radye Temel Yapısının Modellenmesinde Kullanılan Parametrik Değerler

B+Z+8N kattan oluşacak yapının, boyutları yaklaşık olarak 24.0 x 30.0 m² olan 60 cm kalınlığındaki birradye temele oturacağı kabulü ile analizler gerçekleştirilmiştir. Yapı yükü, temel alanı boyunca üniform yayılı olarak etkiyen 180 kN/m² değerinde basınç yükü olarak hesaba katılmıştır. Radye temel, Plaxis programında Plate eleman kullanılarak modellenmiş olup plate eleman için gerekli parametrik değerler Tablo 4'te verilmiştir.

Tablo 4: Radye temele ait özellikler

Temel Kalınlığı	0.60 m.
Malzeme Tipi	Lineer Elastik
γ	24 kN/m³
E	30 000 000 kN/m²
ν	0.15



Geogrid Donatının Modellenmesinde Kullanılan Parametrik Değerler

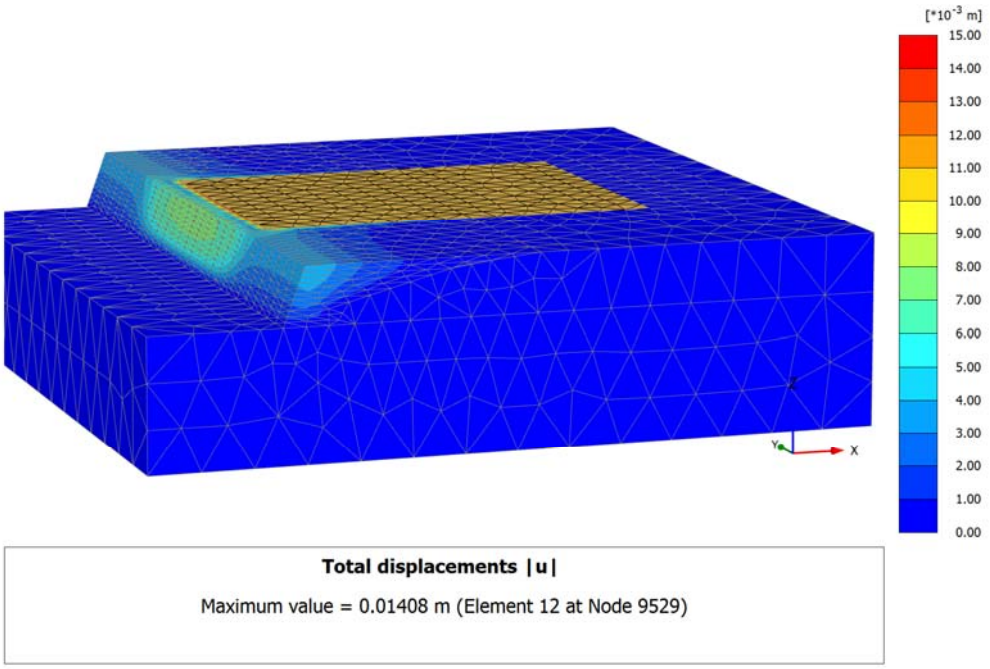
Donatılı kontrollü dolgunun içerisinde kullanılan Miragrid 3XT geogrid donatı malzemesi, plaxis analizlerinde geogrid eleman kullanılarak modellenmiştir. Zemini çekmeye karşı güçlendiren donatı elemanları için analizlerde eksenel rijitlik (EA) değerlerinin mutlaka göz önüne alınması gerekmektedir. Miragrid 3XT geogrid donatının eksenel rijitlik değeri Tencate Firması tarafından bu malzeme için tanımlanmış mukavemet ve deformasyon davranışlarına ait değerler dikkate alınarak hesaplanmıştır. Analizlerde kullanılan geogridin malzemetipi elastik, EA değeri ise 310 kN/m olarak alınmıştır.

Plaxis 3D 2012 Programı ile Gerçekleştirilen Sonlu Eleman Analizleri ve Elde edilen Sonuçlar

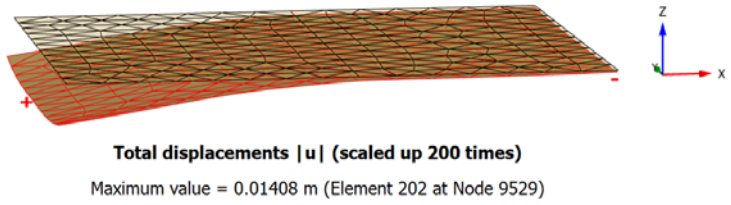
 Copyright © International Science and Technology Conference (ISTEC)

Analizlerde orta kabalıktaki (medium) sonlu eleman ağı kullanılmıştır. Analizlerde göz önüne alınan problem geometrisi ve onun sonlu elemanlara ayrılmış hali sırası ile Şekil 2 ve Şekil 3'te gösterilmiştir.

Şekil 2. Analizlerde kullanılan problem geometrisi



Söz konusu inşaat alanının eğimli olmasından dolayı başlangıç gerilme koşulları "gravityloading" seçeneği ile oluşturulmuştur. Başlangıç gerilme koşullarının oluşturulmasının ardından her biri 40 cm kalınlığındaki 11 adet dolgu tabakası ve her bir dolgu tabakası üzerine serilen geogrid donatı tabakasının imalatı "stagedconstruction" olarak adlandırılan aşamalı inşa seçeneği ile gerçekleştirilmiştir. ReinforcedSoil olarak adlandırılan donatılı kontrollü dolgunun oluşturulması sonrasında bir bölümü dolgu üzerine basacak şekilde radye temel oluşturulmuştur. Radye temelin inşasından sonra da üniform yayılı yük temel yüzeyine uygulanarak yapı yükü temsil edilmiştir. Son hesaplama adımında ise "safety" seçeneği kullanılarak tasarlanan geometriye ait güvenlik analizi yapılıp ilgili problem için güvenlik katsayısı değeri elde edilmiştir.



Şekil 3. Problem geometrisinin sonlu eleman ağı

Analizler sonucunda elde edilen toplam deplasman değeri Şekil 4'da radye temelde oluşan kesit tesirleri Şekil 5'te verilmiştir. Toplam deplasman 1.40 cm olarak belirlenmiş olup yatay deplasman miktarı 0.013 cm ve düşey deplasman miktarı ise 0.19 cm olarak hesaplanmıştır. Analizler sonucunda; temelin dolgu üzerine basan köşesinde, dolgu ve doğal zemin birleşim noktasında ve doğal zemin üzerinde yer alan köşesinde seçilen düğüm noktalarında yük-deplasman ilişkileri elde edilmiş olup Şekil 6'da verilmiş olup temel köşesinde düşey yönde meydana gelen deplasman miktarı yaklaşık olarak 1.10 cm olarak belirlenmiştir.

Mobilize olan maksimum kayma mukavemeti değeri ise 140.6 kN/m² olarak belirlenmiştir.Radye temelde oluşan kesit tesirlerinin maksimum değerlerinden kesme kuvveti, Q_{max}=154.4kN/m, eğilme momenti, M_{max}=106.7 kNm/m olarak belirlenmiştir. Analiz sonucu çözümlenen sisteme ait güvenlik katsayısı değeri SF = 3.985 olarak elde edilmiştir.

Sonuçlar

- 10 katlı bir yapı altında yapılması planlanan geogrid donatılı dolgudan oluşan kesit üzerinde MiraSlope version 1.0 yazılımı kullanılarak yapılan analizlerde T_{ult}=51.1kN/m olan L= 3.40 m uzunluğunda 11 adet gogrid kullanılması durumunda yeterli güvenlik sayıları elde edilmiştir.
- Plaxis programı (sonlu elemanlara dayalı analiz) yardımı ile söz konusu sistemin deformasyon davranışı analiz edilmiş ve elde edilen deplasman değerlerinin izin verilebilir sınırlar içerisinde kaldığı görülmüştür.
- Gogrid kullanılarak oluşturulan şev dolgusunun Plaxis programı yardımı yapılan stabilite analizi sonucunda güvenlik katsayısı SF = 3.985 olarak elde edilmiştir.

GÖRME ENGELLİLER İÇİN BİLİŞİM DÜNYASININ YETERLİLİĞİ VE KULLANILABİLİRLİĞİ; DÜNYADA VE TÜRKİYE'DE YAPILAN ÇALIŞMALAR

Ümmühan AKHİSAR

Kocaeli Üniversitesi, Hereke MYO, Kocaeli- Türkiye

ummuhan.akhisar@kocaeli.edu.tr

Özet: Bilgisayar teknolojileri ve Internet, günümüz insanının, bilgi ve iletişim ihtiyaçlarına daha kolay, daha hızlı ve daha ekonomik ulaşabilmesini sağlamaktadır. Bununla bağlantılı olarak bilişim dünyasının kullanımı, her alanda yaygınlaşmış ve kendine önemli bir yer edinmiştir. Fakat bilişim dünyasında web sitelerinin kullanılabilirliği görme engelli bireyler için tasarlanmamış olması, önemli bir ihtiyacı da ortaya çıkarmıştır. Web sitelerinin, normal kullanıcılara sunduğu imkanların, görme engelli bireyler için de sağlanması önemli bir sorumluluktur. Böylece elektronik ortamdaki bilgi, erişim özgürlüğü, özgüven ve iş yapabilirlik kapıları görme engelli kişiler için de açılacaktır. Bu çalışmada, görme engelli bireyler için bilişim dünyasında web sitelerinin kullanımında karşılaştıkları sorunlar, anket çalışması ile saptanmış ve paylaşılmıştır. Ayrıca görme engelli bireyler için Dünyada ve Türkiye'de yapılan çalışmalar araştırılmış, yaşanılan sorunlar ve öneriler ileri sürülmüştür.

Anahtar Kelimeler: Görme Engelli Bireyler, Bilişim Teknolojileri, Anket Çalışması.

Abstract: Computer technology and the Internet, the modern human, easier access to information and communication needs, provide faster and more economical access. In this connection the use of information technology in the world, has gained widespread in all areas and self-important. However, the availability of information on the website to see a world not designed for people with disabilities has also revealed an important requirement. Web sites, the opportunities offered by normal users, is also an important responsibility to provide vision for people with disabilities. Thus, the electronic information from the media, freedom of access, visual capabilities and business confidence will open doors for people with disabilities. In this study, the problems encountered by the use of websites for the visually impaired individuals in the IT world, determined by surveys and shared. For visually impaired individuals also researched the work done in the world and Turkey, experienced problems and suggestions were put forward.

Keywords: Visually Impaired Individuals, Information Technology, Survey.

Giriş

Günümüzde bir kurumun veya bir kişinin web sayfası edinmesi neredeyse zorunluluk haline gelmiştir. Hazırlanan web sayfalarının ziyaret eden herkes tarafından sorunsuzca erişilebilir olması gittikçe daha fazla önem kazanmaktadır. Örneğin, kamu kurumları kamu hizmeti sağladıkları web sayfalarının tüm vatandaşlar tarafından sorunsuzca erişilebilir olduğundan emin olmalıdır. Ticari firmalar ise daha kaliteli hizmet sunmak, mevcut müşterilerini korumak ve müşteri potansiyelini artırmak adına, web sayfalarının erişilebilirliğini sağlamalıdır. Erişilebilirlik, diğer taraftan, bir grup kullanıcı için de büyük önem taşımaktadır: engelli kişiler. (Yücel, Acartürk 2006)

Çeşitli engelleri sebebiyle günlük yaşamlarında pek çok olanaktan ve hizmetten engelli olmayanlar kadar yararlanamayan bu kişiler için, oturdukları yerden bir bilgisayar aracılığıyla çeşitli hizmetlerden faydalanmak, bilgi kaynaklarına erişmek ve iletişim kurmak gibi işlevler daha kolay ve daha az maliyetle mümkün olabilmektedir. Özellikle görme engelliler için, bilgisayar kullanımı ve pek çok hizmet ve olanağa ulaşmalarını mümkün kılan web sayfaları, bu kişilerin yaşam kalitesinin yükseltilmesinde büyük rol oynamaktadır. (Yücel, Acartürk 2006).

Görme engelliler için günümüze kadar bilişim dünyasında birçok çalışma yapılmıştır. Emiroğlu B. Çalışmalarında görme engelli kişilerin de yararlanabilmesi için, verilen web hizmetlerinde bazı düzenlemeler yapılması gerektiğini vurgulamıştır. Böylece elektronik ortamdaki bilgi, erişim özgürlüğü, özgüven ve iş

 Copyright © International Science and Technology Conference (ISTEC)

yapabilirlik kapıları görme engelli kişiler için de açılacağını belirtmiştir. çalışmasında, görme engelli bireyler için bilgisayar erişimi ve bilişim çalışmaları konusunda var olan imkanlar ve yürütülen çalışmalardan kesitler sunulmakta, Türkiye ve Dünyadan örnekler verilerek durum hakkında yorum ve öneriler getirilmektedir.

Yücel C., Acartürk C., çalışmalarında, görme engelli kişilerin bilgisayar kullanırken ve web sayfalarını ziyaret ederken karşılaştığı sorunlar özetlemekte; web sayfalarının hangi özelliklere sahip olursa görme engelli kişilerce için erişilebilir olduğu üzerine öneriler sunmuşlardır.

Türkiye Engelsiz Bilişim Platformu "Engelsiz bir dünya için bilişimle engelleri kaldırıyoruz" , isimli projelerinde engellilerin bilişimden beklentileri konulu anket çalışması yapmıştır. Anket sonuçlarını yayınlayarak gerekli düzenlemelere yardımcı olmuştur.
(http://www.engelsizbilisim.org/engellilerin-bilisimden-beklentileri-konulu-anket-calismasi-sonuclari/)

Günümüzde artık görme engelli bireyler içinde birçok çalışmalar yapılmaktadır. Bunlardan kullanılanları kısaca açıklayabiliriz.

Yapılan Çalışmalar :

-Görme Engelliler için Market Alışveriş Arabası: Görme engelli bireyler için market dizaynının bir standardizasyonu sağlandıktan sonra ilk olarak ürünlerin bulunduğu stantların adını sesli olarak bildirimi yapılır. İkinci adımda ürünlerin bulundukları raflardaki bar kodların bar kod okuyucuyla okunup kulaklığa ürünün ad, marka, miktar ve fiyat bilgilerinin sesli olarak bireye bildirilmektedir.

Görme engelliler için Sesli Adımlar: Avea'nın teknolojik desteğiyle kullanıma hazır hale gelen "Sesli Adımlar" uygulaması, Boni Beacon'larının kurulu olduğu MetroCity AVM'de, bulunulan noktayı belirtme, mekân sorgulama gibi özellikleriyle görme engellilerin alışveriş merkezlerinde daha rahat ve özgür dolaşabilmelerine imkân veriyor. Uygulama, MetroCity Alışveriş Merkezi'nin yanı sıra ECE Türkiye bünyesinde İstanbul'daki Neomarin AVM, Maltepe Park ve Marmara Park AVM, Eskişehir'de Espark AVM ve Ankara'da ACity AVM'nin dahil olduğu 6 alışveriş merkezinde kullanılıyor. Sesli Adımlar uygulaması aşağıdaki linklerden indirilebilir:
https://itunes.apple.com/tr/app/sesli-ad-mlar/id915304189?mt=8

Görme Engelliler için Akıllı Ev: Ortam aydınlıksa eğer perdeler açık durumda kalır ve oda lambaları sönük durumdadır. Karanlıkta ise perdeler otomatik olarak kapanmakta ve oda lambaları yanmaktadır. Giriş kapısı üzerinde bulunan Ultrasonik sensor ile cisim algılama işlemi yapılmaktadır. Akıllı evde bulunan 2 oda kapısı da el çırpma sesi ile açıp kapanmaktadır. Oda sıcaklığı arttığında fan devreye girer ve oda soğutması tamamlandığında fan tekrar pasif olur.

Yöntem ve Bulgular

Bu çalışmada Beyazay Engelliler Derneği aracılığıyla, görme engelliler için bilişim dünyasının kullanılabilirliği 120 görme engelli bireye bir anket yapılarak araştırılmıştır. Anket çalışmasında görme engelli bireylerin bilişim dünyasını kullanırken yaşadığı zorluklar ve Web sitelerine bakış açısı incelenmiştir.

- Ankete katılanların %80'i hiç görmeyen, %20'si az gören bireydir.

Tablo 1: Yaş Dağılım Tablosu

Görme engelliler için bilişim dünyasının yeterliliği ve kullanılabilirliği hakkında yapılan ankete katılan görme engelli bireylerin yaş dağılımı	
20-30 Yaş Arası	%43,8
30-40 Yaş Arası	%50
40 Yaş üstü	%6,3

Yaş dağılım tablosu daha çok yetişkin (orta yaşlı) kesim bilişim ile daha ilgili ve duyarlı olduğunu gösteriyor.

 Copyright © International Science and Technology Conference (ISTEC)

Tablo 2: Görme Engelli Bireylerin bilişim dünyası yeterliliği ile ilgili düşünceleri

Görme engellilerin bilişim dünyasında eşit haklara sahip olduğunu düşünüyor musunuz?	Evet	Hayır
	%6,7	%93,3

Tablo2'de de açık olarak görme engelliler için web siteleri uygun bir şekilde tasarlanırsa, rahatlıkla erişim imkanı olabilecektir. Buradan da anlaşıldığı gibi görme engelli bireyler bilişim dünyasında eşit haklara sahip olmadıklarını belirtmişlerdir.

Tablo 3: Görme engelli bireylerin web sayfalarının kullanım zorluğuna bakış açısı

	Evet	Hayır
İnternet yazılım ve tasarımı görme engelliler için uygun mu?	%14,3	%85,7
Kurum ve kuruluşların erişim olanağını yeterli buluyor musunuz?	%0	%100

Tablo 4: Görme engelli bireylere yönelik bilişim olanakları

Görme engellileri yönelik bilişim olanakları hazırlanabilir mi?	Evet	Hayır
	%100	%0

Tablo 5: Görme engelli bireylerin için web sayfalarının uygunluğu

	Evet	Hayır
Web siteleri görme engelliler için uygun mudur?	%0	%100
Web sitelerinin görme engelliler için tasarlanmasını tercih eder misiniz?	%93,3	%6,7
Görme engellilerin rahat kullanabileceği bir site v ar mı?	%6,7	%93,3

Sonuçlar ve Öneriler

Bilgisayar teknolojileri ve Internet, günümüz insanının, bilgi ve iletişim ihtiyaçlarına daha kolay, daha hızlı ve daha ekonomik ulaşabilmesini sağlamaktadır. Bununla bağlantılı olarak bilişim dünyasının kullanımı, her alanda yaygınlaşmış ve kendine önemli bir yer edinmiştir. Fakat bilişim dünyasında web sitelerinin kullanılabilirliği görme engelli bireyler için tasarlanmamış olması, önemli bir ihtiyacı da ortaya çıkarmıştır. Web sitelerinin, normal kullanıcılara sunduğu imkânların, görme engelli bireyler için de sağlanması önemli bir sorumluluktur. Böylece elektronik ortamdaki bilgi, erişim özgürlüğü, özgüven ve iş yapabilirlik kapıları görme engelli kişiler için de açılacaktır. Bu çalışmada, görme engelli bireyler için bilişim dünyasında web sitelerinin kullanımında karşılaştıkları sorunlar, anket çalışması ile saptanmış ve paylaşılmıştır.

GÖRÜNTÜ İŞLEME TEKNİKLERİ KULLANILARAK ÇOKTAN SEÇMELİ SINAVLARI DEĞERLENDİRME SİSTEMİ

Hüseyin ESKİ[1], Ümit KOCABIÇAK[2]
[1,2]Sakarya Üniversitesi, Bilgisayar ve Bilişim Bilimleri Fakültesi, Bilgisayar Mühendisliği
[1]heski@sakarya.edu.tr, [2]umit@sakarya.edu.tr

Abstract: Eğitimde kullanılan ölçme değerlendirmede en yaygın kullanılan yöntemlerin başında çoktan seçmeli sorular gelmektedir. Özellikle öğrencilerin tasarım yapması, ürün oluşturması gerektirmeyen sınavların çoğunda uygulanabilir ve alt bilişsel düzey ölçmeleri için objektif bir ölçüm yöntemidir. Bu çalışmada, herhangi bir ofis tarayıcısı kullanılarak bilgisayar ortamına aktarılan sınav kâğıtları üzerinde, görüntü işleme teknikleri kullanılarak çoktan seçmeli soruları değerlendiren bir sistem gerçekleştirilmiştir. Geliştirilen bu sistem özel bir optik form kâğıdı gerektirmediği için sınav maliyetleri büyük ölçüde düşmektedir.
Keywords: Görüntü işleme, OMR, optik işaret okuma, çoktan seçmeli sınav

1. GİRİŞ

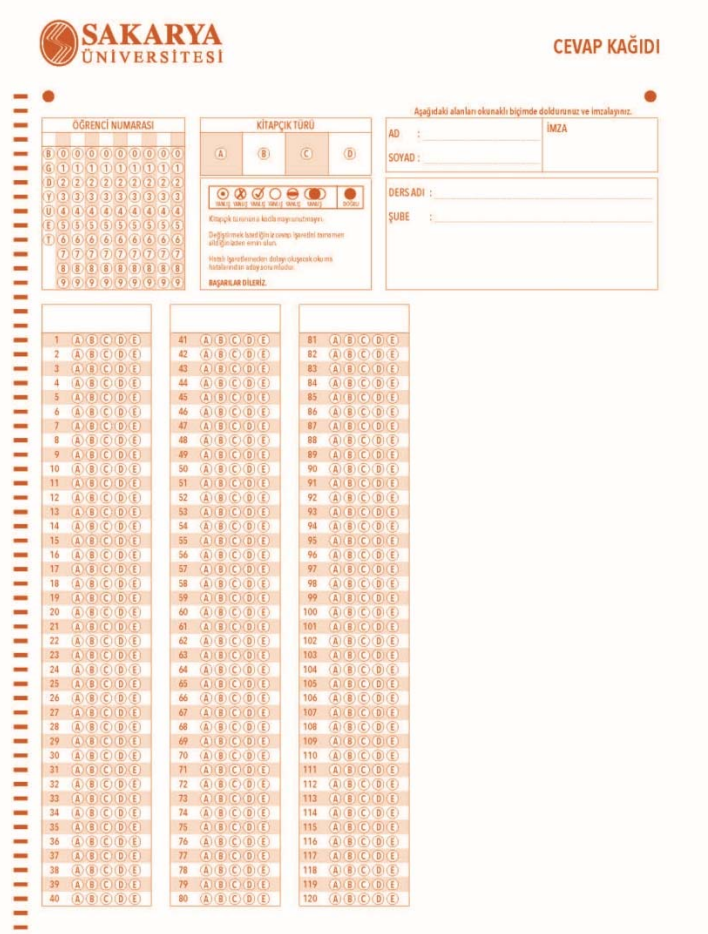
Bilişim teknolojilerinin gelişimiyle beraber insan gücüyle gerçekleştirilen birçok işlem bilgisayar tarafından otonom şekilde yapılır hale gelmiştir. Yapay zekâ, bilgisayar görmesi, sayısal görüntü işleme gibi yöntemler tıp, tarım, imalat, güvenlik ve eğitim olmak üzere birçok alanda yaygın olarak kullanılmaktadır.

Demirbaş ve Dursun 2007 yılında yaptıkları çalışmada tarım alanında ülkemizde yaygın olarak yetiştirilen bazı buğday çeşitleri tanelerinin uzunluk, genişlik, kalınlık, izdüşüm alanı, çevre, küresellik derecesi ve farklı şekil katsayıları gibi bazı fiziksel özelliklerinin görüntü işleme tekniğinden yararlanılarak belirlenmesi üzerine çalışmıştır. Elle ve görüntü işleme teknikleriyle yapılan çalışmalar karşılaştırıldığında bilgisayar temelli otonom bir sistemin daha verimli olacağı kararlaştırılmıştır (Demirbaş & Dursun, 2007).

Kısaoğlu'nun çalışmasında üretilen dokuma kumaşların kalitesi kamera vasıtasıyla alınan görüntüler işlenerek analiz edilmiştir. Geliştirilen sistemin maliyet, güvenilirlik, hız ve uluslararası kabul edilebilirlik açısından avantaj sağladığı ortaya koyulmuştur (Kısaoğlu, 2011). Üretim sürecinde ürün tespiti, nesne tanıma, ürün ayrıştırma, ürün hasar tespiti de imalatta kullanılan temel alanlar arasında yer almaktadır (Samtaş & Gülesin, 2012).

Bulut ve arkadaşlarının çalışmasında kırık kemiklerin tespitinde görüntü işleme teknikleri kullanılmıştır. Geliştirilen yöntem, geleneksel yöntemlere göre çok daha başarılı olduğu gözlenmiştir (Bulut, Ozcinar, Ciftcioglu, & Akpek, 2015). Ortopedi, mikroskobik, kardiografi, sintigrafi, ultrason ve röntgen görüntülerini iyileştirme ve değerlendirme görüntü işlemenin tıpta kullanıldığı başlıca alanlar arasında yer almaktadır(Samtaş & Gülesin, 2012).

Şenol ve Fidan hazırladıkları bir düzenek sayesinde bilgisayara takılan web kameradan alınan görüntüleri görüntü işleme yöntemleriyle değerlendirmişlerdir (Şenol & Fidan, 2014). Kağıtların tek tek elle okutulması gerektiğinden daha hızlı ve pratik çalışan bir sisteme ihtiyaç duyulmaktadır.

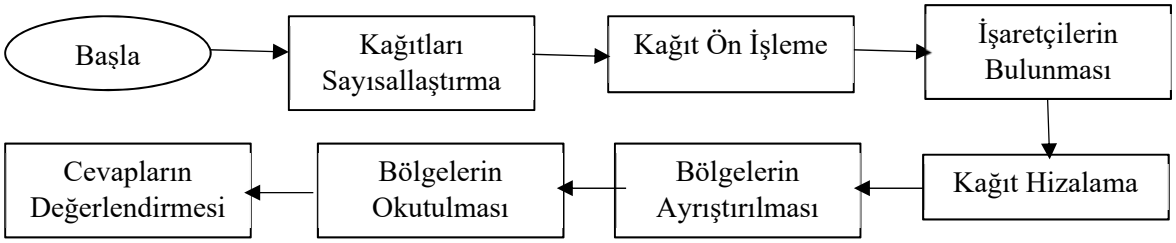


Bu çalışmada ise görüntü işleme teknikleri kullanılarak çoktan seçmeli sınavların değerlendirilmesi ve istatistiksel veriler çıkartılması hedeflenmiştir. Microsoft C# programlama dili ve AForge.NET kütüphanesi kullanılarak geliştirilen program vasıtasıyla, taratılan sınav kâğıtları değerlendirilmiş ve

 Copyright © International Science and Technology Conference (ISTEC)

soru bazlı başarı oranları hesaplanmıştır. Makalenin diğer bölümleri şu şekilde organize edilmiştir. Bölüm 2'de geliştirilen sistemin adımlarının detaylı olarak yer aldığı materyal ve metot kısmı yer almaktadır. Bölüm 3'de ise çalışmanın sonucunda elde edilen veriler, geliştirilen sistemin avantajları ve gelecek çalışmaları içermektedir.

2. MATERYAL VE METOT



Çoktan seçmeli sınav kâğıtlarında kodlamaları gereken öğrenci numarası, kitapçık türü, cevap alanları ile öğrencinin adı soyadını, ders bilgilerini yazacakları bölgeler de yer almaktadır. Tasarlanmış olan sınav kâğıdında Şekil 1'de göründüğü gibi ilk hanesi öğrenim türünü ifade eden karakter diğerleri rakam olmak üzere 10 haneli öğrenci numarası, 4 farklı gurubu destekleyen kitapçık türü ve toplamda 120 tane olan 5 seçenekli soru cevap anahtarı yer almaktadır.

Şekil 1: Sakarya Üniversitesi Test Sınav Kağıdı

Geliştirilen sistem çoktan seçmeli kâğıtların bilgisayar ortamına aktarılması, resim üzerinde ön işlem, işaretçilerin bulunması, hizalama, bölgelerin ayrıştırılması, bölgelerin okutulması, değerlendirme ve aktarma aşamalarından oluşmaktadır (Şekil 2).

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 2: Sistemin Akış Diyagramı

Kağıtları Sayısallaştırma

Kağıtların bilgisayar tarafından görüntü işleme teknikleri kullanılarak değerlendirilmesi için sınav kağıtlarının kamera, resim çekme veya tarayıcı vasıtasıyla sayısallaştırılma işlemidir. Kamera veya resim çekme yönteminde kağıtlar tek tek elle işleme tabi tutulacağı için hem zaman hem de iş gücü gerektirmektedir. Sayısallaştırma işlemi için çoklu doküman tarayıcı(ADF) türünde bir tarayıcı tercih edilmiştir. ADF tarayıcılar, özelliğine göre değişmekle beraber 50-100 adet kağıdı tek seferde tarayıcıya yükleyerek dakikada 40-100 adet kağıdı tarayarak bilgisayar ortamına aktarma imkanı sunmaktadır.

Kağıt Ön İşleme

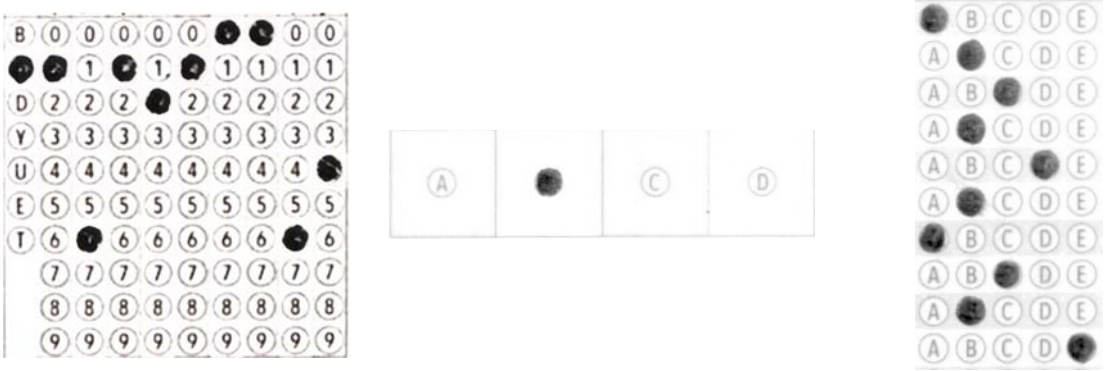
Sayısallaştırılan görüntülerdeki istenmedik bozulmaların (gürültülerin) giderilmesi, farklı çözünürlük ve boyutlardaki görüntülerin boyutlarının ayarlanması bu aşamada gerçekleştirilmektedir. Resim üzerinde hızlı işlem yapmak ve piksellerin boyutunu düşürmek için renkli görüntünün siyah beyaz görüntü haline getirilme işlemi yine bu aşamada yapılmaktadır.

İşaretçilerin Bulunması

Şablon eşleştirme(template matching) algoritması kullanarak kâğıdın solunda bulunması gereken şerit işaretçi (Şekil 3) tespit edilmektedir. Verilen şablona uymayan görüntüler hatalı kâğıt olarak değerlendirilmektedir. Tarayıcıya yerleştirilen kâğıtlarda arkası dönük haldeki yerleştirilen kâğıtlar veya sınav kâğıdı formatında olmayan kâğıtlar bu aşamada tespit edilmektedirler. Şerit işaretçinin konumu tespit edildikten sonra en üst noktası hizasında nokta şeklindeki iki nokta işaretçi (Şekil 4) bulunmaktadır. Nokta işaretçilerin konumlarına bakılarak kâğıdın hizalaması ve her bir işaretleme hücrelerinin kaç pikselden oluştuğunun hesaplanmasına yardımcı olmaktadır.

Şekil 3: Kağıdın Solundaki Şerit İşaretçi

Şekil 4: Nokta İşaretçi



Kağıt Hizalama

Sınav kâğıtlarının sayısallaştırılması aşamasında bazı kâğıtlar belirli oranda dönebilmektedirler. Nokta şeklindeki iki işaretçinin konumlarına bakarak kâğıdın kaç derece döndüğü hesaplanmakta ve kâğıt hizalanmaktadır.

 Copyright © International Science and Technology Conference (ISTEC)

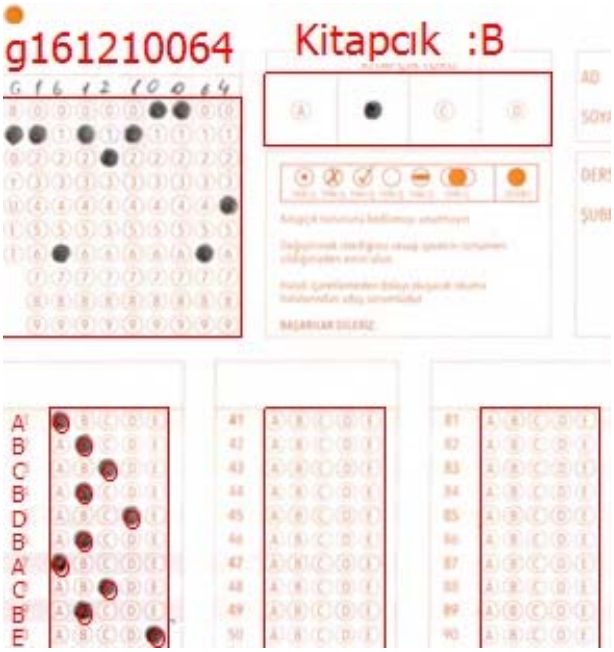
Bölgelerin Ayrıştırılması

Sol üstte yer alan nokta işaretçisinin konumuna göre öğrenci numarası (Şekil 5a), kitapçık türü (Şekil 5b), cevapların kodlandığı bölgelerin (Şekil 5c) koordinat, genişlik ve yükseklik bilgileri hücre miktarı cinsinden sistemde tanımlanmıştır. Nokta işaretçiler arası 42 hücreden oluştuğundan bu mesafe 42'ye bölünerek her bir hücrenin kaç pikselden oluştuğu hesaplanır. Bölgelerin bilgileri hücre bazında olduğundan, ayrıştırma işleminde hücre değerinden piksel değerlerine geçişte bu oran kullanılır.

a) Öğrenci Numarası Bölgesi b) Kitapçık Türü Bölgesi c) Cevaplar Bölgesi

Şekil 5: Nokta İşaretçi

Bölgelerin Okutulması



Bir önceki aşamada ayrıştırılan resimler bu aşamada hücre hücre yorumlanarak okutulma işlemi gerçekleştirilmektedir. Örnek olarak öğrenci bölgesi 10 sütundan oluşan ilk hanesi karakter sonraki 9 hanesi rakamlardan oluşmaktadır. Öğrenci bölgesi sütun olarak 10 eşit alana bölünür ve her alan öğrenci numarasının bir hanesine karşılık gelmektedir. Bu alanlar da kendi içlerinde 10 eşit parçaya bölünerek de hanelerin hücrelerini oluşturmaktadır. Her bir hücrenin piksel değerlerine bakarak siyah olan piksel sayısının hücredeki toplam piksel sayısına oranı hesaplanmaktadır ve hücre doluluk oranı olarak isimlendirilmektedir. Hücre doluluk oranı 0.25'in üzerinde olan hücreler işaretlenmiş olarak değerlendirilmektedir. Bir hanede birden fazla işaretlenmiş hücre bulunması durumunda ise hane değeri hatalı işaretleme anlamına gelen 'X' olarak değerlendirilmektedir. Hatalı okumaları tespit edebilmek için resim üzerinde okutulması gereken bölgeler dikdörtgen içerisine alınmaktadır. Aynı zamanda sistemin okuduğu değerler de yazılmakta ve cevaplar ise resmin üzerine işaretlenmektedir (Şekil 6). Bu işaretli resimler de bilgisayar ortamına kaydedilerek ileri geri alınarak hızlı bir şekilde kontrol sağlanabilmektedir.

3. TARTIŞMA VE SONUÇ

Geliştirilen sistem Sakarya Üniversitesi Bilgisayar, Bilgisayar ve Bilişim Sistemleri Fakültesi, Mühendisliği Bölümünde 11 farklı derste uygulanmış ve 5384 tane çoktan seçmeli sınav kâğıdı değerlendirilmiştir. Bu kâğıtlarda yapılan incelemelerde 43 tane kâğıtta kitapçık türü kodlanmadığı, 27 öğrenci numarasının yanlış kodlandığı veya kodlanmadığı, 45 tane kâğıtta öğrencinin önceki tercihini düzgün silemediğinden dolayı çift cevap olarak okunduğu ve 9 tane kâğıt ters taratıldığı için değerlendirmeye girmediği tespit edilmiştir. Karşılaşılan problemler incelendiğinde sistemin sorunsuz çalıştığı, her sistemde olduğu gibi kullanıcı tabanlı sorunların ortaya çıktığı ve zamanla eğitimlerle sorunun optimum seviyeye indirilebileceği kararına varılmıştır.

Optik okuyuculu sistemlerde kullanılan 110gr kâğıt yerine gündelik hayatta kullandığımız 80gr kağıt kullanılması sadece kağıt maliyetini üçte iki oranında düşürmektedir. En uygun optik form okuyucu cihaz düşünüldüğünde tarayıcı kullanılması da cihaz maliyetlerini en az dörtte üç oranında düşürmektedir.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 6: Değerlendirilmiş Kağıt Görüntüsü

Çalışmanın bundan sonraki bölümünde çevrimiçi bir sistem tasarlanarak, taratılmış kâğıtların yüklenmesi öğrencilerin notlarını görüntülemesi hedeflenmektedir. Düşünülen bu sistemle öğrenciler isteğe bağlı olarak cevap kâğıtlarını da görüntüleyebileceklerdir. Kullandığımız sistem sadece özel hazırlanmış çoktan seçmeli sınav kâğıt formatını desteklemektedir. Form üzerine farklı noktalara konumlandırılmış öğrenci numarası, kitapçık türü ve cevap bölgeleri kullanıcılar tarafından tanımlanarak genel bir optik form okuma sistemi geliştirilmesi hedeflenmektedir.

Abstract: With the growing need for service oriented architecture and the rise of cloud computing, web services have become the focus of many researchers and software developers. Subsequently, the standardization of web services has become crucial. In this paper we are evaluating existing standard related to web services mainly to accomplish the most popular and common tasks performed in web services. WSDL for web service description, PBEL for business process description and creation,WSO2 web service application, SOAP messaging protocol, and WS-Policy to describe and create rules to be applicable on web services. We list the main limitations of BPEL and SOAP and we propose a graph based service composition algorithm as an alternative to overcome existing issues with BPEL and combine it with the use or REST instead of SOAP.

Keywords: Web Services, WSDL, PBEL,SOAP, WSPolicy,WSO2, graph-based service composition.

Introduction

Web services can be any application or service available over the web. The execution of most services over the net require only for the user to install and use the appropriate browser. Most web based services are compatible with all popular browsers. Therefore, the issues of software and hardware compatibility is rare if not absent. All of this has pushed software developer and user to opt for web based services. From that came the need for standardization. Since web based applications can be developed using different languages and have different functionalities; One of the key attributes of Internet standards is that they focus on protocols and not on implementations. thus standards allow for services to be described in a common language (WSDL), to use a common messaging protocol to communicate (SOAP) and finally the integration of these web services and the creation of newer ones based on some features of existing ones (PBEL). Figure1 illustrates the main web service standards, allowing a wide range of functionalities based on web services. All of which will be described in detail in the remaining sections of the paper.

 Copyright © International Science and Technology Conference (ISTEC)

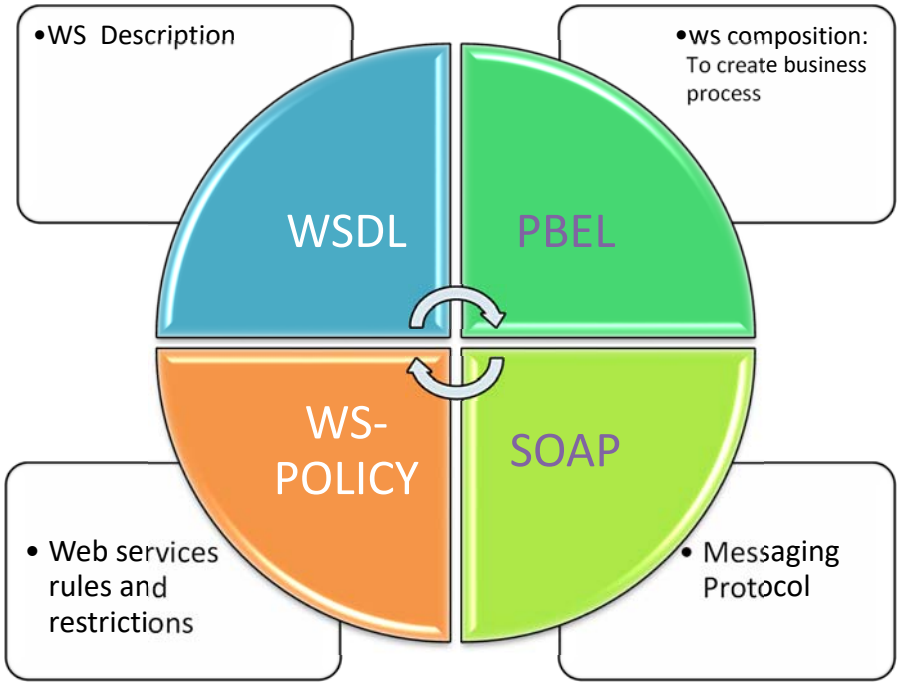

Figure1: Web Service Standards

WSDL

WSDL stand for web service description language. It allows a service provider to write a description of its service. The WSDL file contains information about the service, how to access it and its input and output. WSDL is a specification defining how to describe web services in a common XML grammar. WSDL describes four main important pieces of data:

- Address location of the specified service
- Information about the interface to describe all service functions
- Information about the Data type for all message requests and message responses
- Information about binding specifications for the transport protocol used

The main advantage of WSDL is that it is both language and platform independent. Services by different providers running in different platforms and written in different languages can interact and communicate easily using this specification. WSDL allows for a given service to be invoked by clients and to use all or some of its functionalities.

Web Service Composition

1. BPEL'n'Aspects is a non-intrusive mechanism for adaptation of control flow of BPEL processes based on the AOP paradigm. It relies on Web service standards to weave process activities in terms of aspects into BPEL processes. This paper is a logical continuation of the BPEL'n'Aspects approach. Its main objective is to enable compensation of weaved-in Web service invocations (activities) in a

 Copyright © International Science and Technology Conference (ISTEC)

straightforward manner [1]. PBEL is mainly used in static web service composition which has many limitations such as: a. cannot handle dynamic user preferences because it requires complex programming, b. difficult to maintain the solution and modify it according to changes in the business environment. The new services cannot be dynamic added. Finally it's hard to ensure that the system will perform during unexpected fault scenarios.

2. Petri nets and Pi calculus: formal languages have proven to be the ones to provide a dynamic service composition that can evolve with the environment changes and continue to adapt to meet the user's needs. However we find that they haven't being used much in business and were used mainly in academia, because of the complexity to build solutions using formal languages. Also because there aren't many frameworks allowing the creation of service composition processes using formal languages. Some vendors claim that their systems are based on Petri nets or Pi calculus and other vendors suggest that they do not need a formal language to base their system on. In essence there are three "camps" in these discussions: the "Petri net camp", the "Pi calculus" (or process algebra) camp, and the "Practitioners camp"[2]
3. WS Service Composition: Figure 2 shows how a set of participating services are combined to create a new composed web service to accommodate the user's need. The proposed composed service is palace an order. The customer make a purchase and is in need to get an invoice from the invoice WS, to use shipping WS and to pay the total amount using the credit card WS. The new composed WS combines functionalities from different WSs and prevent the user from having to interact with each WS separately.

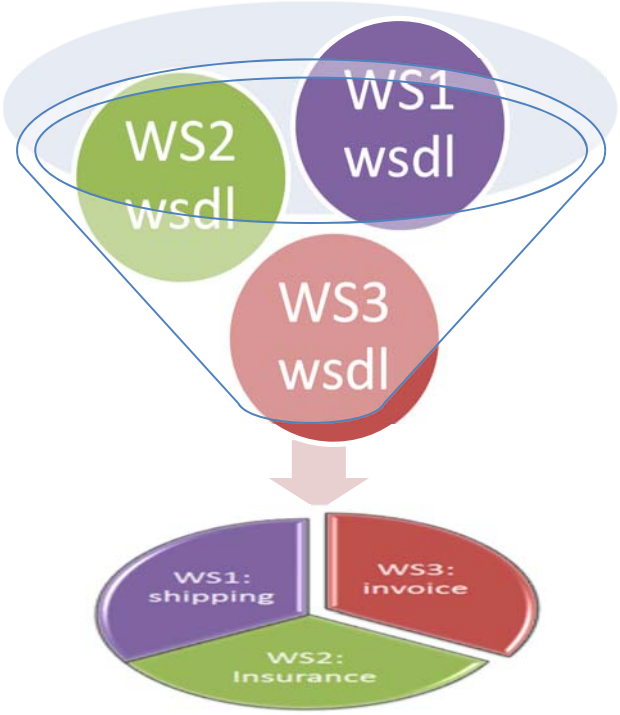

Figure2: Composed Service

4. Graph-based composition: our solution combines the use of web service standards and using formal languages to build a graph in order to generate the needed business process. Figure 3 show the graph-based service composition. The participating services are selected based on the input/output values listed in the wsdl for each WS, the ones that match the user's request either partially or fully are then selected to be part of the composition process, meaning that each WS will be then part of the composition graph. Each participating WS is represented using a node in the graph. The links between the services are the transitions between services. The execution of the service composition orchestration is done using the policies. These policies can include any restrictions or constraints by the service provider or the service user. For example a credit card transaction WS may have a constraint to not process any transaction where the amount is less than 10$. Therefore if the purchase amount is < 10 then the execution of the participating WS will not be done.

 Copyright © International Science and Technology Conference (ISTEC)

5. The graph traversal generates a process; therefore different processes can be generated by different graph traversal, depending on the order of nodes chosen. This order can be based on quality of the result (how close that it match the user's request), or based on other criteria such as response time, shortest traversal…ect. In case of fault from a given node: non responsive web service can be replaced by using a different process, meaning a different traversal of the graph. This makes the composition process more fault tolerant. And offers different alternative solutions based on the user's criteria of selection.

Figure 3: graph-based service composition

WSO2 Web Services Application

WSO2 WSAS is the Enterprise ready Web services engine powered by Apache Axis2. It is a lightweight application server for Web services that incorporates leading open source components into a simple, easy-to-use and highly performant package.

It supports Java components as services using both SOAP and REST models. Web services support include WS-Security, WS-Trust, WS-SecureConversation, WS-Reliable Messaging, WS-Addressing, WS-Policy, WS-SecurityPolicy and more, giving a fully secure and reliable infrastructure that interoperates with both J2EE and .NET frameworks using open standard protocols.

WSO2 WSAS is built on Apache Axis2, the popular Web services framework mainly developed by WSO2 engineers. WSO2 WSAS provides many value additions on top of Axis2, making it a more enterprise ready product. It also integrates other core Apache Web services projects such as Apache Axiom, Apache Rampart, Apache Sandesha2 , and Apache Neethi to form a production quality, comprehensive Web services server platform.[3]

SOAP/REST

SOAP stands for simple object access control. It is a standard to allow different services by different providers to communicate and exchange data. SOAP protocol is intended for exchanging structured information in a decentralized, distributed environment. It uses XML technologies to define an extensible messaging framework providing a message construct that can be exchanged over a variety of underlying protocols [4]. The framework is intended to be independent of any specific programming model and other implementation particular semantics. Below in figure 4 we compare SOAP the web services standard communication protocol and REST Representational State Transfer an architectural style for building networked applications. We see that SOAP Provides significant pre-build extensibility in the form of the web services standards, it includes built-in error handling and has the advantage of automation when used with certain language products. On the other hand REST is easier to use for the most part and is more flexible. It has the following advantages when compared to SOAP:

 Copyright © International Science and Technology Conference (ISTEC)

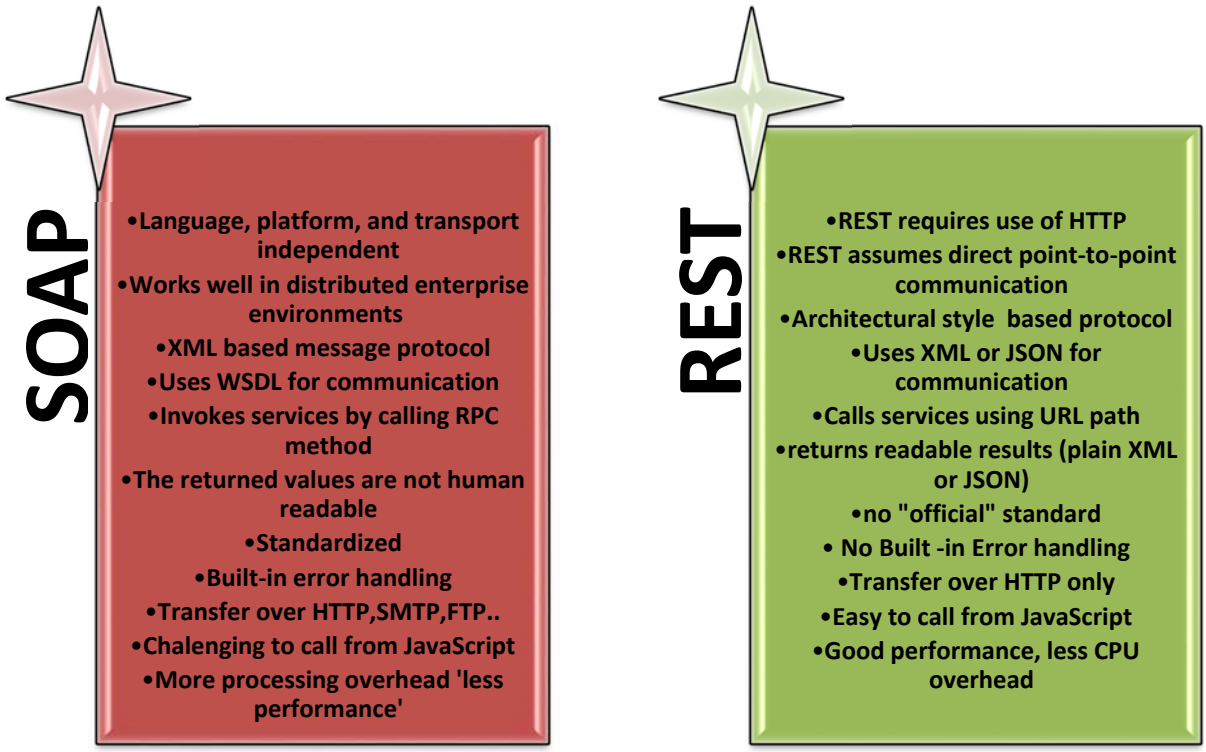

Figure 4: SOAP protocol Verses REST

WS-POLICY

A Policy is a rule for a given action to take place if a given set of conditions are true. Polices allowed adding more functionalities and restrictions to services. There is a wide range of policy writing languages including Ponder and others. Each language has its own pros and cons. The challenge was that policies written in different language cause a problem of interoperability and compatibility. For different policies to apply on a given set of services they have to be expressed using the same language. Thus, there was a need for standardization. Policies declaratively specify the behavior of these services in certain circumstances and can be used in areas like security or quality of service [5]

WS-Policy is a specification for creating and describing policies to be applicable on web services. At the abstract level a policy is a potentially empty collection of policy alternatives. A policy with zero alternatives contains no choices; a policy with one or more alternatives indicates choice in requirements (or capabilities) within the policy. Alternatives are not ordered, and thus aspects such as preferences between alternatives in a given context are beyond the scope of this specification.

Alternatives within a policy may differ significantly in terms of the behaviors they indicate. Conversely, alternatives within a policy may be very similar. In either case, the value or suitability of an alternative is generally a function of the semantics of assertions within the alternative and is therefore beyond the scope of this specification [6].

Conclusion

In this paper we have presented an overview of the main existing standards for web services. We illustrated the main issues and limitations for BPEL and proposed our solution: a graph based service composition based on formal language. The goal is to benefit from the advantages of web services standards such as interoperability and platform independence, and benefit from the advantages of dynamic service composition such as an easy to update solution without any major changes to the structure and the flow of the composition process. It's important to benefit from all the functionalities that web services standards offer. Standardization is not only for application it's also for databases where we could have a database of web services that are dynamically searched and a new composed service is generated upon the user's request. There is the need for standardized semantic metadata

 Copyright © International Science and Technology Conference (ISTEC)

about data-sources and protocols to publish data [7]. In order to reach a potential semantic and automatic navigation at a Web scale Nowadays software development is going more towards service based architecture. The standards covered in this paper cover the main functions done on web services. These are web services description, web service messaging, web service composition and finally web service policies.

Fırat University, Department of Metallurgy and Materials Engineering
ilyassomunkiran@gmail.com

Abstract: In this study, TiC (0.9C%) mixed powder has been alloyed on the low carbon steel surface by using plasma transferred arc process. Weight rates of 0,9%C added to TiC powders.Titanium contents of 5%Ti, 10%Ti, 15%Ti, 20%Ti by weigh were mixed the effect on microstructure of titanium different contents were investigated. With this aim, alloyed layer and interface were examined with optical microscopy, SEM, EDX and interface micro hardness distribution were obtained. Also in this study, differences of PTA process in comparison to other surface alloying process.

Keywords: PTA, Microstructure, TiC

Introduction

The plasma transferred-arc (PTA) powder surfacing process has been widely used in surfacing and coating engineering. During PTA processing the powder is fed into the melting pool on the substrate through the plasma arc space by a specially designed powder feeder. The powder's thermal behavior, melting, vaporization and decomposition, will affect the surface layer's structure and properties greatly, especially under metal–ceramic composites surfacing condi-ting conditions [4,1]. Hence, an understanding of the powder particles' thermal behavior in the plasma arc column will be of general interest, both to the metallurgist wishing to know more about the metallurgy of the powder surfacing process and to those concerned with the powder surfacing industry, such as powder manufacturers and users. Though some work has been done in this field under plasma non-transferred-arc spraying conditions [4,2,3], little work in this field regarding PTA powder surfacing conditions has been reported. Different surface techniques were carried out in order to improve surface properties of materials. plasma transferred arc (PTA) process was widely used for the surface treatment of materials and developed as a modification of the plasma arc welding method [5,6–8]. This technology emerged from the basic principles used in traditional welding surfacing techniques such as oxy fuel gas welding (OFW), gas tungsten arc process (GTAW), manual metal arc welding (MMAW), gas metal arc welding (GMAW) and submerged arc welding (SAW). Compared to these processes, PTA surfacing provides a higher deposition rate (except in the case of SAW) and a relatively low dilution [5,10,7]. The PTA surfacing process is characterized by extremely high temperature, excellent arc stability, low thermal distortion of the part, and high coating speeds [5,9]. PTA process has an advantage of using two independent arcs (i.e. non-transferred arc as pilot and transferred arc as main arc). This advantage may play a role in allowing proper microstructural development and was used in the present study to investigate its effect on the resulting coating properties [5,10]. Argon gas passes through an inner annulus between the cathode and anode and is ionised, forming a constricted plasma arc column. This ionised gas provides a current path for a transferred arc [5,6].TiC carbide as one of common ceramics has many excellent advantages, such as very high melting point and thermal stability, high hardness and excellent wear resistance, low coefficient of friction, high electrical and thermal conductivities. TiC carbide is widely used as the reinforcing phase of the wear-resistant coating for cutting tools and as diffusion barriers in semiconductor technology . Because of its high melting point, good resistance to thermal shock, and good chemical and physical sputtering properties, TiC is also a promising material to be used in fusion reactors [11]. In this study TiC powders was coated on surface of an the low carbon steel (AISI 1020) plate by using plasma transferred arc (PTA) as the heat source. Surface coating was performed in different TiC alloying percentage values under Ar gas protection. As a result of TiC of different percentage values the microstructural changes occurred were examined.

Materials and Methods

TiC coatings were carried out on low carbon steel (AISI 1020) plate by using plasma transferred arc. The operating principle of PTA melting used was schematically shown in Fig. 1. Surface coating procedure was realized in one welding current. Parameters of the PTA deposition were given in Table 1. Low carbon steel plates of 70×25×10 mm in dimension were cut and then polished down to 1200 grit abrasive paper and finally rinsed with ethyl alcohol before coating. TiC powder was mixed with sodium silicate. [5,12] .

