INVESTIGATION OF CORROSION BEHAVIOR OF HOISTING ROPES

Haşim Fırat KARASU, Mine DEMİRSOY

Dokuz Eylül Üniversitesi Makina Mühendisliği Bölümü, Tınaztepe Kampüsü 35397 Buca / İzmir

firat.karasu@deu.edu.tr

ABSTRACT

Hoisting ropes often used in port cranes that exposed to high humidity and sea salt. If the effect of corrosion on the rope in this environment neglects, it arises a serious risk factor for these elements in high load carrying capacity. To prevent this, primarily it is necessary to observe the effects on the rope caused by the corrosion.

In this study, the aim is to investigate the behavior after exposure to corrosion of different types of hoisting ropes. For this, hempen and steel core 6x19 Standard, 8x19 Seale and 6x36 Warrington Seale group ropes are examined. The ropes are applied rapid aging test in aging test chamber for one month according to ASTM B117 standard. The aging test is made with 24 hours cycle and 30 days period process. Afterwards, tensile tests are applied to the ropes and observed changes in mechanical properties.

As a result, it is examined that the corrosion effect on hoisting ropes and given solution proposals and information about studies that can be done in the future with this study.

Triazoles constitute an important class of heterocyclic organic compounds because of their wide range of applications as pharmaceutical agents. Theyhave common mode of action like inhibiting ergosterol synthesis, decreasing adhesion potential of pathogen cells to host tissues and morphogenetic transformation of yeasts to mycelial form. Fungicidal properties of azole agents have been known for many years, however, the investigation of inhibitiory effects of these molecules on various enzymes have increased in recent years. As being the most important group of industrial enzymes, proteases has received significant interest in the food, pharmaceutical and detergent industries.

In this study, the inhibition effect of three triazole derivatives on serine (chymotrypsin and trypsin) and cysteine (papain) proteases were examined and IC50 values were determined. Also, the inhibition type for trypsin was established for each molecule separately

INVESTIGATION OF SINGLE AND MULTI-LAYER NONWOVENS THERMAL INSULATION AND AIR PERMEABILITY BEHAVIORS

Seyda EYUPOGLU*, Nigar MERDAN, Habip DAYIOGLU, Mehmet KILINC

Istanbul Commerce University, Department of Fashion and Textile Design, Istanbul-Turkey

scanbolat@ticaret.edu.tr

Abstract: Textile materials have potential importance for an alternative use on thermal insulation as their porous and fibrous structure. In this study, thermal insulation and air permeability of multi-layer nonwovens with 120, 180 and 500 g/m^2 forming single and double layer were investigated. Moreover, thermal insulation and air permeability of triple-layer and four-layer nonwovens with the weight of 180 g/m^2 were analyzed. It was found that the single layer nonwovens give better thermal insulation properties than the multi-layer nonwovens. Furthermore, the increase of weight of nonwovens causes to increase in thermal conductivity coefficients. According to the air permeability measurements, the results show that the air permeability of samples decreases with the increase of weight of samples and number of layer.

Keywords: Nonwoven, Multi-layer, Thermal Conductivity, Air Permeability.

Introduction

It is very important to have thermal insulation on daily and special habitats. The thermal insulation defined as absorbing (not reflecting) the thermal energy within the material. The textile materials being fibrous and porous have potential applications where thermal insulation is necessary.

The properties of insulation and absorption of the nonwovens differ by fiber geometry and fiber regularity within the texture. It is rather difficult to identify the microstructure of the nonwovens for their complex texture. Nonwoven structure contains not only fiber as well as air gaps. Different fiber composition within the nonwovens leads to change the total surface area (Seddeg, 2009). The sound absorption properties of the textiles having porous structure (Tascan and Vaughn, 2008; Tascan and Vaughn, 2008; Shoshani and Yakubov, 2000), different fiber blends (Nick et al. 2002; Seddeq et al., 2013), stratified composition (Lin et al., 2011; Kucuk and Korkmaz, 2015), standard and hollow polyester with different weight (Abdelfattah et al., 2011). Furthermore, the effect of the acoustic characteristic of nonwovens containing polyester, viscose, glass fiber and basalt fibers on the material thickness, weight, air permeability and porosity have been studied (Yang et al., 2001). There are also more studies on the effect acoustic properties of jute, polypropylene and polyester containing nonwovens on the bases of weight, fabric type, fiber density, number of ply, the distance between the origin of sound and material, and also fiber types (Sengupta 2010).

The energy sources are running out rapidly. This situation, leads activities on especially in developed and other countries to take control of their energy needs, and lead them to search for new energy sources. The major part of the energy saving is natural thermal energy.

Nowadays it became common to use thermal insulation materials on habitants in order to reduce the energy consumption. There are a number of researches on thermal insulation behavior of waste woven fabrics (Briga-Sa et al., 2013), waste wool and regenerated polyester fibers (Patnaik et al., 2015), nonwovens (Woo et al., 1994), stratified nonwovens (Mohammadi et al., 2003), the effect of fiber diameter and porosity dimensions (Zhu and Li, 2003), nonwovens produced by pinning methods (Saleh, 2011), glass, wool, rook wool and mineral wool (Abdou and Budaiwi, 2013).

In order to use polyester nonwovens is a various applications the behavior of air permeability behavior of the weightand pinning density of the polyester viscose blend nonwovens (Zu et al., 2015; Cincik and Koc, 2012), theoretical and experimental as well as artificial neural networks of multi-ply nonwovens (Mohammadi et al., 2002; Debnath et al., 2000), the relations, the pore size effect (Epps and Leonas, 2000), the effect of thermal insulation (Debnath and Madhusoothanan, 2010), and also the relations between air permeability and sound absorption was studied (Thilagavathi et al., 2010).

In this study, the thermal insulation and air permeability properties of nonwoven fabrics with different weight were investigated. The purpose for chosen nonwovens is for being lightweight materials, making them preferable on thermal insulation. In this context, thermal insulation and air permeability of multi-layer nonwovens with 120, 180 and 500 g/m^2 forming single and double layer were investigated. Moreover, thermal insulation and air permeability of triple-layer and four-layer nonwovens with the weight of 180 g/m^2 were analyzed. The thermal

 Copyright © International Science and Technology Conference (ISTEC)

insulation and air permeability properties of samples increase with the decrease of weight and layer numbers of samples.

Materials and Methods

Fabric

Polyester nonwovens with 45 µm fiber diameter of 120, 180 and 500 g/m^2 were used.

Preparation of Multi-Ply Nonwovens

From the polyester nonwovens having 120 and 500 g/m^2 weight of the prepared samples of single and double layer, and 180 g/m^2 polyester nonwovens single, double, triple and fourfold samples were prepared.

Measurements of the Thermal Conductivity Coefficient

Thermal conductivity coefficients of the samples were evaluated in accordance with TS 4512 Standard (TS EN ISO 10534-2) via using P.A.HILTON LTD.H940 instrument. In order to measure thermal conductivity coefficients of the samples prepared, the samples with the diameter of 25 mm was primarily experimented. The heat value (Q) in watt was determined from the digital screen of the instrument. The measurements of the thickness and area of the tested fabrics as well as heat difference between them were replaced in the following equation (Kılıc and Yigit, 2008).

$$Q = -k.A.\frac{dT}{dx}$$

In this equation, Q is the heat flow (W), A is the surface field (m^2), x is the thickness of sample (m), ΔT is the temperature difference (K) and k is thermal conductivity coefficient (W/m K). The measurements of thermal conductivity coefficient were iterated three times.

Measurements of the Air Permeability

The measurements was carried out by using 20 cm^2 circular fabric with 100 Pa pressure difference for 1 second and the results was expressed in mm/s by taken the average of five different measurement. The test was performed according to TS 391 EN ISO 923 (TS 391 EN ISO 9237) test method.

Results and Discussion

Results of Thermal Conductivity Coefficient Measurements

The thermal conductivity coefficient results of the samples with different weights and number of layers are given on Figure 1.

 Copyright © International Science and Technology Conference (ISTEC)

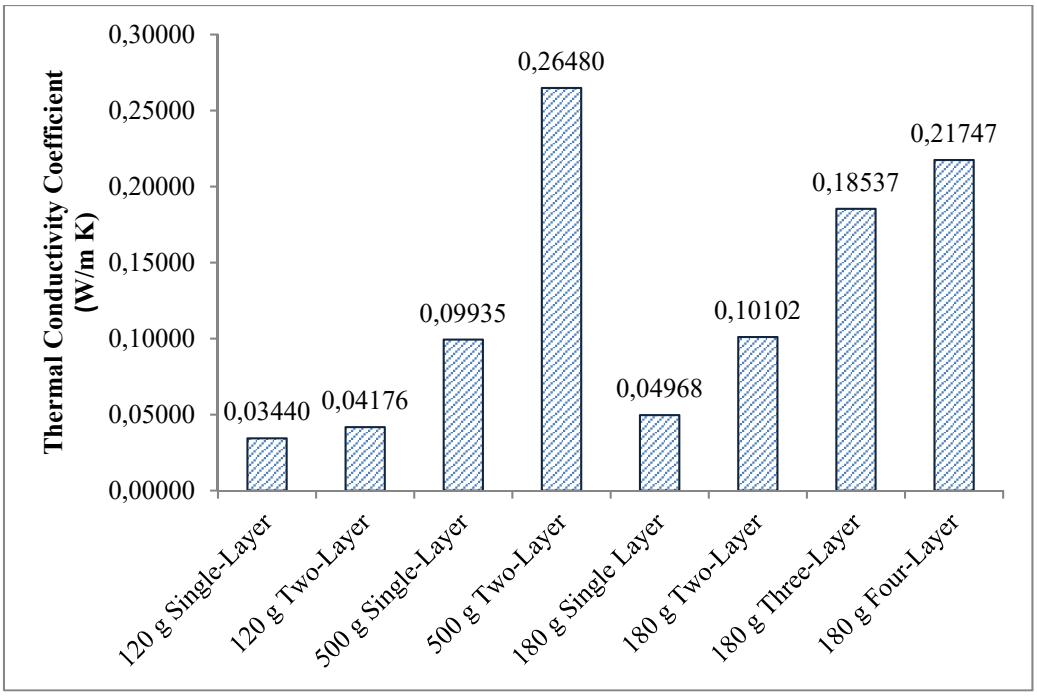

Figure 1. Thermal conductivity coefficient of samples.

Figure 1 shows that, the increased nonwoven weight increases the thermal conductivity coefficient, as a result of increased weight leads to increasing the thickness of the materials. According to the Fourier Law, the increased sample thickness and number of layers causes increasing the thermal conductivity coefficient.
The increased number of layers causes increased thickness, and as a result of this leads to increases the thermal conductivity coefficient. These results were also correlated with the air permeability of the samples decreases by increasing the number of layers and weights.

Results of Air Permeability Measurements

The air permeability results of the samples with different weights and number of layers are given on Figure 2.

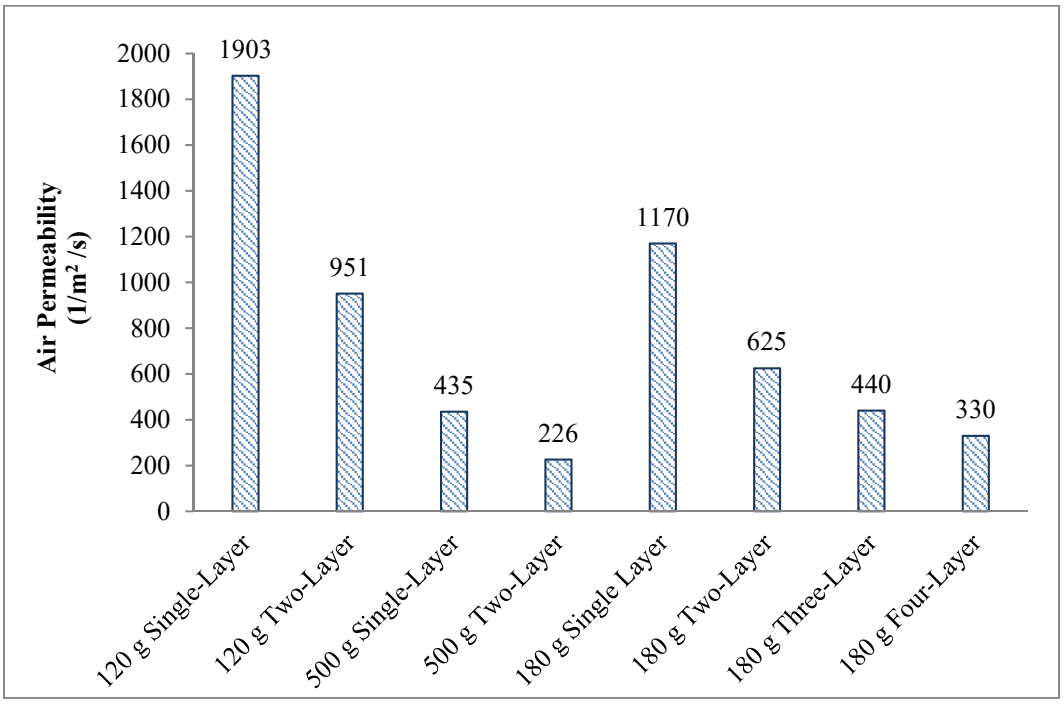

Figure 2. Air permeability measurements of samples.

 Copyright © International Science and Technology Conference (ISTEC)

The air permeability results show that, the increased sample weight decreases the air permeability. This can be explained by the weight increasing causing to density decrease. The density increase leads to decrease the air permeability. The increased number of layers of the samples causes decrease on air permeability. This can be explained by increased number of layers causing increase on the sample thickness. The increased sample thickness causes increased air flow distance during the test and this results decrease on air permeability. Besides, the increased number of layers leads density increase.

Conclusion

In this study, the thermal conductivity coefficient and air permeability of the nonwovens with different weight and number of layers was investigated. In this context, the thermal conductivity and air permeability coefficient of polyester nonwoven fabrics with 120, 180 and 500 g/m^2 weights and also their 2,3 and 4 layers samples was investigated. As a result, the increased weight and number of layers of the nonwovens leads to increase on thermal conductivity and decrease on air permeability. The prepared nonwovens found very suitable materials as having light, cheap, high air permeability and thermal insulation properties.

Abstract: In this study, sloshing behavior in a prismatic tank that is approximately the same volume with a vehicle' s fuel tank is investigated by Computational Fluid Dynamics (CFD) method. Tank is modeled with vertical baffle and without baffle. The tank is filled with water where the rate of 50%-70% and the dynamic behavior of the system examined for both cases. The tank is subjected harmonic motion at the lateral direction, the velocity change of fluid and the pressure at the tank wall are examined.

Keywords: Sloshing, tank baffle, fuel tank

Introduction

The fuel tank is called tank which stores the fuel used to provide the energy required for operation of the vehicle. These tanks can be produced in different sizes and different materials. At last years, it can be said that the investigation of the sloshing event in the fuel tank has gained importance in the automotive industry because of more detailed analysis of vibration and noise in the vehicle (Jadon et al. 2014, Kingsley 2005, Wiesche 2003, Chitkara et al. 2013, Kılıç 2015).

Free liquid surface is formed on the liquid surface of the tank partially filled with liquid fluid. The movement of the surface is defined as sloshing. Free liquid surface shows various types of motion according to the shape of the tank movement and geometry of the tank. These can be classified such as simple planar, non-planar, random shock, symmetric, asymmetric, quasi periodic and chaotic. The amplitude of the sloshing movement depends on the shape of the actuation, the depth of the liquid in the tank, the geometry of the tank and the fluid properties (İbrahim et al. 2001, İbrahim 2005, Akyıldız et al. 2006).

The movement of the fluid in the tank is interested in many engineering systems such as fuel tank, space vehicles and high water towers. Pressure forces at the tank generated as a result of sloshing motion can lead to strain and security problems in mechanical systems. Therefore, determination of distribution of the hydrodynamic pressure and forces and natural frequency of the free liquid surface during sloshing is important (İbrahim 2005, Akyıldız and Ünal 2006). When evaluated according to the tank acceleration, external signals, tank settlement and liquid level of the tank, these loads should not exceed a certain maximum value and should remain within safety limits.

The studies done in the automotive field are investigated widely and summarized below. Wiesche (2003) made investigations from theoretical studies and industrial applications to calculate numerically the sloshing behavior of the viscous liquid in the fuel tanks with different geometries. The Volume of Fluid method (VOF) was used to calculate the free surface flow and prismatic, spherical and non-symmetric fuel tanks were analyzed. Jadon et al. (2014) used a multi physics based numerical method to estimate the sound change from sloshing behavior. During the study, the sloshing model was created by using Computational Fluid Dynamics (CFD), Finite Element Method (FEM) and the Boundary Element Method (BEM). The vibration calculations were carried out under LS-DYNA program. Many parameters such as tank surface pressure, surface integral force, momentum, the average kinetic energy were investigated together with these systems. Chitkara et al. (2013) investigated the sloshing for partially filled tanks using VOF method and analyzed two different geometries using computational simulations considering 40% of fuel and 60% of air inside a 40 liters fuel tank under longitudinal acceleration. Iu et al. (2004) studied on the noise caused by sloshing. Several baffle designs were investigated to suppress the fuel slosh by using FLOW-3D CFD software theoretically and experimentally. Estimated mean kinetic energy and average turbulent kinetic energy of the fluid obtained from the computer simulations were used to compare with sound measurements obtained from experiments. İbrahim et al. (2001) made a very large review study on dynamics of liquid sloshing. Information is given about 1319 publications on sloshing event made up to publication date.

 Copyright © International Science and Technology Conference (ISTEC)

Akyıldız and Ünal (2006) were investigated the sloshing pressure variations and the three dimensional behavior of the liquid in the partially filled prismatic tank by experimental and theoretical studies. Çelebi and Akyıldız (2001) investigated the sloshing event in the partially filled tank with and without baffle structure. Jung et al. (2012) analyzed the lateral oscillating movement of the partially filled fluid tank and investigated the effect of the length of baffle vertically placed into the tank. VOF method was used for monitoring the fluid motion and pressure changes were investigated according to the different baffle height. Kingsley (2005) made various sloshing optimization studies to develop the liquid tank design and analysis. In the study computational fluid dynamics and finite element methods were used.

In this study, sloshing behavior in a prismatic tank with 50 lt volume and 0.3-0.7-0.24 m the width, the length and height is investigated by CFD method. The tank is filled with water where the rate of 50%-70% and the dynamic behavior of the system examined for both cases. Tank is modeled with vertical baffle and without baffle, and subjected to the lateral harmonic movement. The velocity changes of fluid and the pressure values at the tank wall are examined.

Materials and Methods

1. Mathematical model of sloshing

In this section, basic equations of fluid motion and mathematical models of sloshing event are presented briefly. Basic equations for mathematical modeling of sloshing are continuity, momentum and fluid volume VOF equations.

The continuity equation for a control volume with dimensions dx, dy and dz in cartesian coordinate system can be defined generally as below (Çengel and Cımbala 2005, Umur 2009);

$$\frac{1}{\rho}\frac{D\rho}{Dt} + \nabla\vec{V} = 0 \tag{1}$$

Momentum equation with the assumption that the fluid is Newtonian, the flow is incompressible and working condition is isothermal can be written as;

$$\rho\frac{D\vec{V}}{Dt} = -\nabla\vec{P} + \rho\vec{g} + \mu\nabla^2\vec{V} + f \tag{2}$$

The terms defining irregular changes are added to the laminar momentum and continuity equations for turbulent flow and conservation equations for turbulent flow are obtained (Çengel and Cımbala 2005, Umur 2009).

The VOF method is an efficient multi-phase method used to simulate the flow of immiscible liquids (Vaishnav et al., 2014). This method is used for examining the movement of the free surface during sloshing of the liquid in the tank (Jadon et al., 2014). This method developed by Hirt and Nichols (1981) follow the upper surface of the liquid in the container or follow the interphase surface of the system in other words. The liquid defined by the mesh is divided to the fixed or moving small particles to make this follow.

According to linear wave theory, natural frequency of fluid for a rectangular prismatic shaped tank can be defined;

$$\omega_n^2 = g\frac{n\pi}{L}tanh\left(\frac{n\pi}{L}d\right) \tag{3}$$

Here, g: acceleration of gravity (m/s^2), L: tank length in the direction of the movement (m), d: fluid level in the tank (m) and n: mod number. Accordingly, it can be seen that the natural frequency of the fluid in the tank prismatic tank changes depending on the fluid level in the tank, the length of the tank in the direction of the warning (Abraham 2001, Kingsley 2005).

2. System Structure and Simulation

The tank that capacity is 50 lt and 0.3- 0.7- 0.24 m width, length and height, the placement of the baffle into the tank and the pressure measurement points are shown in Figure 1.

In this study, the baffle was placed in the middle of the tank and the height of the baffle is taken 42% of the tank height. Because the tank is symmetrical and homogenous, pressure measurement points are positioned only one side wall of the tank. Tank movement is provided so that it can oscillate in the lateral direction indicated by x. The equation of the acceleration representing the described input can be seen below;

 Copyright © International Science and Technology Conference (ISTEC)

$$\ddot{x} = -A\omega^2 sin(\omega t) \quad (4)$$

Here, A: amplitude of the movement (m), ω: angular frequency (rad/s). The input function is given as acceleration input and an appropriate program is written in C language for the analysis. The tank movement and angular frequency are taken as 2 cm, $\omega=\omega_n$ respectively for baffled and unbaffled cases. There are two different phase as air and water in the tank so multiphase flow model is used in the study. The node and element numbers used in modeling are given in Table 1. Analyses are performed using ANSYS Fluent program.

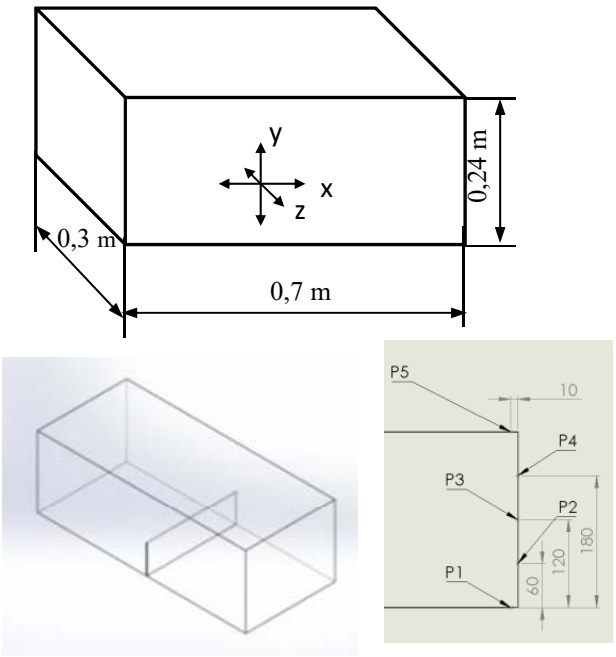

Figure 1. The size of the tank, placement of the baffle and pressure measurement points

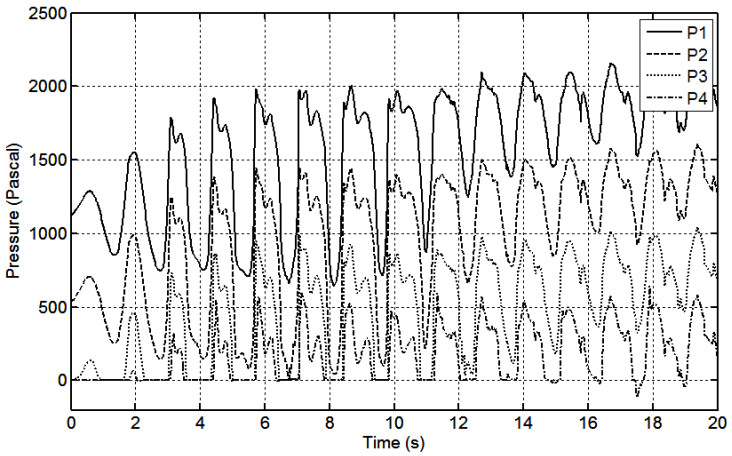
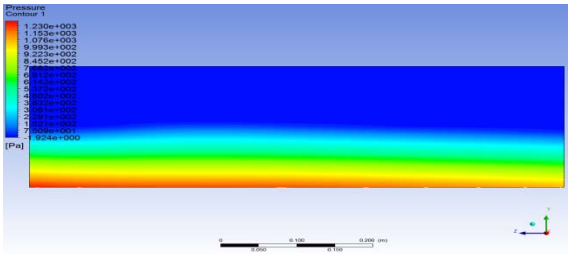
Table 1: The number of the node and element



Tank model	Node number	Element number
Tank with baffle	55025	50400
Tank unbaffled	55800	50730

3. Results and Discussion



In this study, the pressure changes at the wall of the tank and the instant pressure and velocity distribution of the liquid in the baffled and unbaffled tank for 50% and 70% filling rates are obtained as simulation results.

In Figure 2 and Figure 3, pressure changes at the P_1, P_2, P_3 and P_4 points and the pressure and velocity distribution at t=2.35 second for unbaffled tank filled 50% and 70% water are shown respectively.

When Figure 2 and Figure 4 are examined, it can be shown that the sloshing behavior vary considerably between 50% filled baffled and unbaffled tanks. When the baffled tank case is investigated, it can be observed that the fluid cannot be reached to the pressure point 4 (P4) and the pressure distribution become more regular form. When the instant pressure and speed distribution are investigated for two cases, it can be shown that the maximum speed value of the baffled case is reduced at the rate of 62.5% approximately.

As it can be seen from Figure 3 and Figure 5, there are no big difference on the pressure values between baffled and unbaffled tanks. However, it can be said that the form of the sloshing behavior was changed and the maximum speed value is reduced at the baffled tank when the instant pressure and speed distribution are observed.

Conclusion

In this study, fluid sloshing behavior in a prismatic tank that has approximately the same volume with a vehicle fuel tank is investigated by CFD method, pressure and instant speed variations are obtained.

Two different tank configurations are modeled as tank with vertical baffle and unbaffled tank. The tank is filled with water where the rate of %50-70 and subjected harmonic motion at the lateral direction, the dynamic behavior of the system examined for both cases. It was seen from the results that the liquid level and the baffle in the tank affects the sloshing behavior of the fluid significantly. When making design studies, it is important to take into account these parameters such as fluid level and baffle structure placed in the tank.

INVESTIGATION OF TENSILE STRENGTH AND ELONGATION PROPERTIES OF BASALT FIBER-PUMICE REINFORCED POLYPROPYLENE COMPOSITES

Sabih OVALI, Süleyman İlker MISTIK

Marmara University Faculty of Technology Department of Textile Engineering, Istanbul-Turkey

sabih.ovali@marmara.edu.tr

Abstract: Basalt fibre is obtained from volcanic basalt rocks. The manufacture of basalt fiber requires the melting of the basalt rock to about 1400°C. Its chemical structure is nearly related to glass fiber. It has slightly better mechanical properties than glass fiber. Basalt fiber has great potential application to composite manufacturing. In this study, multiaxial fabrics were produced from basalt filaments. Multiaxial basalt fabric and pumice stones were used as reinforcement material for the production of the composite structures. Polypropylene was used as resin. Finally multiaxial basalt fabric-pumice stone reinforced polypropylene composites were produced by using hot press compression machine. Then modulus of elasticity, tensile strength and elongation properties of the thermoplastic composites were investigated.

Keywords: Basalt fibre, composite, polypropylene, pumice

Introduction

Production and using of fiber reinforced composite structures is very attractive and developing subject for few years. Fiber reinforced composite structures have very important advantages such as low weight, low cost, high strength, resistance to flame and corrosion, etc. Due to their advantages, fiber reinforced composites are used instead of conventional structural parts especially in construction, automotive and industrial applications.
Basalt fiber is a newly developed inorganic fiber which produced from molten volcanic basalt rocks [1]. It is similar to carbon fiber and glass fiber, having better mechanical properties than glass fiber, but it is significantly cheaper than carbon fiber and little more expensive than glass fiber. Its chemical structure is nearly related to glass fiber. The most important components of basalt fiber are SiO_2, Al_2O_3, CaO, MgO, Fe_2O_3 and FeO. The manufacture of basalt fiber requires the melting of the basalt rock to about 1400°C. They are not required any additional additives during the production process, so their production cost is low. The molten rock is then extruded through small nozzles to produce continuous filaments of basalt fiber. The fibers typically have a filament diameter between 9 and 13 micrometres. Compared with glass fiber, basalt fibers are more resistant to strong alkali and less resistant to strong acids. Basalt fibers can be used over a wide range of temperature, from 200°C to 600°C. They are resistant to high temperatures. Basalt fiber has great potential to be used in composite structures. The basalt filaments are more ductile than glass and carbon fibers [2-6].

Materials and Methods

Materials

In this study basalt filaments (400 Tex) were used for the reinforcement of the composites. In order to use basalt filaments in composite structures, multiaxial fabrics were produced. Multiaxial fabrics were manufactured by using basalt filaments in 0°, 90°, and ±45°. Photo of the multiaxial fabric is given in Figure1. Also pumice stones were used as filling material. Used pumice stones were in 3 different sizes. Particle sizes of the pumice stones were 0-1 mm, 1-2.5 mm and 2.5-4 mm.

 Copyright © International Science and Technology Conference (ISTEC)

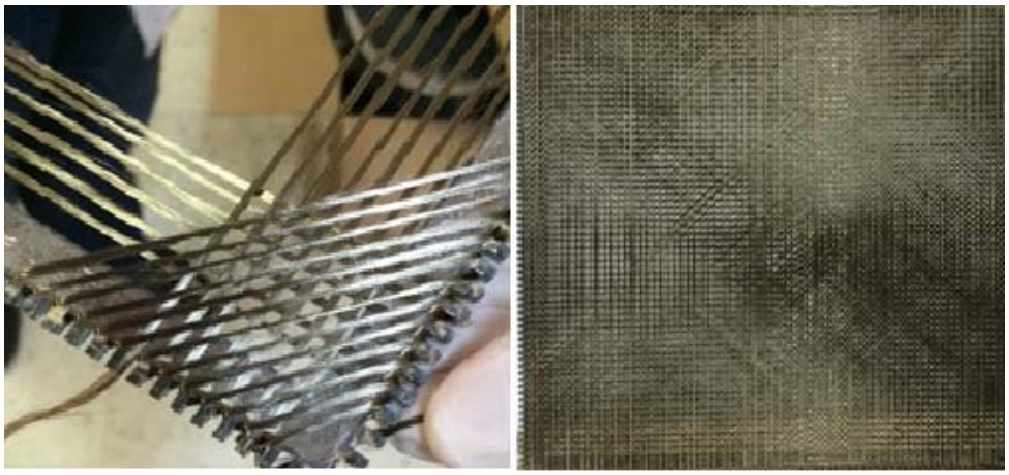

Figure 1. Produced Multiaxial Basalt Fabrics

Production of Composite Structures

Multiaxial basalt filament- pumice stone reinforced polypropylene composites were produced by using hot press compression machine. Production of the composites were performed under 200 °C and 100 bar pressure. Polypropylene resin was used in granule form. Properties of the produced thermoplastic composites are given in Table 1. Photo of the hot press compression machine and produced composite structure are given in Figure 2.

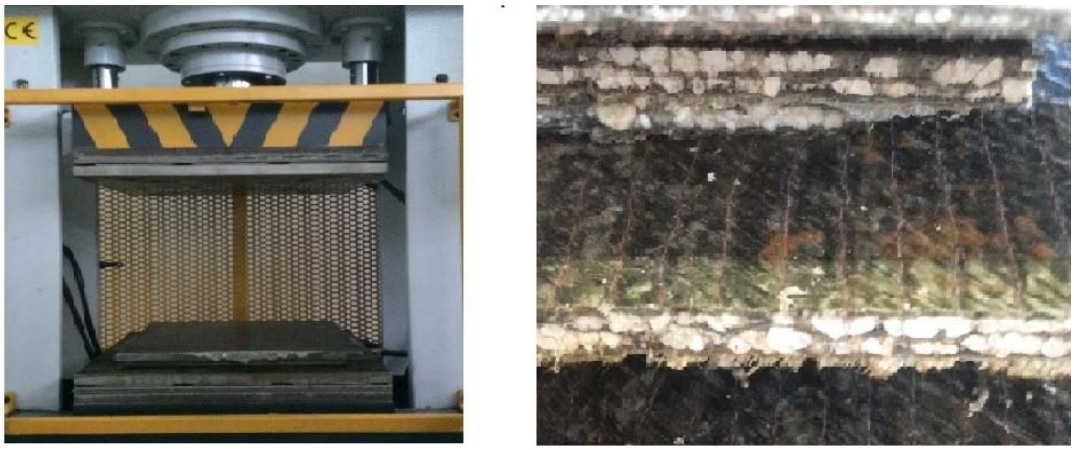

Figure 2. Hot press compression machine and cross sectional view of the composites

Table 1: Properties of the Produced Basalt Filament-Pumice Reinforced Polypropylene Composites

Composites	Ratio of Polypropylene (%)	Ratio of Pumice Stone (%)	Ratio of Basalt Fibre (%)	Pumice Particle Size (mm)
C 1	72	-	28	-
C 2	56	18	26	2.5-4
C 3	56	18	26	1-1.5
C 4	56	18	26	0-1

Results and Discussion

Tensile Strength and Elongation Analysis

Elasticity modulus, tensile strength and elongation at break properties of the multiaxial basalt filament-pumice stone reinforced polypropylene composites were investigated by using Zwick Z010 testing instrument. Tensile strength and elongation analyses of the composites were performed according to ASTM D 3039/D3039M–07 standard.

Elasticity modulus, tensile strength and elongation at break properties of the thermoplastic composites are given in Figures 3, 4 and 5 respectively.

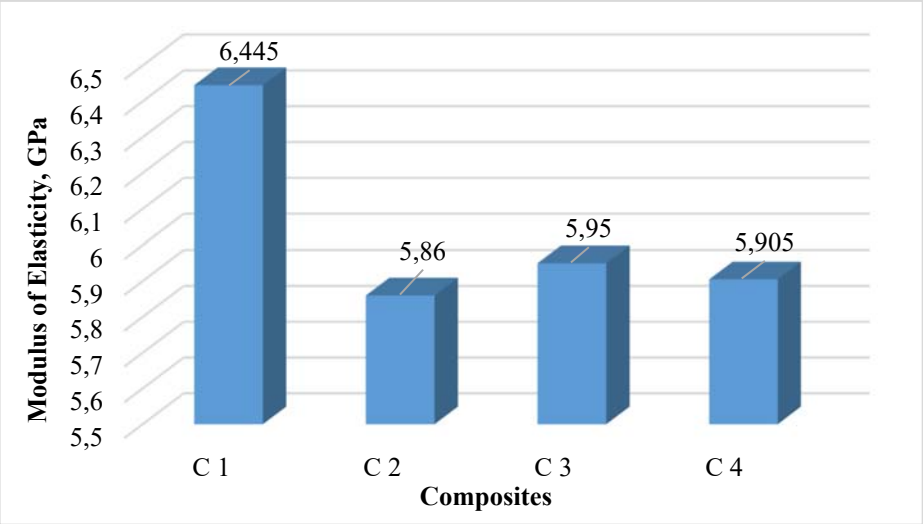

Figure 3. Elasticity modulus properties of the produced composites

Addition of pumice stones decreased the modulus of elasticity properties of the composites. The highest elasticity of modulus properties were obtained by using 1-2.5 mm pumice stones. 2.5-4 mm pumice stone added composites have the lowest elasticity of modulus properties.

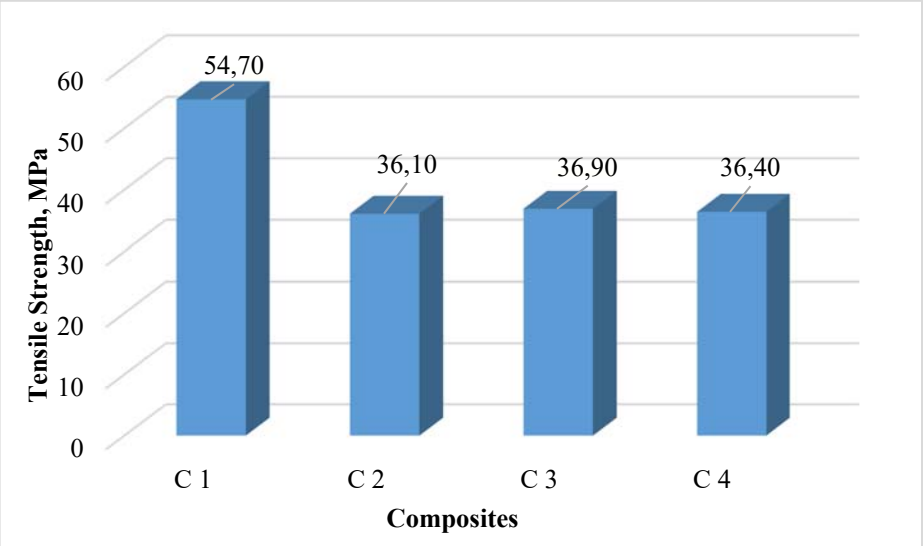

Figure 4. Tensile strength properties of the produced composites

Addition of pumice stones decreased the tensile strength properties of the composites. The highest tensile strength properties were obtained by using 1-2.5 mm pumice stones. 2.5-4 mm pumice stone added composites have the lowest tensile strength properties.

 Copyright © International Science and Technology Conference (ISTEC)

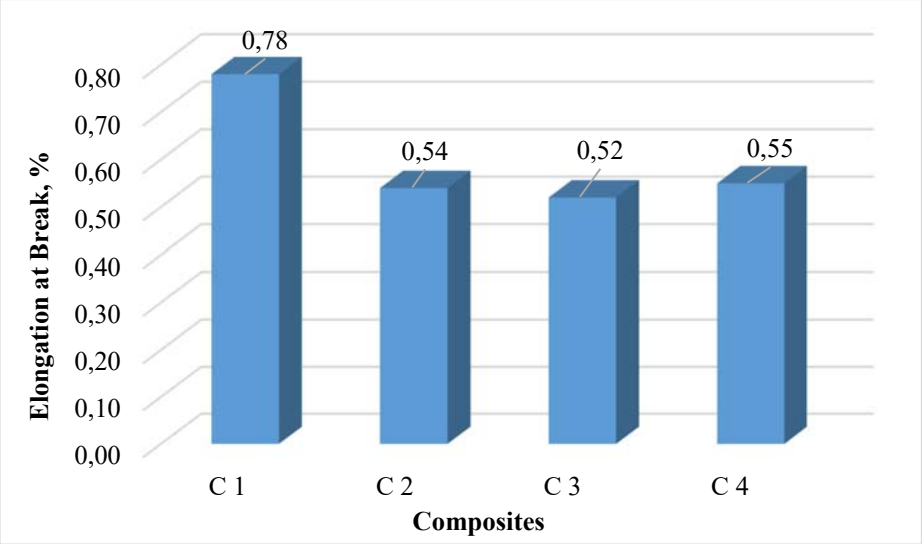

Figure 5. Elongation at break properties of the produced composites

Addition of pumice stones decreased the elongation at break properties of the composites. The effect of the pumice stone sizes on the elongation at break properties of the composites is negligible.

Morphology of the composite structures

Morphology of the produced multiaxial basalt filament-pumice reinforced polypropylene composite structures were analysed by using JEOL JSM-5410 LV Scanning Electron Microscope. SEM micrographs of the composites are given in Figure 6.

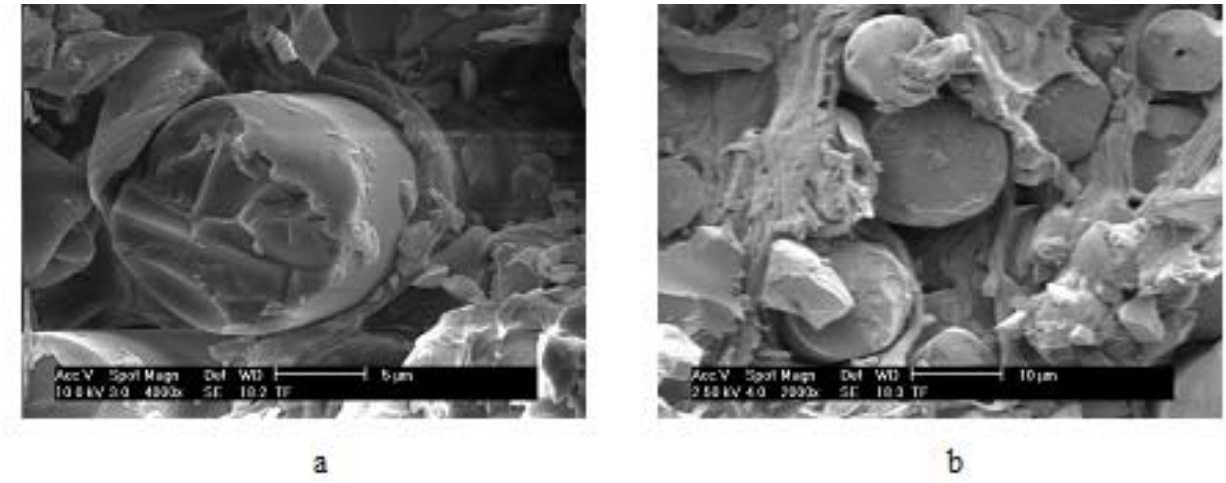

Figure 6. SEM Micrographs of the a)Multiaxial basalt filament reinforced composite b)Multiaxial basalt filament-pumice stone reinforced composite

It is seen from the Figure 6, good adhesion occurred between the basalt fibre and polypropylene resin, it is also observed that pumice stones were slightly bonded to the polypropylene resin.

Conclusion

In general, addition of pumice stones decreased the modulus of elasticity, tensile strength and elongation at break properties of the composites. Better modulus of elasticity and tensile strength properties were obtained by using 1-1.5 mm pumice stones. It is seen that pumice stone size is effective on modulus of elasticity and tensile strength properties of the composites. And good adhesion was occurred between the basalt fiber-polypropylene resin and pumice stones – polypropylene resin. As a result, pumice stones can be added to the fiber reinforced composite structures as filler to obtain moderate tensile and improved insulation properties.

INVESTIGATION OF WIND POWER IN THE REGION OF SAKARYA PROVINCE (TURKEY)

Mehmet Coban
coban@sakarya.edu.tr

Hasan Kucuk
kucuk@sakarya.edu.tr

Mehmet Gunduz
mgun@sakarya.edu.tr

The capacity of the Turkish electricity sector will reach the demand of the 56 GW forecast by 2018. This value assumes steady yearly average increase of some 2,5%. Currently the rate of thermal power plants fed by natural gas, oil and coal is too high within the total capacity of power plants, especially those fed by natural gas reach 50% . Industrial development continues and the demand for electric energy is growing but national energy dependency has not been yet solved, because Turkey is not self-sufficient in production of both natural gas and oil. As an alternative wind energy resource may be more suitable option compared with others. This option is supported that wind technology costs decreases in recent years and will continue to decrease in near future as showing market trends. Evaluation of the wind potential in different areas of the country must be done in order to ensure the best use possible of this option. This paper gives a statistical analysis of the wind characteristics in the region of Sakarya Province. The daily, monthly and annual wind speed values have been discussed together with their prevailing direction. The data will be analyzed correspond to three meteorological stations located in the area.

INVESTIGATION ON ENDURANCE, SPEED AND VERTICAL JUMP PARAMETERS OF SOCCERS

Salih ERDEN

Uludag University, Bursa, TURKEY
saliherden56@gmail.com

Abstract: Football is a collective game, even though their positions according to the task of football are different features. Conditions in different areas in the tempo and distance, need to jump several times in the performance of the three pillars of the soccer game, physical conditioning, technique and tactics are. Physical Conditioning as important features for speed and endurance are a footballer. In addition to playing football in the air not only from place to leap to the fore the importance of the length and size are removed. Football is a collective game, even though their positions according to the task of football are different features. The aim of our study, vertical jump, speed and durability characteristics of football players have played their positions (defense, center court, assault) What percentage of differences between levels and to find out which position player is more dominant. Research in our province of Bursa in the first amateur football each class of the cluster a total of 30 volunteers 10 footballer footballer joined. Vertical jump from the direction; defense, the middle field and attack players, a significant statistical difference between ($p > 0.05$), a significant difference in speed and endurance properties were found ($p < 0.05$). As a result, the mid-field endurance of players, the offensive player of the features of the speedboat, which he played better than in other positions that were observed ($p < 0.05$).

Keywords: Football, Vertical Jump, Speed, Endurance.

Introduction

Football, the width of the playing field, game time and the excessive number of players who play with the richness of the rules with the feature that requires versatile behavior and struggle in terms of other sport has found its own place. So we have to be seen in public in any sport, it has led millions of people to fill a football field (Başer 1994). Football game contains violent and effort of frequently changing time. Effort style of play to the team's technical, tactical and physical fitness varies depending on the situation. Mobility sprint from standing during the game or show up to walk several variables (Sağlam 1993). In general, football, throw the ultimate goal of the pre-planned goals and application made or action occurred as a spontaneous and passing performed works is defined as moving toward game (Türel 1990). In terms of scientific football, which used successive aerobic and anaerobic effort, speed, strength, agility, flexibility, balance, muscular and cardiorespiratory coordinate high to act together to performance factors such as durability it is a sports discipline (Akgün 1992 Eniseler 1994). Football lately based on scientific basis, conscious and showed great progress with systematic studies and technical development of these players, tactics and showed itself clearly in the conditional properties. Football lately based on scientific basis, conscious and showed great progress with systematic studies and technical development of these players, tactics and showed itself clearly in the conditional properties. Measurements carried out on players by various researchers, the total ran the distance in 90 minutes of a football player to be around 12 000 meters and 8680 meters is stated (Bizanz 1988, Eniseler 1994,Reilly1976). Footballers in varying degrees to form a variety of movements while running this distance, accelerating or standing, or running to make the cut to stop or change speeds without stopping at various speeds. The football game is analyzed, the movement to stop the way, walking, jogging, submaximal running, seems to be in the form of maximal running. According to this motion movement numbers as used during football games, 298 of jogging, 226 of walking, 98 of submaximal running, 35 of maximal running (Akgün 1992, Eniseler 1994).

Endurance and sprint performance in football motoric traits that most affect. Durability, the whole organism to resist fatigue in long-standing sporting exercise, the installation of high intensity is defined as the ability to maintain long-term (Renklikurt 1991,Türel 1990).

 Copyright © International Science and Technology Conference (ISTEC)

Football players are not only endurance but also must be fast and quick. Because of the high level of speed and quickness to the team but it can be countered with the speed and quickness of the players in the advanced level (Yavuz 1995). Face; as soon as the unit is in most ways get Capability (Sevim1991), to be able to react as soon as possible against any stimulus (Renklikurt 1991), react in a short period of time and series of low resistance to movement to reach high speeds (Bizanz 1988) is defined as.

Today's football players and durable, both fast should have a good bounce property. According to the position played by football players to rise to the forefront of some of these features can also be an advantage for that position.

Today's football players and durable, both fast should have a good bounce property. According to the position played by football players to rise to the forefront of some of these features can also be an advantage for that position.

Materials and Methods

Our research Bursa First Amateur 10 players from each position playing football in Serie A total of 30 players, including volunteers. Players with their respective vertical jump, assays were performed to measure the speed and durability.

It was found to be in the age of the players. The height and feet bare condition Holtain Limited brand meter height, the body weight of shorts and bare feet were with Arzum brand scales situation.

Applied in vertical jump measurement of subjects' Sargent Jump Test "to measure the difference between the height of which can be reached by leaping with standing height is based on (Bağırgan 1990 Tamer 1991, Withers, 1982). Testing was performed twice with one-minute break was considered the best value.
Measuring 30 meters sprint at the indoor sports hall with electronic photocell unit was on the parquet floor. Each subject ran twice quickly with the highest five-minute break from the 30-foot outpatient output. It was considered the best value.

Resistance value of the 20-meter shuttle run test (Shuttle Run test) were detected with (Şipal 1989). The subjects were 20-meter course in a regular cassette tape and ran as the tempo gradually and in accordance with sound direction by changing round-trip signal from the increased range. Leaving test subject was recorded as the number of stages and the running resistance value.

In statistical analysis, mean, standard deviation and standard applications were made in other calculations. The comparison of the players according to their played position Student "t" test was used.

Results and Discussion

Table 1. According to the statistical analysis of the position of vertical jump feature.

Position,	Average	SD	T	P
Defense	61,3	4,322		
			1,145	>0,05
Midfielder	58,5	6,416		
Defense	61,3	4,322		
			0,84	>0,05
Offensive	63,3	6,165		
Midfielder	58,5	6,416		
			1,705	>0,05
Offensive	63,3	6,165		

There was no statistically significant difference between the sites in terms of vertical jump (p> 0.05).

 Copyright © International Science and Technology Conference (ISTEC)

Table 2. Statistical analysis of speed according to the position of 30 meters.

Position,	Average	SD	t	P
Defense	4,684	0,129		
			0,622	>0,05
midfielder	4,751	0,203		
Defense	4,684	0,129		
			2,363	<0,05
Offensive	4,554	0,117		
Midfielder	4,751	0,203		
			2,654	<0,05
Offensive	4,554	0117		

The difference between the positions of direction in terms of statistical significance was found 30 meters sprint. speed characteristics of the defense and midfield attacking players are better players based ($p < 0.05$).

Table 3. Statistical analysis of the positions of the resistance trait.

Position	Average	SD	t	P
Defense	57,96	3,212		
			1,736	>0,05
midfielder	59,83	1,130		
Defense	57,96	3,212		
			1,881	>0,05
Offensive	55,32	3,293		
Midfielder	59,83	1,130		
			4,186	<0,05
Offensive	55,32	3,293		

Positions in terms of endurance was a significant difference in terms of statistical significance ($p < 0.05$). According to the defense and attacking midfielder player has been observed to be more durable.

Table 4. A comparison of the subjects to their played position.

	Defense	Midfielder	Offensive	P
vertical jump (cm)	61.3+2,68	58,5+3,98	63,3+3,82	p>0,05
30 m. sprint (sn)	4,684+0,08	4,751+0,13	4,554+0,07	p<0,05
Endurance (ml/kg.dk)	57,96+1,99	59,83+0,70	55,32+2,041	p<0,05

Vertical jump players of the participants, 30 m. When compared to the position they play the speed and durability, vertical jump feature not carry a significant difference ($p < 0.05$), there were significant differences in other properties.

Table 5. Statistical values based on the position of physical properties

Physical properties	Defense	Midfielder	Offensive
Age	20,9+1,353	19,9+1,072	21,1+0,989
Height (cm)	180,9+1,926	176,7+3,708	176,3+3,065
Body Weight (kg)	71,3+1,923	67,2+2,44	71+2,615

In our study, we could not obtain a significant difference when you compare it according to the position we have achieved vertical jump values ($p > 0.05$). But when we look at the average values (Table 4) in order to attack players that have the highest value, then it is seen that the defense and midfield reamers. These results also bear the statistical significance Akgun et al (Akgun 1992) supports the results of research made by. In a study of German footballers (T.F.F. Publications, 1978), the offense and defense from the midfield reamers reamers were found to be the more balls in the air. In our research of the players play offense and defense of the values of the vertical jump with the results being the best German players Akgun and his friends is in line with the results of research

 Copyright © International Science and Technology Conference (ISTEC)

carried out. More often go to the balls in the air may have been influential in the development of the vertical jump feature.

Özder and his friends l (Özder, Gunay 1994) in their study on amateur footballers, there was no significant difference when compared to subjects footballer of properties located in the vertical jump. This supports the results we found.

Speed and speed of the offensive players when compared to the strength properties of position, seems to be better durability of the midfielder PREVIEW ($p < 0.05$). The midfielder durability of our study was found to be better than any other position player ($p < 0.05$). after the midfielder was determined to have the highest values of defense and offensive players. Similar sequences have been expressed by many researchers (Cochrane, 1976 Yücetürk 1993). Yücetürk, in a more dominant over the midfielder of the durability defensive and offensive players, the training requirements of midfielders, so the both competitions in defense and attack players than longer run is said to be effective for them to add more distance.

Conclusion

In conclusion, the midfielder of durability, speed feature of the offensive players found to be better than the other position players ($p < 0.05$). There was no significant difference between the sites in terms of vertical jump ($p > 0.05$).

According to the positions of the players to play with different motor skills, pre-season preparation training and the season within the organization, we think it would be more useful in this regard. If required to be included in the club-house expert coaches for each individual property can be an important factor in their success. Also known these characteristics differ from site staff will help to create a match the coach.

İPEK YOLUNUN ŞANLIURFA İNANÇ TURİZMİNE ETKİSİ: ŞEYH MESUD ÖRNEĞİ

Mehmet AKBIYIK

Harran Üniversitesi, Turizm ve Otel İşletmeciliği Yüksek Okulu. Türkiye

mehmetakbiyik@harran.edu.tr

Özet: Türkiye'nin Güneydoğu Anadolu Bölgesinde bulunan Şanlıurfa ili doğudan Mardin, batıdan Gaziantep, kuzey ve kuzeybatıdan Adıyaman, kuzey ve kuzeydoğudan Diyarbakır illeri ile sınırlandırılmıştır. Güneyden ise Suriye sınırı ile çevrilidir.

Şanlıurfa, coğrafi konumu nedeniyle üzerinde tarih boyunca birçok devlet ve beyliğin hüküm sürdüğü, değişik kültürlerin geçiş ve kaynaşma alanı olmuştur. İlk ve ortaçağ da eski uygarlık merkezleri olan Çin, Orta Asya, Mezopotamya ve Arap ülkeleri ile Avrupa arasındaki ipek yolunun bir kolu Şanlıurfa üzerinden geçmektedir.

Çin'den başlayan ipek yolu orta Asya'dan geçerek Anadolu üzerinden Avrupa'ya kadar uzanan önemli bir ticaret ve kültür yoludur.

İpek Yolu sadece ticaret için kullanılmamıştır. İpek yolu, aynı zamanda doğudan batıya ve batıdan doğuya âlimlerin, orduların, fikirlerin, dinlerin, medeniyetlerin ve kültürlerin de yolu olmuştur.

İnsanların İslâm'ı daha iyi anlayabilmesinde ve İslâmiyet'in yayılmasında ipek yolu ile birlikte Anadolu Selçuklular dönemindeki tekke ve zaviyeler önemli rol oynamışlardır. Anadolu'yu Türkleştirmek ve İslamlaştırmak için önemli İslam bilginlerinden olan Hoca Ahmet Yesevî'nin halifeleri dervişleri ile birlikte küçük gruplar halinde Anadolu'ya göç etmişlerdir. Anadolu'nun değişik yerlerinde tekke ve zaviyeler kurmuşlardır.

Şeyh Mesud da 1183 tarihinden önce dervişleriyle birlikte Nişabur'dan Şanlıurfa'ya gelerek Şanlıurfa'nın Türkleşmesine ve Müslümanlaşmasma hizmet etmiş, Ahmed Yesevi halifelerinden biridir. Şeyh Mesud'un babasının adı Said Hengel'dir." Şeyh Mesud'un türbesi ve zaviyesi Şanlıurfa'da bulunan iç kalesinin de güneyinde tepenin üzerindedir. Mezarı bu türbenin içindedir. Bu türbe ve zaviye hem bir ziyaret hem de bir mesire yeridir. Şanlıurfa inanç turizmi için önemli bir ziyaret yeri olan Şeyh Mesud türbesi ve zaviyesi her yıl binlerce yerli ve yabancı turist ziyaret etmektedir.

Bu çalışmamızda İpek yolunu kullanarak Nişabur'dan gelen Şeyh Mesud'un Şanlıurfa İnanç turizmindeki yerini ve önemini tespit etmektir. Şeyh Mesud türbe ve zaviyesinin inanç turizm destinasyonları içerisine dâhil edilerek tanıtılmasını sağlamaktır.

Anahtar Kelimeler: Şanlıurfa, Turizm, İnanç, İpekyolu. Şeyh Mesud.

THE EFFECT OF SILKROAD TO ŞANLIURFA'S BELIEF TOURISM: AS A SAMPLE OF SHEIK MESUD

Abstract: Şanlıurfa City is in the south-east of Turkey and it has borders with Mardin at east , with Gaziantep at west , with Adıyaman at north and north-west , with Diyarbakır at north and north-east. Also it has border with Syria at south. Because of the geoghrapgic location of Şanlıurfa, many states and seigniories have ruled throughout history on it, and it has been also different cultures' transition and coalescence area. One of the silkroad's part between China, Middle Asia, Arabian countries and Europe, was in Şanlıurfa at first age and middle. Begining from the China, the silkroad which is an important trade and culture road cross over Middle Asia and by way of Anatolia it reachs to Europe.

The silkroad has not been used just for trade, it also has been a road, from east to west and from west to east, for scholarly people, armies, ideas, religions, civilizations and cultures. Islamic monasteries and zawias had an important role under favour of silkroad at the period of Anatolian Seljuk Empire and they served to be understood and spread of Islam. Hodja Ahmet Yesevi's khalifas and dervishes who wanted to turkify and islamicize the Anatolia, migrated

 Copyright © International Science and Technology Conference (ISTEC)

to Anatolia in small groups and established Islamic monasteries and zawias in different areas of Anatolia.
Sheik Mesud who is a khalifa of Hodja Ahmet Yesevi came to Şanlıurfa with his dervishes from Nisabur and he served to turkify and islamicize Şanlıurfa. His father's name is Said Hengel. His zawiya and tomb is at the south hill of Şanlıurfa's castle. This zawiya and tomb is both a showplace and picnic area. Every year thousands of foreign and domestic tourists visit Sheik Mesud tomb which is an important place for Şanlıurfa's belief tourism.
This study aims to determine importance of Sheik Mesud who came to Şanlıurfa from Nisabur by way of silkroad for Şanlıurfa's belief tourism.
Keywords: Tourism, Şanlıurfa, Belief, The Silk Road. The Sheik Massoud.

1.1. Şanlıurfa İlinin Konumu ve Başlıca Özellikleri

Şanlıurfa Güneydoğu Anadolu Bölgesinde yer alır. Komşuları doğuda Mardin, batıda Gaziantep, kuzey ve kuzeybatıda Adıyaman, kuzey ve kuzeydoğuda Diyarbakır illeri bulunmaktadır. Güneyde ise Türkiye -Suriye sınırı ile sınırlanmıştır. (Harita1).

Harita 1.Şanlıurfa İlinin Lokasyon Haritası

Güneyden Batıya doğru kenarları fazla uzanmış bir altıgene benzeyen ilin yüz ölçümü 18.584 km2'dir (D.İ.E 1997). Bu Türkiye yüz ölçümünün yaklaşık % 3 üne eş değerdir. Şanlıurfa bu yüzölçümü ile Türkiye'nin 7. büyük ilidir. İlin nüfusu 2015 yılında 1.892.320 yükselmiştir.

Şanlıurfa ili morfolojik bakımdan çok sade bir görünüm arz etmekte olup, ana yer şekillerinden dağ, plato ve ovaları içine almaktadır. Coğrafi anlamda dağ diyebileceğimiz tek kütle Karacadağ (1938 m) volkanik kütlesidir.

Günümüzde de Şanlıurfa, Dünya'nın ve Türkiye'nin en önemli bölgesel kalkınma projelerinden biri olan GAP'ın (Güneydoğu Anadolu Projesi) merkezidir.

 Copyright © International Science and Technology Conference (ISTEC)

Şanlıurfa, 12.000 yıllık tarihi ile Sümer, Pers, Roma, Selçuklu ve Osmanlı gibi uygarlıklara beşiklik etmiştir. Şanlıurfa, çok eski tarihi geçmişi ile doğu ve batının buluşma noktalarından en önemlisi ve de en hareketlisi olmuştur. Aynı zamanda kültür medeniyetlerin Dünya'ya yayıldığı bölge olarak kabul edilen ve "Bereketli Hilal" olarak adlandırılan Mezopotamya topraklarında bulunması nedeniyle, medeniyetlerin de beşiğidir. Yerleşme ve Arkeoloji tarihini değiştiren ''Göbeklitepe'' Dünya'nın ilk tapınağı olarak kayıtlara geçmiştir. Bu medeniyetlere ait çeşitli tarihi mirasları ile tarihi turizmi, geçmişten günümüze ulaşan ve yaşayan kültürel özellikleri ile kültür turizmi, Termal su kaynakları ile sağlık ve termal turizmi, kendine özgü bazı hayvan varlığı ve flora özellikleri ile eko turizmi, Birecik, Halfeti ve Atatürk Baraj gölünde yapılan su sporları ile Karacadağ'da yapılan kayak sporları ile spor turizmi, Sıra geceleri ve zengin mutfağıyla gurme turizmi vb. özellikleri ile turizm potansiyeli yüksek bir şehirdir. Şanlıurfa, üç semavi dinin atası olarak bilinen Hz İbrahim'in doğduğu, Hz Eyüp'ün çile çektiği, Hristiyanlığın ilk kabul edildiği ve Hz İsa'nın mendilini göndererek kutsadığı, Hz Şauyb, Hz Elyasa, Hz Lut, Hz Âdem'in yaşadığı bilinen Peygamberler Şehri'dir. Birçok dinlere ev sahipliği yapmış, birçok peygamberin yaşadığı ve peygamberler şehri olarak bilinen özelliği ve çok sayıda evliyanın türbeleri, tekkeleri ve zaviyelerinin yanı sıra onlarca cami, mescit, kilise, manastır ve tapınak gibi çeşitli dinlere ait inanç mabetlerinin varlığı, Şanlıurfa'yı bu anlamda inanç turizm açısından önemli kılmaktadır.

1.2. Araştırmanın Amacı, Materyal ve Metot

Şanlıurfa ilinin inanç turizmi potansiyelini ve Şeyh Mesud'un inanç turizmine etkisini araştırmayı amaçlamaktayız. Bu amaca ulaşmak için inanç turizmi açısından değeri olan yerlerde ve Şeyh Mesud türbesi ve zaviyesinde öncelikle kaynak taraması yapılmıştır. Ayrıca alan çalışması ve gözlemler yapılmıştır. Alan araştırmasında inanç turizmle ilgili yerlerde ve Şeyh Mesud türbe ve zaviyesinde gerekli görüşme ve mülakatlar yapılmıştır. Şeyh Mesud türbesi ve zaviyesi fotoğraflarmıştır.

2.Şeyh Musud'un inanç Turizmine Etkisi

Günümüzde turizm, birçok ülkede ve bölgede ekonomik ve kültürel kalkınmanın, gelişmenin ve bölgelerarası gelişmişlik farklarının azaltılması için en önemli kaynaklardan biridir. Büyük ölçüde hizmet sektörüne dayalı olan turizm, işsizliğin yoğun olarak bulunduğu ülke ve bölgeler için büyük önem taşır. Dünya'daki birçok ülkede olduğu gibi, ülkemizde de bölgelerarası gelişmişlik farkları bulunmaktadır. Bu bağlamda, Şanlıurfa'nın gelişmişlik farkının azaltılması ve ekonomik kalkınmasının sağlanmasına etki edecek sektörlerden biri de turizmdir.

İnanç turizmi ise İnsanların yaşadıkları, çalıştıkları ve çeşitli gereksinmelerini karşıladıkları yerlerin dışında, inanç merkezlerini ziyaret etmek, inançlarının gereğini yerine getirmek amacıyla gerçekleştirdikleri dini amaçlı turistik gezilerin, turizm olgusu içerisindeki değerlendirilmesi olarak tanımlanabilir.

İnanç turizmi bakımından ülkemiz büyük bir potansiyele sahiptir. Nitekim gerek ilkçağ medeniyetlerinin Anadolu'da gelişmesi gerekse de Hristiyanlığın ilk dönemlerinde Havarilerin, Ortaçağ'da ise Musevilerin yaşadıkları yerlerde karşılaştıkları ağır baskı ve yok etme politikaları sonucu, bu topraklara sığınmış olmaları, Türklerin kendi dini olan İslamiyet'e ait eserlerin yanı sıra, çok sayıda sinagog ve kilisenin Anadolu'da yer almasına neden olmuştur (Zaman, 2012: 395).

Bunun sonucunda da Anadolu'da inşa edilmiş dini mabetler ve tapınaklar, milletimizin İslami anlayış paralelinde derin saygı ve hoşgörü içerisinde günümüze kadar ulaşmıştır.

Şanlıurfa ilinde pek çok dinin geliştiği, birçok peygamberin yaşadığı veya bulunduğu, bu anlamda da peygamberler şehri adının verildiği Şanlıurfa, inanç turizm bakımından önemli bir potansiyele sahiptir. Şanlıurfa; insanların yerleşik düzene geçtiği çok eski dönemlerden itibaren muhtelif kültür ve medeniyetlerin bulunduğu, farklı toplulukların mensup oldukları çeşitli inançların yaşandığı bir alandır.

Dicle ve Fırat nehirleri arasında yer alan Yukarı Mezopotamya bölgesinde Bereketli Hilal olarak tanımlanan geniş ve verimli toprakların bulunması nedeniyle tarihte birçok medeniyetler oluşmuştur. Şanlıurfa doğu ve batının buluştuğu bir şehirdir. Doğu ve batı dünyasını kültür, medeniyet ve ticaret bakımından birbirine bağlayan

 Copyright © International Science and Technology Conference (ISTEC)

eski ve önemli ulaşım yollarının kesiştiği bir coğrafi konumda olması nedeniyle tarihin her döneminde önemli bir yerleşme alanı olmuştur.

Türkiye Turizm Stratejisi belgesinde Şanlıurfa Tarsus'tan başlayarak Hatay, Gaziantep ve Mardin yörelerini de kapsayan İnanç Turizmi Koridorunda yer almaktadır.

12.000 yıllık tarihi ile birçok dinin geliştiği, birçok peygamberin yaşadığı veya bulunduğu, bu anlamda da peygamberler şehri adının verildiği Şanlıurfa, inanç turizm bakımından önemli bir potansiyele sahiptir.

Anadolu'nun Türkleşmesi ve İslamlaşması sürecinde gerçekleşen fetih hareketlerinin en önemli neticelerinden birisi bu coğrafyaya yapılan büyük göç hareketleridir. Mâverâünnehir, Harezm, Azerbaycan ve Erran Türkmenleri'nin Anadolu topraklarında yer bulma amacıyla gerçekleştirdikleri bu göç hareketleri, X.-XIII. yüzyıllarda yoğunluk kazanmıştır (Şeker,1997:65).