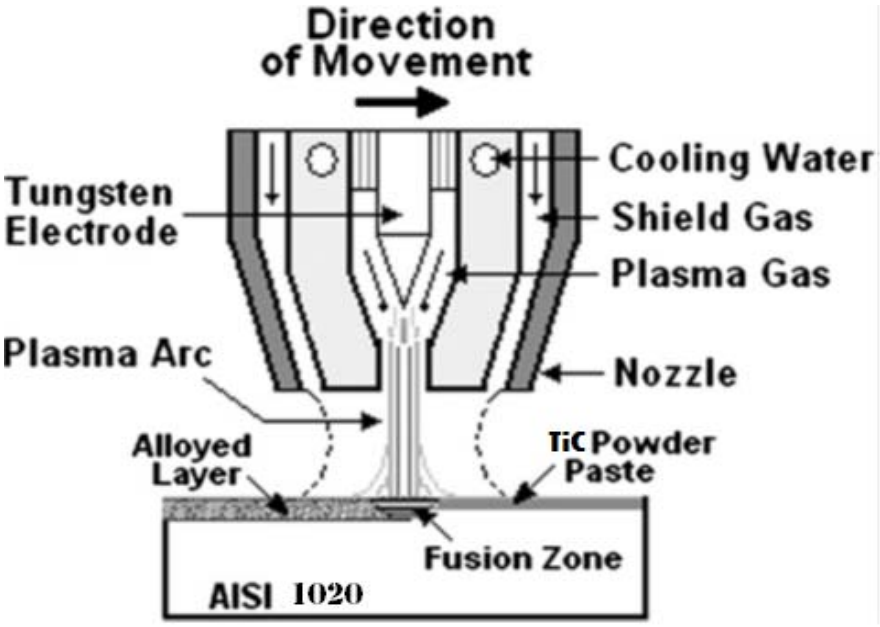

Figure 1. Schematic of the PTA system[5].

A groove, 2 mm in depth and 4 mm in width, machined on the surface of the substrate by a milling machine and mixed powders were applied into this groove and dried in hot air. Chemical compositions of substrate and coating material were presented in Table 2. Plasma arc was used as the heat source to melt the coating layer and substrate [5,13,14]. Plasma transfer arc experimental parameters presented in Table 1. Photos of the produced speciments given in Fig. 2. Metallographic examination of coated surfaces involved preparing transverse sections by grinding and polishing to 3 μm diamond paste. For microstructural examination, substrate was etched electrolytically in a solution of % 50 HNO_3+% 50 H_2O, and coating layer was etched by 10 ml HF+25 ml HNO_3+ 150 ml H_2O solution. The microstructures of the specimens were investigated by optical microscope and scanning electron microscopy (SEM). Micro hardness measurements were carried out by a Future Tech micro hardness tester FM-700 under a load of 20 g [5].

Table 1: PTA experimental parameters

Parameters	Values
Arc current (A)	130
Energy input (kj/mm)	0.82

Results and Discussion

Investigation of the image of optical micrograph

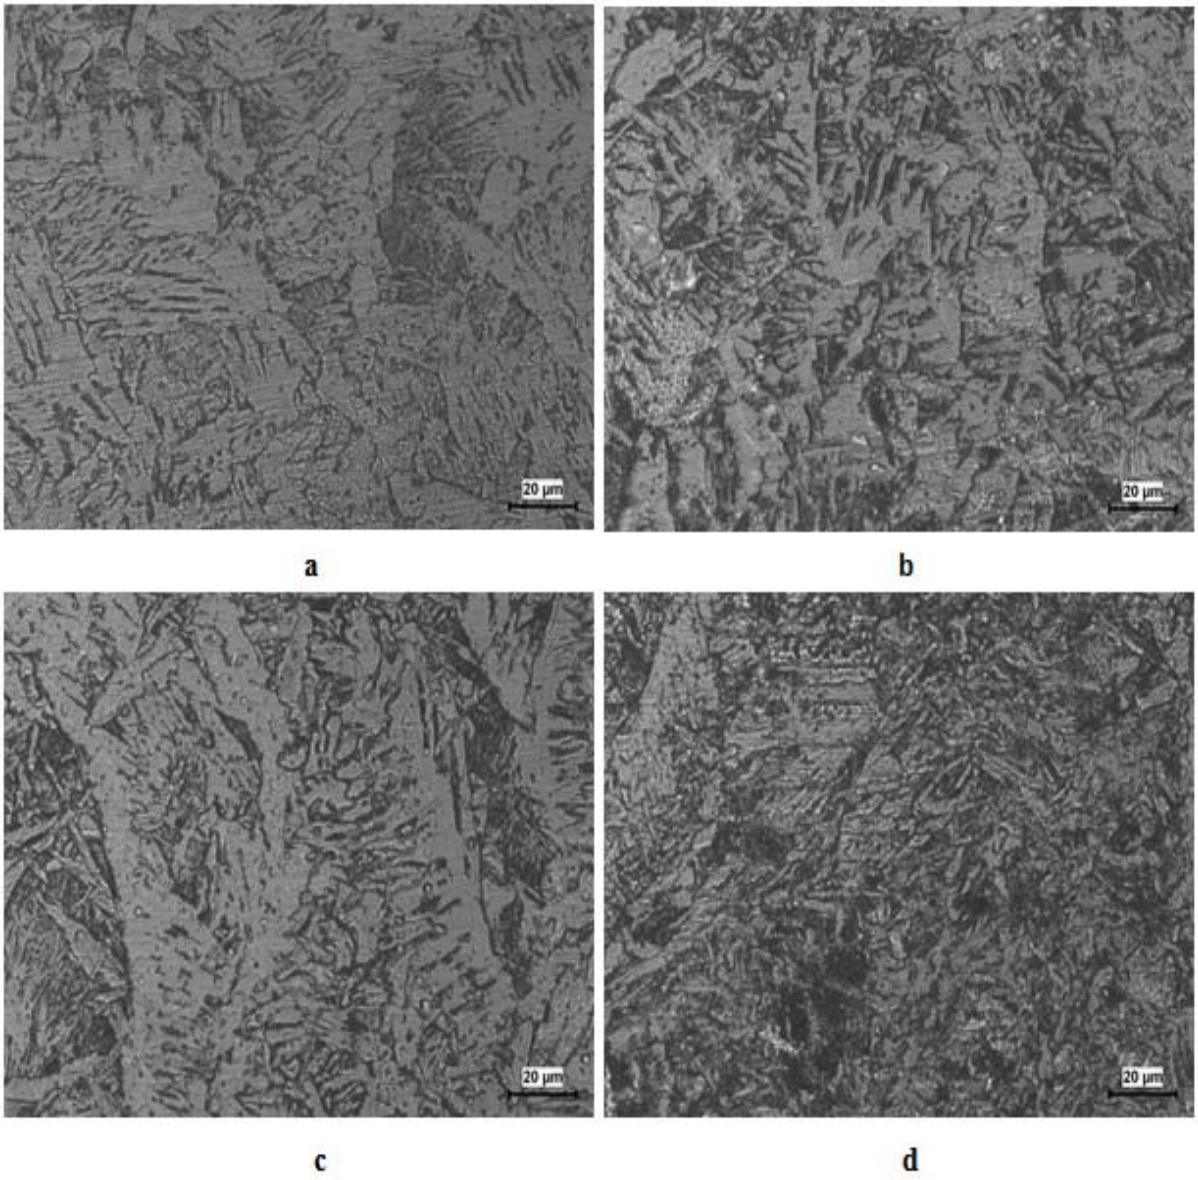

Figure 3. Optical images of coating plates of the a) S1, b) S2, c) S3, d) S4 samples at 20µm.

Optical images of samples coating plates are shown in Fig.3. When investigated images rate of dendrite where in the coating layers increasing observed with increased Ti rate. The maximum rate of dendrites observed in 20%Ti alloying sample. During other method coating process substrate with coating materials each other can't to diffuse and occurred pores observed in the interface zone. But in the PTA coating process, observed fine bonding interface of two materials. Also occurred pores and macro cracks not seen in the microstructure. [16]. During the alloying process reached high temperature (10000 ile 30000°K). [16]. Because of heat both substrate and coating materials affected from heat. Then atoms occurred diffuse both sides and transformations occurred in the microstructure. [17].

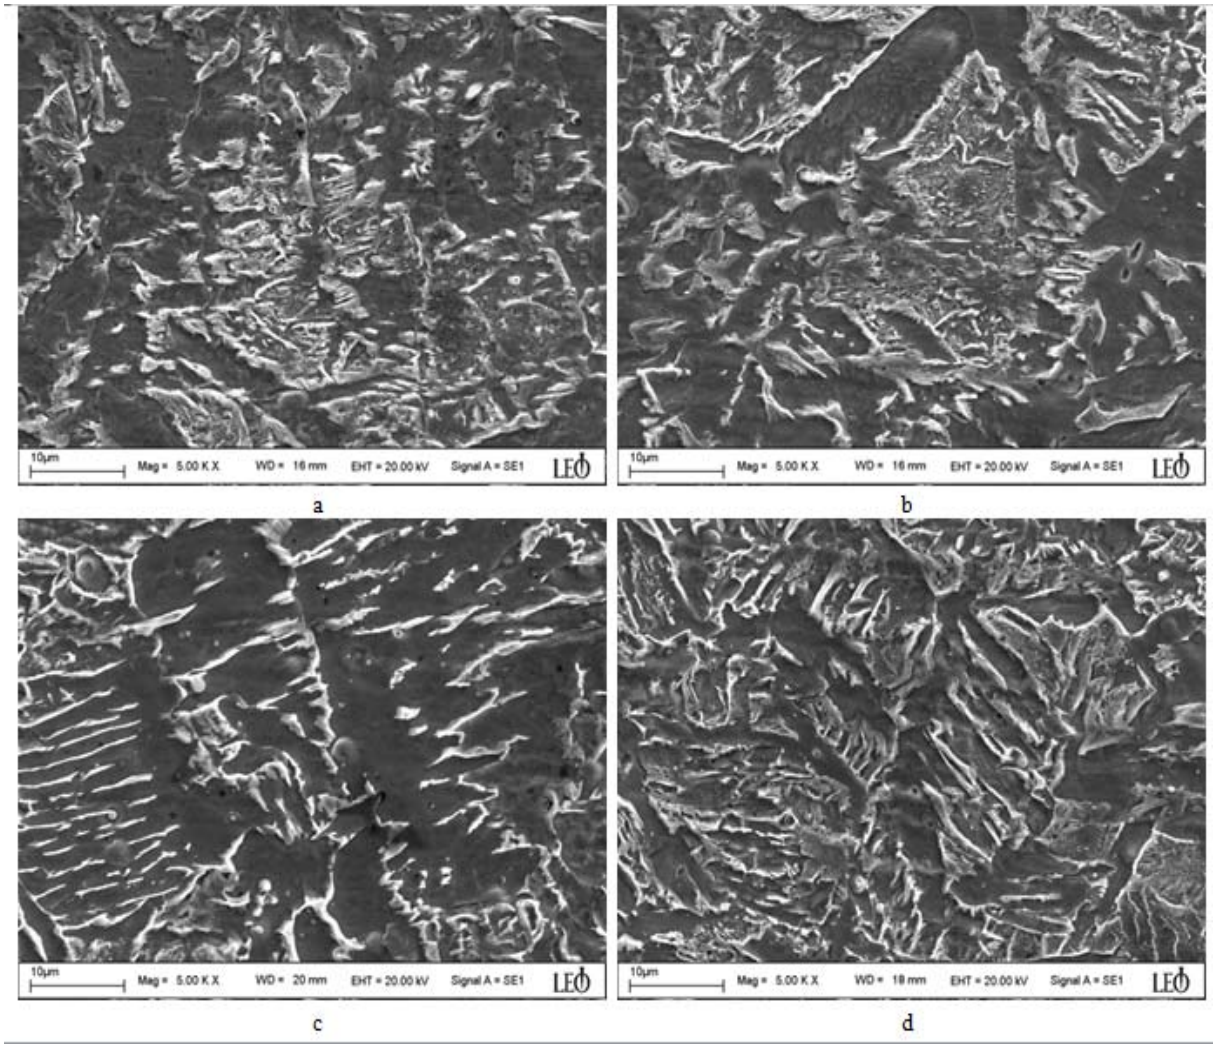
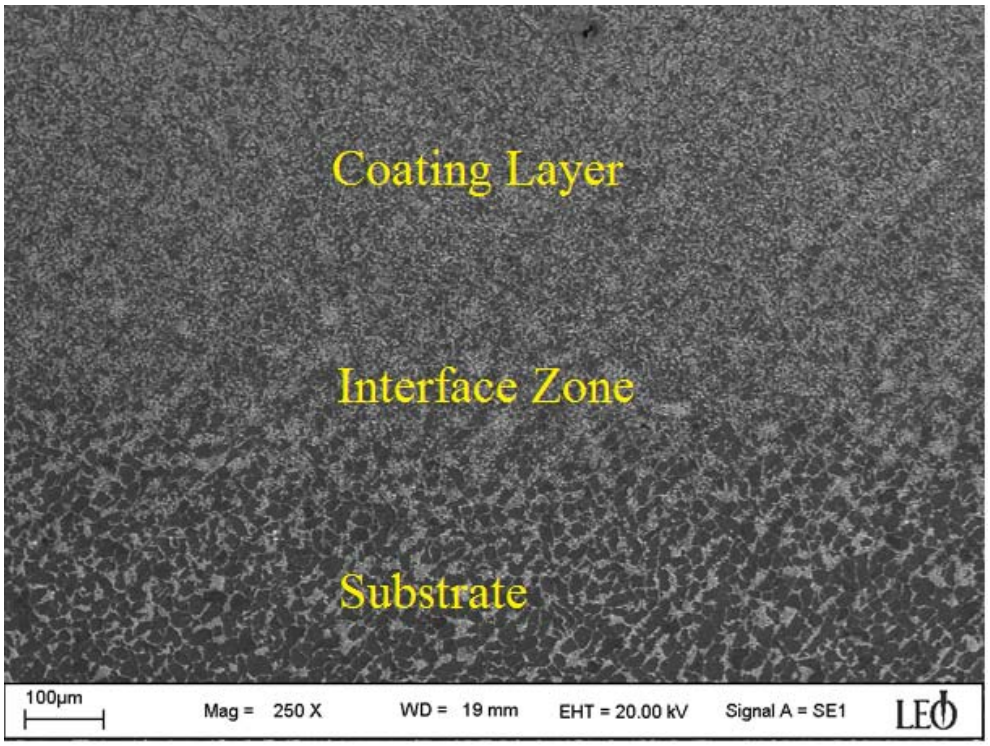
Investigation of the images of SEM micrograph





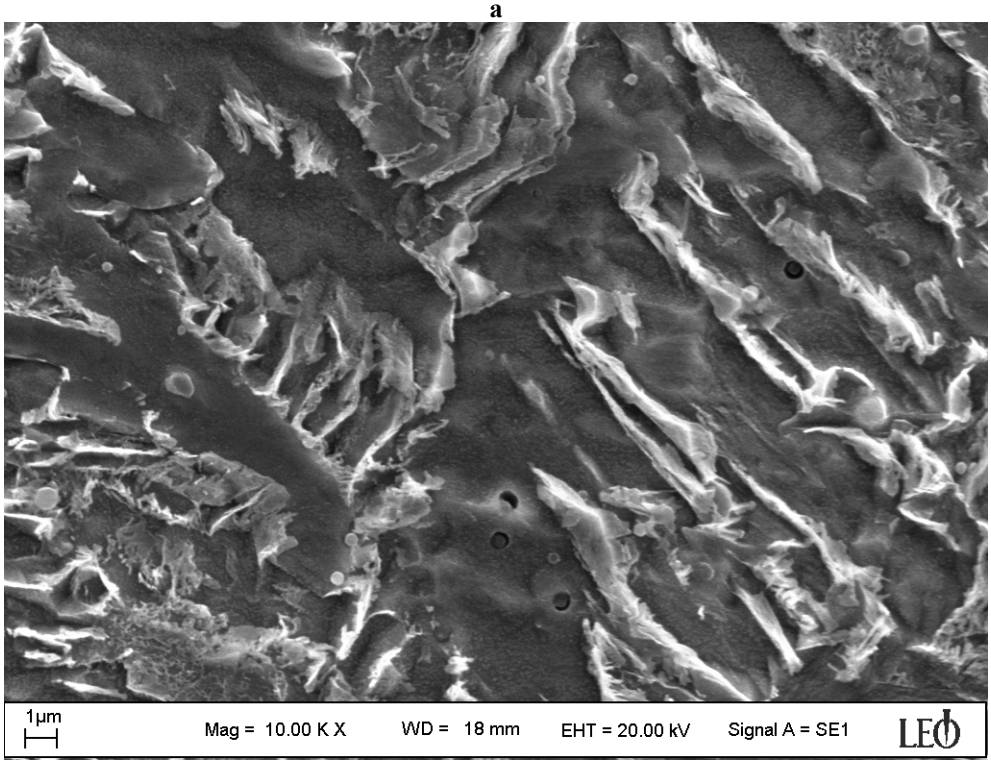


Figure 4. SEM micrograph of coating layer and substrate material interface for a)S1, b) S2, c)S3, d)S4.

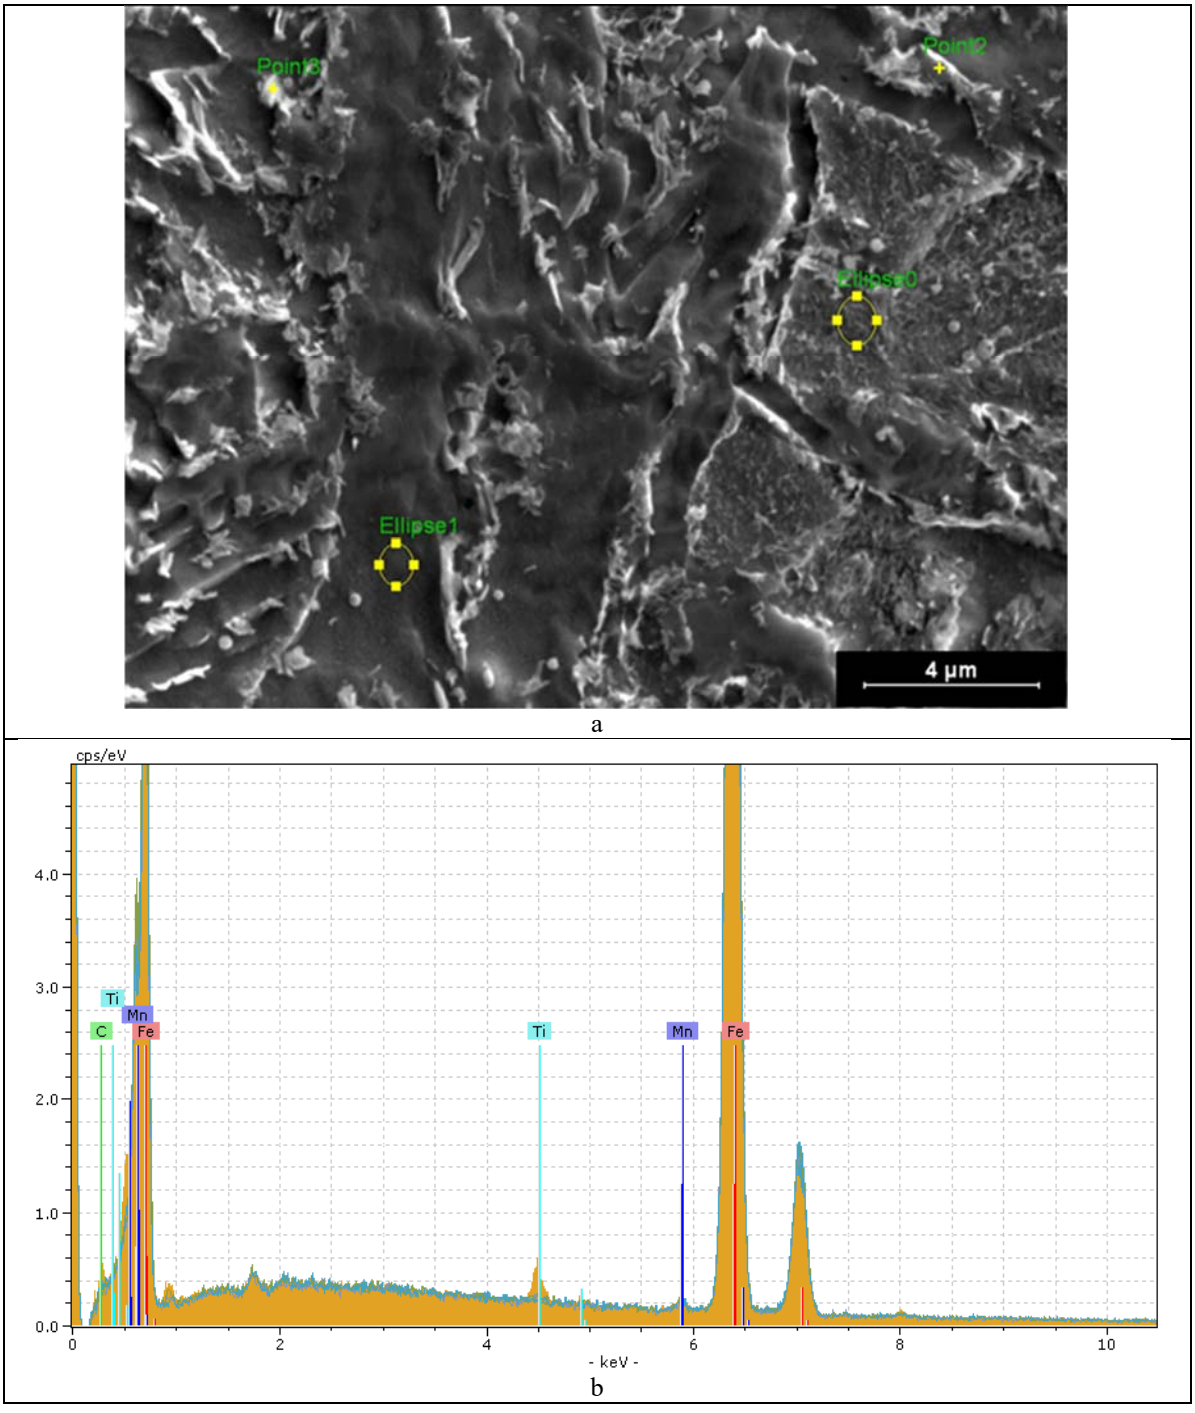
No cracks or pores were seen both in the coating layer and interface. In a previous study it was reported that small pores were detected in the NiTi coating layer produced by TIG process and poor shielding caused pore formation in the coating layer [10]. This problem was exceeded by using plasma transferred arc. Figure 4. showed the entirely dendritic solidification of coating microstructures for all coatings. Some grain boundary solid solutions such as βTi occurred due to diffusion from the coating layer to substrate material, as could be seen in Fig. 5.

 Copyright © International Science and Technology Conference (ISTEC)

a

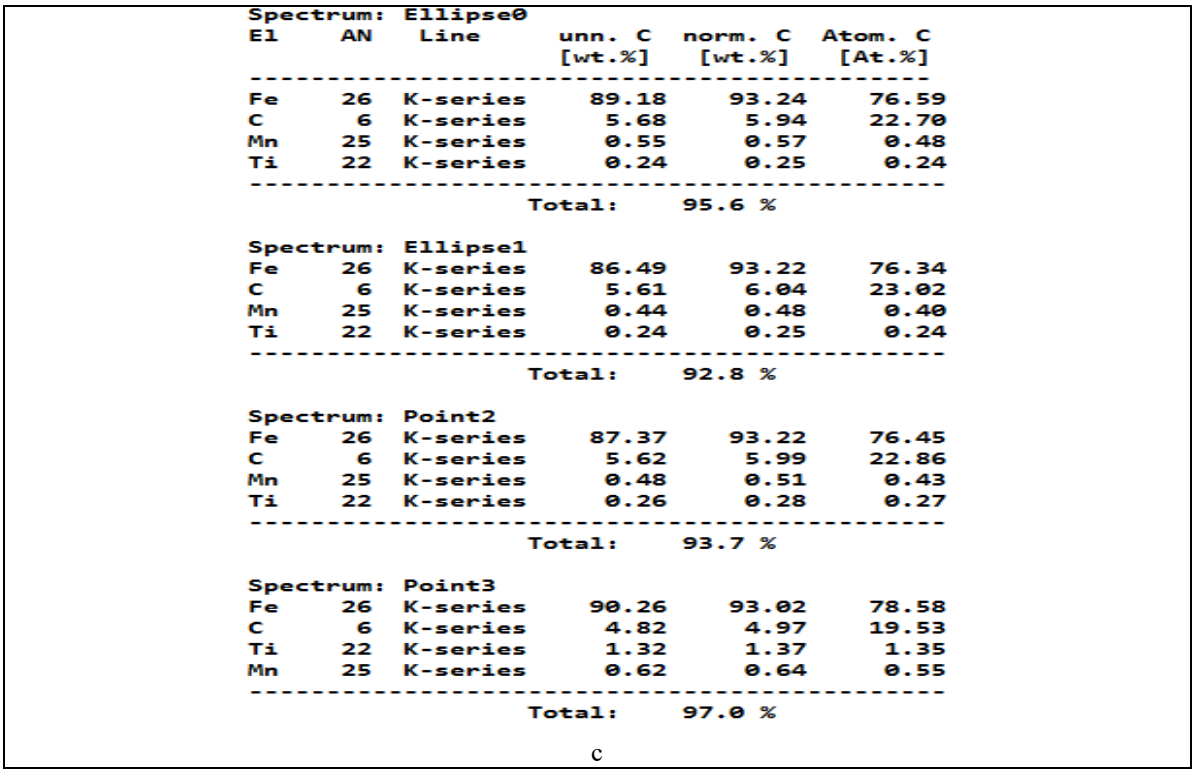
b

Figure 5. SEM micrograph of a) all layers b)coating layer at the S4.



Four different regions occurred during coating, namely: coating layer, interface region, heat affected zone (HAZ) and substrate [5]. Fig. 5 shows typical morphology of the alloyed layer. It shows clearly that interface zone between coating and substrate. Ferritic and pearlitic structure was observed in the substrate. Also Fig. 5 shows the microstructures of the coating layers for %20 Ti. When Fig 5. a. investigated it was observed very fine grains. We are thinking that proportionally with the thinner grain hardness of the coating layers will increase. It was seen clearly diffusion of the coating atoms from interface zone to substrate. It was observed very fine binding because of the fine diffusion in the interface zone. Also it was observed existence of TiC compound and solid solutions as a result of the diffusion of the Ti in the heat effected zone (HAZ) When Fig. 5. b. İnvestigated dark zones consist

 Copyright © International Science and Technology Conference (ISTEC)



of the Fe base and Ti solid solutions. Also we are thinking white zones consist of the TiC compound. The width of the interface zone, which formed with rapid solidification, was 80 µm for S4. The width of heat affected zones (HAZ) was approximately 120 µm for S4.

Investigation of the SEM-EDX analysis

It was observed where taken image and EDX analysis in the Fig.6 S4 of the interface zone, best diffusion and bonding occurred in the 20%Ti sample. coating plate of the 20%Ti alloyed observed most βTi solid solution contained, when investigated Ti- C binary phase diagram in Fig. 8. Due to the excess βTi solid solution according to the other samples Ti diffusion more occurred to interface zone

c

Figure 6. SEM-EDS ve XRD graphics analysis results of the S4 sample in the interface zone.

The EDX results taken from interface zone of S4 were shown in Fig. 6-b,c. The composition of the plotted region as ellipse0 in Fig. 6-a consisted of 0,24% Ti and 22,70% C. In Ti-C binary phase diagram, this composition corresponds to TiC phase. The plotted Elipse 1 consisted of 0,24% Ti, 23,02% C, 76,34%Fe and 0.40 Mn . Point2 consisted of 0,27% Ti, 22,86% C, 76,45% Fe and 0,43 Mn which corresponded to TiC intermetallic in Ti-C binary phase diagram. Point3 consisted of 1,35%Ti, 19,53%C, 0,55Mn% and 78,58%Fe. We can observe via diffusion of Ti and C atoms from coating layers to interface zone because of this conclusions. We are thinking when we investigate EDX analysis in the Point3 white zones was formed from TiC base. Moreover we think dark zones occur Fe based ferritic solid solutions.

Investigation of the Micro hardness

The micro hardness test results taken from the coating layer, interface and substrate were shown in Fig. 7. Maximum hardness was measured in the coating layer whereas the lowest values were recorded in the substrate. Regarding alloying TiC ratio input, it can be seen that hardness increased with the increasing TiC ratio. Increasing in the micro hardness occurred usually as directly proportional from substrate materials to coating layers. Increasing micro hardness of the S1,S2,S3 samples occurred low level and each other near value. But micro hardness of the S4 more high observed than other samples. When Ti-C binary phase alloy diagram investigated in the S4 sample estimated formed phases = 25% TiC + 75% βTi solid solution. Due to high proportion βTi solid solution in this sample high micro hardness was observed. We believe that increasing micro hardness because of the proportion βTi solid solution in the S4 structure

 Copyright © International Science and Technology Conference (ISTEC)

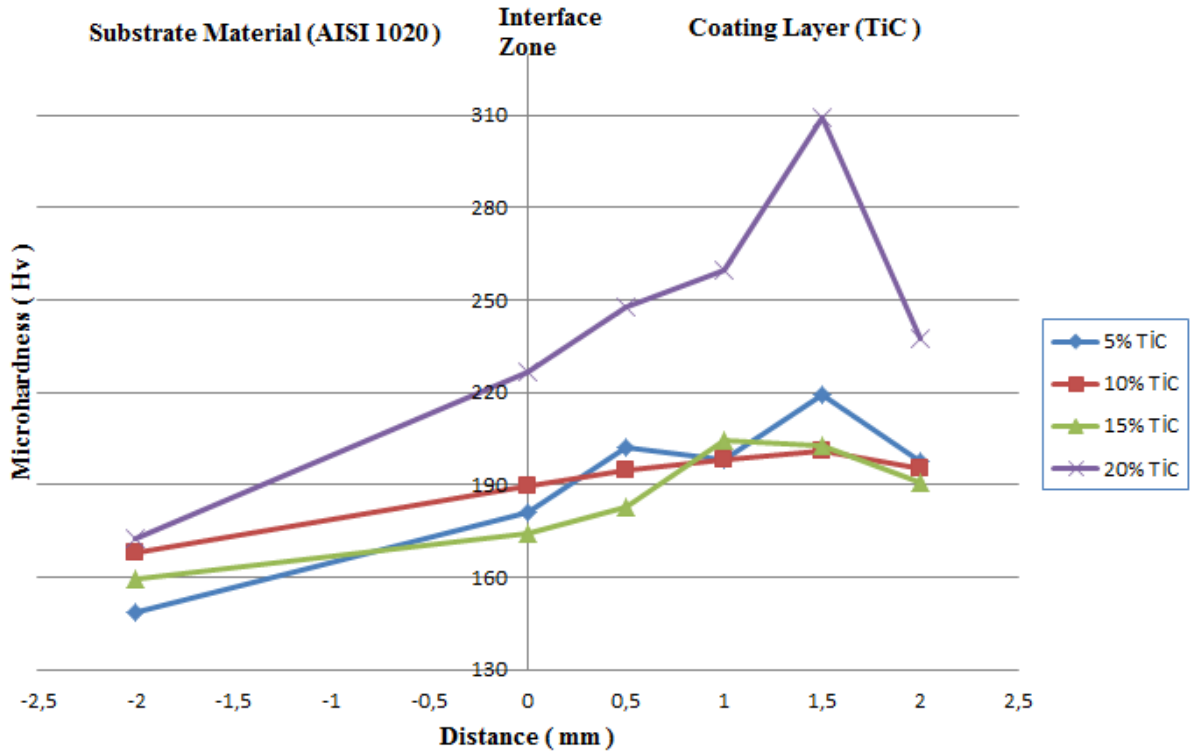

Figure 7. Micro hardness values of coating layer, interface and substrate.

When referencing binary phase diagram in Fig. 8, analysis of the phase structure which formed TiC alloy samples is as follows. βTi solid solution ratio increased in the structure with increased titanium ratio. Therefore as parallel increasing of the βTi solid solution in the structure, we can observe linear increasing in micro hardness values.

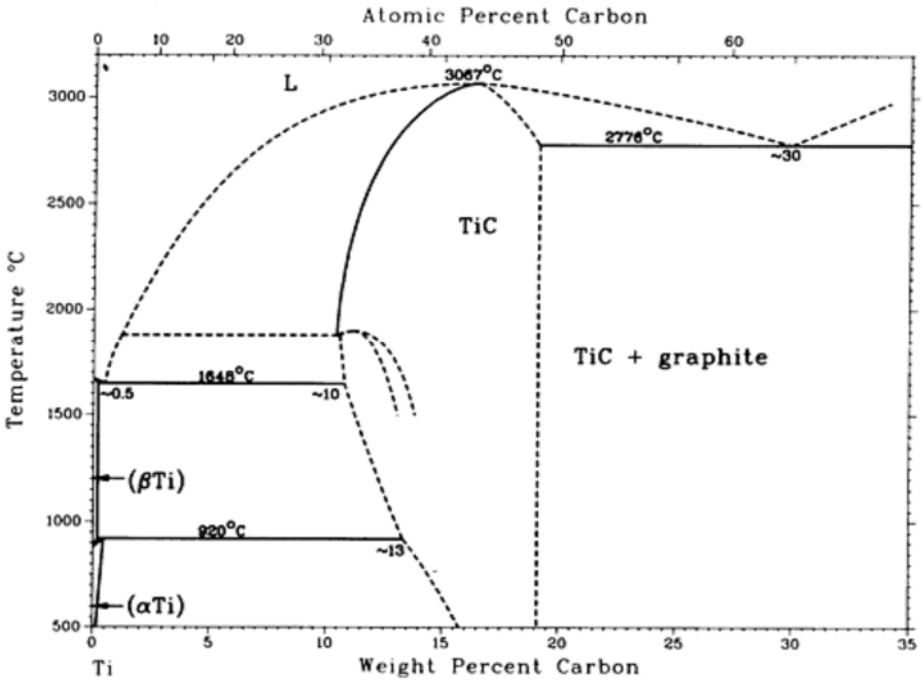

Figure 8. Binary Phase diagram of the Ti – C [15] .

When applied lever arm rule to Ti-C binary phase diagram according to alloying proportion, estimated phase structure is like formula (1)

S1= (0,9C / 5TiC) x 100=18% C = 82% Ti, Estimated formed phases = 100% TiC

 Copyright © International Science and Technology Conference (ISTEC)

S2= (0,9C / 10TiC) x 100=9% C = 91% Ti, Estimated formed phases = 85% TiC + 15% βTi solid solition.
S3= (0,9C / 15 TiC) x 100=6% C = 94% Ti, Estimated formed phases = 50% TiC + 50% βTi solid solition.
S4= (0,9C / 20 TiC) x 100=4.5% C = 95,5% Ti, Estimated formed phases = 25% TiC + 75% βTi solid solition.

(1)

Conclusion

When investigated optical images, rate of dendrite where in the coating layers increasing observed with increased Ti rate. The maximum rate of dendrites observed in 20%Ti alloying sample.

When investigated SEM images , Four different regions occurred during coating, namely: coating layer, interface region, heat affected zone (HAZ) and substrate. No cracks or pores were seen both in the coating layer and interface. Also showed the entirely dendritic solidification of coating microstructures for all coatings. Some grain boundary solid solutions such as βTi occurred due to diffusion from the coating layer to substrate material.

When investigated all coating layers, We are thinking that proportionally with the thinner grain hardness of the coating layers will increase. It was seen clearly diffusion of the coating atoms from interface zone to substrate. It was observed very fine binding because of the fine diffusion in the interface zone. Also it was observed existence of TiC compound and solid solutions as a result of the diffusion of the Ti in the heat effected zone (HAZ).

When investigated SEM-EDS ve XRD graphics analysis results, We can observe diffusion of Ti and C atoms from coating layers to interface zone. And best diffusion observed 20% Ti alloyed sample.

Also we were investigate micro hardness results, we could observe βTi solid solution ratio increased in the structure with increased titanium ratio. Therefore as parallel increasing of the βTi solid solution in the structure, we can observe linear increasing in micro hardness values.

When investigated Ti-C binary phase diagram, it was observed that βTi solid solution ratio increased with increasing the ratio Ti in estimated phase structure

According to estimated phase structure with micro hardness analysis, SEM images, EDX analysis the best micro hardness value and the best bonding of interface observed in the 20%Ti alloying coating plate.

ÖZET

Türkiye'de iklim değişikliğinin gözlenen ve beklenen etkilerini açıklayan birçok bilimsel çalışma, Şanlıurfa çevresi ve Harran Ovası'nın, iklim değişikliğinden olumsuz etkilenen/etkilenebilecek alanlar içinde kaldığını göstermektedir. Türkiye'deki önemli tarımsal üretim bölgelerinden olan Harran Ovası, kuraklık ve çölleşme ilişkileri açısından oldukça kırılgan bir bölgede yer almaktadır. Atatürk Baraj Gölü'nden sulama kanallarıyla taşınan su, kurak ve çok sıcak olan yaz aylarında bu ovada gerçekleşen olumsuz etkileri bertaraf etmeye yardımcı olmaktadır. Fakat, bu iklim koşullarında açık sulama kanallarının yüzeyinde gerçekleşen şiddetli buharlaşma önemli su kaybına neden olmaktadır. Buharlaşmanın fazla olmasıyla birlikte yanlış sulama teknikleri de toprak sorunlarını ortaya çıkarmaktadır. Ova çevresinde yer alan, doğal süreçlerin kontrolündeki ekosistemler ise çölleşmeye karşı daha savunmasızdır. Bu nedenle, iklim değişikliğinin neden olacağı olumsuz etkileri azaltmak ve yeni koşullara uyum yöntemlerinin geliştirilmesi çok önemlidir.

Bu çalışmada, Akçakale ile Şanlıurfa meteoroloji istasyonlarının 1975-2012 yılları arasındaki verileri kullanılarak Harran Ovası'ndaki kuraklık özellikleri Standart Yağış İndeksi (SPI) ve Thornthwaite yöntemi ile incelenmiştir. Yağışlı geçmesi beklenen mevsimlerde gerçekleşen kuraklık, zaten kurak bir mevsim olan yaz mevsiminde gerçekleşen kuraklıktan daha tehlikelidir ve bunun belirlenmesi oldukça önemlidir. Kuraklık olayını başlatan meteorolojik kuraklığın yağışla ilgisinden dolayı, ovadaki meteorolojik kuraklığın uzakbağlantı (teleconnection) ilişkileri de incelenmiştir. Bu amaçla Türkiye'nin önemli bir bölümünde özellikle kış yağışlarını etkileyen Kuzey Atlantik Salınımı'nın (NAO), Harran Ovası ve çevresindeki yağış ve kuraklık olaylarıyla ilişkisinin doğası tanımlanmıştır. Yıl içinde tarımsal sulama döneminin ve sulama miktarının belirlenmesi için yararlı olacağı düşüncesiyle kurak dönemin başlangıcı, bitişi ve süresi belirlenmiştir. Ayrıca kuraklık olasılığı, kuraklık şiddeti, kuraklık genliği ve kurak dönemlerin sayısı da belirlenmiştir.

Anahtar Kelimeler: Harran Ovası, Kuraklık, Standart Yağış İndeksi (SPI), Thornthwaite metodu, Kuzey Atlantik Salınımı (NAO).

CHARACTERISTICS OF DROUGHT EVENTS IN THE HARRAN PLAIN

ABSTRACT

Many scientific studies describing the observed and expected effects of climate change in Turkey, indicate that Şanlıurfa and Harran Plain are in the area which affected/could be affected negatively by climate change. The Harran Plain which an important agricultural production region in Turkey, is located in a highly vulnerable region in terms of drought and desertification relationships. The water carried by irrigation canals from Atatürk Dam helps to avoid negative impacts on a very hot and dry summer in the plain. However, high rate of evaporation in this conditions cause a significant amount of water loss by evaporation from the surface of open irrigation channels. Also improper irrigation techniques with high rate of evaporation emergences the land use problem. The ecosystems which under the control of natural processes at around the plain are more vulnerable to desertification. Therefore, to reduce the negative effects of climate change and the development of methods of compliance with the new conditions is very important.

 Copyright © International Science and Technology Conference (ISTEC)

In this study, we investigated the drought properties in Harran Plain by the Standardized Precipitation Index (SPI) and Thornthwaite method using Akçakale and Şanlıurfa meteorological stations data within the period of 1975 to 2012. The drought that occurred in the season expected rainy is more dangerous than the drought occurred in dry summer season and so to determine this is very important. Due to rainfall events related to meteorological drought that starts drought, the meteorological drought in the plains was investigated by teleconnection relations. For this purpose, the nature of the relationship with North Atlantic Oscillation (NAO), which affects especially winter rainfall in the important part of Turkey, and Harran Plain and its surrounding rainfall and droughts was identified. At the thought would be useful for the determination of the irrigation period of the year and amount of irrigation, the beginning, ending and duration of the dry season were determined. In addition, the possibility of drought, drought intensity, the number of dry periods and drought magnitude was determined.

Key Words: Harran Plain, Drought, Standardized Precipitation Index (SPI), Thornthwaite method, North Atlantic Oscillation (NAO).

ÖZET: Sürekli kullanımı olan ve sağlık hizmeti veren mekânların, kullanıcıları tarafından nasıl algılandığının ve ne derece memnun kalındığının araştırılması ve değerlendirmesi önemlidir. Toplam kalite yönetimine de geçen hastanelerde, hasta ve çalışan memnuniyetinin sağlanması için hastaların ve çalışanların mekândan beklentilerinin ölçülmesi önemli görülmektedir.

Bu çalışmada Erciyes Üniversitesi Tıp Fakültesi Gevher Nesibe Hastanesi hasta odaları, mimari mekân tasarımı ve yapı elemanları, işlevsel performans açısından incelenmiştir. Bu amaçla; çalışma yapılırken kullanıcıların memnuniyet durumlarını belirlemek önemli görülmüştür. Belirlenen kullanıcılara, bölüm klinikleri personeline (doktor, hemşire, teknisyen vb.) ve hasta odalarında kullanıcı olarak yatan hastalara veya çocuk hastaların yakınlarına, anket uygulanmıştır. Mekânların planlamasıyla ve yapı elemanları ile ilgili memnuniyet ve istek durumları ile ilgili anket uygulanmıştır. Bu, mekânların algısal kalitesini belirlemek için de önemli olmuştur. Hastanelere yönelik yapılan çalışmanın sonucunda, mimari mekânın işlev yönü ile kalitesi ve yapı elemanlarının performansı belirlenmiştir. Çalışmanın hastanelerin mekânsal ve yapı elemanlarına yönelik kullanıcı memnuniyeti ve toplam kalite yönetimi alanlarında yapılacak çalışmalara katkı sağlaması umulmaktadır.

Anahtar Kelimeler: hastane, yapı elemanları, performans ölçümü, kullanıcı memnuniyeti

1. GİRİŞ

Sağlık ve sağlıklı olma insanoğlunun varoluşundan itibaren vazgeçilmez olmuştur. Teknolojinin ve bilimin gelişmesiyle beraber sağlık anlayışında da farklılıklar olmuştur. Günümüzde halk sağlığında, hastalık olgusu oluşmadan sağlığın korunması veya iyileştirilmesi ön plana çıkmaya başlamıştır (Biçer T., vd. 2001; Tezcan S., vd., 2000). İnsanoğlu, hastalıklarını iyileştirebilmek için tedavi olabilecekleri mekâna ihtiyaç duymaktadır. Hastaneler, bu ihtiyacı karşılayan günümüzdeki sağlık koşullarını sunan mekânları oluşturmaktadır. Geçmişten beri mekânsal, teknolojik, kurumsal vb. konularda çok hızlı bir şekilde gelişen sağlık kurumları, insanların sağlık yönünden ihtiyaçlarını karşılamaktadır (Yıldırım K., Muslu M. S., 2006).Hastaneler insanların günlük yaşam alanlarından ve yaşam biçimlerinden farklı ortam ve mekânları içermektedir. Hastanelerde tedavi için konaklama tedavi süreci, tanı, teşhis gibi kavramlar, insanlar üzerinde biyolojik, fizyolojik ve ruhsal yönden negatif bir izlenim ve etki oluşturmaktadır. Hastane kurumlarındaki olumlu fiziksel çevre, insanları fiziksel, ruhsal ve sosyal yönden pozitif etkilendiğinden dolayı diğer kurumlara kıyasla çok daha önemlidir. Hastanelerdeki çevrenin olumlu etkisinin hastaların iyileşme sürecini olumlu yönde etkilediği düşünülmektedir (Yıldırım K., Muslu M. S., 2006).

Sağlık hizmeti ise, birçok faktörü içinde barındıran organizasyonların bileşiminden oluşmaktadır (Çıraklı Z. L., Sayım, F., 2009 ve Aslan Ş.,Özata M., 2005). Kalite hasta memnuniyetini anlama ve karşılama konusunda önemli bir etmendir. Hasta memnuniyetini ölçmede verilen hizmetin kalitesi ve süresi, teşhis, tedavi, bakım gibi çeşitli unsurlar etkin rol oynamaktadır. Verilen hizmet ile beklentilerin arasındaki farktan oluşan hasta memnuniyetinin derecesini; verilen hizmetin algılanması, hizmet süresi ve sürekliliği, çalışanların nezaketi, hizmet sunan kişilerin uzman olması, gibi olgular değişmektedir (Tarım, M., 2000).

Bireylerin, sağlık hizmetine ihtiyaç duymaları ve gelişen teknoloji sonucunda, sağlık hizmetinden beklentileri değişmiştir. Kaliteli hizmet uygulaması ile bireyler daha seçici davranmış ve kaliteli hizmet sunulması gündeme

 Copyright © International Science and Technology Conference (ISTEC)

gelmiştir. Sağlık hizmetlerindeki kalitenin belirlenmesinde hasta memnuniyeti önemli bir yere sahiptir. Memnuniyet kavramı kişiye göre değişmekte ve ortak bir karara varılması zor olmaktadır. Hasta memnuniyetini sağlamak, bir sağlık kurumunda kolay bir durum değildir. Sürekli hizmet veren bir sağlık kurumu kullanıcılarının kurum hakkındaki isteklerini, beklentilerini ve sağlık kurumundan memnunluk derecelerini araştırmak, değerlendirmek ve sonuçlara göre nasıl bir hizmet sunulması gerektiğini tasarlamak önemlidir. Strasen (1988) '*hasta memnuniyeti, klinik sonuçlar kadar önemlidir ve bunu ölçmek her sağlık kuruluşunun hedeflerinden biri olmalıdır.'* görüşündedir (Strasen L., 1988). Bu bakımdan kalite ve memnuniyet kavramı insanlar bilinçleştikçe hayatımızda daha önemli bir konuma sahip olmaya başlamıştır.

Sağlık sektöründen yararlananlar, kısa sürede tedavi olmayı, tedavi ve tanı gibi olayların doğru ve başarılı bir şekilde gerçekleşmesini arzulamaktadır. Teknolojinin ve bilimin gelişmesi, kalite beklentisini de arttırmıştır. Sağlık alanında hizmet sunumunda doğabilecek hatalar veya yetersizliklerden dolayı kalite kavramı çok önemli bir konuma gelmektedir (Aydın, B., 2008). Sağlık sektöründeki kullanıcılar, hastane mekânlarını kullanan hizmet alan veya veren tüm kişilerdir. Hastanelerde kullanıcı profili, iki grupta incelenmektedir. Bunlardan ilki iç müşteri olarak tanımlanan sağlık kurumunda çalışan veya sağlık kurumuyla iletişim halinde bulunan, sağlık çalışanları olarak bilinen doktor, hemşire, farklı konularda hizmet veren sağlık teknisyeni, sağlık hizmetlileri vb. kişi ya da gruplardır. İkinci kullanıcılar ise dış müşteri olarak tanımlanabilecek bir sağlık kurumunun sunduğu hizmetlerden doğrudan ya da dolaylı olarak yararlanan kurumları, hastalar, hasta yakınları ve ziyaretçileri oluşmaktadır.(Kavuncubaşı S., 2000).

Sağlık yapılarını sadece hastalar ve hasta yakınları kullanmamaktadır. Memnuniyet kapsamına hastane çalışanları da girmektedir. Bu doğrultuda hastane çalışanlarının da sağlık kurumundan beklentileri önemlidir. Özellikle yeni uygulamaya geçirilmeye çalışılan iş sağlığı ve güvenliği konusuna yönelik yasal mevzuatlarda da yer alan çalışma ortamının durumuna yönelik uygulamalar, konunun önemini vurgulamaktadır. Hastalar, hasta yakınları ve hastane çalışanları için mekânsal memnuniyet ve kalite önemli bir konudur. Fakat ülkede sağlık yapılarına yönelik, kullanıcı memnuniyeti odaklı çalışmalar sınırlı kalmıştır. Her iki kullanıcı grubu için de mekansal memnuniyet önemli olmaktadır. Bu durum toplam kaliteyi de beraberinde getirmektedir. Ancak ülkede hastane yapılarına yönelik olarak son 25 yılda fazla çalışma yapılmadığı bilinmektedir (Ergenoğlu S. A.,Tanrıtanır A, 2013). Hastanelerde mekânsal olarak yapılacak ve kullanıcı memnuniyetinin içeren alan çalışmaları önemli görülmektedir. Hastane yapıları birbirinden farklı kullanıcıların ihtiyaçlarını ve isteklerini karşılayacak nitelikte olmalıdır. Kullanıcı memnuniyeti arttıracak mekânsal düzenlemelerin tasarım ve yapımında alan çalışmalarını içeren geri besleme sayesinde, hastaneler artık sadece klinik hizmet veren mekânların dışında fiziksel ve ruhsal iyilik halinin yükseltilmeye çalışıldığı alanlar olabilecektir. Böylece iki kullanıcı gurubunun mekânsal memnuniyetleri artırılacaktır.

Hastane yapıları tasarlanırken hastaların ve kullanıcıların kolay erişebilir, güvenilir, nitelikli ve keyifli, stresi azaltan, ruhen ve fiziksel olarak iyileşmeye pozitif etkisi olabilecek mekânların olması önemlidir. Hastane yapılarının plan ve mekân kurgusunun hastalara, engelli insanlara, çocuklara yani her gruptaki insana hitap etmesi önemlidir. Dolayısı ile hastane yapıları, diğer kamu yapılarına göre daha kompleks ve yoğunluklu bir planlama ve kurgu gerektirmektedir (Gezer H., 2014).

Önal ve Önal'a (2000) göre hastane yapıları yatan hasta, ayakta tedavi gören hasta, tanı ve tedavi, idari ve fiziki hizmet, eğitim ve araştırma fonksiyonlarını kapsamaktadır. Bu fonksiyonların ihtiyaçlarını karşılamak için bir hastanede; hasta bakım alanı, klinik alan ve hastanenin işlevini sürdürmesini sağlayan servis birimleri olmak üzere üç ana kullanım gerektiğini vurgulanmıştır (Önal F.,Önal B., 2000). Değişim ve dönüşüm olgusu mimarlıkta ve mimari ürünlerde sıklıkla görülmektedir. Mimarideki bu değişimin hastane yapılarında ve mekanlarında daha fazla olduğu düşünülmektedir (Ergenoğlu S., Aytuğ A., 2007).

Yapılan hastane tasarımlarında; kaliteyi arttırarak kullanıcıların psikolojik, ergonomik, fizyolojik olarak mutlu ve rahat bir ortam tasarlamak, önemli bir amaç haline gelmektedir. Bu bağlamda; 'iyileştiren hastane' ve 'hastanelerde kalite' ön plana çıkmaktadır. İyileştiren hastane; Hastane ortamının; sosyal, manevi, psikolojik, estetik, hayat standartlarını konforunu artıran, iyileştirici, rahatlatıcı, güven verici, ergonomik, ışık, ses, renk ve malzemeye yönelik istekleri karşılayan alanlardan oluşması gerekmektedir. Hastanelerde tasarım kalitesi konusu mekan standartları ve maliyet ile birlikte kullanıcının ergonomik, psiko-sosyal kalitesini de düşünmeyi gerektirmektedir (Ergenoğlu S., Aytuğ A., 2007).

Çoruh'a (1998) göre *"Kalite Kavramının sürekli kendini yenilemesi ve toplumun gereksinimlerine yanıt vererek gelişmesinin yolu, bu kavram aracılığıyla ortaya çıkacak zorunlulukların ve bunların ne derece uygulanabildiğinin sıkı şekilde takip edilebilmesinden yani ölçülebilmesinden geçer"* (Çoruh, M., 1998). Bu

 Copyright © International Science and Technology Conference (ISTEC)

ifadeden anlaşıldığı gibi kalite ve memnuniyetin sürekliliği ve verimi için rutin olarak kaliteyi ve memnuniyeti artıracak etmenleri denetlemek ve güncellemek gerekmektedir.

Hastane yapılarında aydınlatma, ses-gürültü, hastane planlaması, erişilebilirlik gibi konular, kullanıcı memnuniyetini önemli derece etkilemektedir. Bu açıdan, tasarımcılara bu konuda büyük bir yük düşmektedir. Aydınlatma için Bayar (1994), uygun ve gerekli aydınlatmayla görsel konforun sağlanması gerektiğini yoksa yanlış teşhis -tanı, çabuk yorulma, göz hastalıkları gibi belirtilerin ortaya çıkacağı, bundan dolayı aydınlatma şeklinin ve konforunun iyi bir şekilde oluşturulması gerektiğini vurgulamıştır (Bayar M., 1994). Ses ve gürültü için Şentürk (1994), bu kavramların sağlık alanında ne kadar önemli olduğunu ve çalışan personellerin bu konuda eğitim almaları gerektiği, kullanılan araç, gereç ve malzemelerin sürekli kontrol edilip, bakımının yapılması ve ses ve gürültü oluşturmayacak kalitede olması, hasta odalarının kapılarının kapalı tutulması çalışanların kullandığı ayakkabıların ses çıkartmayan türde olması gerektiğini belirtmiştir (Şentürk F., 1994). Hastane planlamasında, sağlık yapıları kullanıcıları için kaliteli tasarım ölçütleri, net bir planlama, denetim altına alınmış fiziksel değişkenler, hasta ve ziyaretçilerin ilişkilerinde denetim ve iç mekân tasarımının kullanıcıları moral ve sosyal düzeylerini iyileştiren ve geliştiren bir planda olması gerektiğini ifade etmiştir (Tüker Ç., 1996). Sağlık yapılarında erişilebilirlik kapsamında, yapıların planlamasında oda, koridor boyutların genişliklerini, yüksekliklerini, yüzeylerin, bildirişim elemanlarının gerekli yönlendirme ve uyarı işaretlerinin standartlar doğrultusunda erişilebilir olması gerekmektedir (Gezer H., 2014). Bu başlıklar kullanım alanları olarak; otopark, bina girişi, asansör, rampa, merdiven, kapı ve pencereler, tuvaletler, manevra alanları, yönlendirme ve iletişim uygulamalarının, döşeme ve duvar yüzeyleri tasarımlarının erişilebilir olması önem kazanmaktadır. Kısacası sağlık yapılarında tasarımcının yaptıkları kullanıcının memnuniyetini ve sağlığını önemli derecede etkilemekte olduğu için tasarımcılara büyük bir sorumluluk düşmektedir.

Bu çalışma Kayseri Erciyes Üniversitesi Gevher Nesibe Hastanesi'nin incelenmesi ile hastanede kullanıcılarının memnuniyeti ve kalite ölçümü yaparak mimari tasarımların kullanıcılar üzerindeki etkisini somut bir şekilde ortaya koymak amaçlanmıştır. Kayseri Erciyes Üniversitesi Gevher Nesibe Hastanesi'nin seçilme sebebi ise Kayseri'deki son derece yoğun, çok çeşitli kompleks ve heterojen hastaların bulunmasıdır. Hastanede birçok farklı hizmet alan ve veren hasta odaları, bekleme salonları, ameliyathane, tedavi, teşhis odaları, vb. gibi farklı kullanıcı profiline sahip odalar bulunmaktadır. Hastanede mekânların ve kullanıcıların çeşitliliği sayesinde yapılan çalışma, sağlık alanında her kesime hitap edebilecektir. Bu nedenle hastanede doğrudan veya dolaylı olarak hizmet veren ve alan kişilere bir anket çalışması düzenlenmiştir. Bu anket çalışması ortamın mimari, estetik, ergonomik, açıdan kalitesini ve memnuniyet oranını ölçmesinde yardımcı olmuştur. Anketteki sorular bu amaca özel olarak hazırlanmış ve elde edilen bulgular çerçevesinde yapının kullanıcılar açısından ne tür bir sıkıntı yaşadıkları, nerelerden, nasıl, memnun olup olmadıkları yapılan anket sonucunda ortaya çıkması amaçlanmıştır. Çıkan sonuç çerçevesinde hastane bina yönetiminin ve/veya Sağlık Bakanlığı'nın alması gereken önlemleri ve geliştirmesi gereken konular, hangi malzemelerin nerede, nasıl, ne çeşit olması gerektiği gibi konular irdelenerek öneri haline getirilmiştir. Bu çalışmada sadece hasta odalarına yer verilmiştir. Hastanedeki poliklinik ve ameliyathane gibi diğer bölümlerin ise başka çalışmalara temel olması düşünülmektedir.

2. YÖNTEM

Hasta sayısı hastalık türü ve tipindeki değişimler doğrudan yapay çevreyi etkilemekte ve bu etkileşim mekan tasarımında önemli bir belirleyici olarak ortaya çıkmaktadır. Bu bağlamda, çalışmada; Erciyes Üniversitesi Tıp Fakültesi Gevher Nesibe Hastanesi örnek uygulama yapılacak hastane olarak belirlenmiştir. Bu belirlemede hastanenin, Kayseri'deki yoğun, çeşitli, kompleks ve heterojen hastaların tercih ettiği, her konuda tam teşekküllü hizmet sunmakta olan ve çevre illerden de hastaların hizmet aldığı en büyük kuruluş olma özelliği göstermesi etkili olmuştur. İç Anadolu Bölgesi içerisinde farklı yerleşimlerden gelen kullanıcılara, hastanede dâhili ve cerrahi her alanda hizmet sunulmaktadır. Hastanede farklı hizmet alan ve hizmet veren, hasta odaları, bekleme salonları, ameliyathane, tedavi, teşhis odaları, vb. gibi farklı kullanımlara hizmet eden mekanlar bulunmaktadır. Mekânların ve kullanıcıların çeşitliliği sayesinde yapılan çalışmanın, sağlık alanında katkı sağlayacağı açıktır.

Çevre illerden hasta alımı ile hastaneden hizmet alan farklı kültürlerden ve yaşam ortamlarından geldiği görülen kullanıcının bulunması, çalışmanın güvenilirliğinin artmasına katkıda bulunmuştur. Ayrıca, bu durum, kullanıcının mekan üzerindeki beklentilerini ve algılamalarındaki farklılıkları da getirmiştir.

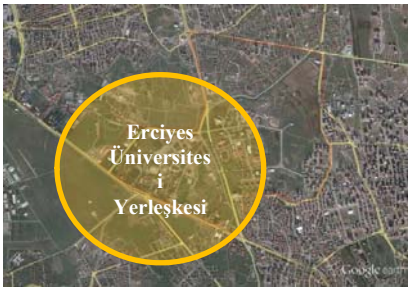
Araştırma için çalışmanın yapılacağı sağlık kurumunun başhekimliği ile görüşülerek resmi izin alınmıştır. Bu çalışma, Erciyes Üniversitesi Rektörlüğü Sağlık Uygulama Ve Araştırma Merkezi Müdürlüğü'nün 44008645-010.99/65318 sayı ve 28.08.2015 tarihli izni alınarak yasal uygulamalar çerçevesinde gerçekleştirilmiştir. Anketler; hasta ve/veya hasta yakınları ve sağlık personelinin araştırmaya katılmalarında isteklilik/gönüllülük ilkesine özen gösterilerek gerçekleştirilmiştir.

 Copyright © International Science and Technology Conference (ISTEC)

Araştırmada hastanenin fiziki koşullarını ölçmeye yönelik hastane kullanıcıları olarak hizmet alan ve çalışanlara mekânsal algı ve memnuniyeti içeren veri toplama gereci olarak anket yöntemi kullanılmıştır. Anket formu, 5'li Likert Ölçeği kullanılarak hazırlanmış 31 adet sorudan oluşmaktadır. Anketteki meslek, cinsiyet, yaş soruları ile hastaların sosyo-demografik özellikleri; kalış süresi ile mekanı deneyimleme süreleri; hasta odasına yönelik, odanın bulunduğu kat ,bölüm, cephesi sorularıyla da hastanın anketini cevapladığı oda tanımlanmıştır. Ankette hastaların cevaplarını 'çok kötü-kötü-kararsız-iyi-çok iyi' şeklinde 5 farklı derecelendirme ile cevaplaması istenmiştir.

Çalışma; amacı kişilere yüz yüze anlatıldıktan sonra, hastanede yataklı tedavi hizmeti alan hasta ve hasta yakınından ve sağlık personelinden, çalışmaya katılmayı kabul eden 127 hasta, hasta yakını ve 10 hastane çalışanı toplamda 137 kişi ile gerçekleştirilmiştir. Hizmet alanlar sadece hastalar olarak görülmemiş bunun yanında özellikle çocuk ve bakım hastalarının refakatçileri de anketi cevaplamışlardır. Çalışanlar ise sadece doktor ve hemşireler değil aynı zamanda teknik ve diğer hizmetleri gerçekleştirenler de olmuştur. Çalışmaya gebeler, doğum servisi hastaları, psikoloji servisi hastaları, 18 yaşından küçükler ve cerrahi operasyon geçirmiş hastalar da dahil edilmiştir.

Hastane ana işlev olan hastane odaları üzerinde durularak incelenmiştir. İlki farklı branşlardaki servis katları olarak değerlendirilmiştir. Çalışma, hastane servis katları; gastroloji, ortopedi, jinekoloji, genel cerrahi, beyin cerrahi, çocuk cerrahi, endokrin, psikoloji, kulak-burun-boğaz, göz, göğüs hastalıkları, fizik tedavi bölümü ve üroloji olmak üzere, toplamda 13 farklı branş ve bu branşların kendi içlerinde ayrıldıkları farklı uzmanlık alanlarına göre değerlendirilerek yürütülmüştür.



Çalışmada, hastane binasının ve mikro ölçekte hasta odalarının hasta bakım kalitesini etkileyişi üzerinde durulmuş ve bu etkiler; işlev, psiko-sosyal ve teknik konular üzerinden irdelenmiştir. Anket çalışmasında hasta odaları mekan kalitesini ölçmeye yönelik; işlev, estetik-konfor ve güvenlik ana başlığı altında hazırlanmış ve tek kişilik banyolu, 2-3 kişilik banyosuz, 4 ve üstü sayıda kişinin kaldığı banyosuz olmak üzere farklı oda tipolojilerinde yatarak hizmet alan hasta ve hasta yakınlarına uygulanmıştır. Bu çalışmada hastanenin psikiyatri servisi de dâhil olmak üzere özel izin ile her katındaki ve her tip odasında kalan hasta veya hasta yakınlarına anket yapılmıştır. Bu durum çalışmanın önemini artırmaktadır.

Bu çalışma 3 aşamalı oarak gerçekleştirilen bir üst çalışmanın işlev kısmının ele alındığı bölümünden oluşturulmuştur. Ana çalışmada mekanlar işlev, estetik ve konfor ve güvenlik başlıkları altında incelenmiştir. bu çalışmada yer alan işlev kavramı mimarinin ilk basamağını oluşturduğu için önemli görülmüştür. İşlevsel olarak, oda dolaşımı, boyutu, malzeme seçimi, malzeme kullanımı, banyolu odalarda ise; banyo tasarımı ve hasta odasının engelliler tarafından kullanımı gibi sorular ile mekansal organizasyon, kullanım ve ulaşılabilirlik analiz edilmiştir.

3. BULGULAR

3.1. Erciyes Üniversitesi Gevher Nesibe Hastanesi Konumu ve Fiziksel Durumu

Kayseri coğrafi konum itibari ile İç Anadolu ve diğer çevre illerden kolay ulaşılabilir durumdadır. Kayseri'de yer alan sağlık kurumları da bu coğrafi durum sebebi ile ulaşımı kolay olan bir yere sahiptir. Erciyes Üniversitesi ise Kayseri kent merkezine, havaalanına, çevre yoluna ve raylı sisteme mesafe olarak kısa ve kolay ulaşılabilir bir mevkie sahiptir (Harita 1-2). Erciyes Üniversitesi'nin pek çok alanda eğitim-öğretim vermesi ile birlikte kuruluşundan itibaren bulunan Tıp Fakültesi'nin bulunması üniversitenin önem algısını artırmaktadır. Bunun yanı sıra Erciyes Üniversitesi Tıp Fakültesi'nin vermiş olduğu eğitim ve hasta tedavi hizmetleri de ülkede ve dünyada iyi bilinen bir seviyede bulunmaktadır. Ayrıca Tıp Fakültesi hastanesinin her alanda tam donanıma sahip olması, hastaların burayı tedavi için seçme tercihlerini artırmaktadır.

Harita 1: Erciyes Üniversitesi Yerleşkesi, www.google earth, 2016)

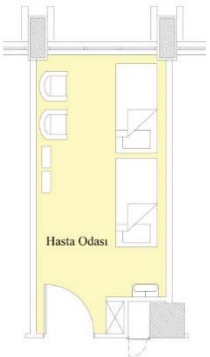
Harita 2: E.Ü. Gevher Nesibe Hastanesi Çevre Yerleşkesi, (www.google earth, 2016)

 Copyright © International Science and Technology Conference (ISTEC)

Tıp Fakültesi bünyesinde 6 hastane bulunmaktadır. Bu hastaneler kendi alanlarında, uzmanlaşılan hizmetleri sunmaktadır. Hastane yapıları içerisinde ilk ve en büyük kullanıma sahip olan Gevher Nesibe Hastanesi, iki kat poliklinik, ameliyathane ve yönetim kısmı ile 12 kattan oluşan servislerin bulunduğu ana bloğa sahiptir (Fotoğraf 1). Bu çalışmada Servislerin bulunduğu 10 kat ele alınarak inceleme yapılmıştır.

Hastane zemin ve ikinci katı ana polikilinikler, acil servis, ameliyathaneler ve öğretim elemanlarının yer aldığı birimlerden oluşmaktadır. Bu kısımlar kampus içerisinde geniş bir yer tutmaktadır. Servislerin bulunduğu blok ise 12 katlı olup her katta ayrı bir branşın servisi olduğu gibi bazı katlarda iki yada üç branş bir katı kullandığı duruma sahiptir. Hastanenin hizmet ettiği hasta sayısı arttıkça ve hastane içerisinde hizmet veren branşlarda uzmanlaşma arttıkça bu durumla daha çok karşılaşılmıştır.

Hastane planında iki hasta asansörü, bir öğretim elemanı asansörü bir servis asansörü ve üç genel kullanıma yönelik asansör ile merdivenin bulunduğu bir çekirdek bulunmaktadır. Çekirdeğin doğu batı yönüne doğru yer alan iki yanında ise hasta odaları bulunmaktadır. Bu hasta odalarının arasında koridorlar, toplu duşlar, wc, depolar ve genel sekretarya hizmetlerinin bulunduğu servis alanları mevcuttur(Şekil 1).



Şekil 1: Gevher Nesibe Hastanesi Kat Planı, Argeus Mimarlık (Argeus Mimarlık Ltd. Şti., 2016)

Hasta odaları, tek, iki, üç ve dört kişilik olarak düzenlenmiştir (Şekil 2-3). Tek kişilik odalarda hasta yatağının yanı sıra refakatçinin kullanabileceği katlanır yatak (Fotoğraf 2), soğutucu, tv bulunan bir yatma birimi ve içerisinde duş-klozetin bulunduğu bir banyo da (Fotoğraf 3-4) yer almaktadır. İki ve üstü kişi içini düzenlenen odalarda ise sadece hastaların kalabileceği şekilde düzenlenmiş, birkaç adet de refakatçi için koltuk tefrişte yer almaktadır (Fotoğraf 5-6-7).

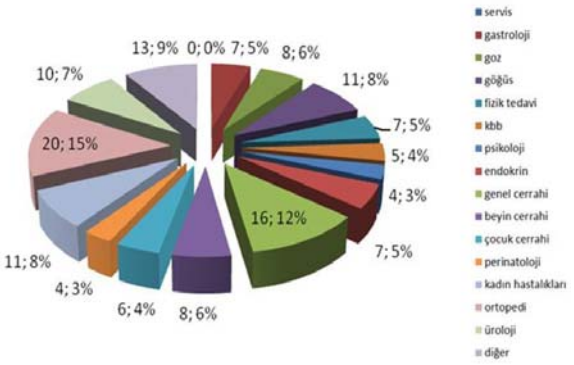
3.2. Hastane Odalarının İşlevsel İnceleme Sonuçları

Çalışmada yer alan anketi cevaplayanların 88'i bayan (%64,7) 42'si bay (30,9) olmuştur. cinsiyeti girilmeyen anket katılımcıları da düşünüldüğünde anket katılımcılarının cinsiyet geçerlilik oranları %67,7 bayan ve %32,3 bay olarak alınmıştır (Tablo 1).

Tablo 1: Anketi Yanıtlayanların Cinsiyet Oranları

	Frekans	Yüzde %	Geçerli Yüzde %
Bayan	88	64,7	**67,7**
Bay	42	30,9	**32,3**
Toplam	130	95,6	100,0
Girilmeyen	6	4,4	
Toplam	**136**	100,0	

Anketi cevaplayanların yaşları değişkenlik göstermektedir. Anketi cevaplayanlar yoğunluk olarak en çok 21, 60 yaşındaki hastalar birinci sırda, 40, 57 yaşındaki hastalar ikinci sırada yer almaktadır (Tablo 2). Dolayısı ile anketi cevaplayanların hastane konusunda sorulan anket sorularına verecekleri cevapların gerçeği yansıtacak yaş düzeyine sahip oldukları görülmektedir. Ayrıca hastane odaları ile ilgili algılarındaki farklılıklarında çok olmayacağı ve algılamada bir ortalama çıkarılabileceği düşünülmektedir.



Anket hastanede tüm servislere uygulanmıştır. Bu hastaların %7,5'i (7 kişi) gastroloji, %8,6'sı (8 kişi) göz, %11,8'i (11 kişi) göğüs hastalıkları, %7,5'i (7 kişi) fizik tedavi, % 5,4'ü (5 kişi) kbb, %4,3'ü (4 kişi) psikoloji, %7,5'i (7 kişi) endokrin, %16,2'si (16 kişi) genel cerrahi, %8,6'sı (8 kişi) beyin cerrahisi, %6,4'ü (6 kişi) çocuk cerrahisi, %4,3'ü (4 kişi) perinatoloji, %11,8'i (11 kişi) kadın hastalıkları, %20,15'i (20 kişi) ortopedi, %10,7'si (10 kişi) üroloji, %13,9'u (13 kişi) diğer servisinde kalmaktadır (Tablo 3.).

 Copyright © International Science and Technology Conference (ISTEC)

Tablo 2: Anketi Yanıtlayanların Yaşları

Tablo 3:Anketi cevaplayanların Kaldıkları Servisler

Hasta ve hasta yakınlarının hangi tip odalarda kaldıkları sorgulanmıştır. Anket yapılan kişiler, % 26,4'ü tek kişilik ve banyoulu (34 kişi), %42,6'sı (55 kişi) 2-3 kişilik banyosuz, %25,6'sı (33 kişi) 4 ve daha fazla kişilik odalarda kalmaktadırlar (Tablo 4). Bu durum hastaların oda ile ilgili görüşlerinde etkili olacak bir konu olduğu için sorgulanmıştır.

Tablo 4: Kalınan oda tipi

	Frekans	Yüzde %	Geçerli Yüzde %
Tek Kişilik Banyolu	34	25,0	**26,4**
2-3 Kişilik Banyosuz	55	40,4	**42,6**
4 Ve Üstü Banyosuz	33	24,3	**25,6**
Diğer	7	5,1	**5,4**
Toplam	129	94,9	100,0
Girilmeyen	7	5,1	
Toplam	**136**	100,0	

Anketi cevaplayanların hangi yöne bakan bir odada kaldıkları, oda ile ilgili görüşlerde etkili olacağı düşünüldüğü için ankette oda yönü ile ilgili soru yer almıştır. Anketi cevaplayanların %42,1'i (48 kişi) kuzey, %46,5'i (53 kişi) güney (53kişi), %3,5'i (4 kişi) doğu, %7,9'u (9 kişi) batı cephesinde yer alan odalarda kaldıklarını belirtmişlerdir (Tablo 5). Güney ve kuzey yönlerine bakan odalarda kalan sayısının çok görünme sebebi ise Şekil 1.'de görüldüğü üzere hastane planının dikdörtgen bir şemaya sahip olması ve uzun cephelerinin bu yönlere gelecek şekilde vaziyet uygulamasının yapılmış olmasından kaynaklanmaktadır.

Tablo 5:Kalınan Odanın Yönü

Girilmeyen	22	16,2	
Toplam	**136**	100,0	

Hasta ve hasta yakınlarına kullandıkları odanın boyutunun kullanıma uygunluğu ile ilgili soru sorulmuştur. Anketi cevaplayanlar %3,0'ı (4 kişi) çok kötü, %20,3'ü (27 kişi) kötü, %6,0'ı (8 kişi) kararsız, %59,4'ü (79 kişi) iyi, %11,3'ü (15 kişi) çok iyi olduğunu belirtmişlerdir (Tablo 6). Bu konu, kullanıcıların oda içerisinde hareketlerindeki rahatlık durumu için sorgulanmıştır.

4. TARTIŞMA VE SONUÇ

İnsan yaşamının standart düzeylerin dışına çıktığı süreçlerde kullanılan sağlık kurumları, mekânsal, teknolojik, kurumsal gibi konularda sürekli bir devinim içerisinde olmuşlardır. Bu süreç kendi içerisinde gerekli teknik gelişmeleri getirmiş ve hastanelerde mekânsal farklılıklar olmuştur. Dolayısı ile sağlık hizmetlerinden ve buna bağlı olarak mekânlarından beklentiler artmıştır. Buna rağmen hastaneleri özellikle normal yaşam aktivitelerinin bozulduğu dönemlerde kullanan ve günlük yaşam alanlarından ve yaşam biçimlerinden farklı bir mekânda geçirmek zorunda kalan insanların hastane algılarının, olumsuz olduğu görülmüştür. Burada o mekâna girilme sebebi ve orada bulunulduğunda günlük yaşam standartlarının dışında bir ortamda olmalarının etkisi ve hasta olma psikolojisi etken olmaktadır. Bunun sonucu olarak memnuniyet durumu da düşme göstermektedir. Kalite ve memnuniyet kavramları da baskın olarak bu mekânlarda olrtaya çıkmakta ve algısı farklılaşmaktadır. Çünkü insanlar hizmeti mi yoksa mekânı mı değerlendireceklerini karıştırmakta ve hizmeti iyi değil ise mekân da iyi değil yaklaşımı içerisine girmektedirler. Ayrıca genel yanılgılardan bir diğeri ise kullanıcı olarak sadece hasta ve hasta yakınları ele alınarak çalışmaların yapılmasıdır. Mekân kullanıcıları arasında o mekânda çalışanların da mekân hakkındaki görüşleri önemlidir ve mekânı belirleyici olarak düşünlümelidir. Özellikle hastane çalışanlarının çeşitliliği mekân kalitesi üzerindeki görüşleri ve algıyı da etkilemektedir.

Bu çalışmada; hem hastlar ve haysa yakınları hem de hastane çalışanları yer almıştır. Çalışma psikiatri, çocuk dâhil tüm servislere, yapılmıştır. Bu açıdan çalışma; alanında tek olma özelliğine de sahiptir. İstatiksel verilerde çalışmanın eksikliği ise; SPSS programı ile analiiz yapılırken bir örneklem grubu oluşturulmamasıdır. Ancak tüm servislere yapılması ile bu eksikliği, farklı bir yönden giderilmiştir. Çalışmada, gerekli tüm etik ve yasal izinler, çalışmanın yapıldığı üniversite hastanesi yönetiminden alınmıştır. Çalışma 3 aşamalı bir üst çalışmanın ilk aşaması olan işlev bölümün ele alınarak yapılmıştır. Çalışmanın gerçekleştirildiği hastane tüm İç Anadolu Bölgesi'ne hitap eden bir bölge hastanesidir. Bu durum çalışmayı değerli kılmaktadır.

Yapılan çalışmaya katılanların anket cevaplamada başta teredütleri olmuştur. Hasta ve hasta yakınları, hatane ile ilglili her hangi bir konuyu eleştirdiklerinde, bunun kendilerine olumsuz yansıyacağını ve tedavilerine devam edilmeyeceği veya edilse de iyi olmayacağı düşüncesine olmuşlardır. Hastane kullanıcılarına yapılan bu uygulamanın aşılması gereken zorluğu olarak karşılaşılan bu durum, çalışmaya katılanlara tek tek durumun anlatılması ile mümkün olduğunca aşılmaya çalışılmıştır. Once hasta ve hasta yakınları ikna edilmiş ve daha sonar uygulama yapılmıştır. Ancak yine de bazı konularda bilgi eksikliği ve çekinceler olduğu gözlemlenmiştir.

 Copyright © International Science and Technology Conference (ISTEC)

Anket bayan ve bay olmak üzere her iki gruba da yapımıştır. Cinsiyetin istatistiksel olarak mekânda memnuniyeti üzerinde etkisi olmamıştır. Aynı zamanda farklı yaş guruplarının da ankete katılımı sağlanmıştır. Yaşın algıda fark yaratmadığı düşünülmektedir. Anket tüm servislerden en fazla 20, en az 4 kişiye yapılmıştır. 4 kişi yapılan birim, hastaların özel durumundan dolayı, psikiatri olmuştur. Çalışmaya katılanların tek, iki, 4 ve üzeri ve banyolu-banyosuz gibi farklı odalardan olmalarına özen gösterilmiştir. Odaların her cepheye bakan odalar olması istenmiştir. Ancak diktörtgen plana sahip olan hastanede odaların büyük çoğunluğu kuzey ve güney yönünde yer almaktadır.

Çalışmaya katılanlar kullandıkları odaların boyutunu, oda içerisinde rahat hareket etme durumlarını göz önüne alarak, yeterli görümüşlerdir (% 70,7). Odalarının mahremiyet durumu da kullanıcılar tarafından olumlu algılanmaktadır (%65,4). Hasta odalarında bölücü elemanların var oluşu ve personelin davranışı ile bu durum kullanıcılar bakımından iyi bulunmuştur. Odalardaki görsel ve işitsel mahremiyet durumunda kullanıcıların fikirler farklılaşmıştır. Bu durumun tek, iki, üç ve daha fazla sayıda kişnin kaldığı odalarda farklılaştığı düşünülmektedir (% 29'u olumsuz, % 8,9'u kararsız, % 62,5 olumlu). Hasta odalarının boyutunun tefrişe uygunluğu konusunda kullanıcıların yine farklı görüşleri olmuştur (%32,3 olumsuz, %7,9'u kararsız, % 59,8'i olumlu). Çalışmaya katılanların farklı oda grubunda bulunmaları, hastanenin mobilyalarındaki kullanıma bağlı olarak oluşan yıpranma, kişisel ihtiyaçların farklılığı ve beklentiler sonucu bu konuda sonuç değişken olmuştur.

Hastane kullanıcılarının engelli olma olasılığı diğer bir kamu kurumuna göre daha fazladır. Ayrıca hasta odalarının rahatsız kişilerin tekerlekli sandalye kullanma durumunda uygun olması önemlidir. Tekerlekli sandalye ile odada dolaşım durumu incelendiğinde kullanıcıların %15,8 i kararsız kalmıştır. Bunun sebenin de tekerlekli sandalye kullanmalarına gerek kalmadığından fikir beyan etkmedikleri olduğu düşünülmektedir. Ancak hastaların çoğunluğunun odanın tekerlekli sandalye için yeterli boyutta olduğunu belirtmişleridir (%61,2). Engellilerin de kullandığı standart boyuttaki odaların engellilere uygunluğuna bakıldığında ise kullanıcıların karasızlığı söz konusu olmuştur (% 36,3 olumsuz, %29,8 kararsız, % 33,9'u olumlu). Çünkü kullanıcıların bu konuda bilinçsizliği söz konusudur. Hasta odalarındaki malzemelerin işlevine uygunluğuna yönelik kullanıcı algısı incelenmiştir. Buna gore; kullanıcıların % 70,8'i malzeme seçiminin işleve uygun olduğunu söylemiştir.

Banyo tasarımlarının kullanışlılığı sorgulanmıştır. Burada karasızlıkların fazlalığı dikkat çekici olmuştur. Çünkü çoğu hastanın banyoyu, özellikle kişisel hijyen alışkanlıklarından dolayı kullanmamış olması ve ev ortamındaki banyo beklentileri ile kıyaslamaları söz konusudur (% 37,7'si olumsuz, %27,2'si karasız, % 35,1'i olumlu). Banyoların engelli, yaşlı, çocuk vb hasta gruplarına uygunluğu da incelenmiştir. Yine karasız yaklaşımlar vardır (%29,4'ü olumsuz, %32,8'i kararsız, %38,3 olumlu). Çünkü engellilere, çocuk ve yaşlılara yönelik olan tasarımların neler olabileceği konusunda da bilgi eksikliği bulunmaktadır.

Çalışmada incelene Erciyes üniversitesi Tıp FAkültesi Gevher Nesibe Hastanesi, hasta odalarının bir üniversite hastenesi, bölge hastanesi ve bir kamu kurumu olarak, işlev bakımından genelde, olumlu özelliklere sahip olduğu belirlenmiştir. Buna rağmen; çalışmada yapılan gözlemlerde özellikle hasta refakatçilerinin kalmaları gerekli ise odalarda buna yönelik düzenlemelerin artırlıması ve tefrişin düzenlenmesi gereklidir. 2 ve daha fazla sayıda hastanın kaldığı odalarda bu durum daha önemli olmaktadır. Tek kişilik odalarda refakatçi daha uzun sure kalabilmektedir. Bu odaların da mümkün olduğunca tefrişlerinin yenilenmesi ve gerekli ise iki refakatçi için tasarlanması gereklidir. Tek kişilik odalarda sağlık personelinin çalışması zor olmaktadır. Seçilecek tefriş elemanlarının buna gore tasarlanması gereklidir. Personelin evrak işlerini yaptığı masa ve hastalarını yemek yediği masa aynı olmaktadır. Bunun hem çalışan hem hasta açısından hijyenik bir durum olmadığı açıktır. Everk işleri ve yemek olayının ayrı düşünülmesi gereklidir. Ayrıca refakatçiler için yemek yeme işlevi zordur. Katlarda belli saatlerde refakatçiler için ayrı bir alan veya odaların içerisinde ayrı bir düzenleme yapılması gereklidir. Özellikle tek kişilik odalarda televizyon, buzdolabı gibi donanım bulunmaktadır. Bunlar yeterli görülmüştür. Ancak iki ve daha fazla kişnin kaldığı odalarda dab u donanımlara ihtiyaç daha fazla bulunmaktadır. Banyolarda açık duşun bulunması yerine ayırıcı seperatörlerin yapılması ile bir mikta hijyen de sağlanmış olacaktır.Bu öneriler yapılırken hastanenin hizmet verdiği hasta ve yakınlarının sayısının fazlalığı ve hastane fiziksel imkanlarının mevcut durumu da göz önüne alınmaktadır.

Hasta odalarında engelli yaşlı ve çocuklara yönelik olan yasal mevzuata uygunluk önemlidir. Tüm hasta odalarında bu konuya dikkat edilmesi gereklidir. Kullanıcıların da konu üzerinde bilinç düzeylerinin artırılması, mekan algısı için önemli görülmektedir. Hastane odalarında yapılan çözümlemeler günün koşulları ve teknolojisi için tasarlanmaktadır. Ancak ileride gelişebilecek farklı durumlar da göz önüne alınarak tasarımlar gerçekleştirilirse mekanların sürdürülebilirliği sağlanmış olacaktır. Elbetteki boyutlandırmada birincil very olarak insane faktörü önemlidir. Ancak kapasitenin artırılmasına yönelik de tedbir alınmalıdır. Teknolojik verilerin gelişmesi her zaman söz konusudur. Bunun için hasta odalarında ön görülü davranıp fazladan tesisat alanı için uygun boyut ve yer bırakılmalıdır.

 Copyright © International Science and Technology Conference (ISTEC)

İncelenen bir bölge, üniversite ve kamu hastanesi olan binadan çıkarılan sonuçların genel olarak diğer aynı özelliklere sahip hastane yapıları için de geçerliliği bulunmaktadır. Çalışmanın, kullanıcı memnuniyeti, mekanların işlev açısından sürdürülebilirliği, kalite kavramı ve bundan sonar yapılacak çalışmaları katkıda bulunması umulmaktadır.

TEŞEKKÜR

Çalışmada kişisel yardımlarını esirgemeyen Erciyes Üniversitesi Tıp Fakültesi Anestezi ve Reanimasyon Anabilim Dalı öğretim üyeleri Doç. Dr. Cihangir Biçer ve Doç. Dr. Recep Aksu'ya teşekkür ederiz.

Giriş: Sağlık hizmetleri sunumunda hastalıkların teşhis ve tedavilerini gerçekleştirmek amacıyla birçok invazif ya da noninvaziv testler yapılmaktadır. Bu çalışma ile hasta ve çalışan güvenliğine etkisi açısından aynı amaçla kullanılan iki farklı testin karşılaştırılması amaçlanmıştır.

Materyal-Metot: H. plori insanlarda mide ve duodenum mukozasına yerleşerek enfeksiyon ve ülsere sebep olan bir bakteri olup tespiti için invaziv,noninvaziv testler bulunmaktadır. Noninvaziv testlerden birisi de Üre nefes testidir. Üre nefes testi için iki farklı yöntem bulunmaktadır. Birbirlerine üstünlükleri çok fazla olmayan bu iki testen birincisi C14 üre diğeri de C13 üre testidir. C14 üre solunum testi maliyeti ucuz olup daha hızlı sonuç vermektedir ancak radyoaktiftir. C13 üre solunum testi ise maliyetinin daha fazla olmasına karşın radyoaktif olmadığından emniyetli ve kolay uygulanabilir bir testtir. Bir kısım maliyeti pahalı fakat hem sağlık çalışanı hem de hastalar açısından daha güvenli olan C13 üre nefes testini tercih etmesine karşın diğer bir kısım ise maliyeti daha az ve hızlı sonuç vere fakat gebelerde ve çocuklarda önerilmeyen C14 üre nefes testini tercih etmektedir.

Sonuç: Hasta ve çalışan güvenliğinin ön planda tutulması gerekliliği düşünüldüğünde maliyeti pahalı da olsa, risk açısından sıfır riskli olduğu düşünülen yöntemlerin tercih edilmesinin uygun olacağı değerlendirilmiştir.

Keywords: Üre testi, C13 ve 14 testi

HAVA TÜREVLERİ VE GELİŞMEKTE OLAN ÜLKELERDE KULLANIMINA YÖNELİK BİR UYGULAMA

Gülsen ALKAÇ ÖZDEMİR
Uludağ Üniversitesi, Ali Osman Sönmez Sosyal Bilimler Meslek Yüksekokulu, Bursa – Türkiye
gulsenozdemir@uludag.edu.tr

Özet: Günümüzde tarım, turizm, enerji ve giyim gibi birçok sektör hava durumuna bağlı olarak yaşanan değişimlerden etkilenmektedir. Hava durumunda beklenmeyen değişimlere karşı işletmeler satış, kar ve müşteri kaybı gibi sorunlar yaşamaktadır. Bu olumsuzluklara karşı bazı gelişmiş ve gelişmekte olan ülkelerde havayla ilişkili riskleri yönetmek için sigortanın yanı sıra finansal türev araçlardan yararlanılmaktadır. Hava veya iklim türevi olarak ifade edilen bu araçların en çok kullanılan türleri opsiyon, swap ve future sözleşmelerdir. Bu çalışmanın ilk bölümünde hava türevleri, hava türevlerinin türleri ve farklı sektörlerdeki hava türevi uygulamaları ele alınmaktadır. Daha sonra, bir hava türev uygulama örneği sunulmaktadır. Çalışmanın sonuç bölümünde, hava türev piyasalarının gelişmekte olan ülkelerde gelişmesi için öneriler sunulmuştur.

Anahtar Kelimeler: İklim Değişimi, Türev Ürünler, Hava Türevleri, Gelişmekte Olan Ülkeler

WEATHER DERIVATIVES AND AN APPLICATION FOR USE IN DEVELOPING COUNTRIES

Abstract: Today, many sectors such as agriculture, tourism, energy and clothing are affected by changes in weather. Due to unexpected changes in the weather, business suffer from problems such as loss of customers, sales and profit. Businesses in some developed and developing countries against these problems, to manage the risks associated with weather are also benefit from financial derivative instruments, as well as the insurance. The most widely used types of these instruments expressed as weather derivatives are options, swaps and futures contracts. The first part of this study, weather derivatives, types of weather derivatives and weather derivatives applications in different sectors are examined. Later, the application example for weather derivatives are presented. In the conclusion of the study, recommendations for growth in developing countries of the weather derivatives market are presented.

Keywords: Change of Climate, Derivative Instruments, Weather Derivatives, Developing Countries

Giriş

Hava riski ifadesi bir işletmenin sıcak, soğuk, kar, yağmur ve rüzgâr gibi hava olayları sonucu ortaya çıkan finansal etkilere maruz kalmasını tanımlamak için kullanılır. Bu durum, doğada meydana gelen fakat felaket olarak tanımlanmayan hava olaylarının bir sonucudur ve işletmenin karlılığını etkilemektedir. Arzulanmayan hava durumlarının ortaya çıkardığı finansal dalgalanmaları elimine etmek veya azaltmak için hava riski mutlaka yönetilmelidir (Clemmons, 2002: 3). Hava koşullarında oluşan normalden sapmalar, ısı etkisi dışında, yağış miktarı, kar miktarı ve rüzgâr düzeyleri gibi hava parametrelerini de kapsamaktadır (Sytsma ve Thompson, 2002: 3). Hava risk piyasası enerji, sigorta, banka, tarım, turizm ve eğlence gibi birçok sektörden katılımcıları içermektedir. Hava risk piyasası ABD'de doğup gelişmeye başlamış olup Avrupa, Asya ve Latin Amerika'dan yeni katılımcılarla hava türev piyasası genişlemektedir (Geyser, 2004: 1).

Hava türevleri, geleneksel riskten korunma enstrümanlarından farklılık göstermektedirler. Hava türevleri, mal futures sözleşmeleri ve diğer finansal türev türlerinden farklı olarak bir malın tedarik ve talep miktarında havayla ilişkili azalmalara karşı korunma sağlamak için oluşturulur. Bu, fiyat riski değil, miktar riskidir (Ali, 2004: 75).

Bu çalışmanın amacı, günümüzde küresel iklim değişimiyle birlikte yaşanan hava durumuyla ilgili risklere karşı bir finansal risk yönetim aracı olan hava türevlerini tanıtmak ve uygulama örnekleri sunmaktır. Bu amaçla, ilk olarak hava türevleri piyasasının doğuşu ve gelişimi, hava türev ürünlerinin temel unsurları, hava türev ürünleri ve özellikleri ele alınmakta, sonrasında ise uygulama örnekleri sunularak sonuç bölümünde Türkiye gibi gelişmekte olan ülkelerde bu piyasanın sağlıklı gelişmesi için çeşitli öneriler sunulmaktadır.

Hava Türevleri Piyasası Ve Gelişimi

Hava türevleri; sıcaklık, yağış miktarı gibi hava değişkenleri üzerine düzenlenen türev ürünler olup, çeşitli hava indeksleri üzerine düzenlenen opsiyon, futures ve swap sözleşmeleridir. Bir diğer ifadeyle hava türevi, hava türevi sözleşmesine konu olan taraflar arasındaki ödemelerin nasıl değiştirileceğinin, sözleşme dönemi boyunca gerçekleşen hava koşullarına bağlı olmasının şart koşulduğu, iki taraf arasındaki sözleşmedir (Geyser, 2004: 1).

Hava türevleri, borsalarda işlem gören standartlaştırılmış future ve opsiyonlar ya da bankalar tarafından üretilen müşteriye özel yapılanmalar kullanmak suretiyle hava durumu risklerine karşı korumayı sağlayan finansal araçlardır (Sarıoğuz, 2007: 176). Hava türevleri, hava şartlarındaki değişiklikler nedeniyle kazançları olumsuz etkilenen taraflarca kullanılır. Bunlar arasında enerji, inşaat, altyapı ve sigorta şirketleri, tarım ve turizm sektörü sayılabilir. Enerji sektörü, hava koşullarından en çok etkilenen sektördür. Hava risklerine karşı korunmanın belirlenebilmesi için öncelikle hava türevlerinin nasıl bir hava düzensizliğine karşı kullanılacağının bilinmesi gerekmektedir (Chambers, 2005: 55-56).

Hava türevleri ve sigorta sözleşmeleri benzer bir amaçla kullanılabilmesine rağmen, bu sözleşmeler arasındaki temel farklılık, sigorta sözleşme sahibinin tazminat alabilmek için havaya bağlı bir finansal kayba uğradığını kanıtlamak zorunda olmasıdır. Hava türevlerinin ödemeleri ise, sadece hava koşullarının sonucuna bağlıdır. Türev ürün sahibinin bundan nasıl etkilendiğine bağlı değildir. Ayrıca hava türev sözleşmesinden faydalanmak için hava şartlarına duyarlı bir ürüne sahip olmaya da ihtiyaç yoktur. Bu sözleşmeler sadece spekülasyon için satın alınabilir (Alaton vd., 2002: 5). Ayrıca sigorta yüksek risk ve düşük olasılıklı olayları kapsarken, hava türevleri düşük risk ve yüksek olasılıklı olaylara (örneğin ılık kış) karşı gelirleri korumaktadır (Garcia ve Sturzenegger, 2001: 9).

Hava türevleri tezgâh üstü piyasası ilk olarak enerji sektöründeki şirketler tarafından başlatılmıştır. hava koşullarına dayalı ilk hava türevi sözleşmesi, Eylül 1997'de Enron ve Koch arasında yapılmıştır. Enerji üreticilerinin ihtiyacı, ısı dalgalanmalarının neden olduğu miktar riskine karşı korunmaktır (Geyser, 2004: 2). Bu tarihten sonra, hava türevleri piyasası, tezgâh üstü piyasa içinde hızla gelişme göstermiştir. Hava türevleri piyasasında, 2001 yılının Nisan ayına kadar yapılan sözleşme sayısı 4784'tür. Toplam nominal değer 4.5 milyar $'dır (Hess, 2001: 16).

Chicago Ticaret Borsası Eylül 1999'da hava türevleri için GLOBEX adında standart hava türevi ticaretinin ilk olarak yapıldığı yeni bir elektronik piyasa başlatmıştır. 1999'da, sıcaklıkla ilgili hava türevlerinin dünyadaki ilk borsa işlemi, 4 ABD şehri, Atlanta, Chicago, Cincinnati ve New York için HDD indeks futures sözleşmeleriyle başlamıştır. CME'de küçük işlem miktarı ve düşük maliyetler bulunması, yeni katılımcıların artmasını sağlamıştır (Property & Casualty/Risk & Benefits Management, 1999: 12). Londra Uluslararası Finansal Futures ve Opsiyon Borsası'nda (LIFFE) 2001 yılında hava futures sözleşmeleri işlem görmeye başlamıştır (Burçkin ve Boyacıoğlu, 2004: 104).

CME'de hava türevleriyle ilgili işlemlerin başladığı ilk 5 saat içinde 53 sözleşme satılmıştır (Carpenter, 1999: 12). 1997 yılından 2002'ye kadar geçen beş yılda, hava riski ile ilgili hava türevi sözleşmelerinin işlem tutarı, 7 milyar $'ın üzerine çıkmıştır. ABD'nde CME Borsası'nın kotasyonu sıcaklık bazlıdır ve CME'de, günün ısı dereceleri indeksi bazında futures sözleşmelerinin alım satımı yapılmaktadır. CME, Atlanta GA, Chicago IL, Cincinnati OH, Dallas TX, DesMoines IA, Las Vegas NV, New York NY, Philadelphia PA, Portlans OR ve Tuesan AS gibi 10 ABD şehri için günün dereceleri indeksi temelinde futures ve futures bazlı opsiyonları alım satıma sunmaktadır (Connors, 2003: 21-22). CME şu an CME Group adıyla 45 şehrin (ABD 24, Avrupa 10, Kanada 6, Japonya 2, Avustralya 3) hava sıcaklığına dayalı hava durumu türevi sunmaktadır (Görgün, 2009: 76). CME'de işlem gören futures üzerine opsiyon sözleşmeleri, Avrupa tipi opsiyonlardır. CME son kullanıcılardan ziyade, pozisyonlarını riskten korumak için piyasa yapıcılarının yer aldığı bir borsadır (Alaton vd., 2002: 2-4). Piyasa yapıcıları, borsa tarafından istendiğinde, belli bir opsiyon için alış ve satış fiyatı kote eden kişi veya kuruluşlardır (Ceylan, 2003: 328). Hava türevleri piyasası, birincil ve ikincil piyasa olarak ikiye ayrılabilir. Son kullanıcılar, birincil piyasada alım satım işlemleri yapmaktadır. Bu kapsamda "son kullanıcı" terimi elektrik veya gaz dağıtım işletmeleri gibi kamu hizmeti işletmeleri, inşaat işletmeleri, eğlence parkları ve tarım işletmeleri gibi kendi faaliyet alanlarında hava riskleriyle karşılaşan kuruluşlar demektir. İkincil piyasa, genelde

 Copyright © International Science and Technology Conference (ISTEC)

hava türevlerinde uzmanlaşmış yatırım bankaları ve aracı kurumlar alanlarından oluşmaktadır. Bunların amacı, hava türevlerinde alım satım işlemleri yaparak alım satım ve arbitraj karı elde etmektir (Müller ve Grandi, 2005: 21-22).

Hava Türevlerinin Unsurları

Hava türev sözleşmesi, genellikle ortalama veya maksimum günlük sıcaklık gibi bir hava olgusunu temel alan bir indeks seviyesine karşılık ödeme yapmayı sağlayan bir sözleşmedir (West, 2002: 9). Hava türev sözleşmesinde; türev ürün alıcısı, olumsuz hava koşullarından kaynaklanan risklere karşı korunmayı isteyen taraftır. Hava türev türlerini sunabilen kuruluşlar ise; diğer enerji firmaları için bu ürünleri tedarik eden enerji firmaları, bu tür anlaşmalar için gerekli işlem yapma ve fiyatlandırma becerisine sahip yatırım bankaları, reasürörler ve hava durumu hasarlarına karşı poliçeler düzenleyen sigorta şirketleridir. (Sarıoğuz, 2007: 179).

Finansal türevler hisse senetlerine, tahvillere, kur oranlarına veya paralara dayanır ve bunların tümü havanın aksine teslim edilebilir nesnelerdir. Hava türevlerinin temeli ise, örneğin bazı malların alım satım miktarını etkileyen ısı derecesi gibi, hava parametrelerine dayanır (Müller ve Grandi, 2005: 1). Bu nedenle hava türevleri değişkenlerinin alınıp satılabilme özelliği ve fiyatı yoktur. Hava türevi değişkenleri, ürünlerin alım satım miktarını etkileyen sıcaklık, yağış gibi verilere dayalıdır. Ayrıca finansal türev ürünlere göre hava türevleri; miktar riskinden korunmak için kullanılmakta, manipüle edilememekte ve hava değişkenlerinin alım satımı yapılamamaktadır (Cao ve Wei, 2001: 21).

Bir hava durumu türevinin işleyişinde, ilgili mevsim için, anlaşmaya konu olan sıcaklık endeksinin belirlenen seviyenin altına düşmesi veya üzerine çıkması durumunda tazminat alınacaktır. Sıcaklık endeksi, toplanmış sıcaklık derecelerinden meydana gelir. Örneğin kış soğudukça endeks en üst seviyesine çıkmaktadır. Kış sıcak geçtikçe endeks en alt seviyesine inmektedir. Derece günü (Degree Day) terimi; hem yazın, hem kışın yakıt tüketimini ölçen bir endeksin birim değeri olarak tarif edilmektedir (Sarıoğuz, 2007: 168-169).

Hava türevleri, temel alınan hava indeksinin farklılıkları bazında, genellikle swap, futures ve alım/satım opsiyonları şeklinde yapılandırılmaktadır. Kullanılan indeksler, sıcak ve soğuk derece günler, nemlilik, yağmur ve kar yağışıdır. Bununla beraber sektör, sözleşmeler için temel olarak ısı üzerine kurulmuştur. Hava türev sözleşmeleri ile ilgili kullanılan temel kavramlar aşağıda ele alınmaktadır (Alaton vd., 2002: 3):

Günün sıcaklık derecesi (DD) ($T_{(i)}$) i günü için sıcaklığı gösterir. Hava türevleri için temel alınan en önemli değişken günün sıcaklık derecesidir. T_i^{max} ve T_i^{min} olarak verilen spesifik bir hava durumu, belirli bir i gününde ölçülen maksimum ve minimum sıcaklık derecesini (santigrat derece) gösterir. Bir i günü için sıcaklık ise şöyle tanımlanır:

$$T_i \equiv \frac{T_i^{max} + T_i^{min}}{2}$$

En temel hava indeksleri, ısınma derecesi gün-HDD_i, (Heating Degree Day- HDD) ve soğuma derecesi gün CDD_i (Cooling Degree Day- CDD) olarak tanımlanır. Bunlar, aşağıdaki gibi oluşturulur.

$HDD_i \equiv \max \{18 - T_i, 0\}$
$CDD_i \equiv \max \{T_i - 18, 0\}$

Belirli bir gün için, HDD_i veya CDD_i rakamları referans ısı düzeyinden ayrılan ısı derecesi rakamlarıdır. Bu rakam, referans düzeyi 65 fahrenhayt (18 C derece) olarak konulan ABD'ndeki endüstri standardıdır. Isınma ve soğuma derece gün ifadesi, ABD enerji sektöründe ortaya çıkmıştır. Bunun nedeni ise şöyle açıklanabilir. Eğer sıcaklık 18 derecesinin altına düşerse, insanlar evlerini ısıtmak için daha fazla enerji kullanmaya yönelecekler, buna karşın eğer sıcaklık 18 derecenin üzerine çıkarsa insanlar serinlemek için klimalarını açacaklardır (Alaton vd., 2002: 3).

Sıcaklık sözleşmeleri daha çok günlük ortalama sıcaklık bazında tanımlanan HDD ve CDD'ler olarak işlem görür. HDD sayısı, 65 F^0 (18 C) ile günlük ortalama sıcaklık arasındaki farkı gösterir, CDD sayısı ise günlük ortalama sıcaklık ile 65 F^0 arasındaki farktır. HDD ve CDD negatif olamaz. Günlük ortalama sıcaklıklar gece yarısı temeline göre, bir gece yarısındaki minimum ile maksimum aritmetik ortalama kayıtlarıdır. HDD ve CDD'nin tanımları daha açık bir ifadeyle aşağıdaki gibi oluşturulur (Garcia ve Sturzenegger, 2001: 9):

HDD = maksimum { 65 F^0 – günlük ortalama sıcaklık, 0}
CDD = maksimum { günlük ortalama sıcaklık – 65 F^0, 0}

 Copyright © International Science and Technology Conference (ISTEC)

Hava türevleriyle ilgili temel unsurlar aşağıdaki gibi açıklanabilir (Connors, 2003: 22):

- **Günün Sıcaklık Derecesi (Degree Day (DD)):** Gece yarısı esasına göre, bir gece yarısında bir günün ortalama sıcaklığının ölçümüdür.
- **Isınma derecesi gün (Heating Degree - Day (HDD)):** 65 F^0 ile karşılaştırılan günlük derecenin soğukluğunun ölçümüdür. Günlük HDD= Maksimum (65 F^0 – DD).
- **Soğuma derecesi gün (Cooling Degree - Day (CDD)):** 65 F^0 ile karşılaştırılan günlük derecenin sıcaklığının ölçümüdür. Günlük CDD= Maksimum (DD – 65 F^0)
- **Isınma Derecesi Günler İndeksi- (Heating Degree - Day Index):** Bir ay üzerinden günlük olarak tutulan, günlerin sıcaklık derecelerinin toplamıdır. Referans sıcaklık ile günlük ortalama sıcaklık arasındaki farka görü günlük HDD bulunur. Sonra günlük HDD'ler kümülatif olarak toplanır ve HDD indeksi oluşturulur. HDD İndeksi = HDD
- **Örnek**: Nisan HDD ∑ 0, 31, 20 ,10, 0, 25, 15, 10, 8, 7, 9, 11, 12, 40, 17, 10, 2, 0, 0, 17, 10, 13, 9, 27, 40, 26, 20 , 21, 0, 5, 3.
- Nisan HDD İndeksi = 0+31+20+10+0+25+15+10+8+7+9+11+12+40+17+10+2+0+0+ 17+10+13+9+27+40+26+20+21+0+5+3 = 418.
- **Soğuma Derecesi Gün İndeksi (Cooling Degree - Day Index):** Bir ay üzerinden günlük olarak tutulan, günlerin soğukluk derecelerinin toplamıdır. CDD İndeksi = CDD
- **Sözleşme Değeri:** HDD/CDD futures sözleşmelerinin değeri HDD veya CDD indeksinin 100 $'la çarpılmasıyla bulunur.
- **Örnek:** Nisan HDD İndeksi = 418 ise, Sözleşme Değeri = 418 x 100$ = 41.800 $ olur.
- **Tik Büyüklüğü:** Sözleşmede, temel değişken olarak kullanılan indeks değerindeki minimum değişmeyi gösterir. Tik, bir derece güne karşılık gelmektedir.

En çok ısı bazında yapılan hava türevleri, belirli bir dönem esnasındaki HDD_s veya CDD_s'lerin hesaplanması temeline dayanır. Bu dönem genellikle bir takvim ayı veya bir kış/yaz dönemidir. Genellikle, HDD sezonu Kasım ayından Mart ayına kadar olan kış aylarını kapsarken, CDD sezonu ise Mayıs ayından Eylül ayına kadar olan zamanı içerir. Nisan ve Ekim aylarına çoğu zaman "destek ayları" olarak başvurulur (Alaton vd., 2002: 4). Hava türevleri temel olarak satın alma opsiyonu, satma opsiyonu, swap ve bunların kombinasyonlarından oluşmaktadır. Opsiyon, futures veya swap'ların dört unsuru bulunmaktadır. Bunlar; temel alınan HDD/CDD indeksleri, toplam dönem (bir sezon veya bir ay), günlük sıcaklık kayıtları için belirli bir hava istasyonu, her bir HDD/CDD için belirlenen tik büyüklüğüdür (Garcia ve Sturzenegger, 2001: 9-11).

Hava Türevlerinin Türleri

Hava Opsiyonları

Hava türevleri piyasasındaki işlemlerin yaklaşık %70-80'ini sıcaklık dalgalanmalarından korunmayı amaçlayan opsiyonlar oluşturmaktadır. Opsiyonlarda satın alma opsiyonu alınması/satılması ve satma opsiyonu alınması/satılması olmak üzere dört çeşit temel işlem bulunmaktadır. Opsiyon işlemleri için HDD ve CDD indeksleri baz alınır. HDD indeksi kış mevsimi, CDD indeksi ise yaz mevsimi için ortalama sıcaklığı ölçer (Burçkin ve Boyacıoğlu, 2004: 96). HDD satın alma opsiyonunda, vade sonunda, HDD belirlenen kullanım düzeyini aşarsa alıcı ödeme alır. Ödemenin miktarı, kullanım düzeyi ve tik değeri tarafından belirlenir. Hava opsiyonunda sözleşmenin türü (alım veya satım), sözleşmenin vadesi (örneğin Ocak 2001), temel alınan indeks (HDD veya CDD), sıcaklık verilerinin elde edileceği resmi bir hava istasyonu, kullanım düzeyi, tik büyüklüğü, maksimum ödeme (eğer varsa) parametreleri mevcuttur (Alaton vd., 2002: 4). Sözleşmelerde bir derece güne karşılık gelen *tik büyüklüğü*, ödeme düzeyini belirlemek için tanımlanır (Müller ve Grandi, 2005: 2).

Satın alma opsiyonunun alıcısı, vade sonunda, hava indeksinin kullanım düzeyini aşması durumunda ödeme alır. Ödeme tutarı, indeksin kullanım düzeyini ne kadar aştığıyla ilişkilidir (Feachems, 2000: 39). Satın alma opsiyonunun satın alınmasıyla işletme kendini soğuk kışa veya sıcak yaza karşı koruyabilir. Kış ne kadar soğuk veya yaz ne kadar sıcak olursa, opsiyonu satın alana ödenecek miktar o kadar artar. Fakat bu ödemenin maksimum bir üst sınırı olur (Burçkin ve Boyacıoğlu, 2004: 96).
. Sözleşme dönemi için alım ve satım opsiyonunun formülleri aşağıdaki gibidir (Alaton vd., 2002: 4):

$$P = k \text{ maks } \{W - S, 0\}$$

W = Hava indeksi, S = Kullanım Düzeyi, k = Tik değeri

Satma opsiyonun satın alınmasıyla işletme kendini sıcak kışa veya soğuk yaza karşı koruyabilir. Satma opsiyonun ödeme formülü de aşağıdaki gibidir.

 Copyright © International Science and Technology Conference (ISTEC)

P = k maks {S -W,0}
W: Hava indeksi S: Kullanım düzeyi k: Tik değer

Belirli bir alanda ölçülen hava faktörünün kümülatif değeri, belirlenmiş kullanım düzeyinin altına düştüğü zaman, satma opsiyonu gerçek değere sahip olur. Eğer opsiyon gerçek değerinde değilse, kullanılmayacağından alıcısı sadece primi kaybeder. Hava indeksinin alışılmadık şekilde düşmesi halinde, satıcının aşırı kaybını önlemek için sözleşmeye "floor" bir diğer ifadeyle taban şeklinde bir sınırlama getirilir (Gardner, 2003: 10).

Bir HDD satma opsiyon sözleşmesinde, opsiyonunun alıcısı, uygun hava koşullarında kazançlarını arttırır, ılık yani sıcak bir kışta ise kazançlarındaki düşüşe karşı korunmak istemektedir. Ödeme, indeks kullanım düzeyinden aşağıya düştükçe artar. Eğer HDD, kullanım düzeyinden aşağıya düşerse satma opsiyonunun alıcısı satma opsiyonunun satıcısından ödemeyi alır (Feachems, 2000: 39-40).

Bir CDD satma opsiyonu satın alan işletmeye yapılacak ödeme şu şekilde bulunur (McKay, 2004: 12):

P= k x (S-W)
W: Günün gerçek dereceleri, yani CDD indeksi, S: Satma opsiyonu kullanım düzeyi, k: Tik.

Yukarıdaki veriler ışığında oluşturulan örnek bir CDD satma opsiyon sözleşmesinde aşağıdaki maddeler üzerinde anlaşılmıştır (McKay, 2004: 12):
Kullanım: 3150 CDD, Tik: CDD başına 20.000 $, Prim: 400. 000 $
Dönem için gerçekleşen CDD: 3100'dür.

Satma opsiyonunun ödemesi: 20.000 $ x (3100 – 3150) = 1.000.000 $. 400.000 $ prim düşüldüğünde, işletmenin net karı 600.000 $ olur. Dolayısıyla opsiyonun işletmeye maliyeti sadece primdir (McKay, 2004: 12-13).