Söz konusu süreçte göçebe Türkmenler arasında Anadolu'ya gelen ulema ve derviş zümrelerinin de bulunduğu bilinmektedir. Nitekim bu dervişler XI. ve XIII. yüzyıl Anadolu'sunda vergiden muaf bir şekilde medrese, tekke ve zaviyelerde dönemin halkına İslâmiyet'i anlatmışlardır (Barkan, 1942:159) Anadolu'nun fethini müteakip burada kurulan Türkiye Selçukluları, Beylikler ve Osmanlı devirlerinde, bu faaliyetleri destekleme adına dinî-hayrî anlamda birçok müesseseler vücuda getirilerek bunların masraflarını karşılamak üzere bir takım emlak ve arazi vakfedildiği de bilinmektedir (Köprülü, 2005:323).

Türk halk İslâmî'nin şekillenmesinde etkili olan sûfîlik geleneğinin, üç evliya veya sûfî zümresini ön plana çıkardığı görülmektedir. Bunlardan birincisi, Orta Asya'da İslâm'ın yayılmasına önayak olan ve Ahmed-i Yesevî ile başlayan Türk sûfîlik geleneği; İkincisi Horasan Melâmetiyyesi, yani İran sûfîliği; üçüncüsü ise, ilk ikisinin oluşturduğu temelde teşekkül etmiş, Mevlânâ, Hacı Bektâş-ı Velî ve Yunus Emre tarafından temsil edilen Rum/Anadolu sûfîliği sentezidir (Ocak, 2002:33).

Daha çok Anadolu'nun fethi ve Moğol istilası sürecinde Orta Asya, İran ve Anadolu coğrafyasından gelen bu dervişlerin çoğu, devlet adamları tarafından saygıyla karşılanarak, adlarına tekke ve zaviyeler yaptırılmış, vergiden muaf tutulmuş, bölgedeki tarım arazisini kullanmalarına imkân tanınmıştır (Barkan, 1991:292).

Halkın İslâm'ı daha iyi anlayabilmesinde ve İslâmiyet'in yaygınlaşmasında Anadolu Selçuklular dönemindeki tekke ve zaviyeler önemli rol oynamışlardır. Anadolu'yu Türkleştirmek ve İslamlaştırmak için Hoca Ahmet Yesevî'nin halifeleri bazen dervişleri ile birlikte küçük gruplar halinde Anadolu'ya göç etmişler, tekke ve zaviyeler kurmuşlardır.

Anadolu'nun çeşitli yerlerinde kurulan tekke ve zaviyelerde bölgeye gelip giden ticaret yapan insanlara, yolculara veya askerlere barınma ve yiyecek ihtiyaçlarını karşılayan dervişler İslamiyet'i yaygınlaştırmaya çalışmışlardır.

Şeyh Mesud'un kimliği hakkında tek bilgi, zaviyesinin birkaç metre batısında Yağmur sularını toplamak için kazılan sarnıcın hemen doğu duvarı üzerinde yükselen kayanın üzerine kazdırdığı Şanlıurfa'da en eski Eyyûbî-İslâm kitabesidir. İşte bu kitabe şöyledir.

"Kad farağa min ameli sahrinci el-fakiru ila rahmetillahi Mesud ibni Said Hengel el-Nişaburi fı'l-aşereti min recebi'l-ağer. Senete tis'a ve sab'ine ve hamse mietin. ferahimallahu men dea (...) ve i'anehu ve sa'adehu ve li'cemi'i'l- müminin."(Karakaş, 2010:80). (Fotoğraf 1.).

Günümüz Türkçesine çevirisi şu şekildedir: "Bismillâhirrahmanirrahîm.

Allah'ın rahmetine muhtaç, fakir, Nişaburlu Said Hengel'in oğlu Mesud bu sarnıcın yapımından fariğ olup inşasını Recep ayının onlu günlerinden Pazar günü. Sene beş yüz yetmiş dokuzda tamama erdirdi. Allah'ın rahmeti, inâyeti onun üzerine olsun. Onun ve tüm mü'minlerin yardımcısı olsun!" (mufidyuksel.com). Buradaki tarihe bakacak olursak 579 yılı Recep ayının onlu günlerinde, Pazar günü 11 Recep veya 18 Receb'e tekabül

 Copyright © International Science and Technology Conference (ISTEC)

etmektedir. Bu durumda Miladi takvimle 30 Ekim 1183 veya 6 Kasım 1183'e karşılık gelmektedir (mufidyuksel.com).

Fotoğraf 1. Sarnıçın yanındaki kayaya yazılmış kitabe.

Kitabeden Şeyh Mesud'un yaşadığı dönem Şanlıurfa'da Zengi-Eyyübi döneminin hüküm sürdüğü zamana denk gelmektedir. Şeyh Mesud devrinin âlim ve mutasavvıflarından biridir. Doğum ve vefat tarihleri bilinmemektedir. Kitabeden anladığımıza göre Nişaburludur ve babasının da adı Said Hengel'dir. Nişaburlu Said oğlu Mesud hakkında bu iki satırlık kitâbeden başka yazılı bir belge bulunmamaktadır. 1183 tarihinden önce Nişabur'dan Şanlıurfa'ya gelerek, iç kalenin güneyindeki tepelerin üzerinde çaykuyu platosunun kuzeye bakan yamaçlarında bir zaviye yaparak yerleşmiştir. Nişabur'un İslam tarihindeki yerine baktığımız zaman 651 tarihinde Basra Valisi Abdullah b. Amir tarafından İslam topraklarına katıldığını görmekteyiz. Horasan'ın en büyük şehirlerinden biri olan Nişabur, IX. Yüzyılda Horasanın en ileri gelen medeniyet merkezlerinden biri olmuştur. Ekonomide ileri bir durumda olduğu gibi kültür bakımından da Horasanın merkezi durumuna gelmiştir. Burada çeşitli dini akımlar bulunuyordu. Çok sayıda büyük âlimler ve mutasavvıflar yetiştirmiştir. Bunlardan biri olan XI. Yüzyılda yaşayan mutasavvıflardan Şeyh Ebu Said Ebul-Hayr, miladi 1024 ile 1035 yılları arasında Nışabur'da bulunmuştur.

Büyük mutasavvıflardan Kuşeyri (986-1072) ve Sülemi (936-1021) Nişabur'da doğmuşlardır. XI. yüzyılda Nişabur, ilimlerin, fakihlerin, edebiyatçıdan ve mutasavvıfların bir arada yaşadığı bir kültür şehri haline gelmiştir. Bu bakımdan Nişabur'a "Darü'l-İlm" adı vermişlerdir.

 Copyright © International Science and Technology Conference (ISTEC)

Türklerin Müslüman olduktan sonra kalabalık bir şekilde yaşadıkları bölgeler Türkistan şehirleridir. İlim ve irfan öğrenmek isteyenler, Horasan ve Buhara gibi âlim ve mutasavvıfların kalabalık olduğu bu şehirlere giderler. Bu tarihlerde Türkistan'da şöhret kazanmış ve "Pir-i Türkistan" diye de isim yapmış Hoca Ahmed Yesevî'nin (ö. 1166) yaşadığı devreye rastlamaktadır.

Hoca Ahmed Yesevî'nin: yetiştirdiği öğrenciler doğu Türkistan, Anadolu ve hatta Bulgar içlerine kadar giderek İslam dinini yaymaya çalışmışlardır. O tarihlerde Anadolu, Selçuklular tarafından yeni fethedilmiş ve Müslüman Türkler büyük gruplar halinde Anadolu'ya gelerek yerleşmeye başlamışlardır. İşte Anadolu'yu Türkleştirmek ve İslamlaştırmak için Hoca Ahmet Yesevî'nin halifeleri bazen dervişleri ile birlikte küçük gruplar halinde Anadolu'ya göç etmişlerdir. Hatta Hacı Bektaşi Veli'nin bile bunlardan olduğu söylenilmektedir.

Böylece Şeyh Mesud' da 1183 tarihinden önce 'Horasan Ereni' olarak Şanlıurfa bölgesine geldiği kabul edilmektedir. Nişabur'dan Şanlıurfa'ya gelerek buranın Türkleşmesine ve Müslümanlaşmasına hizmet etmiş, Ahmed Yesevi halifelerinden biri olması kuvvetle muhtemeldir. Ahmed Yesevi'nin ölümü ile Şeyh Mesud'un Şanlıurfa'da bulunuşu arasında sadece 17 yıl bulunmaktadır. Bu da görüşümüzü kuvvetlendirmektedir (Fotoğraf 2). Zaviyesinin yanında bir sarnıç kazarak, su ihtiyacını buradan temin etmiştir Böylece Şeyh Mesud uzun yıllar Şanlıurfa'da halkı Müslümanlaştırmaya çalışmış evliyalarından biridir diyebiliriz.

Fotoğraf 2. Türbe ve Zaviye İç kalenin Güneyinde Tepelik Alanda Bulunur.

Şanlıurfa'daki türbe ve zaviye tarzındaki yapıların en eski tarihlisi olan yapı, dört eyvanlı, Selçuklu medrese mimarisine uygun tarzda köşegen olarak inşa edilmiştir (Fotoğraf 4).

 Copyright © International Science and Technology Conference (ISTEC)

Fotoğraf 3. Şeyh Mesud Türbesi ve Zaviyesi Şanlıurfa Taşı ile İnşa Edilmiştir.

Türbe ve Zaviye inşa edilirken ortada yer alan kubbenin üstü yarı açık bırakılmıştır. Karasal iklime sahip olan Şanlıurfa'da hem gün ışığından azami derecede istifade etmek hem de hava dolaşımını sağlayarak yazın sıcaklığının etkisini azaltmayı amaçlayan bir mimari ile tasarlanmıştır (Fotoğraf 4).

Bu türbe ve zaviyenin geçmiş tarihte iki defa tamir gördüğü iç bölümde yer alan batı ve kuzey duvarları üzerinde bulunan kitabelerinden anlaşılmaktadır. Şeyh Mesud Türbesi ve zaviyesi en son 2010 yılında Vakıflar Bölge Müdürlüğü tarafından restore edilmiştir.

Fotoğraf 4. Gökyüzünü Gören Bir Mimari ile İnşa Edilmiştir.

Doğu tarafındaki eyvanın alt kısmındaki bodrumdaki odada, Şeyh Mesut'un mezarı, üstündeki eyvan içerisinde de sandukası vardır. Türbe ve zaviyenin içinde mescidi, çilehaneleri ve misafirler için ayrılan odaları bulunmaktadır (Fotoğraf 5).

Fotoğraf 5. Şeyh Mesud'un Mezarı Bodrum Katında Yer Almaktadır.

Sonuç ve Öneriler

Şeyh Mesud türbe ve zaviyesi hem inanç turizmi açısından ziyaret yeri hem de ziyaretçiler için bir mesire alanıdır. Şeyh Mesud günümüzde halk tarafından Şıh Maksud olarak bilinmektedir. Şeyh Mesud türbesi ve zaviyesi Şanlıurfa şehir yerleşmesi yakınında bulunan iç kalenin güneyinde bulunan tepelik mekânda yer almaktadır. Bu türbe ve zaviye yerleşme alanı ve ulaşım imkânları yeterli olmayan mevkide iken Şanlıurfa'nın nüfus artışına bağlı olarak yerleşme alanları genişlemiş ve zamanla yerleşmeler yakınına kadar gelmiştir. Yerleşmelerin türbe, zaviye ve zaviyenin etrafını çevrelemiştir. Türbe ve zaviyenin etrafındaki yerleşmelerin ulaşımı sağlamak için Şanlıurfa Büyükşehir Belediyesi tarafından düzenli otobüs seferleri düzenlenmesi Şeyh Mesud türbesi ve zaviyesinin daha çok tanınmasına ve erişebilirliğini artırmıştır. Şanlıurfa Büyükşehir Belediyesi tarafından türbe ve zaviyenin çevre düzenlemesi yapılmıştır. Şeyh Mesud türbesi hem bir mesire alanı hem de Şanlıurfa inanç turizmi için önemli bir ziyaret yeri olarak her yıl binlerce yerli ve yabancı turist ziyaret etmektedir.

Sonuç olarak; Şanlıurfa ilindeki turizm faaliyetlerini çeşitlendirmek için, çok zengin bir inanç turizm potansiyeli bulunmaktadır. Tarihi süreç içerisinde çeşitli dinlere mensup insanların yaşadığı, ibadetlerini gerçekleştirdikleri mekânları, günümüzde de aynı dinlere mensup insanlara ve diğer ziyaretçilere tanıtımları yapılarak inanç turizminin hizmetine sunmak gerekmektedir. Şeyh Mesud türbe ve zaviyesinin de Şanlıurfa inanç turizminin gelişmesi ve çeşitlenmesi için yerli ve yabancı turistlere gerekli tanıtımların yapılması inanç turizminin gelişmesi açısından son derece büyük bir öneme sahiptir.

seneldir@gmail.com

Sinan AYDIN
Kocaeli Üniversitesi, Kocaeli Meslek Yüksekokulu, Kocaeli - Türkiye
sinanaydın1704@yahoo.com

Özet: İşkoliklik ve mükemmeliyetçilik, aşırı iş yükü, iş-aile çatışması, A Tipi kişilik ve tükenmişlik kavramlarıyla pozitif ilişkilidir. İşkolik kavramı, "iş" ve "alkolizm" kelimelerinin bir bileşimidir. Çoğu kişi, işkolikle çalışkan olmayı karıştırır. Aşırı iş yükü, ya mevcut zamanda gerçekleştirilecek çok iş olmasından ya da işin gerçekleştirilmesinin çok zor olmasından kaynaklanır. Son çalışmalar göstermiştir ki, mükemmeliyetçilik odaklı davranışlar, başarıyı engeller. İş-aile çatışmasının ilişkili olduğu konulardan bazıları; daha az iş tatmini, daha az yaşam tatmini, daha yüksek stres, artan depresyon ve sıkıntı, fiziksel sağlık şikâyetleri, yüksek tansiyon ve artan hazır gıda tüketimidir. A tipi bireyler arasında işkoliklere daha fazla rastlanmaktadır. İşkolik A tipi bireyler, aynı anda birçok görev yerine getiren, son teslim tarihleriyle yaşayan ve en küçük ertelemeden mutsuz olan bireylerdir. Tükenmişlik ise, aşırı iş yükünden kaynaklanan bir iş stresi durumudur.

Anahtar Kelimeler: İşkolizm, mükemmeliyetçilik, stres.

WORKAHOLISM AND PERFECTIONISM

Abstract: Workaholism and perfectionism are positively correlated with work overload, work-family conflict, type A personality and burnout syndrome. The term "workaholic" is a combination of the words "work" and "alcoholism". Many people confuse hard-working people with workaholics. Work Overload results if there is too much work to perform in the time available, or work that is too difficult for the employee to perform. Recent studies show that perfectionist attitudes actually interfere with success. Work-Family Conflict has been linked to: lower job and life satisfaction, higher stress, increased depression and anxiety, physical health complaints and hypertension, increased fatty food consumption. Type A individuals are often highly achieving workaholics who multitask, drive themselves with deadlines, and are unhappy about the smallest of delays. Burnout is a condition of job stress that results from overwork.

Key words: Workaholism, perfectionism, stress.

Giriş

Bireyler arasında kötü alışkanlıkların sayısı günden güne artmaktadır. Bireyleri böyle kötü alışkanlıklara iten birçok sebep olmasına karşın, içinde bulunduğu aile ortamı, benlik gelişimi ve yetiştiği çevre gibi önde gelen özellikleri saymak mümkündür. Hızla değişen aile yapısının etkisiyle uyuşturucu ya da uyarıcı madde kullanımı ciddi bir problem olarak toplumu ve insan hayatını tehdit etmektedir.

İnsan olma özelliğimizi oluşturan sosyal, biyolojik ve psikolojik boyutlardan birinde, ikisinde veya hepsinde sorun varsa; problem var demektir ve yardım gerektirir. Bağımlılık, 21. yüzyılın önde gelen insanlık sorunudur. **Zevkle çalışsalar da işkolikler**, kendilerine ve yakınlarına (ruhsal, bedensel ve toplumsal olarak) zarar vermeyeceklerini zannederler.

Son yıllar içerisinde meydana gelen teknolojideki hızlı değişim ve ekonomideki küreselleşme, işgörenlerin daha uzun sürelerle çalışmalarına yol açmış ve işkolik davranışlar göstermelerine neden olmuştur. Birçok örgütte kurumsal kültür, kişilerin işte uzun saatler geçirmelerini sağlamaya yönelik ödüllendirici bir nitelik taşımaktadır.

 Copyright © International Science and Technology Conference (ISTEC)

Worth (1987) bu konuyla ilgili yaptığı araştırmada, her on işyerinden dokuzunun kişileri daima işleriyle meşgul olmaya yönlendirdiğini ortaya koymaktadır. Bu tarz işyerleri, e-posta, çağrı cihazları, cep telefonları, taşınabilir bilgisayarlar ve çeşitli teknolojik araç ve gereçlerle çalışanlarına 24 saat işle ilgili olabilme olanağı tanımaktadır. Aynı zamanda kurumların küçülmesi, çalışanları daha fazla çalışmak zorunda bırakmakta, bu durum da çalışanların zihinlerinin sürekli işle meşgul olmasını ve işe motive olmasını gerektirmektedir. Böylece çalışanlarda, işkoliklik bir alışkanlık haline gelmektedir. Ayrıca aşırı çalışmanın ödüllendirildiği bir sistemin olduğu örgütlerde kişilerin işe bağımlı olmaları kaçınılmaz olmaktadır (Garson, 2005'den akt.: Temel, 2006: 112). Kimi zaman ekonomik krizlerin etkisiyle örgütlerdeki çalışan sayısının azaltılması da bireylerin daha uzun sürelerde çalışmak zorunda kalmalarına yol açmaktadır (De La Poza vd., 2014).

İşkoliklik Kavramı

İşkolik kavramı, «İş» ve «Alkolizm» kelimelerinin bileşiminden oluşur. İşkoliklik, 1960'lı yılların sonunda türetilmiş bir kavramdır. Bu dönemde performansı arttıran olumlu bir ruh hali olarak da ele alındığı görülmektedir. Fakat ilerleyen zamanlarda, bireyin sağlığına ve toplumsal ilişkilerine zarar verdiği için, olumsuz bir durum olarak değerlendirilmeye başlanmıştır.

İşkoliklik, ilk olarak Birleşik Amerikalı ilahiyat profesörü Wayne Oates (1971) tarafından alkol ve uyuşturucu bağımlılığı gibi diğer bağımlılık türlerinden hareketle türetilmiştir. İlk olarak 1971 yılında Oates'in "Bir İşkoliğin İtirafları" adlı kitabında kullanılmıştır. Oates, işkolikliği bir çeşit alkol veya uyuşturucu bağımlılığından yola çıkarak "kompulsif ve kontrol edilemeyen bir şekilde sürekli olarak çalışma ihtiyacı" olarak tanımlanmaktadır. Bağımlılık kişileri kontrol altına aldığı için obsesif olmaya sürüklemektedir. Ayrıca işkoliklik, "iş bağımlılığı" anlamında kullanılmakla birlikte "aşırı derecede çalışma" olarak da ifade edilmektedir (Salihoğlu, 2014). Günümüz modern örgütleri için verimliliği düşüren en önemli problemlerden belki de birincisi işkolikliktir. İşkolikler çok çalışmalarına rağmen, iş yoğunluğundan kaynaklanan psikolojik ve fizyolojik problemler nedeniyle yüksek performans gösterememektedirler.

Genellikle araştırmacılar işkolikliği olumsuz bir tutum ve durum olarak ifade etmiştir (Akdağ ve Yüksel, 2010):

- *Maschlowitz (1980) ile Mosier (1983)'e göre, işkoliklik; çalışanların işe koşulların gerektirdiğinden fazla zaman ayırmaları ve haftada 50 saatin üzerinde çalışmanın yanısıra, sürekli işlerini düşünmeleridir.*
- *İşe olan bu ekstra bağlılık ve çalışma saatlerinin fazlalığı, rasyonel bulunmamaktadır.*
- *İşkoliklik aynı zamanda depresyon, kaygı (Haymon, 1993), stres ve mükemmeliyetçilik ile de ilişkilendirilmektedir.*

İşe karşı aşırı ve kontrol edilemez bir bağımlılık olarak tanımlanan işkoliklik, kısa vadede bireyin işine olan ilgisini ve motivasyonunu artırsa da uzun vadede bedensel, ruhsal ve sosyal sorunlara yol açmaktadır (Gülova vd, 2014.). İşkolikliğin «fizyolojik» etkileri sonucunda, bireylerde; sağlık problemleri görülmektedir. Nedeni ise işkoliklerin sağlıklarıyla ilgilenecek vakit bulamamaları veya hissettikleri baskıdan rahatsızlanmalarıdır (Salihoğlu, 2014). Hızlı yemek yeme nedeniyle kilo almak, hızlı yaşamak sonucu iletişim kurduğumuz kişilere yeterli ilgiyi göstermemek, çevremizdeki kişilere daha az sevgi ve ilgi göstermek, hızlı çalışmanın getirdiği artan hata oranı, hızlı karar almanın getirdiği yanlış kararlar, hızlı iş yapmak için daha kalitesiz işler çıkarmak; işkoliklerin yaşadığı üzücü olumsuzluklardandır.

İşkoliklik sadece sağlık sorunlarının değil, iş dışı sosyal ilişkilerin de zayıflamasına neden olmaktadır. İşkolikliğin «sosyal» etkileri açısından; işkolik bireyler enerjilerinin çoğunu işlerinde harcadıkları için sosyal ilişkilerinde azalmalar görülmektedir. Diğer insanların yaşamlarına karşı umursamaz davranmakta, sosyal ilişkilerde daha alıngan davranışlar sergilemektedir.

Literatürde işkolikle ilgili teorik çalışmalar iki kısımda incelenebilir: (Akdağ ve Yüksel, 2010.)

- (1) içsel faktörlerden kaynaklanan işkoliklik (korkular, özgüven eksikliği, kendini değersiz hissetme, mükemmelliyetçilik) (Porter,1996; Killinger, 1991; Scott v.d. , 1997),
- (2) dışsal faktörlerden kaynaklanan işkoliklik (ebeveyn ve/veya toplumun yüksek beklentileri (Dougherty, 1989).

İşkolikler farklı farklı tanımlamalarla sınıflandırılabilmektedir. Robinson yaptığı araştırma sonucunda işkolikleri aşağıda belirtilen kategoriler altında sınıflandırmıştır (Robinson, 2006'dan aktaran Goodman, 2006: 41):

• Hep ya da hiç işkolikler: Bu tip işkolikler yaptıkları işi ya mükemmel yaparlar ya da hiç yapmazlar. Yaptıkları her işin mükemmel olmasını isterler, çevrelerinden de bunu beklerler. Onlar için sadece bekleneni veya isteneni karşılayan performans yeterli değildir. İşe ilgili başarması imkânsız beklentilere sahiptirler.

 Copyright © International Science and Technology Conference (ISTEC)

• Devam eden işkolikler: Bu tip işkolikler işe başlamakta değil bitirmekte zorlanırlar. İş delege etmekten hoşlanmazlar, her şeyi kendileri yapmak isterler. Kendilerine verilen her işi "Hayır" demeden kabul ederler. Ellerinde gereğinden ve olması gerektiğinden fazla iş olduğu içinde işleri zamanında ve istenen kalitede tamamlamakta zorlanırlar.

• Detaycı işkolikler: Bu tip işkolikler işin detaylarına çok fazla odaklanırlar ve işi tamamlasalar bile eksik bir şeyler olduğunu düşünüp tekrar işle ilgili tüm detayları tek tek gözden geçirirler. İşi başkaları yaptığında hep bir şeylerin eksik yapıldığını ve kendisi yapsaydı daha mükemmel olacağını düşünürler. • Kahraman işkolikler: Bu tip işkolikler kendilerinin sorun çözen kahraman olmaları için bilerek sorun ve krizler yaratırlar. Kriz veya sorunu çözen olmanın onları diğer kişilerden ayıran üstün bir özellik olduğuna inanırlar.

1.Alkolizm ile İşkolizmin Karşılaştırılması

a) Hem alkoliklerin hem de işkoliklerin ortak özelliği; aileyi, arkadaşlıkları, kişisel ilişkileri ve diğer sorumlulukları ihmal etmeleridir.

b) Alkolikler; alkol alındığında kendini aktif ve başarılı hissetmektedir. Duygulardan kaçmak için alkole yönelmektedir. **İşkolikler ise;** kendisini daha iyi hissetmek ve kendilerini rahatsız eden duygularından kaçmak için çabalamaktadır.

c) Hem alkoliklerin hem de işkoliklerin diğer bir ortak özelliği, bağımlılığı bıraktıklarında geri çekilme davranışıdır. (Alkolsüz olduğunda endişeli olma ve fiziksel olarak geri çekilme davranışı yaşanmaktadır. Benzer şekilde, işle ilgili olunmadığında da endişeli olma ve fiziksel olarak geri çekilme davranışı söz konusudur.) (Salihoğlu, 2014)

2.İşkoliklik / Çalışkanlık:

İşkolikliğin toplumda kabul edilmiş bir durum olması ve bir problem olarak görülmemesi aslında büyük bir sorundur. Gereğinden fazla çalışmak, sürekli mesai yapmak, sürekli iş düşünmek çalışma hayatında çalışkanlığın göstergesi olarak görülmektedir. İşkolikler, dağınık ve düzensizdir. Çalışkanlar ise organizedir ve odaklanırlar. İşkolikler; daha fazla çalışmak için nedenler arar, iş yapmadıklarında ise kaybolmuş hissederler. Çalışma sayesinde sorunlarını gizler, nasıl ve ne zaman dinleneceğini bilmezler. Çalışkanlar ise ne zaman duracağını bilir. İşkolikler; eve iş getirir, ailesi ile iyi iletişim kuramazlar. Dengesiz ve tek boyutlu hayata sahiptirler. Çalışkanların ise iş dışında bir hayatı vardır.

İşkolizm Ve Mükemmeliyetçilik

İşkoliklik ile ilgili olan bazı kavramlar; bağımlılık, aşırı iş yükü, iş-aile çatışması, alkoliklik, A tipi davranış, çalışmaya tutkunluk, iş stresi, dinlenme zamanlarında çalışmamaktan dolayı can sıkıntısı, yalnızlık, tükenmişlik, yaşam memnuniyetinde azalış ve mükemmeliyetçiliktir. İşkoliklik arttıkça, üzüntü ve stres de artmaktadır. Çalışmaya bağımlılık oluştuğu için çalışmama nedeniyle; işkoliklerde üzüntü, sinirlilik, can sıkıntısı, utanç ve suçluluk gibi olumsuz duygular oluşur. Görünüşe göre işkolik çalışanlar, olumsuz duyguları yaşamamak için kendilerini çalışmaya verirler. Düşük öz değer ve güvensizlik duygularına bir cevap olarak, işkoliklik gelişir. Kaygı, uykusuzluk ve sosyal işlev bozukluğu; işkolikliğin en yaygın olumsuz belirtileridir. Yapılan bir araştırmada zayıf ruh sağlığının, işkoliklikle ilişkili olduğu bulunmuştur (Bartczak & Bulik, 2012).

İşkolikler normal bireylere göre daha fazla mükemmeliyetçi olmaktadırlar. Bu nedenle yetkilerini devretmekte isteksiz davranırlar. Mükemmeliyetçi kişilik tipinde "gerçekçi olmayan yüksek hedeflere ulaşma ile kendini yenilgiye uğratıcı düşüncelere sevk eden" bir yapı söz konusu olmaktadır. Mükemmeliyetçi bireylerin; diğer bireylerin istek ve gereksinimlerine karşı duyarlılık gösterememeleri, ilişkilerinde başarısız olmalarına neden olmaktadır.

a) Mükemmeliyetçilik: Mükemmeliyetçilik, basitçe "Hiç hata ve eksik yapmadan kusursuza ulaşma çabası" olarak tanımlanabilir. Mükemmeliyetçilerin önemsiz ayrıntılarla aşırı meşguliyeti, zaman alıcıdır ve etkinliği azaltıcıdır. Hatalara yönelik tekrar tekrar incelemeler yapılır. Stresli ve gergin hissetmeleri nedeniyle görevlerini ertelerler. İş nedeniyle genellikle gece geç uyurlar. Kişi, kendisinin aptal olduğunu düşünebilir. "Tam bir başarısız olacağım ya da en yüksek standartları başarmalıyım." düşüncesiyle görevlerini yönetme stratejisi söz konusu olabilir. Mükemmeliyetçiliğin temel unsurları; kişinin kendisinden beklentileri, diğerlerinin kişiden beklentileri ve kişinin diğerlerinden beklentileri olarak belirtilebilir. Mükemmeliyetçilik azaldıkça, başarı artar.

 Copyright © International Science and Technology Conference (ISTEC)

Mükemmeliyetçilerin bazı özellikleri şunlardır:

-Eleştirilmeye tahammülleri yoktur: Bu yüzden kusursuz davranma çabasına girerler.
-Kendini yenilgiye uğratıcı: Mükemmeliyetçilikte, aşırı derecede yüksek ve gerçekçi olmayan hedeflere yoğunlaşan, kendini yenilgiye uğratıcı bir dizi düşünce ve davranışa yönelten bir yapı söz konusudur. İşlerin yolunda gitmediğini fark ettikleri anda kaygı yaşamaya başlarlar. Kendilerine zarar verdiklerinin genellikle farkına varmazlar.

-Süreç yerine "hedef" üzerinde odaklanmaları: Bir şeyi elde etmeye çalışırken yaşananlardan zevk almak, süreç sonunda elde edileceklerden daha önemlidir. Yalnızca sonuçtaki başarıyı ya da başarısızlık korkusunu kafalarına taktıkları için, süreç içinde yaşadıkları yoğun kaygılar, kendilerinin tüm çabalarını sabote eder.

Anthony ve Swinson (2000), mükemmeliyetçilerin özelliklerini şu şekilde belirtmiştir:
1.Ya hep ya hiç düşüncesi: Doğru ile yanlış arasında pek çok derece olabileceğini düşünmeden, olayları sadece doğru veya yanlış görme eğilimindedir.

2.Süzgeçten geçirme: Mükemmeliyetçiler, seçici bir şekilde davranarak olumsuz detayları abartma eğilimindedir.
Bu olumlu bilgilerin gözden kaçmasına neden olmaktadır.

3.Zihin Okuma: Genellikle insanların kendisi hakkında olumsuz düşündüklerini sanmaktadırlar.
4.Tünel bakışı: Mükemmeliyetçiler, detaylara fazlaca dikkat ederler ve bu yüzden genel durumu görememektedirler.

5.Kişisel hassasiyet: Genellikle başkalarının fikirlerine aşırı önem verirler, beğenilmek isterler.

6.Felaket olacağını düşünme: Olumsuz olayları, baş edemeyecekleri felaketler olarak nitelendirirler ve kaçınma davranışında bulunurlar.

7.Aşırı katı standartlar ve esnek olamama: Daha azına razı olmayı yenilmek olarak değerlendirirler. Beklentilerini esnetmekte zorlanırlar.

8.Aşırı sorumlu hissetme ve kontrol ihtiyacı: Çevrelerinde olan insanların hata yapmalarından kendini sorumlu görerek, onların davranışlarını kontrol etmenin gerekli olduğuna inanmaktadırlar.

9.Zorunluluklar: İşlerin nasıl olması gerektiği konusunda kurallar belirlerler. Bu kuralları bozduklarında ise, suçluluk ve yetersizlik hissederler.

10.Başkalarına güvenme güçlüğü: Bir işi yaparken başkalarına görev verme veya iş paylaşımı konusunda güçlük
çekerler.

11.Uygunsuz sosyal karşılaştırma: Kendilerini sürekli diğer insanlarla karşılaştırmakta ve bu karşılaştırmalar sonucu daha fazla olumsuz duygu hissetmektedirler.

b) Mükemmeliyetçilik Türleri: Gordon L. Flett, Andrea Green ve Paul L. Hewitt (2004) üç çeşit mükemmeliyetçilik tanımlamıştır:

***1.Kendine yönelik*:** Ulaşılması olanaksız ve gerçek dışı standartlar belirleme eğilimidir. Kişi, kendisine son derece yüksek beklentiler dayatır, hata kabul etmez ve sürekli olarak kendisini eleştirir.

***2.Başkasına yönelik mükemmelliyetçilik*:** Belirlenen gerçek dışı ve yüksek standartlara başkalarının uymasını bekleme eğilimi. Bu kişiler başkalarına iş veremezler, yaptıklarını beğenmez, sürekli hata bulurlar. Genellikle öfke ve doyumlu ilişki kuramama sorunları vardır.

3.Sosyal beklentili mükemmeliyetçilik: Başkalarının kendilerinden ulaşılması olanaksız beklentileri olduğu inancı. Bu kişiler çevrelerinden onay ve takdir görmek için çok yüksek standartlara ulaşmaları gerektiğine inanırlar. Genellikle öfke, standartlara ulaşamadıklarında depresyon ve başkaları tarafından yargılanma korkusu duyduklarında da sosyal kaygı sorunları vardır.

 Copyright © International Science and Technology Conference (ISTEC)

c) Mükemmeliyetçiliğin Nedenleri: Mükemmeliyetçilik, kişinin mevcut durumundan daha üstün bir noktaya ulaşmak amacı ile hedefler koyarak bu hedeflere ulaşmaya çalışmanın ötesinde, takıntılı bir şekilde ulaşılması imkânsız hedefler koyması ve kendi değerini yalnızca koymuş olduğu hedeflere ulaşıp ulaşamaması üzerinden kazandığı başarı ile sağlaması olarak tanımlanabilir (Burns, 1980). Bu kişiler, başarısız olma durumu ile baş edemezler ve kendi değerlerini başarı dışındaki herhangi bir şey üzerinden sağlayamazlar. Sosyal ilişkiler konusunda zorluk çekerler ve çoğunlukla yalnızdırlar. Bunun bir nedeni, kusursuz olmazlarsa diğer insanlar tarafından kabul edilmeyecekleri düşüncesidir. Düşüncelerinin aptalca bulunacağı korkusu ile insanlara yakınlaşamaz ve iç dünyalarını açamazlar. Eleştirileri dinleyip işlevsel olarak algılayamamaları ve kendi benliklerine yapılmış birer tehdit olarak algılamaları, yaşadıkları sosyal sorunların diğer bir nedenidir.

Yetersiz görünmekten korktukları için gerçek duygu ve düşüncelerini açıklamaktan çekinirler. İlişkilerinde sıcaklık ve samimiyet ortamı oluşmaz. Kendilerini yetersiz görürler. Çünkü başarılı insanların kişisel amaçlarına yüksek özgüven ile çok çaba harcamadan ulaştıklarını düşünürler. Kendilerinin geliştirmiş olduğu başarı yöntemlerini yetersiz görürler. Kendilerine sürekli olarak ulaşılması güç hedefler koymaları ve yetersizlik duyguları, öğrenilmiş çaresizlik yaşamalarına sebep olur (Burns, 1980).

Sosyal ortamda sorun yaşadıkça, kabul görebilmek için kusursuz olmaları gerektiğine dair inançları pekişir ve bu sosyal mutsuzluk, bir kısırdöngü halinde devam eder. Onaylanmama ve kabul görmemeye karşı taşıdıkları hassasiyet nedeniyle, sosyal ortamlarda ödülden çok ceza ile karşı karşıya kalırlar (Burns, 1980).

1.Sosyal beklenti: Küçüklükte başkaları tarafından sevilme/takdir görme/onaylanma ve kabul edilme gereksinimlerinin başarı karşılığında doyum görür. Böylece çocuk kendi kendisine başkalarının kendisine verdiği değer kadar değer vermeyi öğrenir ve özgüveni dış etmenlere bağlı olarak biçimlenir. Kendisini eleştirilerden korumak için de, tek silahının "mükemmel olmak" olduğuna karar verir. Bu kimseler başkalarının düşüncelerine ve eleştirilerine karşı duyarlı ve kırılgan birer yetişkine dönüşürler.

2.Sosyal öğrenme: Anne-babaları mükemmeliyetçi olan çocuklar onları taklit etme eğilimine girerler. Çocuklar mükemmel görünen anne-babalarını yüceltir ve onlar gibi olmak ister.

3.Sosyal tepki: Karmaşa içindeki (örneğin, sürekli kavga eden ana-baba, belirsiz ya da tutarsız kuralların olduğu bir ev ortamı) bir ortamda büyümüş ve çeşitli tacizlere (örneğin, fiziksel şiddet görmek, utanca boğulmak) uğramış çocuklarda oluşma olasılığı fazladır. Bu çocuklar, kendi denetleyemedikleri ve öngöremedikleri şeylerin olduğu bir ortamda, denetim duygusu geliştirebilmek amacıyla savunma mekanizması olarak mükemmeliyetçilik geliştirebilir.

d) A Tipi Davranış: A tipi kişiler, genellikle aynı anda birkaç görevi yürütmekte, işin bitiş tarihleri konusunda kendilerini zorlamakta ve en küçük ertelemede mutsuz olmaktadır. İlk olarak kardiyoloji uzmanları Meyer Friedman ve R. H. Rosenman tarafından, A tipi davranışın damar hastalıklarına yol açan bir risk etkeni olduğu belirtilmiştir. Rekabetçi, saldırgan, hızlı konuşan, sabırsız ve gevşeyemeyen kişilerdir.

A tipi davranıştan kaygısızlığa ulaşmak isteyen her kişi için yararlı olabilecek stratejiler:

- **1.Beyninizi yeniden eğitin:** Zorunluluk kelimeleri içeren mükemmeliyetçi düşüncelerinize dikkat edin. Yapmalıyım, zorundayım şeklindeki düşüncelerinizi kontrol edin, doğru mu düşünüyorsunuz? Yoksa duruma bakmanın başka yolları olabilir mi?

- **2.Kökteki mükemmeliyetçi düşünceyi bulun:** Bir sorun nedeniyle strese girdiğinizde nedenini bulmak için birkaç dakika ayırın. Arkadaşınızın şehrinize gelmesi nedeniyle gergin olduğunuzu varsayalım. Arkadaşınızı etkilemek için niçin bu kadar endişelisiniz? Arkadaşınızın, sizden daha iyi olduğunu düşündüğüne inanmanız, mükemmeliyetçi olmanıza yol açar. Şimdi bu kök düşüncenizi değiştirin.

- **3.Alışkanlığınızı değiştirin ve olumsuza «teşekkür ederim, hayır» deyin:** Her akşam, gün süresince olan yeni veya iyi olayları birkaç dakika düşünün.
-
- **4.Yüzde 80/20 planını deneyin:** Zamanınızın % 80'ini hedefinize ayırdıysanız, % 20'si daha dikkatsiz olabilir.

 Copyright © International Science and Technology Conference (ISTEC)

e) .İş-Yaşam Kalitesi: İşkoliklik davranışı, iş-yaşam kalitesinin bir alt boyutu olan iş-yaşam dengesini etkilemektedir. İş yaşam kalitesi yalnızca iş tatminini etkilememekte, aynı zamanda sağlık, aile yaşamı, iş dışındaki boş zamanlar, kültürel ve sosyal yaşam, ekonomik durum, eğitim, arkadaşlık ilişkileri, komşuluk ilişkileri, maneviyat gibi diğer yaşam boyutları üzerinde de etkiye sahiptir. Çünkü yayılma etkisi sayesinde, bir yaşam boyutunda tatmin sağlanması, diğer yaşam boyutlarındaki tatmine etki etmektedir. Uzun çalışma süreleri olan işlerde çalışan bir birey, daha düşük iş yaşam kalitesi algısına sahip olabilmektedir.

Daha düşük iş ve yaşam doyumu (Kossek & Ozecki, 1998) ve daha yüksek stres (Parasuraman & Simmers, 2001); iş yaşam kalitesini etkiler.

f) Tükenmişlik Sendromu ve İşkolizm: Tükeniş, fazla çalışmadan kaynaklanan iş stresi durumudur. İlk kez 1974 yılında Herbert Freudenberg tarafından "başarısız olma, yıpranma, enerji ve gücün azalması veya tatmin edilemeyen istekler sonucunda bireyin iç kaynaklarında meydana gelen tükenme durumu" şeklinde tanımlanan tükenmişlik üzerinde birçok araştırma yapılmış ve yeni tanımlar geliştirilmiştir. En yaygın kullanılan ve kabul gören tanım, kendi adıyla da anılan Maslach Tükenmişlik Ölçeğini (MBI) geliştirmiş olan Christina Maslach'ın tanımıdır (Gülova vd, 2014). Maslach'a göre tükenmişlik, "işi gereği yoğun duygusal taleplere maruz kalan ve sürekli diğer insanlarla yüz yüze çalışmak durumunda olan kişilerde görülen fiziksel bitkinlik, uzun süreli yorgunluk, çaresizlik ve umutsuzluk duygularının, yapılan işe, hayata ve diğer insanlara karşı olumsuz tutumlarla yansıması ile oluşur. İşkoliklik sürecinin yol açtığı bir sonuç olarak tükenmişlik, örgütsel önlemler gerektiren bir hastalıktır.

Sonuç Ve Öneriler

Teknolojik gelişmeler ve çalışma hayatında her geçen gün hızla artan rekabet ortamı kişileri daha iş odaklı yaşamaya itmektedir. Sürekli iş düşünen ve çalışmadığı zaman kendini mutsuz hisseden birer işkolik haline dönüşen çalışanlar, zaman ve işleri yetiştirme baskısı nedeniyle de hayatta yaptıkları her şeyi normalinden 2-3 kat daha hızlı yapmaktadır. İşyerinde mükemmeliyetçilik ile ilgili çalışmalar, mükemmeliyetçilik ve işkoliklikte benzer özellikler bulunduğunu göstermiştir. İşkoliklerin, mükemmeliyetçilerle benzer özellikleri savunulmaktadır. Belki de en doğru varsayım, işkolikliğin özelliklerinden birinin mükemmeliyetçilik olmasıdır.

İşkoliklik problemi yaşayan bir kişinin bu sorunu çözümlemesi için yapması gerekenler aşağıda sıralanmıştır:

- Davranış ve düşünce değişimi: Rasyonel olmayan fikirlerin yerine rasyonel olanları koymak. İşi yaşam amacı ve hayatın merkezi olarak görmemek, iş dışındaki yaşamında farkına varmak. İşkolikliğin çözülmesi gereken bir problem olduğuna inanmak.

- Delegasyon: Çalışma arkadaşlarına da iş ve görev aktarmak, paylaşımda bulunmak.

- Sınırları belirleme: Mesai saati bitiminde çalışmayı bırakmak, iş-özel hayat arasındaki sınırları belirleyip dengeyi sağlayarak stres ve kaygıdan uzak durmak.

- Kaygıyla başa çıkabilme: Az çalışma nedeniyle işini kaybetme kaygısını yenmek için aşama aşama çalışma süresini azaltma. Çalışma süresini bir anda günde 12 saatten 8 saate düşürme zor olacağı için her gün 5 dakika azaltarak çalışma süresini kısaltma ve eve iş götürmemek.
- Hayata eğlence katma: İş dışında hobi ve spor vb. hayata eğlence katıp rahatlamayı sağlayan aktiviteleri zaman kaybı olarak görmemek, bu tip faaliyetlere zaman ayırmak.

İşkolik eşe sahip olan bireylere sunulan öneriler de yararlı olabilir: Bireye öncelikle içinde bulunduğu durum, kendisine ve etrafına verdiği zararlar fark ettirilmeli ve evde geçireceği zamanı en iyi şekilde geçirmesi sağlanmalıdır. Sosyal aktiviteler planlayarak eşi işten biraz da olsa uzak tutmaya çalışmalı, ev veya aile ile ilgili konularda işkolik eşten yardım istenmeli. Örneğin, işkolik eşin haftada iki gün çocukları okuldan alması veya her ay bir cumartesi-pazar ailece, arkadaşlarla bir yere gidilmesi sağlanmalıdır. İşkolik eşin bir hobi edinmesine yardımcı olunmalı ve teşvik edilmeli. Bu yöntemler yeterli gelmiyorsa, sorun büyüyorsa bir profesyonelden destek alınmalıdır.

Mükemmeliyetçilikle mücadele için; istek ve gereksinimlere uyan gerçekçi hedefler belirlenmelidir. Böylece bireyin kendine duyduğu güven artacaktır. İşler önem sırasına göre planlanmalıdır. Bir işte yüzde yüz başarı sağlanamayan durumlarla yüzleşmeli, bu durumun getirileri veya kaybettirdikleri değerlendirilmelidir. Sonuca değil, sürece odaklanılmalı, yapılan işten zevk almayı öğrenmelidir. Her insanın ilgi, yetenek ve gereksiniminin

 Copyright © International Science and Technology Conference (ISTEC)

farklı olduğu kabul edilmelidir. Mükemmeliyetçiliğin arkasındaki korkularla nedenini sorgulayarak yüzleşmelidir. Hatalardan neler öğrenilebileceği değerlendirilmelidir. Eleştirilerle nasıl baş edileceği öğrenilmelidir. Dış çevrenin değerlendirmelerine karşı aşırı hassas yaklaşım yerine kişinin kendi kapasitesi ölçüsünde performans hedefini belirlemesi de oldukça önemlidir. Hayatın "Hep ile Hiç" arasındaki bir anlayıştan ibaret olmadığını fark etmek gerekir. Kaybetmeyi göze almak gerekir. Katı zaman sınırlamaları konulmamalıdır. Mükemmel, iyinin düşmanıdır.

İZMİR ALİAĞA BÖLGESİNDE RÜZGAR TÜRBİNLERİNİN YÜKSEKLİĞE BAĞLI ENERJİ DEĞİŞİMLERİNİN İNCELENMESİ

Ibrahim Aydın
ibrahimaydin78@hotmail.com

Ahmet Murat Pınar
ahmet.pinar@cbu.edu.tr

Ibrahim Fadıl Soykök
ibrahim.soykok@cbu.edu.tr

Bu çalışmada, Türkiye'de İzmir-Aliağa bölgesinde bulunan Ege Üniversitesi Aliağa Yerleşkesi Kampüs Alanınında 5kW lık rüzgar türbininün farklı yüksekliklerde bir yılda üreteceği elektrik enerji değerleri hesaplanarak yorumlanmıştır.

Çalışmada; 5kW'lık bir rüzgar türbininin İzmir-Aliağa bölgesinde üreteceği elektrik enerji miktarlarının belirlenmesi amaçlanmıştır. Bu türbinin üretebileceği enerji miktarlarını belirleyebilmek için, İZMİR-Aliağa bölgesindeki kampüs alanı içerisine kurulan ölçüm istasyonunundan yararlanılmıştır. Bu istasyonundan 27 m yükseklikte 1 yıllık saatlik rüzgar hız ve yön ölçüm verilerileri alınarak değerlendirme yapılmıştır. 1 yıl 8760 saatlik bu ölçüm verileri excell programından yararlanarak bilgisayara girilmiştir. 5kW'lık rüzgar türbininin 20, 30 ve 40 m yükseklikte üreteceği, teorik güç, maksimum güç ve saatlik elektrik enerji değerleri hesaplanmıştır.

Çalışma sonucunda, küçük güçlü rüzgar türbinleri ile bu kampüs alanının aydınlatma ve bilgisayarların kullanımı gibi temel bazı ihtiyaçlarının karşılanabileceği kanaatine varılmıştır.

KALMAN FILTER OFFLINE PARAMETER TUNING VIA GENETIC ALGORITHM AND A PASSENGER JET AIRCRAFT STATE ESTIMATION EXAMPLE

Aziz Kaba
azizkaba@anadolu.edu.tr

Emre Kiyak
ekiyak@anadolu.edu.tr

Kalman filter has been widely usedfor parameter estimation at aviation industry for over 50 years. Some applications of Kalman filter are, noise elimination, state and parameter estimation, sensor fusion, integrated measurement unit and global positioning system coupling for navigation solutions.

If noise to be eliminated has uncorrelated Gaussian distribution, then Kalman filter fulfills very satisfying results. But an important issue arises at the applications where we are assumed to know exact values of the system modeling and sensor measurement error correlation matrices. When we have no idea about these matrices or have little knowledge which yields unrealistic values will cause divergence problems due to miscalculation of the error covariance matrix and also Kalman gain. Since these matrices are hard to know and need serious tests to tune them statistically from observation data, one may try to find these values via optimization algorithms.

Popular optimization algorithms for these usage are artificial neutral networks and evolutionary algorithms thanks to their derivative free approach. Since neutral networks and fuzzy logic algorithms are applied to online parameter tuning or namely adaptive tuning, this paper is intended to use genetic algorithm because of offline tuning.

Optimization procedure heavily relies on choosing the right minimizing function which is called fitness function at genetic algorithms. In our case, also Kalman filter depends, fitness function is chosen as error covariance matrix

$E\{(x-e_x)(x-e_x)'\}$

where x is the state vector for aircraft, e_x is estimated value of the state vector and E{} is the expectation operator. So optimum correlation matrices values which minimizes above equation will force the Kalman filter to find the optimal values for aircraft states and prevents the divergence problems.

At this paper, several different correlation matrices are optimized via proposed genetic algorithm based on monte carlo simulations and improvements are compared as final conclusion.

Keywords: kalman filter, parameter tuning, estimation, genetic algorithm, aircraft

KARESEL KESİTLİ BORU HATTI ETRAFINDAKİ AKIMIN SAYISAL İNCELENMESİ

A.Alper ÖNER

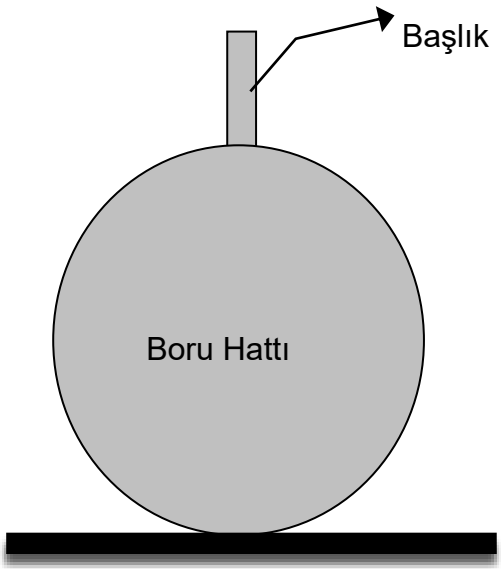
Erciyes University, Department of Civil Engineering, Kayseri- Türkiye

alperoner@erciyes.edu.tr

Özet: Boru hatları, aşırı hidrodinamik kuvvetlerden korumak veya balıkçılıktan kaynaklanabilecek zararlara engel olmak amacıyla genellikle deniz tabanına gömülmektedir. Gömme işlemi mekanik şekilde yapılan hendek açılması ile yapılabildiği gibi fırtına durumlarında boru hattı ve deniz tabanı arasındaki etkileşim sayesinde kendi kendine de meydana gelebilmektedir. Deniz tabanında yapılan pahalı hendek açma operasyonlarından kaçınmak ve öz-gömülme hız ve derinliğini artırmak amacıyla boru hattı üzerine başlık yerleştirilmesi tekniği geliştirilmiştir. Daha önce yapılan deneysel ve sayısal çalışmalar, başlığın boru hattı memba ve mansabında oluşan ayrılma bölgelerinin boyutlarını artırdığı ve bu ayrılma bölgeleri içerinde oluşan girdaba benzeyen enerjik yapıların sızmayı ve borulanmayı artırarak deniz tabanındaki oyulmayı tetiklediğini göstermektedir. Borulanma ve sızmanın artmasıyla boru hattı altındaki deniz tabanının taşıma gücü azalmakta ve nihayet başlığın sebep olduğu ters yönlü kaldırma kuvveti boru hattını deniz tabanına doğru itmektedir. Onlarca yıldan beri birçok projede uygulanmış olmasına karşın, başlığın boru hattı etrafındaki akıma, boruya etkiyen kuvvetlere ve oyulma mekanizmasına etkisi konusunda yayınlanan yeterli veri bulunmadığı görülmektedir. Bu çalışmada kare ve dairesel kesitli boru hatları üzerine yerleştirilen 0.5D yüksekliğindeki başlığın akım alanına etkisi sayısal olarak analiz edilmiştir. Oluşturulan sayısal model, üç farklı türbülans kapatma yöntemi kullanılarak çözülmüştür. Simülasyon sonuçları, boru hattı etrafındaki ayrılma bölgesi genişliğinin karesel kesitlerde daha geniş olduğunu ve başlığın varlığının ayrılma bölgelerinin genişliklerini daha da artırdığını göstermektedir.

Anahtar Kelimeler: Boru hattı, Başlık, Öz-gömülme, Ayrılma Bölgesi

Abstract: Pipelines are often buried underneath the seabed to be protected from excessive hydrodynamic forces or to avoid the damage of fishing gear. The pipeline is buried completely in the seabed either by mechanical trenching or by itself during storm conditions due to interaction between pipeline and the erodible seabed. To avoid expensive trenching operations and to increase the speed and final depth of the self-burial process, the technique of applying a spoiler on the top of a submarine pipeline has been developed. Past experimental and numerical researches showed that spoiler increases the length of the upstream and downstream separation regions and energetic vortical structures in this separation zones stimulate the scouring process by increasing the degree of seepage and piping that takes place on the seabed. The processes of piping and seepage both initially decrease the value of the bearing capacity of the seabed beneath the pipeline and eventually spoiler cause a downward lift force to push the pipeline into the seabed. In spite of the usage of the spoiler in numerous pipeline projects for decades, it seems that there is, still, a paucity of data regarding the effect of the spoiler on the flow area around the pipeline, the forces acting on the pipe and the scouring mechanism. In the present study, the flow field around a pipeline analyzed numerically for circular and square shape pipelines with a spoiler of 0.5D heights. The simulations analyzed by three turbulence closure methods. The simulations show that the size of the separation areas around the pipeline found to be larger for the square shaped one and the existence of the spoiler is enlarging the separation areas.



Keywords: Pipeline, Spoiler, Self-burial, Separation Area

Giriş

Katı madde bakımından hareketli bir taban üzerine, kıyı ötesine veya nehir tabanına yerleştirilen boru, iletim hatları veya deşarj boruları gibi küt cisimler sebebiyle tabanda oyulmalar meydana gelebilmektedir. Oluşan oyulmalar neticesinde, zamanla, boru yada iletim hattı ile taban arasında boru çapına eşdeğer büyüklüklere varabilen boşluklar oluşabilmekte ve bunun sonucunda, boru hattı tabana yakın bir mesafede askıda kalabilmektedir. Bir boru hattının veya yatay bir silindirik yapı elemanın tabana yakın şekilde monte edilmesi yada zamanla erozyon sebebiyle askıda kalması durumunda silindir ile taban arasında oluşan boşluk mesafesi, silindir etrafındaki akım alanı özelliklerinin belirlenmesinde tasarım açısından önem kazanmaktadır. Ayrıca tabandaki aşınma boru hattı boyunca ilerlediğinde boru hattı kendi ağırlığı altında tabana gömülmektedir (Sumer ve Diğ., 2001). Boru hattı memba ve mansabında oluşan oyulmalarda, tabanda oluşan vortisitelerin de etkili olduğu bilinmektedir (Mao, 1988). Hidrodinamik kuvvetlerden ya da insanların sebep olabileceği zararlardan korumak için iletim hattının taban içerisine gömülmesi gerekebilmektedir. İletim ya da boru hattı, zaman içerisinde

 Copyright © International Science and Technology Conference (ISTEC)

meydana gelen akıntılar, fırtına gibi doğal etkenlerle, yukarıda anlatıldığı gibi, kendi kendine taban içerisine gömülebilmektedir. Ancak doğal etkenler her zaman beklendiği gibi sonuçlanmayabilmektedir. Ayrıca balıkçılık gibi faaliyetlerin yapıldığı yada hidrodinamik kuvvetlerin fazlasıyla etkin olduğu bölgelerde boru hattını, oluşabilecek zararlardan korumak için tabanda belli derinliklere gömmek gerekebilmektedir. Bunun için, hattın geçtiği güzergâhta tabanda bir hendek açıp boruyu yerleştirmek ve hendeği doldurarak borunun gömülmesi gerekmektedir ki, bu işlemler boru hattı maliyetini fazlasıyla artırmaktadır. Bu sebeple boru hattının gömülmesinde alternatif, ucuz yöntemler araştırılmaktadır. Daha önce yapılan çalışmalar (Hulsbergen,1984, Hulsbergen ve Bijker, 1989) bir boru hattının kendi kendine gömülmesini artırmanın ve hızlandırmanın boru hattı üzerine bir başlık (spoiler) yerleştirilerek yapılabileceğini göstermiştir (Şekil 1). Boru üzerine başlık yerleştirilmesi yeni bir fikir gibi görülse de arabaların, bacaların üzerine başlık yerleştirilmesi işlemi eskiden beri yapılmaktadır. Bütün bu başlık yerleştirme işlemlerinin ortak amacı cisim etrafındaki akım alanının istenilen şekilde değiştirilmesidir.

Şekil 1. Geçirimsiz Taban üzerine Oturan Başlıklı Boru Hattı

İlk olarak Kuzey (Dutch) denizinde uygulanan başlıklı boru hattı, günümüzde birçok projede uygulanmaktadır. Boru hattı üzerine başlık yerleştirilmesinin, oluşan oyulma miktarını artırdığı gibi başlıksız bir boru hattına göre 10 kata kadar daha hızlı gömülmeye sebep olduğu bildirilmektedir (Hulsbergen ve Bijker, 1989). Bu konuda yapılan deneysel ve teorik çalışmalar, oyulma miktar ve hızında meydana gelen artışa sebep olarak, yerleştirilen başlığın neden olduğu blokaj etkisini ve taban ile boru hattı arasındaki akım yoğunluğunun artmasını ana etkenler olarak göstermektedir (Mao,1988, Chiew 1992).

Birçok projede uygulama alanı bulmuş olmasına karşın, konunun ticari boyutu sebebiyle boru hattı üzerine yerleştirilen başlığın boru hattı etrafındaki akıma etkisi konusunda literatüre yansıyan yeterli verinin bulunmadığı görülmektedir. Bu çalışmada dalga etkisinin hissedilmediği düzenli akıntı durumunda, aynı çapa (D=50mm) sahip dairesel ve kare kesitli bir boru üzerine yerleştirilen, boru çapının yarısı yüksekliğe sahip (0.5D), başlığın akımda neden olduğu değişimleri incelemek amacıyla, ANSYS® 14-Flotran CFD(HAD) paket programı kullanılarak sayısal bir model oluşturulmuş ve dairesel ve kare kesit için elde edilen simülasyon sonuçları karşılaştırılmıştır.

Temel Denklemler

Silindir etrafındaki iki-boyutlu, düzenli, sıkışmayan, türbülanslı akımda hareketi idare eden, temel denklemler aşağıdaki gibi yazılabilir;

$$\frac{\partial u_i}{\partial x_i} = 0 \tag{1}$$

$$\rho u_j \frac{\partial u_i}{\partial x_j} = \rho K_i - \frac{\partial p}{\partial x_i} + \mu \frac{\partial^2 u_i}{\partial x_j \partial x_j} + \frac{\partial}{\partial x_j}(-\rho \overline{u_i' u_j'}) \tag{2}$$

denklemdeki türbülans kayma gerilmesi bünye denkleminden elde edilmiştir ve aşağıdaki gibi verilebilir:

 Copyright © International Science and Technology Conference (ISTEC)

$$\tau_{ij} = -\rho\overline{u_i' u_j'} = \eta\left(\frac{\partial u_i}{\partial x_j} + \frac{\partial u_j}{\partial x_i}\right) \quad (3)$$

denklemde yer alan η, türbülans viskozitesi olarak adlandırılır. Hesaplamalı Akışkanlar Dinamiği (CFD) yöntemleri ile yapılan modellemelerde, denklemindeki η türbülans viskozitesinin belirlenmesi için farklı türbülans modelleri geliştirilmiştir.

Bu çalışmada, akışkan hareketini idare eden denklemlerin sayısal çözümü, standart k-ε, standart k-ω ve SST türbülans modelleri kullanılarak, sonlu elemanlar yöntemine dayalı olarak çalışan ANSYS®14 paket programı ile yapılmıştır.

Standart k-ε türbülans kapatma modeli (Launder ve Spalding, 1974)

İki denklemli türbülans kapatma modellerinin en çok bilinenlerinden olan k-ε türbülans kapatma modelinde türbülans viskozitesi η, türbülans kinetik enerjisi, k, ve onun kayıp oranı, ε'a bağlı olarak aşağıdaki gibi verilmiştir:

$$\eta = \rho C_\eta \frac{k^2}{\varepsilon} \quad (4)$$

Denklem 4'teki C_η sabittir ve genellikle 0.09 değerini almaktadır.

Standart k-ω türbülans kapatma modeli (Wilcox, 1988)

k-ε türbülans kapatma modelinden sonra geliştirilmiş olan iki denklemli türbülans kapatma modellerinden biri olan ve katı sınır yakınlarında daha iyi sonuç vermesi için tasarlanan k-ω türbülans kapatma modelinde türbülans viskozitesi η'nın hesaplanmasında türbülans kinetik enerjisi, k'nın yanında özgül kayıp oranı olarak isimlendirilen ω için ikinci bir transport denkleminin çözümü gerekmektedir;

$$\eta = \rho \frac{k}{\omega} \quad (5)$$

Denklemdeki ω, birim türbülans kinetik enerji için türbülans kayıp oranıdır ve aşağıdaki gibi ifade edilmektedir:

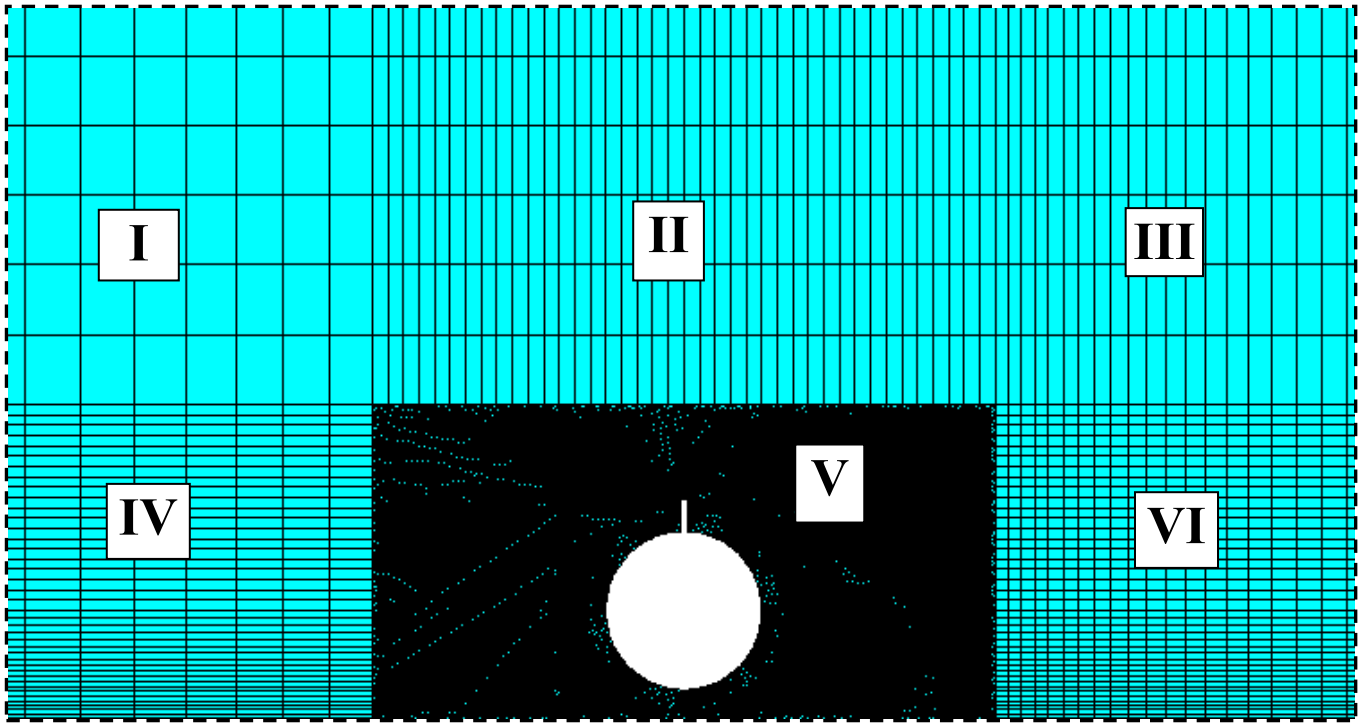
$$\omega = \frac{\varepsilon}{C_\eta k} \quad (6)$$

SST türbülans kapatma modeli (Menter, 1994)

k-ε ve k-ω türbülans kapatma modellerinin birleşiminden oluşmaktadır. sst türbülans kapatma modelinde, katı sınıra yakın bölgelerde daha iyi sonuç verdiği biline k-ω modeli katsayıları kullanılırken, katı sınırdan uzak bölgelerde ise k-ε model katsayılarına geçiş yapılmak suretiyle her iki modelin üstün yönleri tek bir modelde birleştirilmeye çalışılmıştır.

Çözüm Bölgesi ve Sınır Şartları

Başlıklı ve başlıksız boru hatları etrafındaki akım alanının sayısal olarak hesaplanabilmesi için oluşturulan sayısal hesap bölgesi geometrisi, sınır ve başlangıç şartları Şekil 2'de verilmiştir. Çözüm bölgesinin orijini silindir merkezi olarak seçilmiştir. Katı yüzeyleri oluşturan kanal tabanı ve silindir yüzeyinde hız sıfır (no-slip) sınır şartı kullanılırken üst yüzey ve çıkış atmosfer (p=0) sınır şartı ile tanımlanmıştır. Girişte ise akımın yatayda u0=190mm/s 'lik serbest akım hızıyla aktığı kabulü yapılmıştır ki bu hıza karşılık gelen boru çapına bağlı Reynolds sayısı $\mathrm{Re} = \frac{U_0 D}{\nu}$ =9500 (ν; akışkan viskozitesi) olmaktadır.