HDD/CDD satın alma ve satma opsiyonlarının ısı temelli sağladıkları korunmalar, bunların uygulanma zamanları ve ödemenin yapılışı aşağıdaki tablo 1'de gösterilmektedir (Müller ve Grandi, 2005: 10):

Tablo 1. HDD/CDD Satın alma ve satma opsiyonunun ısı temelli sağladığı korunma, uygulanma zamanı ve ödeme yapısı

Opsiyon Türü	Sağladığı Korunma	Uygulanma Zamanı	Ödeme Yapısı
HDD satın alma	Aşırı soğuk kışlara karşı	HDD > Kullanım Düzeyi	Tik x (HDD -Kullanım Düzeyi)
HDD satma	Aşırı ılık kışlara karşı	HDD < Kullanım Düzeyi	Tik x (Kullanım Düzeyi - HDD)
CDD satın alma	Aşırı sıcak yazlara karşı	CDD > Kullanım Düzeyi	Tik x (CDD -Kullanım Düzeyi)
CDD satma	Aşırı serin yazlara karşı	CDD < Kullanım Düzeyi	Tik x (Kullanım Düzeyi - CDD)

Hava Swapları

Hava swapı, üzerinde anlaşılan swap düzeyine ve sözleşme vadesinin sonunda oluşan hava indeksine bağlı olarak taraflar arasındaki nakit akışının değiştirilebildiği finansal sözleşmedir. Swap'ın alıcısı eğer indeks, swap düzeyinin üzerinde oluşursa satıcıdan ödeme alır. Tersine, indeks swap düzeyinden aşağıda oluşursa alıcı satıcıya ödeme yapar. Swap sözleşmelerinde prim yoktur (Feachems, 2000: 40). Sözleşmenin sonunda satıcı alıcıya P = k (W - S) miktarında bir ödeme yapar. P 'nin negatif olması durumunda ödeme alıcı tarafından satıcıya yapılır. Buradaki S, swap için "kullanım indeksi" veya "referans indeksi" olarak bilinir (Zeng, 2000: 73). Hava swapları, teknik olarak forward ya da futures sözleşmeler olarak ele alınabilir. Fiyatlar, indeksin kullanım düzeyince konulur. Futures olarak swapların 15'i ABD'de, 5'i Avrupa'da ve 1'i de Japonya'da olmak üzere toplam 21 bölgede, aylık ve mevsimlik sözleşmeler olarak CME'de alım satımı yapılmaktadır (Jewson, 2004: 57-58).

Eğer, belirli bir dönem sonunda günün derecesi sözleşmede belirlenen dereceden daha yüksek olursa, bir taraf diğerine ödeme yaparken, eğer günün derecesi belirli bir dönem sonunda kullanım düzeyinden daha düşük olursa diğer taraf ödeme yapacaktır (Garcia ve Sturzenegger, 2001: 11).

 Copyright © International Science and Technology Conference (ISTEC)

Hava Futures Sözleşmeleri

HDD/CDD indeksi futures sözleşmeleri belirli bir gelecek tarihteki HDD/CDD indeks değerinin alınması ve satılması sözleşmeleridir. Sözleşmeler HDD/CDD indeks puanlarına göre kote edilmiştir. Futures sözleşmeler nakit olarak sonlandırılmaktadır. Müşterinin hesabına kazanç ve kayıplar uygulanarak günlük fiyat ayarlaması yapılmaktadır (Alaton vd., 2002: 4). Eğer, günün dereceleri aylık olarak üzerinde anlaşılan düzeyden daha yüksek ise, bir taraf ödeme yapar. Eğer günün dereceleri aylık olarak üzerinde anlaşılan düzeyden düşükse, bu defa diğer taraf ödeme yapar.

Pek çok inşaat firması, aşırı sıcaklık değişimine karşı teminata ihtiyaç duyar. Öneğin yol inşaatı yapan bir firma, sıcaklık donma derecesinin altına düşerse, betonun karıştırılması güçleştiği için asfalt boşuna harcanmış olur. İnşaat sektöründe, belediyeler ve hükümetle yapılan sözleşmelerde, sözleşme bitiş tarihinde, sözleşme gerekleri yerine getirilmezse, bu durum, taahhüt veren tarafa gün başına yüksek maliyetlere neden olabilmektedir (Sarıoğuz, 2007: 163).

Bir işletmenin futures sözleşmeyle korunması, inşaat sektöründe yer alan bir işletme örneğiyle aşağıda açıklanmaktadır (Connors, 2003: 22-23):

İnşaat şirketi, havayla ilgili tarihsel verileri incelemiş ve inşaat maliyetleri ile soğuk hava arasında yüksek korelasyon olduğunu fark etmiştir. Ortalamaya yakın kışlar normal karlara, ılık geçen kışlar ortalamadan daha yüksek karlara, soğuk kışlar ise, yüksek maliyetlere neden olmaktadır. İşletme, CME'nin HDD indeks futures sözleşmelerini kullanarak ortalamadan daha soğuk bir kışın riskinden korunmayı seçmiştir. Basit olması açısından, örnekte sadece Şubat ayı ele alınmaktadır.

Korunmanın nasıl oluşturulacağını belirlemek için inşaat şirketinin yönetimi, soğuk hava maliyetleri ile HDD hava veriler ilişkisini incelemek zorundadır. İstatistiksel araştırma sonuçları, indeksteki %1'lik artışın yapı maliyetlerini % 0,5 arttırdığını göstermektedir. Şubat ayı için tahmini yapı maliyeti 72.000.000 $'dır. Şubat ayı futures sözleşmesi için HDD indeksi 1200 değerindedir. Şubat HDD indeksindeki %1 artış mevcut fiyat düzeyinde sözleşme başına 1.200 dolar değerindedir (%1 X 1200 (HDD indeks fiyatı) X (tick başına 100 $)). HDD indeksindeki % 0,5'lik artış, yapı maliyetlerinde 360.000 $'lık artışa (% 0,5 * 72.000.000) neden olacaktır. Korunma oranı veya satın alınan sözleşme sayısı 300 sözleşmedir (360.000 $ / sözleşme başına 1200 $).

Eğer kış ortalamadan daha soğuk olursa, varsayalım ki, 2 Martta, Şubat ayı HDD sözleşmesi 1400 olsun. İndeksten % 16,66 daha soğuk hava, ilave 6.000.000 $ ilave yapı maliyetleri getirir. Bu ilave yapı maliyetinin bulunuşu ise şöyledir: %16,66 X 0,5 X 72.000.000 $ = 6.000.000 $. HDD indeks sözleşmesinden 6.000.000 $ [300 sözleşme X tik başına 100 $ X (1400 HDD – 1200 HDD)] kazanılır. Bu kazanç, kayıpları karşılar.

Eğer kış ortalamadan daha ılık olursa, varsayalım ki, 2 Martta, Şubat ayı HDD sözleşmesi 1100 olsun. Ilık kış, indeksten % 8,33 daha ılıktır. İşletme ılık geçen havadan dolayı 3.000.000 $ kazanacaktır (%8,33 X 0,5 X 72.000.000 $). HDD indeks sözleşmesinden İnşaat firmasının kaybı 3.000.000 $ olacaktır. (3.000.000 $= 300 sözleşme X tik başına 100 $ X (1100 HDD – 1200 HDD)). İnşaat firması, HDD indeks futures sözleşmesindeki zararını, ılık havadan elde ettiği kazançla karşılar.

Hava Türevlerinin Fiyatlaması

Hava türevleri konusundaki önemli konulardan biri de fiyatlama konusudur. Bu konuda birçok akademik çalışma yapılmış ve yapılmaktadır. Örneğin bu çalışmalardan birinde Sun ve Van Kooten (2015) buğday üretiminde hava riskinden korunmak için finansal türev araçların fiyatlandırılmasını ele almışlar ve büyüme dereceli günlere (GDDs) dayalı olarak hava türev seçeneklerinin fiyatlandırmasındaki farklı metotları karşılaştırmışlardır.

Hava türevlerinde temel alınan değerler hava değişkenleri olduğundan ve bunların da ticareti yapılmadığından, hesaplamalarda gerekli olan para çarpanı, hava değişkenlerinin günün ısı derecesi para değerine dönüştürülerek bulunur (West, 2002: 9). Hava türevleri için genel kabul görmüş bir fiyatlama modeli bulunmamaktadır. Geleneksel opsiyon fiyatlama modeli Black/Scholes ve Arbitrajsız opsiyon fiyatlama modeli, hava türevlerinin değerlemesinde kullanılamamaktadır. Çünkü bu modeller, alınıp satılabilen bir değişkenin varlığını şart koşmaktadır. Hava türevlerinin temel değişkenleri finansal piyasalarda alınıp satılabilen değerler olmayıp, vade sonunda normal dağılım da göstermeyebilirler. Temel hava indeksleri, sabit olmadığından fiyatlama için aktüeryal tekniklerin uygulanmasında da zorluklar bulunmaktadır (Zeng, 2000: 72-73). Günümüzde hava türevleri fiyatlaması, aktüeryal hava tahmin bilgisi ile birleştirilen standart opsiyon fiyatlama modelleri ve burn

 Copyright © International Science and Technology Conference (ISTEC)

analizinin karmasından oluşmaktadır (Müller ve Grandi, 2005: 19). Türkiye için sıcaklığa dayalı hava durumu opsiyonlarının fiyatlandırılmasını ele aldığı çalışmasının sonucunda Göncü vd. (2011) gelişmekte olan ülkelerin politika yapıcıları için çeşitli öneriler sunmuşlardır. Bu anlamda hükümetler özel sektördeki bilgi ve uzmanlık eksikliğini giderecek çeşitli mekanizmalar geliştirebilir. Bu konuda görev alabilecek finansal kurumlar da belirli sektörlerin taleplerini karşılamak için bu sektörlere özel ürünler geliştirebilirler.

Gelişmekte Olan Ülkelerde Hava Türevleri Piyasası Ve Uygulamaları

Hava türevleri piyasaları, gelişmekte olan ülkelere afet risklerinin yönetimi ve tarım gibi havaya son derece bağlı sektörler için yeni sigorta ürünlerinin geliştirilmesi yönünde katkı sağlamaktadır. Hava türevleri gelişmekte olan ülkelerde, hava riskini yönetmede, doğal afetlere karşı önemli bir araç haline gelmektedir. 1999 yılında doğal afetler tüm dünyada yüz beş binden fazla insanı etkilemiş ve ABD'nde 100 milyar $'lık bir zarara neden olmuştur. Doğal afetler gelişmekte olan ülkeleri çok daha fazla etkilemekte ve bu ülkelerde daha büyük zararlar oluşturabilmektedir (Varangis, 2001: 1-3).

Gelişmekte olan ülkelerde, hava türevleri daha çok tarım sektöründe uygulama olanağı bulmaktadır. Ancak, tarımda hava türevlerinin kullanımı diğer sektörlerden farklıdır. Ürün ve hava faktörü arasındaki ilişkinin dikkatlice ortaya konması gerekir. Örneğin enerji sektöründe hava türevleri için HDD'ye bağlı bir türevde ısı ve ısıtıcı talebi arasındaki ilişki basit ve doğrusaldır. Tarımsal üretim ilişkisi ise her zaman için böyle doğrusal değildir. Çünkü yetiştirilen ürünler, ürünlerin gelişim aşamaları ve toprak yapısı farklıdır. Örneğin, aynı hava faktörlerine karşı verilecek yanıt, farklı coğrafik bölgeler ve farklı ürünler için farklı olacaktır. Bu nedenlerle tarımda hava türevlerinin uygulaması da önemli derecede farklılıklar göstermektedir (Stoppa ve Hess, 2003: 4). Ayrıca hava şartları çok geniş bir faaliyet alanını etkilediğinden çiftçi ve üreticilerin hava şartlarından kaynaklanan istikrarsızlığı, tarım alanında makroekonomik dalgalanmalara dönüşür (Hess vd., 2002: 2).

Hava türevleriyle ilgili olarak birçok ülkede çeşitli uygulamalar gerçekleştirilmiştir. Örneğin Meksika'da havaya dayalı risk yönetim ürünleriyle birleştirilebilen iki tane kurumsal yenilik gerçekleştirilmiştir. İlki, 1996'da kurulan Doğal Afetler Fonudur (FONDEN) (Skees vd., 2002: 16). İkincisi ise tarım sigortası kapsamında, çiftçi organizasyonları için ortak sigorta fonlarının oluşturulmasıdır. Ayrıca Dünya Bankası tarafından Meksika'da prototip yağış miktar sözleşmesi oluşturularak, bu sözleşmenin ürünlerden elde edilen gelirleri nasıl etkilediği incelenmiştir. Yağış miktarı sözleşmeleri nispeten riskin % 30 kadarını azaltabilmektedir. Elde edilen bulgular yağış miktarı sözleşmelerinin Meksika'da potansiyelinin olduğunu göstermektedir (Varangis, 2001: 8-9).

Romanya'da ise tarım alanıyla ilgili olarak yağmur yağışını temel alan hava türev sözleşmesi yapılmıştır. Yağmur yağışının temel alınmasının nedeni, tarımsal gelirlerin yağmur yağışıyla olan korelasyonunun yüksek olmasıdır (Spaulding vd., 2004: 7).

Güney Afrika'da ise önceleri havayla ilgili risklere sadece geleneksel sigorta perspektiften bakılmıştır. Özellikle enerji piyasasının liberalleşmesinden önce başlıca hedef sektör olarak tarım sektörü ön plana çıkmış ve hava türevlerine önemli bir ilgi artışı olmuştur. Gensec Bankası, ilk kez aktif olarak Güney Afrika piyasasına hava türevlerini pazarlamıştır (Sacharowitz, 2004: 7).

Fas'ta ise Faslı tahıl üreticilerini kuraklığın ekonomik etkilerinden korumak için yağış miktarı indeks türevi yapılmıştır. Yağmur yağışı türev planının pilot uygulaması, Fas'ın kuzeyinde, buğday yetiştirme alanı olarak görülen Meknes bölgesinde yapılmıştır (Stoppa ve Hess, 2003: 8-9). Bu tür sözleşmelerin altında yatan temel fikir yağış miktarı ile gelir arasında kurulan korelasyonun yüksek olmasıdır. Bu nedenle tarım üreticileri, seçilen kullanım düzeyinin altına düşen yağmur yağışı durumunda ödemelerin yapılacağı bir sözleşmeye girerek kendilerini koruyabilmektedir. Ancak sözleşmeyi oluşturmak için kullanım düzeyinin ve bunun hangi düzeyde nasıl oluşturulacağının değerlendirilmesi önemlidir (Hess vd., 2002: 9).

Hava indeks sigortasının tarım sektöründe kullanıldığı gelişmekte olan ülkelerde, bu sigorta türü tarım sigortasına bir alternatif olarak kullanılırken, Türkiye'de henüz tarım sigortası uygulamasının tam olarak gelişmemesi, tarım sektöründe hava indeks sigortasının gelişimi açısından bir dezavantaj oluşturmaktadır. Bu nedenle, öncelikle tarım sigortasının gelişmesi gereklidir. Ayrıca Türkiye'de tarım alanlarının mülkiyet yapısı, işletme ölçeği, üreticinin niteliği, tarım işletmelerin işletilme, üretim ve verimlilik farklılıkları hava indeksinin uygulanabilmesi açısından görülen diğer dezavantajlardır (http://www.zmo.org.tr/etkinlikler/6tk05/061tanferdinlerson.pdf, 02.03.2005).

Hava türev sözleşmelerinin dünyada çıkış noktası olan enerji sektörü, Türkiye gibi gelişmekte olan ülkeler için de hava türevlerinin kullanılabileceği sektörlerin başında gelmektedir. Nitekim Türkiye'de, hava durumu

 Copyright © International Science and Technology Conference (ISTEC)

türevlerinin ilk örneği 2005 yılında Bursa Gaz firması tarafından gerçekleştirilmiştir. Firma bu alanda Türkiye'de bilinen ilk Türk şirketidir. Bursa'da Kasım 2004 - Nisan 2005 kış dönemi ortalamanın üzerinde ılık geçince, şirketin satışları azalmıştır. Bu nedenle Bursa Gaz, hava türevleri üzerine araştırma yapmaya başlamıştır. Türkiye'de bu konuyla ilgili uzmanlığa sahip bir kuruluş bulunmadığından, Bursa Gaz Avrupa'da bir reasürans şirketi olan Swiss Re firmasıyla görüşmüştür. Bursa Gaz, bu firmayla sözleşme yaparak, hava durumu HDD satma opsiyon sözleşmesi satın almıştır. Sözleşme, Aralık 2005 - Nisan 2006 kış döneminde günlük ortalama sıcaklığın 9°C'nin üzerine çıkması durumunda opsiyonun kullanılabilmesi üzerine kurulmuştur. Sözleşme döneminde sıcaklık, opsiyonun uygulanabilmesi için gereken değere ulaşmadığından opsiyon uygulamaya konmamıştır. Bursa Gaz'ın opsiyon anlaşması yapması diğer şirketlerin de bu piyasaya ilgisini çekmek konusunda fayda sağlamıştır. Nitekim bazı firmaların bilgi almak için Swiss Re firmasıyla görüştüğü bilinmektedir (Sarıoğuz, 2007: 232).

Hava Türevlerine Yönelik Bir Uygulama

Hava türevleri çok çeşitli sektörlerde uygulanmaktadır. Farklı sektörlerin hava durumundan etkilenme durumu ve karşılaşacağı riskler de farklı olmaktadır. Aşağıdaki tablo 2'de çeşitli sektörlerin maruz kalabilecekleri hava olayları ve üstlenecekleri riskler yer almaktadır (Cui ve Swishchuk, 2015: 60).

Tablo 2. Sektörler, maruz kalınabilecek hava durumu ve risk türleri

Sektör	Hava türü	Risk
Enerji tüketicileri	Sıcaklık	Aşırı veya azalan talep
Enerji sektörü	Sıcaklık, rüzgâr, güneş ışınımı, yağış	Aşırı veya azalan tedarik
Tarım	Sıcaklık ve yağış	Mahsul verimi, taşıma, depolama, zararlılar
Perakendecilik	Sıcaklık ve yağış	Azalan talep
Seyahat	Sıcaklık, yapış, kar yağışı	İptaller ve daha düşük gelir
Taşımacılık	Sıcaklık, yağış, rüzgâr, don ve kar yağışı	Gecikmeler, iptaller, daha yüksek operasyon maliyetleri, daha düşük gelirler
Hükümet	Sıcaklık, yağış, kar yağışı	Daha yüksek bütçe maliyetleri
İnşaat	Sıcaklık, yağış, kar yağışı	Gecikmeler, daha yüksek bütçe maliyetleri

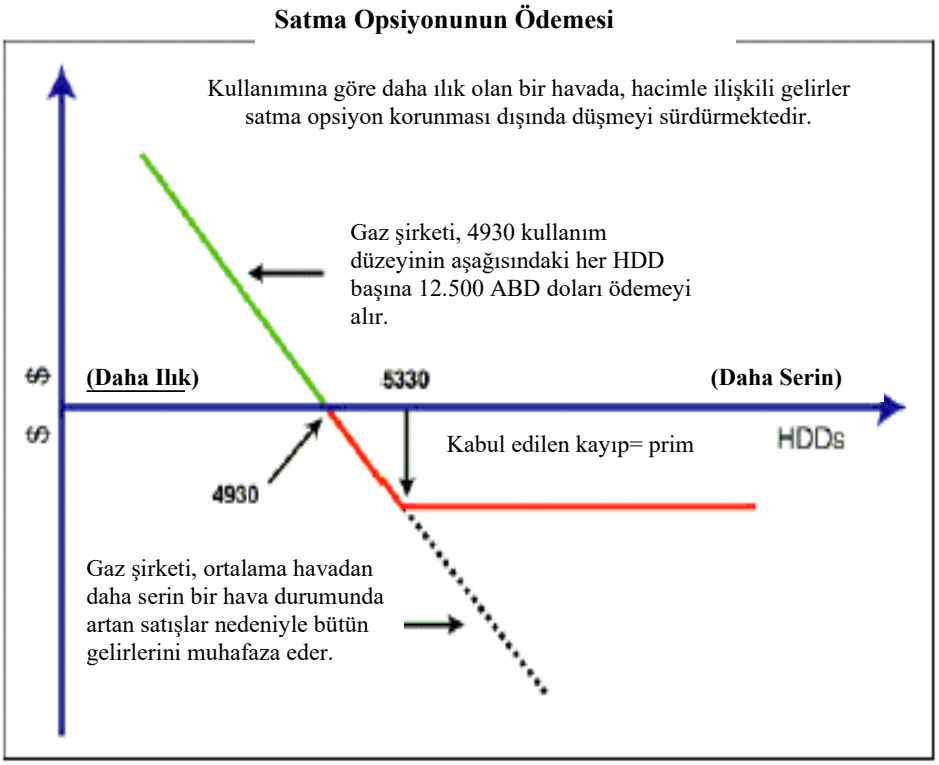
Birçok sektör üzerinde etkili olan hava değişimi bisiklet kullanımı üzerinde dahi etkili olabilmektedir. Bu konuda Norveç'in Bodø kentinde yapılan bir çalışmada, iklim değişikliğine ilişkin öngörüler gerçekleşirse, kısa vade de olmasa da 2050 yılında kış ayının yaklaşık iki ay kısalacağı, bununla birlikte bisiklet kullanma süresinin daha uzun olacağı öngörülmektedir (Mathisen vd., 2015: 270).

Cayra ve Kusyb (2007) ise hava türevlerinin kullanılabilirliğini Kanadalı Buz Şarabı Üretimi üzerinde araştırmışlardır. Buz şarabı, iklim ve belirli ısı şartlarının uygun olduğu dünyanın çok az bölgesinde üretilmektedir. Bu bölgelerden biri de Kanada'nın Niagara bölgesidir. Uygun şartların dışına çıkılması bu bölgedeki üretimi doğrudan etkilemektedir. Çalışmada bu bölgedeki tarihsel mevsimlik ısı değişimleri incelenmiş ve üreticiler için bu tür opsiyon sözleşmelerinin önemli korunma fırsatları sağladığı bulunmuştur.

Günümüzde işletmelerin finansal performansı üzerinde hava ve iklim şartlarının etkili olduğu konusunda artan bir farkındalık bulunmaktadır. Örneğin, FirstEnergy tarafından hazırlanan raporda, Amerika Birleşik Devletleri'nin kuzeydoğusundaki elektrik satışlarından elde edilen 2001 son çeyrek gelirlerinin ılık geçen kış nedeniyle bir önceki yıla göre 122.000.000 $ az olduğu belirtilmiştir (Dutton, 2002: 1304).

Olağandışı hava koşulları doğal gaz şirketlerine son kullanıcıdan gelen talep miktarının düşmesine sebep olmaktadır. Ilık geçen bir kış veya serin geçen bir yaz, doğal gaz şirketlerinin faaliyet karlarının düşmesine neden olmaktadır (Sarıoğuz, 2007: 251).

Hava şartlarından etkilenen başlıca sektörlerden biri de doğal gaz sektörüdür. Bir gaz şirketinin yıllık raporuna göre, satış hacmi, normale göre daha ılık sıcaklıkların bir sonucu olarak azalmıştır. Aşağıda gaz sektörüyle ilgili bir uygulama örneği ele alınmaktadır(http://64.125.144.31/librarydocs/bc51_wrma/public/file542.pdf, 01.10.2004, s. 1-2).



Tarihsel durumu verilerine göre, dağıtılan gaz miktarıyla temel alınan kış arasında yüksek bir korelasyon bulunmaktadır. Kasım-Mart dönemi için, gaz şirketi son 30 yıllık ortalamaya bakarak HDD'nin 5.330 olacağını tahmin etmektedir. MMBtu's satışı konusunda, bu HDD miktarı (5330) için bütçelenen gelirler bölgede 50

 Copyright © International Science and Technology Conference (ISTEC)

milyon $'dır ve tahmin edilen marjin her bir HDD sapması için 12,500 $ kadar geliri azaltmaktadır. Eğer hava ortalamaya göre (bu tam olarak 4,930 HDD'dir) %7,5'dan daha fazla sıcak olursa, bu gelirlerde %10'dan daha fazla bir düşüşe neden olmaktır.

Kasım ayından Mart ayına kadar 4930 HDD veya daha azının gerçekleştiği bir kışa karşı korunmak isteyen bir gaz şirketi için oluşturulan bir "satma opsiyon" yapısı aşağıdaki şekil 1'de gösterilmektedir. Bu kullanım düzeyinin altındaki her bir HDD için şirket 12,500 $'lık bir ödeme alacaktır.

Belirlenen dönemde, eğer 4,920 HDD meydana gelirse (daha önceden belirlenen kullanım düzeyine göre daha ılık bir hava), gaz şirketi (ödemiş olduğu prim dışında) 125.000 $ [(4930-4920)*12500] bir ödeme alır. Bu ödeme, azalan gaz dağıtımının neden olduğu şirketin gelir kaybını dengeler.

Şekil 1. Satma Opsiyonunun Ödemesi

Soğuk kışlar, gaz dağıtım şirketleri için uygun şartlar yaratmaktadır. Ancak ılık kışlar hacmi zayıflatmakta ve bu durum, bir sonraki yıl için nakit akış problemleri meydana getirmektedir. Bu yöneticiler için büyük sorunlara neden olurken, potansiyel kredi verenler de özellikle Ekim-Nisan dönemi kazançlarındaki dalgalanmalarla ilgilenirler.

Sonuç

Türev piyasaların ortaya çıkışının arkasındaki temel fikir riskten korunma olup, hava türevleri piyasasında da temel amaç hava durumunun neden olduğu risklerden korunmaktır. Hava riski, ekonomik riskin diğer kaynaklarıyla karşılaştırıldığında bazı farklı özelliklere sahiptir. Özellikle, hava riskinin kontrol edilemeyen, yerel bir coğrafik riski vardır. Ayrıca, hava riski genellikle hacimsel risk olarak adlandırılır. Potansiyel etkileri doğrudan fiyat üzerinde değil, esas olarak hacim üzerinde olmaktadır (Scaillet ve Barrieu, 2010).

Son on yılda, hava risk yönetimi cazip ve ilginç yeni türev sınıfı olarak ortaya çıkmıştır. Hava türevleri, beklenmeyen veya ters hava şartlarının doğuracağı riski azaltmak için risk yönetim stratejisinin bir parçası olarak organizasyonlar veya bireyler tarafından kullanılan finansal araçlardır (Botoş ve Ciumaş, 2012). Hava türevleri işletmelerin ve diğer kuruluşların hava durumundaki dalgalanmalara karşı kendilerini korumasına imkan sağladığından sigorta, reasürans şirketleri, bankalar, hedge fonları ve enerji şirketleri gibi bir çok işletme tarafından kullanılmaya başlanmış ve bu konuda departmanlar oluşturmuşlardır (Swishchuk ve Cui, 2013: 81).

 Copyright © International Science and Technology Conference (ISTEC)

Hava türevleri piyasası finansal türev piyasasıyla karşılaştırıldığında, likidite ve hacim olarak hava türevleri piyasasının zayıf kaldığı ve henüz gelişimini tamamlamadığı ve hatta pek çok ülke piyasasında ya hiç ya da yeterince bilinmediği gözlenmektedir. Bütün piyasalarda olduğu gibi hava türevleri piyasasında da hacmi ve likiditeyi arttırmak için bazı koşulların yerine getirilmesine ihtiyaç vardır. Bu koşullar; piyasa katılımının arttırılması, indeks için güvenilir verilerin sağlanması, riski yüklenmeye istekli tarafların varlığı ve artmasıdır (Feachems, 2000: 33-35). Gelişmekte olan ülkelerden biri olan Türkiye'de havaya ilişkin sıcaklık, yağış ve rüzgâr gibi veriler, Türkiye Meteoroloji Genel Müdürlüğü tarafından 1971 yılından beri tutulmakta ve bu veriler talep edildiğinde belirli bir ücret karşılığında verilmektedir. Hava türevlerinin uygulanabilmesi için en az 30-40 yılık verilere ihtiyaç olduğu düşünülürse, Türkiye'de kayıtları tutulan verilerin tarihselliği konusunda bir sorun bulunmamaktadır. Ancak Changnon ve Changnon'un (2010: 325) önerdiği gibi hava türevleri gibi yeni risk yönetim araçlarının geliştirilmesine ve kullanımına katkı sağlayabilecek olan ve/veya katkı sağlamak isteyen meteoroloji alanında çalışan bilim insanları finans, coğrafya, ekonomi, istatistik ve bilgi teknolojileri gibi alanlarda eğitim deneyimlerini genişletmeli ve bu konulardaki bilgi ve yeteneklerini geliştirmelidirler.

Hava türevleri piyasasının gelişimin önünde bazı engel ve endişeler de bulunmaktadır. Örneğin Banka ve Wiesner (2011) tarafından Avusturya'daki 61 telesiyej operatörüyle görüşülerek yapılan araştırmada, kış turizmi sektöründe hava türevlerinin kullanımına yönelik olarak operatörlerin motivasyonları, endişeleri ve engeller araştırılmıştır. Araştırma sonucunda operatörlerin çoğunluğunun havadan kaynaklanan risklerin farkında oldukları, ancak hava türevleri kullanılarak potansiyel kayıpların önlenebileceğini bilmedikleri bulunmuştur. Bunun temel nedeni operatörlerin farkındalıklarının olmaması ve bilgi eksikliğidir. Bu anlamda hava türevlerinin kullanımına yönelik referanslarla farkındalık, bilgi ve desteği artırmak mümkün olabilecektir.

Gelişmekte olan ülkelerden biri olan Türkiye'de hava türevleri piyasası oluşmamıştır. Hava türevleri piyasasının oluşmasının ön şartı, iyi işleyen bir türev ürünler piyasasının olmasıdır. Türkiye'de, ilk türev ürün borsası olan Vadeli İşlemler ve Opsiyon Borsası, 4 Şubat 2005'te açılmıştır. Türkiye'de, hava türevlerinin etkin bir şekilde kullanımı söz konusu değildir. İşletmeler, hava türevleriyle ilgili eğitim alıp, bilgi eksikliklerini gidererek, faaliyet alanlarıyla hava durumu riskleri arasındaki ilişkiyi de iyi kurarak, uluslararası hava türev piyasalarına da başvurabilirler. Bu şekilde kullanımın yaygınlaşması, Türkiye'de de hava türev piyasasının gelişmesine ön ayak olacaktır.

Ayrıca, Akkaya'nın (2010: 15) da belirttiği gibi hava türev piyasası şimdiye kadar yüksek oranda tezgâh üstü piyasada geliştiğinden Türkiye gibi gelişmekte olan ülkelerde hava türevlerinin uygulamaya geçilebilmesi için öncelikle tezgâh üstü piyasada bu tür sözleşmelerin alınıp satılması gerekmektedir.

Bu çalışmada hava türevleri konusu teorik olarak ele alınmıştır. Gelecekte yapılacak çalışmalarda gerçek uygulama örneklerinin ele alınması hem pratik hem de akademik olarak hava türevleri konusundaki bilgi birikiminin artmasına katkı sağlayacaktır.

HAVACILIK SEKTÖRÜNDE TOPLAM VERİMLİ BAKIM UYGULAMASI: CESSNA UÇAĞI PERVANE ÇATLAK ÇENTİK KONTROLÜ

Muharrem ÜNVER[1,a], Selçuk ÖZCAN[1,b], Ahmet Ziyaeddin BULUM[1,c]

[1] Endüstri Mühendisliği Bölümü, Karabük Üniversitesi, Karabük, TÜRKİYE

[a] muharremunver@karabuk.edu.tr

[b] selcukozcan@karabuk.edu.tr

[c] ahmetbulum@karabuk.edu.tr

Havacılık sektöründe artan ekipman teknolojisi ve otomasyonla beraber uçuş faaliyetlerinin aksamaması, maliyetlerin artmaması için; bakım için gereken insan gücünün, eğitim becerisinin, motivasyonun ve organizasyonun önemi de artmaktadır. Bu amaçla Toplam Verimli Bakım - TVB (Total Productive Maintenance - TPM) uygulamaları ön planda yer almaktadır. Havacılık sektöründe özellikle de sivil havacılık alanında toplam verimli bakım uygulamalarının artmasıyla beraber, uçak kazalarında rapor edilmemiş hataların önüne de geçilebilecektir. Yapılan çalışmada "Cessna Model T41-D" uçakları pervane çatlak çentik kontrol ve bakımı üzerinde incelemeler yapılmış olup, toplam verimli bakım uygulamalarına katkı sağlayan yöntem ve faaliyetlerin uygulama öncesi ve sonrası etkileri kıyaslanmıştır.

Anahtar Kelimeler: Havacılık, Toplam Verimli Bakım, Bakım Kontrol

Giriş

Özellikle 2. Dünya Savaşından sonra Japon endüstri yönetimi imalat beceri tekniklerini ABD 'den ithal edip bir takım değişikliklerden sonra kendi tekniklerini uygulamaya başlamışlardır. Japon ürünlerinin, bu süreçten ve uygulamalardan sonra kazandıkları üstün kalite özelliklerinin tüm dünyaya yayılmasıyla bütün dünya gözlerini Japon yönetim sistemlerine çevirmiştir.

Japonlar elli yıl öncesinin amerikan tarzı bir bakım sistemi olan VERİMLİ Bakımı kendi ülkelerine ithal etmiştir. 1969 yılında bir Toyota gurubu üyesi olan, otomobil parçaları üreticisi Nippodenso Co. Ltd. tarafından tanıtılmış ve şirket tüm üyelerin katılımıyla VERİMLİ bakım sistemini; Toplam VERİMLİ Bakımı benimsemiştir. 1971 mali yılında PM (Japonya)ödülü kazanmıştır. Böylelikle TVB ilk olarak Toyota şirketler gurubunda yayılmıştır.

TVB ın temeli, operatörün makinesini sahiplenmesi, makinesinin farkına varması, makine, enerji hammadde ve kendisi ile ürün, yani girdiler ile çıktılar arasında ilişkiyi kurması, makine ve enerji bilgilerini ön plana çıkararak bunları iş hayatına yansıtması şeklindedir.

TVB' ın temel amacı üretimde çalışana verilen değeri ön plana çıkararak kalite ve verimliliği maksimum değere ulaştırmaktır. TVB, üretim araçlarının sıfır hata ve sıfır kayıp ile üretir hale getire bilinmesiyle, kalite ve verimliliğin üst sınırlarının sürekli zorlandığı bir sistem olarak ürünlerin, firmalar arası artan rekabetin içinde, rekabet güçlerini devamlı geliştirebilmek amacıyla uygulanacak bir sistemdir.

TVB ilk Toyota gurubu içinde yayılmakla beraber sonraları otomobil, makine, yarı iletken endüstrileri gibi imalat ve montaj endüstrilerinde uygulanmaya geçilmiş, 1980 lerde kimyasal gıda maddeleri, çimento, ve seramik gibi proses endüstrilerinde ve havacılık endüstrisinde proje tipi üretimlerde uygulanmaları görülmüştür.

TVB ın ilk uygulamaları üretim faaliyetlerinde görülmekle beraber, son zamanlarda üretim kapsamı genişletilerek şirketin bütün departmanlarına (örnek olarak sekreterlik ve mühendislik gibi) yayılmasıyla, TVB ın üretimle sınırlandırılmasına oranla çok daha etkili olması sağlanmıştır. Bu sayede şirketin daha etkileyici

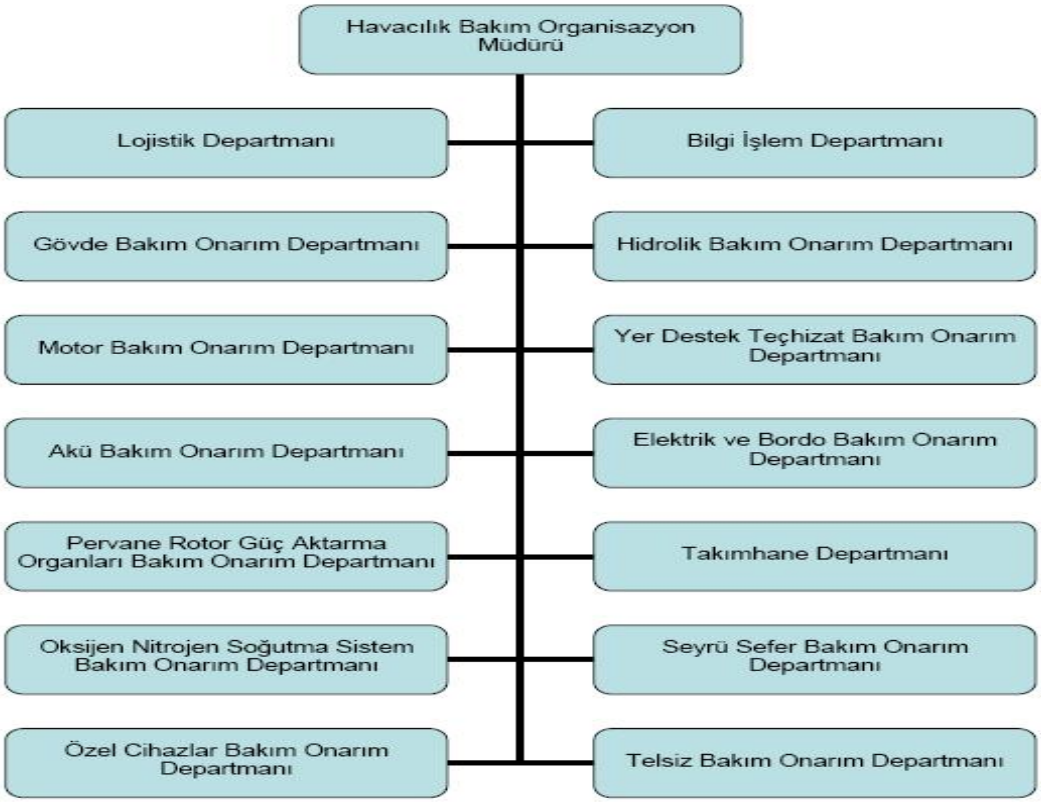
sonuçlar alması sağlanır, ve en üst yönetimden, işçilere, ofis sekreterlerinden tüm mühendislere kadar tüm birimlerin iştiraki gerçekleştirilir.

Havacılık ve uzay endüstrisinde ve özellikle de sivil havacılık alanında toplam verimli bakım uygulamalarının artmasıyla beraber, uçak kazalarında rapor edilmemiş hataların önüne de geçilebilecek olup, Yapılan bu çalışmada "Cessna Model T41-D" uçakları pervane çatlak çentik kontrol ve bakımı üzerinde incelemeler yapılmış olup, toplam verimli bakım uygulamalarına katkı sağlayan yöntem ve faaliyetlerin sonucunda elde edilen kazanımlar paylaşılmıştır.

Bulgular ve Yöntem



Havacılık sektöründe meydana gelmesi arzu edilmeyen uçak kazalarında, rapor edilmemiş hatalar bir buzdağına benzetilmektedir.(Bkz. Resim 1.) TVB uygulamaları bu buzdağının azaltılması ve kazaların minimize edilmesinde yardımcı olacaktır.

Resim 1. Uçak kazalarında rapor edilmemiş hataların bir buzdağına benzetilmesi

Bu istenmeyen kazaların meydana gelmesinde tüm organizasyon depertmanlarına görev yükleyen toplam verimli bakım uygulamasında, bakım-onarım, kazalara karşı önlem maksadıyla ve alınması gerekli tedbirleri erkenden görmek amacıyla tüm yetkili birimlere sorumluluk yüklemektedir. (Bkz. Şekil 1.)

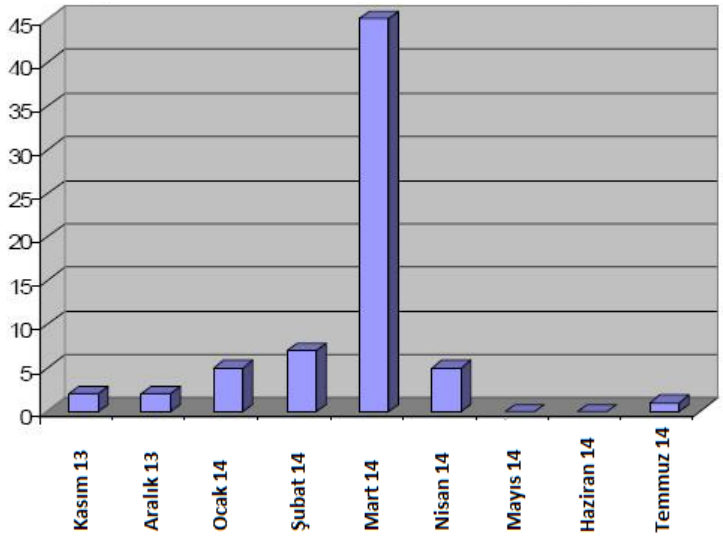
Resim 4. Pervane hücum ve firar kenarı onarımını ve sonrası görüntüler.



T-41D Uçağı günlük faaliyet raporları 8 aylık süre dikkate alındığında pervane çatlak kontrollerinin aylar bazında dağılımı aşağıda verilmiştir. (Bkz. Şekil 2.)

Şekil 2. T-41D Uçağı Genel Çatlak Kontrol Dağılımı

 Copyright © International Science and Technology Conference (ISTEC)

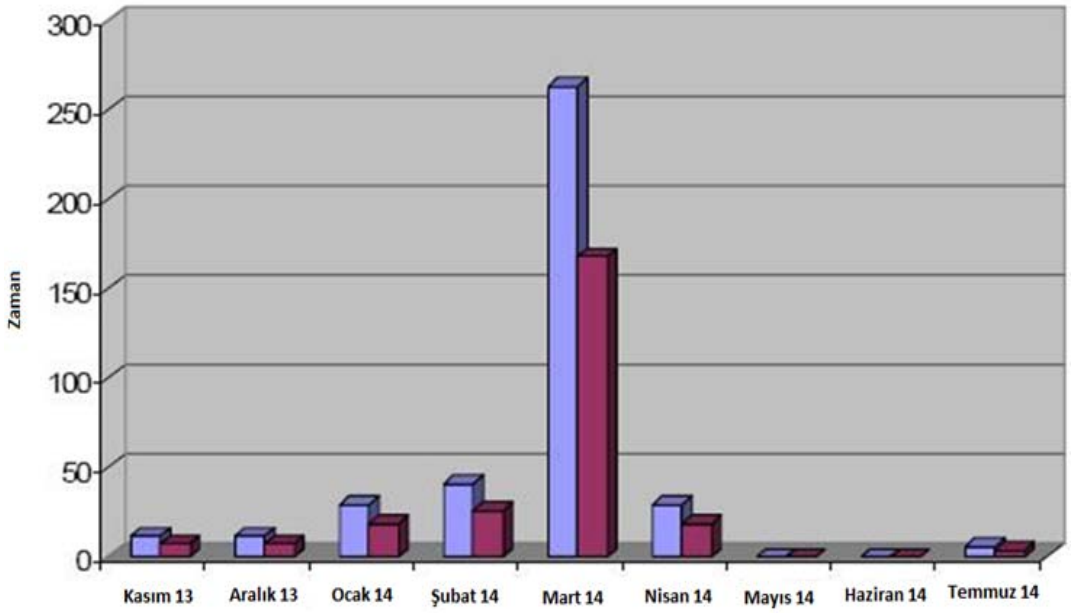
Aylara göre pervane çentik çatlak kontrolleri yapıldığında Mart ayında görülen artışla birlikte öncelikle pervanelerde hasarın azalmasına yönelik yöneticilere aktarılarak kullanıcılara eğitim verilmesi sağlanmış; TVB'nin otonom bakım uygulamasının küçük bir örneği yapılmıştır. (Bkz. Şekil 3.)

Şekil 3. Aylara Göre Pervane Çatlak Kontrol Dağılımı

Bu eğitimde;

- Çatlak çentiğin nasıl oluştuğu,
- Uçuş emniyetinin taşıdığı önem,
- Pilotların dikkat etmesi gereken hayati hususlar ,
- Uçuş meydan sorumlularına çatlaklara sebep veren pistteki çakılların temizlenmesi 5S(temizlik-tertip-düzen-disiplin-standartlaşma) uygulaması kapsamında anlatılmıştır.
- Yatay bilgi akışı ile günlük bakımı yapan teknisyen ile çatlak kontrolü yapan teknisyenin bilgi paylaşması sağlanmıştır.

Yapılan uygulama çalışması sonrasında, toplam verimli bakım uygulamalarına katkı sağlayan yöntem ve faaliyetlerin uygulama öncesi ve sonrası etkileri kıyaslanmıştır. (Bkz. Tablo 1.)



Tablo 1. Toplam Verimli Bakım Uygulamalarının Etkilerinin Karşılaştırılması

	TVB UYGULAMA ÖNCESİ	TVB UYGULAMA SONRASI	İYİLEŞME %
Her günlük bakımında 1 pal için kontrol	1 adam x 0,5 saat	1 adam x 0,5 saat	-
Uçağın taşınması	1 adam x 0,25 saat	1 adam x 0,15 saat	% 40
Yatay iletişim eksikliğinden gecikme	1 adam x 1,1 saat	1 adam x 0 saat	% 100
Standartlaşma eksikliği	1 adam x 0,5 saat	1 adam x 0 saat	% 100
Kayıtların tutulması	1 adam x 0,5 saat	1 adam x 0,25 saat	% 50
Onarım	1 adam x 0,5 saat	1 adam x 0,33 saat	% 34
Çatlak kontrolü	1 adam x 2 saat	1 adam x 2 saat	-
Boyama	1 adam x 0,5 saat	1 adam x 0,5 saat	-
Boya kuruması için gereken zaman (bekleme süresi)	10 saat	4 saat	% 60
Genel Toplam	1 adam x 5,85 saat	1 adam x 3,73 saat	% 36

 Copyright © International Science and Technology Conference (ISTEC)

67 adet kontrol için ihtiyaç duyulan 315.95 adam x saatlik süreyi 249.91 adam x saate indirerek %36 oranında tasarruf sağlayıp günlük faaliyet durum çizelgesinin 8 aylık sürede görülen 400 farklı türde 2211 adet bakım onarım faaliyetine daha çok zaman ayrılabilecektir.

Buna göre, Toplam Verimli Bakım uygulamalarıyla aylara göre oluşan verimlilik kıyaslamaları aşağıda verilmiştir. (Bkz. Şekil 4.)

Şekil 4. Aylara Göre Toplam Verimli Bakım Verimlilik Oranı

Sonuç

Çalışmada da belirtildiği gibi otomasyonun gelişmesi ve bakım onarım faaliyetlerindeki yenilikler ile insandan çok ekipmana bağlı üretim sistemleri gelişmiş ve işletme için kalite, verimlilik, maliyet, güvenlik, sağlık gibi öğeler gittikçe ekipmana bağlanmaktadır. Bu açıdan TVB, işletmeler için kazançlı bir yöntem olarak ortaya çıkmaktadır.

Her ne kadar otomasyonun gelişmesi, şirketlere insansız üretim olanakları sunsa da ekipman bakımı için insana ve yoğun bir insan becerisine ihtiyaç duyulmaktadır. Fakat unutulmaması gereken, insan becerileri, tek başına yeterli olmayışı, bakım faaliyetleri için bir etkin bir organizasyonu sağlanması gerekmektedir. TVB işletmelerde bu organizasyonu sağlamaktadır.

İncelemede, genel olarak TVB ile ilgili iyi tablolar çizilmiş, genel uyarılar çeşitli noktalarda verilmiştir Gerçekte bütün TVB uygulamaları başarı kazanmakta mıdır? Cevap ne yazık ki "Hayır" olacaktır. Peki, başarısızlıkların genel sebepleri nelerdir?

Unutulmaması gereken temel nokta TVB her ne kadar otomasyon sistemlerinin gelişmesiyle ekipman kullanım etkinliğini arttırmaya çalışan bir yöntem olarak dikkat çekse de, TVB "İnsan" üzerine organize olmaktadır.

İnsan belirsizliklerin temel kaynağı olarak gösterilmektedir. TVB organizasyonun bütün olarak çalışanların katılımını gerektirmesi açısından temel olarak bu belirsizliklerin ortadan kaldırılması gerekmektedir. bunun için temel şart eğitimdir. Peki, eğitim yeterlimidir? TVB uygulamasının başarısı için iyi bir liderlik çevresi, ihtiyacı da bulunmaktadır. Bu çevreyi sağlayamayan, baskıcı, otoriter bir anlayışla ilerleyen organizasyonlar çalışanlarında gerekli motivasyon ve morali sağlayamayacaktır. Dolayısıyla çalışanlar değişimi benimsemeyecekler veya hedeflere olan inançlarını kaybedeceklerdir.

Unutulmamalıdır ki; Ancak, değişime inanmış, motive edilmiş, moralli, hedefler konusunda inançlı çalışanlardan oluşan aktif varlıklarla, çalışanlarının gelişimi için gerekli olanakları sunan, sabırlı, hedeflerine

 Copyright © International Science and Technology Conference (ISTEC)

tutkuyla bağlı ve başarı için şartlanmış bir üst yönetimden oluşan bir organizasyonun TVB uygulamasında büyük başarılar kazanması muhtemeldir.

Yapılan bu çalışma da toplam Verimli Bakım Faaliyetlerinin öncesi ve sonrasındaki kıyaslamalar göstermiştir ki, bu faaliyetlerin ana görevi yüksek işletme güvenilirliği, yüksek bakım güvenilirliği ve yüksek devamlılık sağlamaktır. Bunu başarabilmek için üretim ve bakım departmanları müştereken bakım planlamasını yaparlar.

Burada toplam verimli bakım 'ın (7) temel hedefi vardır. Bunları sıralarsak; İş veriminin ve ürün kalitesinin yükseltilmesi, Esnek üretim imkanlarının artırılması, Çok yönlü donanmış çalışanlar yetiştirmek, Bakım faaliyetlerinde ortaya çıkan sorunların çözümlenmesinde iyileştirme çemberleri kullanmak ve onları desteklemek, "YAŞAM BOYU MALİYET" kavramını yatırımların geliştirilmesi çalışmalarında hayata geçirmek ve kullanmak, yeni ürünler tasarlamak ve rasyonalizasyon, temizlik ve düzeni, yaşam biçimine dönüştürmektir.

Sonuçta bu çalışmada, verimlilik artışı, hataların giderilmesi, iş kazalarının azalması, çalışanların motivasyonu ve ürün kalitesinin artması olarak işletmeye geri dönmüştür. Toplam Verimli Bakım için yapılan harcamaların elde edilen kazanımlardan oldukça az olduğu görülmüştür.

HIBRIT ARAÇLARDA DC/DC KIYICI ILE AKÜ ŞARJ DEVRESININ TASARIMI VE UYGULANMASI

Üzeyir Kuzu
uzeyir.kuzu@cbu.edu.tr

Mustafa Nil
mustafa.nil@cbu.edu.tr

Ulaşım sektöründe yüksek paya sahip olan karayolu araçlarında temiz enerji kullanımına verilen önem son yıllarda hızla artmaktadır. Günümüzde otomotiv sektörü zararlı emisyonları azaltarak, ekonomik, yüksek verimli hibrit ve elektrikli araçlar üretme eğilimindedir. Bu elektrikli araçların kullanımı yaygınlaşmaya başladıkça, bu araçların elektriksel güç ihtiyaçlarının karşılanması için gereken şarj istasyonları kurulumu da hızla artmaktadır. Bu ihtiyaçların karşılanması amacıyla, DC/DC kıyıcı kullanarak hem istasyonların boyutunun küçültülmesi hedeflenmekte hem de Hibrit araçların ihtiyaç duyduğu enerjinin kesintisiz, kaliteli ve ucuz olarak karşılanması sağlanarak bir performans artışı beklenmektedir.

Bu çalışmada DC/DC kıyıcı ile akü şarj devreleri tasarımı yapılıp daha küçük boyutlarda ve kayıpları daha az olan akü şarj istasyonları tasarlanarak, enerjinin kaliteli, ucuz ve sürekli olması sağlanmıştır. Bu tasarım esnasında sarmaşık tip DC/DC kıyıcı ve yumuşak anahtarlama teknikleri kullanılarak mosfetin anahtarlama esnasında oluşan anahtarlama kayıpları en aza indirilmiştir.

Keywords: DC/DC Kıyıcı, Yumuşak Anahtarlama, Hibrit Araç

HİDROMEKANİK DERİN ÇEKME İŞLEMİNDE BASKI YASTIĞI/KALIP AÇISI DEĞİŞİMİNİN DERİN ÇEKME ORANINA ETKİLERİNİN SONLU ELEMANLAR YÖNTEMİ İLE ANALİZİ

Osman ANKET[*], İbrahim KARAAĞAÇ[1], Tuncer KORUVATAN[2]

[*] Dr.Maj., Gulhane Military Medical Faculty, ANKARA, oanket@gata.edu.tr

[2] Assist.Prof.Dr. Turkish Military Academy, ANKARA, koruvatan@gmail.com

Özet: Saç malzemelerin derin çekme yöntemi ile şekillendirilmesinde baskı yastığı ve kalıp açısının değişimlerinin şekillendirilebilirlik parametreleri üzerine etkilerinin incelenmesi konusunda çalışmalar yapılmaktadır. Çalışmalarda, baskı yastığı ve kalıp açısının belirli değerlerinin şekillendirilebilirliğe olumlu katkı sağladığı görülmektedir.

Saç malzemelerin şekillendirilmesi alanında hidromekanik derin çekme yöntemi son yıllarda ilgi çekmeye başlamış ve saç malzemelerin şekillendirilmesi proseslerinde olumlu gelişimlere imkan sağlamıştır.

Bu çalışmada; hidromekanik derin çekme işleminde baskı yastığı/kalıp açısı değişiminin derin çekme oranına etkilerinin sonlu elemanlar yöntemi ile analizi yapılmıştır. Silindirik hidromekanik zımba ve kalıp kullanılarak, α=0°, α=5°, α=10°,α=15° olmak üzere 4 farklı baskı yastığı/kalıp açısının derin çekme oranına etkileri incelenmiştir. Analizler sonlu elemanlar yöntemi ile simülasyon ortamında yapılmıştır.Soğuk haddelenmiş DC03 otomotiv sacı kullanılmıştır.

Anahtar Kelimeler: Kalıp Açısı Değişimi, Derin Çekme Oranı, Hidromekanik Derin Çekme, DC03

Giriş

Madeni düz pulların veya plakaların çekme kalıbı dediğimiz düzenlerle pres altında çökertilerek belirli derinlik ve profillerde kap şekline sokulması işlemine presçilikte "çekme" ismi verilmektedir. Derinliği fazla olan kaplar birkaç çekme işlemi ile elde edilebilirler. Birkaç işlemle yapılan çekme "derin çekme" olarak isimlendirilir. Çekilecek parçalar silindirik, konik, küresel ve benzeri biçimlerde olabileceği gibi herhangi bir biçimde de olabilir (Tonka, 2009).

Literatürde, farklı malzemelerin derin çekme yöntemi ile kare yada silindirik profilde şekillendirilmesi durumunda, ilkel parça geometrisi, baskı plakası kuvvetleri ve zımba radyüsü gibi birçok derin çekme parametrelerinin β üzerindeki etkilerinin deneysel olarak araştırıldığı görülmektedir. Özek çalışmasında, mevcut literatürden farklı olarak, DIN EN 10130–1999 derin çekme sacının kare derin çekilmesi işleminde diğer derin çekme parametrelerinin yanı sıra matris/baskı plakası açılarının β, zımba kuvveti ve duvar kalınlığı üzerindeki etkilerini deneysel ve Sonlu Elemanlar Metodu (SEM) ile araştırmıştır (Özek, 2011).

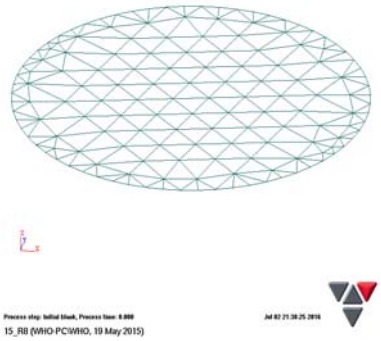
Özek, açılı kalıplarda baskı yastığı / kalıp açısı ve zımba radiüslerinin sınır çekme oranına etkilerini incelemiştir. 0-15 derece baskı yastığı/ kalıp açısı ve 0-10 derece kalıp zımba radüslerini değişken olarak kullanmıştır. Deneylerinde zımba radius artışı ve kalıp/baskı yastığı açısının artışıyla sınır çekme oranının arttığını gözlemlemiştir (Özek, 2009).

Savaş, yeni bir kalıp tasarımı çalışmalarında bulunmuş, 8 mm kalıp radiüsünde 0-15° arasında 4 farklı kalıp açısı değişkeni denemiş ve kare kalıpta 15° kalıp açısında 2,175 derin çekme oranı elde etmiştir (Savaş 2007).