Şekil 2. Sayısal Hesaplama Bölgesi ve Sınır Şartları

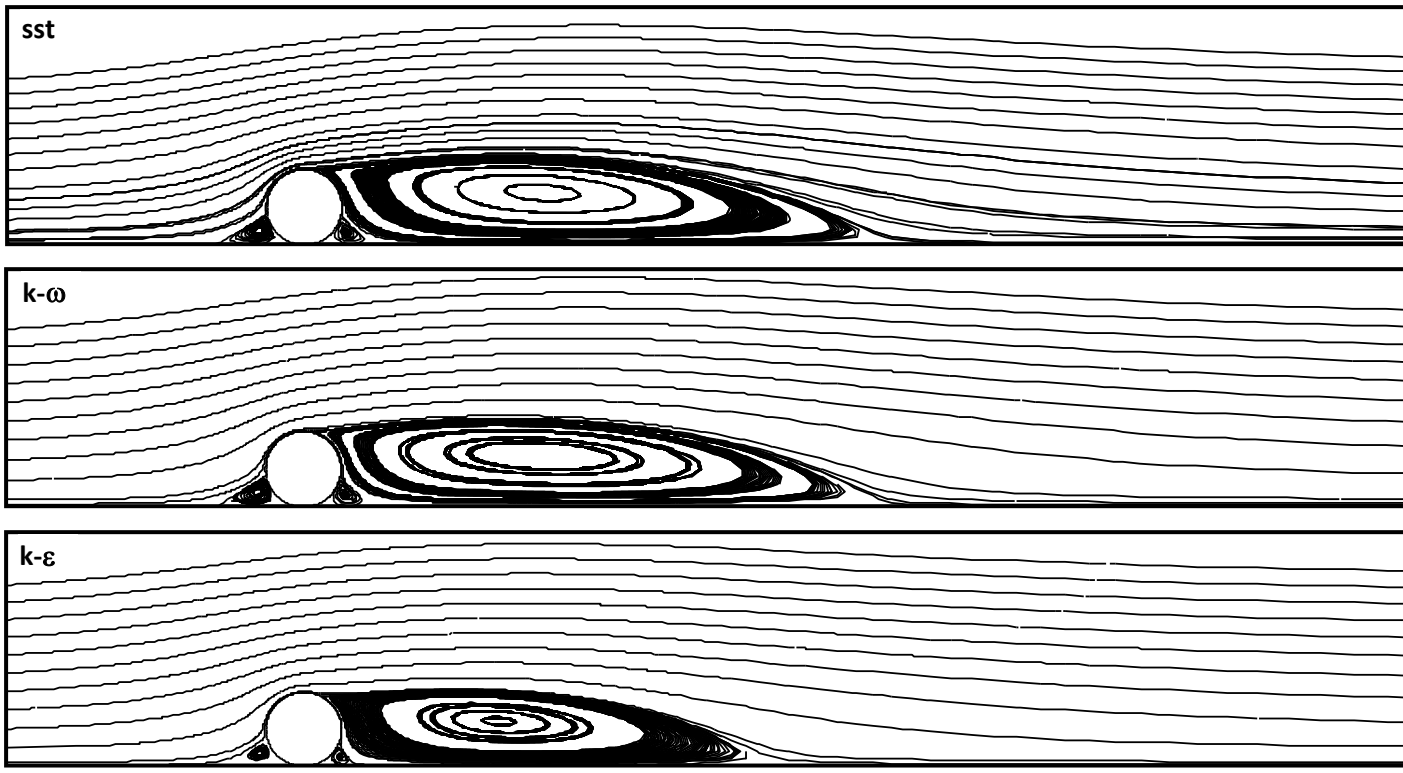
Şekil 2'de verilen sınır şartlarına göre oluşturulan sayısal model ile (1) ve (2) denklemlerinin hız ve basınç için sayısal benzemiş sonuçları, sonlu elemanlar yöntemine dayalı olarak çalışan ANSYS 14.0 CFD paket programı kullanılarak yapılmıştır.

 Copyright © International Science and Technology Conference (ISTEC)

Sonlu Elemanlar Hesap Ağı

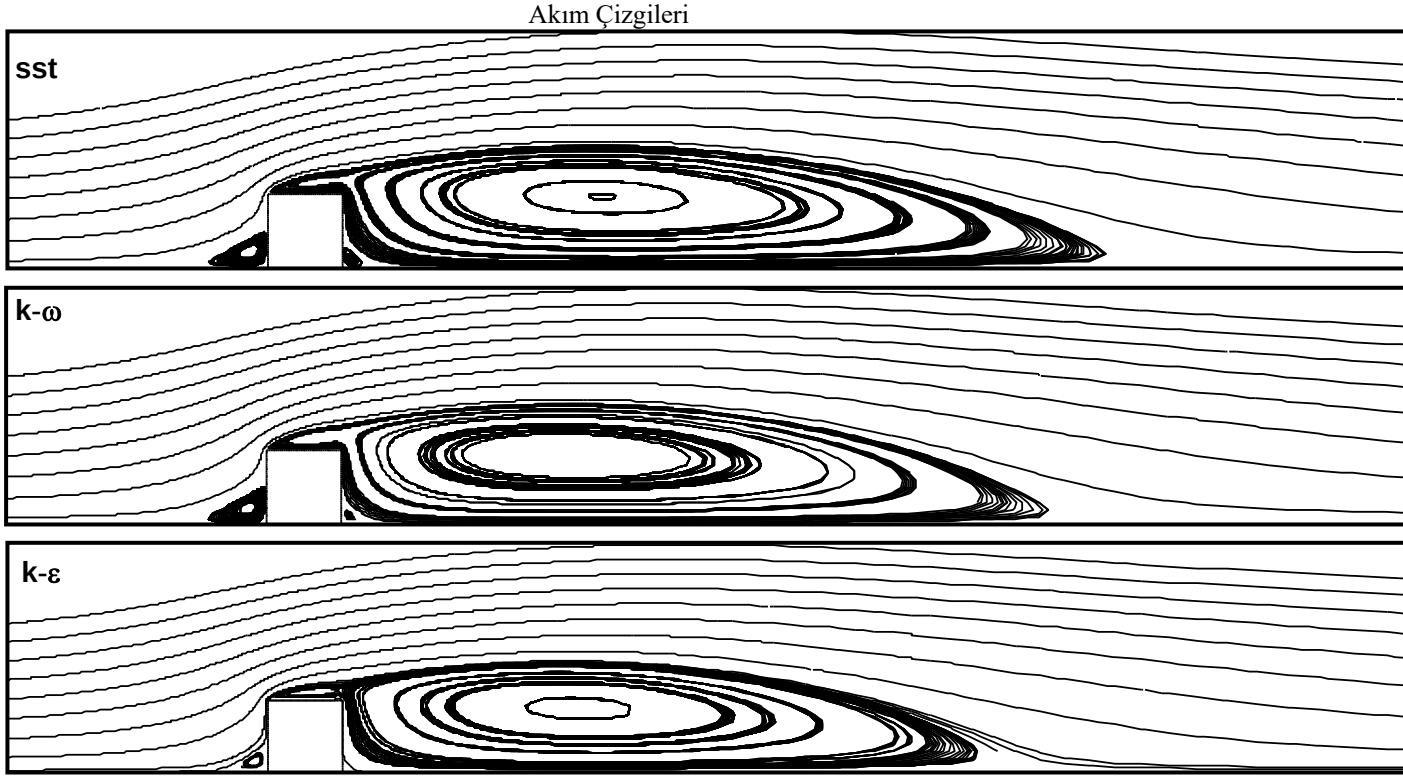
Bu çalışmada oluşturulan sayısal modelde ağ çalışması yapılmamıştır. Farklı sıkılığa sahip, optimum ağ yapısının aranmasından çok türbülans kapatma yöntemlerinin sonuca etkisi ve kare kesit ile başlığın akım alanında oluşturduğu değişimler irdelenmiştir. Buna karşın sayısal modellemelerde çok sık ağ kullanmanın çözüm süresini uzatmasına karşın sonuca fazla etkimediği, pozitif basınç gradyanı oluşan bölgelerde ve katı sınıra yakın bölgelerde daha sık ağ yapısı kullanmanın gerektiği önceki çalışmalardan bilinmektedir (Öner, 2016). Bu sebeple sayısal hesaplama bölgesi, akım alanı içine yerleştirilen boru hattından etkilenme derecesine göre 6 farklı bölgeye ayrılmış ve farklı yoğunluğa sahip olacak şekilde ağ geometrisi oluşturulmuştur. Şekil 3'de görüldüğü gibi, hesaplamalarda dörtgen eleman kullanılan IV ve VI bölgeleri tabana doğu sıklaştırılırken I, III, IV ve VI bölgeleri aynı zamanda boru hattına doğru da sıklaştırılmıştır. Boru hattının varlığından en çok etkilenen V bölgesinde ise çok daha yoğun bir eleman yapısı kullanılmış ve silindir şeklinden dolayı ağ şekillerinde oluşan bozuklukları engellemek amacıyla üçgen eleman seçilmiştir. Şekil 3'de görülen I ve II bölgelerinde 1250, III, IV ve VI bölgelerinde ise 2500 quadratik eleman kullanılmıştır. Silindir etrafındaki V bölgesinde ise yaklaşık 20000 üçgen eleman kullanılmıştır.

Şekil 3 Sayısal Hesaplama Ağı



Bulgular

Akım çizgileri



Şekil 4, Şekil 5, Şekil 6 ve Şekil 7'de oluşturulan sayısal model ile elde edilen hız alanlarının değerlendirilmesi sonucu bulunmuş olan başlıksız silindirik, başlıksız kare, başlıklı silindirik ve başlıklı kare kesitli boru hatları etrafındaki akım çizgileri verilmiştir.

Hesaplamalarda kullanılan sst, k-ω ve k-ε türbülans kapatma modellerinden elde edilen sonuçlar incelendiğinde k-ω ile elde edilen sonuçların sst ve k-ε ile elde edilen sayısal benzemiş sonuçlarının arasında bir görüntü verdiği belirlenmiştir. sst modelinde tabanda k-ω, tabandan uzakta k-ε model katsayılarının kullanıldığı düşünülürse bunun beklenen bir sonuç olduğu söylenebilir. Akım çizgileri incelendiğinde; sst ile elde edilen boru hattı etrafındaki ayrılma bölgeleri ölçülerinin k-ω ve k-ε modelleri ile elde edilenlere nispeten daha geniş olduğu belirlenmiştir.

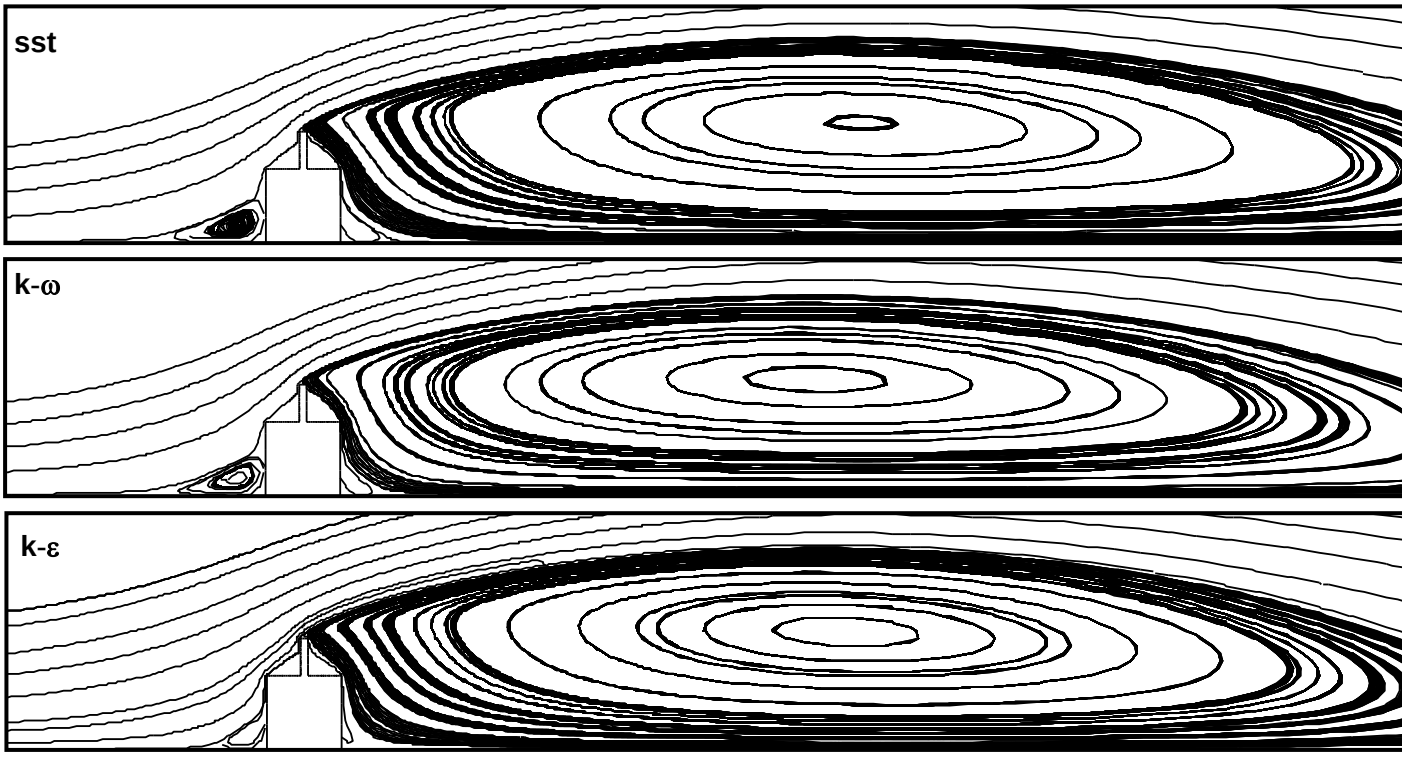
Şekil 4 Başlıksız Dairesel Bir Boru Hattı için sst, k-ω ve k-ε Türbülans Kapatma Modelleri ile elde Edilen Sayısal Akım Çizgileri



Şekil 5 Başlıksız Kare Kesitli Bir Boru Hattı için sst, k-ω ve k-ε Türbülans Kapatma Modelleri ile elde Edilen Sayısal Akım Çizgileri

Şekil 4 ve Şekil 5 incelendiğinde, dairesel yerine kare kesitli boru hattı kullanılması durumunda, özellikle boru hattı mansabındaki ayrılma bölgesi boyutlarının önemli ölçüde arttığı görülmektedir. Ancak, Şekil 6 ve Şekil 7'de görüldüğü gibi aynı şeyi boru hattı üzerine 0.5D yüksekliğe sahip bir başlık yerleştirilmesi halinde söylemek mümkün değildir. Zira her iki kesit şeklinde de ayrılma bölgelerinin genişlikleri yaklaşık aynı kalmaktadır.

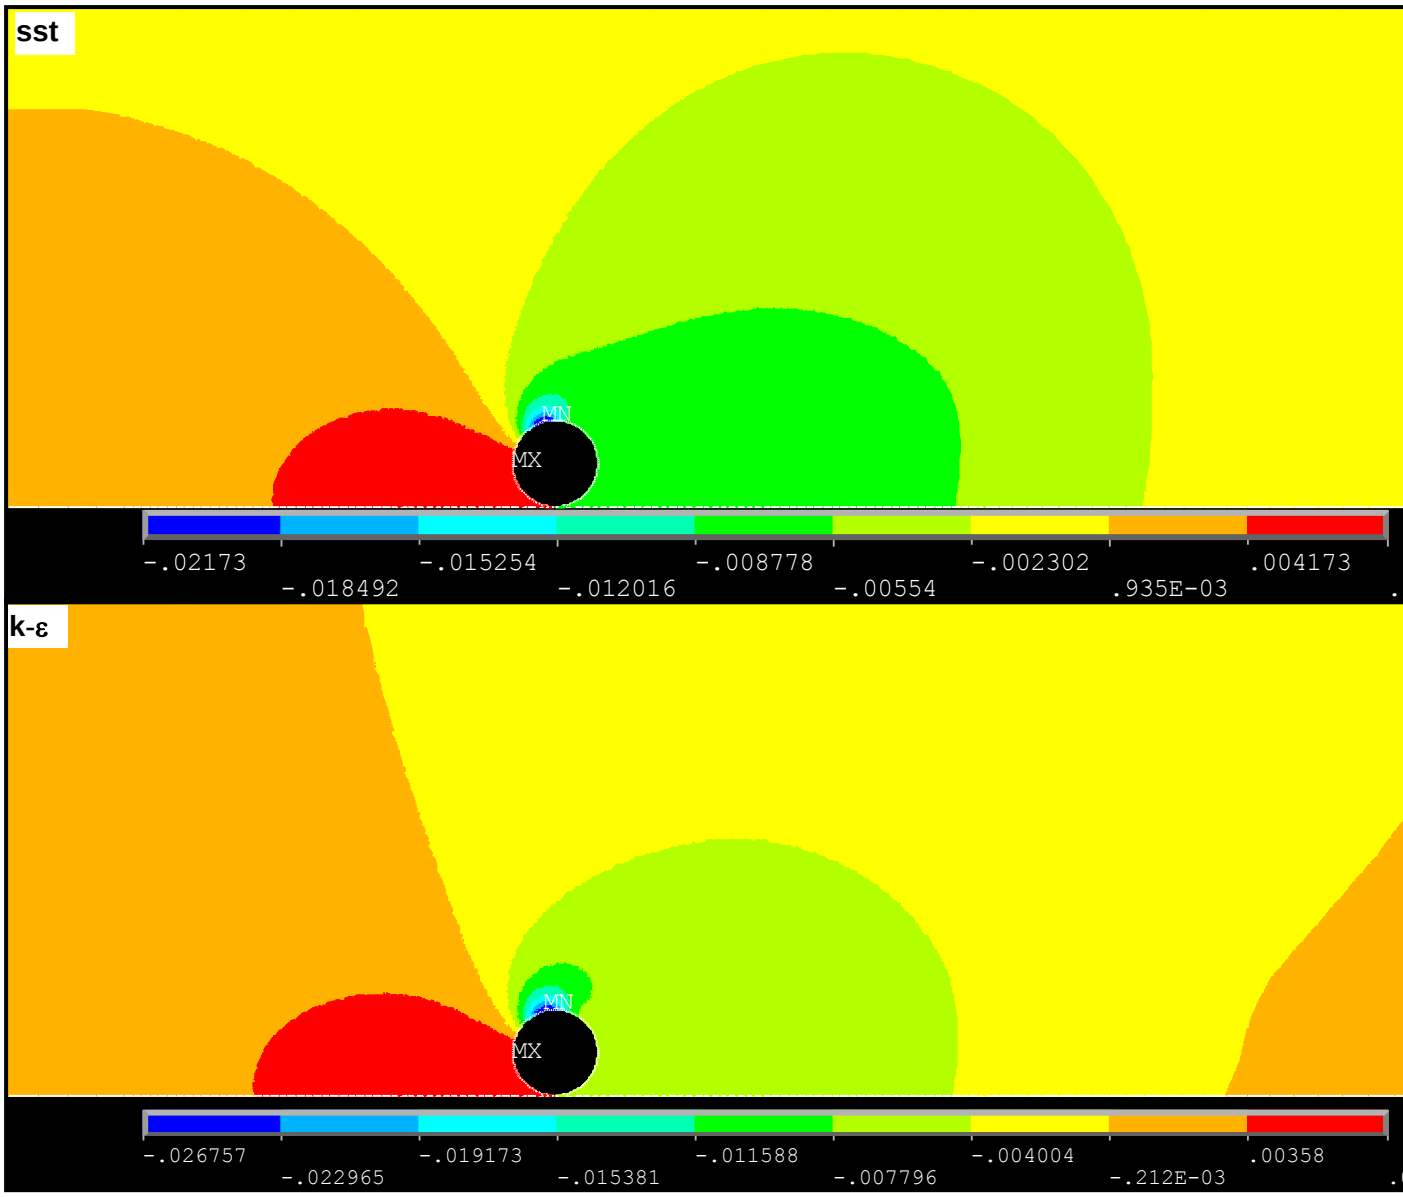
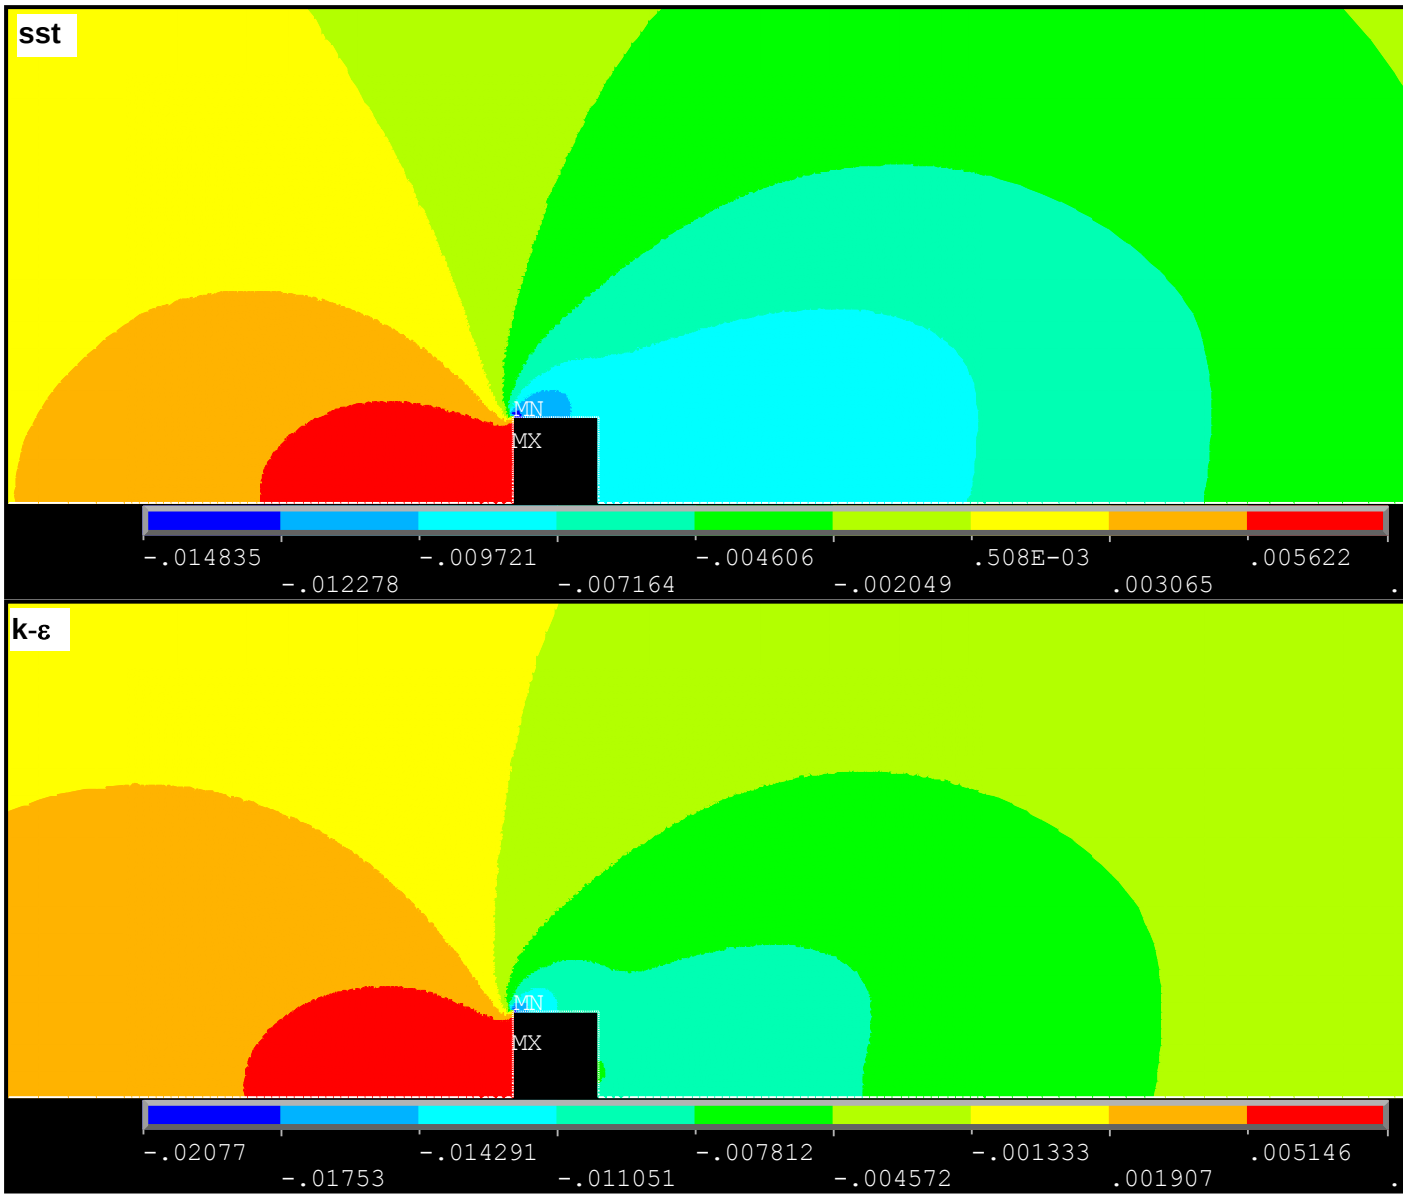
Şekil 6 Başlıklı Dairesel Bir Boru Hattı için sst, k-ω ve k-ε Türbülans Kapatma Modelleri ile elde Edilen Sayısal Akım Çizgileri



Şekil 7 Başlıklı Kare kesitli Bir Boru Hattı için sst, k-ω ve k-ε Türbülans Kapatma Modelleri ile elde Edilen Sayısal Akım Çizgileri

Basınç Dağılımı



Bu bölümde, oluşturulan sayısal model bulgularına dayanarak boru hattı etrafındaki akım alanında meydana gelen basınç dağılımının değişimi irdelenmiştir. Üstteki bölümde de bahsedildiği gibi k-ω türbülans kapatma modeli sst ve k-ε arasında kalan bir sonuç vermektedir. Dolayısıyla bu bölümde sadece sst ve k–ε türbülans kapatma modeli ile elde edilen sayısal basınç alanlarının verilmesi yeterli görülmüştür.

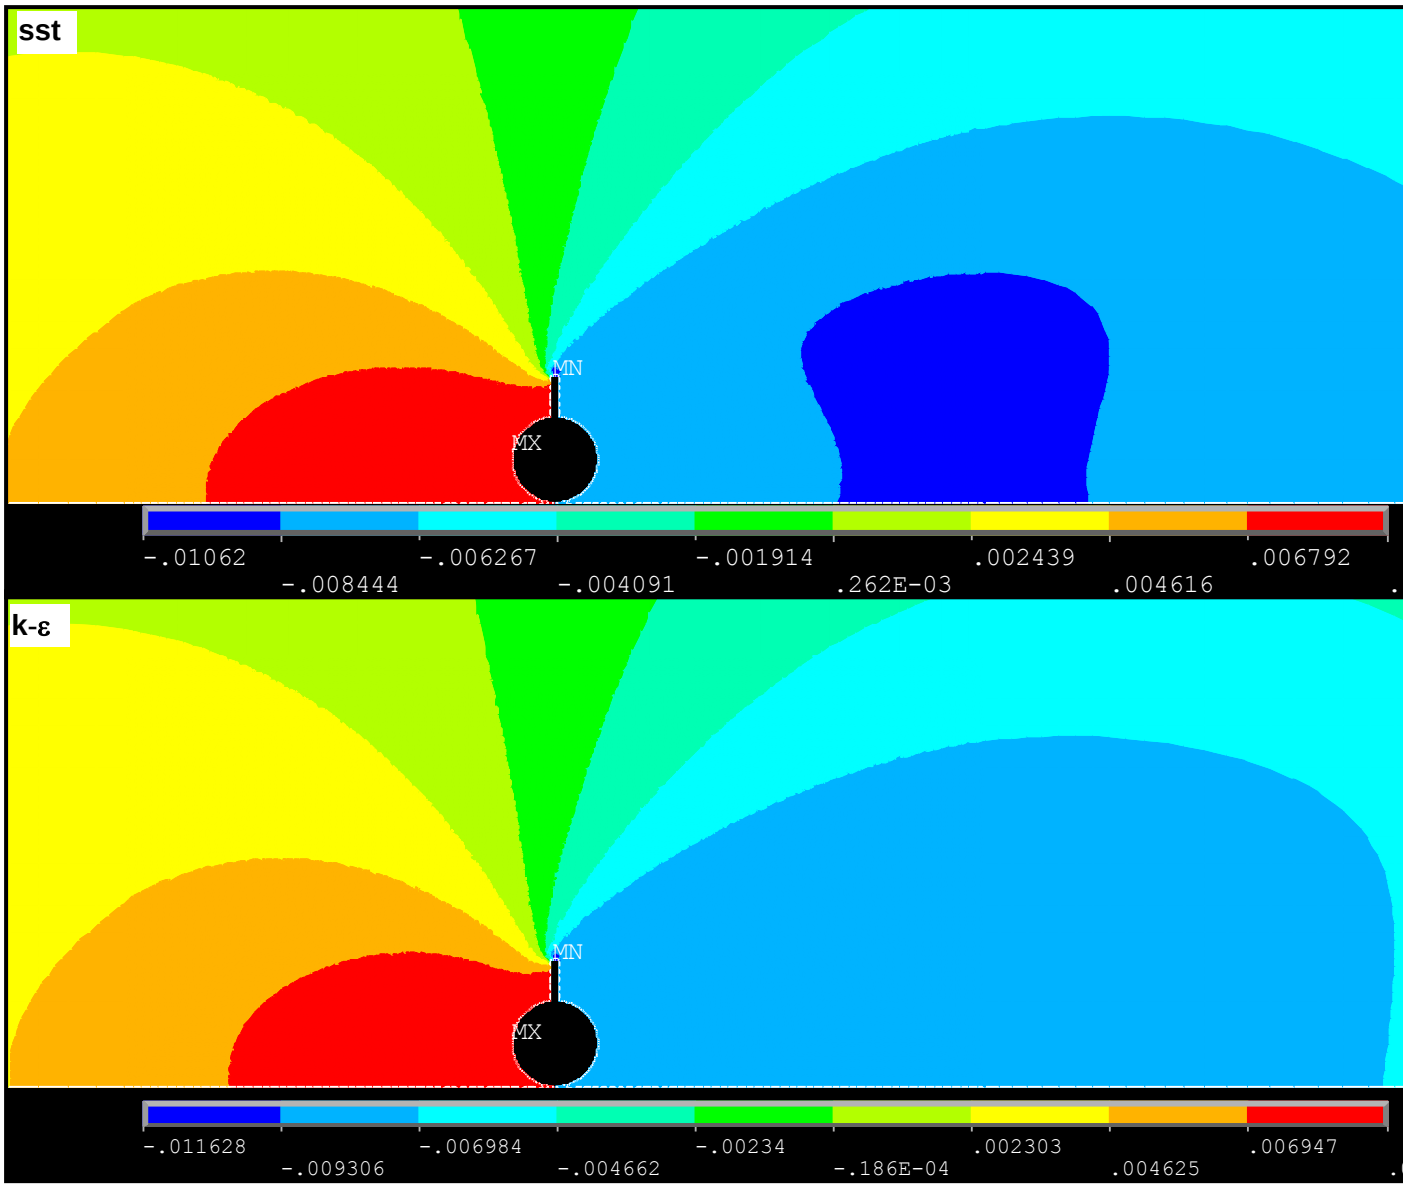
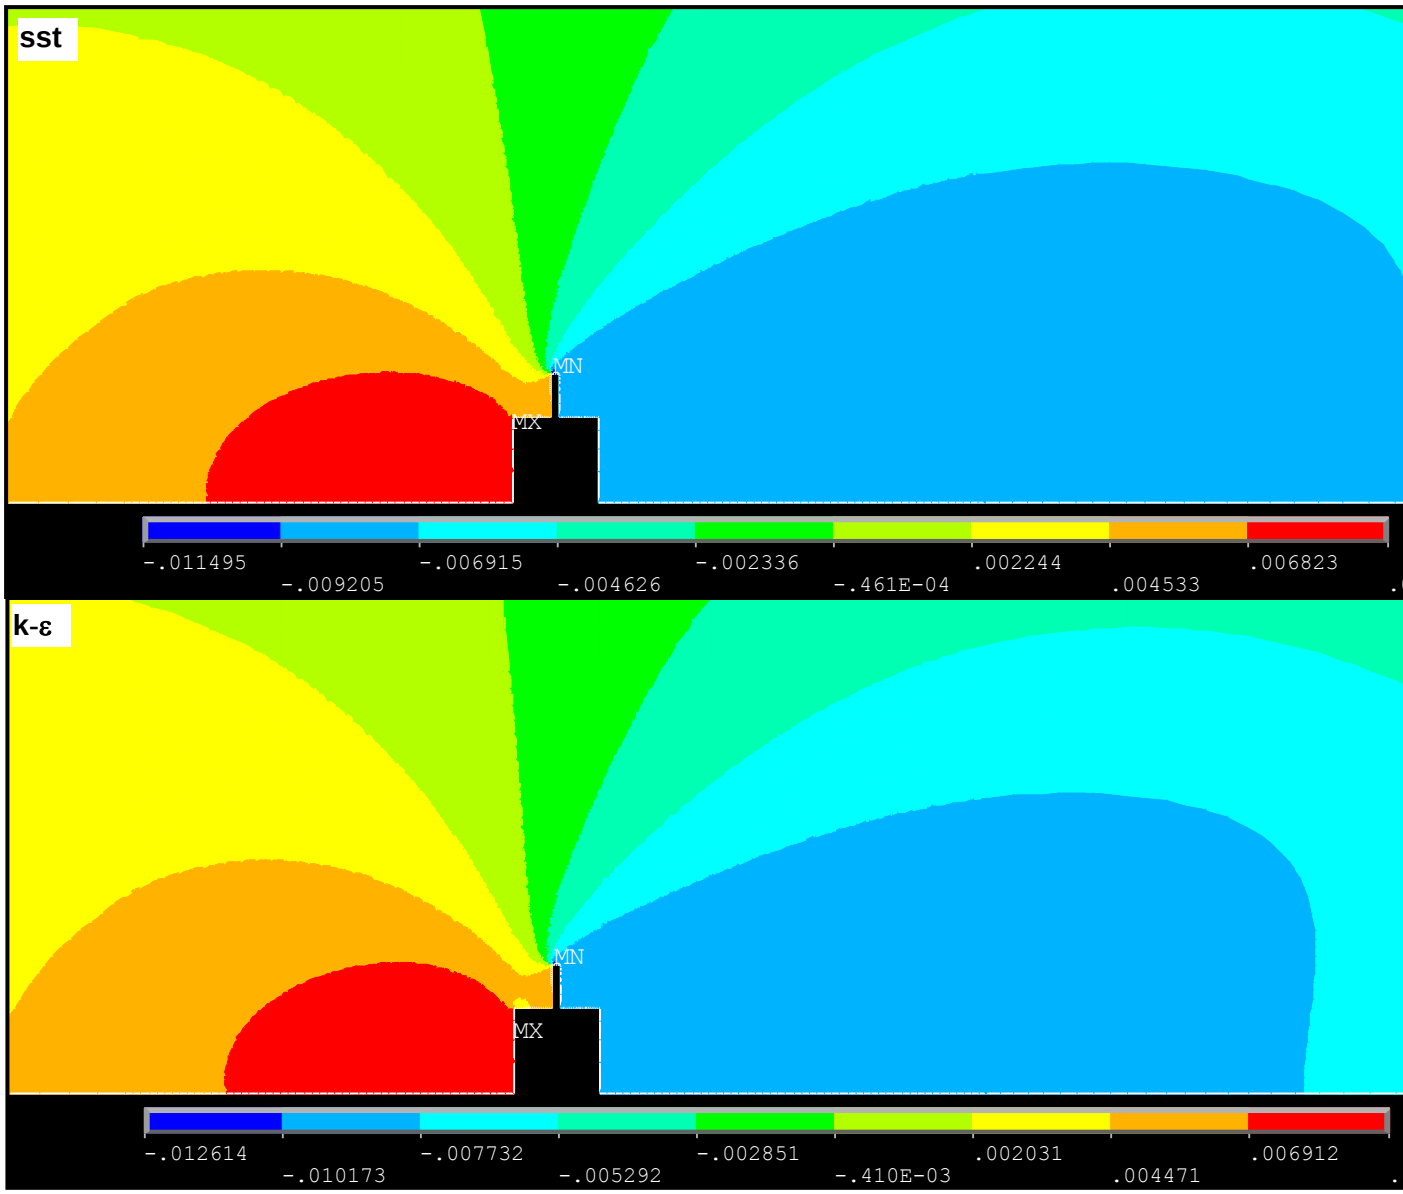
Şekil 8 Başlıksız Dairesel Bir Boru Hattı için sst ve k-ε Türbülans Kapatma Modelleri ile elde Edilen Basınç Dağılımı (Pascal)

 Copyright © International Science and Technology Conference (ISTEC)



Şekil 9 Başlıksız Kare Kesitli Bir Boru Hattı için sst ve k-ε Türbülans Kapatma Modelleri ile elde Edilen Basınç Dağılımı (Pa)

Şekil 8 ve Şekil 9'da görüldüğü gibi boru hattı mansabında oluşan ayrılma bölgesi içerisinde negatif basınç meydana gelmektedir. Maksimum basınç değeri her iki kesit şeklinde de boru hattının memba yüzeyinde oluşmaktadır. Dairesel kesit için sst modeli ile elde edilen basıncın maksimum ve minimum değerleri daha büyük iken kare kesitte ise k-ε modeli ile daha büyük değerler hesaplanmıştır. sst ile elde edilen maksimum basınç değeri dairesel kesitte 0.007411Pa iken, kare kesitte bu değer 0.008179Pa değerine çıkmaktadır. Minimum değerler ise dairesel kesitte -0.02173Pa iken kare kesitte bu değer -0.014835 olmaktadır.



Şekil 10 ve Şekil 11'de verilen, boru hattına başlık yerleştirilmesi durumunda ise maksimum basınç değerleri k–ε türbülans kapatma modeli ile elde edilen hesaplamalar ile elde edilmiştir. Maksimum basınç değerleri başlıksız boru hatlarında olduğu gibi boru hattı membasında oluşmaktadır. Basıncın maksimum değerleri dairesel kesitli başlıklı boru hattında sst modeli için 0.008969Pa, k-e için ise 0.009268Pa olarak hesaplanmışken, bu değerler kare kesitli boru hattı için sst modeli ile 0.09113Pa, k-e modeli ile 0.09353Pa olarak bulunmuştur. Minimum basınç değerleri ise başlığın üzerinde oluşmaktadır ve dairesel kesitli başlıklı boru hattı için sst ile -0.01062Pa, k-e için -0.011628Pa, kare kesit için ise sst ile -0.011495Pa, k-e için ise -0.012614Pa olduğu Şekil 10 ve Şekil 11'de görülmektedir.

Sonuçlar ve Tartışma

Bu çalışmada, kare ve dairsel kesitlerdeki boru hatları etrafında akım alanı bir Hesaplamalı Akışkanlar Dinamiği paket programı olan ANSYS 14.0-Flotran ile sayısal olarak simule edilmiştir. Simülasyonların oluşturulmasında boru hatlarının öz gömülmesini sağlayan, boru hattı üzerine başlık yerleştirilmesinin akım alanında meydana getirdiği değişimler üç farklı türbülans kapatma modeli kullanılarak incelenmiştir.

Sayısal hesaplamalarda kullanılan sst, k-ω ve k-ε türbülans kapatma modellerinden elde edilen sonuçlar, incelendiğinde sst modeli ile elde edilen ayrılma bölgesi genişliklerinin diğer iki modele nispeten daha geniş olduğu ve k-ω ile elde edilen akım çizgisi boyutlarının sst ve k-ε türbülans modelleri ile elde edilenlerin arasında bir görüntü verdiği belirlenmiştir ki sst modelinde tabanda k-ω katsayılarının kullanıldığı, tabandan uzaklaştıkça k-ε türbülans kapatma modeli katsayılarına geçildiği düşünülürse bunun beklenen bir sonuç olduğu söylenebilir.

Kare şekline sahip boru hattı kullanılması durumunda, özellikle mansap, ayrılma bölgesi boyutlarının büyüdüğü tespit edilmiştir. Borular üzerine başlık yerleştirilmesi durumunda ise mansaptaki ayrılma bölgesinin boyutları çok daha fazla artmaktadır. Ancak başlıklı kare ve dairesel kesitli boru hatları etrafındaki ayrılma bölgeleri boyutları arasında önemli bir farklılık belirlenememiştir.

Kare ve dairesel kesitli boru hatları kullanılması durumunda ve boru hattı üzerine başlık yerleştirilmesi halinde boru hattı etrafındaki basınç dağılımı belli oranlarda değişmektedir. Zemin taşıma gücünü azaltarak öz gömülmeye önemli katkı sağladığı düşünülen borulanmanın temel sebebi olarak su yapısının memba ve mansabı arasındaki basınç farklığı gösterilmektedir (Sümer ve Frodsoe, 2001, Öner, 2009). Hesaplamalarda boru hattı membasında

 Copyright © International Science and Technology Conference (ISTEC)

oluşan maksimum basıncın dairesel kesit yerine kare kesit kullanılması durumunda yaklaşık 0.0008Pa, başlık kullanılması durumunda başlıksız dairesel kesitle başlıklı dairesel kesit arasında 0.0015Pa, başlıksız kare kesit ile başlıklı kare kesit arasında ise 0.001Pa artış olduğu belirlenmiştir. Başlıklı dairesel kesit ve kare kesit arasında ise yaklaşık 0.001Pa artış meydana gelmektedir.

Bu çalışmadan elde edilen veriler ışığında, boru hattı üzerine başlık yerleştirilmesi durumunda silindir memba ve mansabında oluşan daha geniş ayrılma bölgeleri içerisindeki vorteks hareketlerinin varlığı sebebiyle bu bölgelerdeki oyulmaların tetikleneceği, boru hattı memba ve mansabı arasındaki basınç farkının artması sebebiyle boru hattı altında oluşacak borulanma miktarının artarak kendi kendine gömülme mekanizmasını hızlandıracağı sonucuna varılmıştır.

Abstract: Tracking of the target, environment and position of the target may vary depending on the position of the camera. Target and camera movements cause continuously to change of position and size of the target in the video stream. In this study, tracking of the target is performed by considering all these changes. SIFT(Scale-invariant feature transform) and SURF (Speeded Up Robust Features) algorithms are used for this purpose. In this study, two different books are identified by system as images then, these books are placed in various locations in the room and a video stream is captured. These books are tracked with SIFT and SURF algorithms. First, scalar space is created. Then, key points of these books are detected. The original book images filtered with Gaussian smoothing. Thus, the processing load is reduced by decreasing the numbers of keypoints. FLANN (Fast Approximate Nearest Neighbor) method is used for the matching in the video stream. At the end, success rate of SIFT and SURF algorithms are measured. This application is realized using OpenCv 2.4.5 library.

Keywords: SIFT, SURF, FLANN, Keypoint Extraction, Tracking, Image Processing.

1.Introduction

Purpose of the tracking algorithm is detection of next state of a moving object. Properties of the object such as color, size, speed etc should be known for this purpose. Tracking problem can be studied by using three main approaches. The first approach is used for tracking fixed object from moving background. The second approach is used for tracking moving object from fixed background The third approach is used for tracking moving object from moving background. A great deal of tracking algorithms are developed for each approach. In this paper, we use the first approach. SIFT(Scale-invariant feature transform) and SURF(Speeded Up Robust Features) methods are selected from developed algorithms for the first approach. SIFT and SURF algorithms are local feature detector and descriptor which are used for object recognition, image registation, classification, 3D reconstruction, robotic mapping and navigation, image stitching, 3D modeling, video tracking and match moving[1,2].

In recent years, a great deal of results concerning with the SIFT and SURF methods for tracking have been proposed. In[3], outdoor changes are observed by SIFT and SURF methods when season changes. Namely, they focused to appearance-based topological localization problem. SIFT and SURF methods which is based on local image feature is used for comparison. Methods are applied on multiple data sets. The data sets consist of

 Copyright © International Science and Technology Conference (ISTEC)

panoramic images that are acquired nine months period. Then they introduce epipolar constrait to improve the results.

In[4], they match two image frames that are taken by looking at object from a different angle. First of all, distinctive and fixed features of object are extracted. SIFT and SURF methods were used to detect and descript scale and rotation invariant interest point.

SIFT and SURF algorithms were performed on different datasets in [5]. 64D, 96D and 128D shorter SIFT descriptors were proposed. These descriptors reduced the computational cost and also good classification results were observed by using SURF methods on different datasets.

In[6] success rates of SIFT and SURF methods are compared in terms of runtime. They observe that SIFT finds more keypoint than SURF, but SURF is faster than SIFT in terms of runtime.

In[7], a new method is called BRISK that is presented for keypoint detection, description and matching. A comprehensive evaluation was made on datasets to reveal BRISK's adaptive, and low computational cost was observed.

ORB method is presented alternative to SIFT and SURF methods, in[8]. ORB is a very fast binary descriptor based on BRIEF. This method is rotation invariant and resistant to noise. Experiments show that ORB is faster than SIFT at two order magnitude. ORB is experienced on several application such as object detection and patch-tracking.

The main objective of this paper is to implement key point extraction and tracking of two books with SIFT and SURF methods. In this paper, a video stream is captured from a moving camera. In the video stream, two books are placed to different place in a room. Because the camera is moving, size of the books and viewpoint to the books are contiously changing. All of this changes are considered for tracking process. So, key points of the books are separately extracted. The application is realised Microsoft Visual Studio environment using OpenCV library. Success rates of the methods are measured and compared.

The rest of the paper is organized as follows: materials and methods, SIFT and SURF methods, results and discussion and conlusion parts.

2.Materials and Methods

2.1 SIFT Method

In this paper, SIFT algorithm is divided into 4 stages.

- Scale-space extrema detection
- Definition of Keypoints' Location
- Acquiring Resistance Against Keypoint Orientations
- Determine the identifiers of the key points

2.1.1Scale-Space Extrema Detection

Here are lots of techniques to find constant extreme points at scale-space. DoG(Difference of Gaussians) method is used in this application. Scalar space is created. Determination of keypoints is made. The original image is filtered using following Gaussian filter equation which is given with equation(1).

$$G(x, y, \sigma) = \frac{1}{2\pi\sigma^2} e^{-(x^2+y^2)/2\sigma^2} \quad (1)$$

 Copyright © International Science and Technology Conference (ISTEC)

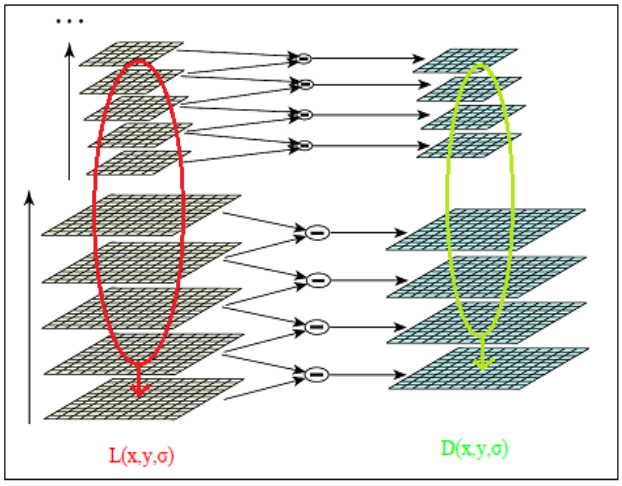

Figure 1: Formation of Scale-Space[9].

I: Original image
G: Gauss function
Scale space function equation L:

$$L(x, y, k\sigma) = G(x, y, k\sigma) * I(x, y) \quad (2)$$

D(x, y, σ) is a DoG function which calculates difference of two images, one of the images is k times bigger than the other image,

$$D(x, y, \sigma) = L(x, y, k\sigma) - L(x, y, \sigma) = (G(x, y, k\sigma) - G(x, y, \sigma)) * I(x, y) \quad (3)$$

$$\sigma\nabla 2G = \partial G/\partial \sigma \approx [G(x, y, k\sigma) - G(x, y,\sigma)] / (k\sigma-\sigma) \quad (4)$$

and thereby

$$G(x, y, k\sigma) - G(x, y,\sigma) = (k-1).\sigma 2\nabla 2G \quad (5)$$

is optained.
This equation shows similarity between Laplace transform and Gauss filtering. The point is extremum point or not in its neighbours is controlled.

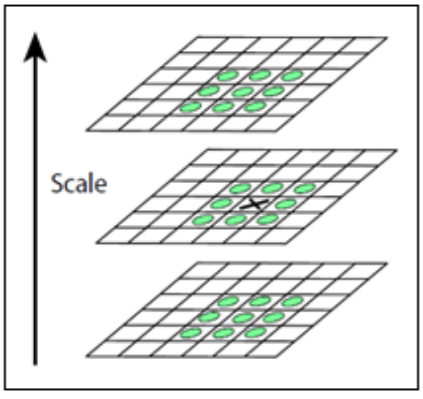

Figure 2: Extraction of Keypoints[9].

Original images of the two books are on the left sight, extrema points of the books are shown on the right sight in Figure 3.

 Copyright © International Science and Technology Conference (ISTEC)

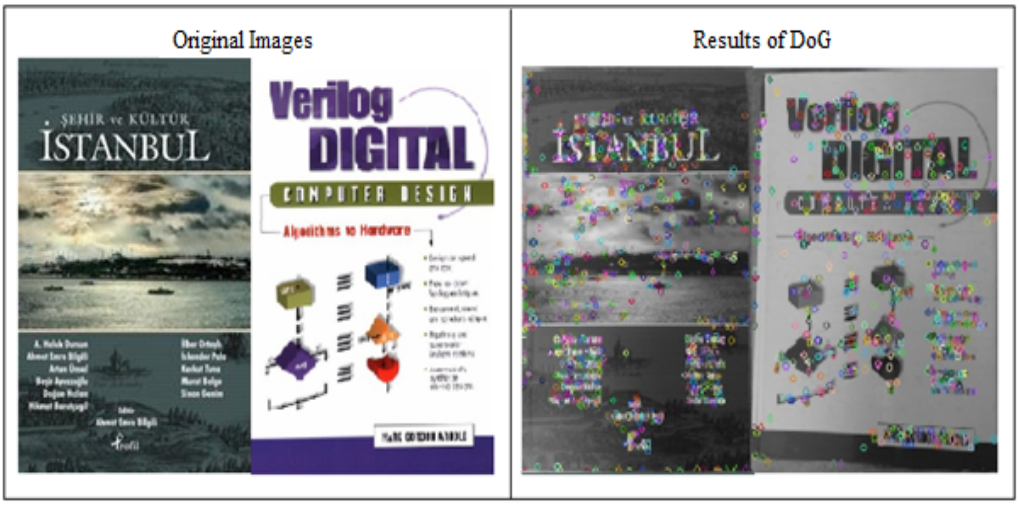

Figure 3: Result of DoG Scale-space extrema detection.

2.1.2 Definition of Keypoints' Location

In the previous step, there are great number of key point canditates that can be non-stable. In this step, non-stable key point candidates, low contrast pixels(affected by noise) or weak edges are extracted.

2.1.3 Acquiring Resistance Against Keypoint Orientations

This step of the SIFT method is important because resistance is acquired against to two dimentional orientation. Gradient magnitude m(x,y) and angle θ(x,y) of gaussian smooted image I(x,y) at scale σ are calculated using L(x, y, σ) = G(x, y, σ) * I(x, y) by following equations (6) and (7).

$$m(x,y) = \sqrt{(L(x+1,y) - L(x-1,y))^2 + (L(x,y+1) - L(x,y-1))^2} \quad (6)$$

$$\theta(x,y) = \tan^{-1} \frac{L(x+1,y) - L(x-1,y)}{L(x+1,y) - L(x-1,y)} \quad (7)$$

2.1.4 Determine the Identifiers of the Key Points

In this step, resistence is gained against the other changes (brightness, 3D appearance, etc). Firstly, gradient magnitude and angles around the key point are sampled using scaler magnitude key areas (n×n). To provide rotational invariance ,location and gradient angles are rotated based on key point angle.

This step is comparable to previous step. Eight-dimentional vectors are identified around the key point for each point in n×n region. Thus the length of the vector that is defined for each key point becomes n×n×r.

2.2 SURF Method

SURF method is based on the same principles as SIFT; but details in each step are different. The method is devided into three parts:

- Interest point detection,
- Local neighborhood description
- Matching.

2.2.1 Interest Point Detection

SURF uses square-shaped filters as an approximation of Gaussian smoothing. SURF uses a blob detector based on the Hessian matrix to find points of interest. The determinant of the Hessian matrix is used as a measure of local change around the point and points are chosen where this determinant is maximal. In contrast to the Hessian-Laplacian detector by Mikolajczyk and Schmid, SURF also uses the determinant of the Hessian for selecting the scale, as is also done by Lindeberg. Given a point p=(x, y) in an image I, the Hessian matrix H(p, σ) at point p and scale σ, is:

 Copyright © International Science and Technology Conference (ISTEC)

$$H(p,\sigma) = \begin{pmatrix} L_{xx}(p,\sigma) & L_{xy}(p,\sigma) \\ L_{xy}(p,\sigma) & L_{yy}(p,\sigma) \end{pmatrix} \quad (8)$$

where $L_{xx}(p,\sigma)$ etc. are the second-order derivatives of the grayscale image.

2.2.2 Local Neighboorhood Description

The goal of a descriptor is to provide a unique and robust description of an image feature. The first step consists of fixing a reproducible orientation based on information from a circular region around the interest point. Then we construct a square region aligned to the selected orientation, and extract the SURF descriptor from it.

2.2.3 Matching

The descriptors which are obtained from different images by comparing, matching pairs can be found.

3.Results and Discussion

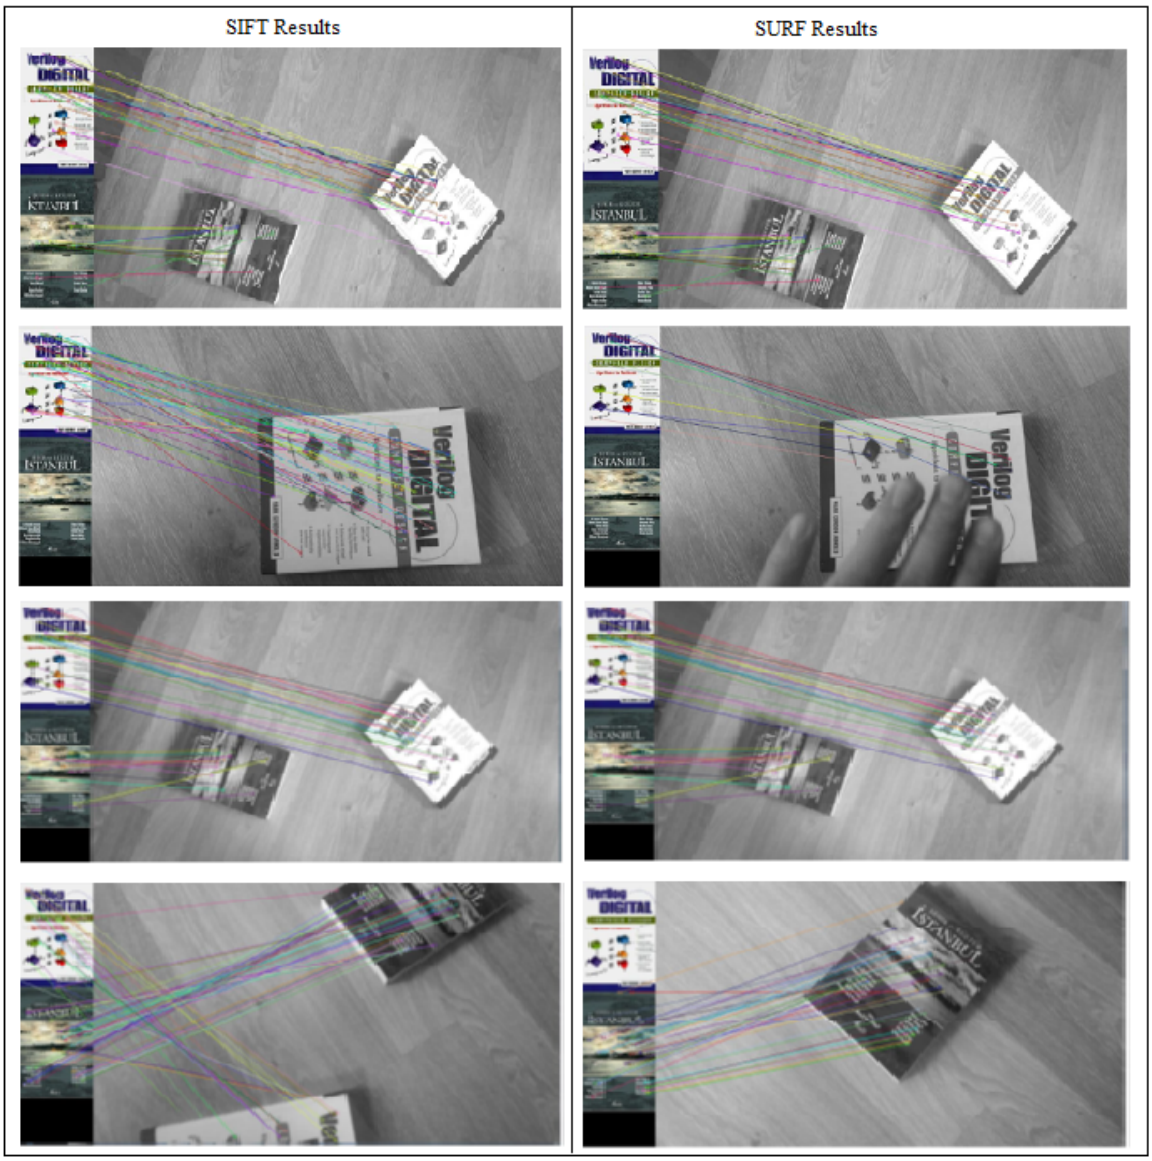

Figure 4: SIFT and SURF results

In Figure 4, examples of SIFT and SURF methods results are depicted, number of keypoints, maximum and minimum distance are shown for each ten image frames which are selected randomly using respectively SIFT and SURF methods in Tables 1 and 2.

4.Conclusion

In this paper, we have implemented that tacking of two books with SIFT and SURF method in a video stream. We have also observed that success rate of the methods. The properties of the video stream is given in table 3.

Tablo 3: Properties of The Video Stream.

Resolution	Number of frame	Duration
1280*720	689	23 seconds

The total processing times have been calculated about four hour and a half. From the results of Tables 1 and 2 we can conclude that the running times of the SURF is slower than SIFT. But SURF has found more key point than SIFT. The maximum and minimum distances between keypoints have been measured to improve the methods. In case of distance between of two key point is two times bigger than minimum distance, the result has been disregarded. Thus, better results have been shown on the screen.

Fast Approximate Nearest Neighbor FLANN is used for matching process after keypoints have been detected. FLANN has shown better results than Brute Force Matching algorithm in terms of speed. Also, we have also observed that the resolution of the video streams has a great impact on the performance of the implemented algorithm.

Günümüzde inşaattan lojistiğe kadar her sektörde yakıt tüketimini azaltmak, yapıların ağırlığını azaltmak gibi amaçlarla ağırlık azaltma ile ilgili pek çok çalışma yapılmaktadır. Bal peteği kompozitler düşük ağırlıkları ve ağırlıklarına oranla sahip oldukları yüksek mekanik dayanımları sebebi ile ağırlık azaltma çalışmalarında ilk akla gelen malzemelerden birisidir. Bu çalışmada yük taşımacılığında kullanılan taşıtlarda zemin uygulamalarında sıkça kullanılan alüminyum damla desenli saç ve hazır cam takviyeli polyester(CTP) levha kullanılarak üretilmiş bal peteği sandviç levhaların CTP levha kalınlığı ve çekirdek kalınlığı değişimi ile eğilme dayanımı arasındaki ilişki incelenmiştir.

Çalışma kapsamında 2,5 mm alüminyum damla desenli saç sabit tutularak 15 ve 20 mm kalınlığında hücre çapı 9 mm olan ve kalınlığı 70 mikron olan alüminyum bal peteği yapısı ile 2 mm ve 9 mm kalınlığında CTP levhalar kullanılarak üretilmiş bal peteklerinin üç nokta eğme testleri yapılmış, CTP levha kalınlığı ve bal peteği kalınlığı değişimlerinin dayanıma olan etkisi incelenmiştir.

Sonuç olarak CTP levha kalınlığındaki artışın dayanımı arttırdığı ancak bal peteği kalınlığının CTP Levha kalınlılığından dolayı oluşan artışa oranla mukavemeti çok daha fazla arttırdığı gözlemlenmiştir.

Mevcut acil durum çağrı sistemleri, hücresel şebekeleri veya uydu haberleşmesini kullandıkları için kapsama alanı ve haberleşme maliyetleri açısından bazı problemler içermektedir. Özellikle acil durum çağrı sistemlerine ihtiyaç duyulan alanlarda, acil durum yerinin hızlı tespiti insan hayatı bakımından çok önemlidir. Bu çalışmada, kişiler için hayati sinyaller olarak nitelendirilebilecek nabız ve vücut sıcaklığı bilgileri, GPS uydularından alınan konum verisi ile birleştirilerek APRS protokolü ile amatör telsiz bandından yayın yapan bir cihaz tasarlanmıştır. Yapılan yayınlar, portatif PMR telsizleri ve amatör telsiz istasyonları tarafından alınabilir niteliktedir. Telsiz yayınlarının I-GATE'ler vasıtasıyla Internet üzerinden takip edilebilmesi mümkündür. Acil durum oluşması durumunda kimlik ve konum bilgisi sesli mesaj olarak da yayınlanmaktadır. Bu çalışma sonucunda tasarlanan sistem ile yaklaşık bir günlük batarya ömrüne ve açık alanda 5 km çapında yayın mesafesine ulaşılmıştır.

Kullanım alanları gündelik hayatımızın bir parçası olmaya başlayan internete bağlı cihazlar (Nesnelerin İnterneti – IoT) kendilerine atanmış görevleri başarıyla yerlerine getirmektedir. Yazılım ve network mimarilerinde bu görevler bir defa tanımlandıktan sonra değiştirilmesi oldukça zor ve zaman almaktadır. Bununla birlikte IoT'ların görevleri için satın alınacak servis ve hizmet sağlayıcı kuruluşların değişimi de farklı yazılım mimarileri ile haberleşme maliyetleri getirmekte ve bu maliyetler kabul edilebilir sınırlar içerisinde değildir.

IoT'ların görev ve rollerinin yönetim maliyetlerini düşürmek, network yapılandırılması içerisinde, güvenlik politikaları dâhilinde, kurumsal mimarilerde yapısal değişikliklere neden olabilmektedir. Kurumların yazılım sistemlerinde yapılacak bu büyük değişiklikler geliştirme maliyetleri kadar test ve işletme maliyetlerini de artırmaktadır.

Temelde gerçek dünyadan veri toplamak amacıyla oluşturulan IoT'lar farklı görevleri, zaman ve konum bazlı rolleri kendi bünyesinde barındırmaktadır. Bu çalışmanın amacı bunun tam tersi olarak IoT cihazlarının görev ve rol yönetimlerini bir üst yapıda toplanmasıdır. Geliştirilecek bu yapıyla cihazlar sadece topladıkları veriyi belirtilen düğüme iletmekle sorumlu olacak ve gerekli tüm mimari kararlar ise bu üst yapı tarafından verilecektir. Elde edilen veri anlamlandırılarak sadece ilgili kişi ya da yazılım mimarilerine ulaştırılabilecektir. Maliyet tasarrufu sağlayacak bu model sayesinde; veri iletişim mimarisinde var olan donanım ve network yapılandırılması herhangi bir değişikliğe ihtiyaç duymaksızın IoT'ların kurumsal mimariler içerisinde rahatça kullanılabilmesini sağlayacaktır.

Polimer esaslı kompozit malzemelerde matris malzemesi olarak kullanılan doymamış polyester(UP) reçineleri düşük maliyet, kısa kür zamanı, hava koşullarına ve kimyasallara direnç ve bu malzemeden üretilen ürünlerin çok iyi mekanik ve kimyasal özellikleri dolayısı ile tüm dünyada yaygın bir şekilde kullanılmaktadırlar. Polyester üretiminde genellikle doymamış asit olarak maleik, ortoftalik, izoftalik, tereftalik, vb. asitler kullanılmaktadır. Bu çalışmanın amacı; farklı oranlarda kürleştirici kullanımının polyester reçinelerin fiziksel ve mekanik özelliklerine etkilerini araştırmaktır.

Çalışma kapsamında polyester türü olarak izoftalik ve ortoftalik olmak üzere üç çeşit doymamış polyester(UP) reçinesi kullanılmıştır. Reçinelerin içerisine %1, %1.5, %2 ve %2.5 oranlarında kürleştirici ve tüm numunelerde %1 sabit oranında hızlandırıcı katılarak polyester reçine karışımları hazırlanmıştır. Bu reçine karışımlarının, fiziksel ve kimyasal deneylerle; jelleşme süresi, jelleşme sıcaklığı, peak exotherm sıcaklığı, viskozite, katı madde içeriği, stiren içeriği, çözünürlük parametresi ve kimyasal içerikleri belirlenmiştir. Tüm reçine numuneleri 1 ve 7 gün süre ile standartta belirtilen koşullarda bekletilmiş ve daha sonra bu numuneler üzerinde mekanik deneyler yapılmıştır. Mekanik deneyler ile; çekme deneyi, çekme E modülü, basınç dayanımı ve basınç E modülü, eğilmede çekme dayanımı ve eğilme E modülü, gerilme-birim deformasyon davranışı ve kopma uzaması parametreleri belirlenmiştir.

Deneysel çalışmalarda elde edilen sonuçlar karşılaştırmalı olarak değerlendirilmiş ve fiziksel ve mekanik özellikler açısından kompozit malzeme üretiminde kullanılabilecek en iyi performansa sahip reçine türü belirlenmiştir.

LEAN PRODUCTION IN TERMS OF CUSTOMER VALUE

Zeynep TÜRK
Prof., Osmaniye Korkut Ata University

Eray ÇETİN
Lecturer, Osmaniye Korkut Ata University

Abstract: In today's increasingly competitive conditions, businesses establish various strategies to meet all aspects of customer demands, reduce their costs and ensure their continuity. Generally, various applications are performed in accordance with decisions taken by the executive management of a company but they produce only temporary solutions. This application is generally in the form of reducing the cost. Reducing costs can undoubtedly be considered as a success in terms of business. However, it is difficult to maintain continuity and the functioning of the system. Because customer demand also varies continuously. Changing the production process according to the changing nature of demand and accordingly the products produced can put a business downturn. However, adopting of a lean manufacturing system and policies accordingly will improve the competitiveness of businesses. Businesses that depend on lean principles can perform production in accordance with the demands of their customers by reducing production costs because customer value lies on the basis of a lean system and all activities take place around this value. Therefore, the customer is a factor which directs and lights a lean production. The aim of this study is to examine the customer value in terms of lean principles.