Hidromekanik derin çekme yönteminde ise; ilk aşamada, akışkan sıvı dişi kalıp içerisine doldurulmaktadır. Devamında; sıvı ile doldurulmuş hazne üzerine şekillendirilmemiş sac metal malzemenin yerleştirilmesi ile birlikte baskı plakası başlangıç sac numunesi üzerine kapanmaktadır. Sonraki adımda, şekillendirme işlemi olmakta zımba sac malzemeye doğru hareket etmektedir. Bu esnada, başlangıç sac numunesi sıvı ile ön basınç verilerek şişirilmektedir. Zımbanın sac malzemeye teması ile birlikte, kalıp içerisindeki hidrolik sıvı basıncı artmaya başlamaktadır. Kalıp içerisinde oluşan hidrolik sıvı basıncı, hassas kontrol valfleri ile sabit değerlerde tutulmaktadır. Kalıp içindeki hidrolik sıvı basıncı, başlangıç sac numuneyi zımbaya doğru preslemekte ve sac malzemenin şekil almasını kolaylaştırmaktadır. Kalıp içindeki hidrolik sıvı

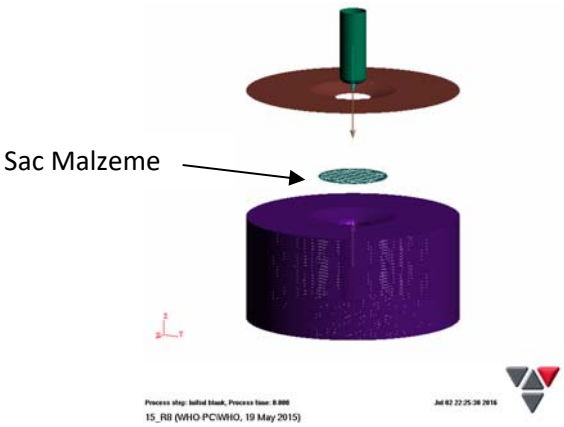
 Copyright © International Science and Technology Conference (ISTEC)

basıncının bir diğer fonksiyonu da; zımba ve sac malzeme arasında sürtünmeyi arttırması, kalıp ve sac malzeme arasında ise sürtünmeyi azaltması ve ürün üzerindeki gerilim dağılımını iyileştirmesidir. Bu durum, sac malzemenin yırtılmadan daha çok şekil almasını sağlamaktadır.(Karaağaç, 2013).



Sonlu Elemanlar Yöntemi ile analizde, kalıp içerisinde sacın hareketi küçük zaman adımları ile çözülürken her zaman adımında pekleşme (stress hardening), sac geometrisinin o andaki durumu ve etkileri (örn. baskı yastığı üzerindeki alan), incelmeler, kırışmalar (malzeme yığılması) gibi birbirini etkileyen değişkenler dikkate alınmakta ve bir sonraki adımda kullanılmaktadır. Zamanda entegrasyon alınırken olayın nonlineerliği küçük zaman adımları sayesinde simülasyon edilebilmektedir. Çıkan sonuçlar, gerçek hayattaki sonuçlarla % 95 civarında bir doğrulukla uyum sağlamaktadır. Bu tip bir çözüm kullanıldığında; pratik hayatta yapılan kalıp için istenilen kaliteyi sağlayacak olup gereksiz maliyetlerden ve zaman kayıplarından kurtulmayı mümkün kılacaktır (Grupotomasyon, 2010).

Bu çalışmada; hidromekanik derin çekme işleminde baskı yastığı / kalıp açısı değişiminin derin çekme oranına etkilerinin sonlu elemanlar yöntemi ile analizi yapılmıştır. Silindirik hidromekanik zımba ve kalıp kullanılarak, α=0°, α=5°, α=10°, α=15° olmak üzere 4 farklı baskı yastığı/kalıp açısının derin çekme oranına etkileri incelenmiştir. Analizler sonlu elemanlar yöntemi ile simülasyon ortamında yapılmıştır. Soğuk haddelenmiş DC03 otomotiv sacı kullanılmıştır.

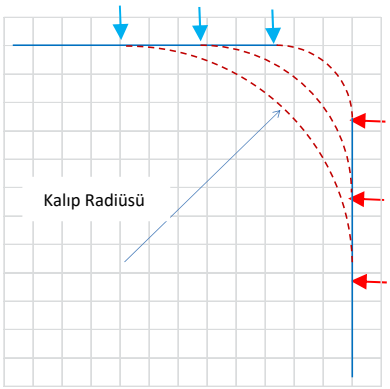


Materyal ve Metod

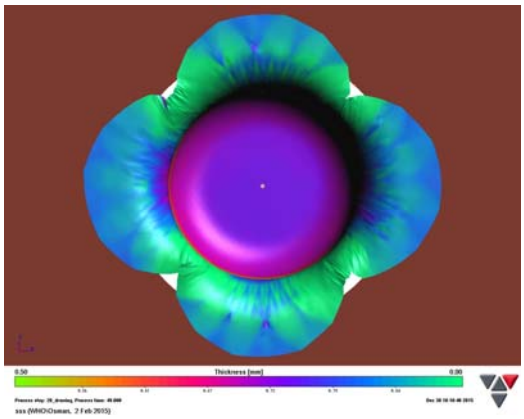
Baskı yastığı / kalıp açısı değişiminin derin çekme oranına etkilerinin sonlu elemanlar yöntemi ile analizi için AUTOFORM paket programı kullanılmıştır. Deney değişkenlerinin analizine geçmeden önce en uygun sonuçları verecek deney düzeneğinin hazırlanması ve diğer değişkenlerin tespit edilmesi işlemi yapılmıştır. Deney düzeneği için kalıp, zımba ve sac malzeme paket programlar ile çizilmiş ve "igs" formatında kaydedilmiştir. "İgs" formatındaki kalıp, zımba ve sac malzeme AUTOFORM paket programına ithal edilmiştir.

İlk aşamada, paket programda "mesh"leme işlemi, yani sonlu elemanlar yöntemi ile analizde kullanılacak parça büyüklükleri tespit edilmiştir. Çok küçük parça seçiminde analizlerin çok uzun zaman aldığı, çok büyük parça seçiminde ise sonlu elemanlar yöntemi ile analizde hasas kalıp radiüslerinde doğru hesaplama yapamadan parçaların kesildiği (kırıldığı) görülmüştür. Meshlemede 0,01x5 mm paket program değerleri kullanılmıştır. Şekil 1'de meshleme yapılmış sac malzeme görülmektedir. Sac malzeme kalınlığı 0,8 mm'dir.

Şekil 1.Meshleme Yapılmış Sac Malzeme.



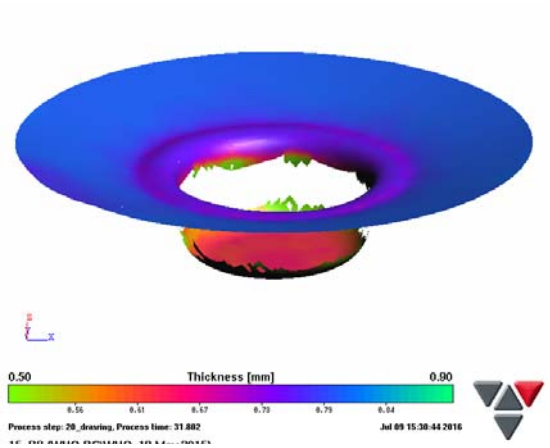
Şekil 2.Kalıp, Baskı Plakası, Sac Malzeme ve Zımbanın Koordinat Sistemindeki Konumu.



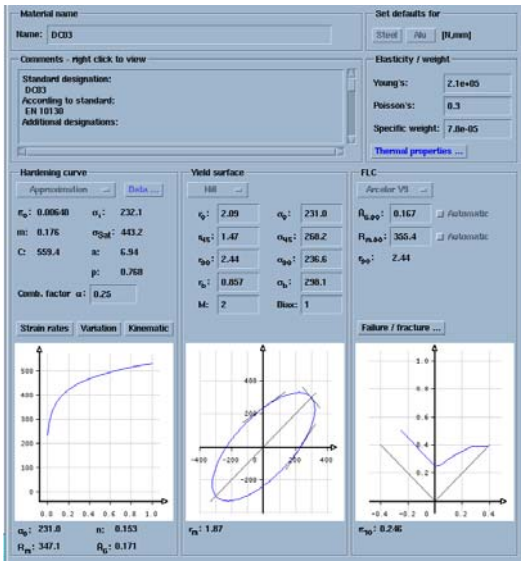
Meshleme ayarlarından sonra kalıp, baskı plakası, zımba ve sac malzeme paket programda koordinat systemine yerleştirilmiştir. Söz kosunu parçalar Şekil 2'de görülmektedir. Baskı plakasının kapama işlemi sağlanarak zımba ile sac malzeme şekilllendirilmiştir. Kalıp boşluğu (offset) 0,1 mm olacak şekilde zımba tarafına verilmiştir. Daha büyük yada daha küçük kalıp boşluğu değerlerinde çekme işlemi kötüleşmiştir. Analizlerde 30 mm çapında zımba kullanılmıştır.

Sistemin yağlanmasında zımba tarafında sürtünme katsayısı 0,15, kalıp tarafında ise 0,05 olarak belirlenmiştir. Zımba tarafında sürtünme daha yüksek, kalıp tarafında ise daha düşük belirlenmiştir.

 Copyright © International Science and Technology Conference (ISTEC)



Şekil 3. Sac Malzemenin Çekillendirme Etkisinden Çıktığı Noktalar (Mavi ve Kırmızı Oklar).



Şekil 4. Sac Malzemede Kulak Oluşumu ve Baskı Plakasının Kapama Etkisini Kaybetmesi.

Kapama esnasında zımba ve baskı plakası 1 mm/sn hızla 10 adımda hareket etmiştir. Çekme esnasında kalıp sabit tutulup baskı plakası 2 MPa baskı kuvveti ile sac malzemeyi baskılamış ve zımba 1 mm/sn çekme hızında sac malzeme çapına bağlı olmak üzere zaman basamaklaması yapılarak şekillendirme sağlanmıştır. Bu esnada sac malzemeye sabit sıvı basıncı uygulanmıştır.

Şekillendirme işlemi sac malzeme kalıp içerisine çekildiğinde, kulaklar oluşup kulak haricindeki kısımlar baskı plakası etkisinden çıktığında durdurulmuştur. Sac malzemenin bir kısmı baskı plakası etkisinden kurtulduğunda sıvı basıncı sac malzeme üzerindeki etkisini kaybetmektedir. Şekil 3'de sac malzemenin şekillendirme etkisinden çıktığı noktalar (mavi ve kırmızı oklar), Şekil 4'de sac malzemede kulak oluşumu ve baski plakasının kapama etkisini kaybetmesi durumu görülmektedir.

Şekil 5. Şekillendirme Olmadan Kesilme Meydana Gelmiş Bir Analiz Örneği.

Şekil 6. DC03 Sac Malzemenin Analiz Programındaki Teknik Özellikleri.

Şekillendirme esnasında paket programın "elastik-plastik shell" modu seçilmiştir. Diğer modlarında sac malzeme tam temsil edilememiş ve malzemede deformasyon meydana gelmiştir. Şekil 5'de şekillendirme olmadan kesilme meydana gelmiş bir analiz örneği görülmektedir. Şekil 6'da DC03 sac malzemenin analiz programındaki teknik özellikleri görülmektedir. Sac malzeminin çekme eğrisinden ve şekillendirme eğrisinden kopmadan çekilebileceğini, Anizotropi değerlerinden ise hadde yönüne bağlı olarak kulak oluşumuna neden olabileceğini görebilmekteyiz.

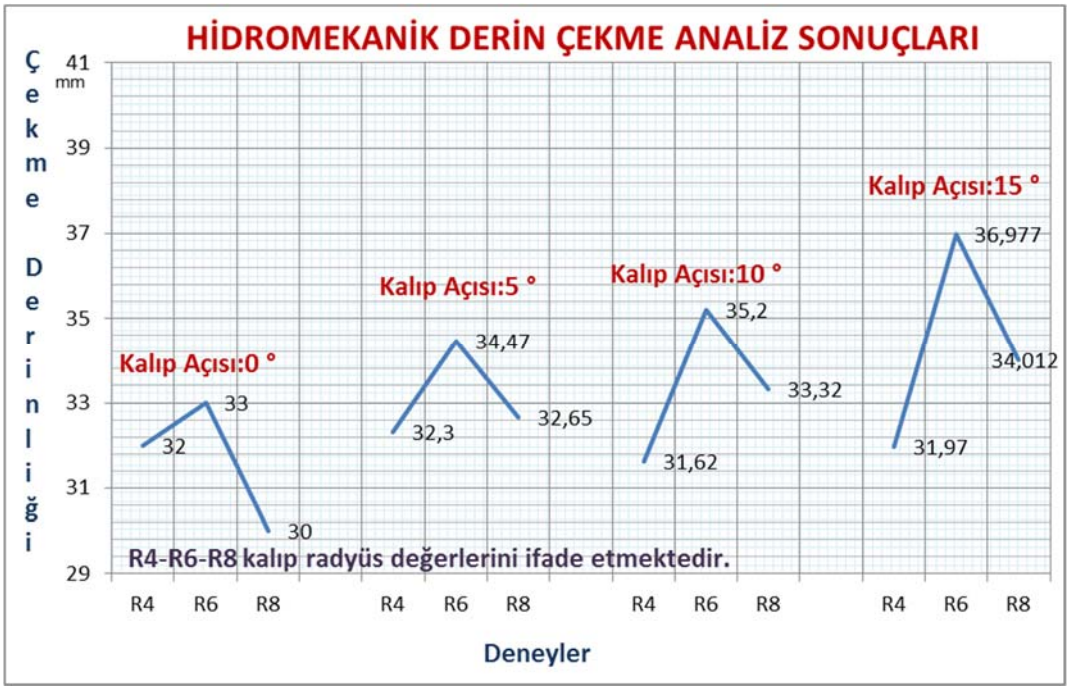
 Copyright © International Science and Technology Conference (ISTEC)

Hidromekanik Derin Çekme yönetmi ile farklı kalıp açılarının sonlu elemanlar yöntemi ile analizinde kullanılan deney değişkenleri Tablo 1'de görülmektedir.

Tablo 1. Deney Değişkenleri.

Kalıp Açısı (°)	0°			5°			10°			15°		
Kalıp ve Zımba Radiüsü (mm)	4	6	8	4	6	8	4	6	8	4	6	8
Sac Malzeme İlk Çapı (mm)	72-73	77-78	79-80	72-73	77-78	79-80	73-74	78-79	80-81	73-74	78-79	80-81
Sıvı Basıncı (MPa)	10-20-30-40-50-60											
Baskı Plakası Kuvveti (MPa)	2											
Çekme Derinliği (mm)	Deneyde kullanılan sac malzemenin ilk çapına ve kalıp radiüs değerine göre değişkenlik göstermiş, sac malzeme baskı plakası etkisinden çıkıncaya kadar devam etmiştir.											

Bulgular ve Tartışma



Analizlerde 0°-15° arası kalıp açıları için 4-6-8 mm kalıp-zımba radius değerleri kullanılmıştır. Hazne basıncı olarak 10-60 MPa arası 6 farklı basınç değeri kullanılmış, deneyler esnasında baskı plakası kuvveti 2 MPa olarak sabit tutulmuştur. Çekme derinliği deneyde kullanılan sac malzemenin ilk çapına ve kalıp radiüs değerine göre değişkenlik göstermiş, sac malzeme baskı plakası etkisinden çıkıncaya kadar devam etmiştir. Sac malzeme kalınlığının 0,5 mm'ye düştüğü durumlarda analizler sonlandırılmış, 0,5 mm kalınlık miktarı analiz sonrası Kabul edilebilir sonuç olarak belirlenmiştir. Bu durumda incelme %38 olmaktadır. Sac malzemenin kesilmeden çekilebildiği değerlerin %44'leri bulduğu gözlenmiştir.

Analizlerde 6 mm kalıp-zımba radius değeri için 0-5° kalıp açılarında 2,60, 10-15° kalıp açıları için 2,63 derin çekme oranı elde edilmiştir. Hidromekanik derin çekme analiz sonuçları Şekil 7'de sunulmuştur. Kalıp Açısı arttıkça daha fazla çekme oranına ulaşılabilmiştir. Analizde çekme oranının tek başına yeterli olmadığı çekme derinliğinin değerlendirilmesinin daha faydalı olacağı görülmüştür. Kalıp açısına bağlı olarak çekme derinliğinin artmasından çekme oranının artacağı görülmektedir. 6 mm kalıp-zımba radius değeri için 0° kalıp açısında 33 mm çekme derinliğine ulaşılabilirken 15° kalıp açısında 36,977 mm çekme derinliğine ulaşılmıştır.

0° Kalıp Açısı için; 4 mm Kalıp-Zımba radiüs değerinde 32 mm çekme derinliğine, 6 mm Kalıp-Zımba radiüs değerinde 33 mm çekme derinliğine ve 8 mm Kalıp-Zımba radiüs değerinde 30 mm çekme derinliğine ulaşılmıştır. 6 mm kalıp radius değerinde daha fazla çekme derinliğin ulaşılmış, Radiüs değerinin 8 mm'ye çıkması ile sac malzemenin baskı yastığı etkisinden kurtulmasından dolayı daha büyük çap çekilmesine ragmen etkili çekme derinliği azalmış, 4 mm radius değerine göre daha düşük çekme derinliği elde edilebilmiştir. 4 mm radius değerinde ise sac malzeme çekilmeden kesilme meydana geldiğinden çekilebilir sac malzeme ilk çapı düşmüştür. İdeal şekillendirme 6 mm kalıp radius değerinde meydana gelmiştir.

5° Kalıp Açısı için; 4 mm Kalp-Zımba radiüs değerinde 32,3 mm çekme derinliğine, 6 mm Kalıp-Zımba radiüs değerinde 34,47 mm çekme derinliğine ve 8 mm Kalıp-Zımba radiüs değerinde 32,65 mm çekme derinliğine ulaşılmıştır. 6 mm kalıp radius değerinde daha fazla çekme derinliğin ulaşılmış, Radiüs değerinin 8 mm'ye çıkması ile sac malzemenin baskı yastığı etkisinden kurtulmasından dolayı daha büyük çap çekilmesine ragmen etkili çekme derinliği azalmıştır. 4 mm radius değerinde ise sac malzeme çekilmeden kesilme meydana geldiğinden çekilebilir sac malzeme ilk çapı düşmüştür. İdeal şekillendirme 6 mm kalıp radius değerinde meydana gelmiştir. Kalıp açısının artmasından dolayı 8 mm radius değerindeki şekillendirmede 0°'dekine göre çekme derinliğinde artış meydana gelmiştir.

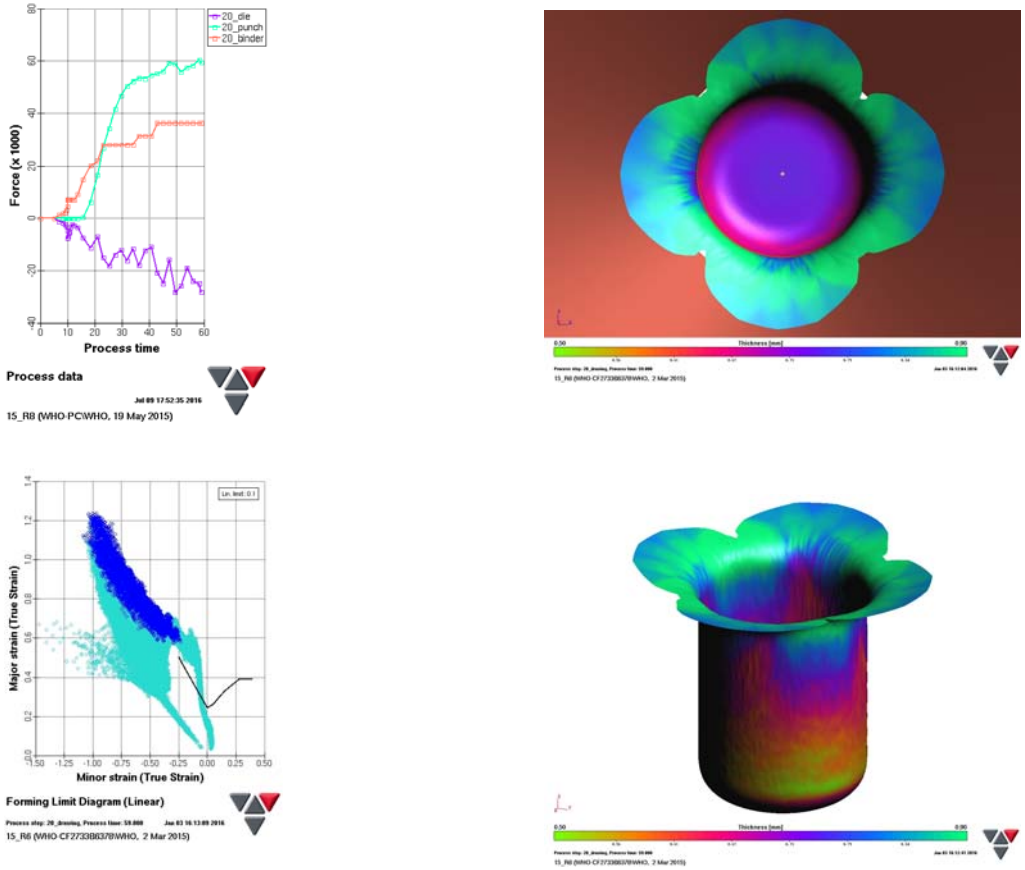
Şekil 7.Hidromekanik Derin Çekme Analiz Sonuçları.

10° Kalıp Açısı için; 4 mm Kalp-Zımba radiüs değerinde 31,62 mm çekme derinliğine, 6 mm Kalıp-Zımba radiüs değerinde 35,2 mm çekme derinliğine ve 8 mm Kalıp-Zımba radiüs değerinde 33,32 mm çekme derinliğine ulaşılmıştır. 6 mm kalıp radius değerinde daha fazla çekme derinliğin ulaşılmıştır.

15° Kalıp Açısı için; 4 mm Kalp-Zımba radiüs değerinde 31,97 mm çekme derinliğine, 6 mm Kalıp-Zımba radiüs değerinde 36,977 mm çekme derinliğine ve 8 mm Kalıp-Zımba radiüs değerinde 34,12 mm çekme derinliğine ulaşılmıştır.

15° Kalıp Açısında ve 6 mm kalıp radius değerinde diğer kalıp açılarına ve kalıp-zımba radiüs değerlerine göre en fazla çekme derinliğine ulaşılmıştır.



15° Kalıp Açısında ve 8 mm kalıp radius değerinde 2,7 ile en fazla çekme oranına ulaşılabilirken en fazla faydalı çekme derinliğine 15° Kalıp Açısında ve 6 mm kalıp radius değerinde ulaşılmıştır.

Hidromekanik Derin Çekme yöntemi ile farklı kalıp açılarının sonlu elemanlar yöntemi ile analizi sonucunda elde edilen Çekme Kuvveti değerleri, Şekillendirme Sınır Diyagramı ve çekilen parça örnekleri Şekil 8'de sunulmuştur. Şekil 8'de 15° kalıp açısında 6 mm kalıp radiüsünde ve 2,63 çekme oranında 36,977 mm faydalı çekme derinliğinde elde edilen sonuçlar bulunmaktadır. Proses data'sında zamana bağlı olarak kalıp, zımba ve baskı yastığı kuvveti değerleri görülmektedir. Analiz programı analiz esnasında baskı yastığının açılmasına müsade etmeyecek kuvvet artışını gerçekleştirmiştir.

Şekillendirme sınır diyagramında şekillendirme eğrisinin sol tarafına ve eğrinin hemen üzerinde şekillendirme olduğu daha çok çekme- çekme yerine çekme-basma şeklinde şekillendirme meydana geldiği görülmektedir.

DC03 sacı için 4 adet kulaklanma meydana geldiği, kulaklanma bölgesinde kalınlık artışı olduğu diğer bölgelerde ise incelme meydana geldiği görülmektedir. Sac malzemenin baskı plakası etkisinden kurtulmasıyla analizin sonuçlandığı görülmektedir.

Şekil 8. Hidromekanik Derin Çekme Yöntemi ie Farklı Kalıp Açılarinin Sonlu Elemanlar Yöntemi ile Analizi Sonucunda Elde Edilen Çekme Kuvveti Değerleri, Şekillendirme Sınır Diyagramı ve Çekilen Parça Örnekleri.

Sonuçlar

Kalıp açısının artmasıyla; yüksek radius değerlerinde daha fazla çekme derinliğine, doğal olarak çekme oranına ulaşılabildiği, düşük radius değerlerinde ise çekme derinliğinde herhangi bir artış olmadığı gözlenmektedir. 4 mm radius değerinde 32 mm civarı toplam çekme derinliği elde edilebilirken, 6 mm radius değerinde kalıp açısının artmasına bağlı olarak 33 mm'den 36,977'ye ve 8 mm radiüs değerinde aynı şekilde kalıp açısının artmasına bağlı olarak 30 mm'den 34,012 mm'ye artma meydana geldiği görülmektedir.

Elde edilen derin çekme oranı değerlerinin Özek'in çalışmaları ile uyumlu olduğu görülmektedir. Özek çalışmalarında 15° kalıp açısı için 2,32 kare kalıp derin çekme oranı elde etmiştir. Buradaki çalışmada 15° kalıp açısı için silindirik derin çekmede 2,63 derin çekme oranına ulaşılmıştır.

En fazla çekme derinliğine 15° kalıp açısında ve 6 mm Kalıp-Zımba radiüs değerinde ulaşılmıştır. Analizlerden, kalıp açısının artması ile derin çekme oranının ve derinliğinin arttığı, Kalıp-Zımba radiüs değerinin ise 6 mm'de en iyi sonuç verdiği görülmüştür.

Hidromekanik derin çekmede 2,63 derin çekme oranı elde edilerek literatürde elde edilen 2,32 derin çekme oranlarının çok üzerinde çekme oranı elde edilebilmiştir.

Analiz sonuçlarının literatürde yapılmı olan Savaş ve Özek'in çalışmaları ile mukayesesi yapıldığında Sonlu elemanlar yöntemi ile analizde gerçek deney şartlarına yakın sonuçlar elde edildiği bu kapsamda gerçek üretim aşamasına geçmeden sonlu elemanlar yöntemi ile analiz yapan paket programlardan elde edilecek sonuçların optimum üretim şartlarını elde etmede büyük fayda sağlayacağı, zaman, malzeme ve maliyet kaybını en aza indireceği görülmektedir.

Teşekkürler

Bu çalışmanın sonlu elemanlar yöntemi ile analizi süreçlerinde emeği geçen Gurupotomasyon'a şükranlarımızı sunarız.

HM-CFRP İLE GÜÇLENDİRİLMİŞ KOMPOZİT KİRİŞLERİN YÜKLEMEDEN BAĞIMSIZ KAPASİTE ANALİZİNDE YENİ BİR YAKLAŞIM

[1]Elif AĞCAKOCA, [2]Zehra Şule GARİP

[2]Karabük University, Department of Civil Engineering, Karabük- TURKEY

elifd@sakarya.edu.tr

Özet: Günümüzdeki bazı yapılar çeşitli sebeplerden dolayı güçlendirme ihtiyacı doğabilmektedir. Güçlendirilmedeki başlıca sebepler arasında, hesaplarda küçük alınmış yükler, gerçek yük değerlerine karşı dayanıklılığı arttırmak, işlev değişimi veya iyileştirme nedeniyle yük taşıma kapasitesini arttırmak, yetersiz detaylandırmaya bağlı ortaya çıkan erken kırılmaları önlemek, korozyon veya yaşlanmayla oluşan bozulmalara bağlı yük taşıma kapasitesinde meydana gelen kayıpları ortadan kaldırmak gibi etkenler sayılabilir. Çelik köprülerde ise, güçlendirme durumu daha çok elemanlardaki paslanmadan ve trafik yüklerindeki artıştan dolayı olmaktadır. Bilimin yeni malzeme arayışı ile fiber teknolojisinin güçlendirme alanına girmesi ile FRP malzemelerinin korozyona dayanıklı olması ve özellikle çelik köprü kirişlerinin devamlı korozyona maruz kalmalarından dolayı FRP malzemesi tercih sebebi olmaktadır. Ancak yeni malzemelerin sağladığı yararların anlaşılabilmesi için deney yapılması gerekmektedir. Çelik, epoksi ve fiber takviyeli malzemeden oluşan güçlendirilmiş kirişlere ait deneysel çalışmalar zaman ve parasal yönden ekonomik olmamaktadır. Bu gibi durumlarda numerik modeller hazırlanıp doğrulanarak parametrik çalışmalar yürütülebilmektedir. Bu çalışmadaki numerik model, deneysel çalışma ile doğrulanmış daha sonra parametrik çalışmalar yapılmış ve YSA ile test edilmiştir. Çalışmanın numerik modellemesinde ABAQUS sonlu eleman modeli kullanılmıştır.

Anahtar Kelimeler: HM-CFRP, ABAQUS, Yapay Sinir Ağları, Çelik

Giriş

Bilimin yeni malzeme arayışı ile fiber teknolojisinin güçlendirme alanına girmesi, güçlendirmede yeni bir sayfa açmıştır. FRP malzemelerinin korozyona dayanıklı olması ve özellikle çelik köprü kirişlerinin devamlı korozyona maruz kalmalarından dolayı ayrı bir tercih sebebi olmaktadır. FRP malzemesi, ince ve hafif olması nedeniyle sistemin ağırlığını fazla artırmamaktadır. Ayrıca yorulmamın sebep olduğu çatlakları da önlemektedir. Bu nedenle güçlendirme tekniği olarak FRP malzemesinin kullanılması bir avantaj daha sağlamaktadır.

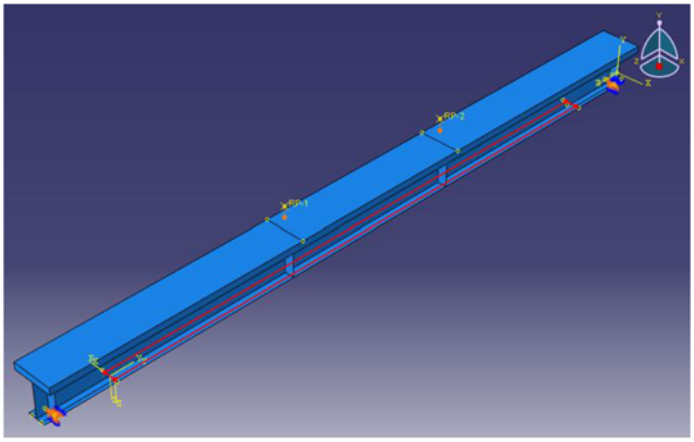
Çeliğin betonarmeden daha dayanıklı bir malzeme olmasından dolayı, güçlendirilmesinde kullanılacak FRP malzemesinin de betonarmenin güçlendirilmesinde kullanılan FRP malzemelerinden daha yüksek dayanıma sahip olması gerekmektedir. Karbon Takviyeli Polimer (CFRP), çeliği güçlendirmede yeterli olamamaktadır. İstenilen performansa erişebilmek için fazla miktarda CFRP kullanılması gibi bir sorun karşımıza çıkmaktadır. Bu soruna, son zamanlarda üretilen HM-CFRP'nin çözüm olacağı düşünülmektedir. Yapılan literatür araştırmalarında, ülkemizde bugüne kadar çelik kirişlerin güçlendirilmesinde HM-CFRP'nin kullanıldığı çalışmaya rastlanmamıştır. Ülkemizin deprem kuşağında yer alması ve 2003 yılı itibarı ile sadece demiryollarımızda 1432 adet çelik köprü olması, bu konuda araştırma yapılması için bir teşvik kaynağı olmuştur.

Yapı elemanlarının FRP tekstiller ve kompozit laminatlar ile güçlendirilmesi ile ilgili Türkiye Deprem Yönetmeliğinde (DBYBHY-2007) betonarme kolonların ve kirişlerin güçlendirilmesi konusunda kurallar yer alırken, çelik yapıların güçlendirilmesine değinilmemiştir. Yurt dışında bu malzemelerin kullanımına yönelik ACI 440'ta taslak bir yönetmeliğin varlığının yanı sıra, İngiltere Karayolları İdaresi tarafından kullanılan bir takım kurallar yer almaktadır. Ayrıca, kompozit malzemelerin betonarme elemanlara yapıştırılarak güçlendirilmesi ile ilgili Avrupa Birliği bünyesinde EUROCOMP tasarım ve el kitabı da mevcuttur.

FRP ile güçlendirilmiş çelik kirişlerin dayanımlarında, kullanılan FRP'nin boyu, kullanılan yapıştırıcı türü, FRP kalınlığı önemlidir(Ağcakoca 2012, Hollaway 2002, Colombi 2006, Tavakkolizadeh 2001). Ayrıca FRP malzemesi sadece köprü elemanlarında değil aynı zamanda iletişim kuleleri gibi farklı tür yapıların dayanımlarında istenilen artışı sağlayabilmektedir(Tavakkolizadeh, 2001).

Literatürde yapay sinir ağları ile birçok alanda çalışma yapılmıştır. YSA İnşaat Mühendisliği alanında mevcut yapıların deprem performansının belirlenmesinde(Garip,2012), yapıların deprem güvenliklerinin belirlenmesinde(Koyuncu, 2009), doğrusal ve doğrusal olmayan yapıların kontrol edilmesinde(Kim,2000), yapı hasarlarının belirlenmesinde(Marwala,2000) yapıların dinamik analizlerinin daha hızlı ve güvenilir

 Copyright © International Science and Technology Conference (ISTEC)



yapılabilmesinde(Çağlar,2002) deprem etkisindeki binaların yapı zemin etkileşimi ile ilgili sorunların çözümünde(Pala,2004)kullanılmıştır.
Bu çalışmada farklı boy ve kalınlıkta kullanılan HM-CFRP ile güçlendirilen çelik kirişlerin sonlu eleman modeli ABAQUS yardımı ile oluşturulmuş, kirişlerin güçlendirme sayesinde artan moment taşıma kapasiteleri bulunarak bu artış YSA ile test edilmiştir.

Solu Eleman Metodu

Sonlu elemanlar metodları (SEM), analitik olarak çözümü mümkün olmayan veya çeşitli mühendislik problemlerine kabul edilebilir bir yaklaşımla çözüm arayan sayısal çözüm yöntemidir. Sonlu elemanlar yönteminin daha etkin ve yaygın kullanımı bilgisayar teknolojisindeki gelişmelere paralel olarak sağlanmıştır. İlk kullanımı 1950' li yıllara dayanan sayısal çözüm yöntemi daha çok yapı sistemleri için geliştirilmiş olsa da dayandığı esasların genellikle zemin mekaniği, uçak mühendisliği gibi birçok mühendislik alanında problemlerin çözümünde kullanılmaktadır. Sonlu elemanlar analizi yapının belli parçalarını bölen, malzeme özelliklerine sahip ve sınır şartları olan bir sistemdir. Bu tür bilgisayar programlarından biri olan ABAQUS doğrusal ve doğrusal olmayan problemlerin çözümünde kullanılmaktadır. Programında implicit ve explicit olarak 2 farklı çözüm yöntemi vardır. Implicit çözümler, explicit çözümlere göre genellikle daha az işlem adımıyla çözüm yapmaktadır. Dolayısıyla implicit metod, explicit çözüme göre daha kısa zamanda çözüm olanağı sunmakta ancak daha genel sonuçlar vermektedir. Bu çalışmada ise hassas çözüm gerektiren kompozit eleman davranışı incelerken ABAQUS/Explicit kullanılanılmıştır.
Doğrulanması yapılan kiriş numerik modelinde çelik malzeme, ideal elasto-plastik malzeme davranışına göre tanımlanmıştır. HM-CFRP malzemesi ise çekme kırılmasının etkin olduğu bir malzeme olduğu için, ABAQUS sonlu elemanlar programında modellenirken gevrek kırılma malzeme davranışını temsil eden "brittle cracking" malzeme modeli kullanılmıştır. Yani HM-CFRP malzemesi doğrusal olmayan gevrek malzeme olarak modellenmiştir. HM-CFRP malzemesi maksimum çekme gerilmesine kadar lineer elastik kabul edilmiştir. Yapıştırıcı elemanlar için yine sonlu eleman modellemesinde kullanılan ara yüzlerden faydalanılmıştır. Yapıştırıcı elemanlar, ABAQUS eleman kütüphanesinden COH3D8 ile tanımlanmıştır. Yapıştırıcı eleman her iki yüzeyde bulunan çelik ve HM-CFRP elemanlarına bağ olarak isimlendirilen elmanlarla sayesinde birlikte çalışması sağlanmıştır. ABAQUS programında oluşturulan HM-CFRP'li kiriş elemanı için, malzemelerin mekanik özellikleri yapılan deneylerle belirlenerek ABAQUS programında Tablo 1'de gösterildiği şekilde tanımlanmıştır.

Tablo 1: Malzemenin mekanik özellikleri

HM-CFRP		Çelik (I-Kiriş)			Epoksi	
Kopma Gerilmesi (MPa)	1200	Başlık	Akma Gerilmesi (MPa)	275	G, Modül (GPa)	10720

YSA

YSA, çalışma prensibi olarak insan beynini ve sinir sisteminin mimarisini kendine model edinmiş yapay bir sistemdir. Öğrenme ve genelleştirme özelliği, yapay sinir ağlarının en önemli özelliğidir. YSA, mevcut örnekleri kullanarak, herhangi bir problemin nedenleri ve sonuçları arasındaki ilişkiyi öğrenebilmektedir. Mevcut örneklerle eğitilmiş YSA modeli daha önce hiç karşılaşmadığı problemleri çözebilmektedir.

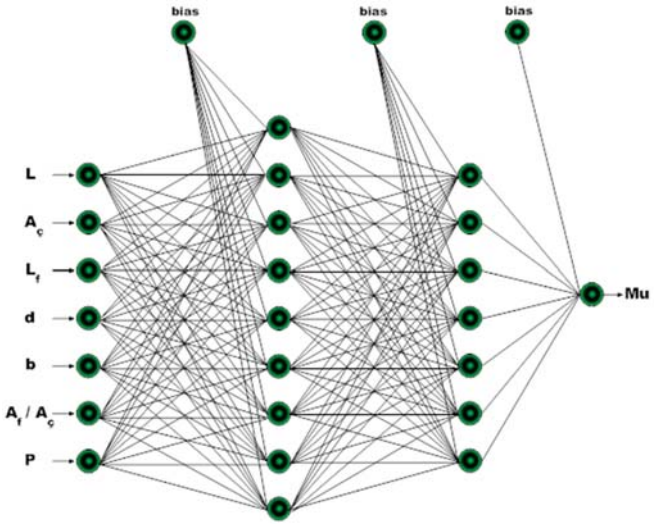
YSA modeli, birbirine bağ ağırlıkları ile bağlı, bir girdi katmanı, bir veya daha fazla gizli katman ve bir çıktı katmanından oluşmaktadır. Gizli katman sayısı ve bu katmanlarda bulunacak işlem elemanı sayısı, deneme yanılma yöntemi ile belirlenmektedir. Bu aşamada dikkat edilmesi gereken husus ağ hatasının minimum olması ve öğrenme hızının maksimum olmasıdır.

Yapay sinir ağlarının en temel birimi işlem elemanıdır. Bir işlem elemanı girdiler, ağırlıklar, birleşme fonksiyonu, transfer fonksiyonu ve bir çıktı olmak üzere beş elemandan oluşmaktadır. YSA modeli oluşturulurken girdiler seçilen bir birleştirme fonksiyonunda işlenir ve transfer fonksiyonuna iletilir. Bu elde edilen bilgi transfer fonksiyonu ile işlenerek işlem elamanının çıktısı oluşturulur. İşlem elemanın çıktısı diğer işlem elemanlarına gönderilir (Şekil 2).

Şekil 2. Bir işlem elemanın yapısı

Sayısal Çalışma

Bu çalışmada,I kesitli Çelik-Betonarme kompozit kirişlerin HM-CFRP ile onarım ve güçlendirilmesine yönelik geliştirilen nümerik metot ile elde edilen veriler yüklemeden bağımsız kapasite belirlemesinde yeni bir yaklaşım olarak yapay sinir ağları kullanılmıştır. Nümerik yöntemle elde edilen verilerin daha hızlı, güvenilir ve ekonomik alternatif bir yöntemle doğrulanması amaçlanmıştır. Bunun için YSA tabanlı bir değerlendirme modeli oluşturulmuştur.



Tablo 2'de verilen girdi bilgileri kullanılarak YSA tabanlı değerlendirme modelinde nümerik yöntemle elde edilen veriler tahmin edilmeye çalışılmıştır. Bu amaçla deneysel veriler kullanılarak 127 farklı nümerik model eğitim seti ve 20 farklı nümerik model test seti olacak şekilde belirlenmiştir. Test setinde kullanılan veriler eğitim setinde kullanılmamıştır. YSA tabanlı değerlendirme modeli 30000 iterasyon yapılarak eğitim seti ile eğitilmiş ve test seti ile test edilmiştir.

YSA tabanlı değerlendirme modelinin mimarisi 1 adet girdi katmanı, 2 adet gizli katman ve 1 adet çıktı katmanı ile oluşturulmuştur. Katmanlardaki işlem elemanlarının dağılımı, girdi katmanında 11 adet, 1. gizli katmanda 20 adet, 2. gizli katmanda 10 adet, çıktı katmanında 1 adet olarak belirlenmiştir (Şekil 3). YSA tabanlı değerlendirme modelinin mimarisinde gizli katman sayısı ve katmanlardaki işlem elemanı sayıları deneme yanılma yöntemi ile belirlenmiştir.

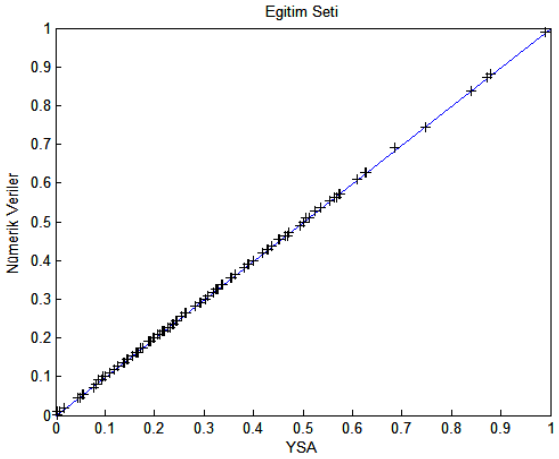
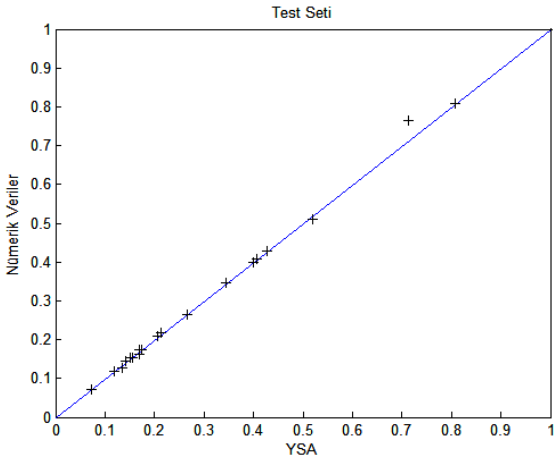
	FRP Kalınlığı	d_f	mm	0.93	11.92	12
	FRP Genişliği	b	mm	50	150	200
	FRP A./ Profil A.	A_f / A_s		1.70	22.40	25
Çıktı	Moment Artışı	Mu	%	0.00	109	110



Şekil 3. YSA tabanlı değerlendirme modelinin mimarisi



YSA tabanlı değerlendirme modelinde sigmoid fonksiyonu transfer fonksiyonu olarak kullanıldığı için tüm veriler 0 ile 1 arasında normalize edilmiştir. YSA tabanlı değerlendirme modelinin yapısı geri beslemeli olarak tasarlanmıştır.

YSA modelinin performansı belirlenirken; gerçeğe en uygun değerler için eğitim ve test seti verilerinin R^2 (determinasyon katsayısı) değerlerinin birbirine yakınlığı ve 1'e yakın olması (regresyon doğrusunun etrafında dağılması) dikkate alınmıştır. YSA tabanlı değerlendirme modeli ile elde edilen tahminlerin 45^0 açı yapan doğrunun üzerinde olması modelin istenen sonuçları tahmin ettiğini göstermektedir. Bu doğru üzerinden sapmalar olması durumunda istenen değerlerden uzaklaşmaları göstermektedir (Şekil 4,5).

YSA tekniğinin, varsayımlar ve kabuller yapmadan problemi direk örneklerden öğrenmesinden dolayı diğer yöntemlerle kıyaslandığında birçok üstünlüğü bulunmaktadır. YSA tekniği kullanılarak I kesitli Çelik- Betonarme kompozit kirişlerin HM- CFRP ile onarım ve güçlendirilmesinde daha hızlı, güvenilir ve ekonomik sonuçlar elde edilebilir.

The imprinting technique [1] was exploited for developing Hybrid imprinted membranes for the specific recognition of the flavonoid quercetin (QCT).

Flavonoids represent a class of natural antioxidants that increase the lifetime period and the nutrition value of food. They exhibit also a protection against cardiovascular diseases and cancer [2] as well as anti-allergic, anti-inflammatory, and anti-viral functions. These compounds are present in natural complexes matrices and during the production process are transferred to beverages. Since their low concentration in these matrices, new efforts are required for developing innovative techniques aimed at sample enrichment and purification. In this perspective, molecularly imprinted membranes (MIMs) are potential tools to facilitate selective analyte isolation from these matrices. MIMs are advanced functional membranes with high specificity and selectivity toward a molecule of particular interest called template. This peculiarity is due to the presence of specific recognition sites in the membrane, which are complementary to the template in chemical function, shape and size. These sites contain the molecular memory of the template and are introduced into a membrane by means of the molecular imprinting technique [3].

Aim of this work was to extend some advances of this technique to develop novel imprinted membranes towards quercetin by hybridizing cross-linked imprinted polymer powders into a poly(ether ether ketone) PEEK-WC support matrix [4]. Different membranes were prepared varying the amount of the imprinted polymer in the hybrid system (10-30 wt.%). For each membrane, binding capacity towards QCT and the selectivity against the structurally related compounds chrysin (CRY) and naringin (NR), was investigated by performing binding experiment in a filtration cell.

The highest binding capacity (12.0 μmol/$g_{memb.}$) was exhibited by the membrane containing the 25 wt. % of MIP particles. Referring to this membrane, the selectivity These results are encouraging for a potential employment of the novel QCT-imprinted membranes in pre-concentration and/or clean-up of this potent antioxidant and valuable flavonoid.

HYBRID MATERIALS OF TRANSITION METAL DICHALCOGENIDES AND REDUCED GRAPHENE OXIDE

Hyeon Suk Shin
shin@unist.ac.kr

The rapid progress in graphene research has led to intensive exploration of novel 2D materials. In particular, transition metal chalcogenides with layered structures have received significant attention because they offer many opportunities for fundamental and technological research in a variety of fields, including catalysis, energy storage, sensing, and electronic devices. In this talk, I demonstrate how to prepare various transition metal chalcogenides/reduced graphene oxide (rGO) composites such as VS_4/rGO, CoS_2/rGO, and WS_2/rGOby a simple hydrothermal method. In the experimental condition that In particular, an interesting thing is that $VS_4$was selectively synthesized on graphitic layer such as rGO. In the same experimental condition without rGO, only VS_2 was synthesized. Furthermore, I introduce that VS_4/rGO and WS_2/rGO can be promising functional materials for Li storage and hydrogen evolution, respectively.

HYDROGEN ADSORPTION PROPERTIES ON NATURAL ZEOLITES FROM BIGADIC AND GORDES REGIONS

Meryem Sakızcı[1]

1.Department of Physics, Science Faculty, Anadolu University, 26470, Eskisehir, Turkey.msakizci@anadolu.edu.tr

Abstract: In this study, hydrogen adsorption properties of the clinoptilolite rich zeolite tuff, from Bigadic and Gördes (Turkey) were investigated. Zeolites are microporous crystalline aluminosilicates with a framework formed by a three-dimensional network of SiO_4 and AlO_4 tetrahedra linked together by common oxygen atoms. In zeolite structure, some of the Si^{4+} is replaced by Al^{3+}, giving rise to a negative charge balanced by exchangeable cations such as Na^+, K^+, Ca^{2+} etc., in the framework. The adsorption of gases by microporous solids has shown to great potential in the fields of gas separation, gas storage and environmental problems. The demand for an alternative to fossil fuels is escalating due to the increasing problem of global warming and climate change. Bigadic and Gördes clinoptilolite-rich minerals were crushed into small pieces from rock forms and then powdered in a mortar. After sieved through 63 micrometer < samples collected from under the sieve were used in the hydrogen adsorption study.Samples of 5.0 g of clinoptilolite-rich minerals were activated by washing with 100 ml of 0,1M HCl solution followed by a washing in de-ionized water. These washed zeolites were dried in an oven at 110 °C for 16 h. Hydrogen adsorption isotherms of clinoptilolite samples were obtained by a static volumetric method. XRF, XRD, SEM and nitrogen adsorption methods were used for the characterization of the zeolites. BET, DFT and *t*-plot methods were applied in the analysis of nitrogen adsorption data. Hydrogen adsorption isotherms for both adsorbents at 77 K were obtainedat pressures up to 100 kPa. It was found that natural clinoptilolite (G-CLN.) obtained from Manisa–Gördes is more suitable adsorbent forhydrogen storage than natural clinoptilolite (B-CLN.) from Bigadic.

IEEE 802.11 KABLOSUZ AĞLARDA MULTİMEDYA UYGULAMALARI İÇİN KULLANICI-TARAFLI GERİ-BİLDİRİMLİ HIZLI ÇERÇEVE İLETİMİ

Mehmet Fatih TÜYSÜZ

Harran Üniversitesi, Bilgisayar Mühendisliği, Şanlıurfa, Türkiye

ftuysuz@harran.edu.tr

Abstract: IEEE 802.11 kablosuz ağlarında gecikmeye duyarlı multimedya çerçeveleri hattı ele geçirmek için diğer çerçevelerle eşit koşullarda yarıştığından, çerçevelerin beklenenden geç iletimi ve dolayısıyla düşük servis kalitesi (QoS) problemiyle yüzleşmektedirler. Bu problemin çözümü için IEEE tarafından 802.11e standardı getirilmiş ve ses, video ve data çerçevelerine farklı backoff aralığı imkanı sunulmuştur. Yalnız, IEEE 802.11e standardı, yoğun trafiğe sahip kablosuz ağlarda, çerçevelerin yüksek çarpışma ihtimalinden dolayı, iletilen çerçevelerin çarpışmalar sonucu tekrar tekrar iletilmesi ve çerçevelerin karşı tarafa çok geç ulaştırılması sorununu çözememektedir. Bu problemin çözümü için bu çalışma kapsamında kullanıcı-taraflı geri-bildirime dayanan yeni bir hızlı çerçeve iletimi yaklaşımı önerilmektedir. Önerilen yöntemde, hattaki bir ses veya video çerçevesi başka bir çerçeve ile çarpışmış ise, çarpışan ses/video çerçevesi için ACK_timeout süresi dolmadan hatta bir geri-bildirim yapılmaktadır. Bu geri-bildirim ile; hatta bir çarpışma olduğu ve bu çarpışma sonucu bir multimedya çerçevesinin gecikeceği ağdaki diğer tüm kullanıcılara bildirilir. Bu sayede hattaki istasyonların backoff aralığını en az bir slot kaydırmaları ve çarpışan multimedya istasyonunun da çerçevesini hattı ele geçirmek için diğer istasyonlarla yarışmadan (zaman kaybetmeden) tekrar iletmesi sağlanır. Önerilen yöntemde kullanıcıların kanala yolladıkları geri-bildirim çerçeveleri, kablosuz ağ standardında belirlenen CTS (clear-to-send) çerçeveleri olduğu için, IEEE 802.11 kablosuz ağ standardında herhangi bir değişikliğe veya eklentiye ihtiyaç duyulmamaktadır. Bu sayede önerilen çalışma kolayca cihazlar üzerine yazılımsal olarak yüklenebilir.

Keywords: IEEE 802.11 Kablosuz Ağları, Hızlı tekrar çerçeve iletimi, QoS

Introduction

Gecikmeye duyarlı gerçek zamanlı multimedya uygulamaları için servis kalitesi (QoS) desteği hem eknik hem de ticari açıdan önemli bir konudur. Örneğin, yüksek çerçeve kayıpları ve çerçeveler arası gecikme süreleri VoIP uygulamalarının ses kalitesini önemli ölçüde düşürür. Kablosuz ağlarda [1] link katmanında kullanılan tekrar iletim mekanizması sayesinde gönderilemeyen çerçevelerin tekrar gönderim teşebbüsüyle, çerçeve kayıpları minimuma indirilmektedir. Yalnız, bu işlemde çerçeve kayıp oranıyla çerçeveler arası gecikme süreleri arasında bir mübadele söz konusudur. Çerçeve kayıpları azaltıldıkça, gecikme süreleri artacağından istenilen servis kalitesi sağlanamamaktadır. Bu amaçla çerçeve kayıplarını azaltırken, çerçeveler arası gecikme sürelerini de belirli bir servis kalitesi değeri içerisinde tutabilen yeni bir çerçeve ietimi algoritmasına ihtiyaç duyulmaktadır.

Literatürde gecikme süresini minimize etmeyi amaçlayan hızlı çereve iletmi ile ilgili yapılan farklı çalışmalar mevcuttur. Örneğin [3]'de yazarlar VoIP uygulamaları için backoff prosedürünün getirdiği ek yükleri minimize ederek hızlı tekrar çerçeve iletimi yöntemi sunmuştur. [4]'te yazarlar gecikme varyasyonlarını önleyebilmek için dağıtık bir kontrol mekanizması önermişlerdir. [5]'te yazarlar yeni bir algısal ses kalite düzeyi ölçebilen tekrar iletim mekanizması önermiştir. Ayrıca [6]'te yazarlar Network Coding yöntemi ile alınan çerçevelerin gecikme ve varyasyon sürelerini azaltmayı amaçlayan farklı bir çalışma sunmuşlardır. Yalnız, yukarıdaki çalışmaların hiçbiri backoff prosedürünün getirdiği eksponensiyel artış oranını incelememiş ve bu konuda herhangibir çözüm sunmamıştır.

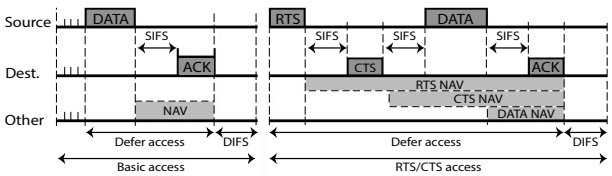
Bu çalışmanın temel amacı kullanıcı-taraflı geri-bildirime dayanan yeni bir hızlı çerçeve iletimi yaklaşımı tasarımıdır. Önerilen yöntemde, hattaki bir ses veya video çerçevesi başka bir çerçeve ile çarpışmış ise, çarpışan ses/video çerçevesi için ACK_timeout süresi dolmadan hatta bir geri-bildirim yapılmaktadır. Bu geri-bildirim ile; hatta bir çarpışma olduğu ve bu çarpışma sonucu bir multimedya çerçevesinin gecikeceği ağdaki diğer tüm kullanıcılara bildirilir. Bu sayede hattaki istasyonların backoff aralığını en az bir slot kaydırmaları ve çarpışan multimedya istasyonunun da çerçevesini hattı ele geçirmek için diğer istasyonlarla yarışmadan (zaman

 Copyright © International Science and Technology Conference (ISTEC)

kaybetmeden) tekrar iletmesi sağlanır. Önerilen yöntemde kullanıcıların kanala yolladıkları geri-bildirim çerçeveleri, kablosuz ağ standardında belirlenen CTS (clear-to-send) çerçeveleri olduğu için, IEEE 802.11 kablosuz ağ standardında herhangi bir değişikliğe veya eklentiye ihtiyaç duyulmamaktadır. Bu sayede önerilen çalışma kolayca cihazlar üzerine yazılımsal olarak yüklenebilir.