Key Words: Lean Manufacturing, Customer Value, Lean Principles

1. Introduction

In relevance with the change and developments which occurred in world economy and technology, methods of manufacture as well have changed through the time. Especially in connection with the mechanization which is introduced by the industrial revolution, labor intensive manufacturing left its place to machine intensive manufacturing hence capital intensive manufacturing and this established the basis for the modern mass-production. However, at the time there were not any fully-functional accounting and costing management system and accordingly; management and controlling of such; has been a hard task. Especially in early 1900's; when Henry Ford discovered and applied the mass production method in car manufacture, the idea of manufacturing uniform products in large amounts, was in the agenda for the first time. This development resulted in development of the economies and manufacture systems. Thanks to this advancement, product costs have been reduced. Especially in this era; so as to be able to calculate the costs of products, the concepts of indirect cost and direct cost have been introduced, therefore the concept of product cost management concept came to scene. From that day on, systems of manufacture applied by the enterprises and accordingly, respective cost systems, have changed. However, none has been as effective as "Lean" (production).
Lean production and the lean accounting it introduced; have been successfully developed and (still) used by Toyota, the Japanese car manufacturer. These systems kept on their significance and timeliness. Basis for the lean production system which is also known as Toyota manufacturing system is simplification of "value stream costing" and all corresponding activities therefore minimizing the workforce and materials required for the performance of these processes, segregation of the manufacturing processes in schematic cells and cancelling out any elements which cause loss or doesn't create value. Lean production places human factor right in the middle of the system. In the system; the customer defines the value and those who work so as to establish the value; operate the system. Lean production also consists some Japanese philosophy-based patterns of behavior in it. That being said; within the duration from procurement to final delivery to the customer; lean production suggests to minimize stocks(inventories) therefore minimizing any relevant costs which would otherwise reflect on the customer price, meanwhile respecting the human factor as its first priority, the system continuously questions the processes, cancelling out any inefficient elements. It is likely that in the course of time, new methods of production will be developed and cost management will be performed more efficiently. However for now, it is obvious that the most clear and most efficient system is Lean production. Even if they cannot apply all the functions of the system, due to enterprises volume and means of production; at least various lean production

 Copyright © International Science and Technology Conference (ISTEC)

system principles can be put into use, considering human the first priority, therefore the economic system yielding benefits for everyone.
In connection with the Lean production practices and positive outcomes; the system attracts a lot of attention, followed by popularity and inclination. This increase in interest has shown itself both in academic studies and the number of the enterprises which apply the system. In relevance with lean production and lean accounting, many definitions have been put forth.

2. Thinking And Applying It "Lean"

Lean production, adopted by Toyota at first place, is a system which is meant to prevent wasting. So as to prevent wasting; two principles of: zero stocks and zero error are adopted, present process and systems are subjected to continuous improvement. Basically what Lean production means is to reduce the duration of time between the products' manufacture and distribution and to deduct the wasting from the price (Ertaş and Arslan, 2010).
Manufacturing enterprises which carry on business in the last 20 years of time have adopted the principles of the idea of Lean production. While establishing this, they have been re-organized so as to enhance the customer response time i.e. by adopting the use of cellular scheme structure and stream of values (Fullerton, Frances and Widener, 2014). Lean production idea, brings along remarkable amounts of success stories and potential, for those who adopt this discipline (Merwe and Thomson, 2007).
Customer is the determining factor in lean system. Accordingly, the customers demand as per their needs and this will actuate the corresponding cells of the lean manufacturer. The communication is made by each cell signaling to a previous cell therefore making the system operational. As a result of the mentioned operation, taking into consideration the value created by the customers, the production at the previously determined amount and right on time. Due to the fact that there is no extra production; there will be no extra stocks created and any relevant costs shall be eliminated.

Transforming to lean system can be troublesome. Quitting the habits obtained from the traditional manufacturing and converting the operational units into lean production comes up as a time consuming and cost-increasing action, at first sight. That being the case, the enterprises which prefer this system will naturally face high initial, conversion related costs and hesitate about the conversion. What matters is to think and apply it "lean" and overcome mentioned distress. The enterprises which can manage this shall soon enjoy the benefits of the lean system.
Without "*leanification*" it is often impossible to perform analyses down to the roots and have an understanding of it. Accordingly, the concept of lean management exhibits a holistic view and suggests "*leanification*" of any management tasks. Accordingly the companies which adopt lean management concept; shall be in a tendency of "*leanification*" not only in manufacturing but in all areas (Can and Güneşlik, 2013).

3. Lean Principles

Lean is a system established on 5 simple stages and principles. These stages are; value, stream of values, flow, pulling and perfection (Özçelik and Ertürk, 2012).

Value: Starting point for lean thinking is value and the value can only be defined by the final customer. Value is the sum of the benefits presented to the customer. So as for the definition of "value" make any sense; it must be expressed in terms of a specific product(product and service) which meets customer's specific needs at a specific time and the value is created by the consumer (Maraşlı, Çoban and Topbaş, 2014). In defining the value, these questions are to be replied "What do customers want?, When and how they want?, Which specifications, capacities, compliance and price would be preferred by customers?" (Özçelik and Ertürk, 2012).
As can be seen; the customer is the factor which leads the Lean production and lean principles. At any stage of the manufacturing, the value requested by the customers, is aimed at. If an enterprise does not take the customer value into consideration, this clearly indicates that the conversion to lean system is incomplete.
Stream of values is the sum of the process and activities which are needed in the manufactured product's delivery to the customer, throughout the whole cycle (Duque and Cadavid, 2007). Stream of value analyses show that three different movements occur during the flow; a) the actions which create value in the way the customer wants. b) Those which don't create value but are compulsory due to present technic and production circumstances. c) Many other stages do not create any value and can be immediately removed (Özçelik and Ertürk, 2012).

 Copyright © International Science and Technology Conference (ISTEC)

Basic principle for a Lean production system is to eliminate any processes which do not create benefits for the customer and are easy to be removed; and to continue the processes which create value but by cancelling out practices which cause any wasting.
Within the scope of Lean production concept; there are seven forms of wasting which are called *muda* in Japanese, and these must be eliminated. These points of wasting can be defined as follows.
Errors: Are the situations which require re-processing or cause the material to be wasted/scrapped.
Stocks: It is when available raw materials and semi-products at hand are more than needed.
Movement: The movements performed by people and the machines throughout the production cycle.
Unnecessary process: The actions which do not create value during the processing or use of materials or raw materials.
Excess Production: Manufacturing more than requested or desired amounts.
Transportation: Unnecessary or excess movements of the raw materials and materials which are present in the production line.
Waiting: During the production, materials or raw-materials' waiting aside due to various reasons.
As can be seen above, mentioned processes which can be called forms of wasting; which may occur during, before and after the production, may exist at an extent which can increase the product price. The customers do not want to undertake unnecessary costs. The purpose of a lean system in this context, is to eliminate wasting therefore simplifying the manufacture process meanwhile reducing the costs which occur accordingly. Due to the fact that the costs will have been reduced when the wasting is eliminated, the customer satisfaction shall be increased due to lower prices.
Enterprises which adopt mentioned kinds of Lean production also considering listed forms of wasting, can achieve desired profit figures as they don't waste anything from their overall capacity, and the customers pay the actual amount they would need to pay (Deran and Beller, 2014).

Flow: It is to arrange the value-drivers in sequence so as to provide proper flow of products for the customer (Aktaş and Kargın, 2011). Enterprises should try to create a continuous stream of values instead of heaps and clusters. The companies with traditional operational structure cannot obtain proper flow of values, accordingly an approach with lean-oriented teams is recommended (Duque and Cadavid, 2007). This is to say that it forms the basis for the activities from the beginning to the end of the flow process and at every stage. Therefore the flow should be sustained without fault.

Pulling: Unlike the principle of "pushing" in the conventional production methods, Lean production system suggests "pulling" actions. Pulling is the process through which the manufactured products are delivered to the customer without stopping (Stenzel, 2007). Accordingly; pulling system, is an element of the on time manufacturing and it does not perform any production work without signaling from downward-stream to the upward-stream (Balcı, 2011).
Lean teams, with their "pulling" system; through the stream of values towards meeting all orders; focus on stream of service and products. Lean teams, rather than optimizing a department or work center's performance; they provide stream of values on an overall-system basis (Debusk, 2012).
The system, as it gains functionality depending on the demands from the customer; the customer is in pulling status. If there is no demand of any kind; no cells within the flow system shall be actuated. In case of any demands; the system which starts from the demanding customer and extends to the provider shall be actuated and corresponding production shall be performed.

Perfection: As the lean practice is adopted by the enterprises, it becomes even more obvious that continuous improvement is a permanent process. Lean manufacturers adopt a policy of continuous development and renewal (Maraşlı, Çoban and Topbaş, 2014). This is such a belief that, improvement efforts never cease and the efforts keep on the discipline which is required for the development in the field (Duque and Cadavid, 2007).

3.1. Customer Value in Connection with The Lean Principles

Customer value is the most important subject of the plain philosophy and a plain enterprise which adopts it. Determining the customer value with regard to company and distributing the value to overall system and channeling the actions accordingly; are the most significant keys to success for lean enterprise.
Lean enterprises, continuously question the customer value for their every action. Right-on-time delivery, waste and scrap rates, complaints with the product and customer satisfaction criteria monitoring; underline the lean enterprises' value priority in view of the customer. These define issues such as meeting the customer demand and more (Özçelik and Ertürk, 2012).
For Lean management; positioning of the customer starts with designing of a product or service and continues with the after-sales support. So as for the customer-based lean management bi effective, the customers should be

 Copyright © International Science and Technology Conference (ISTEC)

provided with maximal benefits with lowest spending. When it comes to defining the customer value: the focus is not on presenting an endless value to the customers, but on maximizing the customer value (Stenzel, 2007).
Cost is one of the problems at this point. If the costs of the products which are designed regarding the customer value, turn out to be higher than the calculated figures; so as for the costs to be reduced down to an amount which is acceptable for the enterprise, the design works should be continued before starting with the manufacturing process. The design is about the designing of the products involved as well as the designing of the production process, itself.
In a lean manufacture process, it takes a long time before the appearance of the benefits which occur due to advanced customer satisfaction, low amount of stocks, high product quality (Carnes and Hedin, 2005). Hence the basic principle of the customer satisfaction is designing of the production. Accordingly, reducing the amount of stocks which can be called "sunk cost" within this frame, therefore eliminating the corresponding scrap and faulty product costs, hence providing positive cash flow into the enterprise. As the system becomes more "lean" the product quality will increase and benefits maximization which can be considered as a customer value; shall increase. Because the customers wish to buy the products as per their needs and at the most reasonable cots. Hence they don't want to pay for unnecessary specifications and operational costs reflected onto prices.
Lean production process is all about creating value for the customer. Process and facilities can be labeled as those which add value and those which do not add value. Accordingly the enterprises prefer the costs which do not add any direct value in customer's view and use simple production techniques to reduce wasting (Ertürk and Özçelik, 2008).
Changing the point of view of the organization, Lean production shapes it towards a more customer oriented form hence maximizing the shares of the stakeholders' shares (Terzi and Atmaca, 2011).
The highest profitability for the enterprises is obtained via maximizing the consistent and uninterrupted production flow throughout the stream of values (Balcı, 2011).

3.2. Target Costing in Connection with the Customer Value

Conventional enterprises tend to focus on costs. Accordingly, managers of many public companies focus on the revenue and shares, which is a narrow point of view. Those are important points as well, but not the focus points for a lean organization (Maskell and Kennedy, 2007). This situation focuses more on the values of the company owners rather than that of the customer therefore failing to comply with the spirit of lean philosophy. Because the customer value underlies a lean system.
Customers are not interested in production cost of the service or product, function of the product is what matters for them. Greatest challenge an enterprise shall face; is to determine the product specifications which will create optimal value for its customers meanwhile creating competition advantage for the company. Customer point of view, in regard to lean accounting, develops with "targeted cost" method. Target cost management, establishes the value defined by the customer (Stenzel, 2007).
After determining the value in view of the customer, "target costing" method; continues with the targeted cost calculations required for stream of values which supports value for the needs of the customers and supports cash and profit for the needs of the enterprises. It is a strong method in actuating the lean thinking throughout the enterprise. Target costing method requires integration of the marketing, sales, product design, manufacture, engineering, purchasing etc. and directs everyone to remain focused on creating customer value (Ertürk and Özçelik, 2008).
For a company to be able to apply target costing approach, it must pass through below stages (Terzi and Atmaca, 2011):

 Copyright © International Science and Technology Conference (ISTEC)

Scheme-1: Target Costing

UNDERSTANDING CUSTOMER REQUIREMENTS	1- Who is the customer? 2- Compare the customer requirements versus product specifications. 3- Customer satisfaction.
UNDERTANDING CUSTOMER VALUE	4- Specifications to meet customer requirements. 5- Balancing the customer value 6- Customer value of goods and products.
TARGET COSTS	7- Value and specifications. 8- Product and service target costs. 9- Target costs relating important elements
MANAGING CUSTOMER VALUE	10- Meeting the target costs for processes. 11- Continuous development.

Source: TERZİ, S. and ATMACA, M., (2011)

First stage in determining of the targeted costs is to establish customer definitions and specifying customer requirements and comparing these to the product specs therefore achieving customer satisfaction. After establishing customer value, product design and manufacture and then manufacturing follows. If the costs of the product defined by the customer values exceed the targeted costs, the product and manufacturing process designs continue, to reach targeted values. At this point, the purpose of the enterprise is to catch up with the target costs without sacrificing from customer value. Continuousity is to be provided after customer value in regard to cost and product and accordingly the customer satisfaction is obtained.

RESULT

Principal purpose of the traditional enterprises is to maximize the market value. However, maximizing the customer value is the factor which underlies the lean philosophy, and the purpose of the lean philosophy is to maximize the customer value accordingly. Besides it is not easy to adopt the new identity and accept total conversion is not easy. The services and products are based on customer value from design stage on. Therefore, production of the services and products which comply with customer-specified specs; designing of manufacturing tool and processes is required. The actions required by the conversion thereof can be listed as follows; eliminating of the works which do not create value if possible, and reducing such if not possible, increasing the quality level of the products, right-on-time delivery of the manufactured products, keeping low stock levels, taking into consideration the customer value during the designing of the services and products. The enterprises which manage to establish above conditions can rise to an advantageous position in competition wars of today. Accordingly we can say that the lean philosophy shall help the associations provide competition advantage in the market by cancelling out the works which don't create value therefore reducing the cost, providing ability to meet the changing customer demand, increasing the variety and quality of the products at a time when product life-cycles are getting shorter.

The enterprises have to determine long term strategies so as to ensure continuity and enhance their strength in the market in which they perform their business. If the determined strategies do not consist of complicated procedures and if the unnecessary works are eliminated and the enterprise is lean at the extent possible; this allows for decisional processes be easier and more flexible, and shorter feedback durations become possible. As a result of this; changing needs and demands of the customers become possible to be met in a short time, and in the final end comes the success for the enterprise: efficiency, profitability and activity. And this is only

 Copyright © International Science and Technology Conference (ISTEC)

possible for the enterprises who take the lean philosophy for their basis and perform all their actions with the customer value set as their priority; shaping and applying all their processes accordingly.

LEO STRAUSS'TA MODERNİTENİN KRİZİ VE KRİZİN ÇÖZÜMÜ

Yasin PARLAR

İnönü Üniversitesi, Felsefe Bölümü, Malatya - Türkiye

yasinparlar87@gmail.com

Özet: Strauss, 20. yüzyılda yaşamış Yahudi asıllı bir politika felsefecisidir. Onun felsefesinin en önemli özelliklerinden biri modernite eleştirisidir. Çağdaşı birçok düşünür gibi o da Batı'nın derin bir kriz içerisinde olduğu düşüncesinden hareket eder. Bu krizin çözümü için klasik politika felsefesini göz önünde bulundurmamız gerektiğine dikkat çeker. Klasik politika felsefesi ile Platon, Sokrates ile onların takipçisi olduğunu düşündüğü Farabi ve Maimonides gibi birçok ismi kast etmektedir**.** Strauss'a göre Modern dönemle birlikte bu düşünürlerin görüşleri arasında kopuşlar gerçekleşmiş ve bu kopuşlar neticesinde Batı düşüncesi krize sürüklenmiştir. Klasiklerin çok farklı ve derin anlamlar yükledikleri doğal hak, doğa, erdem gibi kavramlar Modern dönemde ya göz ardı edilmeye ya da klasik anlamlarından çok farklı şekilde değerlendirilmeye başlanmıştır. Bu çalışma kapsamında klasik ve modern düşüncede ortaya çıkmış olan farklılıkların politik ve ahlaki sonuçlarının izleri sürülmeye çalışılıp modernitenin krizine dair genel bir çerçeve sunulmaya çalışılacaktır.

Anahtar Kelimeler: Doğa, doğal hak, erdem, Modern dönem-klasik dönem, kriz.

Giriş

Strauss'un Modern döneme dair düşünceleri ve eleştirileri çok çetrefillidir. O, modernitenin Machiavelli ile başlayan Rousseau ve Nietzsche uğrakları ile birlikte üç dalga şeklinde yayılan ve günümüze kadar gelen bir süreç olduğunu iddia etmiştir. Başka bir deyişle Strauss'a göre modernite, ilk dalgası Machiavelli, ikinci dalgası Rousseau ve üçüncü dalgası da Nietzsche ile başlayıp günümüze kadar etkisini gösteren bir süreçtir. Strauss'a göre dalga dalga yayılan ve kendisi de bir dalga olan modernitenin her bir dalgasının politik bir karşılığı vardır: Machiavelli'nin başlattığı ilk dalga Hobbes ve Locke aracılığıyla liberalizmin ifadesi olur (Hünler, 2000, s. 8), Rousseau'nun başlattığı ikinci dalga Kant ve Hegel aracılığıyla komünizme varır, üçüncü dalga ve aynı zamanda bizim zamanımızın dalgası ise Nietzsche ve Heidegger ile faşizme götürür (Hünler, 2000, s. 9).

Strauss'a göre modernitenin krizi modern politika felsefesinin krizidir. Ona göre Modern dönemle birlikte klasik düşünceden bir kopuş, politik ve ahlaki olanla ilgili birtakım kırılmalar yaşanmıştır. Strauss bu kırılmanın izlerini ilkin Machiavelli'de görür. Çünkü ona göre klasiklerle modernler arasında vuku bulan ilk önemli ayrılık Machiavelli düşüncesinde kendisini gösterir.

Modernite Krizi ve Krizin Çözümü

Machiavelli, klasikleri iki temel hususta eleştirir: Bunlardan ilki, premodern politika felsefesinin hiçbir zaman olmamış devletler ve prenslikler hayal ettikleri düşüncesinden hareketle onların insanın gerçekte "nasıl yaşadığı"na değil de "nasıl yaşaması gerektiği"ne odaklanmalarıdır. Bu noktada Machiavelli geleneksel politika felsefesinin idealist yaklaşımına karşı çıkmaktadır. Onun diğer görüşü ise şu şekilde ifade edilebilir: *Şans (fortuna)* güç ile kontrol edilebilecek bir kadındır. Bu görüşlerin ne ifade ettiğinin anlamak için Srauss'a göre klasik politika felsefesinin en iyi politik topluluk için bir arayış olduğu göz önünde bulundurulmalıdır. Bu rejim, *erdem (virtue)* pratiğini ya da insanın nasıl yaşaması gerektiğini gerçekleştirmek için en iyi olanak sağlayan rejimdir. Klasik politika felsefesine göre en iyi rejimin kurulması kontrol edilemez, ele geçirilemez *şans*a bağlıdır (Strauss, Three Waves Of Modernity, 1989, s. 84). Bu görüş klasiklerle modernler arasındaki bir diğer ayrılıkta radikal bir boyuta ulaşır. Bu farklılık doğa kavramına yüklenen anlamda görülmektedir. Machiavelli'nin önceki yazarların hayali devletleri olarak bahsettiği şey onun en azından dolaylı olarak reddettiği spesifik bir *doğa* algısına dayanmaktadır. Bu algıya göre tüm doğal varlıklar, en azından canlı olanların tümü, bir amaca, peşinde oldukları bir mükemmelliğe yönelmişlerdir. Her bir özel doğaya/türe göre bir de özel mükemmelleşme söz konusudur. Özellikle sosyal ve rasyonel hayvan olarak insan doğası tarafından belirlenen mükemmelleşme vardır. Doğa bir standart, insan iradesinden tamamen bağımsız bir standart sunar. Bu doğanın iyi olduğunu da vurgular. İnsan bütün içerisinde belirli bir yere, oldukça soylu bir yere sahiptir. Fakat o, bu yerde doğa gereği bulunur. O, bu yeri kendisinden kaynaklanmayan bir düzenden dolayı işgal eder. İnsan her şeyin ölçüsüdür demek onun her şeyin efendisi olduğunu söylemenin tam zıddıdır. O bütün içerisinde bir yere sahiptir, onun gücü sınırlıdır. Doğasından kaynaklı sınırları aşabilecek durumda da değildir (Strauss, Three Waves Of Modernity, 1989, s. 85).

Machiavelli düşüncesinde *erdem*, doğa itibarıyla var olamaz. Doğa insana bir ölçü sunmaz. İnsan kendisini doğanın ölçütü yapar. İyi ve kötü yalnızca bir devlet kurulduktan sonra tanımlanabilir (Merrill, 1998, s. 193)**.**

 Copyright © International Science and Technology Conference (ISTEC)

Strauss'a göre bu Machiavellici temele son dokunuşu Hobbes yapmıştır. Bilindiği üzere Hobbes bizim sadece kendi ürettiğimiz şeyleri kesin bir şekilde bilebileceğimizi söylemiştir ve ona göre bilmek bir çeşit yapmak/üretmektir (Strauss, 1965, s. 174). Bu bakımdan tüm hakikat ve anlam, kökenini insanda bulur. Onlar insanın eyleminden bağımsız bir şekilde var olan bir kozmik düzene içkin değildir.

İkinci dalga Rousseau'nun erdemin değerinin düşürülmesinden duyulan memnuniyetsizlikle başlamıştır. Rousseau, Machiavelli ve Hobbes'ta olduğu üzere erdemin yaşamın korunması ve arzuların tatmin edilmesi şeklinde anlaşılmaya başlanmasını kabul edilemez olarak görür (Merrill, 1998, s. 194). Ancak Rousseau insanın doğası gereği politik hayvan olduğu şeklindeki klasik görüşe dönme adına Hobbes'un doğa durumu kavramını reddetmemiştir (Strauss, Doğal Hak ve Tarih, 2011, s. 303). O, bu konuda Hobbes ile hemfikirdir. Hobbes ve Rousseau arasındaki en temel farklardan biri onların doğa durumundan sivil topluma geçişe dair öne sürdükleri iddialarda yatmaktadır. Hobbes'a göre doğa durumundan toplum durumuna geçiş, basit bir şekilde karşılıklı olarak birtakım haklardan vazgeçişle insan güvenliğinin daha iyi bir duruma getirilebileceği ve bu yüzden de birlikte bir toplum oluşturmaları gerektiği sonucunu çıkaran bir grup yabani (savage) tarafından herhangi bir zamanda başarılmış olabilirdi. Rousseau bunun politik öncesi insan için imkânsız olduğunu görmüş ve bu geçiş işleminin uzun, tedrici bir sosyalleşme ve insanileşme süreci gerektirdiğine işaret etmiştir. O halde Hobbes ve Rousseau arasındaki temel değişiklik aklın yerini tarihin almasıdır. Rousseau düşüncesinde toplum rasyonel bir kararın değil tarihi bir sürecin sonucudur (Merrill, 1998, s. 195).

Rousseau'ya göre her insan doğa gereği özgürdür. Uzun bir tarihsel gelişim ile insan her ne kadar dili, ailevi ilişkileri ve diğer ilkel alışkanlıkları ve nihayetinde madencilik ve tarım sanatlarını edinmiş olsa da bu açık gelişmelere karşın iş bölümü (division of labor), mülk edinimi ve bunların beraberinde gelen tüm kötülükler de ortaya çıkmıştır (Merrill, 1998, s. 195). İnsanın tekrar mutlu olabilmesinin tek koşulu doğa durumunun ilk aşamalarında tatmış olduğu özgürlük ve eşitliği elde etmesine bağlıdır. Fakat bu doğa durumundakine eşit bir tatmin sağlamayacaktır. Doğal özgürlüğün ve eşitliğin bu yapay üretimi böylelikle toplumun ideali olur. Rousseau'nun bu probleme çözümü ise genel iradedir: Toplumun tüm üyeleri yapımına kendilerinin de katkıda bulunduğu yasalara eşit bir şekilde ve tamamıyla tâbi olmalıdır. Yasalardan, pozitif yasalardan daha yüksek bir yasaya, doğal yasaya kaçmanın herhangi bir yolu olmamalıdır. Çünkü böylesi bir girişim yasaların yönetimini tehlikeye atabilir. Pozitif yasanın kaynağı genel iradedir. Düzgün bir şekilde oluşturulmuş bir toplumda içkin olan böyle bir irade aşkın doğal yasanın yerini alacaktır (Strauss, Three Waves Of Modernity, 1989, s. 90-91). Genel irade fikri ile Rousseau *olgu (ıs)* ve *değer (ought)* ayrımını tamamıyla elemine etmiştir. Genel iradeyle yönetilen bir toplumda genel iradenin dikte ettiği ne varsa o olması gerekendir. Rousseau'nun yazılarında insan ilişkilerinde tarihsel sürecin önemine dair sunuşu temelde doğa durumuna doğru geriye bakıştır. O, politik öğretisi olan genel irade ile tarihsel doktrinini birleştirmemiştir. Bu birleştirme işi onun büyük ardılları Kant ve Hegel'in işiydi (Strauss, Three Waves Of Modernity, 1989, s. 91). Bu görüşe göre rasyonel ya da adil toplum, ideal olarak bilinen, genel iradenin hüküm sürdüğü toplum tarihsel süreç tarafından insanın onu gerçekleştirme niyetine bakmaksızın zorunlu bir şekilde gerçekleşecektir. Böylelikle modernitenin ikinci dalgası kültürün ya da toplumun mükemmelleşmesi umudunda doruğa ulaşır. Tüm insanların doğal arzularının yapay tatmini, tarihsel sürecin başlangıcının ideal, evrensel devlette son bulduğu bir toplumda sağlanır. Hegel'in felsefesinde insan artık modern projenin inşa edici efendisi değildir. Bu görev artık tarih ya da tinin bedene bürünmemiş/ruhani rasyonelliği tarafından gerçekleştirilmektedir (Merrill, 1998, s. 197). Böylelikle denebilir ki modernitenin ikinci dalgasında öne çıkan görüş tarihin dönüştürücü güç olarak aklın yerini almasıdır.

Üçüncü dalga tarihin keşfine yönelik tüm bir çabayla tarihin dışına çıkılamayacağına vurgu yapan Nietzsche ile başlamaktadır. Bu Hegel'in genel felsefesine bir karşı çıkış olarak görülebilir. Hegel evrensel, rasyonel ya da kaçınılmaz olarak zirvesine doğru giden ve tarihi yönlendiren bir spritüal süreç veya amaç hakkında konuştuğunda kendisinin bu sürecin dışında olduğunu varsaymaktaydı (Merrill, 1998, s. 199). Yani tarih üstü bir hakikati dile getirmiş olmaktaydı. Nietzsche'ye göre düşüncenin ve eylemin tüm ilkelerinin tarihsel olduğu görüşü, bu ilkelerin tarihsel silsilesinin ilerlemeci olduğu ya da tarihsel sürecin içsel bir yönelmişliğe sahip olduğu yönündeki temelsiz bir umutla zayıflatılamazdı. Hiçbir tarih üstü ideal ya da hakikat yoktur. Nietzsche'nin yıkıcı tarihsiciliği artık rasyonel yasanın otoritesine, bilimsel ilerleme beklentisine, tarihin sonuna yönelik bir mutlaklığa hiçbir şekilde yer olmadığını ilan etmekteydi. Bütün bunlardan sonra herhangi bir kılavuz ya da işaret olmaksızın duran insana kalan yaratıcı eylemdir. Böylelikle Nietzsche, insan potansiyelinden doğanın son kalıntısını da söküp atmıştır. (Merrill, 1998, s. 200) Bu görüşün uzantısı Strauss'un kendi döneminde pozitivizmle birlikte en baskın görüş halini almıştır. Fakat Strauss dönemindeki bu hâkim düşüncelere karşı koyma amacı gütmüştür. O, modernitenin kendi dönemine ilişkin dalgasına istinaden şunları söylemektedir: "Öğrendiğim hiçbir şey, özellikle de klasik biçimindeki 'doğal hakkı', hüküm süren pozitivist ve tarihsici göreceliğe tercih etme temayülümü sarsmamıştır." (Strauss, Doğal Hak ve Tarih, 2011, s. 10). Strauss'a göre doğal hak fikrini terk ederek ve bu terk etme sebebiyle, Alman düşüncesi tarihsel anlamı yarattı ve böylece tam tamına bir görecelilik tutumunu benimsedi (Strauss, Natural Right and History, 1965, s. 1). Bununla birlikte, doğal hak ihtiyacı bugün de yüzyıllardır hatta bin yıllardır olduğu kadar barizdir. Doğal hakkı reddetmek tüm hakların pozitif olduğunu söylemeye gelir ve bunun anlamı hakkın ancak ve ancak farklı ülkelerin yasa koyucuları ve mahkemeleri tarafından belirlendiğidir. Ancak "doğru/adil olmayan" yasalardan ya da "doğru

 Copyright © International Science and Technology Conference (ISTEC)

olmayan" kararlardan bahsetmek açıkça manidar hatta kimi zaman zorunludur. Böylesi yargılarda bulunurken doğrunun ve yanlışın pozitif haktan bağımsız ve ona üstün bir ölçüsü, kendisine göndermede bulunarak pozitif hakka dair yargıda bulunabileceğimiz bir ölçü olduğunu kastediyoruz (Strauss, Natural Right and History, 1965, s. 2). Strauss'un liberalizme yönelik eleştirilerinin de farklı temellerde olsa da doğal hakkın reddinden kaynaklandığı söylenebilir. Liberallere yönelik eleştirisi genel olarak şu şekilde ifade edilebilir: (…) Buna rağmen yüce gönüllü liberaller doğal hakkın terk edilmesini sadece soğukkanlılıkla değil aynı zamanda rahatlamayla karşılarlar. Bunlar, içkin olarak iyi ya da doğru olanın hakiki bilgisini elde etme konusundaki yetersizliğimizin, bizi iyi ve doğru olan üzerine her fikri hoş görmeye ya da tüm tercihlerin ya da tüm "medeniyetlerin" eşit derecede saygıya layık olduğunu kabul etmeye mecbur bıraktığına inanıyor gibi görünürler. Tüm mutlakların bu tutkulu reddinin ardında, bir doğal hakkın; ya da daha kesin olarak, tek zorunlu şeyin farklılığa ya da bireyselliği saygı olduğu şeklindeki doğal hakka dair özel bir yorumun tanınmasını fark ederiz. Ama farklılığa ya da bireyselliğe saygı ile doğal hakkın tanınması arasında bir gerilim vardır. Liberaller doğal hakkın en liberal versiyonunun bile dayattığı farklılığın ya da bireyselliğin mutlak sınırları konusunda tahammülsüz hale geldikleri zaman doğal hak ile bireyselliğin bastırılmamış gelişimi arasında bir seçim yapmak zorunda kaldılar. İkincisini seçtiler. Bir kez bu adım atılınca, hoşgörü zıddına içkin olarak üstün gibi değil, ama birçokları arasında bir değer ya da ülkü olarak göründü. Başka bir deyişle hoşgörüsüzlük saygınlık bakımından hoşgörüden daha değersiz olarak değerlendirilemedi (Strauss, Natural Right and History, 1965, s. 5).

Klasik düşünce ile modernler arasındaki en temel farklardan bir diğeri de Strauss'un felsefesinde de çok ağırlık verdiği bir düşünce olan ezoterik-egzoterik yazma şeklinin modernlerce artık kullanılmamasıdır. Bu ayrım hem filozofun hem de toplumun bekasını koruma adına klasik düşünürlerce özellikle Platon tarafından elzem görülmüştür. Bu düşünce temelde felsefi hakikatin çoğu durumda toplumun genel yapısı ile çatışabilecek yapıda olmasından dolayı ihtiyatlı bir şekilde dile getirilmesi gerektiğini imler. Filozof ezoterik yazmanın gereği olarak bu tarzdaki görüşlerini satır aralarına gizlemelidir. Potansiyel filozof ya da dikkatli okuyucu bu satır aralarındaki hakiki öğretiyi keşfedebilecekken yığınlar metnin yüzeyindeki egzoterik öğretiyle yetinecektir. Dolayısıyla hem toplum hem de filozof yıkılıp yok olmaktan kurtulabilecektir (Staruss, On a Forgetten Kind of Writing, 1988, s. 222). Modern dönemde, özellikle Aydınlanma ile birlikte felsefeye dair bu algı değişmiştir. Orada felsefi bilgi toplumun tüm tabakalarına yayılması gerektiğine dair bir düşünceyle topyekûn bir aydınlanma hedeflenmiştir. İnsana ve insan aklına duyulan sonsuz güvenle toplumun çelişkilerden uzak, herkesin eşit ve özgür bireyler olarak birbirini tanıdığı bir düzen başka herhangi bir şeye referansa gerek kalmaksızın inşa edilebilecektir. Tabiri caizse cenneti yeryüzünde insan eliyle kurmayı hedeflemişlerdir. İki dönem arasındaki felsefeye dair görüşlerdeki bu farklılık esasında bunların *insan* anlayışları arasındaki farklılıktan kaynaklanmaktadır.

Klasikler, modernlerden farklı olarak bir anda toptan bir aydınlanmanın gerçekleşebileceğine inanmamışlardır. Çünkü insanın, özellikle filozof olmayan çoğunluğun sınırlılıklarının farkındaydılar. Bunlar modern dönemden farklı bir şekilde hedef olarak eşitlik ve özgürlükten ziyade erdemi koymuşlardır. Toplumun erdeme ulaşması ise özellikle Platon düşüncesinde görüldüğü üzere yöneticinin filozof olması durumunda mümkündür. Dolayısıyla klasiklerde filozof ve filozof olmayan, başka bir deyişle avam ve havas ayrımı söz konusudur. Bununla bağlantılı bir şekilde de hedef olarak seçilen şey modernlerden farklı olmuştur. Modernleri özellikle de Aydınlanmacı düşünürleri savundukları görüşe iten düşünce temelde insan aklına ve onun yapabildiklerine güvenden kaynaklanmaktaydı. Bu sebeple insan için tek kılavuz akıl olmalıydı. Modern dönemle birlikte yoğunlaşan kutsal kitap ve vahiy eleştirileri de bununla ilintilidir. İnsanın hayatını yönlendirmek için aşkın ya da ilahi bir kaynağa ihtiyaç duymadığına dair inançla hareket etmektedirler.

Dolayısıyla modern dönemle birlikte değişime uğrayan temalardan bir diğerinin akıl-vahiy çatışması ya da Strauss'un deyişiyle teolojik politik problemin ele alınışına dairdir. Strauss bu konuyu özellikle *The Mutual Influence Of Theology and Philosophy* adlı makalesi ile *Spinoza's Crituque of Religion* adlı eserinde tartışır. Hatta teolojik-politik problem olarak adlandırdığı bu tartışmanın kendisine Spinoza'dan miras kaldığı ve o ondan itibaren tüm yaşamı boyunca temel uğraşlarından biri olduğunu ifade eder. Spinoza eserinde kutsal kitap eleştirisi yaparak akıl lehine vahiy çürüttüğünü iddia etmişti. Fakat Strauss'a göre Spinoza bunu başaramamıştı. Aklı aştığını, deney ve gözlemin ötesinde olduğunu iddia eden bir alana dair açıklamalar aklın sınırları dâhilinde, deney ve gözlem temelinde çürütülemezdi. Dolayısıyla vahiy evrenin tüm gizemi çözülene kadar, eğer böyle bir şey mümkünse, bir ihtimal olarak varlığını sürdürecektir (Strauss, Spinoza's Critique of Religion, 1965, s. 28). Ancak modernler akıl lehine vahyi çürütme teşebbüsünde bulunarak birtakım aşırılıklar sergilemişlerdir. Klasiklerle modernler arasındaki en temel farklardan biri buydu. Klasikler için erdem temelde itidaldi ve onlar bu ikisinin, yani akıl ve vahyin dengeli bir şekilde varlığını sürdürebilmesi için çalışmışlardır.

Strauss'a göre akıl ve vahiy ya da Atina ile Kudüs Batı'nın köklerinde bulunan ve esasında birbiriyle çatışan iki unsurdur. Fakat bu çatışmanın yakından incelendiğinde rahatsız edici bir şey olmak bir yana Batı düşüncesine canlılığını veren bir şey olduğunu da görebileceğimizi söyler (Strauss, The Mutual Influence Of Theology and Philosophy, 1979, s. 111), bunlardan birini çıkarıp aldığımızda ya da birini diğeri adına ortadan kaldırmaya çalıştığınızda bu canlılık yerini krize bırakmaktadır.

Değerlendirme

Strauss'un modernite eleştirisinde bulunurken bu dönemin karşısına klasik düşünceyi koyması, bize onun klasiklerin düşüncesini kimi yönleriyle modern dönemden üstün tuttuğu çıkarımını yapma hakkını verir. Strauss'un modernite dönemine ilişkin olarak eleştirilerinin en temelde klasik biçimiyle doğal hak kavramının terk edilmeye başlamasına ilişkin olduğunu bir kez daha belirtmeliyiz. Onun amacı antiklerden özellikle Platon ve Sokrates ile Ortaçağ'da İslam düşüncesinden Farabi'nin politika felsefelerini daha dikkatli değerlendirip doğal hak kavramına olan ihtiyacı gidermek gerektiğine ilişkindir. Bunların düşüncesindeki en temel husus erdemin itidal olduğu görüşüdür. Bu itidal düşüncesi onların öğretilerini ifade ederken de ihtiyatlı davranmaları gerektiği inancını doğurmuştur. Bu yüzden Platon, Farabi gibi düşünürler ezoterik yazma tarzını tercih ederek hakiki öğretilerini satır aralarına gizlemişlerdir. Bunlar modernlerin aksine dinin ya da vahyin toplumsal olarak çok önemli olduğunun bilincinde olarak akıl lehine onu ortadan kaldırmaya yönelik bir aşırılık sergilememişlerdir. Yine bunlarla paralel olarak insan kendi sınırlı doğasının farkında olsa da hep daha iyiye daha mükemmel olmaya yönelik bitip tükenmez çabasından vazgeçmemelidir. Bu ilkin akla duyulan sınırsız bir güven ile başlayan modern projenin hiççiliğe varan macerasında insana bir amaç verecek, onu nihilizmin boşluğundan kurtarabilecek bir hedef sunabilecektir.

LIDAR DATA ANALYSIS WITH DIGITAL IMAGE CORRELATION (DIC) IN OBTAINING LANDSLIDE DISPLACEMENT FIELDS: A CASE OF GSCHLIEFGRABEN LANDSLIDE-AUSTRIA

Abdurrahim AYDIN[1], Remzi EKER[2], Helmut FUCHS[3]

Abstract: Comparison of LIDAR datasets were shown as useful in obtaining information about displacement fields of active landslides. Iterative closest point (ICP) and digital image correlation (DIC) are two main approaches used for this aim. Whereas ICP is based on precisely matching point-clouds, DIC is based on cross-correlation of remotely sensed digital imageries. Although DIC is a popular application in fluid mechanics for quantifying flow velocity, its successful applications in estimating displacements resulted from landslides are available. Studies indicate that DIC is more suitable than ICP when computing displacements in the order of magnitude of several meters. DIC is applied to any raster dataset representing a surface property considering the specific advantages and disadvantages of these techniques. In the present study, DIC was applied for an active landslide (named Gschliefgraben) located in Upper Austria. Two time series of LIDAR data obtained in 11th February 2008 and 28th April 2008 was used. The precision of DEMs with 1*1m raster cell size is 20 cm (horizontal) and 15 cm (vertical). Because Gschliefgraben is a big landslide system, DIC analysis was only made for small part of landslide area located close to the crown (head). This part was selected because more activation was observed between two series with visual inspection. Within the study area two separate active parts were observed. According to results, between two time series, the mean displacement rates in these more active parts within study area were obtained 0.66 m (max. 2 m) with sub-pixel precision image matching.

Keywords: Digital image correlation, Displacement field, Landslide, LIDAR

Introduction

Understanding of landslides and their mechanisms is crucial for reduction of landslide hazard. Because landslides are responsible for human casualties, property damage and environmental degradation. Quantification of kinematics of the movement, mostly superficial displacements, is a way of monitoring of a landslide (Gili et al., 2000). Periodic acquisition and analysis of a series of observations over time are needed for monitoring landslides (Stumpf, 2013). Remote sensing is one of the most important technique used in landslide monitoring (Savvaidis, 2003), especially LIDAR systems have gained wider acceptance due to increasing availability, possibility of high density point clouds, and very high resolution 3D information of terrain with high accuracies (Baldo et al., 2009; Barnhart and Crosby, 2013; Jaboyedoff et al., 2012).

Comparison of LIDAR datasets have been shown as useful in obtaining information about displacement fields of active landslides. Iterative closest point (ICP) and digital image correlation (DIC) are two main approaches used for this aim (Daehne and Corsini, 2013). Whereas ICP is based on precisely matching point-clouds, DIC is based on cross-correlation of remotely sensed digital imageries. DIC is an image processing technique used to measure deformation by comparing two digital images (Take, 2015). This technique was originally developed in the field of experimental solid mechanics (Peters and Ranson, 1982). Although DIC is popular in fluid mechanics for quantifying flow velocity, beginning in the late 1990s, DIC was also noticed as well-suited technique to geotechnical engineering applications (White et al., 2001; Take, 2003; Sadek et al., 2003). Image correlation have currently become one of the most efficient techniques to determine horizontal ground displacements due to volcano (Walter, 2011), earthquakes (Van Puymbroeck et al. 2000), landslides (Delacourt et al., 2004; Aryal et al., 2012; Travelletti et al., 2012; Daehne and Corsini, 2013), glaciers (Kääb et al., 2005), ice flows or sand dune migrations (Rosu et al., 2014).

In the present study, two time series of LIDAR data obtained in 11th February 2008 and 28th April 2008 was used to apply DIC analysis in Gschliefgraben landslide. The precision of DEMs with 1*1m raster cell size is 20 cm (horizontal) and 15 cm (vertical). DIC analysis was applied by using image correlation software (CIAS), which matches offsets between two images based on normalized cross-correlation. DIC analysis was only made for small

part of landslide area (about 10 Ha) located close to the crown (head) of landslide.

Materials and Methods

Study Area and LIDAR Datasets

Gschliefgraben landslide system, located in Upper Austria (municipality Gmunden), was selected as study area (Figure 1). The top, left, right, and bottom coordinates of the area in MGI/Austria GK M31: EPSG Projection are 306000.25, 35399.75, 38500.25, and 303899.75, respectively. Detailed information on this landslide, an earth flow amounting about 3.8 million m^3 accumulated solids, was well represented by Marschallinger et al. (2009). In the present study, two time series of LIDAR data obtained in 11th February 2008 and 28th April 2008 was used. The precision of DEMs with 1*1m raster cell size is 20 cm (horizontal) and 15 cm (vertical) (Figure 2).

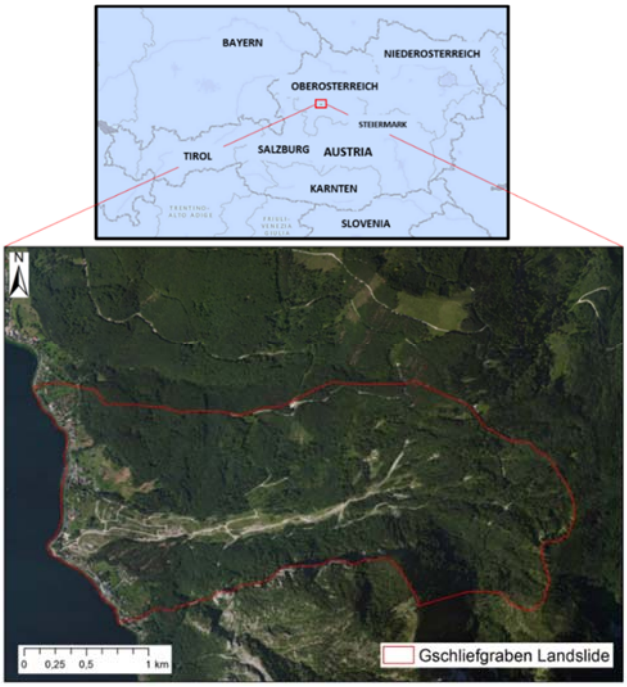

Figure 1. Location map of Gschliefgraben Catchment

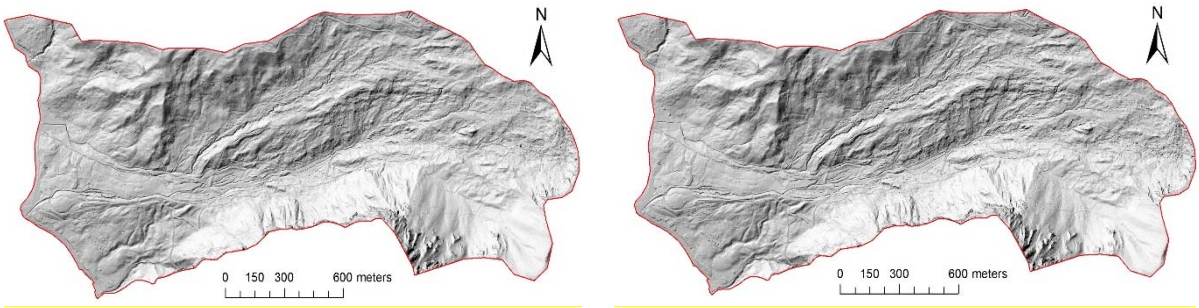

Figure 2. Shaded reliefs of LIDAR data: 11th February 2008 (left) and 28th April 2008 (right).

Digital Image Correlation

Digital image correlation (DIC) is a deformation measurement technique to obtain 2D/3D displacement field by correlating two image acquired at different time (Travelletti et al., 2012). The detailed description of cross-correlation applied to image can be found in the literature (Adrian, 1991). DIC uses pixel intensity values to calculate incremental displacements with subpixel accuracy (Take, 2015). The basic parameters of the correlation are the “sliding window”, the “search space” and “step” (Rosu et al., 2014). One of images of the series is chosen as a reference image. All images are divided into small rectangular regions consisting of NxN pixels (vary from 7x7 pixels to 70x70 pixels and even more) (Malesa et al., 2011). DIC algorithm is then tracking the position of each subset from the reference image in all other images of the series. Corresponding subsets are matched by

 Copyright © International Science and Technology Conference (ISTEC)

finding the maximum of the normalized cross-correlation function coefficient. For each subset in-plane displacement vectors are then calculated. The basic working principle of DIC is given in Figure 3. In the present study, DIC was applied to image pairs of "hillshade" grayscale images, derived from LIDAR DTMs. Because Gschliefgraben is a big landslide system, DIC analysis was only made for small part of landslide area located close to the crown (head) (Figure 4). This area was selected because more activation was observed between two series with visual inspection. Within the study area two separate active parts were observed.

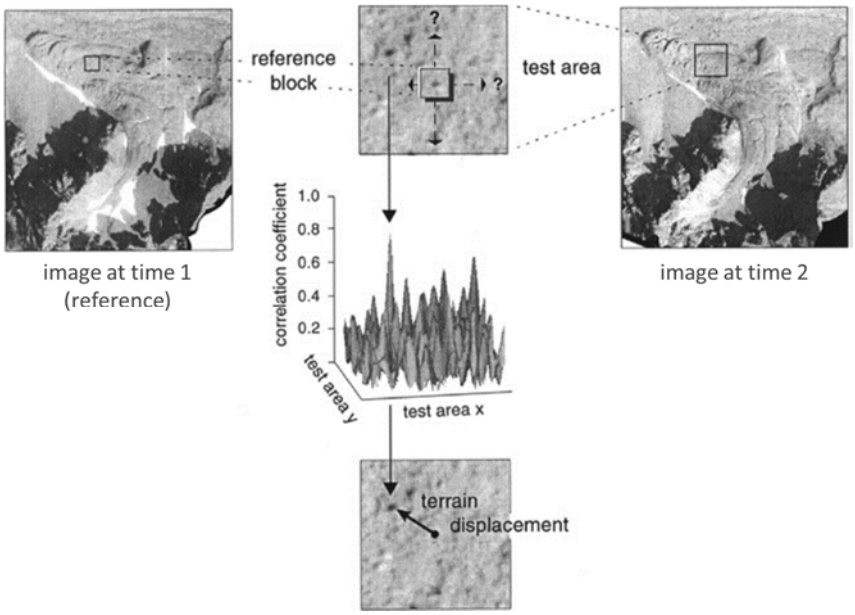

Figure 3. Schema of measuring surface displacements from two images acquired at different time by block-correlation techniques (Kääb and Vollmer, 2000)

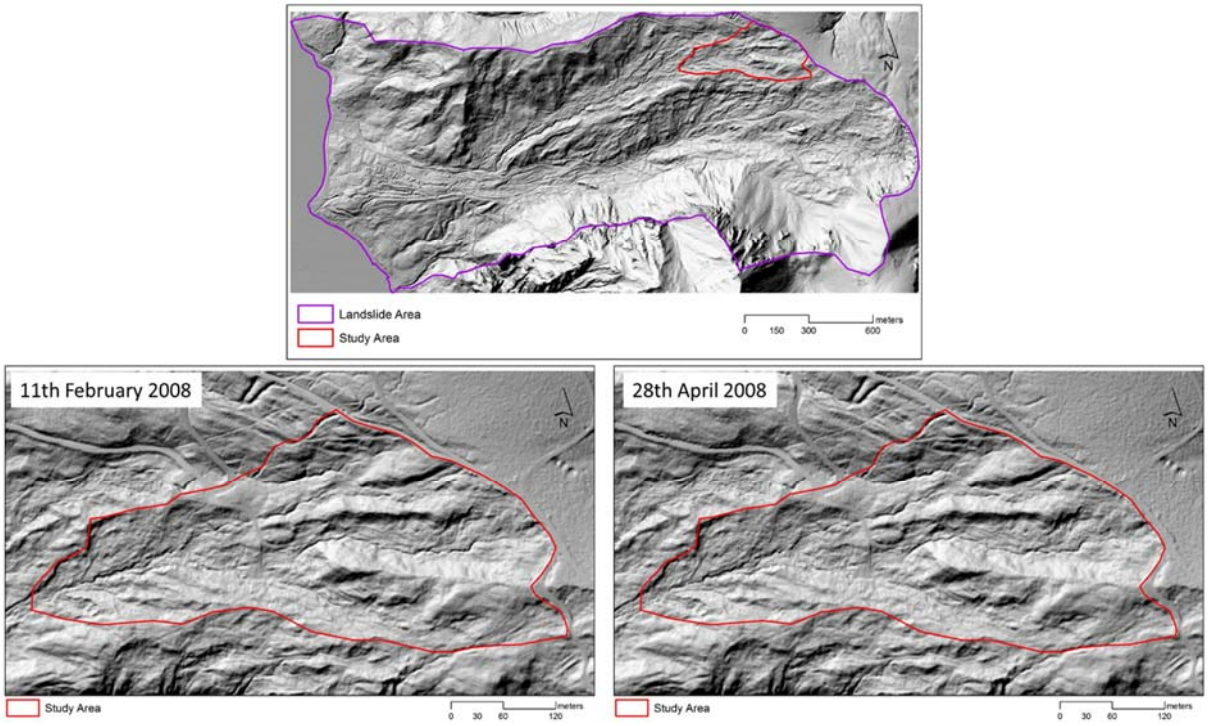

Figure 4. Selected active part of Gschliefgraben landslide for DIC analysis

DIC analysis was applied by using image correlation software (CIAS), which matches offsets between two images based on normalized cross-correlation. CIAS was originally written by M. Vollmer and A. Kääb (Kääb and Vollmer, 2000). The inputs (i.e. both images need to be exactly same resolution and to be single channel

 Copyright © International Science and Technology Conference (ISTEC)

(grayscale). The output is ASCII list of offsets in Cartesian and polar coordinates and correlation coefficients. Measuring an individual horizontal displacement vector basically follows two steps (Kääb and Vollmer, 2000): (1) choosing image section with sufficient contrast in image at time 1, called as "reference block", (2) searching the corresponding image section within a sub-area in the image at time. The ground coordinates of central pixel within the reference block are known due to usage of already georeferenced data ("Geotiff"). The difference of coordinates of central pixel within reference block and coordinates of corresponding location of central pixel in test block where correlation coefficient is maximum provides displacement. The size of the test area has to be chosen according to expected displacement. Also, textural characteristics of the ground surface have to be taken in to account for choosing the size of reference and test blocks (Kääb and Vollmer, 2000). In the present study, size of reference block was 16, and size of test block was defined as 64. Then, results from DIC was compared with displacements estimated from tracking well-constrained morphological features on shaded relief images (Daehne and Corsini, 2013; Esparmer, 2010).

Results and Discussion

DIC analysis was used to determine displacement fields from two time series (11th February 2008 and 28th April 2008) of LIDAR data with 1 m resolution in Gschliefgraben landslide. Between two time series there are 77 days. Shaded relief data with 1 m resolution were generated before DIC analysis was applied. CIAS software was selected, even though there are many other options (such as Cosi-corr, DPIVsoft Matlab, etc.) to apply DIC, because CIAS enables the users to use Geotiff data which is georeferenced, thus any further step is not necessary to convert the results to real world units. In the present study, there is no field check or any GPS surveying, however clearly identifiable features over the moving mass were tracked via visual inspection was carried out to get displacement rates in order to compare DIC results. The results were obtained as compatible with manually identified displacements rates.

Study area selected for DIC analysis is 10.19 Ha and there are two more active parts clearly identifiable by visual inspection. DIC analysis provided high displacements within these 2 more active parts of landslide (depicted in Figure 5) as expected. According to results, between two time series, displacement rates within study area were obtained between 0-32.2 m with sub-pixel precision image matching. DIC provided displacements for 25445 points. The mean displacement was obtained as 0.23 m. In the study area, 51 of all points have displacements higher than 2 m of which mean of maximum correlation coefficient is less than 0.70. Of these points, only 3 points showed displacement more than 30 m, 10 points showed displacement more than 20 m, 21 points showed displacements more than 10 m, and 17 points showed displacements more than 2 m. These points were interpreted as unrealistic (extreme) values of displacements which are not compatible with real situation.

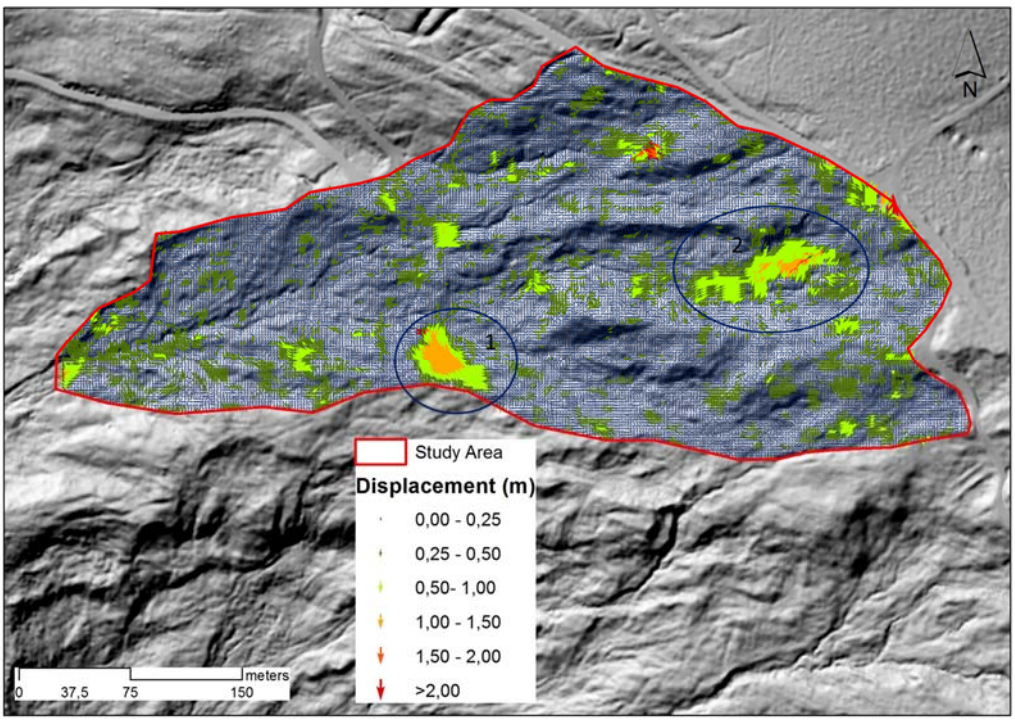

Figure 5. DIC results and two more active part of landslide (coded as 1 and 2)

 Copyright © International Science and Technology Conference (ISTEC)

Displacements obtained from DIC in two more active parts, coded as 1 and 2 (see Figure 5), were given in Figure 6 and Figure 7. Between two time series, the mean displacement rates in these more active parts within study area were obtained 0.66 m (max. 2 m) with sub-pixel precision image matching. In first active part of landslide (code no 1), displacements were observed as mean of 0.86 m and also higher than 2 m of displacements available (red circle in Figure 6) was interpreted as unrealistic. Movement direction was observed as NW, as expected due to topography. As similar to 1 coded active part of landslide, higher than 2 m of displacements was interpreted as unrealistic in 2 coded active part of landslide. Mean displacement in the 2 coded active part of landslide was obtained as 0.64 m. The movement direction in this active part of landslide was observed as SW within the upper slope, and as W within the lower slope.

part of landslide.

Conclusion

Our study showed that the DIC analysis applied to shaded relief from LIDAR data can provide spatially continues, smooth, and compatible displacement fields with real situation. As Aryal et al. (2012) and Daehne and Corsini (2013) stated, the accuracy of DIC displacement measurements is of the order of a few meters, which might be an acceptable limit. The success of DIC applied to LIDAR data is closely related to presence of morphological features which must maintain their shape remaining identifiable in shaded relief maps (Daehne and Corsini, 2013). Because we couldn't have any information from field or any axillary data (such as GPS), the compatibility of displacements were evaluated by using displacements obtained by manual tracking of identifiable features over moving mass. Although the DIC analysis preferably requires having knowledge of displacement magnitude to constrain the parameters, the first-hand knowledge of displacement can easily be acquired by comparing positions of identifiable features over time (Aryal et al., 2012).

LIQUEFACTION POTENTIAL AND POST-LIQUEFACTION SETTLEMENT OF SOMA WASTEWATER TREATMENT PLANT

Erdal UNCUOĞLU[1] Zülküf KAYA [2] Aykut EROL[3] Hacı Bekir KARA [4]

ABSTRACT

During 1953 Yenice-Gönen Earthquake, M_w=7.2, heavy damage was encountered in place around Yenice-Gönen and damage and casualties was occurred in central districts. According to official estimates, approximately 250 people killed, more than 8000 buildings including school, official buildings, mosques destroyed or heaviliy damaged. The local soil conditions was also one of the important factors in different structural damage patterns observed all around the city. Some structures can be collapsed due to soil amplification and some structures can be settled or tilted due to severe liquefaction of sands.

In this study, wastewater treatment plant construction site is selected as a case study to evaluate liquefaction potential of the site according to seismic risk analysis and peak ground acceleration, and to calculate settlements occurred after earthquake. Wastewater treatment plant construction area is located at the city of Manisa.

As a first step, local soil conditions at the site were examined using borehole logs, laboratory and in-situ test results. Liquefaction analyses were performed to take into account the soil conditions. Finally, earthquake-induced settlements were estimated based on Ishihara and Yoshimine (1992) procedure.

Keywords : Seismic risk analysis, liquefaction potential, liquefaction-induced settlement

1. Introduction

The 1953 Yenice–Gönen earthquake occurred at 21:06 local time on 18 March in the province of Çanakkale and Balıkesir in the Marmara region at western Turkey. It had a magnitude 7.5 on the surface wave magnitude scale and a maximum felt intensity of IX (Violent) on the Mercalli intensity scale. According to Kandilli Observatory and Earthquake Research Institute, this earthquake's magnitude was announced as 7.2 and its epicenter coordinate were defined as 39.99°K ve 27.36°D. The earthquake which has 10 km focal depth, coordinate of epicenter point is located about 12 km northeast of Yenice. The quake occurred along the Yenice–Gönen Fault, which is a southern extension of the North Anatolian Fault Zone.

In this study, wastewater treatment plant construction site located at the city of Manisa is selected as a case study. As a first step, local soil conditions at the site were examined using borehole logs, laboratory and in-situ test results. Liquefaction analyses were performed to take into account the soil conditions. Finally, earthquake-induced settlements were estimated based on Ishihara and Yoshimine (1992) procedure.

2. Local Soil Conditions

The construction area is located at the city of Manisa, district of Soma. Four boreholes were drilled in the wastewater treatment plant construction area. The depth of each borehole was about 15.0 m. The layout of the wastewater treatment plant and locations of the soil borings made in construction area have been shown in Figure 1.

The idealized soil profile represented the construction area has been estimated based on interpretation of the subsurface conditions encountered in the borings. The idealized soil profile was summarized in the below and indicated in Figure 2.

0.00 – 0.25 m.	Topsoil
0.25 – 5.00 m.	Silty Sand (SM)
5.00 – 15.00 m.	High Plasticity Clay (CH)

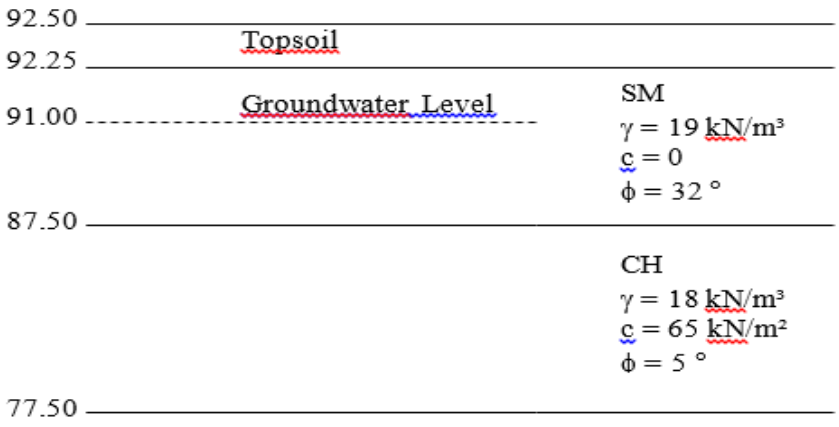

Figure 2. Idealized Soil Profile

The N values obtained from Standart Penetration Tests (SPT), the soil class considering the Unified Soil Classification System (USCS), fines content (FC) and unit weight (γ) of the layers in the profile with respect to the laboratory test results have been summarized for each of the borehole in Table 1. The groundwater level was encountered at the depth of -1.50m in the borings.

 Copyright © International Science and Technology Conference (ISTEC)

The wastewater treatment plant consists of several constructions such as Aeration Tank, Sludge Dewatering Building, Secondary Clarifiers, Oil and Grease Holding Unit, Blower and Transformer Station, Screening and Inlet Pumping Station and Administration Building. The construction area is approximately 48.500 m².

3. Seismicity of the Region

The town of Soma, Manisa is at I degree earthquake zone based on maximum acceleration according to Turkey Seismic Zoning Map prepared by the Ministry of Public Works and Housing and entered into force by the Council of Ministers via decision No. 96/8109 dated 18/04/1996.

The region is very complicated because of the ongoing tectonic earthquakes. The region has the high potential for earthquakes in the future. Earthquakes with larger than magnitude 3.0 between 1900-2015 in the town of Soma, Manisa and the area around it have been indicated in Figure 3.

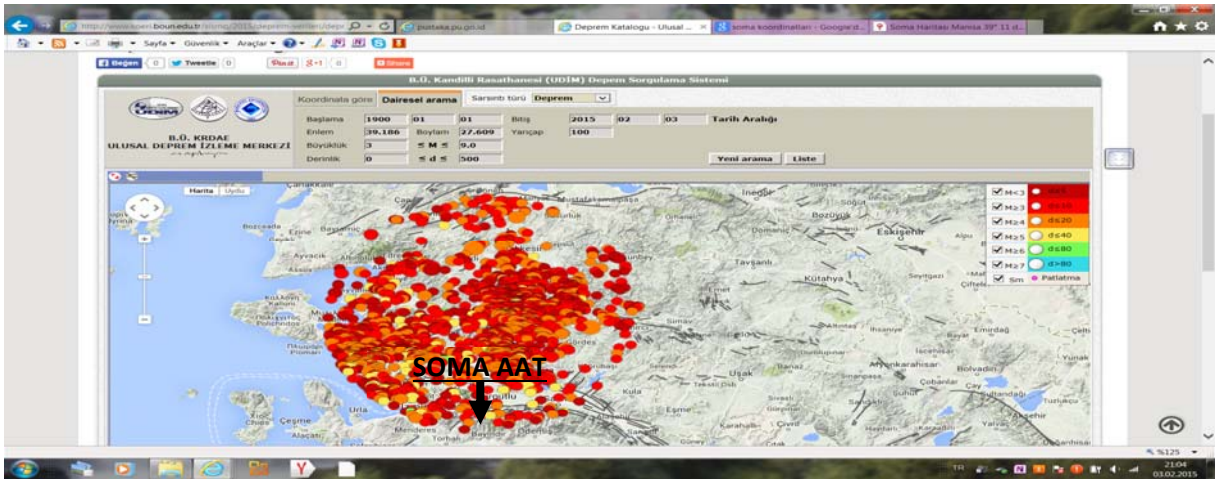

Figure 3. The Tectonic Map of the Town of Soma, Manisa and The Area Around It (Kandilli Observatory and Earthquake Research Institute - 03.02.2015)

3.1. Seismic Risk Analysis

Gutenberg - Richter described a methodology to estimate the magnitudes of earthquakes seem possible in the future based on the magnitudes of past earthquakes. In the seismic risk analysis, this method is used together with the Gumbel`s Annual Extreme Values Method. According to the method proposed by Gumbel, the distribution of the annual maximum earthquake magnitude is given by:

$$G(M) = e^{-\alpha e^{-\beta M}} \quad (1)$$

M: Magnitude of earthquake,

α, β: Regression coefficients,

 Copyright © International Science and Technology Conference (ISTEC)

G(M): Probability of not exceeding the earthquakes having magnitudes more than M in one year.

Gutenberg-Richter (1956) proposed the following relationship which relates the earthquake magnitude to the total number of earthquakes in one year:

$$LogN = a - bM \quad (2)$$

a and b : Regressions coefficients,

N : The number of earthquakes with a magnitude of M or greater in one year

The relationships between the equations 2 and 3 are as follows (Tezcan, 1996).

$$\alpha = 10^{a}, \quad a = \text{Log}\alpha$$
$$\beta = b / \text{Loge}, \quad b = \beta\text{Loge}$$

$$N = \alpha e^{-\beta M} = -\text{LnG} \quad (3)$$

The relationship obtained with respect to the calculated values of the Log N and Magnitudes has been shown in Figure 4.

The maximum magnitude value which is possible to occur in a frequency period corresponding to 115 year has been estimated as M = 6.75 for the Soma Wastewater Treatment Plant construction area. The maximum magnitude value has been estimated based on the earthquakes with larger than magnitude 3.0 between 1900-2015 in the town of Soma, Manisa and the area around it using the equation given below.

$$\text{Log } N = 3.41 - 0.81M + \log T_r$$

Annual magnitude value observed mostly has been obtained as M = 4.20.

 Copyright © International Science and Technology Conference (ISTEC)

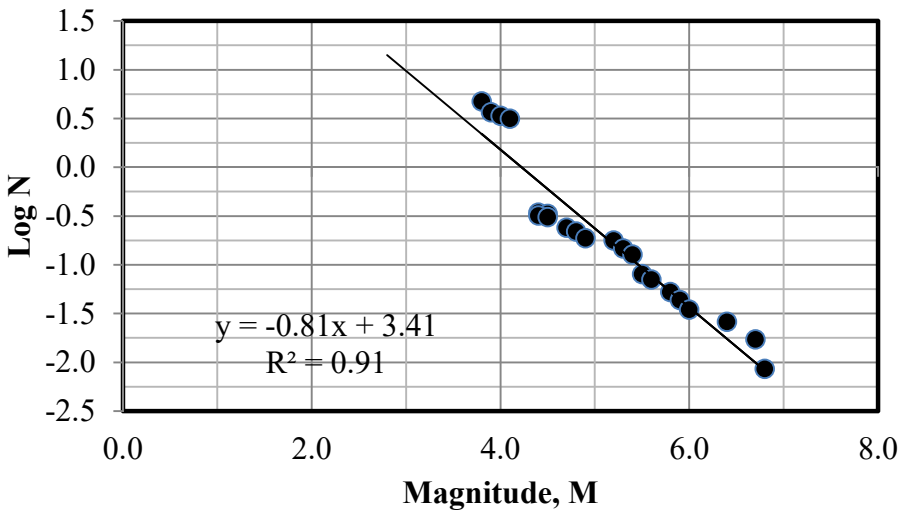

Figure 4. The Relationship Between Log N and Magnitüd

4. The Evaluation of Liquefaction Potential

The liquefaction analyses performed with the method mentioned above gave FS<1 for sand layers in all the four boreholes. The liquefaction potential of granular soils is usually evaluated using the simplified method proposed by Seed and Idriss (1971) using the soil parameters, PGA and Moment Magnitude (M_w). This procedure was modified and improved by Youd et al. (2001). Because of the town of Soma is located in first-degree earthquake zone, effective ground acceleration coefficient assumed as peak ground acceleration. Therefore, the value of effective ground acceleration has been taken as equal to 0.40g. The values of the safety factors against liquefaction obtained for the depths considered for the earthquake of which magnitude of 6.75 are given in the Table 2. As seen from Table 2, Silty Sand (SM) layers have liquefaction potential for the earthquakes of which magnitude is 6.75. On the other hand, liquefaction is not expected in High Plasticity Clay (CH) layers.

5. Determination of Settlements Following Liquefaction By An Emprical Approach

Liquefaction settlements at the investigation site were estimated for each of the four boreholes with the method proposed by Ishihara and Yoshimine (1992). The method is obtained by using the results of simple shear tests, which were utilized to establish a family of curves for various relative density (or SPT-N1) values with respect to factor of safety against liquefaction (FS) and volumetric strain (ε_v). Additional details are presented by Ishihara (1996).

 Copyright © International Science and Technology Conference (ISTEC)

Table 2. The Results of the Liquefaction Analyses

SK NO	Sample Type	Depth (m)	USCS	$FS_{7.5}$	$FS_{6.75}$
SK-1	SPT	1.50	ML	1.09	1.43
SK-1	SPT	3.00	SM	0.75	0.99
SK-1	SPT	4.50	SM	0.67	0.88
SK-2	SPT	1.50	SM	0.78	1.02
SK-2	SPT	3.00	SM	0.58	0.76
SK-2	SPT	4.50	SM	0.52	0.68
SK-3	SPT	1.50	SM	0.82	1.07
SK-3	SPT	3.00	SM	0.61	0.80
SK-3	SPT	4.50	SM	0.54	0.71
SK-4	SPT	1.50	SM	0.82	1.07
SK-4	SPT	3.00	SM	0.73	0.96
SK-4	SPT	4.50	SM	0.65	0.85

Finally, the volume change was integrated with depth to determine the liquefaction induced settlements at the ground surface. The settlements assessed for SK1, SK2, SK3 and SK4 using this method are 3.0, 9.75, 9.90 and 5.40 cm, respectively. It should be noted that these settlements do not include the settlements in clay layers.

6. Conclusions

In present study, wastewater treatment plant construction site is selected as a case study to evaluate liquefaction potential of the site according to seismic risk analysis and peak ground acceleration, and to calculate settlements occurred after earthquake. Building settlements following Yenice–Gönen earthquake are investigated at a site in Manisa, Soma. The maximum magnitude value which is possible to occur in a frequency period corresponding to 115 year has been estimated as M = 6.75 for the Soma. Silty Sand (SM) layers have liquefaction potential for the M_w=6.75. The settlements of the ground surface on the order of 3.3 to 9.9 cm calculated with the method proposed by Ishihara and Yoshimine (1992).

Abstract: This study contains site classification of sediments in Isparta basin based on the current seismic code. Determination of S-wave velocity is very important in the soil classification survey. Among the several techniques of site investigation the ReMi method (Refraction Microtremor) allow the determination of the shear wave velocity profile. Hence, the Refraction Microtremor (ReMi) method is being used around the world by the geotechnical and geophysical community to determine shear-wave velocities. In this study we present refraction microtremors (ReMi) measurements done at sites underlain by different soil types in Isparta. The ReMi data were collected along N-S directional arrays and using standard refraction equipment employing 12 channels.

The project site is located in a region which has the potential seismic events along the Isparta tectonic lines. Sediment characteristics of the region were determined and soil profiles were characterized by ReMi method at different locations. Soil sediments in the Isparta basin will influence ground motions from earthquakes occurred seismic activity in region. Shear wave velocity profiles of these sediments are important for construction industry and urbanization site response in this region.

The geological characteristics of these sedimentary units were compared with the geological boring and seismic site characterization studies to classify the soil deposits. Consequently, the regional site classification map of Isparta basin considering site classes was assessed based on the average shear wave velocity (VS30) results and the shear wave velocity data and thickness of the surface layer based on the Vs values in the NEHRP.

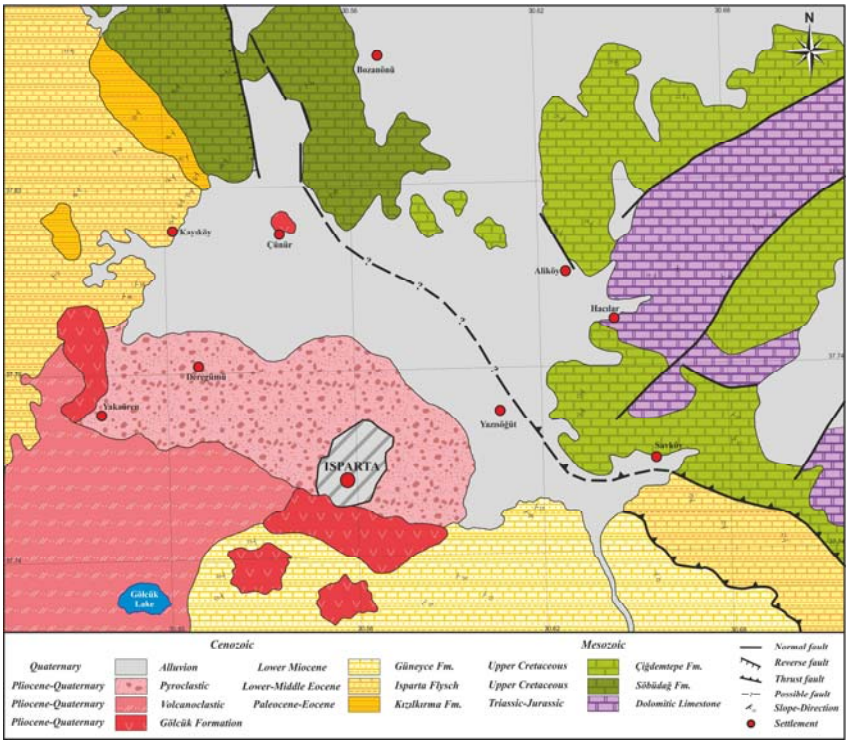
Giriş



Gelişen günümüz koşullarında yerel zemin bilgileri, mühendilik yapılarında deprem etkileri ve zararlarının önceden belirlenmesinde en önemli parametrelerinden birisidir. Bu sebep itibariyle de deprem mühendisliğinin üzerinde durduğu konuların arasında yer almaktadır. Deprem odağına aynı mesafede olmasına rağmen farklı zeminler deprem etkisine birbirlerinden ayrı etki sağlayabilirler. Bu durum özellikle 1985 Copala, 1995 Kobe, 1999 Kocaeli gibi depremlerde etkin bir şekilde gözlenmiştir. Gerek bu depremlerde gerekse farklı depremlerde zemin koşullarından kaynaklı etkinin varlığı birçok araştırmacı tarafından ortaya konulmuştur (Furuma ve Singh 2002; Özel vd. 2004; Hallier vd. 2008; Frankel vd. 2009).

NEHRP zemin sınıflaması kriterlerine göre zemin özelliklerinin belirlenmesinde en önemli bilgi kesme dalgası hızının belirlenmesidir. Jeofizik yöntemlerden ReMi (kırılma-mikrokırınım) tekniği, yeterli açılım ile 100 m derinliğe kadar kesme dalgası hızının elde edilmesinde son yıllarda aktif şekilde kullanılmaktadır (Louie 2001; Kanbur vd. 2008; Büyüksaraç vd. 2013; Barnard vd. 2015). Bu çalışmada, ülkemizin önemli tektonik elemanlarından biri olan Isparta açısının güneyinde kalan Isparta şehir merkezini kapsayan 12x15 km alanın makro ölçekte zemin sınıflaması yapılması amacı ile Tübitak projesi alınmıştır. Bu doğrultuda bölgeyi temsil eder nitelikte belirlenen 176 noktada ReMi yöntemi ile Vs dağılım ve Vs30 zemin sınıflaması haritaları hazırlanmıştır. Bölgede devlet su işleri tarafından kuyu kütük bilgileri ile çalışmadan elde edilen verilerin uyumluluğu incelenmiştir.

Çalışma Alanı ve Jeolojisi

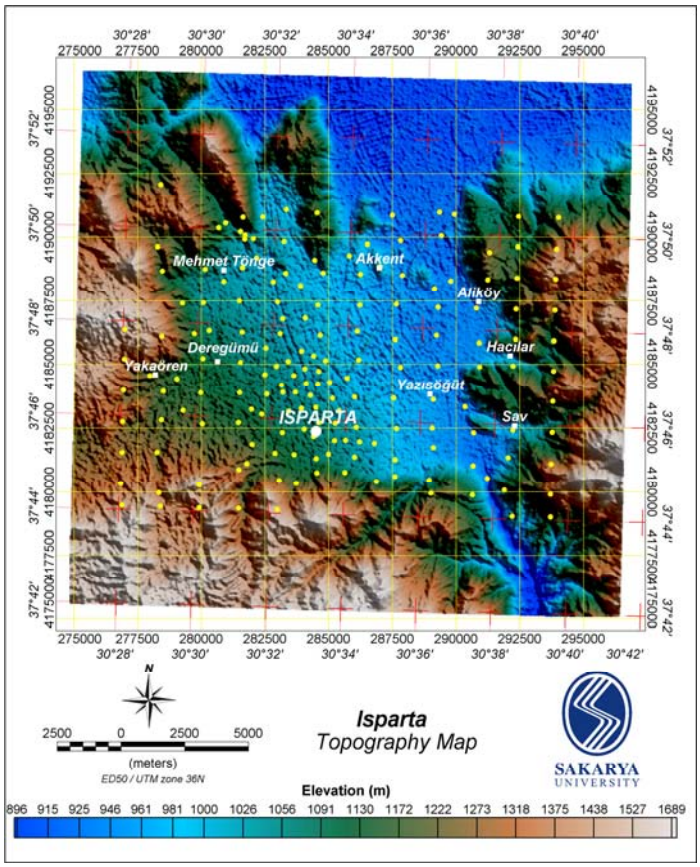
Çalışma alanı olan Isparta ovası, temel olarak otokton ve allokton jeolojik birimlerden oluşmaktadır (Karaman 1990; Yılmaz 2010). Şekil 1'de proje kapsamında hazırlanan çalışma alanı ve yakın çevresinin jeolojik haritasında da görüleceği üzere otokton Davraz kireçtaşı, Söbüdağ kireçtaşı, Çiğdemtepe formasyonu, Güneyce formasyonu, Kızılkırma formasyonu, Gölcük volkanitleri ve Volkanik filişlerinin Isparta şehir merkezini çevrelediği, allakton alüvyon malzemenin ise ova düzlüğüne yayıldığı açıkça görülmektedir.

Şekil 1. Çalışma alanı ve yakın çevresi jeoloji haritası. (Olası fay olarak gösterilen yapı Demer vd. 2010'dan düzenlenmiştir)

Ovayı çevreleyen Eosen ve Kretase yaşlı kireç taşı üyeleri yer yer tabakalı masif görünümlü kireçtaşlarından oluşmaktadır. Düzlük alan içerisinde uzanan kuvaterner alüvyon malzeme çakıl, kum, kil ve silt içermektedir(Karaman 1990).

Materyal ve Metot

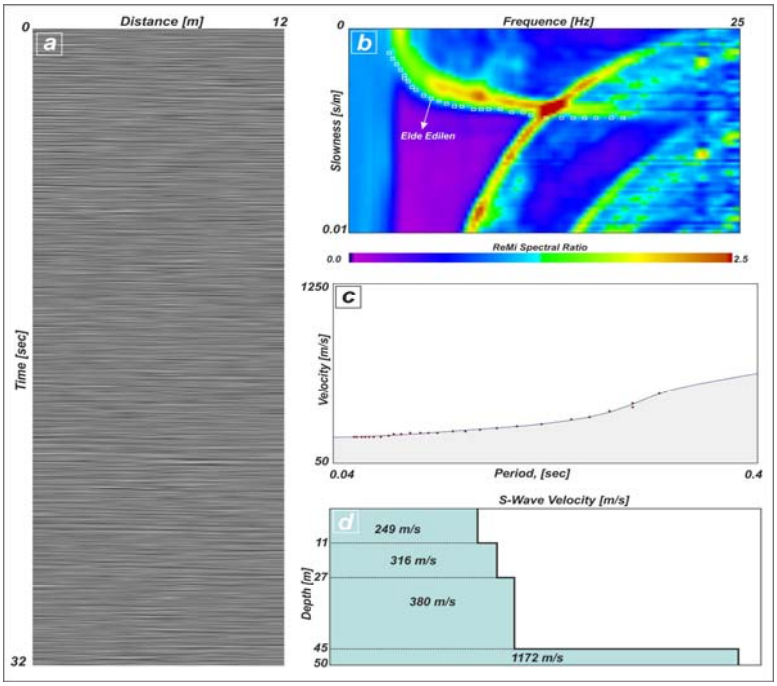
Bu çalışmada Isparta şehir merkezi ve yakın çevresinin Vs dağılım haritalaması ve zemin özelliklerinin belirlenmesinde jeofizik yöntemlerden ReMi tekniği kullanılmıştır. Teknik doğal gürültüyü enerji kaynağı olarak kullandığı için hızlı ve ekonomik bir yöntem olarak ön plana çıkmaktadır. Şekil 2 de dijital yükseklik haritasında (DYH) veri kazanımı yapılan 176 ölçüm lokasyonu sarı noktalar ile gösterilmiştir. Veri kazanım noktaları arası mesafe yaklaşık 1 km olmasına karşın yapılaşmanın yoğun olduğu şehir merkezinde bu mesafe 250 metreye kadar azaltılmıştır.



ReMi Yöntemi

Yüzey dalgası analiz yöntemlerinden birisi olan ReMi tekniğinin detayları ve uygulamaları literatürde yaygın birşekilde anlatılmaktadır(Louie 2001; Başokur 2007; Silahtar ve Kanbur 2015). Tekniğin metodolojisi Louie 2001 den özetle şu şekildedir;

a. τ-ρ dönüşümü,
b. verin τ-ρ ortamından Fourier dönüşümü ile ρ-f ortamına dönüştürülmesi,
c. Louie 2001 tarafınan gösterildiği gibi güç spektrumunun alınması olarak özetlenebilir.



Çalışmada kesme dalgası hızının (Vs) belirlenmesinde sinyal biriktirme özelliği bulunan 12 kanallı Geode Ultra-Light sismik cihazı kullanılmıştır. Literatürde bu tür çalışmalarda kullanılması önerilen 4.5 Hz P jeofonları alıcı olarak tercih edilmiştir(Louie 2001; Kanbur vd. 2008; Silahtar ve Kanbur 2015). 2 ms örnekleme aralığı, 32 s kayıt boyu uzunluğunda ve 10 m jeofon aralığınaki arazi verileri, ReMi spektral oranını yükseltmek amacı ile herbir ölçüm noktasında 10-12 arasında değişen tekrarlar ile gerçekleştirilmiştir (Şekil 3a). Veri kazanımı yapılan verilerin yukarda özetlendiği şeklide güç spektrumları alınıp spektrumlar üzerinde dispersiyon

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 2. Dijital yükseklik haritası ve veri kazanım lokasyon haritası (sarı noktalar ReMi veri kazanım noktalarını göstermektedir).

eğrileri seçimi gerçekleştirilmiştir (Şekil 3b). Bu dispersiyon eğrileri yinelemeli en küçük kareler yöntemi ile ters çözüme tabi tutulup(Şekil 3c) bir boyutlu derinlik-Vs hızı(Şekil 3d) değerlerine dönüştürülmüştür. 176 veri kazanım noktası için tüm işlem ayrı ayrı uygulanarak Vs dağılım bilgisi elde edilmiştir.

Şekil 3. ReMi veri işlem akış diyagramı a) Arazi verisi b) Güç spektrumu üzerinde dispersiyon eğrisi seçimi c) Ters çözüm işlemi d) 1 boyutlu derinlik-Vs kesiti.

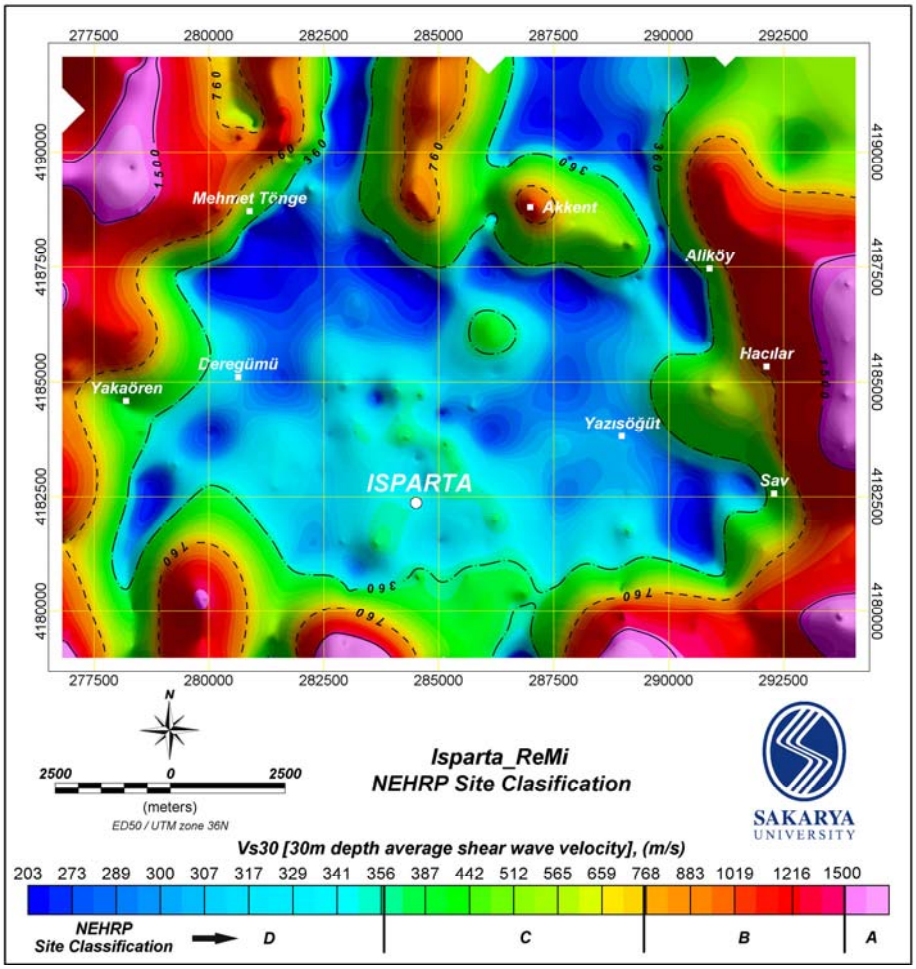
Bulgular

İnceleme alanından toplamda 176 noktada bir boyutlu derinlik-Vs bilgileri oluşturulmuştur. Elde edilen bu değerlerin Devlet Su İşleri tarafından bölgede açılan su sondajı kuyularının kuyu kütüğü bilgileri ile uyumlu olduğu görülmüştür(kuyu kütüğü bilgilerine bu çalışmada yer verilmemiştir).



Tablo 1. NEHRP zemin sınıflaması kriterleri

Site Classification	Description	Index
A	Very hard rocks	Vs_{30} > 1500 m/s
B	Rocks	1500 m/s > Vs_{30} > 760 m/s
C	Hard or very hard soil, soft rocks	760 m/s > Vs_{30} > 360 m/s
D	Hard soil (sands, clays and gravels)	360 m/s > Vs_{30} > 180 m/s
E	Soft soil (clays and sands)	Vs_{30} < 180 m/s

Tablo 1 de belirtilen NEHRP kriterlerine göre zemin sınıflaması yapabilmek için aşağıda verilen eşitlik kullanılarak Vs30 (30 metre derinlik ortalama Vs hızı) dağılım haritası oluşturulmuştur(Şekil 4).

$$Vs30 = \frac{30}{\sum_{i=1}^{N} hi/vi}$$

Burda; hi tabaka kalınlığı, Vi hi kalınlığındaki tabakanın kesme dalgası hızıdır.

Şekil 4. Vs30 dağılım haritası

Şekil 4 üzerinde de görüldüğü üzere şehir merkezinin kurulu olduğu alanda zemin grubu D olarak ortaya çıkmıştır. Köy merkezlerinin bulunduğu (Aliköy, Sav,Yakaören, vb.) alanlar ise nispeten daha güvenli bir grup olan C

 Copyright © International Science and Technology Conference (ISTEC)

sınıfı olarak belirlenmiştir. A ve B grubu zemin özellikleri yapılaşma ve yerleşimin olmadığı dağlık ve tepelik bölgelerde ortaya çıkmıştır.

Sonuçlar

Bu çalışmada Isparta şehir merkezi ve yakın çevresini kapsayan alanın makro ölçekte zemin sınıflaması yapılmıştır. Yüzey dalgaları analiz yöntemlerinden ReMi tekniği Vs bilgisinin elde edilmesinde 176 noktada uygulanmış ve inceleme alanının Vs30 dağılım haritası yapılmıştır. Bu haritalama üzerinde NEHRP kriterlerine göre zemin sınıflaması yapılmıştır. Çalışma alanında zayıf bir zemin özelliği gösteren D grubunun hakim olduğu ve olası yeni yapılaşma bölgelerinin bu alanlar içerisinde olması durumunda, mühendislik yapılarının güvenliğinin sağlanması için gerekli zemin iyileştirmelerin yapılması gerektiği ortaya çıkmaktadır.

Zemin sınıflamasında 360-760 m/s hız aralığındaki C sınıfındaki zemin grubu Isparta şehir merkezinde bulunan köy yerleşim alanları olarak dikkati çekmektedir. Şehir merkezine göre daha sağlam olan bu köy yerleri yapılaşmaya daha uygun alanlar olarak karşımıza çıkmaktadır.

Yapılaşmaya uygun olmayan dağlık ve tepelik alanlarda A ve B sınıfı zemin olarak belirlenmiştir.

Dört aşamalı projenin ikinci basamağını oluşturan bu çalışmadan elde edilen bu sonuçlar bölge için yapılacak senaryo deprem simülasyonu çalışmasına önemli veri kaynağı sağlayacaktır. İnceleme alanında makro ölçekte yapılan ilk çalışma olması açısından da elde edilen sonuçların gerek bundan sonra bölgede yapılacak araştırmalara ve gerekse bölgedeki yerel yönetime önemli katkılar sağlayacağı düşünülmektedir.

Teşekkür

Bu çalışma **TÜBİTAK 114Y836** numaralı proje kapsamında gerçekleştirilmiştir.

LUMINESCENT DETECTION OF BACTERIAL ENDOSPORES VIA FUNCTIONAL HYBRID NANOMATERIALS

Benan Kilbaş
bkilbas@gmail.com

Bacterial spores produced by bacterial cells are resistant to heat, pressure and radiation. [1] They are extensively consist of DNA, ribosomes and dipicolinic acid (DPA, %15 by dry weight). DPA provides to protect the bacterial cell's DNA as well as enables germination. [2] Detection of DPA concentration is very important in many application areas especially health and food industry. Many methodology have been developed over the past decades for DPA detection such as colorimetric assay, UV spectrometric method and immunological techniques. [3-5] Among them, fluorescence spectroscopy is more sensitive, convenient and an accurate process for DPA detection. Lanthanides have been frequently used for the fluorescent detection of DPA due to the having sharp-line like emission bands and long-lived excited states. [6] More recently, considerable attention has been devoted to hybrid nanomaterials for biosensors. Herein, fluorescent detection of DPA has been described using lanthanide chelated gold nanoparticles for the first time.

Keywords: Bacterial spores, gold nanoparticles, nanosensors.

ÖZET: İnsanın dinlenme, eğlenme gibi etkinliklerinin bütünü olarak ifade edilen turizm üzerinde, iklimin etkileri oldukça büyüktür. İklim, herhangi bir alanda turizm faaliyetlerinin gerçekleşmesi için gerekli olan doğal çekiciliklerden biri olmasının yanında, turizm faaliyetlerinin cinsi, süresi, katılımcıların memnuniyeti gibi diğer olgular üzerinde de oldukça etkilidir.

Türkiye'nin Güneydoğu Anadolu Bölgesi'nde yer alan Mardin şehri, tarihi mekânları, geleneksel konut mimarisi, şehir dokusu, çarşıları, peyzaj ve manzara özellikleri, kültürel zenginlikleri ile son yıllarda turizm açısından önemi artan şehirlerimizdendir. Şehirde gerçekleştirilen turizm faaliyetlerinin büyük çoğunluğunu, atmosferik koşulların etkilerinin önemli ölçüde hissedildiği dış mekânlarda gerçekleşen etkinlikler oluşturmaktadır.

Bu araştırmada, Mardin Meteoroloji İstasyonunun 2009-2014 yılları arasındaki 5 yıllık dönemde saatlik sıcaklık, nisbi nem, bulutluluk, rüzgâr hızı, verileri kullanılarak Fizyolojik eşdeğer sıcaklık (PET) değerleri hesaplanıp Mardin şehir merkezinin biyoklimatik konfor koşulları belirlenmiş, yörenin iklim koşulları turizm açısından değerlendirilerek, yöreye gerçekleştirilecek turizm destinasyonları açısından ideal dönemler saptanmıştır.

Anahtar Kelimeler: İklim, Mardin, Biyoklimatoloji, Turizm Klimatolojisi, Fizyolojik eşdeğer sıcaklık

DETERMINING OF THE IDEAL TOURISM DESTINATION IN TERMS OF THE BIOCLIMATICAL CONDITION IN MARDIN CITY

Abstract: The climate has a huge impact on the tourism which is defined as the whole of human recreation and entertaintment activities. Climate which is the one of the most important natural charm aspect of the occurence of the touristic activities, effects the participant satisfaction, duration and type of touristic activities.

Mardin city is situated in South East Anatolia Region of the Turkey and Mardin with the historical areas, traditional residential architecture, urban texture, bazars, landscape and scenery features and cultural diversity has a increasing importance in terms of the tourism in the resent years. The majority of the tourism activities carried out in the city, consists of outdoor activities open to atmospheric conditions.

In this study, Physiological Equivalent Temperatures (PET) have been calculated with the using of the air temperature, relative humidity, cloudiness, wind velocity values, between 2009-2014 and bioclimatical condition of the Mardin city center has been determined. Climatical condition of the study area has been evaluated and the ideal terms have been defined in terms of the tourism destinations.

Key Words: Climate, Mardin, Bioclimatology, Tourism Climatology, Physiologically equivalent temperature

MARKA SADAKATİNİN DEMOGRAFİK FAKTÖRLER BAĞLAMINDA DEĞERLENDİRİLMESİ (EVALUATION OF BRAND LOYALTY IN THE CONTEXT OF DEMOGRAPHICAL FACTORS)

Tolga Dursun
tolgadursun@ibu.edu.tr

Baran Arslan
barslan@harran.edu.tr

Tüketicilerin belirli bir markayı düzenli ve tutarlı bir şekilde satın alma eğilimi olarak tanımlanan marka sadakati rekabetin yoğun yaşandığı pazarlarda işletmelere rekabet avantajı sağlamaktadır. Müşteri sadakati, mal ve hizmet üreten işletmeler için oldukça önemli ve çok tartışılan bir konu haline gelmiştir. Tüketicilerin ürün veya hizmetle ilgili değerlendirmelerinde ve karar aşamalarında marka sadakati önemli bir rol üstlenmektedir. Bu nedenle marka sadakatini etkileyen faktörlerin belirlenmesi işletmeler açısından çok önemlidir. Çalışmada marka ve marka sadakatinin önemi incelendikten sonra tüketicilerin demografik özelliklerinin tüketicilerin marka sadakatleri üzerinde nasıl bir etki yaptığının belirlenmesi amaçlanmıştır. Çalışmaya yönelik hazırlanan anket, İstanbul'da yaşayan ve sürekli aynı beyaz eşya markasını kullanan 321 kişiye uygulandı ve anketler edit edildikten sonra kalan 300 anket analize tabi tutulmuştur. Frekans dağılımları, faktör analizi, güvenirlilik analizi ve t-testi analizi yapıldı. Yapılan analizler sonucunda tüketicilerin demografik faktörlerinden cinsiyet ve medeni durumun marka sadakati üzerinde etkili olduğu sonucuna ulaşılmıştır.

MDS CODES FROM POLYCYCLIC CODES OVER FINITE FIELDS

Mehmet Özen, Halit İnce

Sakarya University, Department of Mathematics, Sakarya- Turkey

ozen@sakarya.edu.tr, ince@sakarya.edu.tr

Abstract: In this work, we construct polycyclic codes over finite fields by using linear algebraic methods. After the construction, we perform an exhaustive search by using polycyclic codes to obtain MDS codes over finite fields which have many applications in cryptography. The computer search results are presented at the end of the paper.

Keywords: Polycyclic Codes, MDS Codes, Finite Fields

1. Introduction

Polycyclic codes are the generalization of cyclic and constacyclic codes and were studied in (William, 1972) for the first time. In (Radkova, 2009) Radkova et al. studied the cyclic and constacyclic codes from a linear algebraic point of view. In this work, we construct polycyclic codes over finite fields by using same methods.Then we perform an exhaustive search by using polycyclic codes to obtain MDS codes over finite fields which have many applications in cryptography. The computer search results are presented at the end of the paper.

2. Polycyclic Codes

Polycyclic codes are the generalization of cyclic and constacyclic codes. We give the definition of polycyclic code.

Definition 2.1: A linear code C with length n over a finite field F is called polycyclic code induced by the polynomial $v(x)=v_0+v_1x+\cdots+v_{n-1}x^{n-1}\in F[x]$ such that if $c=(c_0,c_1,\cdots,c_{n-1})\in C$ then its $v-vector$ shift $(0,c_0,c_1,\cdots,c_{n-2})+c_{n-1}(v_0,v_1,\cdots,v_{n-1})\in C.$

Let $F=GF(q)$ and let F^n be the n-dimensiomal vector space over F with standard basis $e_1=(1,0,\ldots,0),e_2=(0,1,\ldots,0),\ldots,e_n=(0,0,\ldots,n).$
Then polycyclic shift with respect to a vector v is the following transformation:

$$\begin{array}{rccc}\tau_v: & F^n & \to & F^n \\ & (c_0,c_1,\cdots,c_{n-1}) & \mapsto & (v_0c_{n-1}+v_1c_{n-1},\cdots,c_{n-2}+v_{n-1}c_{n-1}).\end{array}$$

Then it has the following matrix

$$T_v=\begin{pmatrix}0 & \cdots & \cdots & 0 & v_0\\ 1 & 0 & \cdots & 0 & v_1\\ 0 & 1 & & \vdots & \vdots\\ \vdots & & \ddots & 0 & \vdots\\ 0 & \cdots & 0 & 1 & v_{n-1}\end{pmatrix}$$

with respect to tstansard basis. Note that the characteristic polynomial of T_v is $f(x)=x^n-v(x)$.

Let $gcd(n,q)=1$. Assume that $f(x)=x^n-v(x)=f_1(x)f_2(x)\ldots f_t(x)$ be the factorization of $f(x)$ into monic irreducible factors over F. Cayley-Hamilton Theorem states that the matrix T_v satisfies $f(T_v)=0$.

Now we consider the set of homogeneous equations

 Copyright © International Science and Technology Conference (ISTEC)

$$f_i(T_v)x = 0, \quad x \in F^n \text{ for } i = 1,\ldots,t.$$

Let U_i be the solution space of $f_i(T_v)x = 0, \quad x \in F^n$. We denote $U_i = Kerf_i(\tau_v)$. Then each U_i is a subspace of F^n.

Then we have the following theorem:

Theorem 2.2: The following statements hold for the subspaces U_i of F^n:

(1) U_i is τ_v-invariant subspace of F^n;

(2) If W is a τ_v-invariant subspace of F^n and $W_i \cap W = U_i$ for $i = 1,2,\ldots,t$, then W_i is free τ_v-invariant and $W = W_1 \oplus \ldots \oplus W_t$;

(3) $F^n = U_1 \oplus \ldots \oplus U_t$;

(4) $dim_F(U_i) = deg(f_i) =: k_i$;

(5) $f_i(x)$ is the minimal polynomial of τ_v over U_i;

(6) U_i is the minimal τ_v-invariant subspace of F^n;

(7) For any subspace U of F^n, U is the direct sum of some of minimal τ_v-invariant subspaces U_i of F^n.

Then the following theorem is clear from the definition:

Theorem 2.3: A linear code C with length n over F is a polycyclic code with respect to some $v(x) \in F[x]$ if and only if C is a τ_v-invariant subspace of F^n.

Theorem 2.4: Let C be a linear polycyclic code with length n over F with respect to some $v(x) \in F[x]$. Then the following statements hold:

(1) $C = U_{i_1} \oplus U_{i_2} \oplus \ldots \oplus U_{i_s}$ for some minimal τ_v-invariant subspaces of R^n and $k := dim(C) = k_{i_1} + \ldots + k_{i_s}$, where $k_{i_j} = dim(U_{i_j}), \quad j = 1,\ldots,s$;

(2) $h(x) = f_{i_1}(x)\ldots f_{i_s}(x)$ is the minimal polynomial of τ_v over C;

(3) $dim(h(T)) = n - k$;\

(4) $c \in C$ if and only if $h(T)c = 0$.

Then we have the following result which explains how we construct pollcyclic codes over finite fields.

Corollary 2.5: $H = h(T_v)$ is a parity check matrix for the code C and $G = (g(T_v))^t$ is a generator matrix for the code C where $x^n - v(x) = f(x) = g(x)h(x)$. In this case, $g(x)$ is said to be the generating polynomial of the polycyclic code C.

3. MDS Codes

In this section we briefly explain the MDS codes and its applications in cryptography. The reader who wants more information about this topic may consult (Augot, 2014).

Definition 3.1: Let C be linear code over F_q with parameters [n,k,d]. C is said to be a MDS code if $d = n + k - 1$ is satisfied.

Definition 3.2: A matrix M is MDS if its concatenation with the identity matrix $G_M := [I_k \mid M]$ yields a

 Copyright © International Science and Technology Conference (ISTEC)

generating matrix of an MDS code C.

MDS matrices are used in linear diffusion layers in cryptography. A linear diffusion layer of a block cipher is defined by an invertible matrix of size $k \times k$ over F_q. It takes $x \in F_q^n$ as a input and yields $y \in F_q^k$ as an output with $y = x \times M$.

The security of a diffusion layer is measured by its differential branch number and the linear branch number. The larger the two branch numbers are, the stronger a diffusion layer is. The diffusion layers with the optimal branch numbers are called being maximum distance separable. Optimal linear diffusion can thus obtained by using codes with largest possible minimal distance, namely MDS codes.

Several different techniques have been studied to obtain MDS matrices, a well known example being circulant matrices as used in the AES (Daemen, 1012) or FOX (Junod, 2004). Recently a new construction has been proposed: the so-called recursive MDS matrices, that were for example used in LED (Guo, 2011). These matrices have the property that they can be expressed as a power of a companion matrix C.

Definition 3.3: The companion matrix of monic polynomial $c(x) = c_0 + c_1 x + \ldots + c_{n-1} x^{n-1} + x^n$ is defined as the square matrix

$$T_v = \begin{pmatrix} 0 & \cdots & \cdots & 0 & c_0 \\ 1 & 0 & \cdots & 0 & c_1 \\ 0 & 1 & & \vdots & \vdots \\ \vdots & & \ddots & 0 & \vdots \\ 0 & \cdots & 0 & 1 & c_{n-1} \end{pmatrix}$$

Recently Augot et al. in [4] propose a fast algorithm which yields $k \times k$ square matrices whose k^{th} power of its companion matrices are MDS matrices. They obtain recursive MDS matrices by using shortened BCH codes.

4. The Link Between Polycyclic Codes and Recursive MDS Matrices

The matrix of a linear transformation of a polycyclic shift with respect to a polynomial $v(x) = v_0 + v_1 x + \ldots + v_{n-1} x^{n-1}$ and the companion matrix of a monic polynomial $x^n + v(x)$ same and as the following:

$$T_v = \begin{pmatrix} 0 & \cdots & \cdots & 0 & v_0 \\ 1 & 0 & \cdots & 0 & v_1 \\ 0 & 1 & & \vdots & \vdots \\ \vdots & & \ddots & 0 & \vdots \\ 0 & \cdots & 0 & 1 & v_{n-1} \end{pmatrix}$$

There is an obvious link between polycyclic codes and recursive MDS matrices. Augot et al.'s algorithm already finds the polynomials whose companion matrices are recursive MDS matrices. So we perform an algorithm as explained below:

1. Choose a field F_{2^s} and a code length n.
2. Take a polynomial $v(x)$ of degree $n-1$ form $F_{2^s}[x]$ from the previous algorithm results (Augot's Algorithm).
3. Compute the polycyclic codes with respect to $v(x)$ using the theory we just derive.
4. Decide if the polycyclic codes we obtain MDS code or not.

We run this algorithm by using computer algebra system MAGMA (Bosma, 1997) and we have seen that most of the codes we obtain is indeed MDS. We think it is worth to study on this topic deeper and more theoretical point of

 Copyright © International Science and Technology Conference (ISTEC)

view. We present the result in a table.

Table 1: The Number of MDS and non-MDS Codes

s	n	Number of MDS Codes	Number of non-MDS Codes
4	4	256	0
4	6	384	0
5	10	4700	0
5	12	5610	30
6	6	7650	0
6	10	12720	0
6	14	15996	48

Omer Çakmak
omrcakmak@outlook.com

The applications of titanium (Ti) based alloys are widely used as orthopedic implants owing to the good formability, mechanical properties and potential applications. Moreover these alloys present the highest level of mechanical, fatigue and corrosion resistance. In the present study, Ti-18Nb shape memory alloys with different porosity were fabricated by powder metallurgy. The mixed elemental powders having compositions of Ti-18at%Nb were cold-pressed in a cylinder die of 10 mm diameter at 100 MPa, 150 MPa and 200 MPa, after that the green compacted samples were sintered at 1400 ºC for 2 h. The microstructure and mechanical properties of the Ti-Nb alloys were investigated using scanning electron microscopy (SEM), X-ray diffraction (XRD), and compression test. The results show that the porosity decreased with increasing green compact, and the ultimate compression increased up to 900 MPa with decreasing porosity. Also, the phases such as α, β and a small amount of α″ martensite are seen in the microstructure.

Keywords: Ti-18Nb alloy

MERKEZİ ORTAK SINAVDA (TEOG) SORU SORULAN VE SORULMAYAN FEN BİLİMLERİ KONULARINI ÖĞRENME-ÖĞRETME SÜRECİNE İLİŞKİN ÖĞRETMEN GÖRÜŞLERİ

Melek Karaca
melekkaraca38@gmail.com

Sibel Saracoglu
saracs@erciyes.edu.tr

Oktay Bektaş
obektas@erciyes.edu.tr

Bu araştırmanın amacı; Türkiye'de 2013-2014 eğitim-öğretim yılından itibaren ortaokul 8. sınıf düzeyinde uygulanmakta olan Merkezi Ortak Sınav'da (TEOG) soru sorulan ve sorulmayan Fen Bilimleri dersi konularını öğrenme-öğretme sürecine ilişkin öğretmen görüşlerini incelemektir. Mevcut araştırma, nitel araştırma yönteminin olgu bilim desenine göre yürütülmüştür. Amaçlı örneklem olarak seçilen çalışma grubu, 2014-2015 eğitim-öğretim yılında Kayseri ili Melikgazi ilçesinde görev yapan dört Fen Bilimleri öğretmeninden oluşmuştur. Araştırmanın verileri, yarı yapılandırılmış görüşme ve yarı yapılandırılmış gözlem ile toplanmıştır. İçerik analizi yöntemi ile analiz edilen sonuçlar kodlar, temalar ve kategoriler oluşturularak verilmiştir. Araştırmada, bir fen konusunun sınavda sorulma durumunun öğretmenlerin motivasyonlarını, konuyu önemseme düzeylerini, ders işleme yöntemlerini, ders için yaptıkları ön hazırlık türünü, verdikleri ödev türünü ve ödev kontrolünü etkilediği sonucuna ulaşılmıştır. Ayrıca öğretmenlerin öğrencilerin ders içi motivasyonunu ve derse etkin katılımını sağlama gibi konularda sınav sonrası olumsuz yönde etkilendikleri de elde edilen sonuçlar arasındadır. Bu sonuçlara dayanarak gelecekteki araştırmacılar için önerilerde bulunulmuştur.

MESLEK YÜKSEKOKULU İNŞAAT BÖLÜMÜ ÖĞRENCİLERİNİN MATEMATİKSEL YETERLİLİK ANALİZİ: KOCAELİ MYO ÖRNEĞİ

Bülent KOPARAN
Kocaeli Üniversitesi, Kocaeli Meslek Yüksekokulu, Kocaeli -Türkiye
bkoparan@mynet.comm

Sinan AYDIN
Kocaeli Üniversitesi Kocaeli Meslek Yüksekokulu Kocaeli -Türkiye
sinanaydin1704@yahoo.com

Özet: Bu çalışmanın amacı, meslek yüksekokulu inşaat bölümü öğrencilerinin, lise ve meslek yüksekokulunda aldıkları matematik eğitimine ilişkin görüşlerini belirlemektir. Çalışmanın örneklemini, Kocaeli Meslek Yüksekokulu İnşaat Bölümün 2. sınıfında okuyan 72 öğrenci oluşturmaktadır. Veri toplama aracı, olarak 7 tane açık uçlu sorudan oluşan bir ölçek kullanılmıştır. Verilerin analizi, yüzde ve frekans değerleri hesaplanarak yapılmıştır. Bulgular, inşaat bölümü öğrencilerinin, hem lise dönemlerinde hem de ön lisans eğitimlerinde gördükleri matematik derslerinde genelde kullandıkları matematiksel formülleri ne olduğunu anlamadan ezbere kullandıklarını ve örnek ve uygulama çalışmalarında hangi matematiksel formülünü kullanacaklarına öğretmenlerinin çözdükleri örnekleri model alarak karar verdiklerini ifade etmişlerdir. Yüzeysel ve kavramadan öğrendikleri matematik kavramlarını kendi alanlarında etkili bir biçimde uygulayamadıklarını belirtmişlerdir.

Anahtar kelimler: matematiksel yeterlilik, meslek yüksekokulu, inşaat bölümü

Giriş

Eğitim, insanların en temel ihtiyaçlarından bir tanesidir. Devletler bu ihtiyacı karşılamak için değişik sistemler oluşturmakta ve zamanla bu sistemleri değişime ve yenilemeye tabi tutmaktadırlar. Bu sistemlerin üstün yanları olduğu gibi zayıf ve eksik yanları da olabilmektedir. Üzerinde en çok araştırma yapılan ve sürekli yeni eğitim öğretim yöntemleri geliştirilen alanlardan bir tanesi de matematik eğitimidir. Bilimin dili olarak tanımlana matematik, her zaman bireyler için vazgeçilmez bir alan olmuştur. Soyut bir yapıya sahip olmasından dolayı, matematiğin öğretilmesinde ve öğrenilmesinde her zaman zorluklar yaşanmaktadır (Baker, 1996; Dikici & İşleyen, 2004; Durmuş, 2004; Tall, 1993; Tall & Razali, 1993; Weber, 2001). Ancak yaşanan bu zorluklar, insan beynini kullanabilme ve geliştirebilme açısından gerekli olan ilişkilendirme, analiz etme ve üretme gibi özelliklerin en verimli kullanıldığı matematik öğretiminden ve öğrenimimden vaz geçmek doğru bir çözüm olarak görülmemektedir (Aksu, 1991)

Matematiğin kavramlarının bir biri ile bağlantılı ve öğrenmede süreklilik gerektirdiği düşünüldüğünde öğrencilerin lise döneminde aldıkları matematik eğitiminin yeterli düzeyde olmaması, onların üniversite öncesi hazır bulunuşluk seviyelerinin eksik olmasına dolayısıyla bu dönemde sıkıntılar yaşamlarına ve zorlanmalarına sebep olmaktadır (Fidan, 1986; Tuna & Kaçar, 2005; Yenilmez & Kalkmacı, 2008; Yılmaz & Sünbül, 2003). Üniversiteye giriş sınav sistemlerinin (YGS ve LYS) test tekniğini kullanması, zaman kavramına endeksli olması ve pratik çözüm yöntemlerini kullanmayı gerektirmesi, temel düşünce biçimlerini kullanmayı ön plana çıkarmaması yaşanan bu sorunlara temel oluşturmaktadır. Bununla birlikte Milli eğitimin lise programlarındaki temel amaçlarına bakıldığında durum pratikten çok farklıdır. Birinci temel amaç öğrencilere temel becerilerin kazandırılması, ikincisi öğrencilerin yükseköğrenime hazırlanmasıdır.

 Copyright © International Science and Technology Conference (ISTEC)

Üniversitelerin fen ve matematik ağırlıklı bölümlerinde okuyan öğrencilerin bazı temel matematik konularını lise döneminde hiç görmedikleri ya da bu konular hakkında çok az bilgi sahibi oldukları belirlenmiştir.(Doğan Sulak ve Cihangir, 2002). Hazır bulunuşluk düzeyindeki bu eksiklikler öğrencilerin matematiğin soyut, teorik ve aksiyomatik yapısını anlamalarına engel olduğu dolayısıyla matematik ve matematiğin birçok kavramını kullanan bağlantılı derslerde zorlanmalarına sebep olduğu veya bu derslerde başarısız olmalarına etken olduğu söylenebilir. Bu çalışmanın amacı meslek yüksekokulu inşaat bölümü öğrencilerinin lise ve üniversitede verilen matematik eğitimine ilişkin görüşleri belirlemektir.

Yöntem

Araştırmanın örneklemi, Kocaeli üniversitesi Kocaeli Meslek Yüksekokulu inşaat bölümünde okuyan 72 öğrenciden oluşmaktadır. Bu öğrenciler 2014 yılında sınavsız geçişle bu bölüme yerleşmişlerdir. Araştırmada görüşleri alınan öğrencilerin tamamı her hangi bir meslek lisesinden mezun olduklarını belirtmişlerdir.

Verilerin toplanmasında, inşaat bölümü öğrencilerinin lise ve üniversitede verilen matematik eğitimine ilişkin görüşlerini belirlemek amacıyla veri toplama aracı olarak Baştürk (2005) tarafından geliştirilen bir öğrenci anketi kullanılmıştır. Anket, açık uçlu 7 sorudan oluşmaktadır.

Araştırmada elde edilen veriler betimsel analiz yöntemi kullanılarak çözümlenmiştir. Öğrencilerden elde edilen veriler incelenip analiz edilerek gruplara ayrılmış ve her bir soruya verilen yanıtlar yüzde ve frekans olarak sayısallaştırılmıştır.

Bulgular

1. Soruya İlişkin Bulgular

İnşaat bölümü öğrencilerinin *"Niçin matematik öğrenme ve öğretme ihtiyacı duyuyoruz?*" sorusuna verdikleri cevaplar incelendiğinde 5 farklı cevap kategorisinin olduğu belirlenmiştir. Cevaplara ait yüzdeler Tablo 1'de sunulmuştur.

Tablo 1: Öğrencilerin, Niçin matematik öğrenme ve öğretme ihtiyacı duyuyoruz? Sorusuna verdikleri cevapların dağılımı

	f	**%**
Matematik okul bitirmek ve bir iş sahibi olmak için gereklidir	70	97,2
Matematik çok önemli bir temel bilim dalıdır	66	91,6
Matematik günlük hayatta çok kullanışlıdır	54	75
Matematik anlaşılması zor bir derstir	52	72,2
Matematik öğrenmekten keyif duyuyoruz	33	45,8

Tablo 1 analiz edildiğinde, frekans sayılarının toplamı toplam öğrenci sayısını (72) aştığı görülmektedir. Bunun sebebi öğrencilerin soruya cevap olarak birden fazla gerekçe sunmalarından kaynaklanmaktadır. İnşaat bölümü öğrencilerinin neredeyse tamamı matematik dersini öğrenmelerinin en önemli gerekçesi olarak bu dersten başarılı olup üniversiteden mezun olmak olarak ifade ettiler (97%). Öğrencilerin yine çok büyük bir kısmının matematik dersinin temel bir bilim dalı olduğunun farkında oldukları söylenebilir(%91,6). Bu soruya verilen cevaplardan öğrencilerin matematiği zor bir ders olarak gördükleri (%72,2) ve dolaysıyla bu dersi öğrenmeyi çokta sevmedikleri söylenebilir (45,8%).

3. Soruya İlişkin Bulgular

İnşaat bölümü öğrencilerinin *"Üniversiteye başlamadan önce ve başladıktan sonra, matematik hakkındaki görüşleriniz nasıl?"* sorusuna verdikleri cevaplar incelendiğinde 5 farklı cevap kategorisinin olduğu belirlenmiştir. Cevaplara ait yüzdeler Tablo 2'de sunulmuştur.

 Copyright © International Science and Technology Conference (ISTEC)

Tablo 2: Öğrencilerin, Üniversiteye başlamadan önce ve başladıktan sonra, matematik hakkındaki görüşleriniz nasıl? Sorusuna verdikleri cevapların dağılımı

	f	%
Lisede işlemsel pratik ve uygulamalı üniversitede işlemsel, teorik, ispatlı ve uygulamalı	72	100
Lisede daha anlaşılır ve daha kolay üniversitede daha karmaşık ve daha zor	61	84,7
Lisede konular daha az ve yüzeysel üniversitede daha fazla ve derinlemesine ele alınıyor	60	83,3
Lise ve Üniversite matematiğinin her ikisi de zor, karmaşık ve sıkıcı geliyor	40	55,5
Lise ve üniversite matematiğinin her ikisi de anlaşılır, bağlantılı ve zevkli	27	37,5

Öğrencilerin tamamının lise matematiği ile üniversite matematiğini işlemsellik-kavramsallık, pratiklik-teoriklik ve uygulamalı-soyutluk düzeylerinde tamamen farklı kategoride gördükleri anlaşılmaktadır (100%). Lisede konular tanım-örnek-uygulama formatında, üniversitede ise tanım-örnek-teorem-ispat-uygulama sıralamasında işlendiğinden, öğrencilerin lise matematiğini daha anlaşılır ve üniversite matematiğini daha zor ve karmaşık ifade ettikleri söylenebilir (84,7). Lise ve üniversite matematiğinin her ikisini de zor bulanların genelde bu dersi anlama ve öğrenme zorluğu çeken ve matematik başarı düzeyleri zayıf olan öğrenciler oldukları söylenebilir (55,5). Matematik başarı düzeyleri hem lisede hem de üniversitede yüksek olan ve derslere ilgili olan öğrencilerin her iki düzeydeki matematiği anlaşılır buldukları ve matematik öğrenmeyi sevdikleri görülmektedir (37,5%).

4. Soruya ilişkin Bulgular

İnşaat bölümü öğrencilerinin *"ÖSYS'de matematik sorularını doğru olarak cevaplayan bir öğrencinin üniversite öğreniminde başarılı olacağını söylemek her zaman mümkün müdür? Niçin*?" sorusuna verdikleri cevaplar incelendiğinde 5 farklı cevap kategorisinin olduğu belirlenmiştir. Cevaplara ait yüzdeler Tablo 3'te sunulmuştur.

Tablo 3: Öğrencilerin, ÖSYS'de matematik sorularını doğru olarak cevaplayan bir öğrencinin üniversite öğreniminde başarılı olacağını söylemek her zaman mümkün müdür? Niçin? Sorusuna verdikleri cevapların dağılımı

	f	%
Kesinlikle başarılı olur	10	13,8
Başarılı olur	14	19,4
ÖSYSE Sınav başarısı üniversiteye yansımayabilir	23	31,9
İki başarı birbirinden bağımsızdır	20	27,7
İki başarı birbirinden tamamen bağımsızdır	5	6,9

Öğrencilerin ÖSYS başarısı ile üniversite başarı arasındaki bağlantı konusunda hemfikir olmadıkları söylenebilir. Üniversiteye giriş sınavında matematik sorularını çözmedeki yüksek başarı puanının üniversite eğitimindeki başarıya yansıyacağı düşüncesini öğrencilerin çok paylaşmadıkları söylenebilir (33,2%). Bunun sebebi öğrencilerin üniversite giriş sınavındaki soruların kapsamı, bu soruların çözüm biçimleri ve sınav konularını öğrenme biçimleri olarak izah edilebilir. Yukarıdaki incelemede dikkat çeken diğer bir sonuç ise öğrencilerin ÖSYS'deki matematik başarısı ile üniversite eğitimindeki başarıyı birbirinden bağımsız görmemeleridir (34,6%). Bu durum meslek yüksekokulu inşaat bölümü öğrencilerinin her iki başarı arasında net bir görüşe sahip olmadıklarını göstermektedir.

Sonuç

Bu çalışmada meslek yüksekokulu inşaat bölümü öğrencilerinin matematik dersi hakkındaki görüşleri, ÖSYS' deki matematik başarı puanı ile üniversite matematiği başarısı kapsamında incelenmektedir. Öğrencilerin lisede ve üniversitede öğrendikleri matematik arasında kapsam ve öğretme yöntemleri açısından bir benzerlik görmedikleri sonucuna varılmıştır. Öğrencilerin her iki matematik dersine bakış açıları yukarıdaki sonucu

 Copyright © International Science and Technology Conference (ISTEC)

destekleyecek biçimde bir birinden farklı olduğu görülmüştür. Öğrencilerin, lise matematiğini daha somut, anlaşılır ve basit, üniversite matematiğini ise daha soyut, karmaşık ve teorik buldukları sonucuna varılmıştır. Son olarak öğrenciler, ÖSYS matematik başarısı ile üniversite matematiği başarısı arasında bir bağlantı olup olmadığı konusunda kesin bir kanaate sahip olmadıkları sonucunu doğurmuştur.

[3]Karabük Üniversitesi, Teknoloji Fakültesi, Enerji Sistemleri Mühendisliği, Karabük-TÜRKİYE

Özet: Mobil ve sabit hidrojen depolama uygulamaları için en avantajlı yöntem metal hidrürler olarak görülmektedir. Ancak metal hidrürlerde depolanan hidrojen miktarları hala istenilen seviyelere gelememiştir. Bu çalışmada metal hidrür reaktörlerde hidrojen depolanması önündeki bazı problemlerin giderilebilmesi ve verimli depolama parametreleri belirlenerek, daha verimli depolama sağlayacak çözüm yollarının incelenmesi amaçlanmıştır. Metal hidrür reaktörlerde hidrojen depolama parametreleri mühendislik programı kullanılarak geliştirilen sonlu elemanlar analizi ile incelenmiştir. Sonlu elemanlar analizi ile hidrojen depolama prosesine etki eden birçok parametre kombinasyonları oluşturularak sonuçlar detaylı olarak değerlendirilmiştir. Çeşitli kombinasyonların oluşturulduğu ve hidrojen depolama kapasitesine ve verimine etki eden parametreler arasında metal hidrür malzemesi, metal hidrür depolama tankının kanatçıksız veya kanatçıklı olması, kanatçıklı ise düz veya açılı kanatçık tasarıma sahip olması, hidrojen giriş basıncı, partikül boyutu ve genel ısı iletim katsayısındaki değişimler sayılabilir. Söz konusu parametrelerden elde edilen veriler bilgisayar ortamına aktarılmış, sonuçlar karşılaştırılarak optimum alaşım özellikleri ve hidrür reaktör tasarımları, debi ve şarj basınçları gibi parametreler arasındaki ilişkiler belirlenmiştir..

Keywords: Metal hidrür, tank tasarımı, hidrojen depolama

Giriş

Metal hidrür depolama metalleri ile ilgili araştırılan karakteristikler şarj/deşarj edilen hidrojen miktarı, metal hidrürün termal stabilitesi, şarj/deşarj kinetiği, termodinamik ve termofiziksel özellikler, kristal yapı ve segregasyon veya karbonizasyon gibi yüzey işlemleri olarak sıralanabilir. Özellikle reaksiyon hızını önemli ölçüde etkileyen parametrelerin basında alaşım özellikleri ve reaktör tasarımı gelmektedir. Metal hidrür esaslı hidrojen depolanmasında, şarj süresi ve reaksiyon ısısının uzaklaştırılması en önemli parametrelerdir. Yang vd, tasarım aşamasındaki ilerlemeleri incelemiş, optimal reaktör tasarımın metal hidrit sisteminin karakteristiklerinin ve uygulama gerekliliklerinin çok iyi bilinmesi gerektiğini belirtmiştir(Yang vd., 2003). Mellouli vd, metal hidrit tankı ve ısı eşanjöründe ısı ve kütle transferini incelemek için 2 boyutlu matematiksel model geliştirmiş, geometrik ve operasyonel parametrelerin (kullanılan malzeme, gözenek büyüklüğü, özgül yoğunluk vs) ve şarj prosesinin, verim üzerindeki etkilerini incelemiştir(Mellouli vd., 2009). Mellouli vd, kanatlı ve spiral tüplü ısı esanjörü ile 2-D matematiksel model geliştirmiş, metal hidrit depolama tankında ısı ve kütle transferi mekanizmalarını incelemiştir(Mellouli vd., 2010). Chung vd, ısı borusu kullanıldığı farklı konfigürasyonlarda $LaNi_5$ hidrür alaşımı kullanılan metal hidrit tankları tasarlamış, ısı borusu ilave edilmiş hidrür tanklarda, hidrojen şarjı ve deşarjı sırasından oluşan ısı transferinin iyileştirilmesi incelemiştir. Çalışmada oldukça büyük kapasiteli tanklar dahil olmak üzere, ısı boruları kolaylıkla montaj/demontaj edilebileceğini ve hidrojen şarj süresinde önemli oranda düşürülebileceğini göstermiştir(Chung vd., 2013). Kaplan, farklı şarj basınçlarında, doğal konveksiyonla soğutulan kapalı bir silindir, etrafında ilave kanatçıkların konulduğu hidrür reaktör ile etrafında suyun sirküle ettirilmesiyle soğutulan reaktör olmak üzere 3 farklı metal hidrit reaktör tasarımı üzerinde ısı transfer mekanizmasının şarj prosesi üzerindeki etkilerini incelemiştir. Hidrojen absorpsiyonu reaksiyonunun ekzotermik doğası gereği, su soğutmalı reaktörlerde şarj zamanı ve sıcaklık dağılımının lineerliği açısından en iyi sonuçları elde edilmiştir. Daha fazla hidrojenin direkt teması nedeniyle reaktör için giriş kısmına yakın bölgelerde sıcaklık artışı daha yüksektir. Hidrojen şarj basıncını arttıkça, aynı zaman diliminde reaksiyon sayısındaki artış nedeniyle, tüm durumlar için nispeten daha yüksek sıcaklık profili elde edilmektedir (Kaplan, 2009). Visaria vd [16], Hidrojen depolama reaksiyon süresini, ısı transfer oranı, soğutucu debisi, yüzey direnci, metal hidrit tabakalarının kalınlığı ve metal hidrit tozunun efektif iletkenliği parametrelerinin ısı transferine olan etkilerini analiz edebilmek için maksimum ısı oranı olarak boyutsuz iletkenlik parametresi tanımlamış, bu parametrenin yüksek olmasının, T_{max} metal hidrür sıcaklığında, ısı transfer hızının yüksek olmasına karşılık geldiğini belirtmiştir(Visaria vd., 2010). Kikkinides, dış yüzeyinde dairesel kanatlar bulunan, içinde soğutucu akışkanın aktığı ve çevresel bileziklere sahip hidrojen depolama sistemlerinin tasarımı, optimizasyonu ve modellemesinde genel matematiksel yöntemleri incelemiştir. Yapılan çalışmalar ve simülasyonlar, metal hidrit tankının dış yüzeyinde kanatların

 Copyright © International Science and Technology Conference (ISTEC)

kullanılması ile standart $LaNi_5$ malzemeli sistemde % 90'lık hidrit kapasitesi için depolama zamanının %11'e kadar arttığını raporlamaktadır(Kikkinides, 2011). Askri vd [42], 2 boyutlu matematiksel model geliştirerek deneysel sonuçlarla birlikte analizler gerçekleştirmiştir. Bu modelde, tank duvarı ısıl kütlesinin hidritleme prosesindeki etkilerini incelemiş, duvar malzemesinin çelik ve pirinç olmasını karşılaştırmıştır. Bununla birlikte modelde ayrıca, dışarıda kanatları olan silindirik tank, soğutucu akışkanın sirküle edildiği eş merkezli tüpleri olan silindirik tank ve eş merkezli kanatlı silindirik tank seçenekleri ile bu tasarımların dinamik davranışlarını analiz etmiştir. Elde edilen sonuçlar, uygun bir tasarımla depolama zamanının %80 iyileştirilebildiğini göstermiştir. Yen vd [43] çalışmasında kullanılan reaktördeki sıcaklık dağılımını iyileştirmiş depolama tankı görülmektedir. Bu çalışmada, Hidrojen'i yönlendirme amaçlı gözenekli tüp de dikkate alınmış, böylece hidrit reaksiyonunun penetrasyon derinliğini arttırılmış ve absorpsiyon zamanının kısaldığı sonucuna varılmıştır (Yen vd., 2011). Bao vd [46], üç boyutlu model üzerinde Navier Stokes denklemleri üzerinden COMSOL v3.5a programı ile sonlu elemanlar analizi gerçekleştirmiştir. Metal hidrit reaktöründe hidrit absorpsiyon oranı, Yang vd (64) tarafından tanımlanmış olan ısı transfer kontrollü reaksiyon oranı r_h ile belirlenmektedir. Bu çalışmada, ihmal edilen ısı transfer akışkan sıcaklığının değişimin dikkate almak için boyutsuz N parametresi tanımlanarak Hidrojen absorpsiyon oranı üzerinde, ihmal edilen ısı transferi akış sıcaklığının etkisini incelenmiş, metal hidrit efektif ısı iletkenliğinin, ısı transfer akışkanı akış oranının ve temas direncinin metal hidrit reaktörlerinde performansın iyileştirilmesinde rol oynayan önemli faktörler olduğunu değerlendirilmiştir(Bao vd., 2013). Uchida vd [63], AB_2 ve AB_5 alaşımlarını 2 farklı tank konfigürasyonunda (plaka- kanatlı tip ve bölünmüş odalı tip, her tip için ısı eşanjör boru sistemli) deneyler gerçekleştirmiş, kanatlı tip sistemden alınan sonuçlarda şarj oranının, hidrit malzemesinin karakteristiğinden daha çok, büyük oranda tankın ısıl performansına bağlı olduğunu görmüştür(Uchida vd., 2002).

Yapılan çalışmalar incelendiğinde şarj süresinin ve depolanan hidrojen miktarının geliştirilmesi açısından, ısı borusu, içten/dıştan kanatçık, spiral ısı değiştiriciler, tüp içerisinde köpük malzeme, ısı borusu kullanımı gibi farklı tasarımlar deneysel ve analizlerle incelenmiştir. Bu çalışmada tüp et kalınlığı, açılı kanat kullanımı, hidrojen şarj basıncı, hidrür tane boyutu, $LaNi_5$ alaşımı içerisine Al ilave si gibi birçok paramtre COMSOL ticari yazılımı kullanılarak maematiksel olarak incelenmiştir.

Materyal ve Metod

Matematiksel modelde bulunan parçalı diferansiyel denklemlerin sonlu elemanlar metodu kullanılarak çözülmesi amacıyla COMSOL Multiphysics yazılımı kullanılmıştır. Modelde sabit olarak tanımlanan sistem parametreleri belirlenmiş, diferansiyel denklemler dışında bulunan fonksiyon ve korelasyonlar sistem değişkeni olarak tanımlanmış, çözüm esnasında sonuçların takip edilebilmesi amacıyla bazı noktalara ölçüm probları tanımlanmıştır. Ölçüm problarının tanımlandığı bu noktalarda denge basıncı, hidrojen kütle değişimi ve metal hidrürün farklı bölgelerindeki sıcaklık değerleri takip edilebilmektedir. Sonlu eleman yoğunluğu da parametrik olarak tanımlanmıştır. 'Mesh1' bölümünde, modellenen sistemin sonlu elemanlar prensibine göre mesh oluşturulmaktadır.