IEEE 802.11 Kablosuz Ağları

Kablosuz yerel ağ standardında cihazların ağa erişimini sağlayan yöntem Dağıtık Koordinasyon Fonksiyonu (DCF) yöntemidir. DCF CSMA/CA yaklaşımını geri çekilme (backoff) algoritması ile gerçekleştirir. DCF yaklaşımında, ağa erişmek isteyen bir cihaz iletim öncesi ağı bir DIFS (Distributed Interframe Space) süresi kadar bekler. Bu süre zarfında kanalın meşgul olduğu algılanırsa, cihaz iletimini kanalın boşalacağı süreye kadar beklemeye alır. Birden fazla cihazın bulunduğu bir ağda, ağın meşgul olduğunu anlayan cihazların tamamı ağ boşalana kadar iletimlerini ötelerler. Ağın boşaldığı algılanınca cihazlar aynı anda iletim yapmaya kalkışırlarsa, iletilen çerçeveler çarpışır. Aynı ağdaki farklı cihazların aynı anda çerçeve iletme ihtimalinin azaltılması için DCF cihazlar üzerinde rassal bir geri çekilme algoritması çalıştırır. Bu algoritma cihazların çerçeve iletimlerini DIFS sonrası belirli bir süre daha beklendikten sonra iletme prensibine dayanır. Kablosuz ağlarda zaman dilimi slotlara ayırılmıştır ve cihazların beklemesi gereken toplam slot sayısı her cihaz tarafından rassal olarak belirlenir.



$$Backoff = rassal(1, CW) \times slot \;\; süresi$$

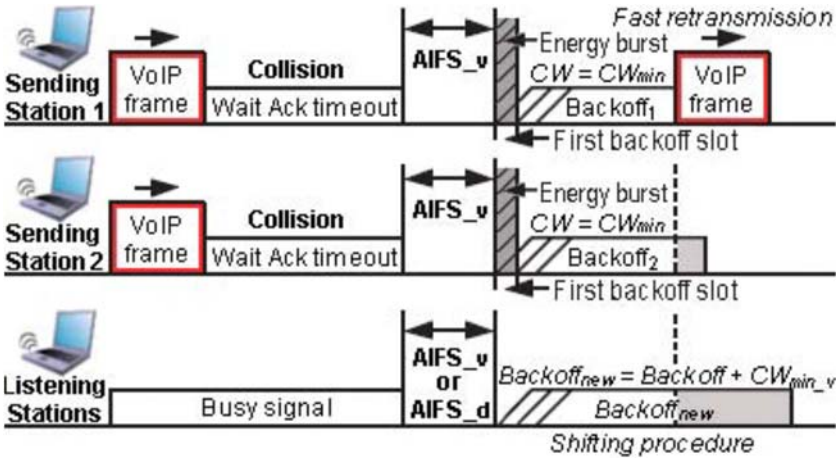
Bu yöntem ile ağın boşaldığını aynı anda algılayan cihazlar geri çekilme değerlerini rassal olarak seçerek iletim zamanlarını farklılaştırırlar ve çerçevelerin çarpışma ihtimalini azaltırlar. Bir cihaz çerçevesini ilk defa iletmek için hatta yarışıyorsa, cihaz o çerçeve için 1 ile CW_{min} (31) arası bir geri çekilme değeri seçer ve toplam geri çekilme süresini belirler. İletilen çerçevenin başka bir çerçeve ile çarpışması durumunda ise, cihaz o çerçeve için daha büyük bir geri çekilme aralığı seçerek, çerçevenin tekrar çarpışma ihtimalini azaltır. İletilmeye çalışılan çerçeve başka çerçevelerle çarpıştıkça, geri çekilme slot aralığı büyütülür. Yalnız, çerçeve aralığı CW_{max} 1024 değerinden büyük olamaz. DCF protokolü tarafından kullanılan ikili üssel geri çekilme prosedürü Algoritma_1'de gösterilmektedir. İletilen çerçevelerin başarılı olması durumunda ise alıcı tarafından ileticiye çerçevenin başarıyla alındığını bildiren ACK çerçevesi yollanır.

Algorithma 1: İkili Üssel Geri Çekilme Prosedürü (Backoff)

```
if ( Rc == 0 ) then                    // ilk iletim
    CW = CWmin                             // CWmin = 32
else                                   // tekrar iletim
    CW = 2(CW + 1) – 1
    CW = min(CW, CWmax)                    // CWmax = 1024
Backoff = rand(1, CW) x (slot)
```

Ayrıca Şekil 1'de gösterildiği gibi, ağdaki çarpışmaların önlenmesi için Request to send ve Clear to send (RTS/*CTS*) ağ erişim metodu da kullanılabilir (Langendoen and Halkes 2005). Yalnız bu yöntemde, özellikle de ağda çok sayıda cihaz bulunmuyor iken, ek RTS/CTS çerçeve gönderimlerinden dolayı, data çerçevelerinin iletimleri daha uzun süreler alır ve bu da ağın iş-yükü performansının düşmesine ve enerji tüketiminin artmasına sebep olur.

Şekil 1. IEEE 802.11 Ağa Erişim Metodları



Hızlı Tekrar Çerçeve İletim Yöntemi

Kablosuz ağlarda iletim yapan bir istasyon gönderdiği çerçeve için belirlenen süre içerisinde ACK çerçevesi almazsa Çekişme Penceresinin (CW) değeri iki kat artırılır. Bunun sonucunda çerçeve iletimi gerçekleştiren

 Copyright © International Science and Technology Conference (ISTEC)

istasyonun yeni backoff değeri muhtemelen çok daha büyük bir süreye tekabul edecektir. Bu da iletilen çerçevenin daha da gecikmesine sebep olur. Halbuki VoIP çerçeveleri gecikmeye duyarlı gerçek zamanlı erçevelerdir ve düşük gecikme sürelerine ihtiyaç duymaktadırlar. Data çerçeveleri VoIP çerçeveleri gibi gecikmeye duyarlı olmadıklarından dolayı, VoIP çerçevelerine data çerçevelerinden farklı bir yaklaşım uygulanması, bahsedilen gecikme ve gecikme varyasyonu problemini çözebilir.

Bildiri kapsamında önerdiğimiz çalışmada CTS çerçevelerinden yararlanılmaktadır. Bu çerçeveler hattaki tüm istasyonlara çarpışan veya kırıma uğrayan bir VoIP istasyonunun olduğunu bildirmektedirler. Eğer bir istasyon gönderdiği VoIP çerçevesi için belirlenen süre içerisinde bir ACK çerçevesi almazsa, istasyon hatta bir CTS çerçevesi yollar. Çarpışan VoIP istasyonu veya istasyonları yeni çerçeve iletimleri için CW(0,7) aralığını seçerken, hattaki diğer istasyonlar ise yeni backoff değerini en az 7 slot olacak şekilde kaydırırlar. Bu sayede çarpışan veya kırıma uğrayan VoIP çerçevesi, hattı ele geçirmek için tekrar diğer istasyonlarla yarışmazlar. Bu da çarpışmaya veya kırıma uğrayan VoIP çerçevelerinin mümkün olan en kısa sürede hattı tekrar ele geçirerek, çerçeve iletimlerini gerçekleştirmelerini sağlamaktadır.

Şekil 2. İki VoIP çerçevesinin çarpışması ve hızı tekrar iletii

Şekil 3. Bir VoIP ve bir data çerçevesinin çarpışması ve hızı tekrar iletimi

Önerilen hızlı tekrar çerçeve iletimi yöntemi ile ilgili iki farklı senaryo Şekil 2 ve Şekil 3'te gösterilmektedir. İlk senaryoda iki VoIP çerçevesinin çarpışması incelenmektedir. Önerilen algoritmamız kullanıldığında çarpışma sonrası ortama gönderilen CTS çerçeveleri (iki istasyon için iki farklı zamanlı gönderilen CTS çerçevesi) ile hattaki tüm istasyonlar çarpışma veya çerçeve kırımı hakkında bilgilendirilmiş olur. CTS çerçevesini alan hattaki istasyonlar backoff değerlerini 7 slot kaydırarak çarpışan istasyonların diğer istasyonlarla tekrar çarpışarak gecikme ve gecikme varyasyonu sürelerini daha da artırmalarını önlerler. Bu sayede çarpışan VoIP istasyonları

 Copyright © International Science and Technology Conference (ISTEC)

CW değerlerini (0,7) arasında seçerek, hattı çok daha kısa sürede ele geçirerek, hızlı bir şekilde çerçevelerini iletmiş ve gecikme sürelerini minimize etmiş olmaktadır.

İkinci senaryoda ise çarpışma bir VoIP ve bir data istasyonu arasında gerçekleşmektedir. Bu senaryoda ise CTS çerçevesi sadece VoIP istasyonu için gönderilir ve diğer istasyonlar ve çarpışan data istasyonu backoff değerini 7 slot kaydırır. Bu sayede çarpışan VoIP istasyonu CW değerini (0,7) arasında seçerek hattı ilk ele geçiren istasyon olur ve herhangi bir gecikmeye uğramadan çerçevesini tekrar ileterek gecikme süresini ve varyasyonunu minimize eder.

Sonuç

Bu çalışma kapsamında kullanıcı-taraflı geri-bildirime dayanan yeni bir hızlı çerçeve iletimi yaklaşımı tasarlanmıştır. Önerilen yöntemde, hattaki bir ses veya video çerçevesi başka bir çerçeve ile çarpışmış ise, çarpışan ses/video çerçevesi için hatta bir geri-bildirim yapılmaktadır. Bu geri-bildirim ile; hatta bir çarpışma olduğu ve bu çarpışma sonucu bir multimedya çerçevesinin gecikeceği ağdaki diğer tüm kullanıcılara bildirilir. Bu sayede hattaki istasyonların backoff aralığını en az bir slot kaydırmaları ve çarpışan multimedya istasyonunun da çerçevesini hattı ele geçirmek için diğer istasyonlarla yarışmadan (zaman kaybetmeden) tekrar iletmesi sağlanır.

Önerilen yöntemde kullanıcıların kanala yolladıkları geri-bildirim çerçeveleri, kablosuz ağ standardında belirlenen CTS (clear-to-send) çerçeveleri olduğu için, IEEE 802.11 kablosuz ağ standardında herhangi bir değişikliğe veya eklentiye ihtiyaç duyulmamaktadır. Bu sayede önerilen çalışma kolayca cihazlar üzerine yazılımsal olarak yüklenebilir.

ece.simooglu@kocaeli.edu.tr

Özet: Türkiye ekonomisinde sanayi sektörü madencilik, imalat sanayi, elektrik, gaz ve su olarak üçe ayrılmaktadır. Bu sektörlerden imalat sanayi katma değer, istihdam ve ihracat ile oldukça önemli bir yere sahip olmakla birlikte birçok alanda faaliyet göstermektedir. Yapılan çalışmada imalat sanayinin faaliyet gösterdiği alanlardan fabrikasyon metal ürünleri imalatının (makine ve teçhizat hariç) ve metalik olmayan diğer mineral ürünleri imalatı ele alınarak genel olarak imalatlar arasındaki ilişki incelenmiştir. Bu amaçla TÜİK (Türkiye İstatistik Kurumu) tarafından belirlenen veriler kullanılarak istatistiksel olarak test edilmiştir.

Anahtar kelimeler: imalat sanayi, metal ürünler, üretim endeksi

IN THE MANUFACTURING INDUSTRY THE MANUFACTURE OF FABRICATED METAL PRODUCTS (EXCEPT MACHINERY AND EQUIPMENT) AND THE EXAMINATION OF THE MANUFACTURE OF OTHER NON-METALLIC MINERAL PRODUCTS

Abstarct: Industry in Turkey's economy, mining, manufacturing, electricity, gas and water is divided into three. This sector of the manufacturing has been active in many areas but have a very important place, value added, employment and exports. Studies in the field of activity in the manufacturing of fabricated metal products (except machinery and equipment) and the relationship between overall manufacturing by considering the production of other non-metallic mineral products were examined. To this end, TÜİK (Turkey Statistical Institute) were tested statistically using the data specified by.

Keywords: manufacturing, metal products, production index

Giriş

Bir ülkenin kalkınmasında, uluslararası rekabet gücü kazanmasında sanayi politikalarının önemi büyüktür. Birçok gelişmekte olan ülke için sanayileşme ve kalkınma neredeyse eş anlamlıdır. Sanayi üretimini, verimliğini, katma değerini, teknoloji içeriğini artırabilen ülkeler dünya çapında rekabet gücü kazanmakta, hızla milli gelirlerini de artırmaktadır (Bayar, 2014). Türkiye ekonomisi son yıllarda önemli bir dönüşüm içine girmiştir. Bu dönüşümün tetikleyicisi küresel ekonomideki gelişmeler olmuştur. Şirketlerin rekabet gücü ve ekonomi politikaları açısından bakıldığında, bu değişimler yeni yaklaşımların geliştirmesini zorunlu kılmıştır. Türk sanayisi hem ürün grubu açısından, hem de coğrafi yoğunluk açısından önemli ölçüde çeşitlenmiştir. Kamunun yanı sıra özel sektöre dayalı üretim yapısının büyüklüğü ve çeşitliliği, coğrafi açıdan büyüklüğü bu çeşitlenmeye neden olmuştur (Çağlar, 2006).

Türkiye'de sanayi sektörü sınai faaliyetleri kapsar. Bu faaliyetler; üretim faktörlerini kullanarak hammadde ve yarı mamul maddelerin nihai ürün haline getirilmesi, bir başka ifadeyle 'üretim' faaliyetleridir. Türkiye ekonomisinde sanayi sektörü madencilik, imalat sanayi, elektrik, gaz ve su olarak üçe ayrılmaktadır (Tonus, 2016).

Bu çalışmada İmalat sanayinin alt sektörlerinden olan makine ve teçhizat hariç fabrikasyon metal ürünler imalatı ve metalik olmayan diğer mineral ürünlerin imalatının TÜİK verileri ile istatistiksel olarak incelenmiştir. Fabrikasyon metal ürünleri imalatı (makine ve teçhizat hariç) genellikle statik, sabit bir işleve sahip "saf" metal

 Copyright © International Science and Technology Conference (ISTEC)

ürünlerin (parçalar, muhafaza kapları (fıçı, varil vb.), yapılar gibi) imalatını ve takip eden 26 ile 30 arasındaki bölümlerin tersine, hareketli parçalarla çalışan, tamamıyla elektrikli, elektronik veya optik olmayan bu gibi ürünlerin (bazen diğer materyallerle) daha karmaşık birimlere dönüştürülmesine yönelik bağlantı veya montaj ürünlerinin imalatını kapsamaktadır. Silah ve cephane imalatı da dâhildir (Atıl, 2013).

Metalik olmayan diğer mineral ürünlerin imalatı genellikle cam ve cam ürünleri imalatı, ateşe dayanıklı (refrakter) ürünlerin imalatı, kilden inşaat malzemeleri imalatı, diğer porselen ve seramik ürünlerin imalatı, çimento, kireç ve alçı imalatı, beton, çimento ve alçıdan yapılmış eşyaların imalatı, taş ve mermerin kesilmesi, şekil verilmesi ve bitirilmesi, aşındırıcı ürünlerin ve başka yerde sınıflandırılmamış metalik olmayan mineral ürünlerin imalatını kapsamaktadır (TÜİK, 2014).

Analiz ve Yöntem

Yapılan çalışmada, 2005 ve 2012 yılları arasında Türkiye üretilen metal ürünleri imalat sanayi endeksleri ile metalik olmayan diğer mineral ürünleri imalat sanayi endeksleri arasında bir farklılığın olup olmadığı incelenmek istenmiştir. Bu amaçla 2005-2012 yılları arasındaki 12 şer aylık veriler TUİK veri tabanından alınarak bağımsız örneklem t testi kullanılarak değerlendirilmiştir. Öncelikle metalik olan ve metalik olmayan diğer mineral ürünlerin imalat sanayi endeksleri arasında ilgi yıllara göre bir farklılığın olup olmadığına bakılmış şekil 1 de bar grafiği ve tablo 1 de ise test sonuçları verilmiştir.

Metalik Olan	113,61	95	46,98	0,00

H_0: Metal ürünleri imalatı endeksleri arasında 12 şer aylık dönemlerde 2005 ile 2012 yılları arasında fark yoktur.

H_2: Metal ürünleri imalatı endeksleri arasında 12 şer aylık dönemlerde 2005 ile 2012 yılları arasında fark vardır.

Yapılan test sonucunda imalat sanayinde metal ürünleri imalat endeksleri arasında % 95 güvenle istatistiksel olarak farkın olduğu söylenebilir.

Aynı test metalik olmayan diğer mineral ürünleri imalat sanayi endeksleri için yapıldığında ise tablo 3 de ki sonuçlara ulaşılmıştır.

Tablo3. 12 şer Aylık Dönemde Yıllara Göre Metalik Olmayan Diğer Mineral Ürünleri İmalatı Endeksi Test Sonuçları

Malzeme	Ortalama Endeks	s.d	t	p
Metalik Olmayan	114,47	95	69,80	0,00

H_0: Metalik olmayan diğer mineral ürünleri imalatı endeksleri arasında 12 şer aylık dönemlerde 2005 ile 2012 yılları arasında fark yoktur.

H_2: Metalik olmayan diğer mineral ürünleri imalatı endeksleri arasında 12 şer aylık dönemlerde 2005 ile 2012 yılları arasında fark vardır.

Yapılan test sonucunda imalat sanayinde metalik olmayan diğer mineral ürünleri imalatı endeksleri arasında % 95 güvenle istatistiksel olarak farkın olduğu söylenebilir.

Sonuç

2005-2012 yılları arasında TÜİK veri tabanında 12 şer aylık dönemler itibari ile verilmiş olan İmalat Sanayi Eğilim Endekslerine göre metalik metal ürünleri ve metalik olmayan diğer mineral ürünleri imalatı endeksleri arasında istatistiksel olarak bir farkın olup olmadığı belirlenmek istenmiştir. Bu amaçla yapılan t test sonuçlarına göre, ilgili dönemler arasında metal ürünleri ve metalik olmayan diğer mineral ürünleri imalatı arasında istatistiksel olarak anlamlı bir fark çıkmazken, metal ürünleri imalat endeksi ve metalik olmayan diğer mineral ürünleri imalat endekslerine ilgili dönemler açısından ayrı ayrı bakıldığında istatistiksel olarak anlamlı farkın olduğu görülmüştür.

Teşekkürler

Bu çalışmada Kocaeli Üniversitesi'nde görev yapmakta olan Yrd.Doç.Dr. Aysen ŞİMŞEK KANDEMİR' e katkılarından dolayı teşekkür ederim.

IMPLEMENTATION OF BERNSEN'S LOCALLY ADAPTIVE BINARIZATION METHOD FOR GRAY SCALE IMAGES

Can EYUPOGLU

Istanbul Commerce University, Department of Computer Engineering, Istanbul-Turkey

ceyupoglu@ticaret.edu.tr

Abstract: In digital image processing, binarization (two-level thresholding) is a commonly used technique for image segmentation. It is the process of converting a gray scale image to a binary image. Furthermore, binarization methods are divided into two groups as global binarization and locally adaptive binarization. A number of binarization techniques have been proposed over the years. Bernsen's method is one of locally adaptive binarization methods developed for image segmentation. In this study, Bernsen's locally adaptive binarization method is implemented and then tested for different gray scale images.

Keywords: Digital Image Processing, Image Segmentation, Binarization, Thresholding, Locally Adaptive Binarization, Bernsen's Method

Introduction

Binarization is a well-known method for image segmentation due to applicability to many fields in digital image processing (Sahoo et al., 1988). In order to separate objects from background, it is an effective technique. A number of binarization applications have been proposed over the years such as document image analysis for extracting printed characters, logos, graphical content or musical scores, map processing for finding place of lines, legends or characters, scene processing for detecting a target, quality inspection of materials, extraction of edge field and spatio-temporal segmentation of video images (Sezgin and Sankur, 2004).

In recent years, the field of document image analysis has received significant attention and has become one of the important parts of digital image processing. There are various researchers which are seeking to design systems for extracting information from extensive documents as maps, magazines, newspapers, engineering drawings, forms and mails. In most of these systems, binarization is applied as the first step (Trier and Taxt, 1995a). The aim of the binarization of document images is extracting text from images, removing noise and reducing image size. This process is performed with removing useless information in order to increase visibility of useful information in an image (Bataineh et al., 2011). In the work of Kefali et al. (2010), it is asserted that the purpose of binarization is to decrease the existence of undesirable data and conserve the desired data in document images. This operation is done by converting all gray levels of images into two levels as black and white.

Binarization techniques are divided into two groups. These are global binarization and locally adaptive binarization (Singh et al., 2011). Global binarization methods compute a single threshold value for the entire image. Pixels having a gray level darker than the threshold value are marked as black (foreground). In the contrary case, the other pixels are labeled as white (background) (Trier and Jain, 1995). Some of the global binarization methods existing in the literature are Abutaleb's method (Abutaleb, 1989), Kapur et al.'s method (Kapur et al., 1985), Kittler and Illingworth's method (Kittler and Illingworth, 1986) and Otsu's method (Otsu, 1979). Besides, locally adaptive binarization methods calculate a threshold value for each pixel on the basis of information contained in a neighborhood of the pixel. Some of these methods compute a threshold surface over the entire image. In the input image, if a pixel (x, y) has a higher gray level than threshold surface evaluated at (x, y), then the pixel (x, y) is marked as background, otherwise it is marked as foreground (Trier and Jain, 1995). In the literature, some of the locally adaptive binarization methods are Bernsen's method (Bernsen, 1986), Chow and Kaneko's method (Chow and Kaneko, 1972; Nakagawa and Rosenfeld, 1979), Eikvil et al.'s method (Eikvil et al., 1991), Mardia and Hainsworth's method (Mardia and Hainsworth, 1988), Niblack's method (Niblack, 1986), Taxt et al.'s method (Taxt et al., 1989), Yanowitz and Bruckstein's method (Yanowitz and Bruckstein, 1989), White and Rohrer's dynamic threshold algorithm (White and Rohrer, 1983), White and Rohrer's integrated function algorithm (White and Rohrer, 1983), Parker's method (Parker, 1991) and Trier and Taxt's method (Trier and Taxt, 1995b).
The rest of the paper is organized as follows. In materials and methods section, Bernsen's locally adaptive binarization method is explained. In results and discussion section, the results of applying Bernsen's method on

 Copyright © International Science and Technology Conference (ISTEC)

gray scale images are showed for different neighborhood values and contrast limits. Finally, conclusions being under study are summarized in conclusion section.

Materials and Methods

In this paper, Bernsen's locally adaptive binarization method is used in order to extract texts from gray scale images. Furthermore, it is implemented and tested for different neighborhood values and contrast limits. In Bernsen's method (Bernsen, 1986), the threshold value is calculated for each pixel (x, y) according to the following equation (1).

$$T(x, y) = (Z_{low} + Z_{high}) / 2 \quad (1)$$

where Z_{low} and Z_{high} are the lowest and highest gray level pixel values in a square r x r neighborhood centered at (x, y). The contrast measure is calculated for each pixel (x, y) according to the following equation (2).

$$C(x, y) = Z_{high} - Z_{low} \quad (2)$$

If the contrast measure $C(x, y) < l$, then the neighborhood consists only of one class, foreground or background. In addition, r and l values vary depending on the used images and areas. Applying Bernsen's method for gray scale images is shown in Figure 1.

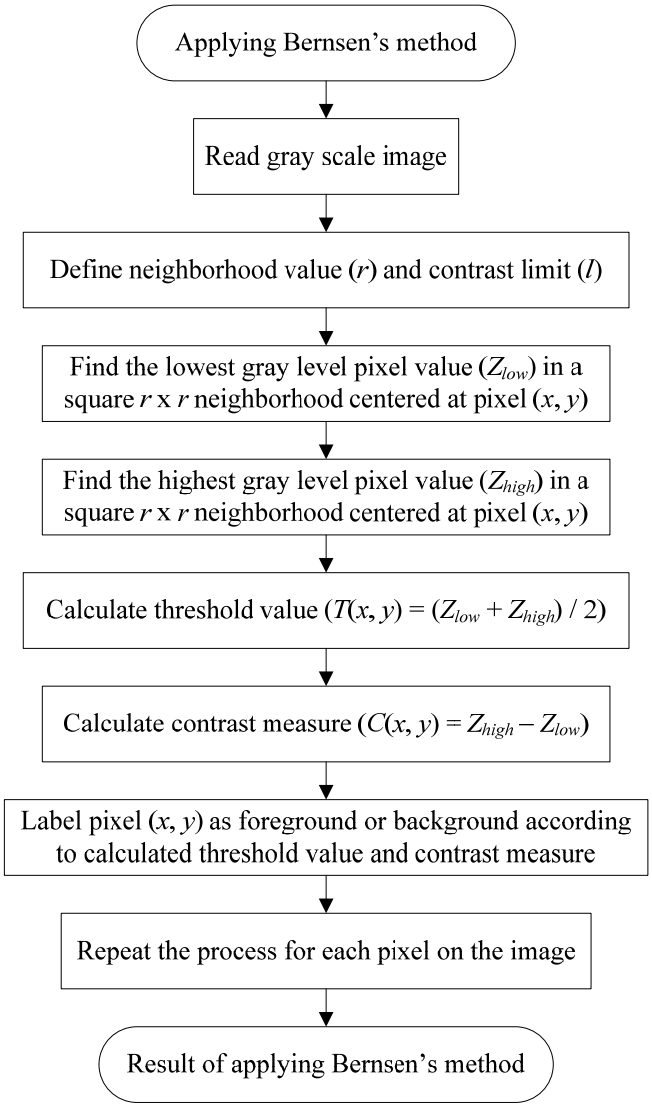

Figure 1. Flowchart of applying Bernsen's locally adaptive binarization method for gray scale images.

As seen in the flowchart, firstly, the gray scale image used for testing is read. Secondly, the neighborhood value and contrast limit are defined. After that the lowest and highest gray level pixel values in a square r x r

 Copyright © International Science and Technology Conference (ISTEC)

neighborhood centered at (x, y) are found and then the threshold value and contrast measure are computed. In the sequel, the pixel (x, y) is labeled as foreground or background according to calculated threshold value and contrast measure. Finally, this process is repeated for each pixel on the image.

Results and Discussion

In this study, in order to extract texts from gray scale images, Bernsen's locally adaptive binarization method is used. The application used for binarization is implemented using MATLAB R2014a. The application is tested for different neighborhood values and contrast limits on various gray scale images. The neighborhood values are chosen as 3, 5 and 15. Moreover, the contrast limits are selected as 15 and 50 for testing the performance of Bernsen's method. As an example, one of the original gray scale images used in this work is shown in Figure 2. The size of this gray scale image is 202 x 202 pixels.

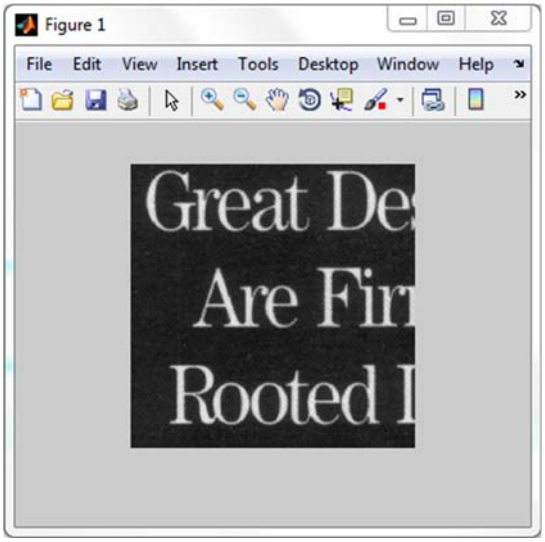

Figure 2. Orijinal gray scale image used for testing Bernsen's method.

The results of applying Bernsen's method on the original gray scale image for r=3 are shown in Figure 3.

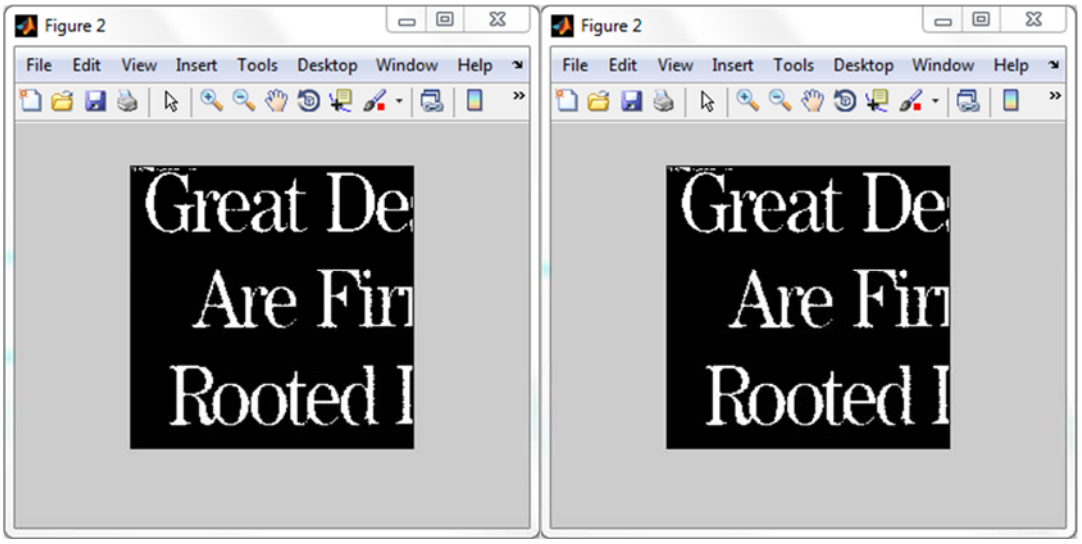

Figure 3. Applying Bernsen's method on the original image for r=3 (l=15 and l=50 respectively).

The results of applying Bernsen's method on the original gray scale image for r=5 are shown in Figure 4.

 Copyright © International Science and Technology Conference (ISTEC)

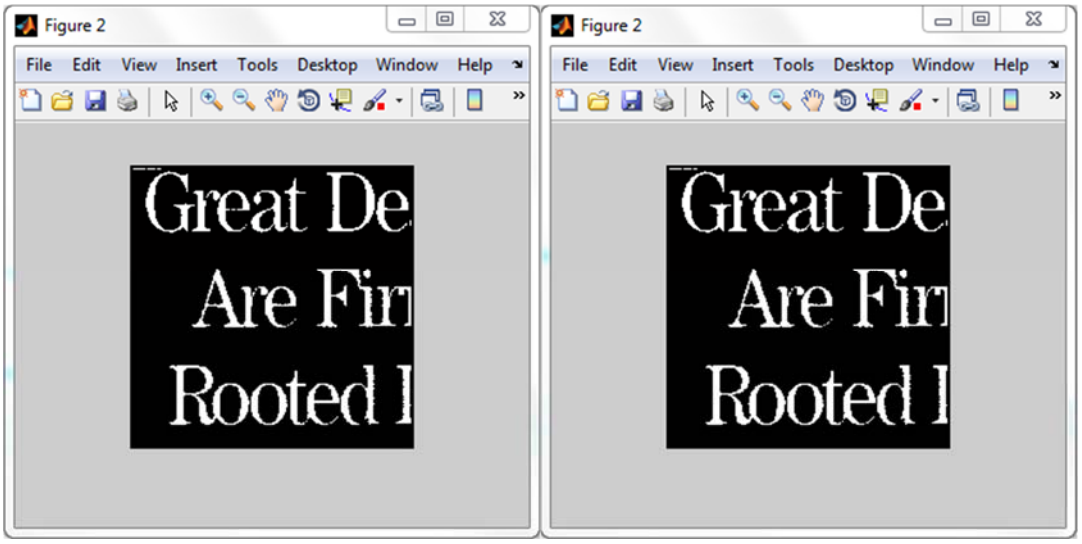

Figure 4. Applying Bernsen's method on the original image for r=5 (l=15 and l=50 respectively).

The results of applying Bernsen's method on the original gray scale image for r=15 are shown in Figure 5.

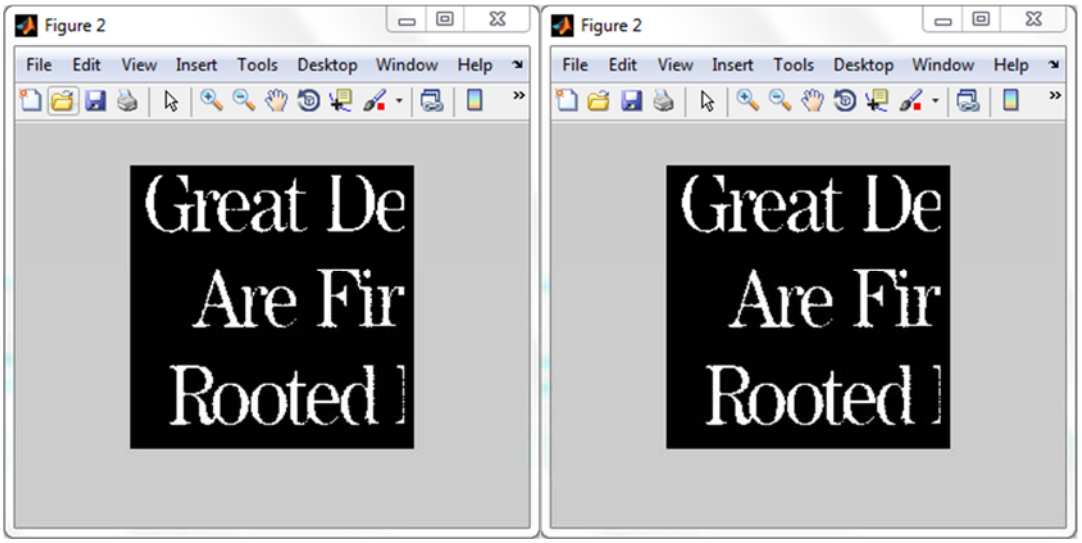

Figure 5. The results of applying Bernsen's method on the original image for r=15 (l=15 and l=50 respectively).

As seen in Figure 3, 4 and 5, the useless information is removed from the original gray scale image and the visibility of the useful information is increased. Consequently, the texts are successfully extracted using Bernsen's binarization method. It is observed that this method is efficient for different r and l values. However, the increase of neighborhood value and contrast limit raises the process time of the method. Besides, the process time is inversely proportional to the processing speed of Bernsen's method.

Conclusion

In recent years, document image analysis has become a significant research topic in the area of digital image processing. Binarization is applied as the first step in most of the document image analysis applications. The purpose of the binarization of document images is to remove useless information and noise in order for extracting text and useful information from images. In this paper, Bernsen's locally adaptive binarization method is implemented and then it is evaluated for different neighborhood values and contrast limits. According to the study results, it is seen that the texts are successfully extracted and Bernsen's method is effective for various neighborhood values and contrast limits. In addition, the more neighborhood value and contrast limit raise, the more the process time of the method increases.

ABSTRACT: Design education adopts different education models that changes constantly due to differences among disciplines. Education models can be varied with different training techniques. The design approaches introduced during the design process, which forms the basis of design education, gain meaning through sketching "with free-hand drawing" which is an effective communication tool for the profession. Sketching ensures fast development and introduction of opinions, serving as an active transmitter of visual expression. The computer technologies that are advancing rapidly today turns the traditional design, the "free-hand technique", into an element with a conceptual impact on the design process. The study aims to discuss the "process of sketching" behind the design factor in the architecture and interior architecture education in Turkey and to analyse the method of sketching as well as its application styles, design, presentation, education, process and results, discussing the importance of sketching process in the education. Finally, the sketching process is associated with the concept of design, emphasizing that it is essential for the architecture and interior architecture design education and it is a skill that must be enhanced through education.

Key Words: Architecture and Interior Architecture Education, Design, Sketching process.

Introduction

Design is to look at the design problem in a different way considering operational, functional, aesthetic concerns by developing new methods. Design, acting towards its personality in this process, is to tangibly provide transfer of ideas in conceptual meaning. Therefore, the effect of visual transfer on persons gains importance. The most efficient method to embody an intangible expression in the design process is to transfer the ideas on a paper fast, in a way to benefit from freehand technique which is a traditional expression method. The most used visualization techniques are freehand drawing, technical drawing and drawing digitally (Gümüş, 2007). Research, thinking, application methods and developing unique design ideas is aimed in design education. In a sense, transfer of unique design ideas tangibly stresses on the importance of sketching namely design data. Sketching is the most influential means of communication in design jobs such as architect and interior architect. Sketching helps to become skillful at fulfilling and developing the idea in design process in a short time and brings continuity with it. It can produce different processes by being supported with visual presentation. In this regard, examining sketching process which is an important element in design education is aimed in this study. Design process and consequences of design education in the Interior Architect and Architect disciplines is studied; Design, design knowledge, design education, the importance of freehand and sketching process in education is examined. In this regard, it is stressed out in this study that sketching process behind the design has a required place in design education.

Design and Design Education

Design is envisaging, shaping or an envisaged fact produced to make a plan or sketch. It is a mental project or scheme in which steps to make a consequence is set forth (Bayazıt, 1994). At present, Interior Architect and Architect are among the modern and renewed jobs with the effect of socio-cultural and economic changes. Therefore, it is inevitable that Interior Architect and Architect education to be shaped under different approaches (Özker, Makaklı, 2015). In the Interior Architect and Architect education especially project/design studio courses are steering and shaping education. According to James Reswick, design which is a creative action is a fact involves creating a new and useful thing which has not existed (Ketizmen, 2002). Design is a creative process; solving problems, sketching, thinking and producing process in a sense. On the other hand, design education is to develop individual behaviors with education and guidance. The aim of design jobs such as Architect and Interior Architect is to transfer the method and fiction of design education to the student. In this sense Interior Architecture education program is consists of design courses such as basic design, project/design studio, furniture design which are design-oriented courses out of technical courses. On the other hand, design

 Copyright © International Science and Technology Conference (ISTEC)

courses such as basic design, project/design studio which are design-oriented courses out of technical courses are in the education program of Architect. Sketching is highly important in design courses in which the student can express herself/himself or becomes skillful at that. Developing design skills, having an idea about what is design is provided with design courses.

Education quality of these jobs which are shown among the popular jobs and increased rapidly is a crucial matter to be examined. In design education especially which is gained at Design studios, questioning the relation between education and design by transferring the definition and process of design correctively is necessary. Design is a new experience for students. Design education is an education type which is continuously open to development and change. It is necessary to properly form the foundation of design education which will adapt developing and changing life conditions (Çetinkaya, 2011). Sketching and visually thinking skills should be gained to the student. So designers' visual communication means in which they express abstract and concrete concepts in way to reflect their own identities, likes and purposes is mostly possible with sketching.(İslamoğlu, 2012). Some works include superficial, fast produced, unclear creative ideas while others include detailed and clear design ideas. Both are necessary for design methods and they are elements that support each other (Silav, 2013). Therefore the purpose of Design education is to raise individuals who think individually and critically, have an aesthetic perception, can interpret its neighborhood by perceiving it, developed his/her expression power. Students, thanks to design courses in design education, learns about unclarity of sketching; that each line crossed has a potential meaning and opens to different interprets; concepts such as visualization, analyzing, determination and nourished from them (Adıgüzel and others, 2012a). Design action is an action that creativity matters. Developing, interpreting and transferring ideas in a paper improve the individual creativity in a sense. What is expected from design education is transferring design conceptualization which students will use in their educational and professional life through a variety of courses, teaching sketching language to them in order to express themselves.

Sketch in the Design Process

Sketch, is a draft data occurs through thinking, it is the first stage, it does not represent "the perfect", it is the language among individuals. As for sketch process is the process of making lots of sketches, "freehand drawing". According to İnceoğlu and others, if writing is the means of expression in literature, drawing is the means of expression in architect. In this sense, sketching in the architect, interior architect and similar design education is important as writing. This process is the preliminary draft of project; a part of design; effective element which produce the outcome. In this regard, sketch is the thinking method which gives meaning to the project in the design courses. Goldschmidt name this process as sketch dialect. Sketching provide with interprets and new deductions of this process to occur (Goldschmidt, 1991). Sketches are dynamic production which can appear in every stage of whole design process. It does not stop, develops continuously, and this dynamic act continues in every stage of whole process (Yakın, 2012a). Sketch is the best sentence describes the idea, finding the idea through sketch is the most important factor of the design process. Spontaneous drawings arise from sketch, it brings the continuity but it is not permanent, the solution shows up while the image is becoming clear (Dodsworth, 2011). The principle aim of design disciplines which look differently at various subjects and try to find a solution is to achieve the same goal. In this context, the objective of Design jobs is to create the design fast and think fast. In order to determine the problem and reach out the solution, the ability to make sketches is crucial. Making the problem and its definition properly, offering the right solutions make the sketch necessary. Even though some designers limit their design process with various criteria, design, indeed, is a process shaping unique for each designer. Sketching is an important part of the design process, it shapes with creative actions. Drawing which is a process of thinking and interpretations starts with expression of visual image with hands and it improves while disciplined eyes and mind evaluate and change the image. Drawing is accepted as whole process or rather as cycle (Hanks, Belliston, 1977). In this regard, sketching "freehand drawing" appears as the most effective means of expression, language of thinking.

Sketching has an interactive role of unifying the ideas in mind, defined functions and the meaning of drawings; finding new forms and adapting them to the design (Edwards, 1979). It is possible to divine sketching studies in two groups as "Searching" and "Interpreting". While the Searching sketches is to find solution to a problem which has not discovered yet, Interpreting sketches is to expressing an existing concrete or tangible actions as newly and uniquely by filtering it with interpreting (Yakın, 2012b). The result expected from drawing in the design process is not the product but its semantic value that is going to show up is important. Therefore, researching, interpreting, develop unique design ideas shows that sketching is important indesign process.

Importance of Sketching In the Design Process and Education

Design education express an entirety with sketching "freehand style", presentation and application methods and there is no matter for distinctive for design jobs. Design is complicated process; designer or project coordinator

 Copyright © International Science and Technology Conference (ISTEC)

manages this process by using their knowledge, experience and creativity. While making analysis by examining certain parameters such as environmental design, historical process relating to architecture and its neighborhood, user needs, functional analysis; concept developing suggestions related to design are offered (Adıgüzel and others, 2012b). In this context, analysis, synthesis along with sketch drawings contributes to design. In this regard, it is possible to examine design education and process like this:

Design Education,
Design education is type of education in which student gains lots of ideas such as thinking, researching, acquiring of knowledge, questioning, and solving problems. Design education namely project courses in disciplines of Architect and Interior Architect is a creative process for creating the new. Establishing common working areas coordinated together with student in the supervisory of a coordinator, design method and fiction are transferred to the student.

Process in Design Education,
Design education process starts with determining a project subject every midterm, the project is completed with end of term jury and in the supervision of coordinator. The student, whose project subject has been decided, researches the design he/she wants to introduce with the data she acquired in the process of acquisition information through freehand sketching methods. In the Architect and Interior Architect education, the aim of the design courses, along with their weight is different from each other, is to raise individuals who defend original ideas, able to speak up and interpret their creativities. Type of education differentiates from departments to departments such as course content, hour, theory, types of teaching lessons. For Example, while design education is performed with computer aided in one department, it can be concluded with computer or hand drawings methods aided by sketching.

Presentation in Design Education,
Design education and reflecting of designer identity to opposite party appear in presentation stage. Observer has an idea about person's creativity while looking his/her presentation. Presentation stage in design education can either be with freehand sketch drawings or it can be prepared while having been benefited from computer environment.

Another supporter of traditional design methods is today's computer technology. Computers which are becoming a must technology and need of modern age are now turning into commonly used devices at the first and last stage of design. However, design first on paper, the first stage of design education, is supported with different drafts. Draft drawings which gains clarity are concluded with computer aid in the last stage of design. Today's developments in digital technology has improved, changed and brought the production process of design focused jobs to different dimensions. Digital based solutions such as parametric modeling, computational design digital design and fabrication, and Building Information Management (BIM) relation with design creation process is being started to questioned. For example, a symposium was held at Yale School of Architecture about questioning the place of a traditional drawing titled "Is Drawing Dead" in digital age.The status of traditional drawing is examined in the digital age.) Keynote speaker Peter Cook mentioned that he is interested less polished version where building remains fictional in an honest way rather than computer renderings with perfect images(URL1).

Digital technologies have developed every day and provide designer with ease of use. In design education, it is aimed that student learns utilization of computer technology and the whole process from two dimensional drawings to rendering. Transferring the ideas mind to a paper or preparing them digitally is interpreted as a mater of choice. Whatever the type of means the aim is to provide an embodiment of an idea in the end. The first sketching design created with computer in education process is only possible after learning various programs. For the students who newly started to design education the place of freehand drawing, in this context, is inevitable for the first experiences in design process. Freehand drawing is not a drawing which only capable ones can make and perfection is pursued in the end rather an expression means in which tangible ideas embody in order to solve problems in design process, and it is a method that can be improved while sparing time on it. By which method that the designer will prepare his/her sketching can be improved accordingly his/her choice at next

 Copyright © International Science and Technology Conference (ISTEC)

process. In this regard, increasing of intellectual quality; being able to make computer aided visual analysis; modeling of created or existed designs or environments with computer; being able to review design rules; improving the tendency to gain disappeared cultural values at virtual platform, what is expected from computer aided design, are benefited by utilization of them in architect education and application (Tokman, 1998). In this sense, the student who design with freehand sketching understands that intellectual quality and design is a thinking power, it is important matter to create fast designs with sketching.

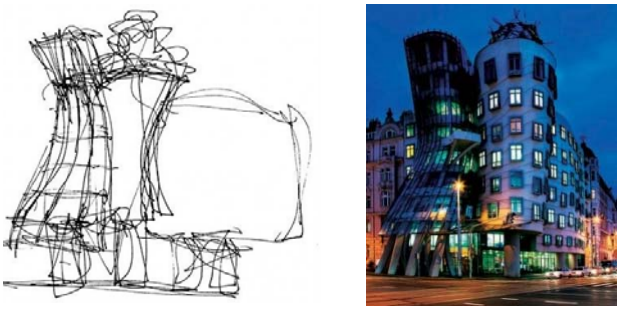

Figure 1-2. Frank O Gehry

Figure 3-4. Mario Botta

Conclusion

Design is an action that affects development of new information and production besides is a process in which design action is realized. Therefore, in design education which is a creative process, it is necessary to bring students sketching habit of which contribution to creativity can not be ignored from the beginning of design education to occupation practices. Sketching is the production first thinking, contributes significantly to making of creative designs. It should be taught that sketching is a necessity and basis of the design education especially, in project courses. In this sense, it should be shown that design education is a problem solving focused education process in which skills such as design, gaining experience, researching, analyzing, synthesizing which are being improved with different education methods and suggestions, are being gained.

In this context, suggestions of this study are ;

- Importance should be given to freehand sketch drawings in the disciplines such as Architect, and Interior Architect,
- Places that encourage creativity should be created in design process,
- Methods that can reveal student's own skill, gain him/her individual self confidence should be found out ,
- It should be transferred to the student that sketch drawing is a design thing rather than a necessity,
- It is necessary to transfer to the student with education that, for creative designs, fast thinking through freehand sketching is contributing significantly to transfer the idea to paper.

Consequently, it has been felt that freehand sketch drawing is losing its importance with today's increasing computer aided design technology environment. However, although it seems as if sketching losing its importance in Design education, freehand sketch drawing is a process attributes meaning to design. Sketch drawing which is shown as a traditional method should not lose its value, it should be aimed to gain sketch habit to the student in all of the design courses.

IMPROVED PI CONTROLLER FOR DC-DC BUCK CONVERTER

Faruk YALÇIN[1], Metin VARAN[2]

[1]Sakarya University, Department of Mechatronics Engineering, Sakarya- TURKEY
[2]Sakarya University, Department of Electrical-Electronics Engineering, Sakarya- TURKEY

farukyalcin@sakarya.edu.tr
mvaran@sakarya.edu.tr

Abstract: This paper presents an improved PI controller for robust DC-DC buck converter operation. Accurate pulse width modulation (PWM) switching based operation duty ratio of the buck converter is achieved by the closed-loop PI controller. A control law based on instantaneous values of the input voltage and the desired output voltage is used to support the PI controller to obtain fast operation duty ratio. Thus, the stability and the efficiency of the converter is improved for high quality desired output voltage when the input voltage, the reference output voltage and the load values are changed. Simulation study has been done in MATLAB-Simulink to demonstrate the efficiency of the improved PI controller based on the proposed control law. The results have proved that the proposed improved PI controller achieves stable, accurate and efficient operation for the buck converter under different system conditions.

Keywords: Buck Converter, PI Controller, PWM

Introduction

The need for various forms of the electrical energy increases depending on the developing technology. For this aim, many converters are developed by the help of improvements in power electronics. DC-DC converters are the power electronics converters that changes the input direct voltage with a different value from the output and they are widely used in many industrial applications where direct voltage regulation is required (Zhang *et al.*, 2015; Babaei *et al.,* 2016; Wu *et al.,* 2015).

DC-DC buck converter produces an output direct voltage value lower than the input voltage value (Kok *et al.,* 2015). Direct voltage transformation depends on the PWM switching duty ration in the buck converter as well as in the other DC-DC converters that are boost and buck-boost converters (Siwakoti *et al.,* 2015; Bhajana *et al.,* 2015). Ideally, the relation between the converter input and output voltages can be derived depending on the PWM duty ratio as algebraically without depending on the system parameters. But in practice, non-ideal converter components and the case of discontinuous current mode converter operation prevent to obtain a certain duty ratio for converter operation for the related operating point. Thus, a feed-back control structure depending on the real and reference output voltage values is strictly required for the accurate converter operation (Ahmed *et al.,* 2003).

There are many studies that use different controllers for the control of the DC-DC buck converter in the literature. The designed controller checks the error between the converter reference and real voltages of the output and eliminates the error according to providing the parameters of the system response. The closed-loop control structures that use traditional PI and PID controllers are frequently applied to control of the DC-DC buck converters (Sira-Ramirez, 1991; Lee *et al.,* 2011). The Sliding Mode Controller control technique that is one of the modern control techniques is applied to many studies successfully where the PI and PID controllers are not sufficient for the converter response (Ling *et al.,* 2016). The design of the mentioned controllers are obtained according to the mathematical models for the defined converter operating points. So, it is clear that the change of one of the system parameters forces to change the mathematical model of the converter. Therefore, it is impossible to provide the performance of the system response for the designed controller parameters. For the DC-DC buck converter performance, it is so important to provide desired system response performance while eliminating the error between the converter reference and real output voltages. So, it is clear that it is impossible to provide the desired converter performance with only the mentioned controllers for the operating points different than the controller parameters which are derived for the determined operating points.

In this study, a new control structure based on the PI controller for the DC-DC buck converter is proposed. In this control structure, the operating duty ratio for the converter is obtained by the PI controller and the proposed open-loop control law. The open-loop control law helps the PI controller through supporting it to eliminate the converter operating error in a fast manner and thus takes the mission to accelerate the system response. Thus, the

 Copyright © International Science and Technology Conference (ISTEC)

control law prevents the need of changing the determined controller parameters for different converter operating points. The control law is the algebraic duty ratio of switching depending on the converter input voltage and the reference output voltage. It can be obtained easily and fast, thus, it does not cause additional complexity and design challenges. The proposed approach for the DC-DC buck converter has been tested in MATLAB-Simulink environment as simulation. The obtained simulation results for different operating points have shown that the proposed control structure based on the open-loop control law have provided robust and efficient converter operation.

Design of the Proposed Converter Control Structure

Open-loop control law

The topology of the DC-DC buck converter is given in Fig. 1 (Salimi *et al.,* 2015). In Fig. 1, $V_i(t)$, $V_o(t)$, L, C, D and S represent the input direct voltage, output direct voltage, inductor, capacitor, diode and the switch that is one way conductive and capable of being turned on and turned off, respectively.

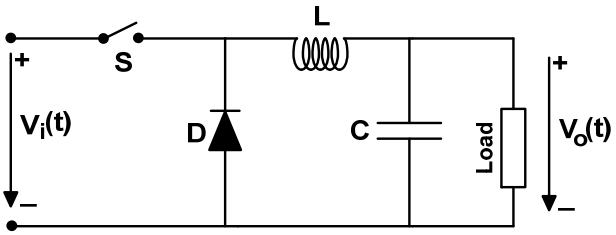

Figure 1. The topology of the DC-DC buck converter.

MOSFET device is used as switch S in this study. The DC-DC buck converter circuit using controllable MOSFET as switching device is given in Fig. 2. In Fig. 2, $I_L(t)$, $I_C(t)$ and $I_o(t)$ represent the inductor current, capacitor current and load current, respectively.

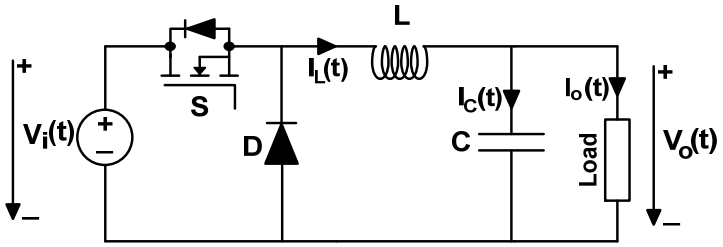

Figure 2. The DC-DC buck converter circuit using MOSFET as switching device.

The operation of the DC-DC buck converter can be explained through the circuit given in Fig. 2. When S is turned on, diode D is off as it is reverse biased. In this case, converter input direct voltage supplies the inductor, the capacitor and the load, thus the inductor is energized. When S is turned off, the diode is forward biased and it is on. In this case, the energized inductor supplies the capacitor and the load. Thus, a voltage value lower than the input voltage value is obtained at the output of the converter depending on the duty ratio of S (Sahin *et al.,* 2014). By assuming that the inductor current is continuous and the converter components are ideal, the relation between the converter input and output voltages can be given as follow (Li *et al.,* 2014);

$$V_o(t) = d(t)V_i(t) \tag{1}$$

Here, $d(t)$ represents the PWM switching duty ratio of S and it is defined as the ratio of the turn-on time of S to the switching period of S ;

$$d(t) = \frac{t_{on}}{T} \tag{2}$$

The open-loop duty ratio that provides the converter operation can be obtained through Eq. (1) under the mentioned ideal conditions above. This open-loop duty ratio is defined as control law and can be given as;

$$d_{CL}(t) = \frac{V_r}{V_i(t)} \tag{3}$$

 Copyright © International Science and Technology Conference (ISTEC)

Here, V_r is the reference value of the desired converter output direct voltage.

The proposed closed-loop converter control structure

As mentioned before, the derived open-loop control law cannot meet to obtain the required converter output voltage value in practice. Because of the discontinuous current situation caused by different load values and non-ideal converter components, the duty ratio of the converter providing the required output voltage is different from than the duty ratio obtained by the open-loop control law. So, the real converter duty ratio that eliminates the error between the reference and real output voltage must be obtained from the closed-loop controller. In this study the PI controller is used as closed-loop controller. The proposed closed-loop control structure for the control of the DC-DC buck converter is given in Fig. 3.

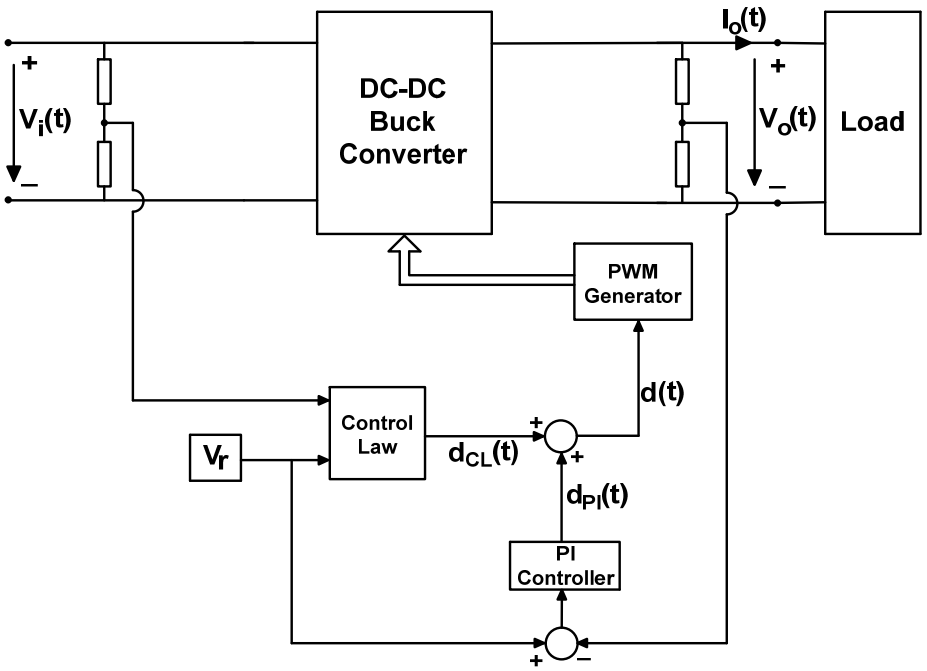

Figure 3. The proposed closed-loop control structure for the DC-DC buck converter.

As seen from Fig. 3, the PI controller produces a feedback duty ratio $d_{PI}(t)$ through the error between the reference and real converter output voltages. The open-loop duty ratio $d_{CL}(t)$ given in Eq. (3) supports the feedback duty ratio $d_{PI}(t)$ obtained by the PI controller and thus, the real duty ratio $d(t)$ for accurate converter operation is produced.

$$d(t) = d_{CL}(t) + d_{PI}(t) \tag{4}$$

As seen from Fig. 3, the PWM generator produces the control signal of the switch S depending on the duty ratio derived by Eq. (4).

Deriving the converter mathematical model for the PI controller

The PI controller is designed by the mathematical model of the converter circuit given in Fig. 2. The mathematical model of the converter can be derived from the equivalent converter circuit given in Fig. 4.

 Copyright © International Science and Technology Conference (ISTEC)

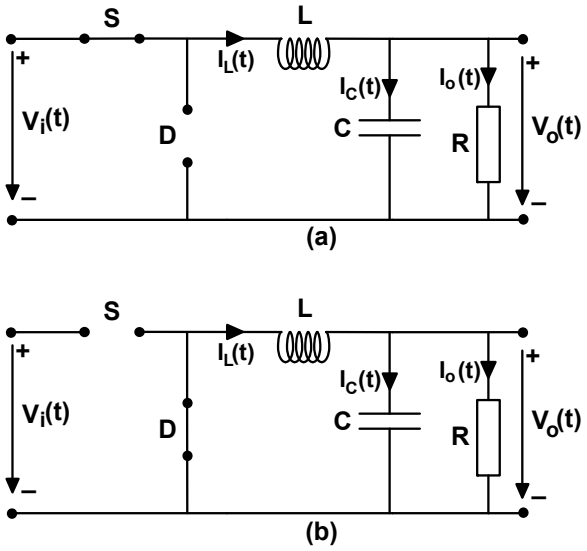

Figure 4. Equivalent circuit of the converter: a) Switch S is on – mode I, b) Switch S is off – mode II.

The dynamic equations for mode I where S is on in Fig. 4(a) can be obtained as;

$$L\frac{dI_L(t)}{dt} = V_i(t) - V_o(t) \tag{5}$$

$$C\frac{dV_o(t)}{dt} = I_L(t) - \frac{V_o(t)}{R} \tag{6}$$

The dynamic equations for mode II where S is off in Fig. 4(b) can be obtained as;

$$L\frac{dI_L(t)}{dt} = -V_o(t) \tag{7}$$

$$C\frac{dV_o(t)}{dt} = I_L(t) - \frac{V_o(t)}{R} \tag{8}$$

The state-space equations for mode I and mode II can be defined from Eq. (5)-(8) respectively as;

$$\frac{d}{dt}\begin{bmatrix} I_L(t) \\ V_o(t) \end{bmatrix} = \begin{bmatrix} 0 & -1/L \\ 1/C & -1/RC \end{bmatrix}\begin{bmatrix} I_L(t) \\ V_o(t) \end{bmatrix} + \begin{bmatrix} 1/L \\ 0 \end{bmatrix} V_i(t) \tag{9}$$

$$\frac{d}{dt}\begin{bmatrix} I_L(t) \\ V_o(t) \end{bmatrix} = \begin{bmatrix} 0 & -1/L \\ 1/C & -1/RC \end{bmatrix}\begin{bmatrix} I_L(t) \\ V_o(t) \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \end{bmatrix} V_i(t) \tag{10}$$

And the average state-space model of the DC-DC buck converter can be given from Eq. (9) and (10) as follow;

$$\frac{d}{dt}\begin{bmatrix} I_L(t) \\ V_o(t) \end{bmatrix} = \begin{bmatrix} 0 & -1/L \\ 1/C & -1/RC \end{bmatrix}\begin{bmatrix} I_L(t) \\ V_o(t) \end{bmatrix} + \begin{bmatrix} d/L \\ 0 \end{bmatrix} V_i(t) \tag{11}$$

The closed-loop control block diagram of the system can be given in Fig. 5 through the closed-loop control structure given in Fig. 3.

 Copyright © International Science and Technology Conference (ISTEC)

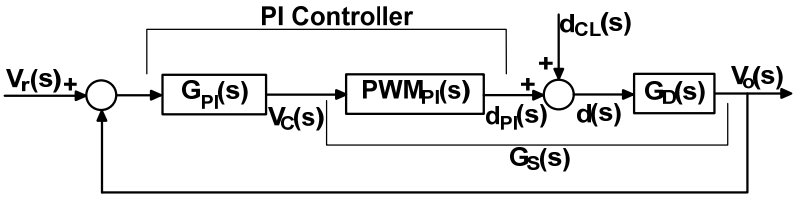

Figure 5. The closed-loop control block diagram of the system.

The transfer function between $V_o(s)$ and $d(s)$ can be obtained through Fig. 5 and Eq. (11) as;

$$G_D(s)=\frac{V_o(s)}{d(s)}=\frac{V_i(s)}{s^2LC+s\frac{L}{R}+1} \tag{12}$$

As seen in Fig. 5, the duty ratio of control law $d_{CL}(s)$ affects to the operation duty ratio $d(s)$. By assuming $d_{CL}(s)$ is zero (considering there is no supporting from the control law), it is considered that;

$$d_{PI}(s)=d(s) \tag{13}$$

$PWM_{PI}(s)$ is the transfer function of the PWM stage between $d_{PI}(s)$ and the PI control signal $V_C(s)$ and can be given as,

$$PWM_{PI}(s)=\frac{d(s)}{V_C(s)}=\frac{1}{V_{PWM}} \tag{14}$$

where V_{PWM} is the amplitude of the ramp in the PWM conversion of the PI controller. Thus, the transfer function of the system which the transfer function of the PI controller $G_{PI}(s)$ is designed according to is derived as;

$$G_S(s)=\frac{V_o(s)}{V_C(s)}=\frac{V_i(s)}{V_{PWM}}\frac{1}{s^2LC+s\frac{L}{R}+1} \tag{15}$$

PI controller has a dynamic behavior and it requires a response time. But the control law has a static behavior as seen from its algebraic structure. As mentioned before, the control law produces a duty ratio value close to the desired operation duty ratio simultaneously with the error change. So, the control law leads the PI controller to compensate the system from the duty ratio point obtained by the control law. Thus, the control law speeds up the system response, after than the PI controller takes over the mission from the control law to eliminate the system error.

Results and Discussion

The proposed control structure of the DC-DC buck converter has been tested in MATLAB-Simulink environment as simulation for different system operating conditions. The simulation results of the proposed approach are given with the results of the traditional PI controller based converter comparatively to show the accuracy and the efficiency of the proposed control structure for the DC-DC buck converter operation. The comparison studies have been done for 3 different operation conditions: changing the reference output direct voltage, changing the input direct voltage and changing the load.

The switching frequency is selected as 10 kHz for the simulation studies. The inductance value of the inductor and the capacitance value of the capacitor in the converter circuit are determined as $L=1\mu H$ and $C=3000\mu F$, respectively. The parameters of the PI controller are kept constant for all operation conditions. The analog PI constants determined for an operating point are used as $K_P=3$ and $K_I=0.08$.

In the first case, the reference output voltage is forced to change during the DC-DC buck converter operation. The converter input voltage and the load are kept constant. The input voltage and load are $V_i=40\,V$ and $R=15\Omega$, respectively. The reference output voltage is increased from $V_r=15\,V$ to $V_r=20\,V$. The comparative results of the

 Copyright © International Science and Technology Conference (ISTEC)

proposed approach and the traditional PI controller based converter operation for case 1 are given together in Fig. 6.

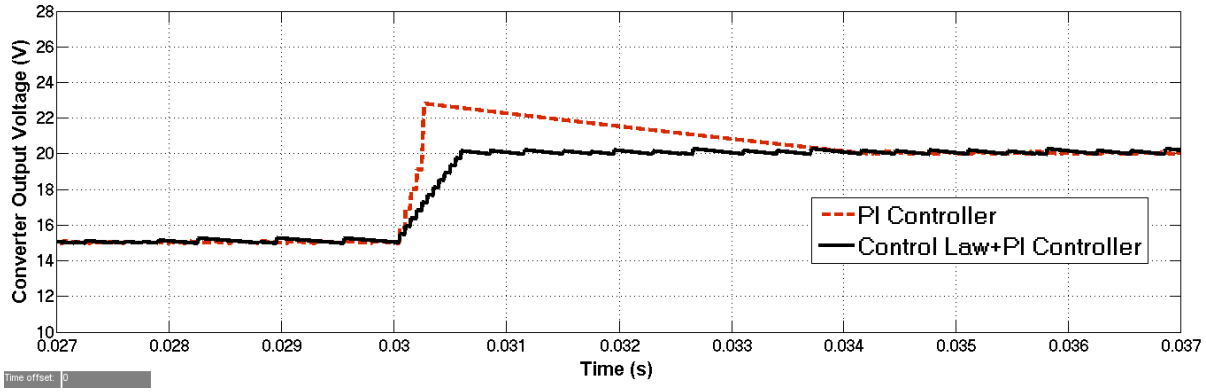

Figure 6. The comparative converter operation results for the change of the reference output direct voltage.

As seen in Fig. 6, the converter controlled by the proposed approach where the proposed control law supports the PI control reaches to the new reference output voltage faster than the converter controlled by the traditional PI controller. On the other hand, the proposed approach prevents the overshoot according to the traditional method.

For case 2, the converter input voltage is changed when the reference output voltage and the load are kept constant. The reference output voltage and the load are $V_r=15\,V$ and $R=15\Omega$, respectively. The input voltage is changed from $V_i=50\,V$ to $V_i=70\,V$. The comparative results of the proposed approach and the traditional PI controller based converter operation for case 2 are given together in Fig. 7.

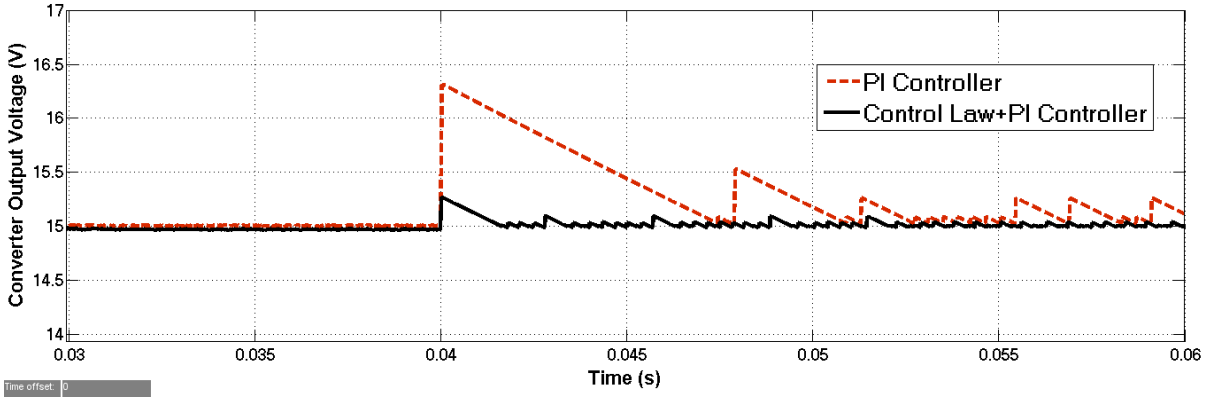

Figure 7. The comparative converter operation results for the change of the input direct voltage.

Fig. 7 shows that the sudden rise of the input voltage causes to increase the output voltages of both of the two converters. But it is clear that the proposed approach provides the converter output voltage to reach to the reference value with less overshoot in a less response time.

The load is forced to change during the converter operation while the reference output voltage and the input voltage of the converter are kept constant for case 3. The reference output voltage and the input voltage are $V_r=20\,V$ and $V_i=45\,V$, respectively. The load is changed from $R=15\Omega$ to $R=30\Omega$. The comparative results of the proposed approach and the traditional PI controller based converter operation for case 3 are given together in Fig. 8.

 Copyright © International Science and Technology Conference (ISTEC)

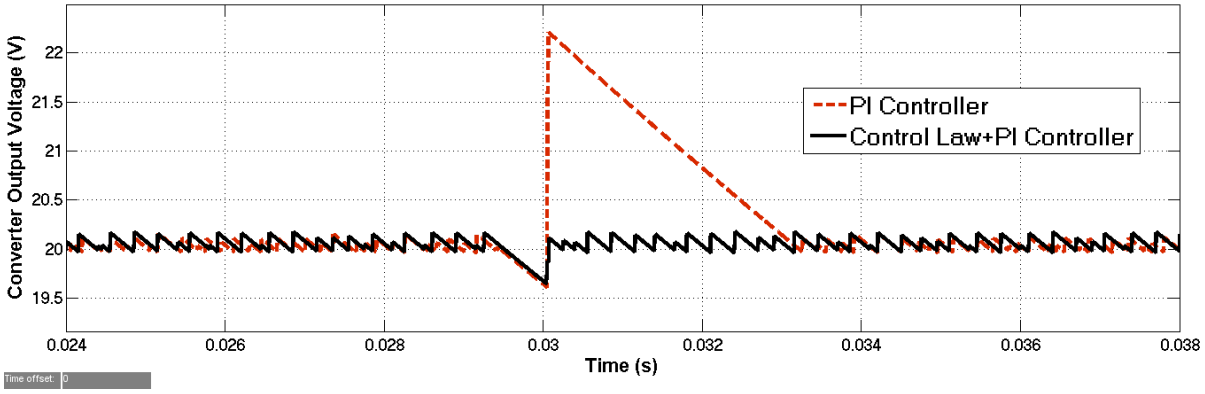

Figure 8. The comparative converter operation results for the change of the load.

As seen from Fig. 8, the sudden decrease in the load value affects increase of the output voltage in both of the two converter operations. At the beginning of the load change the converters output voltages decrease firstly, after than the output voltages increase immediately. The proposed control law based control structure provides the converter output voltage to return to the reference value with less overshoot in a less response time.

It is clear from the results of three different operation cases that the proposed control law approach improves the DC-DC buck converter operation efficiently through supporting the closed-loop PI controller structure. Thus, the better quality converter output voltage is achieved according to the traditional PI controller based system.

Conclusion

Apart from the control structure based on the traditional PI controller, a new control structure based on open-loop control law that supports the PI controller is proposed for the control of the DC-DC buck converter in this study. The control law is derived as algebraic depending on the reference output voltage and input voltage of the converter and it supports the PI controller. Thus, the PI controller is intended to achieve efficient and better quality converter operation for different operation parameters through the control law. The comparative simulation results have proved that the proposed approach has further improved the converter operation than the traditional PI controller based control structure.

Abstract: The Gediz River Delta soils contain abundant flatty (platy) mica grains. Mica grains can alter static and dynamic engineering characteristics of sandy soils due to their flatty shapes. In this study, influence of mica grains on dynamic shear modulus of sandy soils in Gediz River Delta was investigated. Maximum shear modulus (G_{max}), which is a major parameter in dynamic soil response analyses, can be obtained at small deformation amplitudes. Therefore, it is determined through measurement of shear wave velocity. Shear wave velocity provide valuable information about dynamic characteristics of soils. So it is very important to determine the shear wave velocity with high accuracy for dynamic soil response analysis. In this respect, firstly engineering boreholes were drilled and sandy soil samples were recovered along the borehole depth. The mica content of the samples was determined by means of X-RD analysis method. Then test sample contain 1.5%, 10% 20% mica grains were prepared to represent the Gediz River soils. Shear wave velocity of the sand samples were determined with bender element tests under 100 kPa cell pressures in triaxial test device. Followed by the bender element tests maximum shear modules were determined. End of the test program, shear wave velocity of the dense (Dr:55%) samples were determined as 249 m/sn, 214 m/sn and 187 m/sn for 1.5%, 10% and 20% mica content respectively. Mica was reduced the shear wave velocity in considerable percentage about 25% rate. Smiler effect was observed on the maximum shear modules and it is determined as 111.6 MPa, 82.4 MPa, and 62.9 MPa for 1.5%, 10%, 20% mica contents respectively for dense samples (Dr:55%). 20% mica content was reduced the shear wave velocity about 44% rate.

Keywords: Sand, mica content, shear wave velocity, maximum shear modulus

Introduction

Soil properties especially dynamic properties are determined by the empirical relations, although there are special tests for this purpose in the geotechnical engineering. The tests have high cost and perform of the tests requires long time. For this reasons, dynamic properties of the soil are determined by means of Standard Penetration Tests (SPT), Coni Penetration Tests (CPT), and Dynamic Penetration Tests (DPT) etc. Use of the empirical relations based on SPT, CPT, and DPT may lead to error in dynamic soil response analyses for the soils which contain abundant platy grains. In this respect, an experimental study was conducted on sandy soils which are deposited by Gediz River and contain abundant platy mica grains.

The shape of the soil grains are mainly depended on their geological origin and environmental conditions. Alluvial deposits formed by the Gediz River in the west Anatolia are good examples for the soils which contains abundant platy grains. The foundation of Gediz Basin contains rocks which consist of mica minerals (Tabban, 1980) so alluvial deposits in the Gediz Basin may contain about %20 platy mica grains (Başarı, 2012).

In the literature, there are many studies about influence of grain shape on soil behaviors (Santamarina & Cho, 2004). The studies mainly focused on angularity or roundness of grains (Thevanayagam, 2007). Grain shape effects on shear wave velocity were explored by some researchers. Cho et al. (2006) conducted a series bender element tests on rounded and crushed sands. The test results of the Cho et al. (2006) are given in Figure 1. According to Cho et al (2006), shear wave velocity increase with roundness as seen in Figure 1. Shear wave velocity of rounded sand samples is higher than shear wave velocity of angular sand samples. Angularity of the sand grains cause an increase voids between the grains this effect leads to decrease in density of media which shear waves propagate in its. Also, angularity of the grains causes a decrease contact surface area between sand grains. Decreases both of contact surface area and density of media leads to decrease shear wave velocity in soil. Stresses on contact surfaces between grains have a significant role on energy transmission between grains. High stress on the contact surface creates more stable structure in soil, so energy can transferred more easily between grains. In Figure 1 mean effective stress indicates stress on contact surfaces. High mean effective stress means high stress on

 Copyright © International Science and Technology Conference (ISTEC)

contact surfaces. Therefore, increasing the mean effective stress cause an increase shear wave velocity as seen in Figure 1.

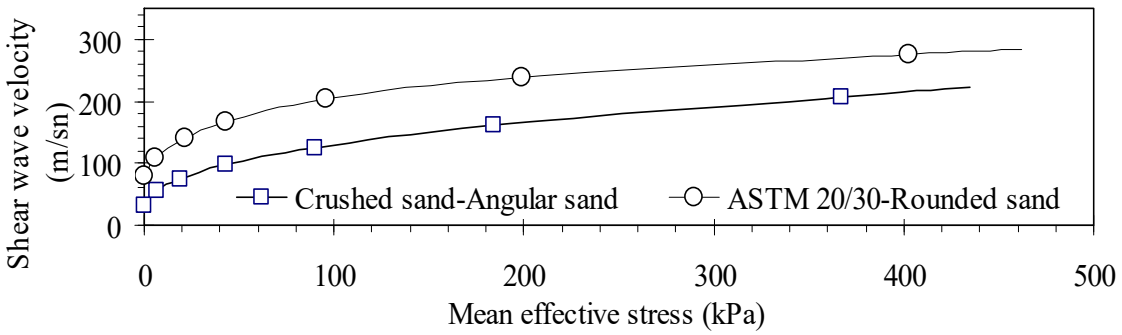

Figure 1. Roundness effect on the shear wave velocity (Cho et al. 2006).

Lee et al. (2007) explored effects of mica grain size ratio on shear wave velocity of sand. In the study, mica grains in different sizes were used. Bender element tests were conducted on samples, which were prepared in conventional oedometer cell as they were vertically loaded. Unfortunately, void ratios or densities of the samples cannot be inferred from the study. Nevertheless, mica effect on the sand samples is obvious in the study (Figure 2). As seen in Figure 2, shear wave velocity decreases with mica content for all mica grain sizes ratio.

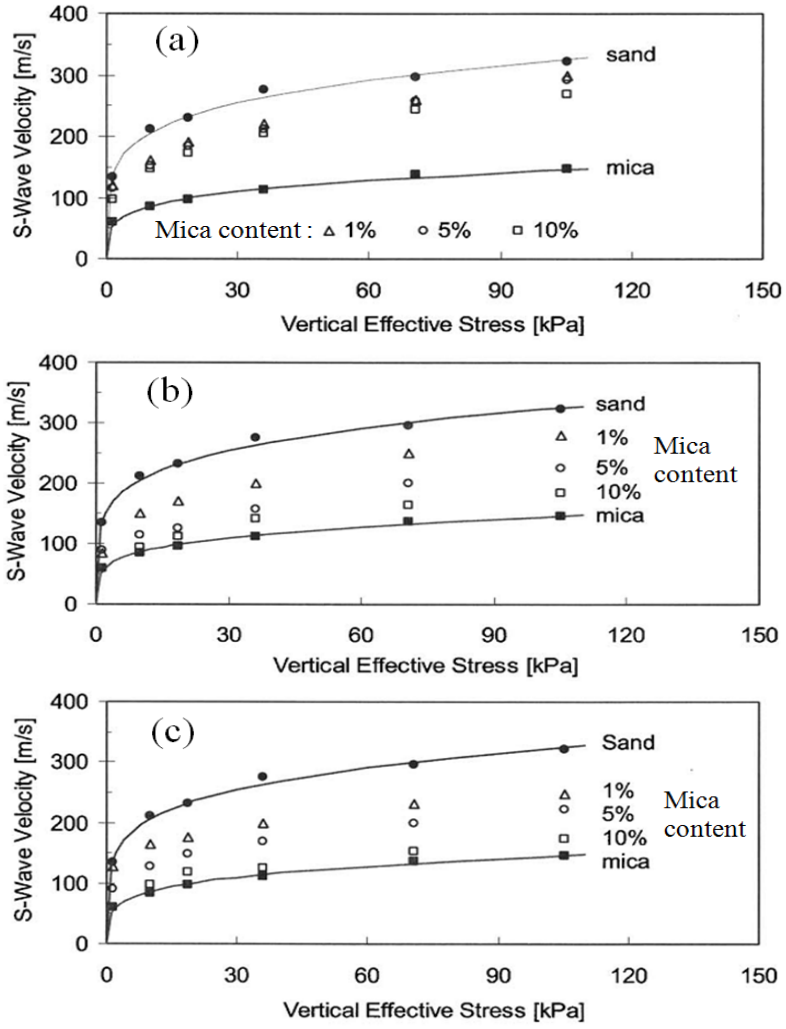

Figure 2. Mica grain size effect on shear wave velocity. (a), (b) and (c) are D_{mica}/D_{sand}=0.33, D_{mica}/D_{sand}=1.0 and D_{mica}/D_{sand}=3.0, respectively (Lee et al., 2007).

 Copyright © International Science and Technology Conference (ISTEC)

Lee et al. (2007) and Santamarina & Cho (2004) explain mica effect on the sand behavior with ordering and bridging concept (Figure 3 and Figure 4). In this concept, when size of the mica grains are equal to or larger than size of the sand grains (D_{50}-mica/D_{50}-sand 1.0), mica grains create bridges among sand grains, and increase the global void ratio. When the global void ratio increases, the strength of sand decreases while compressibility of the sand increases.

Figure 3. Possible mica-sand ordering patterns depending on orientation angle (Lee, et al. 2007).

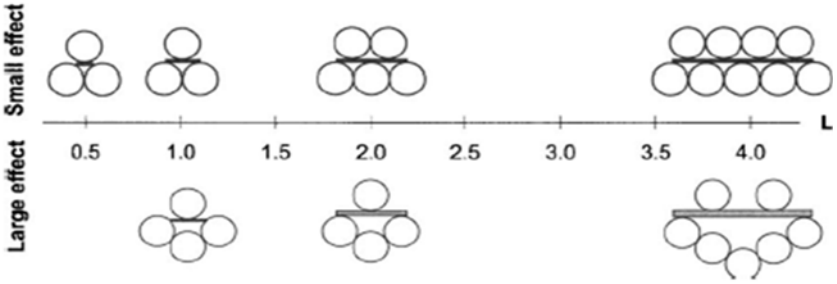

Figure 4. Bridging and ordering effects of mica plates (Lee, et al. 2007)

Materials and Methods

The test samples were taken from field (Figure 5). For this purpose boreholes were drilled in alluvial sandy soils of Gediz River Delta. Alluvial sandy materials which contain platy mica grains in test program were generally obtained from the Standard Penetration Test (SPT) spoon as seen in Figure 5. Amount of sample obtained from the SPT spoon is not enough to prepare the test sample for triaxial device. Because of this reason, the sandy samples of SPT spoons were combined then test program were conducted. The grain size distributions of the field (test samples) can be seen in Figure 5. The upper and lower bounds for the grain size of the alluvial sandy materials in Gediz River Delta are also shown in Figure 5. Diameter ratio of separated sand and platy mica grains (D_{mica}/D_{sand}) is 1.07. Coefficients of uniformity (c_u) for sand and mica grains are 1.67 and 1.64 respectively.

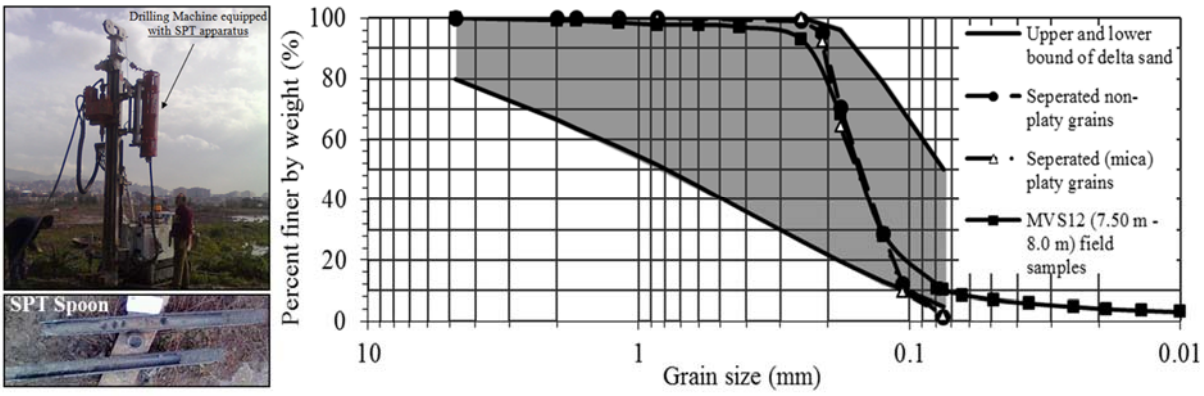

Figure 5. Field study and grain size distribution of field and test samples.

The percentage by weigh of mica minerals (platy grains) for field samples was determined by analyzing the X-Ray Diffraction (X-RD) test results (Başarı, 2012). Mica contents of field samples were determined as %5 - %20. Then mica flakes and rounded sand grains were separated from each other by flotation technique (Geredeli & Özbayoğlu 1995). Separated rounded sand grains and mica flakes were mixed in certain percentage for prepare test samples.

 Copyright © International Science and Technology Conference (ISTEC)

Test samples were prepared at three different mica contents (1.5%, 10%, 20%) by weigh and three different relative densities (30%, 55%, 80%).

Maximum shear modules (G_{max}) of the test samples were determined helping with Equation 1. Shear wave velocity (V_s) of the samples were determined with bender element test. Bender element tests were conducted on triaxial test samples under 100 kPa confining pressure (cell pressure).Triaxial test samples were prepared with moist tamping method (Ishihara, 2003). Diameter and length of prepared samples are 70 mm and 140 mm respectively. Before the bender element test, test samples were saturated and isotopically consolidated under 100 kPa confining pressure. Saturation degree of the tests samples was determined with B value. B values of the all samples are equal or higher than 0.95.

$$G_{max}=\rho V_s^2 \quad (1)$$

Bender element test device consists two piezoelectric tips, signal generator and oscilloscope. One of piezoelectric tips is called transmitter and other tips is called receiver. Transmitter converts electric signals to waves, receiver converts waves motion to electric signals. Travelling time of shear waves in soil sample is determined as illustrated in Figure 6. Wave velocity within the soil is found by dividing the distance between bender element tips to the travelling time. In the bender element test program, amplitude of the used signal was 20 mV.

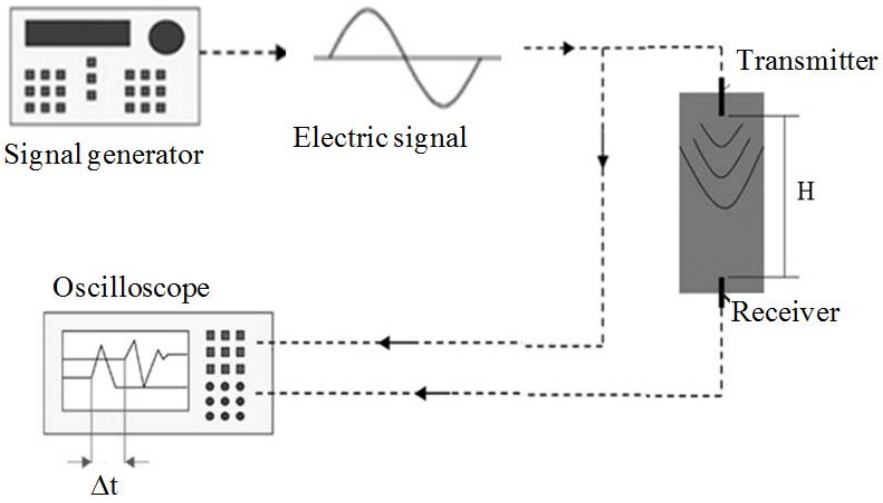

Figure 6. Illustration of bender element test.

Tests Results

Shear wave velocities of soil samples at different mica contents, prepared at relative density values between loose, dense and very dense states, were measured via bender element tests as described above. Samples were set up at 1.5, 10 and 20% mica content. Size ratio of mica and sand (D_{mica}/D_{sand}) grain is 1.07. One of the recorded signals from bender element tests and measured shear wave velocity (V_s) are presented in Figure 7.

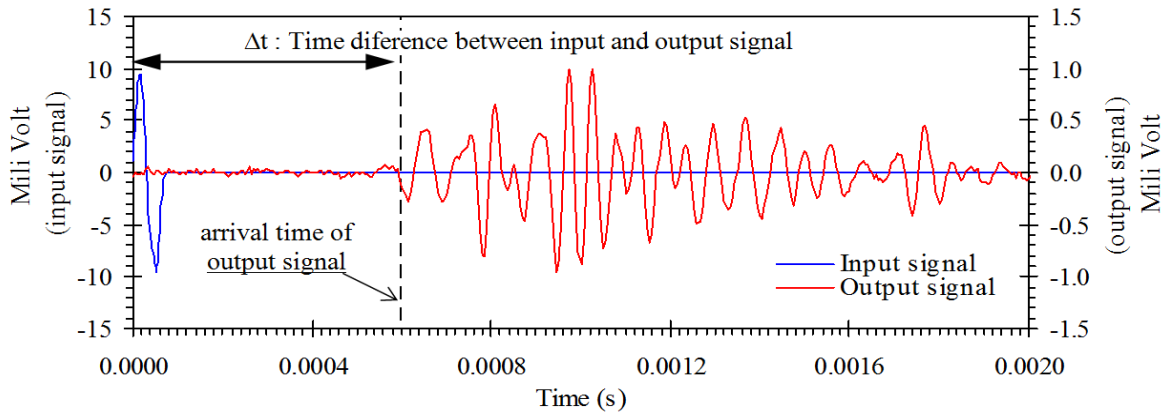

Figure 7. Recorded signals during bender element test.

 Copyright © International Science and Technology Conference (ISTEC)

Test results for shear waves (V_s) presented in Figure 8. Changes of shear wave velocity corresponds to the mica content given in Figure 8.a. Effects of the relative density on shear wave velocity is shown in Figure 8.b. Maximum shear modules (G_{max}) can be seen in Figure 9. Maximum shear modules calculated helping with Equation 1 as seen in Figure 9.a and Figure 9.b. As expected mica and relative density have similar effect on shear waves velocity and maximum shear modules. Both of shear wave velocity (V_s) and maximum shear modules (G_{max}) decrease with increasing of mica content. When the Figures 8 and Figure 9 are carefully examined, it can be seen that relative density can change influence of mica content on shear wave velocity and maximum shear modules.

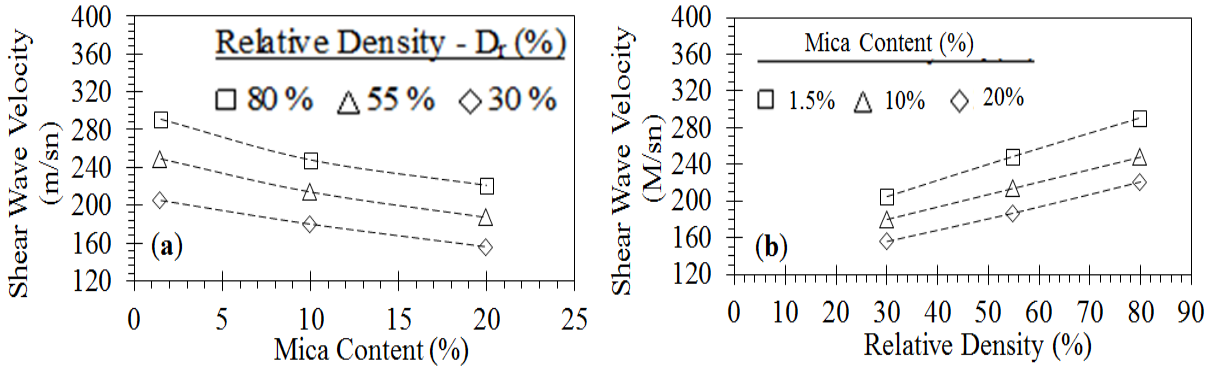

Figure 8. Effects of Platy mica grain and relative density on shear wave velocity.

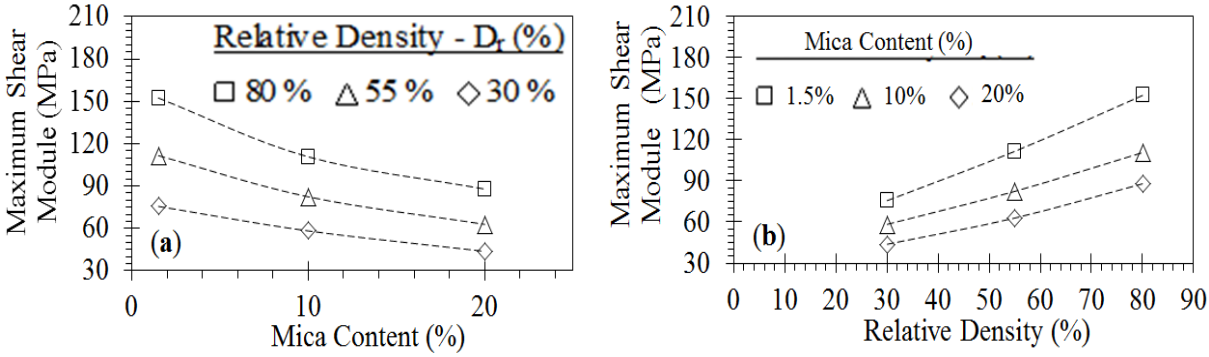

Figure 9. Changing of the maximum shear modules with mica content and relative density.

Conclusion

In this experimental study, the effects of the platy mica grains, on shear waves and maximum shear modules of the sandy soils within the liquefaction depth (20 m) of the study area have been researched.

Soil samples that were recovered from the study area were used in the testing program. Apart from the present study, dynamic experimental studies regarding the Old Gediz River Delta are scarce. Therefore, the findings of this study have significant importance since they will be informative and advisory for future researches to be conducted on the sandy soils of the area.

Platy mica content of the soils within the study area was determined down to 20 m from the surface. Soils of the survey area contain platy mica mineral ranging between 5% and 20%. Such mica content for sandy soils may be sufficient to change major engineering properties especially dynamic properties of the sandy soils. In order to estimate soil behavior correctly, mica content of the sandy soils were studied in detail.

Influence of platy mica grains on shear wave velocity and maximum shear modules were observed during bender element tests. For all mica contents, shear wave velocity and maximum shear modules decrease as relative density and effective confining pressure decreases. It was noticed that shear wave velocity and maximum shear modules were inversely proportional with mica content

 Copyright © International Science and Technology Conference (ISTEC)

Test results shows that, small amount of mica can change shear wave velocity and maximum shear modules of sandy soils. As seen in Figure 8 and Figure 9, when the mica content increases 1.5% to 20%, maximum shear modules decreases 111.6 MPa to 62.9Mpa for dense sand (Dr:55%). Maximum shear modules were decreased about 43.6% rate. Similar effects were observed loose (Dr:55%) and very dense (Dr:80%) sands. When the mica content increases 1.5% to 10%, maximum shear module decreases about 42.1% and 42.3% for loose and very dense sand respectively. An increasing about 10% in mica content caused to decrease in maximum shear modules about 22.9%, 26.1% and 27.4% rates for loose, dense and very dense sand respectively. Shear wave velocity is effected similarly by the platy mica grains. Increasing of platy mica grain contents caused a diminish in shear wave velocity as seen in Figure 8. 10% and 20% mica content caused diminishes about 12~15% and 23~25% in shear wave velocity respectively.

Platy grains have considerable effects on dynamic properties of the sandy soils. Ignoring the effects of platy grain on the sandy soils leads to significant errors in dynamic soil response analyses and other dynamic analyses. Empirical relations should not be used for estimation of soil parameters which contain platy grains.

Abstract: The main purpose of this study was to research the influence of teacher's personal factors and organizational change strategy on Teacher Evaluation for Professional Development (TEPD) in elementary schools. According to the literature reviews in influence of teacher's personal factors and organizational change strategy on TEPD, using TEPD Influence Factor Scale as the research tool, targeting elementary school teachers. There are 299 effective samples. With AMOS processing CFA to choose the best model, and further its reliability and validity were tested. Results showed that the model fits, and its goodness-of-fitness conformed to standard. It can prove that teacher's personal factors have influences on the TEPD with causal relationship and organizational change strategies intervening variables effect are significant. We suggest that education institution can notice this issue in order to enhance the efficiency of the TEPD paper is a report on the findings of a study conducted on a graduate level virtual conference summer school course. Discourse analysis techniques were used to examine the resulting transcript of texts for evidence of a democratic discourse within a community of learners. Findings indicate that gender is not masked in the text driven discussions on the Internet. Distinctive discursive styles are often sex class linked. Like face to face or classroom contexts, status is accorded unequally within discourse communities. Participants are not equal and are not equally attended or responded to. Educators need to take a serious and wary approach to accepting claims of ensured democratic participation in computer mediated communication formatted classes.

Keywords: teacher's personal factor, organizational change strategy, Teacher Evaluation for Professional Development, confirmatory factor analysis

Introduction

1. Research Background and Motives

A teacher plays an important role in ensuring the teaching quality and students' learning effectiveness in school (Tucker & Stronge, 2005). Nowadays, each country is committed to improving teachers' quality and promoting teachers' professional knowledge and teaching skills, and their main practice is to apply teacher evaluation which can enhance teachers' professional literacy and promote teachers' professional career development to improve education achievements (Avalos & Assael, 2006; Danielson, 2001). Therefore, the establishment of appropriate teacher evaluation system can improve teachers' quality and working performance and highlight teachers' professionalization, and it is also the only effective method to ensure teachers' dignity and social status (Yen, 2003).

Many researches suggest that teacher evaluation is an important method to increase teachers' professional development, and it is also an important mechanism to guarantee students' achievement (Sun, 2008). In order to respond to the highly expectation from all works of life to education quality, Ministry of Education ever listed "establishment of teacher evaluation mechanism and improvement of teachers' teaching performance" and "improvement of the current performance appraisal system of elementary and secondary school teachers and the enhancement of teachers' professional performance" into the discussion outline "in the meeting on education reform

 Copyright © International Science and Technology Conference (ISTEC)

review and advancement in 2001" (Ministry of Education, 2001). In September 2003, in the meeting on national education development, Ministry of Education draws a conclusion to especially formulate "the implementation essentials on the handling of teacher evaluation for professional development with the subsidy of Ministry of Education", so as to assist in teachers' professional growth, increase teachers' professional literacy, improve teaching quality and increase students' learning achievements. With the premise of teachers' voluntary participation, a three-year "pilot subsidy scheme on teacher evaluation for professional development" has been promoted since 2006 to courage school to participate in pilot scheme (Ministry of Education, 2006). Pilot scheme has been changed into normal scheme since 2007, and "the implementation essentials on the handling of teacher evaluation for professional development with the subsidy" are published, with the purpose of promoting the professional development of elementary and secondary school teachers and enhancing students' learning achievements through normal handling of teacher evaluation for professional development (Ministry of Education, 2014).

The scheme on teacher evaluation for professional development has been promoted for nearly 10 years in Taiwan. In 2016, there are 1,441 elementary schools participating in pilot scheme, accounting for 54.5% of all elementary schools in Taiwan, with 29,493 participating teachers, accounting for 29.91% (website for teacher evaluation for professional development, 2015); the continuous growth in the number of participating schools and teachers shows that teachers can gradually accept and participate in teacher evaluation for professional development, but there is still room for improvement. Executive Yuan has passed "Amendments on some Articles in Teacher's Law" to bring the teacher evaluation in senior high school and below into law, which has entered into the second reading program of Legislative Yuan (Chiu and Lin, 2012). In order to avoid falling into the same old trap of poor effectiveness in education reform in Taiwan, it is necessary to discuss the factors influencing teacher evaluation for professional development, which can be used as reference for future implementation schools and help to promote teacher evaluation policy and achieve the goal of evaluation.

Teacher evaluation for professional development is one of the important education policies at present and is critical to the significant organizational change of schools. During the implementation of this significant policy, the proper organizational strategies are required to be put forward, and meanwhile teacher's personal factors should also be considered, so that organizational stability and development can be achieved. Wu (1999) indicates that teacher evaluation process is a part of teacher's personal development and administrative reform of school. With teacher's personal factors and organizational change strategy as pointcut, this research first collects data and then applies confirmatory factor analysis to analyze the influence of above-mentioned two factors on implementation effectiveness of teacher evaluation for professional development in elementary schools. Thus, it will help to implement teacher evaluation for professional development in elementary schools and put forward feasible improvement strategies.

2. Research Purposes

According to the above research background and motives, the main purpose for this research is to know about the influence of teacher's personal factors and organizational change strategy on implementation effectiveness of teacher evaluation for professional development; with the technology of Structural Equation Modeling as theoretical verification tool, the goodness of fit for the model "influence of teacher's personal factors and organizational change strategy on implementation effectiveness of teacher evaluation for professional development" is tested to further understand its direct and mediating effect.

Literature Review

Teacher evaluation for professional development is the policy scheme promoted strongly by Ministry of Education in recent ten years, and will also bring significant organizational change in schools. This research will verify the influence of teacher's personal factors and organizational change strategy on implementation effectiveness of teacher evaluation for professional development, and the relevant literature review is as follows:

1. Teacher's personal factors

(1) Teacher's demand and attitude. The demand for teacher's professional development comes from the perceived role gap between "reality" and "ideality" (Sun, 1997); Chang and Lin (2006) points out that in order to respond to the implementation of new curriculum and policies of teaching and evaluation, teachers need professional development to increase confidence and self-efficacy and to understand the weakness in their profession and demand and connotation for professional growth through teacher evaluation for professional development, so as to improve

 Copyright © International Science and Technology Conference (ISTEC)

teacher's professional status. Castle and Aichele (1994) think that intrinsic motivation is the important kinetic energy to promote teacher's continuous professional growth, and the teacher's consciously professional development demands his personal education idea and professional awareness to generate internal driving force for the pursuit of professional growth; Beerens (2001) also indicates that the best method for teacher's professional development is the initiative pursuit based on intrinsic motivation and demand. In addition, for instance, a teacher can sort out teaching files and data systematically due to being the national education guidance group members, so as to understand his own profession degree or strengths and weaknesses in teaching through sharing and counseling the teacher's teaching process (Chang and Lin, 2006).

This research discusses the teacher's demand for professional development as well as his attitude towards teaching and evaluation to understand the influence of this factor on the implementation effectiveness of teacher evaluation for professional development.

(2) Teacher's concerns. Discussion on teacher's concerns originates from the "concerns theory" of Fuller (1969). "Concerns" mean that one person tries to do something under the expected situation or has the tendency of trying to do something under other special situations. Concerns can be said to be the motive power of action, while action is the result of concerns (Sun and Chen, 2007). Fuller divides teacher's concerns into three phases: 1) Self-concerns phase: teacher concerns whether his own performance in teaching ability and role play is competent and affirmed. 2) Task-concerns phase: teacher concerns the environmental factors of teaching and how to achieve teaching task, such as routine of school-room, teaching material resources, working atmosphere, etc. 3) Impact-concerns phase: teacher concerns students' learning process, emotional demand, social development, etc. In her opinion, teacher's concern for teaching is a kind of demand and also the learning motive. Following the research into teacher's concerns for teaching, Hall and Hord (1987, 2001) propose "Concerns-Based Adoption Model" (CBAM) to divide teacher's concerns into 7 development phases: awareness, information, personal, management, consequence, collaboration and refocusing, and their integrated viewpoints are shown in Table 1.

Table 1: Characteristics of teacher's concerns in each phase

Phase	Name	Characteristics
Self-concerns	Awareness	Rare concerns for or participation in innovation.
	Information	Having a preliminary understanding of innovation and wishing to understand more contents about innovation.
	Personal	Aimed at the conflict between innovation and existing school structure, innovate in contradictions between the responsibilities needing to be shouldered now as well as in the connotation of their own and colleagues' treatment and status, and consider it deeply.
Task-concerns	Management	Concerns focus on implementation process and work of innovation as well as the best method for information and resource usage, especially the concerns for the requirements for working efficiency, organization, management, plan and time limit.
Impact-concerns	Consequence	Concerns for the influence of innovation on students, focusing on the applicableness of innovation on students, evaluation for students' learning achievements and change demands for students' performance gains.
	Collaboration	Concerns for how to coordinate and cooperate with others during the implementation of innovation.
	Refocusing	Concerns for searching more wide benefits from innovation, including discussion on significant change or feasibility of being replaced by another innovation; individuals have other schemes or more specific ideas for selection or innovation.

Source: revision by Hall & Hord, 1987, NY: State University of New York Press, p.60.

Hall and Hord (2001) think that in spite of respective characteristics in each development phase, they are not mutually exclusive with each other and have the relationship of dynamic change. That is to say, a teacher may have concerns for different development phases simultaneously in the certain time, where the greatest concerns will change due to the implementation of change. With the time going, the change participants' concerns for change will change for being affected by personal experience, knowledge, impressions and the attitudes towards participation

 Copyright © International Science and Technology Conference (ISTEC)

degree in change. The opinions of teacher's concerns imply the problems facing them, the assistance required and psychological resistance to innovation (Hall & Hord, 1987; Hall & Shieh, 1998); it also shows that the input and commitment of organizational members and requires the change agent to provide effective support and intervention. Thus, this research discusses the above-mentioned 7 kinds of teacher's concerns.

2. Organizational change strategy

From the perspective of organizational change theory of Kurt Lewin, teacher evaluation for professional development implemented in elementary schools can be divided into 3 phases of strategy dimensions of unfreezing, action and freezing, and the discussions are as follows:

(1) Strategy in unfreezing phase

1. Inspiration of change demand: Jackson (2000) and Kotter (2007) think that if organizational members have high degree of self-satisfaction, they will have lower interest in participating in change; in the case of lacking incentive factors, the change work will become more difficult. Successful changes mainly originate from that individual or team begins to seriously think about organizational competition situation and pays attention to potential crisis. Therefore, Kotter (2007) puts forward that the top priority is to establish crisis awareness among the 8 steps of change leadership. The promotion of organizational change requires the highly cooperation of organizational members, and the inspiration of change demand through crisis awareness is related to the cooperation degree of change action, so how to develop members' demands for organizational change and cultivate crisis awareness are the indispensable methods. By means of crisis awareness, the potential crisis and opportunity appearing in organizations are found out, or with the understanding of market competition situation and organizational status, organizational members are promoted to reflect on their own situation to increase their commitment to organizational change.

2. Analysis of change environment: Chen (2003) and Hsieh (2004) indicate that the resistance of school organizational members to the promotion of teacher evaluation change for professional development should be eliminated in unfreezing phase, so as to shape the organizational culture in favor of change. During the promotion of change scheme, the positive driving force in favor of change and negative driving force going against change are bound to appear. Fidler (1996) thinks that school organization has 3 important jobs in this phase: they are respectively presenting the evidence of organizational problems, linking organizational problems and school goals to trigger teachers and administrative staff's anxiety and motivation and presenting the possible solving strategies. In other words, in order to eliminate the adverse factors for the promotion of teacher evaluation for professional development in unfreezing phase, schools should analyze the adverse environment factors and make students know about them, so as to formulate solving strategies in combination with school goal.

(2) Strategy in action phase

1. Organizational change team: Keyton (2005) indicates that the premise for school's promotion of change is that school must formulate change scheme according to organizational characteristics, and the expectation of students, teachers and administrative staffs, community and parents, and really carry out the action strategy of change. Yukl (2002) further indicates that organizational working scheme and promotion process need powerful force, and it is certain that the work will not be completed with only one-man force. The establishment of a powerful change team is the indispensable factor of organizational change and transformation for change team, and its team members must have mutual trust and common goal; only if the team members have the aspiration to pursue common excellent goal, the true collaboration will occur.

2. Construction of shared vision: organizational shared vision is one of the key factors for the success of organizational change (Hall & Hord, 2001), as organizational vision has three roles: clarifying the direction of organizational change, inspiring organizational members to adopt proper action towards the correct direction and rapidly and effectively organizing members to coordinate each other's action. Vision is just like an image presenting the future and provides an open or implicit explanation for the future that partners are try best to create. Keyton (2005) further points out that the formation of vision relies on the effective communication and coordination between change leaders to reach a consensus; the team's change cognition is increased and teacher's personal goal and organizational goal are integrated through the process of whole staff's participation, so as to improve school organizational change efficiency.

3. Inspiration of change and innovation: for individuals, team or organizations, change often goes along with pains and difficulties (Torres & Preskill, 2001), which may cause individual's sense of anxiety for the uncertainty of future

 Copyright © International Science and Technology Conference (ISTEC)

or the resistance to organizational structure inertia or team inertia to threaten the existing power relation (Robbins & Judge, 2007). Therefore, the method of inspiring change and innovation or reducing the resistance to change can be adopted, such as, increasing staff's participation and communication to enhance identity and support, intensifying staff's educational training, adopting material and spiritual reward and counseling and step by step method (Wu, 1999). In addition, relevant researchers indicate that the external incentives and motivations are also extremely important factors; in particular, the factors of peer influence and invitation of directors hold a majority (Li, 2007; Hung, 2007; Chen and Lo, 2011).

4. Enhancement of teacher's empowerment: with teacher's professional development as the main guidance, teacher evaluation for professional development aims to assist teacher in professional growth and increase teacher's professional literacy and improve teaching quality. If school operator can construct a platform where teachers can give full play to their expertise and potential and are willing to share, so as to apply the concepts of teaching leadership, teacher leadership and other distributed leadership for fully empowerment and hierarchical responsibility, the members can be inspired to implement change and innovation to effectively achieve organizational goal (Li, 2003; Lin, 2011; Chang, Chou, and Li, 2011) and realize the functions of teacher empowerment.

(3) Strategy in freezing phase

According to Kurt Lewin, organizational change theory means that establishment of a certain program can make the new action and operation continue and original state will no longer recover, so that the effectiveness obtained in promotion phase is steadied and retained (Hall & Hord, 2001). Only when change is transformed into organizational culture and integrated into the blood of organizations, change can last for long. (Kotter, 2007).

1. Timely review and improvement: after the evaluation for the effectiveness of change, the evaluation results must be fed back to organizational members for the revision of change strategies; with the methods of reward system, resource support, positive reinforcement, etc, the change scheme will become the formal organizational planning to retain the change effectiveness for a long term. After the change (no matter whether it is change in organization, individual or team and technology) lasts for some time and can achieve the change goal of school organizations, it must be institutionalized and formalized to retain the change effectiveness for long, so that organizations will return to the stable and balanced state, i.e. the organizational institutionalization and the permanence of new action of organizational members (Hall & Hord, 2001).

2. Shape of organizational culture: organizational culture is the code of conduct and shared value of organizational members; during the shape of change culture, it is necessary to let members know about the new practice and action to improve performance and guarantee the consistence of supervisor's words with his action (Yen, 2003; Kotter, 2007); if members can clearly see and affirm the effectiveness of change, they will further vigorously advocate the effectiveness of change. In case of the combination between organizational change and organizational culture, organizational members can not only observe the system of organizational change, but also can accept the idea of organizational change heartily (Kotter, 2007).

Therefore, the effectiveness of teacher evaluation for professional development lies in whether organizational members can timely make the review and improvement, so that change scheme will become the common rules of organizational members and be shaped into organizational change culture to retain the effectiveness of organizational change for long.

3. Relationship between teacher's personal factor, organizational change strategy and teacher evaluation for professional development

Tseng (2006) thinks that teacher evaluation for professional development refers to the "formative evaluation" for teacher's profession; during the process of change, teachers are helped to understand their own strengths and weaknesses in teaching or where it can be better and proper help are provided for teacher's growth, so as to promote teacher's professional development and improve teaching quality. Hung and Hsieh (2007) hold that teacher evaluation for professional development refers to the teaching evaluation with the aim of enhancing teacher's professional development. With the teacher's profession as principal axis, this evaluation emphasizes the teacher's initiative participation; a set of systematic evaluation indictors is used to carry out teacher's self-evaluation and intramural evaluation, and evaluation results can assist teachers to understand the strengths and weaknesses in

 Copyright © International Science and Technology Conference (ISTEC)

teaching and its reasons and can be used as the basis for the arrangement of teacher's training or enhancement of professional knowledge and skills. Based on the Taiwanese research, it is found that teacher's initiative, personal motives and attitude are all the influence factors promoting teacher's professional development (Chen and Jiao, 2009; Li, 2002). Goodson (2001) emphasizes that the educational change should not only consider the organizational internal affairs and external relationship, it should also consider the balance between personal factors. In the analysis of change, personal transformation should be put to the top; only when teacher's personal input is considered as the motives for change and its necessary goal, educational change can achieve the greatest effectiveness. Lin (2007) thinks that the implementation process of teacher evaluation for professional development is affected by social opinions, teacher culture, economic factors, structure, politics and other environment factors. According to Chang, Chou, and Li (2011), the influence factors for teacher evaluation scheme for professional development focus on 3 items of teaching leadership, teacher culture and external environment.

School organizations are characterized by bureaucracy system and loosely coupled dual system and belong to domesticated organization (Qin, 2000), so it is more difficult to promote organizational change in schools compared with general business establishments. Since 2006, Ministry of Education has promoted and encouraged teachers below high schools and higher vocational schools to voluntarily participate in evaluation scheme for professional development; it is hoped to assist in teacher's professional growth, increase teacher's professional literacy, enhance teaching quality and increase students' learning achievements through the promotion of this scheme. According to Owens (1995), in face of the change of internal and external environmental factors, in order to achieve the sustainable development in school affair and improve education quality, the school authority will certainly master school organizational characteristics and change focus and adopt good coping strategies for organizational change.

RESEARCH DESIGN AND IMPLEMENTATION

1. Research Subjects

According to the data provided by website for teacher evaluation for professional development (2015), aimed at the schools selected by each county and city to implement teacher evaluation for professional development in elementary schools, stratified random sampling was used for test according to the proportion of teachers in elementary schools participating in teacher evaluation for professional development in northern, middle and southern district; after deducting the samples with incomplete answers and the samples answered by teachers without the experience of participating in evaluation, 299 valid samples were obtained.