Şekil 1. Kanatçıksız, düz ve açılı kanatçıklı durumda Mesh Yapısı ve reaktör kesitleri

Özellikle düzgün bir yapıya sahip olan ve sistemin orta hacmini oluşturan bölge ile birlikte diğer bölgelere uygun mesh'ler tanımlanmıştır. Bu bilgiler, modellenen sistemde parametrik olarak kayıtlı durumdadır. Farklı bölgelerdeki mesh elemanlarının boyutlarının birbirleriyle süreklilik arz etmesi, sistemin modellenmesi ve çözümü açısından oldukça önemlidir. Hidrojenin metal hidrüre soğurulması ve serbest bırakılması işleminin modellenmesi oldukça karmaşık bir modelleme yaklaşımı gerektirmektedir. Gerçek duruma yaklaşabilmek ve oluşturulan modeli deneysel verilerle ilişkilendirebilmek amacıyla birden çok fiziksel denklemin bir arada değerlendirilmesi ve çözümünün gerçekleştirilmesi gerekmektedir [Nasrallah ve Jemni, 1997; Jemni ve Nasrallah, 1995a; Jemni ve Nasrallah, 1995b]. Bununla birlikte, bu denklemlerin birbirleriyle olan ilişkileri doğru

 Copyright © International Science and Technology Conference (ISTEC)

modellenmeli ve çözücü algoritma ile olan uyumuna da dikkat edilmelidir. Matemeatiksel analizlerde kullanılan mesh yapısı ve hirdür rekatör kesitleri Şekil 1'de gösterilmiştir. Simülasyon çalışmasında, hidrojen ideal gaz olarak kabul edilmiş, ortam lokal olarak termal dengede, hidrür yatağın termo-fiziksel özellikleri sıcaklık ve Hidrojen basıncından bağımsız, denge basıncı değişiminde hidrojen konsantrasyonunun etkisi önemsiz, radyasyon ile ısı transferi ihmal edilmiştir. Metal hidrür ile Hidrojen arasında ısı dengesi varsayımına göre, katı ve gaz fazları için tek bir enerji denklemi tanımlanmıştır:

$$(\rho c_p)_s \ \partial T/\partial t + (\rho c_{pg})\, v_g .\Lambda T = \Lambda.(k_e\, \Lambda T) + m\,(\Delta H - T(c_{pg} - c_{ps}) \quad (1)$$

Denklemdeki son terim reaksiyon sırasında açığa çıkan ve soğurulan ısıyı göstermektedir. Katı ve gaz fazlarında tek yönlü ısı iletimi kabul edildiğinde, efektif spesifik ısı ve termal iletim katsayıları şu şekilde ifade edilebilir:

$$(\rho c_p)_g = \varepsilon p_g c_{pg} + (1-\varepsilon)\rho_s c_{ps} \quad (2)$$

$$k_g = \varepsilon k_g + (1-\varepsilon)\, k_s \quad (3)$$

Katı için kütle korunum dengesi şöyle tanımlanmıştır:

$$-\varepsilon\, \partial(\rho_s)/\partial t = -m \quad (4)$$

Momentum dengesi şu şekilde ifade edilmiştir:

$$\partial s(\rho_g) + \Lambda\, .\, (\rho_g v_g) = -m \quad (5)$$

Gözenekli yapı içerisinde gaz hızı Darcy denkleminden elde edilmiştir:

$$V_g = -\, K/\mu_g \ \ \Lambda\,(p_g) \quad (6)$$

Burada K, gözenekli yapı geçirgenliği ve μ_a gazın dinamik viskositesidir.

Absorpsiyon ve desorpsiyon işlemleri için kinetik denklemler aşağıdaki gibi ifade edilmiştir [Chung ve Ho, 2009]:

Absorpsiyon:

$$m = c_a \exp(-E_a/R_gT) \ \ \ln(p_g/p_{eq})\,(\rho_{ss}-\rho_s) \quad (7)$$

Desorpsiyon:

$$m = c_d \exp(-E_d/R_gT)\,(p_g - p_{eq}/p_{eq})\,(\rho_s-\rho_0) \quad (8)$$

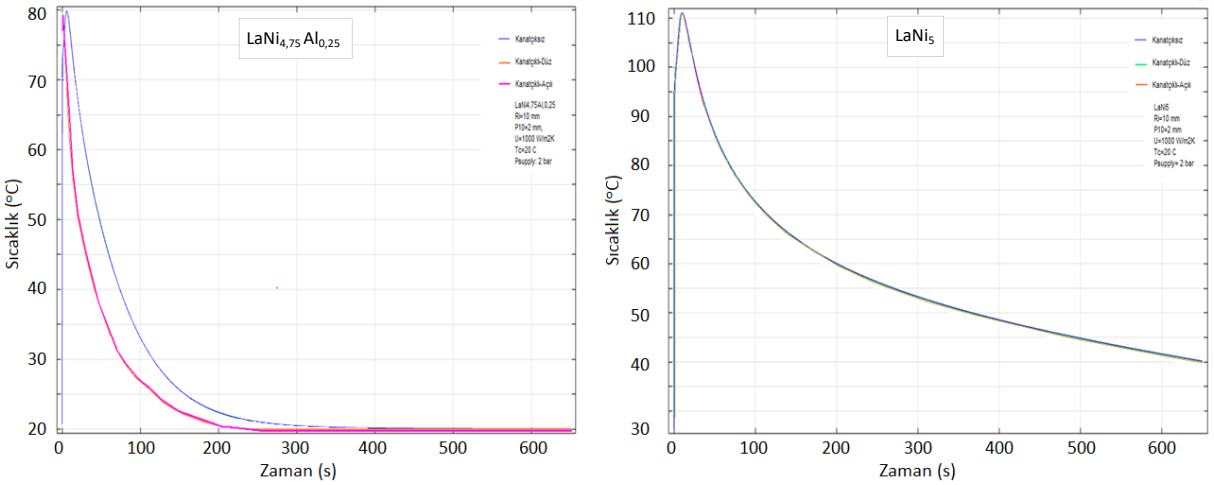
Burada C deneysel olarak bulunan üstel sabit, E aktivasyon enerjisi, ρ_{ss} doygunluk durumunda metal hidrür özkütlesi ve ρ_o metal hidrür başlangıç özkütlesidir.

Hidrojen için kullanılan ideal gaz denklemi şu şekilde ifade edilmiştir:

$$P_g = (p_g M_g) / (R_g T) \quad (9)$$

Denge basıncı hesabı için Van't Hoff kuralı uygulanmıştır. Buna göre;

$$P_{eq} = \exp\,[\,\Delta H / (R_g T) \ \ - \Delta S/R_g \ \ + \ \ (\varphi \pm \varphi_0)\tan[\pi\,(x/x_f \ \ - \ \ ½] \pm \beta/2] \quad (10)$$



ΔH ve ΔS reaksiyon entalpi ve entropisini, R_g evrensel gaz sabitini, Ø, $Ø_0$ ve β deneysel eğim ve histeresis faktörlerini, x Hidrojen konsantrasyonunu temsil etmektedir. Denklemlerde bulunan ± işareti, absorpsiyon durumunda (+) ve desorpsiyon durumunda ise (–) olarak tanımlanmıştır.

Silindirik hacimli ve düz kanatçıklı tank için yapılan absorpsiyon prosesine ait deneysel çalışmalardan elde edilen sonuçlar, aynı tank geometrisinin modellenmesi ve COMSOL yazılımı ile simülasyonunun gerçekleştirilmesi sonrasında elde edilen sıcaklık, absorbe edilen H_2 miktarı ile karşılaştırıldığında benzer grafik eğrilerinin elde edildiği, birbirine yakın sonuçların elde edildiği görülmüştür. Örneğin, 4 farklı koordinatta elde elden deneysel sonuçlarda maksimum sıcaklık değeri 105 ºC mertebesinde ölçülürken, simülasyon çalışmasında her 4 farklı termokapıl noktasına ait sıcaklık değerlerinde de birebir eşdeğer sonuçlar elde edilmiştir. Deneysel çalışmada 20 ºC'ye ulaşma sürelerinin, analiz sonuçlarına göre kıyasla daha uzun olduğu gözlemlenmektedir. Diğer taraftan absorbe edilen hidrojen miktarı, deneysel çalışmada 0,4 g ölçülürken, analiz sonucunda bu değer 1,2 g mertebelerinde elde edilmektedir. Elde edilen sonuçlardaki bazı farklılıkların, deney şartlarındaki bazı ölçülemeyen olumsuzluklar (vakumlama veya şarj esnasında borularda, hortumlarda söz konusu olabilecek kaçak ve sızıntı, kullanılan bazı cihaz ve ölçüm ekipmanların yetersizliği, ölçüm aralıklarının daha hassas seçilememesi, sistemde laboratuar şartları nedeniyle azot tankı, hidrojen rezervuar tankının deney tesisatına dahil edilememesi gibi) ile açıklanabilir. Bu değerlendirmeler ışığında, simülasyon sonucu ve deneysel ölçümlerde elde edilen sonuçlar dikkate alındığında, modelleme ve simülasyon analizinin uygun olduğu görülmüştür. COMSOL yazılımı ile geliştirilen sonlu elemanlar modeline ait analiz sonuçlarının deneysel olarak elde edilen sonuçlarla karşılaştırıldığında, birbirlerini doğruladığı görüldükten sonra, sonlu elemanlar analizi ile hidrojen depolama prosesine etki eden birçok parametre kombinasyonları oluşturulmuştur.

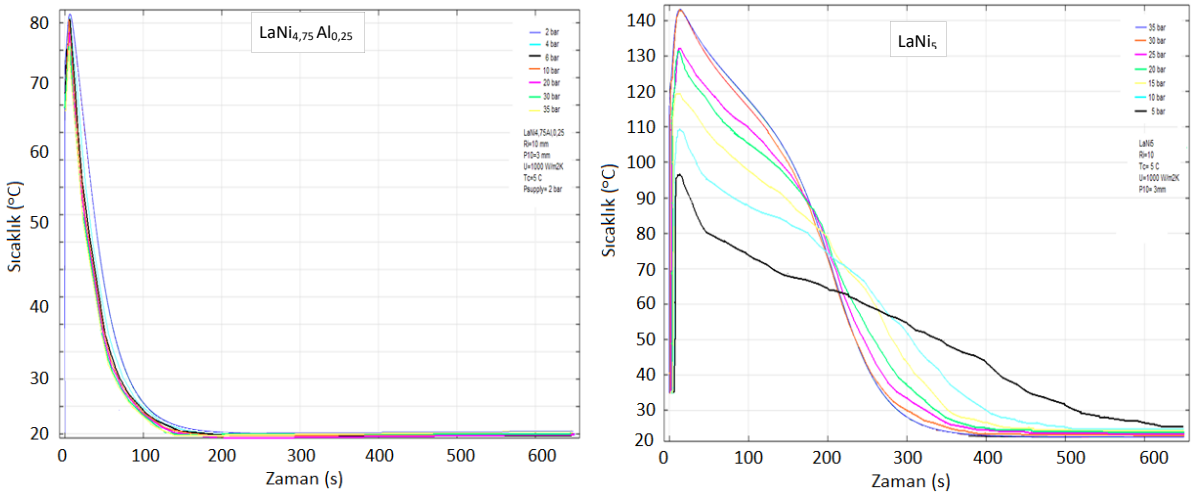
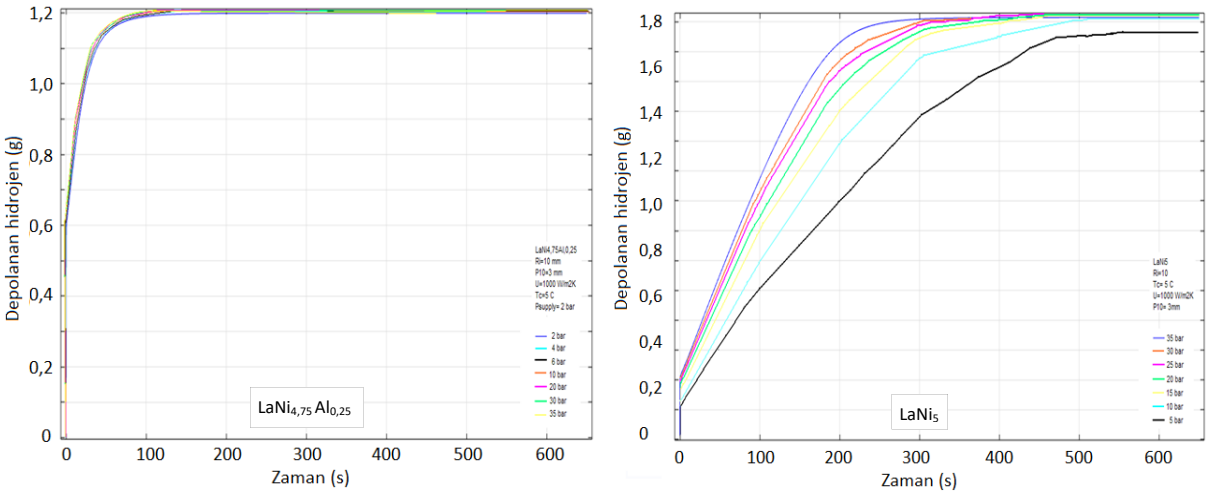
Bulgular ve Tartışma

Analiz değişkenleri olarak kanatçıklı, kanatçıksız ve açılı kanatçıklı reaktörler, hidrojen giriş basıncı, hidrür alaşım tane boyutu gibi parametreler kullanılarak hirür reaktörlerde hidrojen depolama analizleri gerçekleştirilmiştir. Değişken olarak depolama tankının kanatçıksız, kanatçıklı-düz ve kanatçıklı-açılı olmasının alındığı analizde, $LaNi_{4,75}Al_{0,25}$ ve $LaNi_5$ metal hidrür alaşımları için, 44,5 mm mesafedeki tank içi sıcaklık değerinin zamana göre değişimi sırasıyla Şekil 2'de verilmektedir. $LaNi_{4,75}Al_{0,25}$ kullanıldığında, tank içi sıcaklığın maksimum 80 °C değerine çıktığı, 300 s süresinde sıcaklığın 30 °C'ye düştüğü, yaklaşık 700 s mertebelerinde sıcaklığın soğutucu su sıcaklığı değeri ile dengeye geldiği, kanatçıklı tank tasarımında tank içi sıcaklık dağılımının daha iyi olduğu, maksimum sıcaklığın 75 °C'ye ulaştığı, sıcaklığın 200 s mertebelerinde soğutma suyu sıcaklığı ile dengeye geldiği, kanatçıkların pozisyonunun düz veya açılı olmasının belirgin bir farklılık oluşturmadığı görülmektedir. $LaNi_5$ alaşımı kullanıldığında ise sıcaklık yaklaşık 112 °C ulaşmıştır. $LaNi_{4,75}Al_{0,25}$ ve $LaNi_5$ metal hidrür alaşımları için, absorbe edilen hidrojen kütlesinin zamana göre değişimi grafikleri ve elde edilen sonuçlar Şekil 3'te verilmektedir. Kanatçıklı tankta absorbe edilen hidrojen miktarının, kanatçıksız tanka oranla 500 s mertebelerinde 0,03 g daha fazla hidrojen depoladığı, kanatçıklı durumlarda 600 s sonra 0,85 g absorbe edilen kütleye ulaşıldığı, kanatçıkların pozisyonunun düz veya açılı olmasının belirgin bir farklılık oluşturmadığı görülmektedir. Kanatçıklı veya kanatçıksız halde belirgin bir fark olmadığı ve $LaNi_{4,75}Al_{0,25}$ 200 s mertebelerinde maksimum 1,2 g hidrojenin absorbe edildiği $LaNi_5$ için ise 600 s sonunda 1,6 g hidrojen depolandığı görülmektedir.

Şekil 2. Depolama tankının kanatçıksız, kanatçıklı-düz ve kanatçıklı-açılı olması durumunda, 44,5 mm mesafedeki tank içi sıcaklık değişimi



Şekil 3. Depolama tankının kanatçıksız, kanatçıklı-düz ve kanatçıklı-açılı olması durumunda absorbe edilen hidrojen kütle değişimi



Değişken olarak 2 ile 35 bar aralığında hidrojen giriş basıncının alındığı analizde, elde edilen sonuçlar Şekil 4'te verilmektedir. Şekil incelendiğinde, hidrojen giriş basıncının artmasıyla tank içi sıcaklık değerlerinde önemli farkların oluştuğu, tank içi sıcaklığın maksimum $LaNi_{4,75}Al_{0,25}$ alaşımlarında 85 °C değerine çıktığı, Giriş basıncının 35 bar olduğu durumda, 5 bar basınç değeriyle kıyaslandığında, tank içi sıcaklık değeri 600 s sürelerde değil, 200 s mertebelerinde 0 °C soğutucu su sıcaklığı ile dengeye geldiği görülmektedir. Giriş basıncı değerindeki

artışın tank iç sıcaklık dağılımında olumlu etki yaptığı, tank içi sıcaklığın maksimum 82 °C değerine çıktığı, giriş basıncının 35 bar olduğu durumda, 5 Bar basınç değeriyle kıyaslandığında, soğutucu akışkan sıcaklığına daha kısa süre içinde, 200 s yerine 140 s mertebelerinde ulaşılabilmekte olduğu görülmektedir. Şekil incelendiğinde giriş basıncı değerindeki artışın tank iç sıcaklık dağılımında olumlu etki yaptığı, tank içi sıcaklığın 5 bar basınçta maksimum 95 °C, 35 bar'da ise maksimum 135 °C değerine çıktığı, giriş basıncının 5'den 35 bar'a arttırılması durumunda tank iç sıcaklığının 20 °C'ye 700 s yerine 400 s mertebelerinde ulaştığı görülmektedir. $LaNi_5$ te ise maksimum 145 °C değerlerine çıktığı görülmüş, Al ilavesinin tankın soğumasında ve tank içi sıcaklık dağılımında önemli etkileri olduğu görülmüştür. $LaNi_{4,75}Al_{0,25}$ ve $LaNi_5$ metal hidrür alaşımları için, absorbe edilen hidrojen kütlesinin zamana göre değişimi grafikleri ve elde edilen sonuçlar, sırasıyla Şekil 5'te verilmektedir. Hidrojen giriş basıncının artmasıyla absorbe edilen hidrojen miktarında kayda değer farkların oluştuğu, giriş basıncının 35 bar olduğu durumda, 5 bar basınç değeriyle kıyaslandığında, absorbe edilen hidrojen kütlesinin, 600 s de $LaNi_{4,75}Al_{0,25}$ için 1,2 g olduğu belirlenmiştir. $LaNi_5$ içerisinde ise maksimum 1,8 g değerlerine ulaştığı görülmektedir. Hidrojen giriş basıncının artmasıyla absorbe edilen hidrojen miktarında kayda değer farkların oluştuğu, giriş basıncının 35 bar olduğu durumda, 5 bar basınç değeriyle kıyaslandığında 1,7 g yerine 1,8 g hidrojenin absorbe edildiği, üstelik 1,8 g kütleye, 470 s de değil 280 s mertebelerinde ulaşılabildiği görülmektedir.

Şekil 4. Farklı hidrojen giriş basınçlarında z=44,5 mm mesafedeki tank içi sıcaklık değişimi

Şekil 5. Farklı hidrojen giriş basınçlarında, absorbe edilen hidrojen kütle değişimi

Sonuç ve Öneriler

Hidrojen'in metal hidrit malzemesi yardımıyla etkin olarak depolandığı hidritleme prosesinde farklı metal hidrit malzemesinin deneysel ve analiz çalışmaları yapılmakta ve sonuçlar yayımlanmaktadır. Hidrojen'in depolandığı absorpsiyon prosesinde, tepkimenin gerçekleştiği depolama tankında çok kısa süre içerisinde büyük miktarlarda ısı ortaya çıkmakta, bu ısının etkin ve hızlı bir şekilde uzaklaştırılması, hidritleme prosesinin etkinliği açısından büyük önem taşımaktadır. Bununla birlikte kütle transferinin iyileştirilmesi, bu amaçla depolama tankı tasarımlarında uygun iyileştirmeler yapılması, hidrojen'in depolanması prosesinde önemli rol oynayan parametrelerdir. Bu amaçla iki farklı metal hidrit malzemesine ait termo-fiziksel özellikler dikkate alınarak, hidritleme prosesinde önemli olan tank tasarımı için kanatçıklı olmasının, Hidrojen giriş basıncının değişiminin,

 Copyright © International Science and Technology Conference (ISTEC)

tankın dış yüzeyinde yer alan soğutucu akışkan sıcaklığı farklılığının, tankın iç yarıçapının, dolayısıyla iç hacminin ve et kalınlığında yapılacak değişikliğin, aynı zamanda sistemin yalıtımı ile birebir ilişkili olan genel ısı iletim katsayısının tank içi sıcaklık dağılımına, absorbe edilen Hidrojen'in kütlesine ve sistem denge basıncına nasıl ve ne şekilde etki ettiği, COMSOL yazılımı yardımıyla analiz edilmiştir. Söz konusu analizler incelendiğinde Hidrojen giriş basıncının, soğutucu akışkan sıcaklığı değerinin ve tank iç yarıçapnın oldukça önemli rol oynadığı, kanatçıklı tasarım ve genel ısı iletim katsayısı parametrelerinin nispeten daha düşük seviyede farklılık oluşturduğu, buna karşılık tank et kalınlığının depolama tankı üretilebilirliği, işçilik ve malzeme giderleri ile birlikte dikkate alınmasının gerektiği, partikül tane boyutu büyüklüğünün ise kendi içinde değil, ancak seçilen metal hidrit malzemesinin genel termo-fiziksel özellikleri ile birlikte hedeflenen değerlerde rol oynadığı sonucuna varılmıştır.

İleriki çalışmalarda; deneylerin yapıldığı ortam sıcaklığı sabit tutulmalı, reaktör malzemeleri hidrojen depolanan malzemeye yakın veya aynı malzemeden imal edilmeli, rektör malzemesi olarak ısı iletim katsayısı yüksek malzemelerin kullanılması, daha kısa sürede doldurulup boşaltılabilecek reaktör tasarlanması ve imalatı için, efektif ısı transfer katsayısını arttırmak adına farklı ısı değiştiricisi tasarımları; içten kanatçık, dıştan kanatçık, içten soğutucu akışkan, dıştan soğutucu akışkan, kullanımı gibi tasarımların birkaçının veya tamamının birlikte uygulanması, reaktörden istenilen debide hidrojenin alınması için, sabit uygulamalarda indiksiyon elektrikli ısıtıcılar gibi hassas sıcaklık kontrollü ısıtıcılar kullanarak optimum deşarj işlemleri sağlamak ve hareketli uygulamalarda taşıt motor atık ısısından yararlanmak gibi önemler alınarak çalışmalarda daha uygun sonuçlar alınabilecektir.

aliozturk@duzce.edu.tr

Özet: Bu çalışmada yük profillerinin hesaplanmasında meteorolojik verilerden olan sıcaklık bilgisinin dikkate alınıp alınmaması durumlarına göre, elde edilen profiller arasındaki farklar incelenmiştir. Yük profillerinin doğru bir şekilde belirlenmesi, dengesizlik maliyetlerinin azaltılması açısından büyük öneme sahiptir. Türkiye'de bulunan Sakarya Elektrik Dağıtım Anonim Şirketi (SEDAŞ) tarafından sağlanan 2015 yılına ait saatlik sıcaklık ve mesken tüketim değerleri kullanılmıştır. Yük tahminleri için Çoklu Regresyon Analizi Modeli (ÇRAM) matematiksel modeli uygulanmıştır. Elde edilen matematiksel model kullanılarak saat ve sıcaklık bilgisine bağlı olarak tüketim değerleri tahmin edilmiş ve bu tüketim değerlerine göre yük profil katsayıları belirlenmiştir. Yük profil katsayılarının belirlenmesinde, saatlik sıcaklık değerlerinin birer Santigrat derecesi artım veya azalma adımları ile değişmesi olasılıklarına göre yük profilleri hazırlanmış ve aralarındaki farklar karşılaştırılmıştır. Sıcaklığa bağlı olarak elde edilen profiller incelendiğinde sıcaklık bilgisinin dikkate alınması halinde yük profillerinin daha doğru olarak elde edileceği anlaşılmıştır.

Anahtar Kelimeler: Kısa Dönem Yük Tahmini, Regresyon Analizi, Enerji Dağıtım Sistemi

Giriş

Elektrik enerjisinin üretim tüketim dengesinin sağlanması önemli bir konudur. Elektrik enerjisinin üretim iletim ve dağıtımında enerjinin depolanması çok zor olduğu için üretimin tüketim ve kayıpları karşılayacak değerde olması gerekmektedir. Üretim ve tüketim dengesi sağlanamadığı durumda dengesizlik maliyeti oluşmaktadır. Dengesizlik maliyetlerinin azaltılmasında en büyük etken yük tahminlerinin tutarlı yapılmasıdır. Türkiye'de dengesizlik maliyetleri ile ilgili çalışmaların merkezinde Enerji Piyasaları İşletme Anonim Şirketi (EPİAŞ), bulunmaktadır. EPİAŞ'ın başlıca amacı ve faaliyet konusu, piyasa işletim lisansında yer alan enerji piyasalarının etkin, şeffaf, güvenilir ve enerji piyasasının ihtiyaçlarını karşılayacak şekilde planlanması, kurulması, geliştirilmesi ve işletilmesidir. Yük tahminlerindeki isabet uzlaştırma açısından da önemlidir. Uzlaştırma, gün öncesi piyasası, dengeleme güç piyasası ve enerji dengesizliğinden doğan alacak ve borç miktarlarının hesaplanmasını kapsar. Yük tahminlerindeki hatalar piyasa fiyatlarını ve dağıtım şirketlerinin dengesizlik maliyetlerini etkilemektedir (EPİAŞ, 2016). Yük tahminlerini ifade eden profil katsayılarının daha doğu olarak belirlenebilmesi için bir çok farklı çalışmalar yapılmakta ve değişik yöntemler geliştirilmektedir (Francis et. al.,2015, Juan et. al.,2009, , Bujosa et. al.,2007, , Clements et. al.,2016). Elektrik güç sisteminde yük tahmini, dağıtım sisteminin planlanması ve dengede tutulması açısından çok önemli bir çalışma alanıdır. Sadece geçmişe dönük tüketim değerleri dikkate alınarak yapılan tahminler yeterli olmamaktadır. Meteorolojik veriler, müşteri çeşidi gibi faktörler de dikkate alınması gereklidir

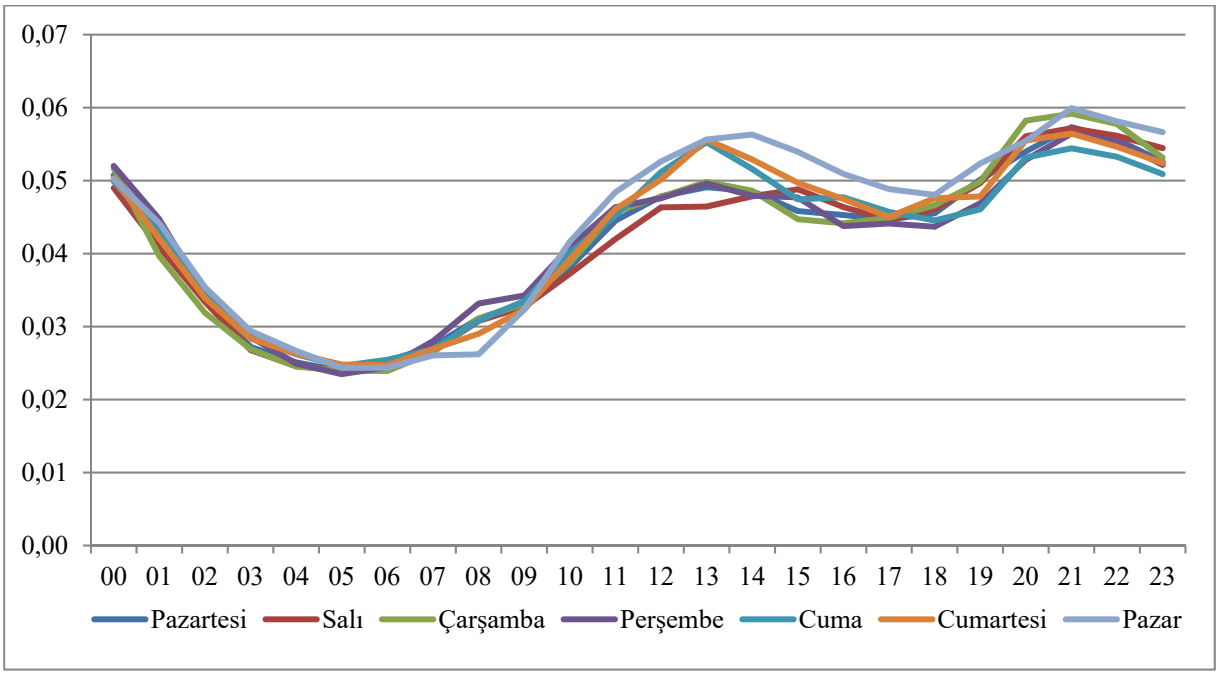
(Samsher & Unde,2012, Song et. al.,2016) . Yük tahminleri genel olarak üç sınıfa ayrılmaktadır. Kısa dönem yük tahminleri, 1 saatlik süreden başlayarak bir haftalık süreye kadar olan tahminleri kapsar. Orta dönem yük tahminleri, bir hafta ile bir aylık süre arasında kalan sürelerdeki tahminleri içerirken, uzun dönem yük tahminleri ise bir yıldan daha uzun zaman dilimleri için yapılan tahminleri içerir (Panapakidis I. P. , 2016, Lee & Hong 2015, Shao et. al. 2015, Friedrich & Afshari, 2015).

.

 Copyright © International Science and Technology Conference (ISTEC)

Yük tahminleri konusunda çok sayıda çalışmalar yapılmıştır. Abu ve arkadaşları bir sonraki yıl içindeki günün saatlik yük tahminini yapabilmek için çoklu lineer ve lineer olmayan regresyon uygulaması üzerinde çalışmış ve orta dönem yük tahminleri gerçekleştirmişlerdir(Shikhah& Aloquili 2011). Romera ve arkadaşları yaptıkları çalışmada yapay sinir ağları ve Fourier Serisi yaklaşımından faydalanarak aylık elektrik enerjisi talep tahmin hesaplaması yapmışlardır(Romera et. al. 2008) . Friedrich ve Afshari yaptıkları çalışmada, hava durumu koşullarının kısa dönem yük tahmini üzerindeki etkilerini incelemişlerdir(Friedrich & Afshari 2015) . Swaroo ve Abdulquder yaptıkları çalışmada güç sisteminin planlanması ve çalıştırılması amacı için yapar sinir ağları yöntemi kullanarak yük tahminlerinde bulunmuşlardır(Samsher & Unde,2012, Song et. al.,2016). Mandal ve arkadaşları yaptıkları çalışmada benzer gün yaklaşımını içeren yapay sinir ağları yöntemi ile değişik mevsim şartları dikkate alınarak birkaç saat sonrası için tahminlerde bulunmuşlardır (Mandal et. al. 2006).

Bu çalışmada Sakarya Elektrik Dağıtım Anonim Şirketi (SEDAŞ) tarafından Enerji Piyasası Düzenleme Kuruluna (EPDK) önerilen "Profil Katsayılarının Dengesizlik Maliyetlerine Etkisi ve Optimizasyonu Projesi" İsimli proje kapsamında 1 Temmuz – 30 Mayıs 2015 tarihleri arasında elde edilen mesken saatlik tüketim ve sıcaklık verileri kullanılması ile matematiksel modeller oluşturulmuştur. Bu model sayesinde sıcaklık ve saat bilgisi değişken olarak alınmak sureti ile istenilen sıcaklık ve saatte tüketilecek olan enerji değeri tahmin edilmiştir. Hissedilen sıcaklık değerlerinin 1'er ^{0}C derecesi azalması veya artması durumları dikkate alınarak her bir durum için profil katsayıları ayrı ayrı hesaplanmış ve profil katsayılarının belirlenmesinde hissedilen sıcaklık faktörünün etkisi ortaya konulmuştur.



Yük Profilleri

Dengeleme uzlaştırma gibi işlemlerde kullanılan ve 2016 yılında kullanılacak olan profil katsayıları dağıtım şirketleri tarafından hazırlanan 2015 yılı veri setleri kullanılmak sureti ile hesaplanır. Profil katsayıları ticarethane, tarımsal sulama, sanayi, aydınlatma, mesken gibi guruplara ayırılarak ayrı ayrı hesaplanırlar. Günlük mesken tüketimlerini ifade etmek üzere profiller hafta içi, hafta sonu ve resmi tatil günlerinin profilleri olarak sınıflandırılırlar. Hafta içi Pazartesi, Salı, Çarşamba, Perşembe, Cuma günlerindeki tüketimleri gösterir. Ancak Pazartesi gününün profili diğer hafta içi günlerinin profilinden farklıdır. Hafta sonu profilleri ise Cumartesi ve Pazar günü tüketimlerini ifade etmektedir. Tatil profili resmi tatil günlerindeki tüketimleri gösterir ve profilin ismi bayram olarak ifade edilir. Profil katsayıları saatlik enerji tüketimini ifade etmektedirler. Mesken Profil Katsayıları (MPK)'nın hesaplanması amacı ile SEDAŞ tarafından yapılan 2015 yılı enerji tüketim ölçümleri incelendiğinde mevsimsel etkiler nedeni ile bazı ayların MPK benzerlik gösterdiği anlaşılmıştır. Örneğin Sonbahar mevsimi olarak ifade edebileceğimiz Ekim –Kasım ayı MPK birbirine çok benzemektedir. Aralık Ocak Şubat ve Mart ayı benzer özellikli MPK kış mevsimini ifade etmektedir. İlkbahar mevsimi MPK olarak Nisan Mayıs aylarına ait verilerin dikkate alınmasının daha doğru olacağı belirlenmiştir. Yaz mevsimini ifade eden Haziran Temmuz Ağustos ayları için hazırlanan MPK'nın da birbirlerine çok benzediği görülmüştür. Bu çalışmada MPK hesaplanması için matematiksel modeller önerilmektedir. Matematiksel model hazırlanırken mevsimsel farklılıklar dikkate alınarak dört farklı model üzerinde çalışılmaktadır. MPK hesabında gün tipi profil katsayıları ayrı ayrı hesaplanır. MPK'nın hesaplanabilmesi için haftanın tüm günlerinin ve Resmi tatil günlerinin saatlik tüketim değerleri belirlenir. Pazartesi günlerinde kullanılan ortalama saatlik tüketim değerlerinin toplamı hesaplanır. Bu değer çok önemlidir. Çünkü profil katsayıları hesaplanırken tüm gün tiplerinin saatlik ortalama değerleri pazartesi saatlik ortalamalar toplamına bölünerek elde edilirler. Örneğin SEDAŞ tarafından "Profil Katsayılarının Dengesizlik Maliyetlerine Etkisi ve Optimizasyonu Projesi" İsimli proje kapsamında Eylül- Ekim 2015 tarihinde edilen mesken saatlik tüketim değerlerine göre hesaplanan MPK Tablo 1 de sunulmuştur. Bu profil katsayılarının hesabında sıcaklık bilgisi dikkate alınmamıştır. Eylül-Ekim 2015 mesken tüketim değerlerine göre elde edilen Sonbahar Mevsimi MPK Şekil 1 ile gösterilmiştir.

Polinamik Regresyon Matematiksel Modeli

Regresyon analizi bağımsız değişkenler ile bağımlı değişken arasındaki ilişkiyi matematiksel olarak ifade etmek için kullanılan bir yöntemdir (Shikhah& Aloquili 2011). En küçük kareler yöntemi yöntemi en fazla tercih edilen bir regresyon yöntemidir(Orun&Karatekin, 2014). Bir tane bağımlı değişkene karşılık birden fazla bağımsız değişkenin bulunması halinde denklem elde edilmesi yöntemine Çoklu Regresyon Analizi (ÇRA) denir. Denklem 1 'de Lineer Regresyon modeli verilmiştir. $\tilde{Y}$(k),

$$\tilde{Y} = a_{00} + \sum_{i=1}^{\lambda} a_{1i}\, X_i(k) + \sum_{i=1}^{\lambda} a_{1i}\, X_{2i}^2(k) + \cdots + \sum_{i=1}^{\lambda} a_{mi}\, X_i^m(k), \quad k = 1,2,\ldots,N \tag{3}$$

Denklem 3 ile *m.* dereceden çok değişkenli polinomik regresyon analizi ifade edilmektedir (Aslan et. al., 2011). Hesaplanması gereken bilinmeyen katsayı değerler a_{ij} ile ifade edilmiştir. Gerçek değer olarak kabul edilen ölçülen değerler ile modelin hesapladığı tahmini değerler arasındaki farkların karelerinin ortalamalarının (Mean Squared Errors (MSE)) minimize edilmesi ile polinom katsayıları hesaplanır. Bu durum denklem 4 ve 5 ile ifade edilmiştir (Karaboğa N.,2015). *m.* dereceden polinom modeli hatanın karesinin hesaplanması ise Denklem 4 ile gösterilmiştir.

$$E = \sum_{i=1}^{N}[Y_i - \tilde{Y}_i)]^2 = \sum_{i=1}^{N}[\, Y_i - a_{00} - a_{11}X_{1i} - a_{12}X_{1i}^2 - \cdots - a_{1m}X_{1i}^m]^2 \tag{4}$$

$$\begin{pmatrix} a_{00} \\ a_{11} \\ \vdots \\ . \\ a_{1m} \end{pmatrix} = \begin{pmatrix} N & \sum_{i=1}^{N} X_{1i} \cdots & \sum_{i=1}^{N} X_{1i}^{m} \\ \sum_{i=1}^{N} X_{1i} & \sum_{i=1}^{N} X_{i1}^{2} \cdots & \sum_{i=1}^{N} X_{1i}^{m+1} \\ \vdots & \vdots & \vdots \\ \sum_{i=1}^{N} X_{1i}^{m} & \sum_{i=1}^{N} X_{1i}^{m+1} \ldots & \sum_{i=1}^{N} X_{1i}^{2m} \end{pmatrix}^{-1} \begin{pmatrix} \sum_{k=1}^{N} Y_i \\ \sum_{k=1}^{N} Y_i X_{1i} \\ \vdots \\ \sum_{k=1}^{N} Y_i X_{1i}^{m} \end{pmatrix} \tag{5}$$

Denklem 4 'de $\tilde{Y}_i$ matematiksel modeli tarafından hesaplanan değeri Y_i ise ölçüm sonucunda bulunan gerçek değeri ifade etmektedir. X_i ise bağımsız değişken değerlerini ifade eder. ÇRA ile Denklem 5 ve 6 da ifade edilen a_{00}, a_{11} ,a_{22} katsayıları belirlenir. Bu katsayıların belirlenmesi için Denklem 6 kullanılır. Denklem 6 ve 7 'de Y_i, üretilen saatlik enerji miktarını, X_1 saat olarak zaman değerini ve X_2 ise Santigrad derecesi olarak sıcaklık değerini ifade etmektedir [b-c-g20,21,22,23]. Denklem 7 ile elde edilen katsayılar denklem 6 de yerine yazıldığında enerji tüketimini zamana ve sıcaklığa bağlı olarak ifade eden matematiksel model elde edilir.

$$f(x) = a_0 + a_1 X_1 + a_2 X_2 + a_3 X_3 + \cdots + a_n X_n \tag{6}$$

$$\begin{bmatrix} N & \sum X_{1i} & \sum X_{2i} \\ \sum X_{1i} & \sum X_{1i}^2 & \sum X_{1i}X_{2i} \\ \sum X_{2i} & \sum X_{1i}X_{2i} & \sum X_{2i}^2 \end{bmatrix} \begin{bmatrix} a_0 \\ a_1 \\ a_2 \end{bmatrix} = \begin{bmatrix} \sum Y_i \\ \sum X_{1i}Y_i \\ \sum X_{2i}Y_i \end{bmatrix} \tag{7}$$

Matematiksel Model ile Yük Profillerinin Hesaplanması

Bu çalışmada, Matlab Programı kullanılarak elektriksel tüketimler için yük tahmini yapacak matematiksek modeller oluşturulmuştur. Modellerin oluşturulması için SEDAŞ bölgesinde 2015 yılı saatlik mesken elektrik enerjisi tüketimi ölçüm değerleri ve aynı saatlerde hissedilen sıcaklık değerleri kullanılmıştır. Modeller Güçlü En Küçük Kareler Yöntemi ÇRA yapılarak elde edilmiştir. Model oluşturulurken mevsimsel şartlar da dikkate alınmıştır. Yaz, sonbahar, kış ve ilkbahar mevsimleri için ayrı ayrı dört farklı model oluşturulmuştur. Ayrıca hissedilen sıcaklık ve günün saat bilgisi de modelde değişken olarak ele alınmıştır. Elde edilen modeller sayesinde, mevsim seçimi yapıldıktan sonra saat ve sıcaklık bilgisine göre tüketilecek elektrik enerjisi miktarı

 Copyright © International Science and Technology Conference (ISTEC)

tahmin edilmektedir. Yaygın olarak model testi için kullanılan, Çoklu belirlilik katsayısı (R^2), hataların karelerinin ortalamalarının karekökü (Root Mean Squared Errors) (RMSE) değerleri her bir model için hesaplanmıştır. Böylece elde edilen matematiksel modellerin güvenirliliği test edilmiştir.

SEDAŞ enerji dağıtım bölgesi içerisinde yapılan ölçümlere göre benzer özellik gösteren aylar bir mevsim olarak kabul edilmiştir. Buna göre Kasım, Aralık, Ocak, Şubat ve Mart Kış Mevsimi, Nisan-Mayıs İlkbahar Mevsimi Haziran, Temmuz, Ağustos Yaz Mevsimi ve Eylül, Ekim ayları Sonbahar Mevsimi olarak dikkate alınmıştır. Bölgesel farklara göre mevsimleri ifade eden aylar farklılıklar gösterebilir bu durum mutlaka dikkate alınmalıdır. Buna göre Kış, İlkbaharı Yaz ve Sonbahar olmak üzere dört farklı matematiksel model elde edilmiştir. SEDAŞ Bölgesinde Eylül ve Ekim aylarının mesken tüketimleri benzer özellik taşıdığı ve diğer aylardan farklı olduğu görülmüştür. Bu durum Şekil 4 ile gösterilmiştir. Bu nedenle Sonbahar mevsimi mesken tüketimlerini tahmin etmek için matematiksel model oluştururken Eylül Ekim ayı tüketimlerinden yararlanılmıştır. Güçlü en küçük kareler yöntemi ÇRA polinomik model kullanılması ile mesken tüketimleri için mevsimsel matematiksel tahmin modeli Denklem 8 ile verilmiştir. a_{00}, a_{10} ,a_{01}, a_{20}, a_{11}, a_{02}, a_{30},a_{21}, a_{12}, a_{03}, a_{40}, a_{31}, a_{22}, a_{13} değerleri denklemin katsayılarını oluşturmakta olup mevsimsel şartlara göre ayrı ayrı hesaplanmış ve Tablo 2 , Tablo3, Tablo4, ve Tablo5 de verilmiştir.

$$z = a_{00} + a_{10}*x + a_{01}*y + a_{20}*x^2 + a_{11}*x*y + a_{02}*y^2 + a_{30}*x^3 + a_{21}*x^2*y + a_{12}*x*y^2 + a_{03}*y^3 + a_{40}*x^4+a_{31}*x^3*y+a_{22}*x^2*y^2+a_{13}*x*y^3+a_{50}*x^5+a_{41}*x^4*y+a_{32}*x^3*y^2+a_{23}*x^2*y^3 \quad (8)$$

Denklem 8 ‘de , z ilgili sıcaklık ve saatte tüketilen elektrik enerjisi değerini, x ^{0}C olarak sıcaklık değerini, y ise günün hangi saatinde olduğumuzu ifade etmektedir. Modelin kabul edilebilir bir model olduğunu test etmek için denklem 9 ile ifade edilen çoklu belirlilik katsayısı hesaplanmıştır. Ayrıca model uygunluk testi için kullanılan ve Denklem 10 ile ifade edilen hataların karelerinin ortalamasının kara kökünü gösteren RMSE değeri de hesaplanmıştır. R^2 determinasyon katsayısını, *e,* hatayı, n değişken sayısını, veri sayısını ifade etmektedir

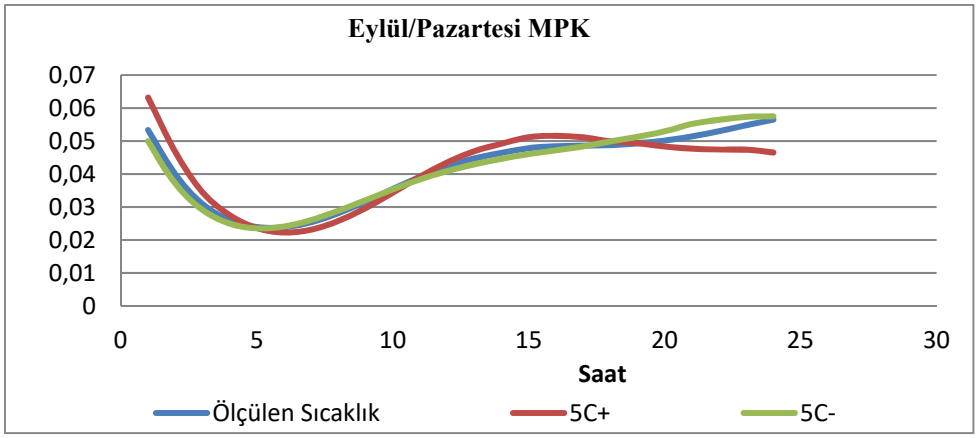
$$R^2 = \frac{\sum_{i=1}^{n}(Y_i - \bar{Y})^2 - \sum_{i=1}^{n} e_i^2}{\sum_{i=1}^{n}(Y_i - \bar{Y})^2} \tag{9}$$

$$RMSE = \sqrt{\frac{\sum (y_i - \hat{y}_i)^2}{n}} \tag{10}$$

R^2 değerinin 0-1 arasındaki R^2 değerinin 1’e yakın olması RMSE değerinin de 5’den küçük olması modelin uygun olduğunu göstermektedir. Denklem 8 ile elde edilen model için uygunluk testi değerleri hesaplandığında elde edilen değerler Tablo 6 de verilmiştir. Tablo 6 da sunulan değerler dikkate alındığında modelin güvenilir bir model olduğu anlaşılmıştır.

Tablo 6 Matematiksel Model Test Değerleri

Mevsim	R^2	*RMSE*
Kış	0.97	3.308
İlkbahar	0.89	5.71
Yaz	0.95	5.24
Sonbahar	0.97	4.55



Mevsimsel farklar dikkate alınarak 4 mevsim için dört farklı matematiksel model üretilmiştir. Matematiksel modellerin değişkenleri olarak saat ve hissedilen sıcaklık bilgileri olması düşünülmüştür. Mevsim seçiminin yapılmasından sonra saat ve sıcaklık değeri bilgisi girildiğinde ilgili mevsime ait herhangi bir gün tipi için tüketilen elektrik enerjisi miktarı tahmini saatlik olarak yapılmaktadır. Örnek olarak 2015 yılı Sonbahar mevsimi ölçülen enerji tüketim bilgileri kullanılarak elde edilen matematiksel model oluşturulmuştur. Üretilen model Denklem 8 ile verilmiştir. Bu model kullanılarak Eylül ayı pazartesi günü için tahmin edilen MPK, ölçülen sıcaklıkta ve saatlik sıcaklık değerlerinin 1’er ^{0}C artması durumlarına göre Tablo 7 ‘de verilmiştir. Eylül Ayı Pazartesi gün tipi için sıcaklık değişimlerinin de etkisini gösteren MPK değişimi grafik olarak Şekil 5 de sunulmuştur.

Eylül ayı pazartesi günü için tahmin edilen MPK, ölçülen sıcaklıkta ve saatlik sıcaklık değerlerinin 1’er ^{0}C azalması durumlarına göre Tablo 8 ‘de verilmiştir. Eylül ayı pazartesi günü için tahmin edilen MPK, ölçülen sıcaklıkta, saatlik sıcaklık değerlerinin 5 ^{0}C artması ve azalması durumlarına göre değişimi grafik olarak Şekil 5 de sunulmuştur. Eylül ayı Salı günü için tahmin edilen MPK, ölçülen sıcaklıkta, saatlik sıcaklık değerlerinin 5 ^{0}C artması ve azalması durumlarına göre değişimi grafik olarak Şekil 6 da sunulmuştur. Eylül ayı pazar günü için tahmin edilen MPK, ölçülen sıcaklıkta, saatlik sıcaklık değerlerinin 5 ^{0}C artması ve azalması durumlarına göre değişimi grafik olarak Şekil 7 de sunulmuştur.

Şekil 6 Sıcaklık artma ve azalma durumlarına göre Matematiksel Model tarafından elde edilen Eylül 2015 Salı için MPK

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 7 Sıcaklık artma ve azalma durumlarına göre Matematiksel Model tarafından elde edilen Eylül 2015 Pazar için MPK

Sonuçlar

Yapılan çalışmada Türkiye Sakarya Elektrik Dağıtım Anonim Şirketi (SEDAŞ) tarafından yapılan Elektrik Enerjisi kullanım ölçüm değerleri ile geliştirilen matematiksel modeller kullanılmıştır. Metematiksel model ile mevsimsel şartlar da dikkate alınarak hissedilen sıcaklık ve günün saat bilgisine göre saatlik elektrik tüketilen güç değerleri tahmin edilmiştir. Tüketim tahminleri elektrik enerjisi enerjisi üretim tüketim planlamalarında büyük öneme sahiptir. İhtiyaç duyulan elektrik enerjisinin tahminindeki hatalar dengesizlik maliyetlerinin artmasına sebep olmaktadır. Dengesizlik maliyetlerini düşürmek için daha doğru tahmin yöntemlerine ihtiyaç vardır. Mevsimsel koşullar da dikkate alınarak ÇRA ile dört farklı matematiksel modeller geliştirilmiştir. Polinomik modellerin katsayıları Tablo2, 3, 4, 5 ile sunulmuştur. Yük profillerinin belirlenmesinde mevsimsel şartlara bağlı olarak geliştirilen dinamik modellerin kullanılmasının önemi ortaya konulmuştur. Geliştirilen modellerin güvenirliliğini gösteren değerler Tablo 6'da verilmiştir. Sonbahar mevsimi modeli sonuçları örnek olarak sunulmuştur. Modelin doğruluğunun test edilmesi için tahmin edilen Eylül ve Ekim ayı saatlik tüketim değerlerini kapsayan 1464 tahmin sonucu üzerinde bir hesaplama yapılmıştır. Hataların karelerinin ortalamasının kara kökünü gösteren RMSE değeri 4.551 olarak hesaplanmıştır. Literatüre ait çalışmalar incelendiğinde bu değerin 5 den küçük olması tahmin modelin güvenilir olduğunu göstermektedir. Ayrıca bir başka test yöntemi olarak da aynı model için R^2 determinasyon katsayısı hesaplanmış ve R^2 değerinin 0.9715 olduğu belirlenmiştir. Çıkan sonuç tahmin modelinin %97 güvenilir olduğunu göstermektedir. Örnek olarak ele alınan MYP hesabında meteorolojik verilerin etkisinin önemli olduğu görülmüştür. Tablo 7 ve Tablo 8 de hissedilen sıcaklık değerlerinin değişmesi halinde MPK değerlerinin de değişeceği görülmektedir. Sıcaklık bilgisinin 5 ^{0}C artması veya azalması durumunda MPK değerleri değişecek ve bu durumu dikkate almadığımız takdirde ihtiyaç duyulan elektrik enerjisi hatalı bir şekilde tahmin edilecektir. Farklı gün tipi olarak, Pazartesi, Salı ve Pazar günlerinin örnek olarak alınmış ve hissedilen sıcaklık değerlerinin değişmesi durumunda MPK değimleri e şekil 5 ,6 ve 7 de gösterilmiştir. MPK hesaplanırken sıcaklık tahminlerinin de göz önünde bulundurulması daha doğru tahmin yapılması için önemlidir. Dinamik modelin kullanılması durumunda dengesizlik maliyetlerinin azalmasına katkı sağlanacağını düşünmektedir.

Açıklamalar

Bu çalışma EPDK tarafından 28.05.2014 tarih ve 5036 sıra nolu Kurul Kararı ile desteklenen "Profil Katsayıları Hazırlama Metodolojisinin Dengesizlik Maliyetlerine Etkisi ve Optimizasyonu Projesi" kapsamında SEDAŞ ve Düzce Üniversitesi işbirliği ile yapılmıştır.

METHODOLOGY OF OPTICAL SPECTRAL ANALYSIS BY LIGHT EMISSION AND DETECTION

Manallah Aissa
manallah_aissa@yahoo.fr

Bouafia Mohamed
bouafia_med@yahoo.fr

The spectral analysis in applied optics is both technological and physical procedure. Our work provides a general methodology that takes into consideration the emission of light, interference filtering, and detection through nanostructures of ZnO on ITO substrates.

We present all theoretical and experimental aspects related with the emission and detection. The theoretical part was supported by practical work showing the procedure starting from the source to the detection of the spectrum. In order to show the results of spectral analysis steps we have used two spectroscopy devices UV-Vis, different sources, interference filters and samples.

MICROSTRUCTURE AND MECHANICAL PROPERTIES OF FRICTION WELDED IRON ALUMINIDES

O.Torun

Afyon Kocatepe University, Bolvadin Vocational School, Afyonkarahisar, Turkey

otorun@aku.edu.tr

Abstract: Fe–40Al alloy were welded by the friction welding technique. Samples were welded for different welding time under a constant forging and friction pressure at 1000 rmp. Microstructures of the welds were examined by optical microscopy. The results showed that the welded samples were free of any pore or crack along the weld interface except for 3s. The micro hardness of the welded samples was measured. The strength of the welds was determined by the shear tests. It was observed that the shear strength of the welds depended on the welding time. The maximum shear strength was 466, 8 MPa.

Keywords: Iron aluminides, friction welding, shear strength

Introduction

Iron aluminides based on Fe_3Al and FeAl are excellent candidates to be used as structural materials for high-temperature service conditions. The advantages of these materials include their low cost, low density, and high sulfurizing and oxidizing resistance at high temperatures (Liu 1997, Stoloff 2000, Deevi 1997, Deevi 1998). These advantages have led to the identification of several potential uses, including heating elements, furnace fixtures, heat-exchanger piping, and sintered porous gas-metal filters, automobile and other industrial valve components, catalytic converter substrates and components for molten salt applications (Stoloff, 1998). However, these alloys have poor ductility at the room temperature, relatively poor high- temperature strength and creep resistance (McKamey, 1991). The development of a joining process is very important in the application of iron aluminides, but the study of welding and/or brazing iron aluminides is very limited in literatures. Welding of iron aluminides plays an important role in practical application of such alloys. Welding of iron aluminides is difficult due to its inherent low temperature ductility and poor weldability (Fasching 1995, Lee 2003). Friction welding is one of the available joining techniques, and it has been used successively in metals and alloys (Ozdemir 2005, Ateş 2007, Tao 2015, Della 2013, Winiczenko 2013, Kırık 2013). There has been several published works on the friction welding of Fe_3Al - FeAl type alloys. Sketchley et al. investigated the friction welding of Fe_3Al-based oxide dispersion-strengthened (ODS) alloy and B.J. Inkson et al. studied on friction welding of FeAl40 Grade 3 ODS alloy. They achieved good bonding (Sketchley 2002, Inkson 1998). In addition, author and co-workers reported the successful friction welding of Fe_3Al and dissimilar Fe–28Al alloy and AISI 316 L (Torun 2011, Çelikyürek 2011). In this paper, cast Fe-40Al alloys were welded by friction welding. Effect of welding time on the microstructure and mechanical properties of the cast Fe-40Al alloy were investigated.

Materials and Methods

The alloy Fe-40Al was prepared with vacuum arc melting under an argon atmosphere from iron and aluminum with 99.99 wt. % and 99.7 wt. % purity, respectively. The samples were homogenized at 1100 ◦C for 50 h and cooled in a furnace. Cylindrical cast alloy samples 8 mm in diameter and 50 mm in length were prepared. The friction welding experiments were carried out by a continuous-drive friction welding machine (Fig. 1) for 3, 5 and 7 s friction time under a constant rotational speed, a constant friction and forging pressure (Table 1). After welding, the welded samples were cut perpendicular to the welding interface. The surfaces of the welded samples were ground with 1200 grinding paper and polished with 1 µm diamond paste, then the samples were etched with a mixture of H_2O (30 ml), HNO_3 (30 ml), HCl (20 ml) and HF (20 ml). The microstructures were observed with light microscopy Microhardness values were measured on the welded samples by means of Vickers

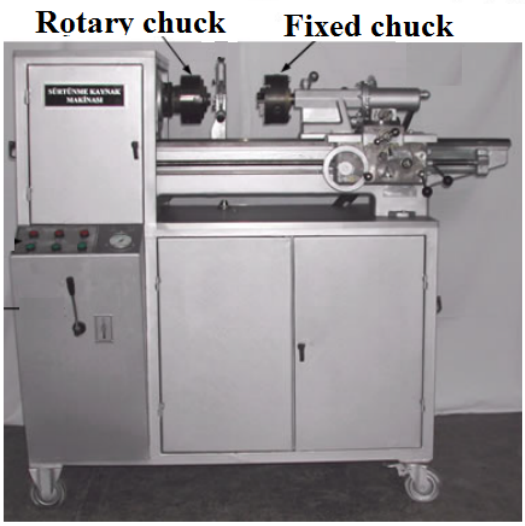

Figure 1.A continuous-drive friction welding machine

indenter with a load of 100 g. Shear tests were performed to determine the strength of the weld interface using an electromechanical universal test machine (Shimadzu AG-IS-250) at room temperature. A specially designed specimen holder was used to measure the shear strength. Three samples were tested for an each welding condition.

Results and Discussion

Flash formation was observed in all welded samples because of plastic deformation during welding. The friction time play an important role in flash formation. The burn-off increased with increase in friction time. More plastic deformation occurs because of the longer friction time, which produces higher heat in the weld interface. Thus, the burn-off (axial shortening) increases with the increase in plastic deformation (Table 1).

Table 1.Parameters of the friction welding.

Friction Speed (rmp)	Forging Pressure(MPa)	Friction Pressure (MPa)	Friction Time (s)	Burn-off (mm)
1000	140	140	3	4.2
1000	140	140	5	10.9
1000	140	140	7	18.5

Microstructural observation was carried out for the weld interface using an optical microscope. Fig. 2 shows the optical micrographs of the weld interface of welded samples for 3, 5 and 7 s.

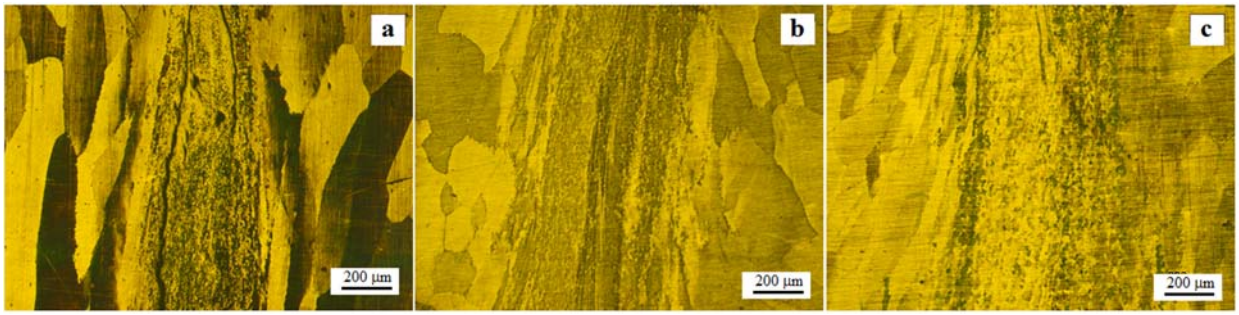

Figure 2. Optical micrographs of the weld interface of welded samples. a)3 s b) 5 s and c) 7 s.

As seen micrographs, the welded samples were of sound quality and they did not exhibit any voids or crack formation along the weld interface except for 3s. Two main regions are observable on the interface of all of the

 Copyright © International Science and Technology Conference (ISTEC)

welded samples: a dynamically recrystallized zone with very fine grains and a plastically deformed zone. The width of the recrystallized zone for all of the welded samples was approximately between 400 and 600 µm. Micro hardness welded samples for 3, 5 and 7s is given in Fig. 3. According to the results of measurements, micro hardness profiles for all welding times are found to be similar.

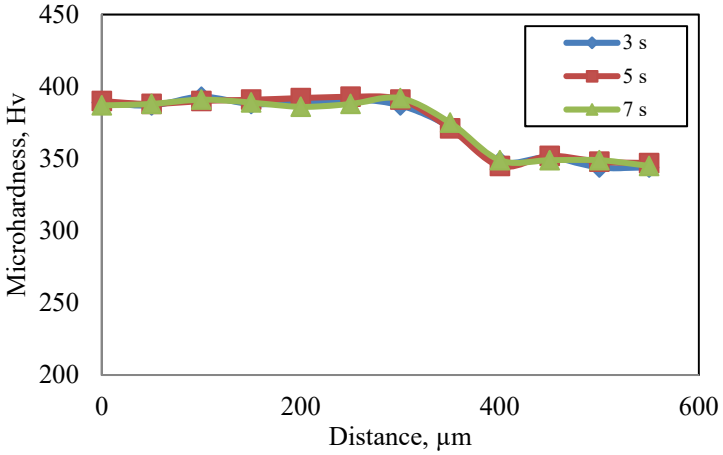

Figure 3. Micro hardness welded samples for 3, 5 and 7s

The shear strengths of welded samples were determined by using a specially designed testing apparatus. The shear of the welds and the base alloy are shown in Fig. 4. Test results demonstrated that the values of the shear strength of the welded samples were increase in increasing of the friction time. It can be said that the shear strength of welds was dependent on the friction time under the experimental conditions. The welded samples for 3s are not high enough to generate the required heat for friction welding. The shear strength of welded samples for 3s has lower due to voids at the weld interface. Test results demonstrate that the shear strength values of the welds are greater than the base metal. This situation shows that the structure with very fine grains formed due to dynamic recrystallization during the friction welding has more strength than the matrix.

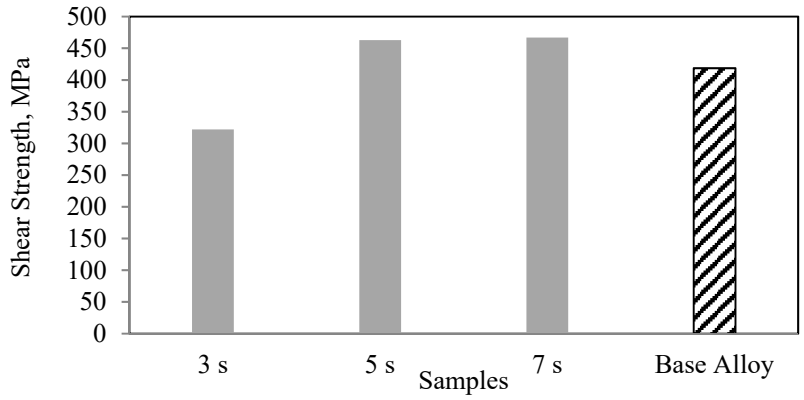

Figure 4. The shear of the welds and the base alloy

Conclusion

In this study, cast Fe–40Al alloy was welded under different conditions by friction welding method. Microstructure studies showed the presence of two different regions at the weld interface: the recrystallized zone and the deformed zone. There was variation in the width of the recrystallized zone and the deformed zone with an increase in the friction time. The micro hardness profiles for all the friction welding times. The shear strengths of the welds increased with increase in the process time. The maximum shear strength was 469,5 MPa.

abeycioglu@duzce.edu.tr

Özet: Beton teknolojisindeki gelişmelere paralel olarak modern mühendislik yapılarında kullanılan betonların özelliklerinde de farklı beklentileri karşılayabilecek önemli performans artışları meydana gelmiştir. Bu önemli performans artışlarının hem reolojik hem de mekanik özellikler açısından en etkin görüldüğü beton türü kendiliğinden yerleşen betondur. Farklı tahmin yöntemlerinin kendiliğinden yerleşen betonların performansını belirlemek amacıyla kullanımına ilişkin çalışmalar literatürde daha sık yer almaya başlamıştır.
Bu çalışmada, yaygın olarak kullanılan yapay zeka yöntemlerinden olan bulanık mantık yaklaşımının ince agrega yerine %5 ve %10 oranında mikronize kalsit ve çimento yerine %20, %40 ve %60 oranında düşük kalsiyumlu uçucu kül içeren kendiliğinden yerleşen betonların basınç dayanımlarının tahmininde kullanılabilirliği araştırılmıştır. Çalışmada mikronize kalsit ve düşük kalsiyumlu uçucu kül ikamesinin yanı sıra betonların kür periyodu da girdi parametresi olarak kullanılmıştır. Sonuç olarak mikronize kalsit ve puzolan içeren kendiliğinden yerleşen betonların basınç dayanımlarının farklı kür sürelerinde yüksek oranda yaklaşıklıkla tahmin edilebileceği ve bulanık mantık gibi tahmin yöntemlerinin beton teknolojisinde kullanılabilirliği üzerine çeşitli çalışmaların faydalı sonuçlar verebileceği görülmüştür.