2. Research Tools

This research adopted "scale on influence factors of teacher evaluation for professional development implemented in elementary schools" (Su, 2014) as the tool, and the measurement items in this scale has been treated as follows in trial test: 1. With the adoption of extreme value test method, trial test samples are divided into two groups by 27% before and after trial test samples; with the significant difference of the two as discrimination degree, items without discrimination degree are deleted; 2. With the use of correlation analysis method of items and total scores, items where the correlation coefficient between item and total scores is smaller than 0.3 and the Cronbach's α coefficient will increase after the deletion are deleted; 3. According to the suggestions of Hair, Anderson, Tatham and Black (2009), items where commonality is smaller than 0.5 are deleted. The scale on "teacher's personal factors" covers teacher's personal demand and attitude (attitude towards teaching and demand for professional development) and teacher's concerns (awareness concerns, information concerns, personal concerns, consequence concerns, collaboration concerns, refocusing concerns), with a total of 8 factor dimensions and 25 items. Bartlett's sphericity test of dimensions is significant, KMO value is 0.939, dimension explanation quantity is 82.30% and Cronbach's α coefficient is 0.931. The scale on "organizational change strategy" is divided into 6 potential factors: inspiration of change demand, analysis of change environment, organizational change team, construction of shared vision, inspiration of change and innovation, enhancement of teacher's empowerment, with a total of 27 items. Bartlett's sphericity test of dimensions is significant, KMO value is 0.942, dimension explanation quantity is 84.230% and Cronbach's α coefficient is 0.944, indicating the good reliability and validity in this questionnaire, so it can be used to discuss the influence of organizational change strategy on implementation effectiveness of teacher evaluation for professional development.

3. Research Method

 Copyright © International Science and Technology Conference (ISTEC)

Through literature review and integration, this research constructs the research structure of teacher's personal factors and organizational change strategy (Figure 1), and applies the structural equation modeling software Amos for confirmatory factor analysis (CFA) to confirm the goodness of fit of this structural modeling.

By referring to Bagozzi and Yi (1988), Jöreskog and Sörbom (1996) and Hairet al. (2009), this research uses the indicator of overall goodness of fit, including (a) the chi-square value of absolute index ($\chi 2$), ratio of chi-square and degree of freedom ($\chi 2/df$), fit index (GFI), root mean square residual (RMR) and root mean square error approximation (RMSEA); b. incremental fit index of incremental index (IFI) and comparative fit index (CFI); c. Parsimony Goodness Of Fit Index (PGFI) after the parsimony and adjust for parsimony index and Parsimony Normed Fit Index (PNFI) to gain compact model.

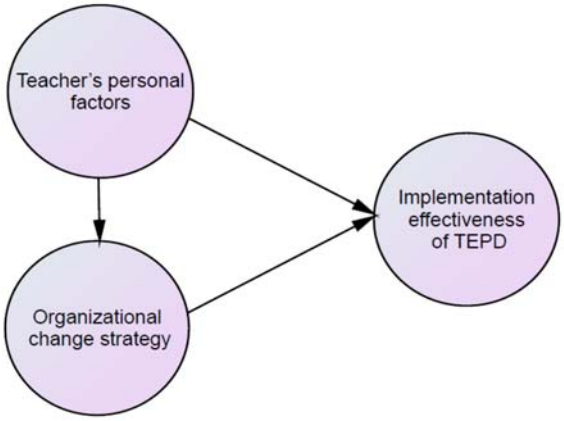

Figure 1. Structural Equation Modeling

RESEARCH RESULTS AND ANALYSIS

1. Goodness of fit test for the modeling of teacher's personal factors

This research uses 299 valid samples to carry out the SEM analysis, and there are totally 8 observation variables in teacher's personal factors (see Figure 2), degree of freedom 8* 9/2=36, with a total of 8 residual errors; with the addition of 1 variance and 7 factor loadings, the degree of freedom is greater than estimated parameter, so the modeling belongs to over identification, conforming to the requirements of positive definite model in theory. The factor loading of the 8 observation variables after CFA is greater than 0.5, but the residual errors of 3 observation variables of collaboration concerns, personal concerns and information concerns are not independent. Due to the compact modeling and the violation of the principle of residual error independence, 5 observation variables are retained after these 3 observation variables are deleted. Each factor loading is as follows: attitude towards teaching is 0.65, demand for professional development is 0.87, awareness concern is 0.6, consequence concern is 0.69, and refocusing concern is 0.76 (see Figure 3).

 Copyright © International Science and Technology Conference (ISTEC)

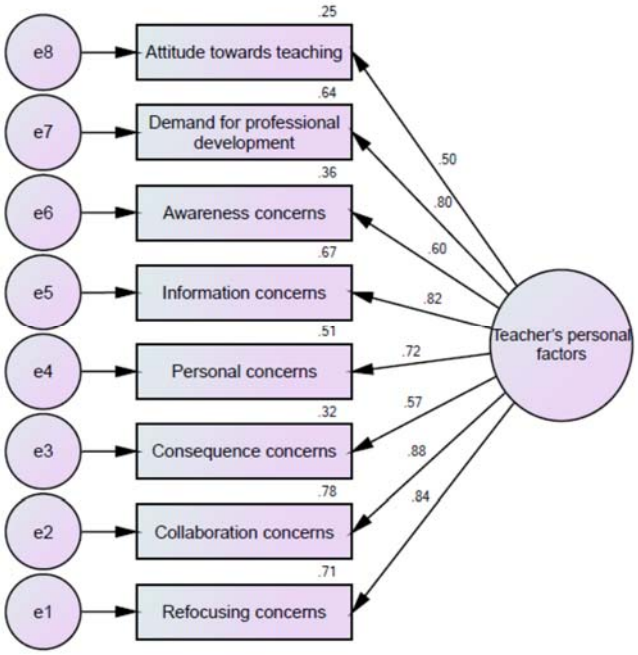

Figure 2. Dimension of teacher's personal factors

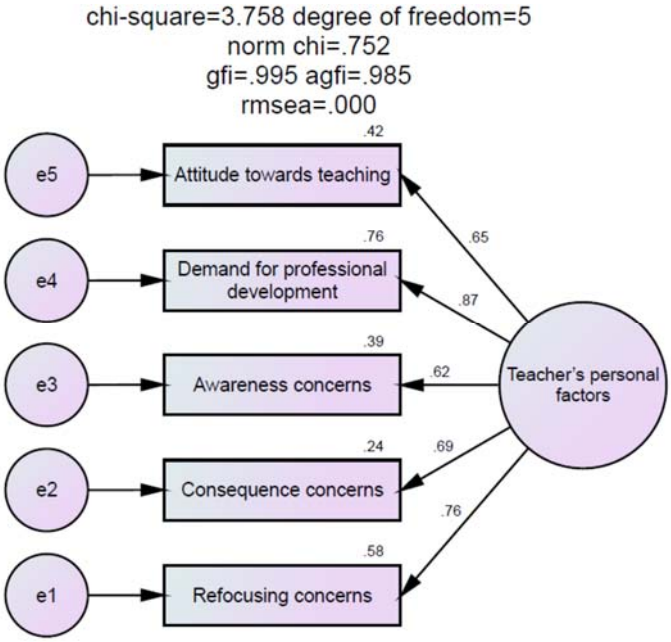

Figure 3. Dimension of teacher's personal factors after cfa

After deleting observation variables, PGFI=0.332 is smaller than suggestive value 0.5, and the reason may be that the item similarity is too high, causing the lower statistics of this index; other absolute fit index, incremental fit index and PGFI all get the ideal value, and the index within the evaluation index is greater than suggestive value, indicating that this modeling has good goodness of fit (See Table 1); the composite reliability of this dimension is (CR value) is 0.884, average variance extracted (AVE) is 0.524, and both of them are greater than suggestive value.

Table 2: Each goodness of fit index and statistics for the dimension of teacher's personal factors

Goodness of fit		Statistics	Suggestive value
Absolute fit index	χ^2	3.758	The smaller, the better
	df	5	
	χ^2/df	.752	<3
	GFI	.995	>0.9
	AGFI	.985	
	RMR	.009	<0.08
	SRMR	.0181	
	RMSEA	.000	
Incremental fit index	NFI	.991	>0.9
	NNFI	1.006	
	CFI	1.0	
	RFI	.983	
	IFI	1.00	
PGFI	PGFI	.332	>0.5
	PNFI	0.50	
	CN	878	>200

2. Goodness of fit test for the modeling of organizational change strategy

There are totally 6 observation variables in organizational change strategy (see Figure 4), degree of freedom 6* 7/2=21, with a total of 6 residual errors; with the addition of 1 variance and 5 factor loadings, the degree of freedom is greater than estimated parameter, so the modeling belongs to over identification, conforming to the requirements of positive definite modeling in theory. The factor loading of the 6 observation variables after CFA is greater than 0.5, but the residual errors of observation variable of "inspiration of change demand" are not independent. Due to the compact modeling and the violation of the principle of residual error independence, 5 observations are retained after this observation variable is deleted. Each factor loading is as follows: inspiration of change and innovation is 0.70, analysis of change environment is 0.83, organizational change team is 0.72, construction of shared vision is 0.83 and enhancement of teacher empowerment is 0.77(see Figure 5).

PGFI	PGFI	.326	>0.5
	PNFI	0.499	
	CN	264	>200

3. Effect analysis between potential variables for structural modeling

According to the results of path model (see Figure 6), it can be known that the influence coefficient of teacher's personal factors on teacher evaluation for professional development has achieve significant level (0.79). Thus, teacher's personal factor has the significant direct effect on implementation effectiveness of teacher evaluation for professional development.

 Copyright © International Science and Technology Conference (ISTEC)

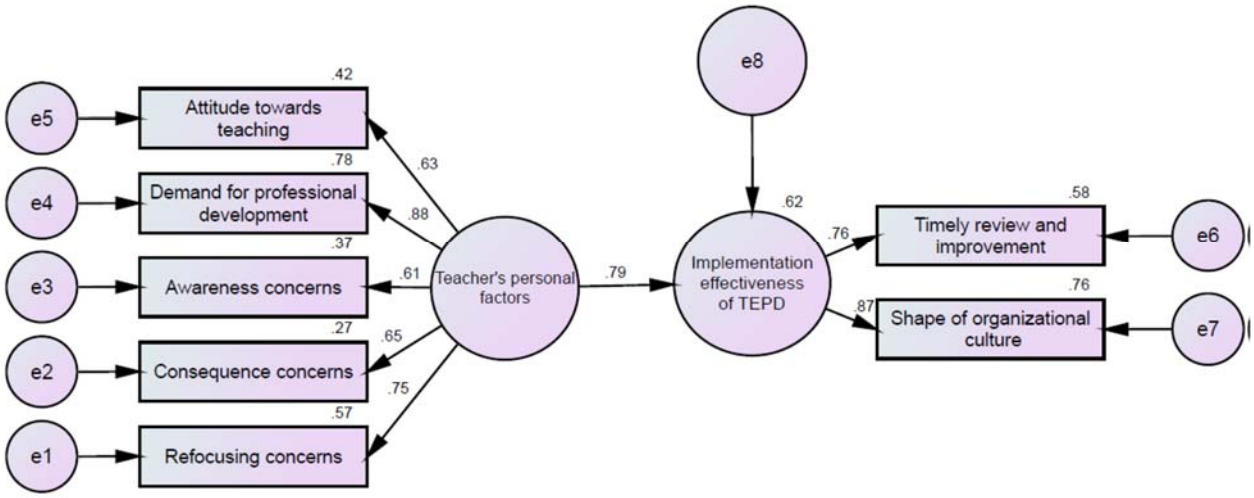

Figure **6.** Coefficient of path structural modeling

As for the effect between all the variables of structural equation modeling in this research, (see Figure 7), Amos is used to test mediating effect and it is found that teacher's personal factors and organizational change strategy have the significant total effect on implementation effectiveness of teacher evaluation for professional development. Moreover, teacher's personal factors also have significant indirect effect on implementation effectiveness of teacher evaluation for professional development through organizational change strategy, indicating that organizational change strategy has the significant mediating effect. The effect of each variable is summarized in Table 4.

Total effect		.86

Conclusion and Suggestions

With the teacher evaluation for professional development strongly promoted by Ministry of Education since 2007, the trial scheme has been further changed into normal scheme, hoping that the teacher's professional development can be promoted through teachers' participating in the process of evaluation activity. This research discusses the influence of teacher's personal factors and organizational change strategy on implementation effectiveness of teacher evaluation for professional development in elementary schools, so as to test, clarify and master the relationship between variables, which can help to research and formulate the thoughtful and feasible improvement method. The conclusions and suggestions in this research are illustrated as follows:

Conclusion

The conclusions for this research are as follows:

1. The research results show that teacher's personal factors and organizational change strategy have the significant direct effect on teacher evaluation for professional development, and teacher's personal factors also have significant indirect effect on implementation effectiveness of teacher evaluation for professional development through organizational change strategy, indicating that organizational change strategy has the significant mediating effect.

2. Attitudes towards teaching, demand for professional development, awareness concerns, consequence concerns, refocusing concerns, etc in teacher's personal factors are all the important factors influencing the implementation of teacher evaluation for professional development. It can be known from research results that "demand for professional development" and "refocusing concerns" are the two items with the highest factor loading in the teacher's personal factors, while teacher's "awareness concerns" has the lowest factor loading.

3. Analysis of change environment, organizational change team, construction of shared vision, inspiration of change and innovation and enhancement of teacher's empowerment in organizational change strategy are the important factors influencing the implementation of teacher evaluation for professional development. "Construction of shared vision" and "enhancement of teacher's empowerment" are the two items with the highest factor loading in the organizational change strategy, while "inspiration of change and innovation" has the lowest factor loading.

Suggestions

1. Teacher's "awareness concerns" has the lowest factor loading, indicating that teachers rarely concern for or participate in teacher evaluation for professional development. Therefore, only the elimination of misgiving and discomfort in teachers' heart, selection of proper contents, criteria and methods of teacher evaluation for professional development can reduce teacher's psychological obstacle of participating in evaluation so as to improve the

 Copyright © International Science and Technology Conference (ISTEC)

effectiveness of teacher evaluation for professional development, which is also the urgent task of the government. Therefore, schools should assist in the teacher's professional development and provide various rewards to improve the effectiveness of teacher evaluation for professional development.

The understanding of relevant teacher's personal factors can help to increase the willingness to participate in evaluation or reduce the obstacle of participating in evaluation.

2. The subjects for this research are only restricted to teachers in public elementary schools, and the subjects will be expanded to teachers in public middle schools and even in private elementary and secondary schools in the follow-up research; after the cross validation is carried out for the research scale, the modeling stability for this research is further verified, and then whether the difference in teacher's factors in elementary and secondary schools with different levels will generate significant change in implementation effectiveness of evaluation is discussed.

3. This research is conducted in terms of teacher's personal factors and organizational change strategy; it is suggested to discuss the influence of organizational change background and other factors on implementation effectiveness of teacher evaluation for professional development in the follow-up research, so as to make the structural modeling more complete to give play to the best effectiveness of teacher evaluation for professional development.

Abstract: Biodegradable materials such as AZ91 magnesium alloy arouse most of the researchers' interest in recent years. AZ91 Magnesium alloy is a potential alloy in order to use in biomaterial applications as it is both light and similar to the mechanical features of bone. However, this alloy shows corrosive behavior (in biological environment) in human body. Extensive studies have been conducted to use of AZ91 Mg alloy as a biodegradable material. This study focuses on the use of AZ91 Mg alloy as a permanent implant. As it is necessary to prevent the corrosion of such alloy in the body, its surface was coated by sol-gel method with hydroxyapatite material which has sufficient strength and tissue compatibility. The effects of process parameters, i.e. different dipping numbers of sol-gel coating at the coating stage and different sintering temperatures of these coatings, on coating quality was analyzed with Scanning Electron Microscopy (SEM) and x-ray diffractometer (XRD).

Keywords: AZ91 magnesium alloy, hydroxyapatite, Sol-gel coating method

Introduction

AZ91 Magnesium alloy is a potential alloy in order to use in biomedical applications as it is both lightweight and similar to the mechanical features of human bone particularly it shows similar Young's modulus to bone. Lightness is extremely important in biomedical applications because stainless steel and many of the similar metallic alloys can lead to infection by causing harm to tissues around the implant when it is used in the body (Wang, M.J., et al., 2016; Surmeneva, M.A. & Surmenev, R.A. , 2015; Liu, G.Y. , et al., 2011; Liu, G.Y. , et al., 2011; Niu, B., et al., 2016). However, its biodegradable behavior in biological environment restricts its use (Surmeneva, M.A., et al., 2015; Niu, B., et al., 2016). Various studies have been conducted to reduce its degradation rate; process modification, alloying of the magnesium and surface coating techniques (Chen, X.-B. , et al., 2012; Hiromoto, S. & Tomozawa, M., 2011; Xu, L., et al., 2009) for instance electrophoretic deposition, electrochemical deposition, sol-gel and dip coating have been widely studied. Corrosion preventive coatings for AZ91 magnesium alloy is very important to develop its usage area (Hiromoto, S. & Yamamotoa, A., 2009).

Hydroxyapatite is a bioceramic material widely used in medicine and dentistry and a calcium phosphate-based material forming the inorganic structure of bone tissue (Kannan, M. B., 2015). HAp has almost the same chemical composition and structure as human bone (Rojaee, R., et al., 2014). Because of its biocompatibility, it is used in the construction of various prosthesis, repairing of cracks and broken bones and coating of metallic biomaterials as an artificial bone (Hiromoto, S. & Tomozawa, M., 2011).

In this study, AZ91 Mg alloy was produced with hot press sintering method and coated with hydroxyapatite using combination of sol-gel and dip coating method. The effects of sintering temperature and dipping number on the quality of surface coating was investigated. Surface morphology and phase structure evaluation of the coatings were analyzed with SEM and XRD, respectively.

Materials and Methods

Sample Preparation

AZ91 magnesium alloy powders were sintered at a pressure of 275 MPa at 325 ºC for a period of 1 h with unidirectional hot pressing. Produced AZ91 Mg alloy was cut in to 60×10×8 mm pieces. The specimens were mechanically ground with SiC papers and finished with 1200 grit, then polished with 6 and 3 µ diamond suspension. Cleaning process was followed by dipping the specimens in acetone and ethanol in ultrasonic bath for 10 and 20 minutes, respectively.

 Copyright © International Science and Technology Conference (ISTEC)

Calcium nitrate tetra hydrate ($Ca(NO_3)_2.4H_2O$) and phosphorous pentoxide (P_2O_5) were selected as Ca and P precursors and dissolved separately in ethanol. Ca precursor was added drop wise to P precursor and then stirred at ambient temperature for 5 hours.

The specimens were dipped the number of 1, 3, and 5 vertically into the prepared solution and pulled off at the speed of 6 mm/min by an electrical dip coater. The dip coated specimens were maintained at room temperature for 24 hours to complete the aging process. Then, they were dried at 60 ºC for 24 hours and sintered to 300 ºC, 400 ºC, and 500 ºC for 6 hours (heating rate: 5 º/min.). The codes of the specimens are given in **Table 1**.

Table 1: Code-designated specimens.

Number of dipping → / **Sintering temperature ↓**	**1 dip**	**3 dip**	**5 dip**
300 ºC	1-300	3-300	5-300
400 ºC	1-400	3-400	5-400
500 ºC	1-500	3-500	5-500

Characterization

The surface and the cross-section morphologies of the specimens were obtained by a scanning electron microscope (SEM). The phases of the coatings sintered at different temperatures and different number of dipping were determined by X-ray diffraction (XRD) technique with a CuKα wavelength of 1.5418 (Å). The settings of diffractometer were adjusted to 40 kV and 30 mA at a 2Θ range of 20-70 º employing a step size of 0.02 º/s.

Results and Discussion

The surface of morphologies of the specimens prepared under different sintering temperatures and dipping numbers are shown in **Fig. 1**. It is obviously seen that coatings fully cover the substrate but there are a lot of cracks on the surface. Crack formation could be resulted from the stresses when volatile constituents escape from the material surface at the sintering stage. And the amount of the cracks and crack area portion decrease with increasing dip number.

The cross-section micrographs of the specimens are shown in **Fig. 2**, which reveals coating thickness of about 3 µm. The coating thickness of the specimens increase with increasing dip number and decrease with increasing sintering temperature.

The distribution of elements in the coatings is given by the EDS analysis in **Table 2**, which indicates the presence of O, Mg, Al, P and Ca. According to the EDS results coating layer consists substrate major element and at the same time the substrate consists the coating elements, too. So, although there are a lot of cracks on the surfaces, the coating layer and substrate are integrated each other.

Fig. 3, Fig. 4, and Fig. 5 shows the XRD patterns of the coatings sintered at stable temperature with 1, 3 and 5 dip numbers and pure AZ91 Mg alloy; **Fig. 6, Fig. 7, and Fig. 8** shows the XRD patterns of the coatings sintered at 300, 400, and 500 ºC with stable dip number and pure AZ91 Mg alloy. α, β, and γ represent Mg, $Mg_{17}Al_{12}$, and hydroxyapatite phases, respectively. Phases were determined according to the literature (Hou, et al., 2015; Razavi, et al., 2014; Kabirian & Mahmudi, 2009; Lee, et al., 2013). AZ91 Mg alloy used in present study was composed of Mg phase together with some $Mg_{17}Al_{12}$ phase as stated in the literature. Coating and substrate peaks cannot be distinguished from each other. This may be due to the average up to 3 micrometers thin film coating layer. As the number of dip and sintering temperature increased, the new γ peaks are formed and the intensity of AZ91 peaks are decreased.

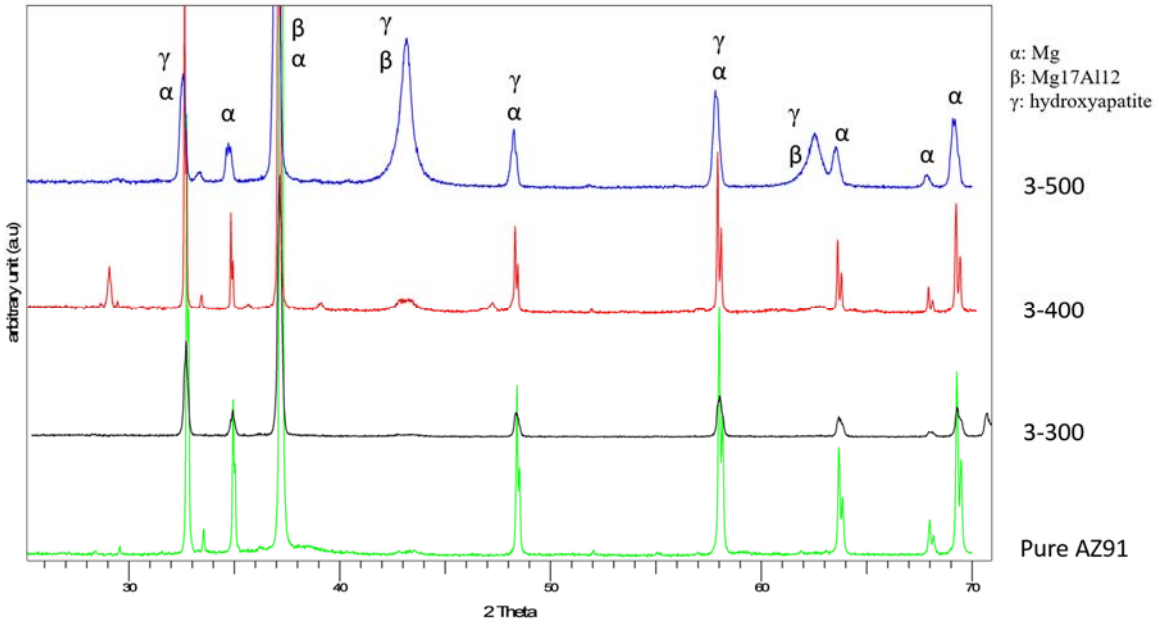

Figure 8. XRD patterns of the coatings sintered at 300, 400, and 500 ºC with 5 dip number and pure AZ91 Mg alloy.

Conclusion

AZ91 alloy was produced with hot press sintering method in this study. Produced specimens were coated with hydroxyapatite using combination of sol-gel and dip coating method. The effects of process parameters on coating quality was evaluated with SEM and x-ray diffractometer (XRD). Coating layer thickness is increased with the increasing number of dip. Furthermore, with increasing sintering temperatures, the cracks on the surface of coatings are increased.

INFLUENCING FACTORS ON THE COGNITION OF FEMALE SENIORS LIVING IN FISHING VILLAGES

Mi-Yang Jeon
myjeon68@gnu.ac.kr

Yeong-Mi Seo
asfirst@gntech.ac.kr

This study was performed in order to provide the basic materials for developing a cognition improvement program for female seniors living in fishing villages. This study examined 45 seniors living in Nun in Gyeongsangnam-do, Republic of Korea. Data on the 45 seniors were collected from March 2 to 6, 2015 and the SPSS was employed herein for data analysis. The cognitive(K-MMSE) of the study participants was 19.02±3.10 points and Depression was 7.71±2.23 points. Concerning blood vessel conditions, Blood Vessel Tension (BVT) was -25.00±13.29; Blood Vessel Output Power (BVOP), 64.36±15.54; Remaining Blood Volume (RBV), –47.04±13.68; and Blood Vessel Aging Level (BVAL), 3.25±1.20. Their body mass index (BMI) was 23.09±3.08㎏/m2. Cognition, age (r=-.624), Systolic blood pressure (r=-.402), blood vessel aging level (r =-.401), and body mass index (r =.478) were found to have statistically significant correlation. Based on the study findings, a multi-dimensional program is proposed which helps improve the blood vessel health, reduce obesity and ease depression in order to improve the cognition of female seniors living in fishing village.

INTERNET OF THINGS AND THE END OF OFFSHORING

Isaac Minian
minian.economia@gmail.com

Ángel Martínez Monroy
martinez_monroy@yahoo.com.mx

As production becomes more capital-intensive with the investment in new technologies a threat for industrialization in emerging countries may surge. Low labour cost advantages will shrink. The robots and other technologies, whose prices are declining, can carry out many production tasks cheaper than human labour with economies of scope and scale, greater productivity.

However, new technologies are more present in capital-intensive industries (automobiles, electronics) than in labour- intensive ones (garment, footwear, leather, and assembly activities). In the latter, robots are not yet able to solve technical problems concerning the accurate transformation of intermediate materials. New technologies are not sufficiently flexible or cost-effective to allow very short cycles of production (quick changes in fashion). In labour-intensive industries the flexibility of labour is higher than one of robots.

Conclusion: unless a breakthrough in technologies generates very readjustable capital goods for assembly processes, the conditions for offshoring will subsist.

INTERNET RESEARCH METHODOLOGIES

Cem Sefa Sütcü
cemsutcu@yahoo.com

Traditional researches mainly involve seminal methodologies of research design and data gathering methods. It requires some physical efforts to design research and gather data. The analyses on data can then be conducted using statistical software systems. After determining research goals and hypotheses, it takes time to define resrach type, choose sample data, and collect data from that sample. After collecting, it is important to clean the data, code them and apply analysis techniques on them to reach out findings. There are time gaps among each step of research. This takes very long a reseach to complete. In Communication, whes a crisis occur, such a long time creates a heavy burden on decision makers on doing the right thing.

Especially in the Internet era, you need to be proactive to problems that may appear. Internet is new media for communicating among individuals. This media has two distinct features: First, it allows fast communication. And the second, it allows wide communication. We can call it time amd space squeeze.

As speed and wideness allows so many individuals to communicate and share their views and things, they like or dislike and express their opinions about so many different things. The results of these efforts is that there are enormous amount of data piling up very second on the Internet, especially on the social media. Many people call those data as "big data".

Internet data or big data have different features than traditionally collected data and need to be handled with different methodologies than the traditional research methodologies. The notion of "meta data" is important in this respect. On the Internet, this type of data can be found in forms of text, sound and image, which we call multimedia.

In this paper, Internet research methodologies are examined and classified according to needs of fast, wide and big data of today's communication environment.

Keywords: Internet research, big data, meta data

INVESTIGATION OF 2-ACETYLPYRIDINE IN A LOW TEMPERATURE NITROGEN MATRIX

Nihal Kuş
nkus@anadolu.edu.tr
Department of Physics, Anadolu University, 26470 Eskişehir, Turkey and Department of Chemistry, University of Coimbra, P3004-535 Coimbra, Portugal

Studies on matrix isolated chemical entities in solidified inert gases (e.g., noble gases, N_2) at temperature close to the absolute zero were pioneered by George Pimentel and his co-workers, as early as in 1954. It is nowadays a well-established technique that still continues to expand its domains of application. One of the most relevant characteristics of the matrix isolation method is that it allows to study with stationary spectroscopic techniques molecules which under other experimental conditions have very short lifetimes. In fact, the chemical inertia of the matrix, together with the used low temperatures, rigid environment and low concentration, allows to preserve almost indefinitely unstable molecules allowing theiur examitation by techniques that do not require time-resolution.
In this study, 2-acetylpyridine (2AP) was isolated in a cryogenic N_2 matrix from the room temperature 2AP gas phase. Only the most stable *cis* conformer was experimentally observed in the matrix by infrared (IR) spectroscopy. Besides the IR spectrum of 2AP isolated in N_2, the IR spectra of the low temperature amorphous and crystalline neat solid states of the compound were also recorded, and correlations between the spectroscopic data and the strength and nature of the dominant intermolecular interactions in 2AP neat condensed phases were evaluated. The analysis of the experimental vibrational data was supported by theoretical calculation of harmonic and anharmonic frequencies and IR intensities obtained at the DFT/B3LYP/6-311++G(d,p) level of theory.

INVESTIGATION OF CARBON PREPREG DISC SPRINGS AT DIFFERENT ANGLES OF ORIENTATION

Haşim Fırat Karasu
firat.karasu@deu.edu.tr

Melih Belevi
melih.belevi@deu.edu.tr

Global warming and the reduction in oil resources is one of the most serious problems of today's world. Therefore, some measures are taken to solve these problems in the machinery sector. Therefore vehicle bodies and some internal structural components made from composite materials, anymore use of composites is became widespread in machine elements. However, it is undesirable to have any disruption in the function of machine elements.

In this study, the aim is to manufacture a composite disc spring to approximate or better the characteristic curve of the steel disc spring constituenting a group of these machine elements. In this way, the weight of the design will be reduced without compromising the force/deformation ratio of disc spring. Firstly, the finite element analysis of the layers of the composite disc spring will be carried out at different cone heights, orientation angles and number of layers for carbon prepregs, and the disc spring will be manufactured and subjected to experiments using the determined methods.

The spring characteristics obtained by compression tests of steel and composite disc springs will be compared and evaluated accordingly.

Keywords: Disc spring, spring characteristic, carbon prepreg, tapering angle

Abstract: Ground motion effects on a concrete gravity (CG) dam in the earthquake zone should be taken into account for design conditions. Boyabat CG dam constructed in Sinop, Turkey, is selected as an application. This study presents two-dimensional earthquake response of Boyabat CG dam including friction between dam and foundation. The two-dimensional finite element model of Boyabat CG dam is obtained using ANSYS finite element software. The unfavorable section of the dam is selected for two-dimensional numerical analyses. The contact-target element pairs are used in the dam–foundation–reservoir interaction. In this case, friction contact is considered in the numerical solutions. Empty and full reservoir cases are also considered in these solutions. The hydrodynamic pressure of the reservoir water is modeled with two dimensional fluid finite elements based on the Lagrangian approach. In the earthquake analyses, the finite element model has fixed boundary conditions. According to linear dynamic analyses, maximum horizontal displacements and maximum principle stress components are presented by dam height in the largest section. These results are evaluated considering empty and full reservoir conditions.

Keywords: Concrete gravity dam, Contact-target elements, Dam-foundation-reservoir interaction, Lagrangian approach.

Introduction

Water has been one of the most important things in human life from first era to now. People always try to live in around water resources. Because water is necessary for the continuing of life, so people had to learn how water was stored and how water usage was done. In many area, water has vital importance for instance, consumption, irrigation, climate and power.

Dam is one of the most difficult structural construction in civil engineering field because dam has huge potential risk in active seismic zones especially. A gravity dam is a massive sized dam fabricated from concrete and designed to hold back large volumes of water (Cracking Dams, 2008). By using concrete, the weight of the dam is actually able to resist the horizontal thrust of water pushing against it. This is why it is called a gravity dam. Gravity essentially holds the dam down to the ground, stopping water from toppling it over. Gravity dams are well suited for blocking rivers in wide valleys or narrow gorge ways. Since gravity dams must rely on their own weight to hold back water, it is key that they are built on a solid foundation of bedrock. The one advantage of a gravity dam is its rather simple design, with most dams being a straight vertical wall across a valley or gorge way. However, gravity dams can also be designed curved, as in the Hoover dam. Gravity dams are very durable and still highly preferred over buttress dams and arch dams (About Dams, 2008). The one drawback is that gravity dams require a large amount of material and construction to build are therefore relatively expensive (Gravity Dams, 2008). Therefore, each project should be evaluated on its own. When the conditions allow consideration of a concrete gravity dam alternative, the following points can be a plus. The method or scheme of diverting flows around or through the dam site during construction is an important consideration to the economy of the dam. A concrete gravity dam offers major advantages and potential cost savings by providing the option of diversion through alternate construction blocks, and lowers risk and delay if overtopping should occur (USACE, 1995).

This study showed that linear behavior of the concrete gravity Boyabat dam under Kocaeli earthquake. The change of maximum principal stresses and horizontal displacements by dam height were investigated. Numerical analyses were performed for empty and full reservoir cases considering fixed boundary conditions. ANSYS software was used for dam modeling and all dynamic analysis. The contact-target element pairs are used in the dam–foundation–reservoir interaction. Besides, friction is considered in the numerical solutions. It is provided by no

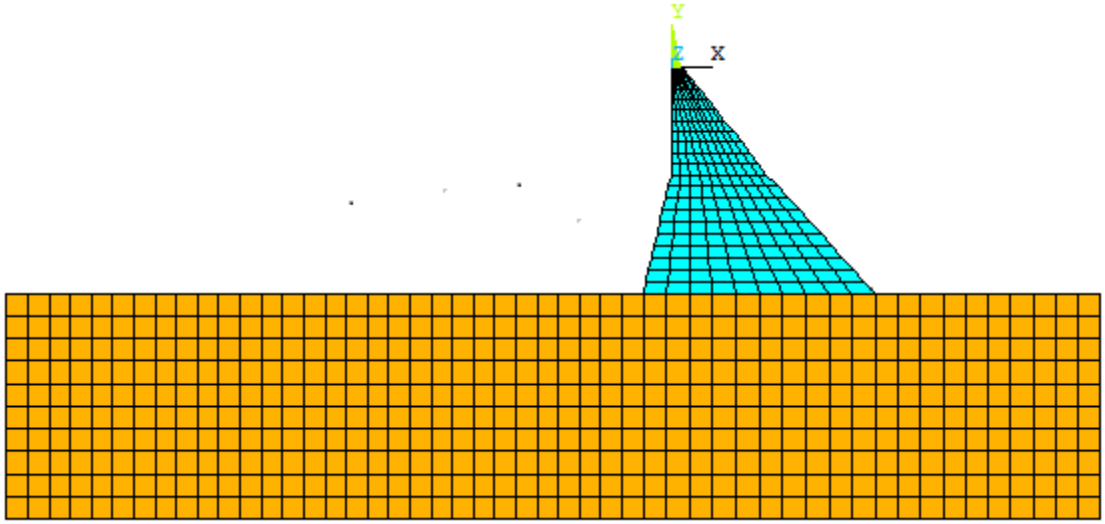
separation friction case.



Mathematical Model of Boyabat CG Dam

Boyabat dam, located approximately 10km south-east of Duragan county center, Sinop, was constructed in 2012 by General Directorate of State Hydraulic Works. It was established on Kızılırmak River. The reservoir is used for irrigation and energy purposes. The dam crest is 262 m in length and 8 m wide. The maximum height of the dam from base to top crest point is 195 m, respectively. The annual total power generation capacity is 1.500×10^6 kWh/year.

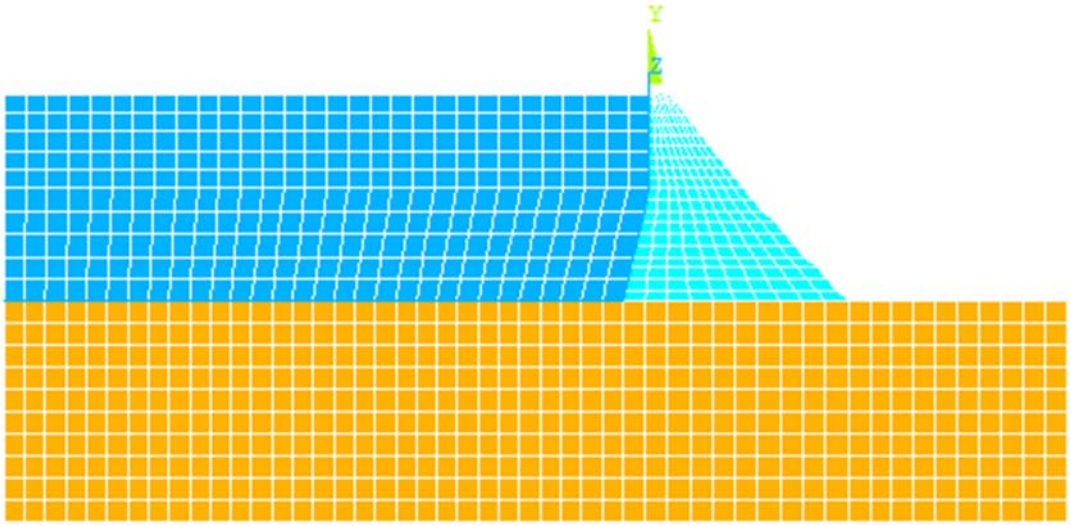


Figure 1. Boyabat Dam.

Boyabat concrete gravity dam was modeled in ANSYS software. Finite element model of concrete gravity dam was divided to convenient finite element sizes. Finite element mesh was carried out approximately resemble measurements for dam model. Finite element model of the dam was given in given Fig. 2.

a) Empty reservoir condition

b) Full reservoir condition

Figure 2. Finite element model of Boyabat Dam

Firstly, contact-target elements were identified between dam body and foundation. Dam model includes two cases. One of these situations is empty reservoir conditions and second one is full reservoir conditions. Linear dynamic analysis was done for the both situations.

Material Properties

The material properties of dam-foundation-reservoir interaction model used in linear analyses given in Table 1.

Table 1: Material properties of Boyabat dam

	Elastic modulus (kN/m^2)	Poisson ratio (υ)	Density (γ) (kN/m^3)
concrete	2.8×10^7	0.2	2.3955
foundation	$10.5E^6$	0.17	2.73293
water	$2.07E^6$	0	0.99918

Lagrangian Approach for Dam -Reservoir -Foundation Interaction

The formulation of the fluid system based on the Lagrangian approach is presented as following (Wilson and Khalvati, 1983). In this approach, fluid is assumed to be linearly compressible, inviscid and irrotational. For a general two-dimensional fluid, pressure-volumetric strain relationships can be written in matrix form as follows,

$$\begin{Bmatrix} P \\ P_z \end{Bmatrix} = \begin{bmatrix} C_{11} & 0 \\ 0 & C_{22} \end{bmatrix} \begin{Bmatrix} \varepsilon_v \\ w_z \end{Bmatrix}$$

where P, C_{11}, and ε_v are the pressures which are equal to mean stresses, the bulk modulus and the volumetric strains of the fluid, respectively. Since irrotationality of the fluid is considered like penalty methods (Zienkiewicz and Taylor, 1989) rotations and constraint parameters are included in the pressure-volumetric strain equation (Eq. (1)) of the fluid. In this equation P_z, is the rotational stress; C_{22} is the constraint parameter and w_z is the rotation about the Cartesian axis y and z.

In this study, the equations of motion of the fluid system are obtained using energy principles. Using the finite element approximation, the total strain energy of the fluid system may be written as,

$$\pi_e = \frac{1}{2}\mathbf{U}_f{}^T\mathbf{K}_f\mathbf{U}_f \qquad (2)$$

 Copyright © International Science and Technology Conference (ISTEC)

where U_f and K_f are the nodal displacement vector and the stiffness matrix of the fluid system, respectively. K_f is obtained by the sum of the stiffness matrices of the fluid elements as follows,

$$\left.\begin{aligned}\mathbf{K}_f &= \Sigma \mathbf{K}_f^e \\ \mathbf{K}_f^e &= \int_V \mathbf{B}_f^{eT} \mathbf{C}_f \mathbf{B}_f^e dV^e\end{aligned}\right\} \quad (3)$$

where C_f is the elasticity matrix consisting of diagonal terms in Eq. (1) is the strain-displacement matrix of the fluid element.

An important behaviour of fluid systems is the ability to displace without a change in volume. For reservoir and storage tanks, this movement is known as sloshing waves in which the displacement is in the vertical direction. The increase in the potential energy of the system because of the free surface motion can be written as,

$$\pi_s = \frac{1}{2} \mathbf{U}_{sf}^T \mathbf{S}_f \mathbf{U}_{sf} \quad (4)$$

where U_{sf} and S_f are the vertical nodal displacement vector and the stiffness matrix of the free surface of the fluid system, respectively. S_f is obtained by the sum of the stiffness matrices of the free surface fluid elements as follows,

$$\left.\begin{aligned}\mathbf{S}_f &= \Sigma \mathbf{S}_f^e \\ \mathbf{S}_f^e &= \rho_f g \int_A \mathbf{h}_s^T \mathbf{h}_s dA^e\end{aligned}\right\} \quad (5)$$

where h_s is the vector consisting of interpolation functions of the free surface fluid element. ρ_f and g are the mass density of the fluid and the acceleration due to gravity, respectively. Besides, kinetic energy of the system can be written as,

$$T = \frac{1}{2} \dot{\mathbf{U}}_f^T \mathbf{M}_f \dot{\mathbf{U}}_f \quad (6)$$

where $\dot{\mathbf{U}}$ and M_f are the nodal velocity vector and the mass matrix of the fluid system, respectively. M_f is also obtained by the sum of the mass matrices of the fluid elements as follows,

$$\left.\begin{aligned}\mathbf{M}_f &= \Sigma \mathbf{M}_f^e \\ \mathbf{M}_f^e &= \rho_f \int_V \mathbf{H}^T \mathbf{H} dV^e\end{aligned}\right\} \quad (7)$$

where H is the matrix consisting of interpolation functions of the fluid element. If (Eq. (2), (4) and (6)) are combined using the Lagrange's equation (Clough and Penzien, 1993) ; the following set of equations is obtained,

$$\mathbf{M}_f \ddot{\mathbf{U}}_f + \mathbf{K}_f^* \mathbf{U}_f = \mathbf{R}_f \quad (8)$$

where $\dot{\mathbf{U}}_f$, $\dot{\mathbf{U}}_f$, $\mathbf{U}_f$ and $\mathbf{R}_f$ are the system stiffness matrix including the free surface stiffness, the nodal acceleration and displacement vectors and time-varying nodal force vector for the fluid system, respectively. In the formation of the fluid element matrices, reduced integration orders are used.

The equations of motion of the fluid system, (Eq. (8)), have a similar form with those of the structure system. To obtain the coupled equations of the fluid-structure system, the determination of the interface condition is required. Since the fluid is assumed to be inviscid, only the displacement in the normal direction to the interface is continuous at the interface of the system. Assuming that the structure has the positive face and the fluid has the negative face, the boundary condition at the fluid-structure interface is,

 Copyright © International Science and Technology Conference (ISTEC)

$$U_n^- = U_n^+ \tag{9}$$

where U_n is the normal component of the interface displacement. Using the interface condition, the equation of motion of the coupled system to ground motion including damping effects are given by,

$$\mathbf{M}_c\ddot{\mathbf{U}}_c + \mathbf{C}_c\dot{\mathbf{U}}_c + \mathbf{K}_c\mathbf{U}_c = \mathbf{R}_c \tag{10}$$

in which $\mathbf{M}_c$, $\mathbf{C}_c$, and $\mathbf{K}_c$ are the mass, damping and stiffness matrices for the coupled system, respectively. $\ddot{\mathbf{U}}_c$, $\dot{\mathbf{U}}_c$, $\mathbf{U}_c$ and $\mathbf{R}_c$ are the vectors of the displacements, velocities, accelerations and external loads of the coupled system, respectively (Kartal, 2012).

Kocaeli Earthquake

In this study, 1999 Kocaeli earthquake records were used in all linear dynamic analysis. The earthquake duration is 27.185 seconds. The earthquake accelerogram was given in Fig .4.

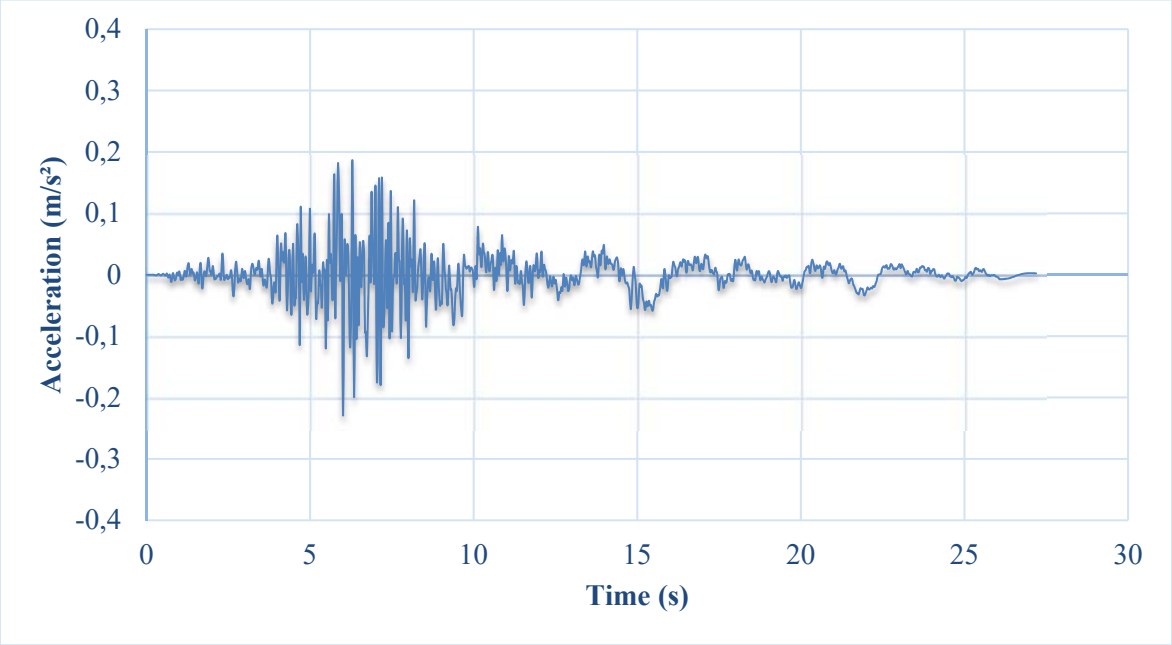

Figure 3. 1999 Kocaeli Earthquake records

Results

The displacements of upstream site of dam were calculated for empty and full reservoir cases. It is clearly seen that full reservoir case has higher displacements than empty reservoir case in linear dynamic analysis due to hydrodynamic pressure. The maximum displacement in full reservoir case is 3.2 cm and the maximum displacement in empty reservoir case is 2.7 cm for the dam. The change of displacements by dam height is given in Fig. 4 and 5.

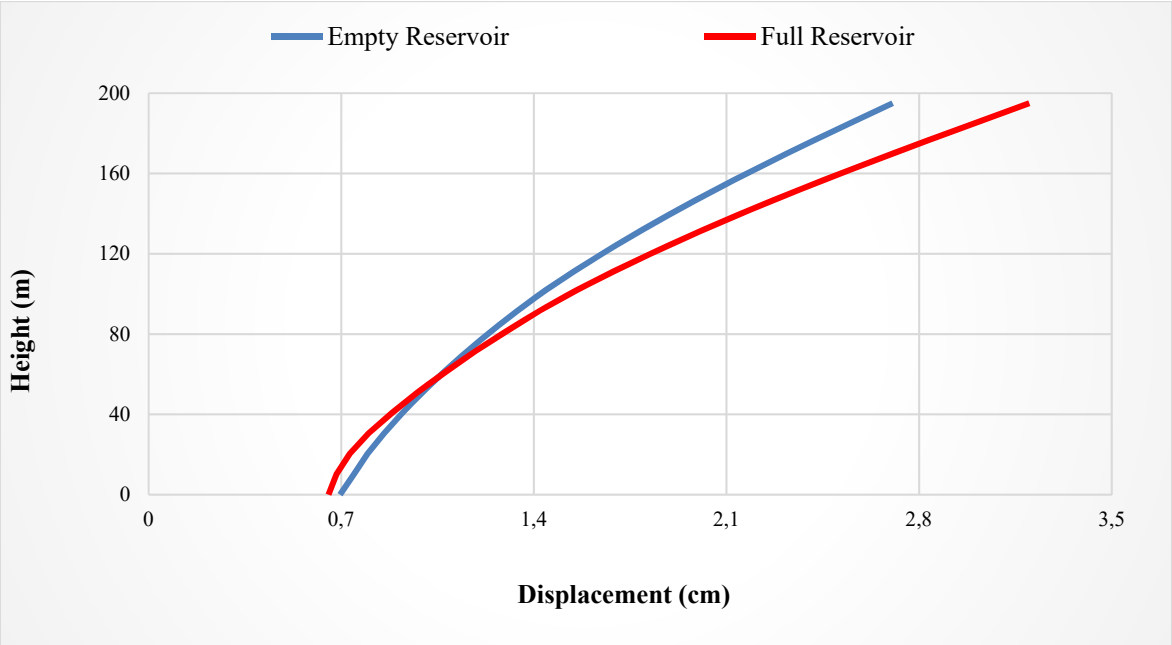

Figure 4. Maximum displacements changing

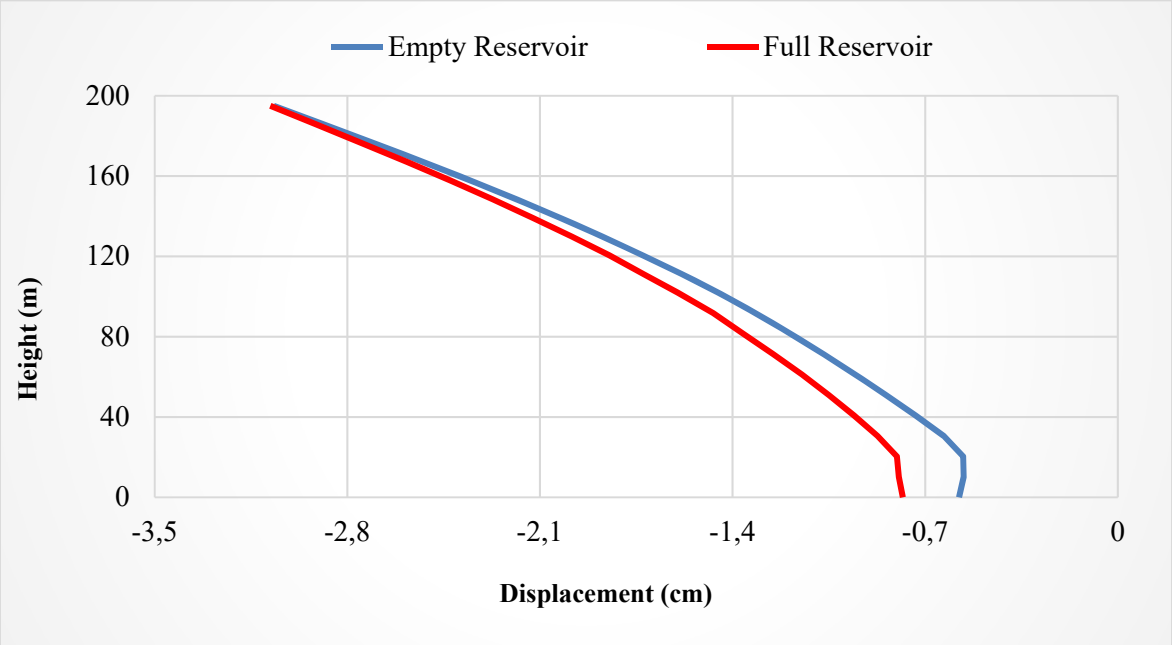

Figure 5. Minimum displacements changing

We investigated the principal stress changing by dam height under Kocaeli earthquake for linear dynamic analysis. It was expected that full reservoir case had higher principal stresses than empty reservoir case because of hydrodynamic pressure effect. According to linear dynamic analysis, it was observed that full reservoir case has higher principle stresses. The maximum principal stress is 2206.96 kN/m² in empty reservoir condition and 2904.08 kN/m² in full reservoir condition for the dam. Besides, the maximum compressive stress is 2622.44 kN/m² in empty reservoir condition and 2324.98 kN/m² in full reservoir condition for the dam. The change of maximum principal stresses and compressive stresses by dam height are given in Fig. 6 and 7.

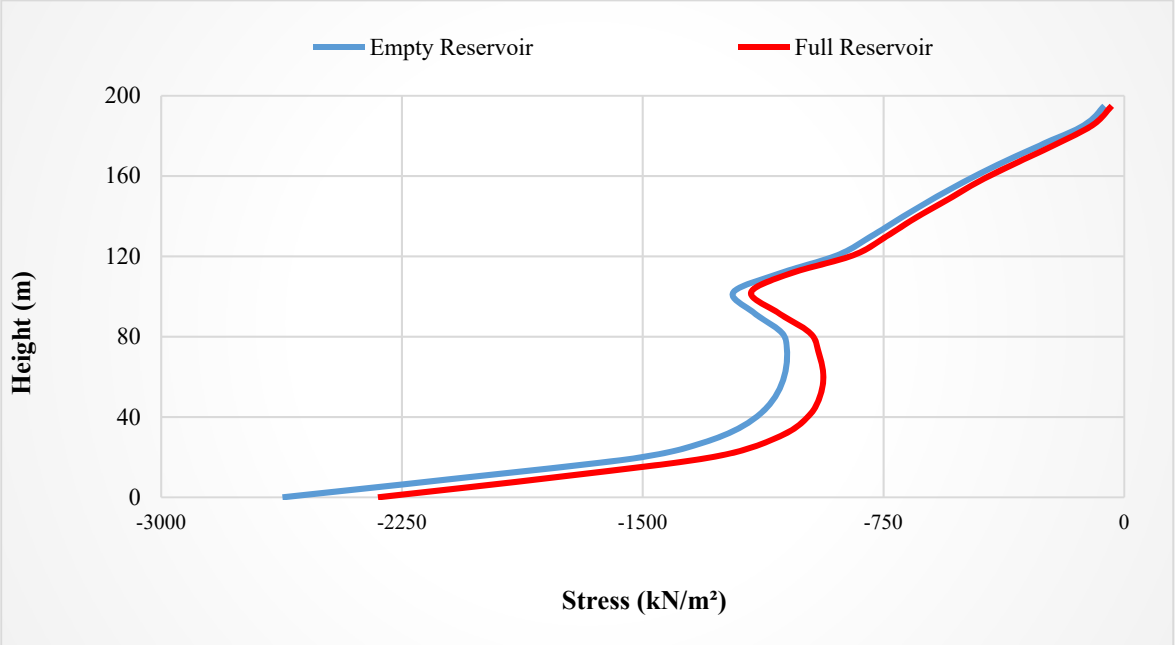

Figure 7. Maximum compressive stresses changing

Conclusion

Boyabat CG Dam geometry and the unfavorable section of the dam was examined using finite element model. Boyabat dam was modeled as two-dimensional and the material and foundation soil mechanical properties were obtained from the experimental data of the dam. After that these materials were identified to dam model by ANSYS software. Fixed boundary conditions were defined around dam and foundation. Finally, 1999 Kocaeli earthquake was selected for this application due to similar earthquake seismic zones.

In this study, we investigated the effect of strong ground motion on stresses and displacements. In addition to this, it was examined that friction, which was identified between dam body-foundation soil, effect on stress for empty and full reservoir conditions. It is clearly seen that full reservoir model has larger tensile-compressive stresses and displacements than empty reservoir model.