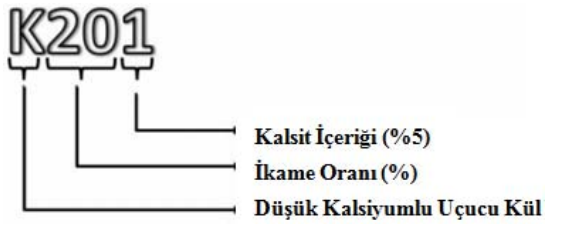
Anahtar Kelimeler: Bulanık mantık, Mikronize kalsit, Düşük kalsiyumlu Uçucu Kül, Kendiliğinden yerleşen beton

Giriş

Kimya alanında birçok gelişme kaydedilmesi ve polimer teknolojisinin ilerlemesi 80'li yılların ortalarından itibaren çok etkili akışkanlaştırıcıların keşfine sebep olmuştur. Yüksek oranda su kesme yeteneğine sahip bu akışkanlaştırıcılar aynı zamanda taze betonun işlenebilirliğini de önemli düzeyde arttırmaktadır. Yeni nesil akışkanlaştırıcıların sağladığı bu etki, bilim adamlarını taze betonun donatıların arasından kalıba yerleştirilmesi ve sıkıştırılması işlemini ortadan kaldırmak için araştırma yapmaya yöneltmiştir. KYB kavramının ortaya çıkışı da bu çalışmaların sonucunda olmuştur (Felekoğlu et al, 2004, Beycioğlu, 2013). KYB, taze haldeyken kendi ağırlığı ile sık donatılı dar ve derin kesitlere yerleşebilen, iç veya dış vibrasyon gerektirmeksizin kendiliğinden sıkışabilen, bu özelliklerini sağlarken ayrışma ve terlemeye neden olmadan kohezyonunu (stabilitesini) koruyabilen, çok akıcı kıvamda olan ve sertleşmiş haldeyken de yüksek dayanım ve dayanıklılık gibi özellikleri sağlayabilen özel bir beton türüdür. Klasik beton karışımından farklı olarak KYB'den taze halde iken beklenen özel performanslar nedeniyle; kimyasal katkı, viskozite arttırıcı katkı ve çok miktarda inert veya puzolanik mineral katkının tümünün veya bir kısmının kullanılması ihtiyacı doğmaktadır (Felekoğlu and Baradan, 2004).

Günümüzde mühendislik araştırmalarında yapay zeka yöntemlerinden biri olan bulanık mantık yaygın olarak kullanılmaya başlanmıştır (Şen, 2001). Bulanık mantık kavramına ait ilk adım 1965 yılında Lotfi A. Zadeh tarafından atılmış olup Zadeh yayımlamış olduğu makalede bunu bulanık mantık veya bulanık küme kuramı ile ifade etmiştir (Zadeh, 1965).Zadeh'e göre bulanık mantık genel özellikleri bakımından kesin değerlere dayalı düşünme yerine yaklaşık düşünmeyi kullanır ve matematiksel modellerden sonuç alınması zor olan sistemlerde oldukça kullanışlıdır. Zadeh'in bulanık mantık kavramını kontrol uygulamalarında kullanan ilk kişi Mamdani'dir. Mamdani bir buhar makinesinin kontrolünü sağlamak amacı ile bulanık mantığı kullanmıştır (Tiryaki and Kazan, 2007).

Materyal ve Yöntem



Bu çalışmada kapsamındaki bulanık mantık modellemesinde düşük kalsiyumlu uçucu kül ve mikronize kalsit içeren ve karışım dizaynları Tablo 1'de verilen kendiliğinden yerleşen betonlarda 7-28 ve 90 günlük kür uygulaması sonrasında elde edilen basınç dayanımı sonuçları kullanılmıştır (Beycioğlu and Aruntaş, 2014).

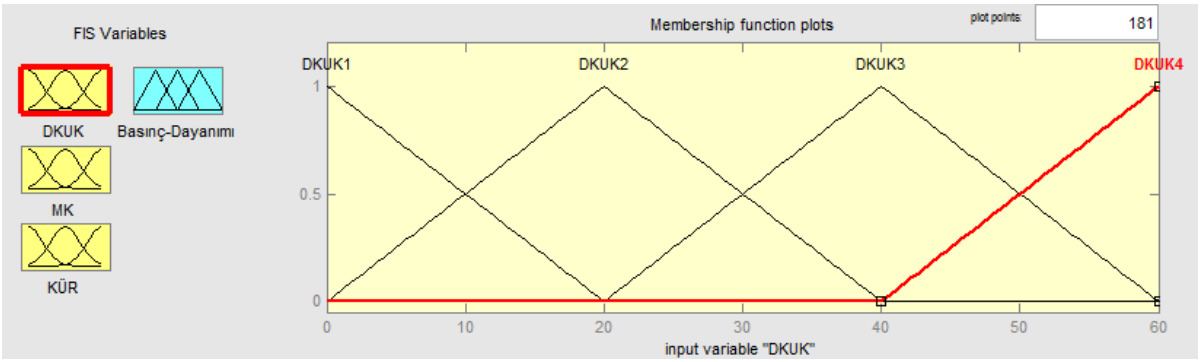
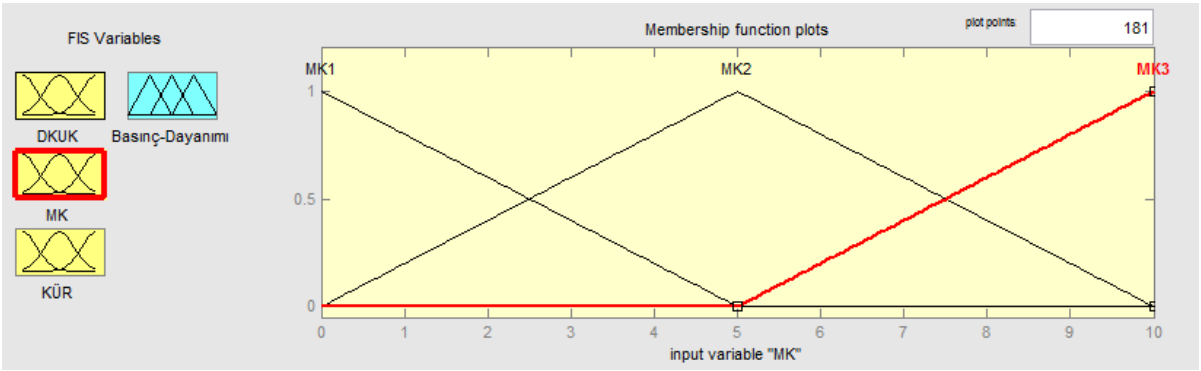
Tabloda görüleceği üzere tüm beton serilerinde beton karışımının içeriğini temsil eden bir kodlama kullanılmıştır. Kullanılan kodlamada düşük kalsiyumlu uçucu külü temsilen "K" kullanılmıştır. Kodlamanın ortasında bulunan iki rakam mineral katkının ikame oranını ve son rakam ise agreganın yerine kullanılan kalsiti temsil etmektedir. Kalsit için kullanılan rakamlardan "0" rakamı karışımda kalsit olmadığını, "1" rakamı karışımdaki toplam agreganın %5'inin kalsit ile yer değiştirdiğini, "2" rakamı ise karışımdaki toplam agreganın %10'unun kalsit ile yer değiştirdiğini simgelemektedir. Kullanılan kodlamaya ait bir örnek aşağıda verilmiştir.

Bulanık Mantık ile Modelleme ve Bulgular

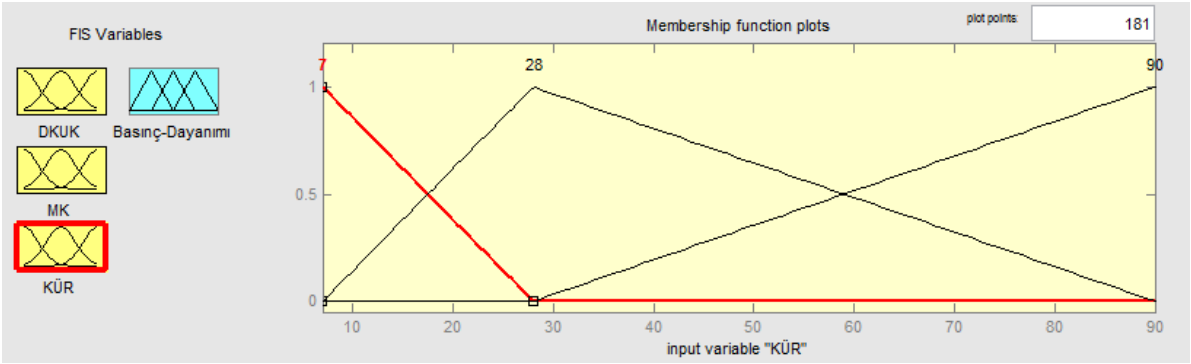


Modellemede düşük kalsiyumlu uçucu kül, mikronize kalsit ve kür süresi girdi parametresi olarak kullanılmış ve 7-28-90 günlük basınç dayanımı değerleri ise çıktı olarak değerlendirilmiştir. Şekil 1'de verilen modelin genel yapısı üzerinde girdi ve çıktı parametreleri görülmektedir.

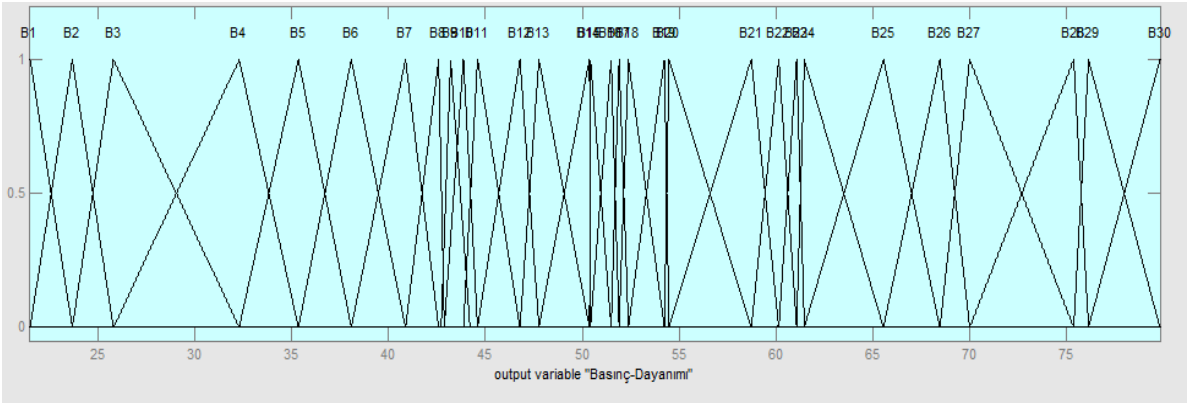


Şekil 1. Bulanık mantık modelinin genel yapısı

 Copyright © International Science and Technology Conference (ISTEC)



Girdi parametrelerinden düşük kalsiyumlu uçucu kül için DKUK1, DKUK2, DKUK3, DKUK4; mikronize kalsit için MK1, MK2, MK3, kür süresi için ise 7, 28, 90 olmak üzere üyelik fonksiyonları tanımlanmıştır. Model girdileri ve çıktıları için belirlenen üyelik fonksiyonları Şekil 2-3-4-5'de görülmektedir.



Şekil 2.Düşük kalsiyumlu uçucu kül girdisine ait üyelik fonksiyonları

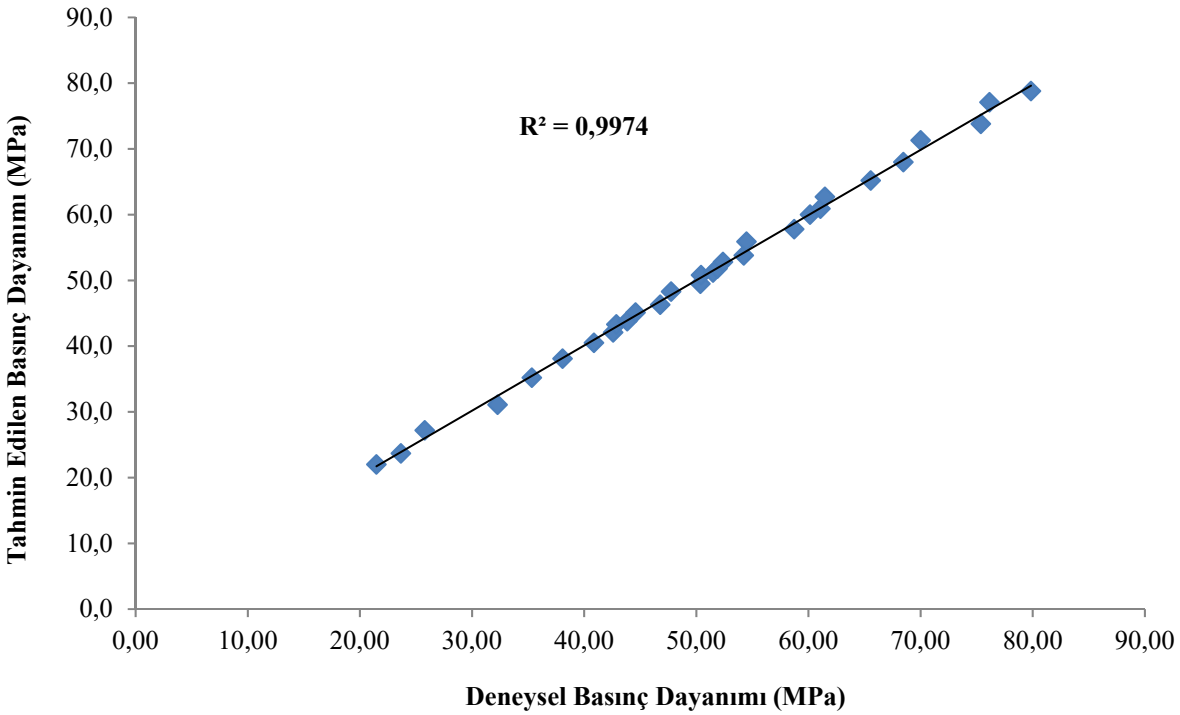
Bulanık mantık modellemede en önemli aşamalardan bir tanesi girdiler ile çıktılar arasındaki ilişkiyi doğru tanımlayabilmektir. Bu çalışmada girdiler ve çıktılar arasındaki ilişkiyi temsil edecek 30 farklı kural programa tanımlanmıştır. Tanımlanan kurallara göre girdiler ve çıktılar arasındaki ilişkiyi yansıtan ve girdi parametresi-çıktı değişimini ortaya koyan grafikler Şekil 6'da görülmektedir.

Şekil 6. Programda kurallara göre oluşan girdiler ile çıktı arasındaki ilişki grafikleri

Kuralların tanımlanmasından sonra modelin tahmin yeteneğini ortaya koymak için modele ait sonuçlar Şekil 7'de görülen durulaştırma ekranından alınmış ve deneysel olarak elde edilen basınç dayanımı sonuçları ile karşılaştırılmıştır.



Şekil 7. Modele ait sonuçları alındığı durulaştırma ekranı

Modele tüm deneylerin girdi parametreleri tek tek giriş yapılarak modelin tahmin sonuçları elde edilmiştir. Modelden elde edilen sonuçlar ile deneysel sonuçlar Tablo 2'de toplu olarak görülmektedir. Ayrıca model sonuçları ile deney sonuçları arasındaki uyumu gösteren korelasyon grafiği de Şekil 8'de görülmektedir.

Sonuç

Günümüzde en çok kullanılan yapı malzemelerinden biri olan betonun tasarım ve kalitesinin kontrolü aşamalarında basınç dayanımı, eğilme dayanımı, çekme dayanımı, aşınma dayanımı gibi birçok farklı parametre bulunmaktadır. Bu deneyler genellikle taze beton deneylerine kıyasla pahalı ve zahmetli deneylerdir. Bu deneylerin yapılmasının yanı sıra bu çalışma kapsamında araştırılan ve hala geliştirilen modelleme yöntemleri de kullanılmaktadır.

Bu çalışmada çimento yerine düşük kalsiyumlu uçucu kül ve agrega yerine mikronize kalsit ikamesinin kür süresine de bağlı olarak kendiliğinden yerleşen betonların basınç dayanımında meydana getirdiği değişiklikler, deneysel çalışmalar neticesinde elde edilen veriler kullanılarak modellenmiştir. Çalışmada gerçekleştirilen karşılaştırmada bulanık mantık modelinin 0,9974 gibi çok yüksek bir korelasyonla deney sonuçlarını tahmin edilebildiği belirlenmiştir. Sonuçlar bulanık mantığın mühendislik çalışmalarında kullanımı üzerine yapılacak araştırmaların faydalı olabileceğini göstermektedir.

Özet: Yapı sektörü içerisinde nitelikli bir yapının yapılabilmesi için yasal ve teknik donanım bakımından mimari proje oldukça önem taşımaktadır. Mimari proje için başvuran müşteri, farklı meslek ve yaş gruplarından olup eğitim seviyeleri de farklılık göstermektedir. Müşteri, mimari büroları akraba ya da tanıdık vasıtasıyla, tavsiye üzerine, bürolar üzerinde araştırma yaparak ya da rastgele bir seçim ile tercih etmektedir. Mimari proje alanında ise; uygulama projesi, takım proje, taslak proje, danışmanlık, iç mimarlık ve ihale dosyalarını hazırlamak gibi hizmetler için mimari bürolar ile müşteri iletişime geçmektedir. Mimari projenin oluşum, uygulama ve sözleşme aşamalarında bazı sorunlar yaşanabilmektedir. Bu sorunlar ve sorunlara bulunan çözümler müşteri ve mimari büroya bağlı olarak değişmektedir. Çalışma konusu kapsamında yapı sektöründeki müşteri ve mimari büro çalışanları arasındaki iletişimi Türkiye genelinde gözlemleyerek çalışma alanı Kayseri kenti seçilip anket çalışması düzenlenmiştir. Kayseri kenti özelinde müşterilerin mimari bürolar ile karşılaştıkları sorunların ortaya çıkarılması ve bu sorunlara yönelik çözümlerin ve önerilerin geliştirilmesi hedeflenmektedir. Çalışmaya örnek alınan Kayseri kenti özelinde müşteri ve mimari büro iletişimi üzerine yapılan bu araştırmanın yapı sektörü bazında ülke ölçeğine de geçirilerek sorunları ve çözümleri ortaya koymakta örnek olması hedeflenmektedir.

Anahtar kelimeler: Kayseri, Mimarlık, Büro, Müşteri

1. Giriş

Mimarlık, insanların barınma, dinlenme çalışma eğlenme gibi eylemlerini sürdürebilmelerini sağlamak ve yaşamlarını kolaylaştırabilmek için gerekli mekânları, işlevsel gereksinmeleri ekonomik ve teknik olanaklar kullanılarak estetik bir şekilde inşa etme sanatıdır. Yapıları ve fiziksel çevreyi tasarlama-inşa etme sanatı ve bilimine *mimarlık* denir (Wikipedia, 2015). Mimarlık (architecture) ve mimara (architect),kelime olarak bakıldığında; ilk bölümü, "baş" veya "en büyük" gibi sıfatlar anlamına gelen ve eklendiği ismi yükselten "arhi" kelimesinden ve ikinci bölümü de dilimizde "teknik" olarak yer eden ve "el ürünü", "yapma becerisi" anlamına

 Copyright © International Science and Technology Conference (ISTEC)

gelen "tektoniki" kelimesinden oluşan eski Yunanca bir birleşik kelime "Arhi-Tektonik" den türetilmiştir (Ergöz, 2002). Mimar; yeryüzünü insan yaşamını sürdürmesine ve rahatlığına en uygun şekilde düzenlemek ile görevli kişi ve Imrah (mimarlık); insan yaşamını sürdürmesine ve rahatlığına en uygun şekilde düzenleme anlamlarına gelen bu kelimeler Türkçeye Arapçadan, mimar, imar, umur, mamur umran gibi bir birleri ile bağlantılı kelimeler şeklinde geçmiştir (Erdi, 2009).

Mimarlık da diğer meslek grupları gibi, insanlığın tarihi boyunca ve ona paralel olarak gelişimini sürdürmüştür. Mimarlık birçok evreden ve dönemden geçerek zaman içinde bir uğraşı alanı olmaktan çıkıp meslek dalına dönüşmüştür. Mimarlık pratiği, her dönemde genel kapsamda insanoğlunun "yapay çevresinin oluşturulması" ile ilgilense bile, mesleğin doğasında bulunan teknik ve sanatsal özelliklerden dolayı içinde bulunduğu devrin toplumsal, sosyolojik, kültürel ve ekonomik durumlarından da payını almıştır. Bunun yanı sıra mimari, teknolojik ve bilimsel gelişmelerden etkilenmiştir (Erdi,2009). Mimari pratik ise bir ofisin çeşitli projeleri gerçekleştirmek için örgütlenmesi olarak tanımlanmaktadır (Turgay, 2006).

Günümüzde mimarlık hizmetlerinin tanımına bakıldığında; uygulamaya, yapmaya, kabule ve imzaya mimarın yetkili olduğu, her türlü araştırma, danışmanlık, bilirkişilik, etüt, tasarım, plan, proje, resim ve hesapların hazırlanması ve bunların uygulanması ile her türlü denetim ve kontrollük hizmetlerine mimarlık hizmetleri denmektedir (TMMOB Mimarlar Odası Mimarlık Hizmetleri Şartnamesi, 2015). Mimarlık hizmetleri ele alındığında odanın hazırladığı hizmet şartnamesine göre mimarların müellif olduğu hizmet alanları; mimari tasarım hizmetleri, mimari uygulama ve yönetimi hizmetleri, mimari danışmanlık hizmetleri, mimari eğitim çalışmaları, diğer sanatsal çalışmalar olmak üzere beş başlık altında birleştirilir (TMMOB Mimarlar Odası Mimarlık Hizmetleri Şartnamesi, 2015). Mimarlık hizmeti bir yapının ortaya çıkış sürecinde mimar tarafından üstlenilen eylemlerin tümünü kapsamaktadır. Mimarlığın bir meslek olarak kabul edilmesi ve bir hizmet halini alması uzun yıllar süren karmaşık süreçlerin bir sonucudur. İnsan yaşamındaki karmaşanın artması, sosyal ve kültürel yapının, kavramların ve ihtiyaçların değişmesine paralel olarak mimarlık da değişmiştir (İşcan, 2011).

Yapı tasarım ve üretim sürecinde birçok aktör yer almaktadır. Bu aktörlerinden birisi de inşaat sürecinin çeşitli aşamalarında yer alarak ve farklı uzmanlık alanları arasında koordinasyon sağlayan ve kritik bir rol üstlenen mimarlık ofisleridir. Günümüz koşullarında her alanda olduğu gibi mimarlık hizmetleri alanında da kullanıcı ve müşterilerin etkisi yoğun olarak hissedilmektedir (Erbil, Akıncıtürk, 2010).

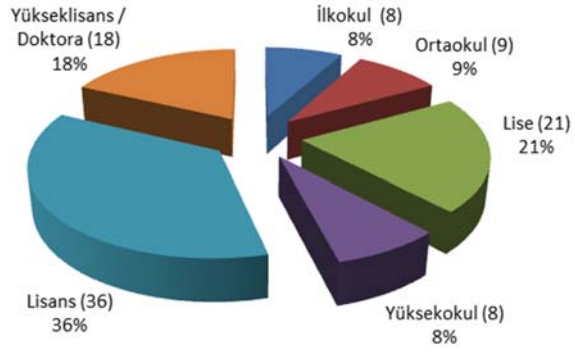
Turgay'a (2006) göre "*Mimar, müşteri ve diğer katılımcılar arasında yüz yüze iletişim süreci kolaylaştırmaya yardımcıdır. Tasarım sürecindeki herkesin; müşterinin, müteahhidin, mühendisin, orada yaşayacak olanların ve sürece katılan diğer kişilerin tasarım hakkında bir düşüncesi olabilmektedir. Mimara, bu noktada, bütün bu düşünceleri koordine etme işi düşmektedir. Sürecin merkezindeki kişi olarak mimarın yeteneği, eğitimi, koordinasyon gücü önemlidir. Mimari pratikte, tasarım tamamen katılımcıların talepleri doğrultusunda oluşmaz, ancak tasarım çözümlemeleri için bir çerçeve oluşturabilir*"(Turgay, 2006).

İyi bir mimarlık eserinin ortaya çıkabilmesinin bağlı olduğu etmenler; mimarın müşterisini iyi anlayabilmesi, iyi bir fikir alış verişi ve iyi bir iş birliğidir. Her müşteri kendine göre özeldir. Mimarlık ofisinin müşterileri; evli veya bekâr bir kişi, bir grup, ticari bir kuruluş ve/veya kamu sektöründen olabilir. Tüm bu müşteri tiplerinin ortak yanı; projelerinin tasarım sürecinde en iyi şekilde yönetilmesi, istek ve beklentilerinin dikkate alınması ve proje açısından var olabilecek herhangi bir kısıtlamanın düşünülmüş olmasıdır (Güzel Sen, 2006). Günümüzde mimar ve müşteri ilişkisi; müşterinin sorununu araştırmak, yatırımın gerekliliğini ve yere uygunluğunu araştırmak, yapının yapım koşullarını ortaya koymak, proje ve üretim organizasyonunu yapmaktır (Güzel Sen, 2006). Mimar ile müşteri arasındaki ilişki; müşterinin görerek ya da dokunarak satın almasıyla değil mimar-müşteri görüşmeleriyle ortaya çıkar. Sonuç ürün oluşuncaya kadar müşteri ne satın alacağını aynı şekilde mimar da ne satacağını bilemez. Mimarlık hizmetinde hem bir ürün oluşturulmakta hem de ürün meydana getirilirken hizmet sunulmaktadır (Pekdemir,2010).

Proje büyüklüğü, yapının yeri, yapım tekniği, tasarım özellikleri ve proje ekibinin niteliklerine göre her proje değişiklik göstermektedir. Projelerde değişen bu özelliklerden dolayı her proje farklıdır ve tektir. Kesin doğrusu olmayan, kendine özgü olan ve her projede yeni stratejiler geliştirilmesi gereken inşaat sektöründe müşteri ilişkilerindeki yönetimin uygulanması zorlaşmaktadır. İnşaat sektöründeki teknolojik değişimler, sosyal, ekonomik, politik, kültürel yönden değişen müşteri istekleri ve hızla büyüyen piyasa şartları müşteriyi bulma ve bulunan müşteride devamlılığı sağlama bakımından rekabete neden olmaktadır. Sürekliliğin sağlanabilmesi için her yeni proje ve müşteri için yeni yönetim modelleri geliştirilmesi önemlidir (Pekdemir,2010).

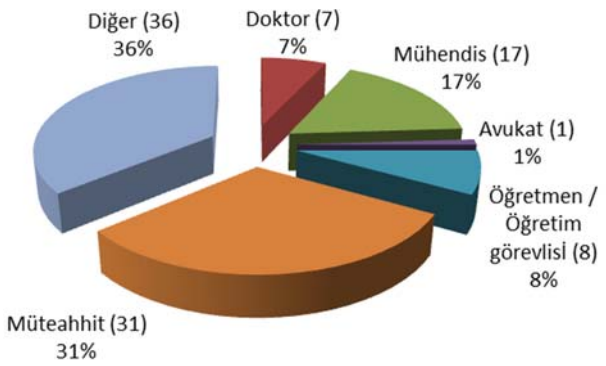
Bu çalışmada yukarıda bahsedilen gelişmeler ışığı altında müşteri ve mimari ofis arasındaki ilişki ele alınmıştır. Çalışmada; mimari hizmet veren bir ofisten müşterinin beklentisinin ne olduğu ve bu beklentilere cevap

 Copyright © International Science and Technology Conference (ISTEC)



verilirken karşılaşılan problemler ya da olumlu yönler ortaya koyulmuştur. Mimar ve/veya mimari bürodan hizmet alan müşterilerin karşılaştıkları sorunlar ortaya koyularak mimari büroların bu sorunları bilip müşteriye yaklaşımını belirlemesi önemli görülmüştür. Çalışma, Kayseri kentindeki mimari bürolardan hizmet alan müşterilere yapılmıştır. Kayseri kenti ölçeğinde yapılan bu çalışmanın ülkede yapılacak konu üzerindeki diğer çalışmalara katkı sağlaması ve yol göstermesi umulmaktadır.

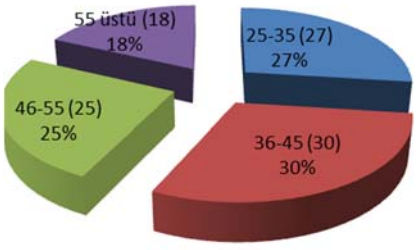
2. Materyal ve Metot



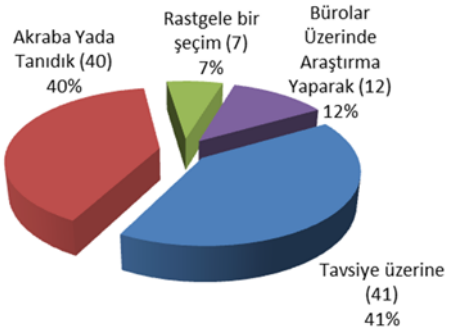
Bu çalışmada çoktan seçmeli anket uygulaması gerçekleştirilmiştir. Hazırlanan anketler, Kayseri'de mimari bürodan çeşitli konularda hizmet alan müşterilere yapılmıştır. Ankete farklı meslek gruplarından 100 kişi katılmıştır. Anket sonucu toplanan veriler, EXCEL programı yardımı ile istatiksel veri haline dönüştürülmüştür. Yapılan istatistikler ise anlaşılabilirliği ve okunabilirliği açısından grafiklerle ifade edilmiş ve sonuçlar yorumlanmıştır. Bu anket çalışmasıyla müşterilerin hangi aşamada mimari büroya ihtiyaç duydukları, mimari büroya, hangi yapı projesi için başvurdukları ve ne tür zorluklarla karşılaştıkları analiz edilmeye çalışılmıştır. Ayrıca müşteriye karşılaşabilecekleri sorunlar hakkında sorular sorulmuştur. Bu sorunların kendilerini nasıl etkilediğine dair cevaplarda ankette yer almıştır.

3. Bulgular

Yapılan anket sonucunda elde edilen bulgular, mimari büroya başvuran müşteri odaklı değerlendirilmiştir. Veriler, anket soruları bazında sıra ile incelenmiştir. Bu anket Kayseri'de 100 işverene yapılmıştır. Mimara ya da mimari bürolarla birlikte çalışan işverenler farklı eğitim seviyesine sahiptir. Yapılan anket çalışması ile işverenin %36'sının lisans, %21'inin lise, %18'inin yüksek lisans, %9'unun ortaokul, %8'inin ilkokul, kalan %8'inin yüksekokul düzeyinde olduğu belirlenmiştir (Grafik 1). Birçok farklı meslek gruplarından olan işverenlerin %31'inin müteahhit, %17'sinin mühendis, %8 inin öğretmen ve öğretim görevlisi, %7'sinin doktor, %1'inin avukat ve kalan %36'sının diğer meslek gruplarından olduğu söylenmektedir (Grafik 2).

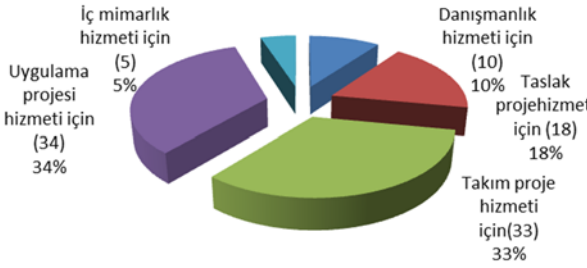


Grafik 1: Mimarlık bürosu müşterileri eğitim durumu

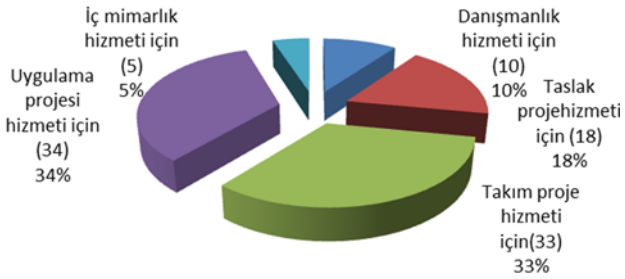


Grafik 2: Mimarlık bürosu müşterileri meslek grubu

Yapılan anketle işveren yaş grubunun %30'unun 36-45 yaş arası, %27'sinin 25-35 yaş arası, %25'inin 46-55 yaş arası, %18'inin de 55 yaş üstünde olduğu bulunmuştur (Grafik 3). İşveren mimari bürolar ile irtibata geçerken farklı yollar tercih etmektedir. İşverenin %41'i tavsiye üzerine, %40'ı akraba ya da tanıdık ilişkisi ile %12'si bürolar üzerinde araştırma yaparak tercihte bulunurken %7'si rastgele bir seçim yaparak mimari büro ile irtibata geçmektedir (Grafik 4).



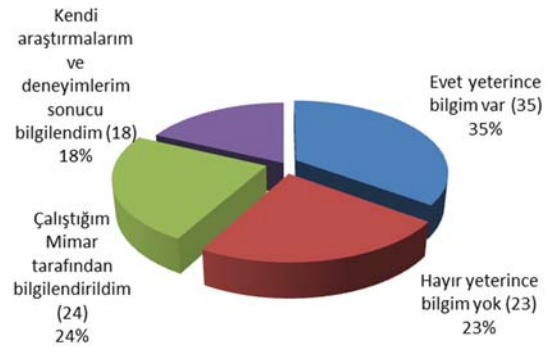
Grafik 3: Mimarlık bürosu müşterileri yaş grubu



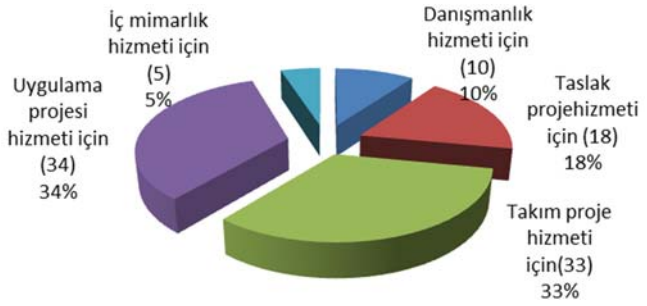
Grafik 4: Mimarlık bürosu müşterileri büro seçimi

 Copyright © International Science and Technology Conference (ISTEC)

Mimari işin farklı çeşitleri vardır ve işveren farklı taleplerde bulunur. İşverene mimari büro ile hangi aşamada iletişime geçtiği sorulduğunda %34'ünün uygulama projesi hizmeti için, %33'ünün takım proje hizmeti için, %18 inin taslak proje hizmeti için, %10 unun danışmanlık hizmeti için, %5'inin de iç mimarlık hizmeti için irtibatta olduğu görülmüştür (Grafik 5). Mimari büroya bazı çalışmalarından dolayı belirli ücretler ödenmektedir. Bu ücretlerin %10'ununun danışmanlık hizmeti için,%18'inin taslak proje hizmeti için,%33'ünün takım proje hizmeti için, %34'ünün ise uygulama projesi için ödendiği görülmektedir (Grafik 6).

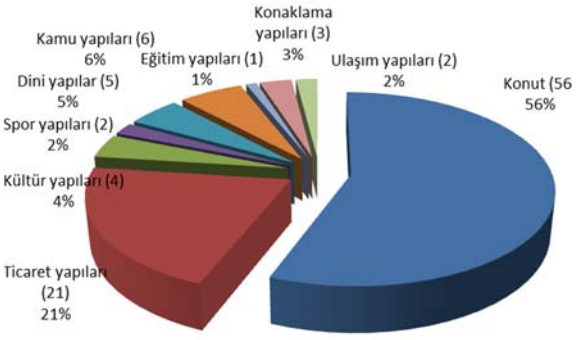


Grafik 5: Müşterilerin mimari bürodan talep edilen hizmetler dağılımı

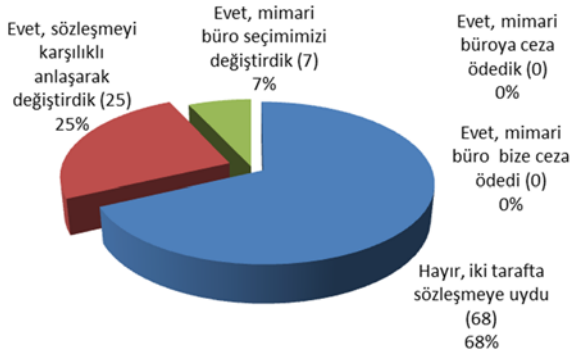


Grafik 6: Müşterilerin mimari büroya ücret ödenen hizmet türleri

Projenin taslak ve uygulama aşamasında mimarın görev ve sorumlulukları vardır. Proje sahiplerinin %35'lik kısmı bu görev ve sorumlulukları bilmekte,%23'lük kısmı yeterince bilgi sahibi olmamakta, %24'lük kısmı mimarlar tarafından bilgilendirilmekte olup %18'lik kısmı ise kendi araştırmaları ve deneyimleri sonucunda bilgi sahibi olduklarını belirtmektedir (Grafik 7). Projede bazı hizmet bedelleri alınmaktadır. Bu konuda proje sahiplerinin %22'lik kısmı danışmanlık ücreti ödememiş,%3'lük kısmı ücretin oldukça yüksek olduğunu, %23'lük kısmı yapılan iş için fazla olduğunu, %8'lik kısmı yapılan iş için az olduğunu, %44'lük kısmı ise ücretlerin normal düzeyde olduğunu belirtmiştir (Grafik 8).



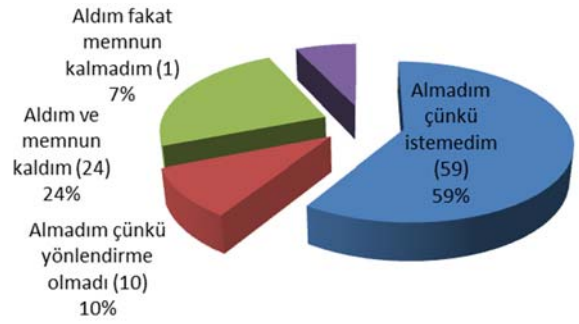
Grafik 7: Müşterilerin aşamasında mimarın görev ve sorumluluklarını bilme dağılımı



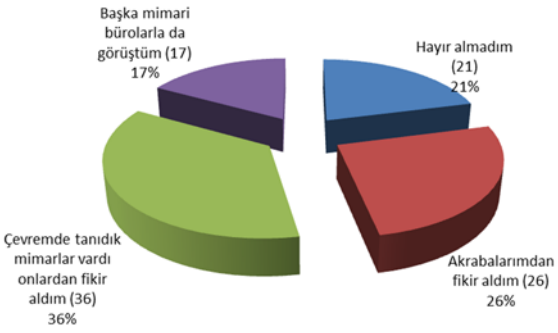
Grafik 8: Müşterilerin mimarlık bürosuna ücret ödediği hizmet türleri

Mimari bürolara farklı yapı projeleri için başvurulmaktadır. Bunlardan %56'sının konut yapıları, %21'inin ticaret yapıları, %4'ünün kültür yapıları, %2'sinin spor yapıları, %5'inin dini yapılar, %6'sının kamu yapıları, %1'inin eğitim yapıları, %3'ünün konaklama yapıları olup %2'sinin ulaşım yapıları olduğu belirtilmiştir (Grafik 9). Mimari bürolarla yapılan sözleşmelerde bazı sorunlar yaşanabilmektedir. Sorun yaşandıysa bu sorunlar; ceza ödenerek ve sözleşme değiştirilerek çözülmüştür. Proje sahiplerinin %68'i sorun olmadığını her iki tarafın da sözleşmeye uyduğunu, %25'i çözümün karşılıklı anlaşarak sözleşmenin değiştirildiğini, %7'si büro seçimini değiştirdiğini belirtmiştir (Grafik 10).

 Copyright © International Science and Technology Conference (ISTEC)

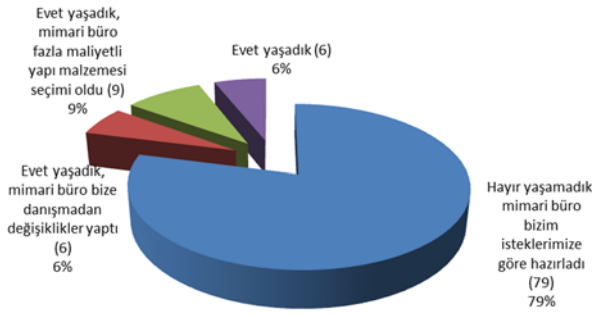


Grafik 9: Mimari büroya başvurulan proje tipleri dağılımı

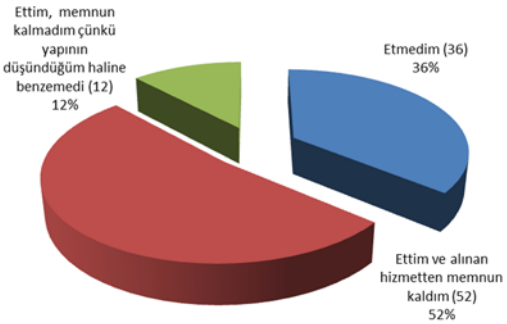


Grafik 10: Mimari büroyla yapılan sözleşmeye mimari büronun uyum durumu

Mimari bürolardan danışmanlık hizmeti; kişisel istekler veya yönlendirmeler doğrultusunda alınmaktadır. Buna göre mimari büro ile çalışan kişilerin %59'u danışmanlık hizmeti almak istemediklerini,%24'ü danışmanlık hizmeti alıp memnun kaldıklarını,%10'u yönlendirme olmadığından dolayı danışmanlık hizmeti almadıklarını %7'si ise alınan danışmanlık hizmetinden memnun kalmadıklarını belirtmişlerdir (Grafik 11). Projeye başlangıç aşamasında çalışılan mimari büro dışında birilerinden fikir alma durumu görülmektedir. Buna göre proje sahiplerinin %36'sı tanıdıkları mimarlardan, %26'sı akrabalarından, %17'si başka mimari bürolardan fikir aldıklarını belirtirken; %21'i ise fikir almadıklarını belirtmişlerdir (Grafik 12).

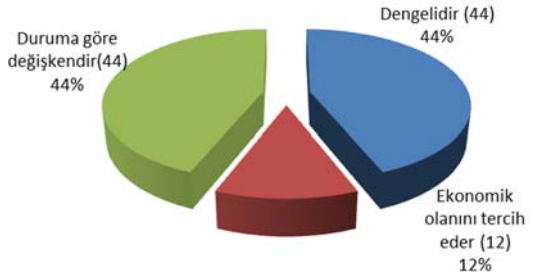


Grafik 11: Mimari bürodan danışmanlık hizmeti alıp almama durumu

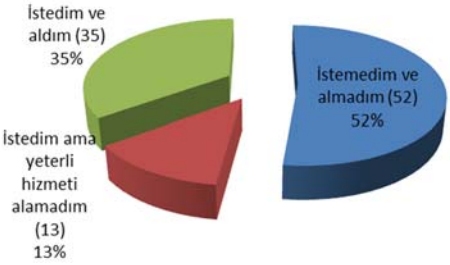


Grafik 12: Tasarım aşamasında mimari bürodan farklı bir kaynaktan fikir alma durumu

Mimari büro ile proje sahipleri arasında projenin çizimi aşamasında bazı anlaşmazlıklar yaşanabilmektedir. Buna göre proje sahiplerinin %79'u mimari büronun istekleri doğrultusunda çalıştığını ve sorun yaşamadıklarını belirtirken; %9'u fazla maliyetli malzeme seçiminden, %6'sı projede danışılmadan değişiklikler yapıldığından %6'sı ise çeşitli sebeplerden dolayı sorun yaşadıklarını belirtmişlerdir (Grafik 13). Mimari bürolarda projenin 3D (üç boyutlu) görselleri verilen hizmetler arasındadır. Buna göre proje sahiplerinin %52'si yapının 3D (üç boyutlu) görsellerini talep ettiklerini ve memnun kaldıklarını, %12'si talep ettiklerini fakat yapının düşünülen haline benzememesinden dolayı memnun kalmadıklarını, %36'sı ise bu yönde bir talepleri olmadıklarını belirtmişlerdir (Grafik 14).



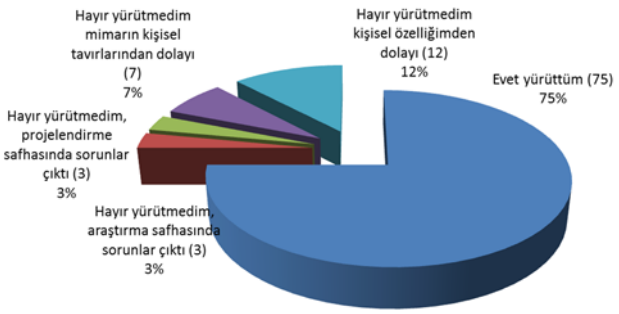
Grafik 13: Projenin çizim aşamasında mimari büroyla yaşanılan anlaşmazlık durumu

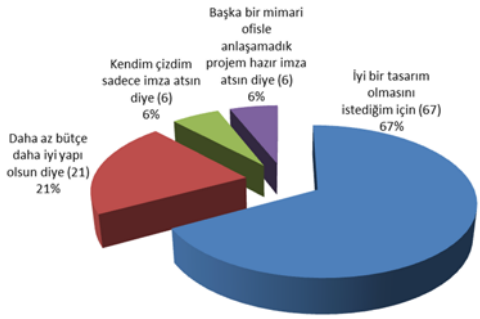


Grafik 14: Mimari bürodan 3 boyutlu hizmet talep durumu

 Copyright © International Science and Technology Conference (ISTEC)

Mimari bürolar proje sahiplerinin istekleri doğrultusunda malzemenin kalitesi ve fiyatı konusunda tercih yapabilmektedir. Buna göre proje sahipleri büroların verdiği tercihler hakkında; %44'ü tercihlerin dengeli olduğunu, %44'ü tercihlerin duruma göre değişken olduğunu, %12'si ise çalışılan mimarı büroların ekonomik olanı tercih ettiklerini belirtmişlerdir (Grafik 15). Müşteriler yapıyla ilgili malzeme seçimlerinde mimari bürolardan hizmet almaktadırlar. Buna göre malzeme seçimi hizmeti konusunda istemeyen ve almayanlar %52, isteyip alanlar %35, istemiş olup alamayanlar %13 oranında belirlenmiştir (Grafik 16).

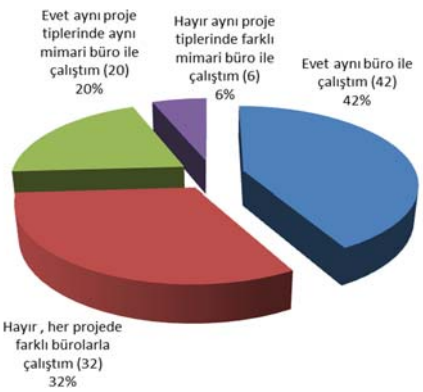




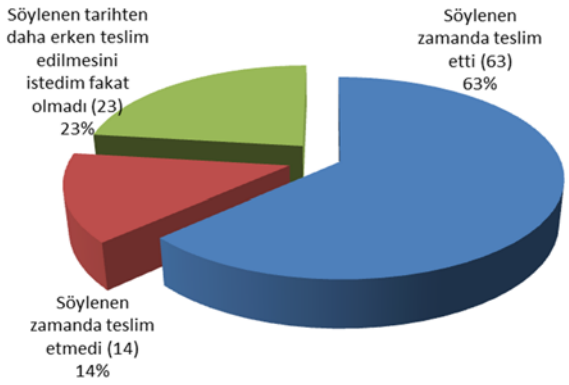
Grafik 15: Mimari büronun malzeme/fiyat tercihi

Grafik 16: Malzeme seçiminde mimari bürodan hizmet talep durumu

Projenin başlangıç aşamasından itibaren müşteriler; istekleri doğrultusunda mimari bürolar ile çalışmalar yürütür. Müşterilerin %75'i çalışma yürüttüklerini, %12'si kişisel özelliğinden dolayı çalışmayı yürütemediklerini, %7'si mimarın kişisel tavırlarından dolayı çalışma yürütmediklerini, %3'ü projelendirme safhasında sorunlar yaşadığını, %3'ü ise araştırma safhasında çıkan sorunlardan dolayı çalışma yürütmediklerini belirtmişlerdir (Grafik 17). Müşterilerin mimari bürolar ile çalışma sebepleri farklılık göstermektedir. Müşterilerin %67'si iyi bir tasarım olmasını istedikleri için, %21'i daha az bütçe ile daha iyi yapı yapılmasını istedikleri için, %6'sı kendi çizdiği mimari projeye sadece imza atılması için, %6'sı ise başka bir ofis ile anlaşamadıkları ve projenin hazır olup sadece imza atılması için mimari büro ile çalışmaktadırlar (Grafik 18).



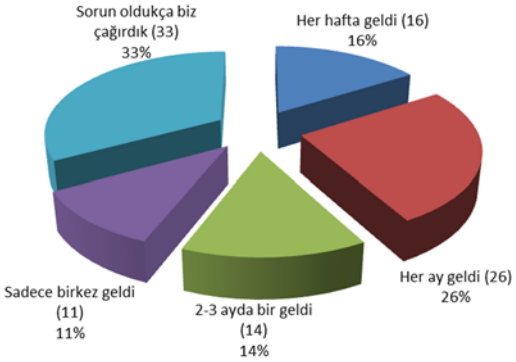
Grafik 17: Projenin tüm aşamalarında mimari büroyla çalışmalar yürütülme durumu



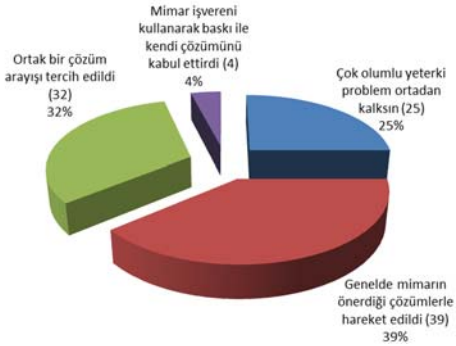
Grafik 18: Mimari büroyla çalışılma sebepleri

Müşterilerin farklı projelerde aynı mimari büro ile çalışma durumu farklılık göstermektedir. Müşterilerin %42'si aynı mimari büro ile çalıştıklarını, %32'si her projede farklı büro ile çalıştıklarını, %20'si aynı proje tiplerinde aynı mimari büro ile çalıştıklarını, %6'sı ise aynı proje tiplerinde farklı mimari büro ile çalıştıklarını belirtmişlerdir (Grafik 19). Müşterilerin mimari bürodan aldıkları hizmetin iş bitim süresine sadık kalmaları; projenin yapım sürecinde önemlidir. Müşterilerin %63'ü mimari büronun söylenen zamanda projeyi teslim ettiklerini, %23'ü mimari büronun söylenen tarihten daha erken teslim etmesini istediği halde projeyi teslim etmediklerini, %14'ü ise mimari büronun projeyi söylenen zamanda teslim etmediklerini belirtmiştir (Grafik 20).

 Copyright © International Science and Technology Conference (ISTEC)

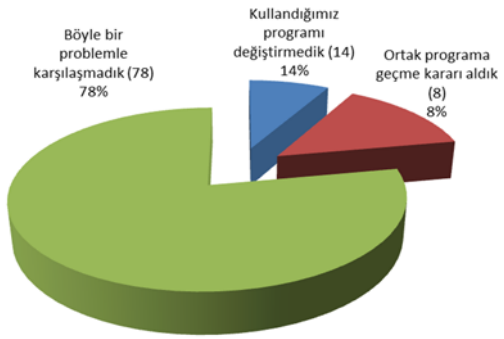


Grafik 19: Farklı projelerde aynı mimari büroyu seçme durumu

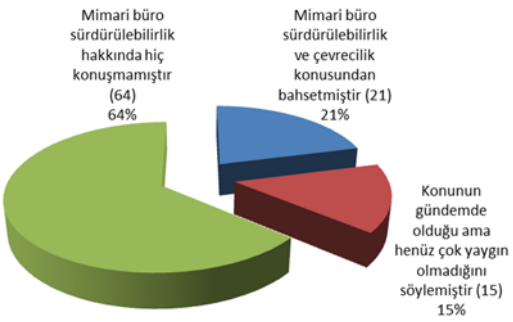


Grafik 20: Mimari büronun iş bitim süresine uyum durumu

Mimari ofislerin hizmetlerinden biri şantiye kontrolleridir. Buna göre mimari ofislerden hizmet alan kişilerin %16'sı her hafta geldiğini, %26'sı her ay geldiğini , %14'ü 2-3 ay da bir geldiğini , %11'i sadece bir kez geldiğini , %33'ü sorun oldukça çağırdıklarını belirtmektedir (Grafik 21). Mimari ofislerin hizmetlerinden biri sahada bir problem olduğunda, alternatif çözümleri değerlendirmektir. Buna göre mimari ofislerden hizmet alan kişilerin, %25'i mimarın problemin ortadan kalkması için olumlu davrandığını, %39'u genelde mimarın önerdiği çözümlerle hareket edildiğini, %32'si ortak bir çözüm arayışı tercih edildiğini, %4'ü mimar işvereni kullanarak baskı ile kendi çözümünü kabul ettirdiğini belirtmektedir (Grafik 22).

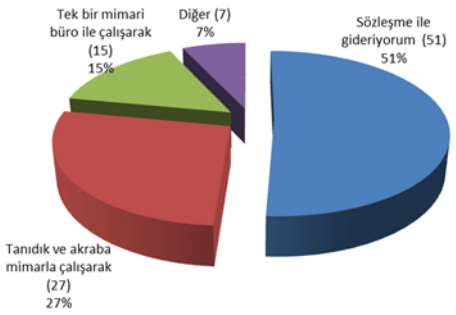


Grafik 21: Mimarın uygulama aşamasında şantiyeyi kontrol etme sıklığı



Grafik 22: Mimari büronun probleme karşı yaklaşım durumu

Kullanılan çizim programları mimari ofislerde farklılık göstermektedir ve kullanılan çizim programlarının uyuşmadığı durumlar ortaya çıkmaktadır. Böyle bir problemle karşılaşıldı mı sorusuna, %8'i ortak programa geçme kararı almadığını, %14'ü kullandığı programı değiştirdiğini, %78'i böyle bir problemle karşılaşmadıklarını belirtmektedir (Grafik 22). Sürdürülebilir tasarımlar çağımızın getirdiği, doğayı ve insan hayatını destekleyen çözümlerden biridir. Sürdürülebilir tasarıma mimari ofislerin yaklaşımı sorulduğunda, %21'i mimari büronun sürdürülebilirlik ve çevrecilik konusundan bahsettiğini , %15'i konunun gündemde olduğu ama henüz çok yaygın olmadığını, %64'ü mimari büronun sürdürülebilirlik hakkında hiç konuşmadıklarını belirtmektedir (Grafik 23).



Grafik 23: Kullanılan çizim programlarının mimari büroyla uyum durumu

Grafik 24: Mimari büronun sürdürülebilirlik kavramıyla ilgili olma durumu

 Copyright © International Science and Technology Conference (ISTEC)

Mimari bürolarla anlaşmazlıklar söz konusu olabilmektedir. Mimari bürolarla çalışanlara sorulduğunda, %51'i sözleşme ile giderdiğini, %27'si tanıdık ve akraba mimarlarla çalışarak giderdiğini, %15' i tek bir mimari büro ile çalışarak giderdiğini, %7'si farklı çözümler sunduklarını belirtmektedir (Grafik 25).

Grafik 25: Mimari büroyla anlaşmazlıkların çözümünde izlenen yollar

4. Tartışma

Mimarlık büroları hizmet veren bürolardır. Toplum içerisinde hizmete ücret ödeme fikri çok kabul gören bir durum değildir. Bu çalışmada, müşterilerin mimari büroda yapılan ve toplum tarafından ücret ödenmek istemeyen hizmet sektörü içerisinde olan hizmetleri kabul etme ve bürolarla yaşanan problemlerin kaynağı araştırılmıştır. Akıncıtürk'ün (2010) "Mimarlık Ofislerinin Yenilikçilik Sürecinde; Kullanıcı ve Müşterilerin Stratejik Rolü Üzerine Kalitatif Bir Araştırma Deneyimi", Ergöz'ün (2002) "Mimarlık Mesleği ve İstanbul Teknik Üniversitesi Mimarlık Fakültesi Mezunlarının Mesleki Kariyeri Üzerine Bir Alan Çalışması", Erdi'nin (2009) ise "Mimarlık Meslek Pratiğinde Etik Değer Ve Sorumlulukların Değerlendirilmesi İçin Bir Yöntem Önerisi" mimarlık meslek pratiğine yönelik yapılan çalışmalar olarak bulunmaktadır. Bu çalışmalar, mimari büro-müşteri ilişkisine yönelik değildir.

Yapılan çalışmada ise müşteri baz alınarak ve müşterinin mimari meslek pratiği içerisinde olan hizmetlerden memnuniyet durumu araştırılmıştır. Çalışmada yer alan anket, mimarlık bürosu müşterisi olan 100 kişiye hazırlanan soruların sorulmasıyla gerçekleştirilmiştir. Bu çalışma ile Kayseri'de bulunan mimarlık bürosu müşterilerinin demografik yapısının nasıl olduğu, hangi tür işler için mimarlık bürosuyla çalıştıkları, bu çalışmalar sırasında karşılaşılan sorunların ve bu sorunlara çözümlerin neler olabileceği ortaya koyulmaya çalışılmıştır. Müşteriler, mimarlık bürolarına çoğunlukla iyi bir tasarım olmasını istedikleri için başvurmakta ve alınan hizmetten genelde memnun kaldıkları için başka projelerde de aynı mimarlık bürolarıyla çalışmaktadır. Mimarlık bürosunun seçiminde çoğunluğun mevcut bürolar üzerinde araştırma yapılarak değil akraba, tanıdık ya da tavsiye üzerine mimarlık bürolarını tercih etmesi, projenin ilerleyen aşamalarında iletişim problemlerine neden olabilmektedir.

Müşteriler, mimarlık bürolarına çoğunlukla uygulama ve takım projesi hizmetleri için başvurmuşlardır. Bu hizmetleri almak için talep ettikleri proje türü genellikle konut olurken, ticaret ve kamu yapıları bunu izlemektedir. Mimarlık bürosuna başvuran müşterilerin yarısından fazlası bürodan projenin 3 boyutlu ifadelerini talep etmektedir. Bu kişilerin bir kısmı ön projenin düşündüğü gibi olmadığını fark ettiği için hizmetten memnun kalmamaktadır. Projelerde kullanılacak malzemenin tercihi yapılırken müşterilerin büyük bir kısmı alınan hizmetten memnun kalmıştır. Projelerin teslim aşamasında ise yine bir kısım müşteri zamanla ilgili problem yaşarken, büyük bir kısmı zamanla ilgili bir problem yaşamayıp, projelerini zamanında teslim almışlardır. Tasarımı yapan mimarlık bürosunun uygulama aşamasında şantiyeyi yeterli sıklıkla ziyaret etmediği, genellikle sorun oldukça çağrıldığı gözlemlenmiştir. Projenin uygulama aşamasında olan problemlere mimarlık bürosunun yaklaşımı çoğunlukla olumlu olmaktadır ve genellikle mimarın önerdiği çözümle hareket edilmektedir.

Proje aşamalarında mimari büroyla oluşabilecek problemlerde müşteriler farklı çözümler tercih etmektedir. Müşterilerin çoğunluğu problemlerini sözleşme ile giderirken, bir kısmı problemlerini tanıdık ve akraba mimarla çalışarak bir kısmı da tek bir mimari büroyla çalışarak çözmeye çalışmaktadır.

5. Sonuç

Tarihi gelişim süreci içerisinde mimari büro kavramında gelişmeler olmuştur. Özellikle teknoloji ve getirileri ile mimari bürolara algılar değişmiştir. Çizim programlarının gelişim göstermesi, uygulamaya geçilmeden projenin son halinin görülebilmesi, insanların mimari büro algısını değiştirmiştir. Bunun yanı sıra mimari büroda

 Copyright © International Science and Technology Conference (ISTEC)

kullanılan programların ve teknik personelin de gelişim göstermesi bu algının değişmesini desteklemiştir. Mimari büroların çağın gerektirdikleri forma ulaşması ve müşterilerin isteklerini karşılayabilmesi hedeflenmektedir. Mimari büro müşterilerinin eğitim seviyelerindeki artış büro algısını olumlu yönde etkilemiştir. Bu durum, mimari büro ile çalışanların müşteri ile arasındaki sorunların çözümünde olumlu etki göstermektedir.

Farklı yaş ve meslek gruplarına sahip müşterilerin genel olarak akraba ya da tanıdık vasıtası ile mimari büro seçtikleri anlaşılmaktadır. Farklı projeler için başvuran müşterilerin mimari bürolar, mimarların sorumlulukları ve ücretlendirmeler hakkında yeteri kadar bilgileri olduğu görülmektedir. Bunun sonucu olarak bürolarla müşteriler arasında yapılan sözleşmelerde genel olarak sorunlar yaşanmamakta, yaşanan sorunların çözümünde de karşılıklı anlaşmalar görülmektedir. Her ne kadar çözümler karşılıklı ise de üretim aşamasındaki denetimler gösteriyor ki mimarın hala müşteri tarafından "sorun oldukça şantiyeye çağırılma" fikrinde olması nedeniyle şantiye alanındaki sorumlulukların hem müşteri hem de mimar tarafından yeterince bilincinde olunmadığı görülmektedir. Şantiye alanındaki sorunların çözümünde genelde mimarın önerdiği çözümlerin tercih edilmesi denetim bilincinin önemini göstermektedir. Bunun yanı sıra mimari bürolardan talep edilen danışmanlık, avan proje, takım proje, resmi evrak, uygulama, iç mimari hizmetlerinin başka bir kuruluştan karşılanmasına gerek kalınmadan başta anlaşma yapılan bürolardan karşılandığı da görülmüştür.

Müşterilerin mimari ofislere başvurma sebepleri genel olarak iyi bir tasarım istemelerindendir. Bunun sonucunda; aldığı hizmetten memnun kalan müşterilerin, bir sonraki işlerde çalıştıkları mimari ofisleri değiştirmediği görülmektedir. Müşteriler, mimari bürolardan aldıkları danışmanlık, avan proje, takım proje, uygulama, iç mimari hizmetleri karşılığında ücret ödemeyi kabul etmektedirler. Bu ücretlerin, hizmetlere göre farklılık gösterdiği ve bu faklılıkların müşteriler tarafından normal düzeylerde olduğunun kabul edildiği görülmüştür.

Bu çalışma kapsamında; Kayseri özelinde mimarlık bürolarına başvuran müşterilerin, karşılaştığı projelendirme ve uygulama safhalarındaki sorunlar ele alınmıştır. Kayseri örnek alanında, yapılan bu çalışma ile büyük şehirlerin de dışında, Anadolu'da yer alan mimarlık büro müşterilerinin projelendirme ve uygulama safhalarındaki sorunlar ortaya koyulmaya çalışılmıştır. Yapılan çalışmanın bundan sonra yapılacak olan mimari bürolar ve müşterileri arasındaki sorunlar ile ilgili çalışmalara katkıda bulunması hedeflenmiştir.

Teşekkürler

Yapılan çalışma MİMS91 Büro Yönetimi Dersi kapsamında gerçekleştirilen ankete dayanmaktadır. Bu anketin hazırlanması ve düzenlenmesinde emeği geçen ve dersi alan öğrenciler; Ayşe Demirel, Burcu Ulutürk, Edem Murakhas, Hümeyra Dursun, Hürmet Çopuroğlu, Müzeyyen Merve Hancı, Rukiye Yavilioğlu, Tuba Özdemir'e teşekkürler sunulur.

MİMARİ PROJELERDE MALZEME SEÇİMİNİN MALİYETE ETKİSİNİN SEDAD HAKKI ELDEM YAPILARI ÜZERİNDEN İNCELENMESİ

Z. Özlem PARLAK BİÇER, Zehra AKSOY, Merve HANCI, Emine YILDIRIM, Ayşe GÜN, Gülsüm ÖZATA, Merve BAŞHOROZ,
Mimarlık Fakültesi Mimarlık Bölümü
Erciyes Üniversitesi,

Özet: Finansman bir yapının oluşabilmesi için gerekli olan girdilerin başında gelmektedir. Finansman yönetiminin doğru yapılması sonuç ürüne beklenen maliyet ile ulaşmakta önemli bir rol oynamaktadır. dolayısı ile kaynakların doğru yönlendirilmesi yapı maliyetini etkilemektedir. Maliyeti etkileyen en önemli kriter ise malzemedir. Bir mimarın malzeme seçiminde sorumsuz davranması, yapı toplam maliyetini direkt etkileyen olgudur. Mimarın yapmış olduğu projede malzeme seçim kararlarını iyi belirlemesi gereklidir. Yapı üretiminde ekonomiyi sağlayabilmek için mimarın malzemeyi iyi tanıması ve maliyetini bilmesi, mimarın malzeme kullanım kararlarını etkilemektedir. Tasarım evresi ve uygulama projesi evresi de dâhil olmak üzere mimarın malzeme kararlarını doğru vermesi önemlidir. Bu durum dünyada olduğu gibi Türkiye'de de geçerlidir. Tanınır mimar olmak demek hiçbir zaman malzeme seçiminde serbest olmayı dolayısı ile maliyette sorumsuzluğu getirmemektedir. Tanınır mimar ve/veya mimari eserlerin maliyet incelemelerinin yapılması ile bu durum genele daha iyi aktarılmış olacaktır. Bu çalışmada Türkiye'nin öncü mimarlarından olan Sedad Hakkı Eldem'in belirlenen yedi tasarımı ele alınmıştır. Sedad Hakkı Eldem, modern mimarinin ülkede önde gelen temsilcilerinden olduğu çin çalışmaya konu olmuştur. Mimarın tasarımlarında seçtiği bazı malzemelerin tespitleri yapılmış ve günümüz birim fiyatları ile maliyetleri bulunmuştur. Belirlenen yapılarda bu malzemeler değiştirilmiş ve yerine modern mimariyi zedelemeyecek malzemeler uygulanmış ve yeni seçimlerin maliyetleri hesaplanmıştır. Yeni seçilen malzeme ve yapının orijinal kullanılan malzemesi arasındaki fiyat farkları ortaya koyulmuştur. Bu çalışma ile bir mimarın malzeme seçimi ile bina maliyetini ciddi biçimde etkileyeceği vurgulanmıştır. Çalışmanın malzeme seçimi ve maliyet konusunda alana katkı sağlaması umulmaktadır.

Anahtar Kelimeler: Malzeme, maliyet, Sedad Hakkı Eldem

GİRİŞ

Ülkede inşaat sektörü Cumhuriyetin ilanı ile gelişmeye başlayan bir sektördür. Cumhuriyetin ilk yıllarında demiryolu hatları ve büyük su projeleri ile başlayan inşaat sektörü, İkinci Dünya Savaşı'ndan sonra tırmanışa geçmiştir. Hukuk sistemi içerisindeki çeşitli kanunlarda inşaat kavramına farklı şekilde değinilmiştir. Medeni Kanun'un 652/1 Maddesine göre inşaat: Arsa-arazi üzerinde malzeme ve emek kullanımıyla inşa edilmiş ve düzenlenmiş varlıklardır. Medeni kanunda genel bir tanımlama yapılmıştır. Bu tanıma göre köprüler, liman tesisleri, inşa edilmiş su kanalları, binalar ve bunların eklentileri, duvarlar, demiryolunun traversleri, raylar, çeşmeler, abideler, su bentleri, maden galerileri, kanalizasyonlar, meydanlar, tüneller, kuyular vb. inşaat imalat kavramına girmektedir (Resmi Gazete, 2001). 3194 sayılı İmar Kanunu'nda ise "yapı" kavramı tanımlanmıştır. Bu tanıma göre; karada ve suda, daimi ve muvakkat, resmi veya hususi yer altı ve yer üstü inşaatı ile bunların ilave, değişiklik ve tamirlerini içine alan sabit ve müteharrik tesislerdir. (Özlü, Y., 2012)

Türkiye'de yapı sektöründe inşaata başlanmadan önce yapının yaklaşık maliyeti, toplam inşaat alanı ile birim m² inşaat maliyetinin çarpılması sonucu bulunur. Birim m² inşaat maliyeti ise Çevre ve Şehircilik Bakanlığı'nın her yıl yayımladığı yapı yaklaşık birim maliyet listesinden elde edilmektedir (Polat, A., 2005). Binalarda kaba ve ince iş olmak üzere iki maliyet hesabı yapılmaktadır. Bu nedenle inşaatlarda maliyet hesabı yaparken iki durum söz konusudur. Mimarlık için maliyet, binanın ne kadarlık bir bütçe ile yapılacağının hesaplanması işlemi olarak belirlenebilmektedir. Diğer bir ifade ile mimari projeden bitmiş bir bina elde etmek için ortaya konulması gereken finansal kaynaktır. Bina üretiminde ilk amaç, minimum maliyet ile maksimum faydayı sağlamaktır. (emlakwebtv, 2014)

 Copyright © International Science and Technology Conference (ISTEC)

Bina maliyetinde, maliyet planlamasına mümkün olduğunca erken başlanması binanın sonuç kısmına gelindiğinde daha az maliyetle yapılmasını sağlamaktadır. Bina maliyetinin mümkün olduğunca ilk karar aşamasında verilmesi istenmektedir (Bostancıoğlu, E., 2006). Yapıma ayrılacak sermayenin yeterli olup olmadığı veya ayrılması gerekli kaynak miktarının bilinmesi ileri aşamalar için çıkacak sorunları ortadan kaldırmaktadır. İlk yatırım kararı, şematik tasarım, tasarımların geliştirilmesi ve uygulanması kararlarının doğru alınması, binanın maliyeti için olumlu sonuçlar çıkartmaktadır. Bina maliyetini düşürme şansının en yüksek olduğu evre ön tasarım evresi olarak görülmektedir (Bostancıoğlu, E., 1999). Tasarımın ilk evresinde maliyetin ne kadar olduğu bilinirse buna uygun seçimler ve tasarım çözümleri geliştirilebilmektedir. İlk yatırım kararı ve ön projeden çıkan sonuçların maliyet adına kesin olmadığı unutulmamalıdır. Binanın kesin maliyeti biten inşaat sürecinden sonra netleşmektedir. Bu bağlamda binanın tasarım kararının verilmesinden inşaat evresinin bitme sürecine kadar olan aşamada maliyet verileri toplanmalı, saklanmalı ve ileride kullanılmak üzere bilgiye dönüştürülmelidir.

Bina maliyetini etkileyen birçok etmen bulunmaktadır. Bunların başında binanın yapılacağı yer, binanın kat yüksekliği ve kat sayısı, bodrum katının olup olmaması, dış duvar tipi ve yapım teknolojileri gelmektedir (Bostancıoğlu, E., 2006). Aynı zamanda binada kullanılacak malzeme çeşitleri maliyeti önemli derecede etkileyen faktörlerin başında gelmektedir. Malzeme seçimi, binanın kat yüksekliği gibi etmenlere, binanın hangi işlevle kullanılacağı sonucu karar verilmektedir. Yani maliyeti etkileyen diğer bir faktör ise binanın işlevidir. Ayrıca binanın çevre uzunluğu, binanın yapım yılı, plan biçimi, iklimsel koşullar da maliyette etkili olmaktadır (Bostancıoğlu, E., 2006). Deprem kuşağında yer alması, taşıyıcı sistem çözümleri, zemin etütleri, projenin uygulanması ve denetimi de maliyeti arttıran etmenler olarak karşımıza çıkmaktadır (Özkan, Ö., Muratoğlu, Ö., 2005). Maliyet sadece binanın yapım sürecinde değil, yapım işlemi bittikten sonraki kullanım sürecinde de önemli olmaktadır. Seçilen malzemenin bakımı, onarımı, binanın işletme maliyeti de düşünülmelidir. Örneğin; ahşap, çelik ya da betonarme bir malzeme seçimi her bakımdan farklı sonuçlar ortaya çıkartmaktadır. Betonarme bir malzeme çoğunlukla sıva boya gerektirdiği gibi ahşap bir malzeme ise nemden koruma gerektirecektir (Bostancıoğlu, E., 2006).

Her dönem içerisinde inşaat projelerinin başarısı, işin zamanında ve planlanan maliyetle tamamlanmasına bağlıdır. Bina tipi, kat yüksekliği, kat sayısı, iklimsel koşullar, dış duvar tipi gibi etmenler önemli olsa da öncelikli olarak yapıda kullanılan tüm malzemelerin yapının maliyetini ne kadar etkilediği ve malzeme seçimine yapının ön tasarım evresinde karar verilmesinin önemi, bu çalışmada vurgulanmıştır. Maliyetin düşürülmesi bakımından, eldeki kaynaklara uygun tasarım yapılması ve alternatifler arasından en uygununun seçilmesinin önemi, bu çalışma ile ortaya koyulmaya çalışılmıştır. Maliyetin bina yapımındaki önemi çalışma içerisinde araştırılmış, özellikle malzeme seçimi açısından maliyeti etkileyen faktörler üzerinde durulmuştur. Çalışmanın bundan sonraki çalışmalara katkı sağlayacağı umulmaktadır.

MATERYAL VE METOD

Cumhuriyet dönemi mimarlığımızı etkileyen mimarların arasında olan Sedad Hakkı Eldem'in seçilen kendine has özellikleri olan 6 yapısı belirlenmiştir. Genel olarak seçilen mimari projelerin Eldem'in İstanbul'daki yapıları olmasına özen gösterilmiştir. Çalışmaya konu olan yapılarda farklı malzemelerin kullanılması, Sedad Hakkı Eldem'in öncü yapıları olması seçim alanının sınırlarını çizmekte etkili olmuştur.

Yaklaşık maliyet hesaplamasında, değiştirilmesi düşünülen malzemelerin birimi ile Çevre ve Şehircilik Bakanlığı ve Bayındırlık Bakanlığı'nın yayınladığı 2015 birim fiyat listesinden yararlanarak malzeme poz numaralarına göre birim maliyetlerin çarpılması sonucu, toplam seçilen malzemenin maliyeti bulunmuştur. Malzeme değişikliğine karar verilen yüzeylerin alan metrajı, elde edilen dwg formatlı dosyalar üzerinden hesaplanmıştır. Bu yapılırken belirlenen mimari projelerin çizimleri dwg ortamına aktarılmış ve sayısal ortamda ölçekli mimari projeler haline getirilmiştir.

Çalışmada, seçilen yapılarda kullanılan mevcut malzemelerin 2015 birim maliyet fiyatları ile maliyetinin ne olacağı hesaplanmıştır. Yapılarda kullanılması önerilen yeni malzemelerin birim m² inşaat maliyeti Çevre ve Şehircilik Bakanlığı'nın 2015 birim fiyat listesinden elde edilmiştir. 2015 birim fiyat listesinden bulunamayan malzemelerin birim maliyetlerinde ise piyasa araştırması sonucu ortak bir değer alınmıştır. Daha sonra elde edilen iki sayısal değer karşılaştırılmıştır.

SEÇİLEN MİMARİ PROJELERİN ÖZELLİKLERİ

Sedat Hakkı ELDEM'in seçilen "Rıza Derviş Köşkü" 1956-57 yılları arasında tasarlanmıştır. Yapı Büyükada/İSTANBUL'da bulunmaktadır. Betonarme strüktüre sahip yapı, 533,32 m² kapalı alan 110 m² açık çıkma olmak üzere toplam 643,32 m² alandan oluşmaktadır (Fotoğraf 1-2). Yapı manzara yöne denize göre konumlandırılmıştır. Ön bahçesinde kendine ait büyük bir havuzu vardır.

Fotoğraf 1: Rıza Derviş Köşkü (flickr.com salt online, 2010)

Fotoğraf 2: Rıza Derviş Köşkü (flickr.com salt online, 2010)

Seçilen yapılardan "Suna Kıraç Yalısı", Sedat Hakkı Eldem tarafından 1965-1966 yılları arasında yapılmıştır. Boğaz'da, var olan bir yapının temelleri üzerine inşa edilen konut, iki kanadında yaşama ve yemek mekânlarının bulunduğu, merkezi sofalı geleneksel Türk Evi'nin bir yorumudur.

Vaniköy İskelesi'nde, mevcut bir binanın duvarlarından yararlanılarak inşa edilen yalının Vaniköy Camisi'nin yanında olması nedeniyle genel görünüşü ve kütlesi bakımından özel bir durumu olduğu söylenmektedir. Bahçesine bir yüzme havuzu, havuz pavyonu ve büyük bir limonluk inşa edilmiş, bahçe yolları mermer şeritler arasında tuğla kaplanmıştır(Fotoğraf 3). Mutfak ve şömine bacaları bahçe tarafında iki kuvvetli çıkıntı oluşturur. Duvarlarda eski taşıyıcılar kullanılmış bu da geçilen açıklıkları sınırlandırmıştır (arkiv.com, 2008). Betonarme strüktüre sahip olan yapı 763.2 m²'dir. Salonlar grubunun solunda iki kademe yüksekliğinde bir oturma köşesi vardır. Cephelerde renk ve malzeme açısından fazla çeşitlilik görülmemektedir. Malzeme olarak ahşap ve sıva cephe kullanılmıştır(Fotoğraf 4). Cephelerde bezeme yoktur. Yapıda değiştirilmek üzere incelenen malzemeler; bütün pencerelerde kullanılan ahşap panjurlar ve sıvalı yapı cephesidir. Var olan ahşap panjurlar yerine ahşap modern güneş kırıcılar; cephelerde sıvalı boya yerine de ahşap kaplama malzemesi kullanılmıştır. Günümüzde yaygın olarak kullanılan bu son yıllarda üretilen yeni malzemeleri yapıda kullanarak yalının çağdaş malzemelerle modern hale getirilmesini sağlamaktır.

Seçilen "Fethi Okyar Köşkü", Büyükada Eski Viranbağ'da mevcut bir kır evinin büyütülmesiyle oluşmuştur. Bu bina, mevcut eski bağ evine yapılan ilâveler ve tadilatla meydana gelmiştir. Büyükada'da çamlıklar arasında bulunan ev, her taraftan geniş bir manzaraya hâkimdir. İnşaatın önemli bir kısmı ahşap olan binaya geniş bir oturma salonu eklenmiştir. Ayrıca yapının önüne ve üç cephesine burayı çerçeveleyen balkon ilâve edilmiştir. Tüm evi çevreleyen ahşap veranda ve bir köşesi yuvarlatılmış geniş salon kütlesiyle yapıya yeni bir görünüm kazandırılmıştır (Fotoğraf 5). Verandanın zemini ahşap ızgara biçimindedir ve yağmur suyunu aşağıya geçirir. Evin önündeki setler, denize doğru birkaç kat ile bahçeye geçişi sağlar. Yapı yüzeyinde sıva ve dış cephe boyası bulunmaktadır. Dış cephe kaplaması uygulamada klinker tuğla kaplama ile değiştirilecektir.

Fotoğraf 3: Suna Kıraç Yalısı (arkiv.com, 2008)

Fotoğraf 4: Suna Kıraç Yalısı (arkiv.com, 2008)

Fotoğraf 5: Fethi Okyar Köşkü (arkiv.com, 2008)

Seçilen yapılardan "Şemsettin Sirer Yalısı" Yeniköy'de 1966-67 yılları arasında inşa edilmiştir. Üzerine oturduğu arsanın bitişik nizam olması sebebiyle dar bir cepheye sahiptir (Fotoğraf 6). Bu darlığa karşın yapının derinliği fazladır. Bu durum aynı zamanda 4 kot ile evin planının çözümünü getirmiştir. Ayrıca Şemsettin Sirer Yalısı'nın planı, tipik yalı veya konak özellikleri ile ilişkilendirilememektedir. Bitişik nizam içerisinde olması sebebiyle iki ana cepheye sahip olan yalının ön cephesi boğaza bakmaktadır (Fotoğraf 7). Ön cephenin ele alınışı geleneksel boğaz yalılarının özelliklerine ve ölçeğine uygundur. Yapı; klasik Eldem uygulamalarına sahiptir. Ön cephedeki geniş saçaklı çatı, çifte balkon ve saçak altına uzanan modüler bölümlenme buna örnektir doğramanın

 Copyright © International Science and Technology Conference (ISTEC)

alüminyum olması yanı sıra büyük ölçüde meşe kaplama ve kafesler cephedeki ince çubuklar dekoratif amaçlıdır. Şemsettin Sirer Yalısı'nda cephenin baskın öğesi cam yüzeyler ve alüminyum doğramalardır. Bu sebeple bu malzemelerin değiştirilmesi uygun görülmüştür.

Seçilen yapılardan "Uşaklıgil Köşkü", Sedad Hakkı Eldem tarafından 1956-1957 yılları arasında tasarlanan yapı 409.3 m² dir. Yapı Emirgan/İstanbul'da bulunmaktadır. Betonarme karkas yapının plan, görünüş ve kaplama motiflerinde gridal düzen hâkimdir. Cephe ve pencerelerde prefabrike beyaz beton elemanlar kullanılmıştır (Fotoğraf 8). Giriş cephesinde malzeme olarak Marmara Mermeri, Rodos Çakılı ve Boğaz Taşı kullanılmıştır. Pencereler farklı boylarıyla ahşap ve beton ayaklı olarak projelendirilip yerinde modeller yapılmış, sonuçta ahşap çerçeveler tercih edilmiştir.

Fotoğraf 6: Şemsettin Sirer Yalısı (arkiv.com, 2008)

Fotoğraf 7: Şemsettin Sirer Yalısı (mimarlikmuzesi.org, 2005)

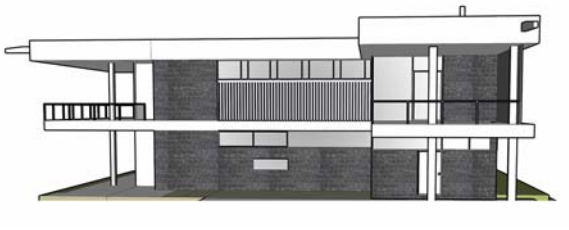
Fotoğraf 8: Uşaklıgil Köşkü (arkiv.com, 2008)

Seçilen yapılardan "Rahmi Koç Evi", Sedat Hakkı Eldem tarafından 1975-1980 yılları arasında yapılmıştır. Yüksek, eğimli bir arazi üzerinde on altı konutluk genel bir plan içerisinde bulunan yapıya yarım kat yüksekliğinden girilmektedir. Bahçe katındaki orta sofa karnıyarık şeklindedir, üst katla merdiven bağlantısı merkezindedir. Sofa, tüm tasarımın baskın karakteri olarak öne çıkar ve çatıdaki ışıklığıyla daha da vurgulanmıştır. Üst kat ana oturma mekânı olarak düşünülmüş, esas giriş ile havuz mekânı buraya bağlanmıştır (Fotoğraf 9). Orta sofası ve köşk oda gibi tanımlanmış kitaplığı ile plan geleneksel Osmanlı evi tipolojisinin özelliklerini taşır. Şömine ve mutfak bacaları Sedad Hakkı Eldem'in tasarladığı yalılarda sıkça kullandığı kuvvetli çıkıntılar şeklinde yapılmıştır. Strüktür sistemi betonarme olan evin iç ve dış mekân kaplaması ağırlıklı olarak ahşap ve betonarme olarak tercih edilmiştir (Fotoğraf 10). Ahşap malzeme, cephede çatı çıkmaları, kat çıkmaları ve pencere panjurları; iç mekânlarda tavan ve zemin kaplamasında kullanılmıştır. Orta sofaya açılan tavan ışıklığı, ahşap kaplama yapılarak orta sofa vurgulanmıştır. Aynı zamanda orta sofada bulunan oturma bölümü de ahşapla kaplanmış, zemin ve ışıklık ile bir bütünlük sağlanmıştır. Cephelerde, yapının içinde olduğu gibi sıva ve ahşap malzeme tercih edilen yapıda değiştirilmek üzere incelenen malzemeler; bütün pencerelerde kullanılan ahşap çatı çıkmaları ve parke kaplamalı sofa olarak seçilmiştir. Var olan ahşap çatı çıkmaları yerine sıva kaplama; sofada parke zemin kaplaması yerine mermer zemin kaplaması kullanılmıştır. Değiştirilen malzemelerle yapının daha sade bir görünüm kazanması amaçlanmıştır.

Fotoğraf 9: Rahmi Koç Evi (arkiv.com, 2008)

Fotoğraf 10: Rahmi Koç Evi (arkiv.com, 2008)

MİMARİ PROJELERİN GÜNÜMÜZ BİRİM FİYATLARI İLE MALİYETİ



ıvalı yüzeylerin günümüz birim fiyatı piyasa araştırması sonucu maliyeti, 21 TL olarak tespit edilmiştir. Yapıda kullanılan malzemenin günümüz birim maliyeti temel alındığında cephelerin toplam maliyeti 3.546 TL olarak hesaplanmıştır (Çizim 1). Rıza Derviş Köşkü'nün cephesinde kullanılan özgün malzemenin yerine günümüz çağdaş malzemelerinden Bazalt taşı kullanıldığında ortaya çıkan maliyet değişimi hesaplanmıştır. Bunun için yapının cephesinin metrajı çıkartılmış ve toplam yüzey alanının 168.9 m² olduğu belirlenmiştir. Bazalt taşının

 Copyright © International Science and Technology Conference (ISTEC)

günümüz birim fiyatı piyasa araştırması sonucu 40,50 tl olarak tespit edilmiştir. Yapılan çalışmada 168.9 m² bazalt taşı metrajı birim maliyetler ile çarpılarak yapının cephesinin günümüz malzemeleri ile değiştirilmesinin toplam maliyeti 6,840 tl olarak hesaplanmıştır (Çizim 2).

Çizim 1: Rıza Derviş Köşkü sıvalı cephe görüntüsü

Çizim 2: Rıza Derviş Köşkü bazalt taşı ile değiştirilmiş cephe görüntüsü

"Suna Kıraç Yalısı" o zamanlarda yaygın olan sıvalı yüzey ve ahşap panjurların kullanılmasından dolayı günümüz yaygın malzemelerle değiştirilmesine karar verilmiştir. Ahşap panjur için cephe metrajı çıkartıldığında toplamda 196.2 m² kullanıldığı tespit edilmiştir (Fotoğraf 11). Yapılan piyasa araştırması sonucu, ahşap panjurun günümüz birim m² fiyatı 120 TL olarak belirlenmiştir. Yapının cephesinde kullanılan malzemenin günümüz birim fiyatı temel alındığında toplam maliyet 24.000 TL olarak hesaplanmıştır. Sıvalı boya için metraj hesabı çıkartıldığında toplamda 365.66 m² kullanıldığı tespit edilmiştir. Sıvalı yüzeylere ısı yansıtma özellikli boya yapılması günümüz birim m² fiyatı 17.04 TL olarak belirlenmiştir. Yapının cephesinde kullanılan malzemenin günümüz birim fiyatı temel alındığında toplam maliyet 6.229 TL olarak hesaplanmıştır. Suna Kıraç Yalısı cephesinde kullanılan özgün malzemenin yerine günümüz çağdaş malzemelerden olan ahşap cephe kaplama ve ahşap güneş kırıcı kullanıldığında ortaya çıkan maliyet değişimi hesaplanmıştır (Fotoğraf 12). Ahşap güneş kırıcı için yapının cephesinin metrajı çıkarılarak toplam yüzey alanının 196.2 m² olduğu belirlenmiştir. Ahşap güneş kırıcı malzemenin günümüz birim fiyatı piyasa araştırması sonucu kg fiyatının 15.45 TL olduğu tespit edilmiştir. 1 m²'nin de yaklaşık 1 kg olduğu hesaplanmıştır. Yapılan çalışmada 196.2 m² ahşap güneş kırıcı metrajı birim maliyetler ile çarpılarak yapının cephesinin günümüz malzemeleri ile değiştirilmesinin toplam maliyeti 9.267 TL olarak hesaplanmıştır. Ahşap cephe kaplama için yapının cephesinin metrajı çıkartıldığında ise toplam yüzey alanının 365.66 m² olduğu belirlenmiştir. Ahşap cephe kaplamanın günümüz birim fiyatı piyasa araştırması sonucu m² birim fiyatının 79 TL olduğu tespit edilmiştir. Çalışmada 365.66 m² ahşap cephe kaplaması metrajı birim maliyetler ile çarpılarak yapının cephesinin günümüz çağdaş malzemeleri ile değiştirilmesinin toplam maliyetinin 28.886 TL olduğu saptanmıştır.

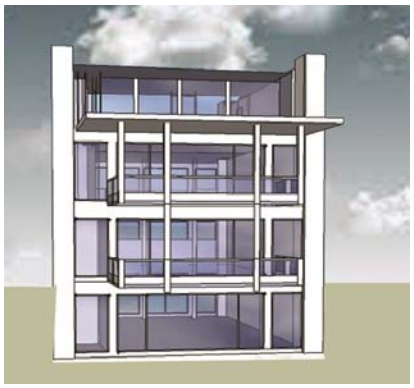
Fotoğraf 11: Suna Kıraç Yalısı sıvalı yüzey ve ahşap panjur cephe görüntüsü

Fotoğraf 12: Suna Kıraç Yalısı ahşap cephe kaplaması ve ahşap güneş kırıcı cephe görüntüsü

"Fethi Okyar Köşkü" dış duvarlarının metrajı çıkarılmış yaklaşık değer 133,00 m² olarak bulunmuştur (Çizim 3). Yapı yüzeyinde sıva ve dış cephe boyası bulunmaktadır. Yapılan piyasa araştırmalarına göre günümüz dış cephe boyası birim fiyatı 17,04 TL olarak tespit edilmiştir. Yapının dış cephe boyası maliyeti günümüz birim fiyatı temel alındığında 2.266 TL olarak bulunmuştur. Fethi Okyar Köşkü'nün cephesinde kullanılan dış cephe boyası yerine, ahşap kolonatlı yapısına uyum sağlayacağı düşünülerek klinker tuğla uygulaması yapılmıştır (Çizim 4). Klinker tuğlanın günümüz birim fiyatı 28.00TL olarak tespit edilmiştir. Daha önce yapılan metraj hesabı ile

 Copyright © International Science and Technology Conference (ISTEC)

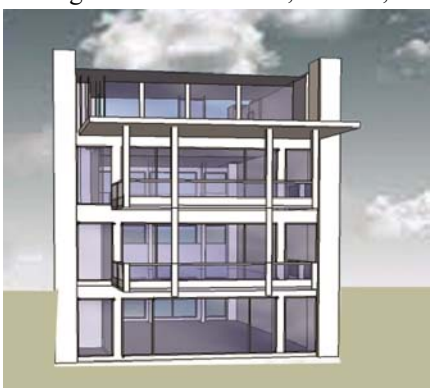
klinker tuğlanın günümüz birim fiyatı çarpılarak yapının cephesinde uygulanacak değişimin toplam maliyeti 3.724 TL olarak hesaplanmıştır.



Çizim 3: Fethi Okyar Köşkü sıvalı yüzey cephe görüntüsü

Çizim 4: Fethi Okyar Köşkü klinker tuğla kaplamalı cephe görüntüsü

"Şemsettin Sirer Yalısı"nın cephelerinde kullanılan doğramaların alüminyum doğramadan pvc doğramaya çevrilmesine karar verilmiştir (Çizim 5-6). Bunun için cephe metrajı çıkarıldığında ön cephe için toplam pencere açıklığının 45 m² arka cephede ise 30 m² olduğu görülmüştür. Yapılan piyasa araştırmalarına göre pvc doğramanın birim fiyatının kg cinsinden 8.64 TL alüminyum doğramanın ise kg cinsinden 14.47 lira olduğu görülmüştür. Ön cephede alüminyum doğrama için 20-24kg/m² alınarak hesaplamalar yapılmış ve maliyeti 13.023 bulunmuştur. Arka cephede ise 8.682 TL bulunmuştur. Böylece toplam maliyet 21.705 bulunmuştur Ön cephede pvc doğrama için;16-18kg/m2 alınarak hesaplamalar yapılmış ve maliyeti 6.220,80 TL bulunmuştur. Arka cephede ise 4.147,2 TL bulunmuştur. Böylece toplam maliyet 10.368 TL olarak hesaplanmıştır.



Çizim 5:Şemsettin Sirer Yalısı alüminyum doğrama pencere görüntüsü

Çizim 6:Şemsettin Sirer Yalısı pvc doğrama pencere görüntüsü

Şemsettin Sirer Yalısı'nın cephesindeki bir diğer değişiklikte ön cephede var olan cam yüzeylerin(Çizim 7) yerine yarısı tuğla kaplama(Çizim 8) yarısı cam yüzeyler oluşturulmak istenmiştir. Bunun için cephe metrajı çıkarıldığında ön cephede toplam pencere açıklığının 45 m², arka cephe toplam pencere açıklığının ise 30 m² olduğu görülmüştür. Yapılan piyasa araştırmalarına göre klasik ısıcam birim fiyatının m² cinsinden 45 TL, klinker tuğlanın ise birim fiyatının m² cinsinden 28 TL olduğu görülmüştür. Hesaplamalar yapıldığında tüm pencere yüzeylerinde klasik ısıcam uygulandığında 2.025 TL bulunmuştur. Yarısı tuğla uygulanıp diğer yarısı cam kullanıldığında ise 630+1.012,5=1.642,5 TL bulunmuştur.

Çizim 7: Şemsettin Sirer Yalısı cam korkuluk görüntüsü

Çizim 8:Şemsettin Sire Yalısı klinker tuğla korkuluk görüntüsü

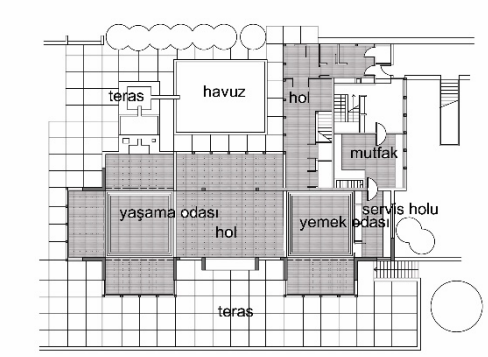
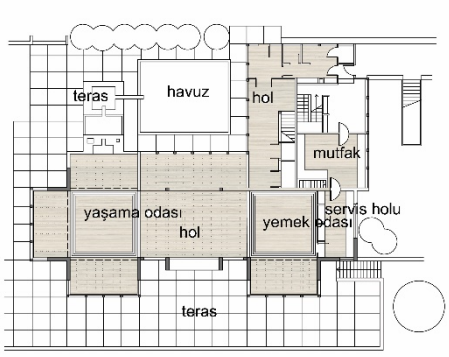
"Uşaklıgil Köşkü"nün cephe ve pencerelerinde prefabrike beyaz beton elemanlar kullanılmıştır. Giriş cephesindeki sebil çalışmaları. Malzeme olarak Marmara Mermeri, Rodos Çakılı ve Boğaz Taşı kullanılmıştır(Fotoğraf 13). Pencereler farklı boylarıyla ahşap ve beton ayaklı olarak projelendirilip yerinde modeller yapılmış, sonuçta ahşap çerçeveler tercih edilmiştir. 409.3 m² olan yapıda değiştirilmek üzere incelenen malzemeler; bütün pencere altlarında kullanılan ahşap kaplamalar ve Marmara mermeriyle kaplanmış zemin döşemesidir(Çizim 9). Ahşap kaplama yerine pencere altlarında kompozit kaplama uygulandığındaki değişimin toplam maliyeti ile zeminde Marmara mermeri yerine de ahşap parke kullanıldığındaki değişimin toplam maliyeti hesaplanmıştır. Yapılan piyasa araştırmalarına göre günümüz dış cephe ahşap kaplama birim fiyatı 57,55 TL olarak tespit edilmiştir. Yapının dış cephe boyası maliyeti günümüz birim fiyatı temel alındığında 5.266 TL olarak bulunmuştur. Uşaklıgil Köşkü'nün cephesinde kullanılan ahşap kaplama yerine, kompozit kaplama uygulaması yapılmıştır. Kompozit kaplamanın günümüz birim fiyatı 178,15 TL olarak tespit edilmiştir. Daha önce yapılan metraj hesabı ile kompozit kaplamanın günümüz birim fiyatı çarpılarak yapının cephesinde uygulanacak değişimin toplam maliyeti 16.307 TL olarak hesaplanmıştır.

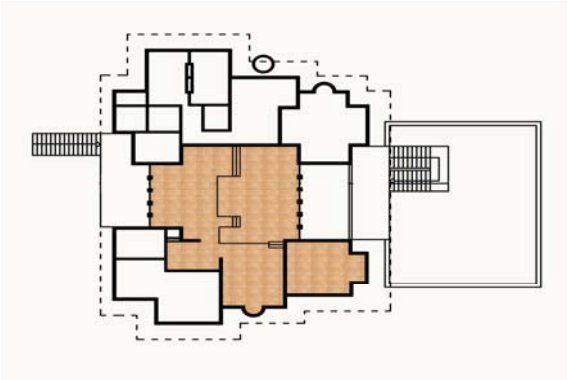


Fotoğraf 13:Uşaklıgil Köşkü orijinal cephesi

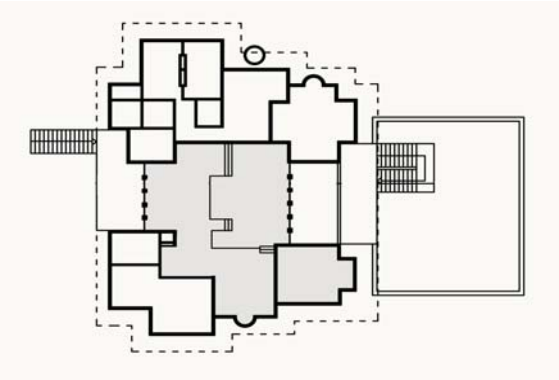


Çizim 9:Uşaklıgil Köşkü değiştirilen mazlemeler ile çizimi

İkinci olarak da değiştirilen malzeme zeminde kullanılan Marmara mermeridir (Çizim 10). Yapının Marmara mermeri maliyeti günümüz birim fiyatı 22 TL'dir. Toplam maliyet 19.119 TL'dir. Marmara mermerinin yerine ahşap parke uygulaması yapılmıştır (Çizim 11). Ahşap parkenin günümüz birim fiyatı 27,15 TL'dir. Toplam maliyet ise 23.620 TL'dir.



Çizim 10: Uşaklıgil Köşkü Marmara mermeri zemin döşeme çizimi



Çizim 11: Uşaklıgil Köşkü ahşap parke zemin döşeme çizimi

"Rahmi Koç Evi" orta sofa ve oturma mekânı zemin kaplamasında kullanılan ahşap zemin kaplama (Çizim 12) değiştirilmiş ve bunun yerine günümüzde yaygın olan mermer zemin kaplama malzemesi (Çizim 13) kullanılmıştır. Sofa ve oturma mekânları zemini toplam 323,25 m²'dir. Piyasa araştırması sonucu ahşap zemin kaplama (parke) m² fiyatı 24 TL olarak saptanmıştır. Sofa zemininde kullanılan parke kaplamanın toplam maliyeti 7.758 TL olarak hesaplanmıştır. Mermer yer döşemesi m² fiyatı 53 TL olarak saptanmıştır. Bu fiyata göre sofa zemin kaplaması için harcanacak mermer döşeme toplam maliyeti 17.172,25 TL olarak belirlenmiştir.

Çizim 13: Rahmi Koç Evi mermer zemin kaplama çizimi

İkinci olarak yapının ahşap çatı çıkmalarının (Çizim 14, Fotoğraf 14) yüzey alanı 117,75 m²'dir. Yapılan piyasa araştırması sonucu, ahşap cephe kaplamasının birim fiyatı 79 TL olarak belirlenmiştir. Çatı çıkmalarında kullanılan ahşap kaplamanın bu birim fiyat hesaplamasına göre toplam maliyeti 9.302,25 TL olarak hesaplanmıştır. Brüt beton, sıvalı veya eski boyalı yüzeylere, astar uygulanarak ısı yansıtma özellikli boya (Çizim 15, Fotoğraf 15) yapılması m² fiyatı 17 TL olarak saptanmıştır. Bu fiyata göre çatı çıkmaları için harcanacak sıva maliyeti 2.006,46 TL olarak belirlenmiştir.

SONUÇ

Yapı malzemesinin teknik imkânları ile mimari biçimlenme dolayısı ile mimari düşüncenin aktarımı gerçekleşmektedir. Soyut düşüncenin mimari bir yapıda somutlaşması malzeme ile olmaktadır. Malzeme her zaman belirleyici olarak formda ilk sıradadır (Mozaikçi, B., 2010).

Yapı malzemesi, bir yapıyı biçimlendiren, yapının bütününü oluşturan, tasarımın hayata geçirilmesini mümkün kılan eleman olarak tanımlanmaktadır. Yapıyı saran malzeme, yapının ekonomik durumunu doğrudan etkilemektedir. Yapının minimum maliyetle maksimum performansı gösterebilmesi için kullanılacak malzemede doğru seçimi yapmak önemlidir (Parlak Biçer, Ö., vd, 2015).

Günümüzde yapı üretiminde gerekli olan malzemeler için pek çok alternatif mevcuttur. Bu alternatifler içerisinden uygun seçimi yapmak mimarın sorumluluğundadır. Seçilen malzemenin özgün işleve, forma, üretim tekniğine ve fiziksel çevre verilerine uygun olması gerekmektedir.

Ekonomi ve konfor gereği yapı malzemelerinde yapılan tercihler farklılık göstermektedir. Kullanıcı talebine yönelik yapı tasarım yaklaşımları ve malzeme seçimleri değişmekte ve bu süreçte tabi ki en büyük rolü mimarın vereceği karar oynamaktadır.

Yapılan çalışmada; Sedad Hakkı Eldem'in farklı konumlarda, farklı zamanlarda yaptığı yapılardan örnekler seçilmiş, bu yapıların belirlenen bölümleri için metraj hesaplamaları yapılmış ve bu bölümler için malzeme maliyetleri, önerilen alternatif malzemeler dikkate alınarak birim maliyet yöntemi ile hesaplanmıştır. Bu hesaplamalar sonucu malzeme değişikliğinin maliyeti etkileme oranının malzeme türüne göre değişiklik gösterdiği belirlenmiştir. İncelenen yapılarda kullanılan mevcut malzemelerin seçimini etkileyen unsur genellikle tasarım kararını vurgulamak olmuştur. Bunu sağlayabilmek için tasarımın bütününde malzeme karakteri önemsenmiş ve değiştirilecek malzeme seçiminde etkili olmuştur. Sedad Hakkı Eldem Türkiye modern mimarlığının oluşmasında önemli katkıları olan bir mimar olmasına rağmen, yapılarında belirlediği ve Türk mimarisini vurgulayan malzeme seçimlerinde bina maliyetini düşünerek malzeme seçimini gerçekleştirmiştir. Çalışmada seçilen konutlar, her ne kadar üst gelir düzeyindeki müşteri profiline hitap eden yapılar olsa da bu yapıların yarısının malzeme seçimleri ekonomik bulunmuştur.

Bu çalışmanın sonucunda malzeme seçiminin ve maliyetinin yapının maliyetine direkt etkisi olduğu saptanmıştır. Çalışmanın mimari tasarım gerçekleştirirken malzeme seçiminin maliyete etkisinin önemi konusunda yapı alanına katkı sağlaması umulmaktadır.

MİNİMİZİNG THE ENERGY OF THE VELOCİTY VECTOR FİELD OF CURVE İN R^3

Ayşe ALTIN

Hacettepe University Faculty of Science 06800 Beytepe Ankara Turkey

ayse@hacettepe.edu.tr

Abstract: The present paper considers all the unit-speed curve segments between two fixed points p and q in R^3. It obtain a condition for the critical curve of the problem of minimizing the energy of the velocity vector field among the family of all curves from p to q. It show that the condition can be expressed in terms of the curvature functions.

Keywords: Energy, Energy of a unit vector field, Sasaki metric

Introduction

The volume of unit vector fields has been studied by (Gluck and Ziller, 1986, Johnson, 1988, Higuchi, Kay and Wood, 2001) among other scientists. They define the volume of unit vector field X as the volume of the submanifold of the unit tangent bundle defined by $X(M)$. In (Wood, 1997), the energy of a unit vector field on a Riemannian manifold M is defined as the energy of the mapping $X: M \to T^1M$, where the unit tangent bundle T^1M is equipped with the restriction of the Sasaki metric on TM.

Generally, every geometric problem about curves can be solved using the curves'Frenet vectors field. Therefore, in (Altın, 2011), we focus on the curve C instead of the manifold M. For a given curve C, with a pair of parametric unit speeds (I, α) in a space R^n, on which we take a fixed point $a \in I$, we denote Frenet frames at the points $\alpha(a)$ and $\alpha(s)$ by $\{V_1(\alpha(a)), \dots, V_r(\alpha(a))\}$ and $\{V_1(\alpha(s)), \dots, V_r(\alpha(s))\}$ respectively. We calculate the energy of the Frenet vectors fields as well as the angle between the vectors $V_i(\alpha(a))$ and $V_i(\alpha(s))$, where $1 \le i \le r$. We observed that both energy and angle depend on the curvature functions of the curve C.

In this paper, we choose two points p and q in R^3. We obtain a condition for the critical curve of the problem of minimizing the energy of the velocity vector field among the family of all curves from p to q. We also prove that this condition can be expressed in terms of the curvature functions. For example the condition is realized for curves whose curvature functions is constant. An example is also provided to show that the curvature of the curve is linear.

Definition 1.1 A curve segment is the portion of a curve defined in a closed interval, (O'Neill 1966).

Theorem 1.1.(Frenet formulas) If $\alpha: I \to R^3$ is a unit speed curve with curvature $\kappa > 0$ and torsion τ, then

$$T' = \kappa N,$$
$$N' = -\kappa T + \tau B,$$
$$B' = -\tau N$$

Where $\{T, N, B\}$ is the Frenet frame on α (O'Neill 1966).

Proposition 1.1 The connection map $K: T(T^1M) \to T^1M$ verifies the following conditions.
1) $\pi \circ K = \pi \circ d\pi$ and $\pi \circ K = \pi \circ \tilde{\pi}$, where $\tilde{\pi}: T(T^1M) \to T^1M$ is the tangent bundle projection and $\pi: T^1M \to M$ is the bundle projection.

2) For $\omega \in T_xM$ and a section $\xi: M \to T^1M$, we have

$$K(d\xi(\omega)) = \nabla_\omega \xi.$$

Where ∇ is the Levi-Civita covariant derivative (Chacón , Naveira and Weston,2001).

Definition 1.2. For $\eta_1, \ \eta_1 \in T_\xi(T^1M)$ define

$$g_s(\eta_1, \ \eta_1) = < d\pi(\eta_1), d\pi(\eta_2) > + < K(\eta_1), K(\eta_2) >. \quad (1)$$

 Copyright © International Science and Technology Conference (ISTEC)

This gives a Riemannian metric on TM. Recall that $g_s$is called the Sasaki metric. The metric g_s makes the projection $\pi: T^1M \to M$ a Riemannian submersion (Chacón , Naveira and Weston,2001).

Definition 1.3. The energy of a differentiable map $f: (M, <,>) \to (N, h)$ between Riemannian manifolds is given by

$$\varepsilon(f) = \frac{1}{2}\int_M (\sum_{a=1}^{n} h(df(e_a), df(e_a))\, \nu \tag{2}$$

where ν is the canonical volume form in M and $\{e_a\}$ is a local basis of the tangent space (Chacón , Naveira and Weston,2001 and Wood, 1997).

A Condition on Minimizing Energy of the Velocity Vector Field of a Curve in R^3

The following theorem characterizes a critical point of the energy of the velocity vector field of a curve in R^3

Theorem 2.1. Let α be unit speed curve in R^3 and α(a) = p, α(b) = q. Let us consider the collection of all curves segments from p to q in R^3 . If the energy of the velocity vector of α along one segment is less than that along any other segment, then the following equation is valid

$$\int_a^b \lambda(s)\kappa(s)\kappa'(s)ds = 0 \tag{3}$$

where κ is the curvature function and λ is the real-valued function n [a, b].

Proof. Let $\alpha: I \to R^3$ be a unit speed curve in R^3 and [a, b]⊂ I, α(a)= p, α(b) = q. There exists a real-valued function λ on [a, b], λ(s)=(s-a)(b-s), λ(a)=λ(b)=0 and λ(s)≠ 0 for all s∈(a, b). Let {T, N, B} be the Frenet frame field on α and

$$\lambda(s)T(s) = \big(v_1(s),\ v_2(s),\ \ v_3(s)\big), \qquad v_i: [a.b] \to R. \tag{4}$$

Let the collection of curves be

$$\alpha^k(s) = \big(\alpha_1(s)+k\ \ v_1(s),\ \alpha_2(s)+k\ \ v_2(s),\ \ \alpha_3(s)+k\ \ v_3(s)\big) \text{ for sufficiently small } k. \tag{5}$$

For k=0, α^0(s)=α(s) and λ(a)=λ(b)=0, we have v_i(a)= v_i(b)=0 . $1 \le i \le 3$ and $\alpha^k(a) = p,\ \ \alpha^k(b) = q.$ These results show that α^k is the curve segment from p to q.

Assume this collection $\alpha^k(s)$ =α(s, k) for all curves. The expression for the energy of the vector field T_k of α^k from p to q becomes $\mathcal{E}(T_k)$.

Now, let TC_k be the tangent bundle. So we have $T_k: C_k \to TC_k$, where $TC_k = \cup_{t\in I} T_{\alpha^k(t)}C_k$, $C_k = \alpha^k(I)$ and $T_{\alpha^k(t)}C_k$ denotes generated by T_k. Let $\pi: TC_k \to C_k$ be the bundle projection. By using equation (2) we calculate the energy of T_k as

$$\mathcal{E}(T_k) = \frac{1}{2}\int_a^b g_S(d\,T_k(T_k(\alpha(s,k)), dT_k(T_k\big(\alpha(s,k)\big))ds \tag{6}$$

where ds is the differential arc length. From (1) we have

$g_S(dT_k(T_k),\ dT_k(T_k))$= $< d\pi(\ dT_k(T_k)),\ d\pi(\ dT_k(T_k)) > + < K(dT_k(T_k)),\ K(dT_k(T_k) >$.

Since T_k is a section, we have $d(\pi) \circ d(T_k) = d(\pi \circ T_k) = d\big(id_{C_k}\big) = id_{TC_k}$. By Proposition 1.1, we also have that

$$K\big(dT_k(T_k)\big) = \nabla_{T_k}T_k = T_k' = \frac{\partial T_k}{\partial s},$$

giving

 Copyright © International Science and Technology Conference (ISTEC)

$$g_S(dT_k(T_k),\ dT_k(T_k)) = \ < T_k,\ T_k > + < T'_k,\ T'_k >.$$

Using these results in (6) we get

$$\mathcal{E}(T_k) = \frac{1}{2}\ \int_a^b (< T_k, T_k > + \ < T'_k, T'_k >) ds \qquad (7)$$

Where $T_k = \frac{1}{w(s,k)}\frac{d\alpha}{\partial s}(\mathrm{s,\ k})$; $w(s,k) = \sqrt{< \frac{d\alpha}{\partial s}(\mathrm{s,k}), \frac{d\alpha}{\partial s}(\mathrm{s,k}) >}$, Suppose that $\mathcal{E}(T_k)$ is such a minimized energy for any "k" α(s, k) with α(s,0)=α(s). We calculate $\frac{\partial \mathcal{E}(T_k)}{\partial k}$ and evaluate at k=0. If $\mathcal{E}(T_k)$ is a minimizing energy, then k=0 should be a critical point of $\mathcal{E}(T_k)$. Supposing that $\frac{\partial \mathcal{E}(T_k)}{\partial k}|_{k=0} = \frac{\partial \mathcal{E}(T_0)}{\partial k} = 0$, from (7) we obtain:

$$\frac{\partial \mathcal{E}(T_k)}{\partial k} = \frac{\partial}{\partial k}\ [\ \frac{1}{2}\ \int_a^b (< T_k, T_k > + \ < T'_k, T'_k >) ds] = \ \frac{1}{2}\ \int_a^b \frac{\partial}{\partial k}\ \ [< T_k, T_k > + \ < \frac{\partial T_k}{\partial s}, \frac{\partial T_k}{\partial s} >] ds.$$

Since $< T_k, T_k > \ = 1$ we have $\frac{\partial}{\partial k}\ \ < T_k, T_k >= 0$ and we get

$$\frac{\partial \mathcal{E}(T_k)}{\partial k} = \ \frac{1}{2}\ \int_a^b \frac{\partial}{\partial k}\ \ < \frac{\partial T_k}{\partial s}, \frac{\partial T_k}{\partial s} > ds = \ \ \int_a^b (< \frac{\partial^2 T_k}{\partial s \partial k}, \frac{\partial T_k}{\partial s} > ds. \qquad (8)$$

We can write

$$\frac{\partial}{\partial s} < \frac{\partial T_k}{\partial k}, \frac{\partial T_k}{\partial s} > \ = < \frac{\partial^2 T_k}{\partial s \partial k}, \frac{\partial T_k}{\partial s} > \ \ + \ < \frac{\partial T_k}{\partial k}, \frac{\partial^2 T_k}{\partial s^2} >.$$

Thus, we can deduce,

$$< \frac{\partial^2 T_k}{\partial s \partial k}, \frac{\partial T_k}{\partial s} > \ = \ \ \frac{\partial}{\partial s} < \frac{\partial T_k}{\partial k}, \frac{\partial T_k}{\partial s} > - \ < \frac{\partial T_k}{\partial k}, \frac{\partial^2 T_k}{\partial s^2} >. \qquad (9)$$

Substituting (9) in (8), for, k=0,

$$\frac{\partial \mathcal{E}(T_0)}{\partial k} = \int_a^b [\frac{\partial}{\partial s} < \frac{\partial T_k}{\partial k}(s,0), \frac{\partial T_k}{\partial s}(s,0) > - \ < \frac{\partial T_k}{\partial k}(s,0), \quad \frac{\partial^2 T_k}{\partial s^2}(s,0) \ \ >] \mathrm{ds}$$

and

$$\frac{\partial \mathcal{E}(T_0)}{\partial k} = < \frac{\partial T_k}{\partial k}(s,0), \frac{\partial T_k}{\partial s}(s,0) > |_a^b \ - \int_a^b \ < \frac{\partial T_k}{\partial k}(s,0), \quad \frac{\partial^2 T_k}{\partial s^2}(s,0) \ \ > \mathrm{ds} \qquad (10)$$

From (4) and (5), we obtain,

$$\frac{\partial \alpha}{\partial k}(\mathrm{s,\ k}) = \lambda(\mathrm{s})\ \ T_k(\mathrm{s}) \qquad (11)$$

and

$$\frac{\partial \alpha}{\partial k}(\mathrm{s,\ 0}) = \ \alpha'(s) = \ T_k(\mathrm{s,\ 0}) \qquad (12)$$

Now we calculate the partial derivatives of (12) with respect to s and k; using Frenet formulas, we get

$$\frac{\partial T_k}{\partial s}(s,0) = \frac{\partial^2 \alpha}{\partial s^2}(s,0) = \alpha''(s) = T'(\mathrm{s}) = \kappa(s)N(s) \qquad (13)$$

and

$$\frac{\partial T_k}{\partial k}(s,k) = \ \ \frac{\partial^2 \alpha}{\partial s \partial k}(\mathrm{s,\ k}) = \ \frac{\partial^2 \alpha}{\partial k \partial s}(\mathrm{s,\ k}).$$

From (11), we have

$$\frac{\partial T_k}{\partial k}(s,k)|_{k=0} = \ \ \frac{\partial T}{\partial k}(s,0) = \lambda'(s)T(s) + \lambda(s)\kappa(s)N(s). \qquad (14)$$

It follows from (13) and (14) that

$$< \frac{\partial T_k}{\partial k}(s,0), \quad \frac{\partial T_k}{\partial s}(s,0) > \ = \lambda(s)\kappa^2(s).$$

 Copyright © International Science and Technology Conference (ISTEC)

Considering the candidate function $\lambda(a) = \lambda(b) = 0$, we get:

$$< \frac{\partial T_k}{\partial k}(s,0), \quad \frac{\partial T_k}{\partial s}(s,0) > |_a^b = \lambda(b)\kappa^2(b) - \lambda(a)\kappa^2(a)=0 \qquad (15)$$

From (13), we get

$$\frac{\partial^2 T_k}{\partial s^2}(s,0) = -\kappa^2(s)T(s) + \kappa'(s)N(s) + \kappa(s)\tau(s)B(s) \qquad (16)$$

Therefore, (14) and (16) gives

$$< \frac{\partial T_k}{\partial k}(s,0), \frac{\partial^2 T_k}{\partial s^2}(s,0) > = -\lambda'(s)\kappa^2(s) + \lambda(s)\kappa(s)\kappa'(s) = [-\lambda(s)\kappa^2(s)]' + 3\lambda(s)\kappa(s)\kappa'(s). \quad (17)$$

Substituting (15) and (17) in (10), yields

$$\frac{\partial \mathcal{E}(T_k)}{\partial k}|_{k=0} = \frac{\partial \mathcal{E}(T_0)}{\partial k} = -\int_a^b ([-\lambda(s)\kappa^2(s)]' + 3\lambda(s)\kappa(s)\kappa'(s))ds=0$$

and

$$\frac{\partial \mathcal{E}(T_0)}{\partial k} = [-\lambda(s)\kappa^2(s)]|_a^b - 3\int_a^b \lambda(s)\kappa(s)\kappa'(s)ds=0$$

We are looking the candidate function $\lambda(a) = \lambda(b) = 0$, which given $[-\lambda(s)\kappa^2(s)]|_a^b = 0$ and

$$\frac{\partial \mathcal{E}(T_0)}{\partial k} = -3\int_a^b \lambda(s)\kappa(s)\kappa'(s)ds=0.$$

This completes the proof of the theorem. Any path that minimizes the energy function $\mathcal{E}(T_k)$ must satisfy equation (3). Note that the condition is necessary, but not sufficient; not every function that satisfies (3) will produce minimal energy. If α is geodesic then it will satisfy equation (3). The following is provided as an example. This
example will also demonstrate that the curvature of the curve is linear, given the aforementioned conditions.

Example. Let $\alpha: I \to R^3$, [0,1]⊂ I, α(0)= p, α(1) = q. If we can choose $\lambda: [0,1] \to R$, λ(s)=s(1-s), λ(0)=0, λ(1)=0 and $\lambda(s) \neq 0$ for all s∈(0, 1). Let the curvature function of α be $\kappa(s) = cs + d$ where c and d are real numbers. Using equation (3), we have

$$\frac{\partial \mathcal{E}(T_0)}{\partial k} = \int_0^1 \lambda(s)\kappa(s)\kappa'(s)ds = c(c + 2d) = 0.$$

If c=0 then κ constant, or c=-2d.

Türk-Alman Üniversitesi, İİBF, İşletme Bölümü, İstanbul - TÜRKİYE

meydanoglu@tau.edu.tr

Özet: Günümüzün müşteri odaklı pazarlarında müşteri ilişkilerini, müşteri ilişkileri yönetimi (MİY) (Customer Relationship Management - CRM) yardımıyla yönetmek işletmelerin başarısı için bir gereklilik olmuştur. MİY ile müşteri memnuniyeti, sadakati, karlılığı artırılırken, müşteri ile etkileşim iyileştirilir ve maliyetler düşürülebilir. MİY çerçevesinde kullanılan aracın müşteri ilişkileri yönetimi amaçlarının planlandığı şekilde gerçekleştirilmesinde önemli bir etkisi vardır. İnternet ve mobil cihazlar gibi dijital kanallar müşterilere her zaman, her yerde, kişisel olarak ve interaktif şekilde erişmek için güçlü kanallardır. Bu temel çalışmanın amacı mobil teknoloji ve mobil cihazların, müşteri ilişkileri yönetimi amaçlarını nasıl etkilediğini ikincil kaynaklara dayanarak incelemektir. Yapılan inceleme göstermiştir ki mobil MİY sağladığı faydalar ile MİY amaçlarını pozitif yönde etkileyebilmektedir. Örneğin, mobil MİY ile mümkün olan interaktif ve kişiselleştirilmiş müşteri ilişkileri, işletmelerin mevcut müşterilerini ellerinde tutmalarına ve müşteri sadakatini artırılmasına katkı sağlayabilir.

Anahtar Kelimeler: Mobil müşteri ilişkileri yönetimi (MİY), müşteri ilişkileri yönetiminin amaçları, mobil müşteri ilişkileri yönetiminin faydaları.

Abstract: In today's customer oriented markets, managing customer relations through the use of CRM (Customer Relationship Management) is a necessity for companies' success. Through CRM customer satisfaction, retention, loyalty, profitability are increased, customer interaction is improved and costs can be decreased. Obviously, the media used in CRM have an impact on the effectiveness of CRM objectives. Digital channels such as the Internet and mobile handheld devices are powerful channels to reach customers anytime, anywhere, personally and interactively. The aim of this basic research is to illustrate how the mobile technology and devices can affect the objectives of CRM based on the secondary sources. The results of the study indicate that mobile CRM brings along some benefits for companies that affect the CRM objectives positively. For example, interactive and personalized relationships with customers enabled by mobile CRM are of great importance for companies to retain customers and thereby to increase loyalty.

Keywords: Mobil customer relationship management, benefits of mobile customer relationship management, objectives of customer relationship management.

Giriş

Mobil teknolojilerdeki gelişmeler ve tüketiciler arasında mobil cihazların kullanımının yaygınlaşmasısı ile aktivitelerini desteklemek amaçlı mobil teknolojilerden ve cihazlardan faydalanan işletme sayısında bir artış söz konusu olmuştur. Mobil iş, günümüzde işletme literatüründe sıkça kullanılan bir kavram olmuştur. İşletmelerde mobil teknoloji ve cihazlarının kullanıldığı bir alan da müşteri ilişkileri yönetimidir. Mobil MİY yeni bir kavram olmamasına ve ilgili literatürde farklı çalışmalarda ele alınıp incelenmiş olmasına rağmen, mevcut çalışmaların büyük çoğunluğu mobil MİY'in tanımı, uygulaması ve benimsenip kullanılması ile ilgilidir (örn. (Sinisalo vd., 2005), (Sinisalo vd., 2007), (Grandhi & Chugh, 2012), (Mobile Marketing Association, t.y.), (Belachew vd., 2007)). İlgili literatürde mobil MİY'in faydaları ve bu faydaların MİY amaçları üzerindeki etkileri yeterince incelenmemiştir. Mevcut çalışma bu açığı kapamayı amaçlar. Bu bağlamda, öncelikle MİY tanımlanır ve daha önce yürütülmüş çalışmalar temelinde MİY'in amaçları tanıtılır. Takiben mobil MİY uygulamasının faydaları ele alınır. Daha sonra MİY amaçlarını gerçekleştirmede mobil araçların rolü açıklanır. Çalışma temel bulgular, çalışmanın sınırı ve olası araştırma alanlarının tanımlanması ile sonlandırılır.

Müşteri İlişkileri Yönetimi ve Amaçları

Deans (2004) MİY'i, işletmelerin müşterileriyle uzun dönemli ilişki kurmaları ve bu ilişkiyi yönetmeleri ile ilgili strateji olarak tanımlar. "*MİY müşteriyle yakın ilişkiyi öneren bir felsefe olarak ta belirtilebilmektedir. Bu felsefenin ana noktasını işletme tabanında bulunan mevcut ve potansiyel müşterilerin ihtiyaçlarını anlama ve sezebilme stratejisi oluşturmaktadır*" (Tiwana, 2001, s. 56). MİY, müşterileriyle ilişkilerini iyileştirmek yoluyla işletmelerin rekabetsel bir avantaj kazanmaları ve değer yaratmaları için işletmelere yardımcı olur (Toor, 2009). Bu

 Copyright © International Science and Technology Conference (ISTEC)

açıklamadan da anlaşılacağı üzere MİY'in temel amacı uzun vadeli müşteri ilişkisi için müşteri ilişkilerini iyileştirmektir. Bu amaç aşağıdaki gibi alt amaçlara ayrılabilir:

- Müşteri memnuniyetini artırmak (Kim vd., 2003), (Burnett, 2001), (Xu vd., 2002),
- elde tutulan müşteri sayısını artırmak (Kim vd., 2003), (Dyche, 2001), (Swift, 2001), (Wilson vd., 2002),
- müşteri sadakatini artırmak (Xu vd., 2002), (Wilson vd., 2002), (Peppers vd., 1999),
- daha yüksek müşteri karlılığı (Burnett, 2001), (Dyche, 2001), (Wilson vd., 2002),
- iyileştirilmiş müşteri etkileşimi (Kim vd., 2003), (Peppers vd., 1999),
- azalan maliyetler (örn. pazarlama faaliyetleri ve satışlar ile ilgili azalan idari masraflar) (Ryals & Knox, 2001).

Bilişim teknolojilerindeki gelişmeler, müşteri ilişkileri yönetimi süreçlerinin İnternet ile entegre edilmesini ve basitleştirilmesini mümkün kılmıştır (Chang vd., 2005). Böylece elektronik MİY ortaya çıkmıştır. Mobil teknolojilerdeki gelişim ve mobil cihazların (örn. akıllı telefonlar, PDA'lar [Personal Digital Assistant]) yaygınlaşması mobil cihazların da MİY aktivitelerini (örn. satış yönetimi, pazarlama, satış sonrası hizmetler) desteklemek üzere kullanımına ve mobil MİY'in doğmasına yol açmıştır. Mobil MİY, bir işletme ile bu işletmenin müşterileri arasındaki müşteri ilişkilerinin kurulması ve yönetilmesi amacı için mobil cihazlar ile yürütülen satış, pazarlama ve müşteri hizmetleri aktiviteleri ile ilgili olan tek taraflı ya da interaktif iletişim olarak tanımlanır (Sinisalo vd., 2007). Mobil pazarlama, mobil satış otomasyonu ve mobil müşteri hizmetleri tipik mobil MİY aktiviteleridir (Schierholz vd., 2007).

Mobil cihazlar, MİY kapsamında kullanılan diğer kanalların (e-posta, televizyon, İnternet vb.) yapabildiklerini yapmalarının yanı sıra mobil olmalarına has özellikleri sonucu (Sinisalo vd., 2007), işletmelere aşağıdaki imkanları da sunabilmektedirler:

- İletişimin kişiselleştirilmesi: Müşteriler ile iletişim için mobil cihaz kullanımıyla sadık müşterilere bireysel bazda kişiselleştirilmiş hizmet sunmak mümkündür. Bu, işletme ile sadık müşterileri arasındaki duygusal bağı kuvvetlendirmek bakımından önemlidir (Sinisalo vd., 2007).
- İnteraktiflik: Mobil cihazları klasik araçlardan ayıran en önemli özellik, bu cihazların interaktif iletişime imkan vermesidir. Mobil cihazlar, işletmeler ve müşterileri arasında gerçek zamanda, iki yönlü iletişimi mümkün kılarlar (Belachew vd., 2007).
- İletişimde esneklik: Mobil cihazlar, özellikle kullanıcıların daima yanlarında taşıdıkları mobil telefonlar, müşterilere her yerde ve her zaman erişim imkanı sağlarlar (Sinisalo vd., 2007).

Mobil Müşteri İlişkileri Yönetiminin Müşteri İlişkileri Yönetimi Amaçları üzerindeki Etkileri

Yukarıda izah edilmiş olan mobil MİY özellikleri yine yukarıda açıklanmış olan MİY amaçlarının gerçekleşmesine katkı sağlayan bazı faydaları beraberinde getirir. Mobil MİY'in bahsedilen özelliklerine göre sağlayabileceği faydalar üç grupta toplanabilir:

İletişimin kişiselleştirilmesiyle elde edilebilecek faydalar: Bir işletme ile iletişime geçmeyi onaylayan müşteri, MİY veri tabanlarında kullanılmak üzere verilerini işletme ile paylaşır (Mobile Marketing Association, t.y.). Böylece müşterilerin satın alma davranışları ve tercihleri ile ilgili güvenilir veri elde edilebilir. Müşteri veri tabanı temelinde müşteri davranışının ve ihtiyaçlarının zaman içinde değişimini analiz ederek kişiselleştirme ve özelleştirme yapmak, uzun dönemli müşteri sadakati ve karlılığı oluşturmak ve korumak adına önemlidir (Amofah & Ijaz, 2005)

Kişiselleştirme ile sağlanan müşteriye özel muamale müşteri memnuniyetini artırır, müşterinin elde tutulması imkanını sağlar, dolayısıyla müşteri sadakatini pozitif yönde etkiler (Peppers vd., 1999). Artan müşteri memnuniyeti ve sadakati daha fazla satışı beraberinde getirebilir ki bu müşteri karlılığının artmasını da pozitif şekilde etkiler. Kişiselleştirme sayesinde artan müşteri memnuniyeti ve sadakati mevcut müşterileri elde tutmak ve yeni müşteri kazanmak için oluşacak maliyetleri düşürebilir (Grandhi & Chugh, 2012), (Amofah & Ijaz, 2005).

Mobil MİY ihtiyaç duyulan noktada içerik ve hizmet temin eder (Belachew vd., 2007) ve doğru mesaj ile doğru yerde doğru zamanda doğru kişilere ulaşmaya önemli katkı sağlar (Mobile Marketing Association, t.y.).

İnteraktiflik sonucu elde edilebilecek faydalar: Mobil MİY, sağladığı interaktivite ile müşteri etkilişiminin iyileştirilmesine doğrudan bir katkı sağlar. İnteraktif bir şekilde ilişkide bulunduğu işletme ile iletişim kurabilmek müşterinin memnuniyetini artıran, işletmelerin mevcut müşterileri elde tutma ya da yeni müşteriler kazanma

 Copyright © International Science and Technology Conference (ISTEC)

çabalarına ve tüm bunlar dolayısıyla müşteri karlılığının artmasına da dolaylı olarak olumlu yönde katkı sağlayan bir husustur.

İletişimdeki esneklik sonucu elde edilebilecek faydalar: Mobil MİY, müşterilerin işletmelere kendileri ile ilgili bilgileri vermelerini, bunun karşılığı olarak işletmelerden ürünleri/hizmetleri ile ilgili ihtiyaç duydukları bilgileri her yerde ve her zaman alabilmelerini sağlar. Bahsedilen değer değişimi yoluyla kazanılan bilgi, müşteri ilişkileri yönetimi veri tabanına pozitif yönde katkı sağlarken pazarlama ve reklam faaliyetleri için güvenilir veri teminine imkan tanır (Mobile Marketing Association, t.y.).

Özetle, mobil cihazlar müşterilerle spontane, interaktif, doğrudan ve hedefli bir etkileşimi her yerde ve her zaman mümkün kılarlar (Zeng vd., 2003). Bu, mobil cihazları mevcut diğer kanalları (örn. e-posta) tamamlayan değerli bir müşteri ilişkileri yönetimi kanalı yapar.

Mobil MİY'i farklılaştıran özellikleri sonucu ortaya çıkan faydaların yanı sıra mobil MİY'in müşteri ilişkileri yönetimi amaçlarını etkileyen genel bazı başka faydaları da vardır.

Diğer faydalar: Yeni müşteri kazanmaya kıyasla mevcut müşterileri elde tutmak için oluşacak maliyetler genelde daha az olduğundan ve mobil MİY sadık müşteriler kazanmaya katkı sağladığından mobil MİY yeni müşteri kazanma kaynaklı oluşacak maliyetleri düşürmeye etki edebilir (Swift, 2001). Mobil MİY işletmelerin rakipleri karşısında kendilerini farklılaştırmalarını ve böylece rekabetsel bir avantaj elde etmelerine de katkı sağlar (Hoffman & Kashmeri, 2000), (Toor, 2009).

Sonuç

Bu çalışma mobil MİY'in faydaları ve söz konusu faydaların MİY'in amaçlarını nasıl etkilediğini araştırmıştır. MİY aktivitelerini desteklemek amaçlı mobil araçların kullanımı, işletmelerin müşterileri ile etkin şekilde etkileşimi için önemli bir kanal oluşturur. Mobil MİY, işletmeler için sundukları daha iyi müşteri servisi ile müşteri memnuniyetini, elde tutulan müşteri sayısını, müşteri sadakatini, müşteri karlılığını artırmayı ve MİY aktiviteleri ile ilgili maliyetleri azaltmayı mümkün kılar. Ancak mobil cihazların işletmelere bu avantajları tek başlarına değil, klasik kanallar ile etkin bir şekilde entegre edilmeleri sonrası sağlayabileceği unutulmamalıdır (Sinisalo vd., 2007).

Bu çalışma, MİY amaçlarının gerçekleştirilmesi için mobil MİY'in rolü hakkında genel bir bakış verir. Bu teorik çalışmadaki tespitler, gelecekte yürütülecek araştırmalarda somutlaştırılarak test edilebilir.

Bu çalışma Türk-Alman Üniversitesi Bilimsel Araştırma Projeleri Komisyonunca kabul edilen 2016BI0006 nolu proje kapsamında desteklenmiştir.

MODEL OF ARCHITECTURAL LANDSCAPE CONFORMS TO ENVIRONMENT FOR AIR TEMPERATURE REDUCTION OF BUILDING ENVELOPE IN THAILAND

Thanawuth Khunthong
tkunt_2002@hotmail.com

Thailand is located in humid tropical climate and near the equator. Thus the average air temperature is high throughout the year. Environmental factors in the sun, wind and humidity affect residential buildings especially, heat from the sun is a main factor which leads to be a problem on heat inside the buildings (Prawewan Amornpong, 2001). Therefore, Installation air conditioning inside the buildings is the solution for this problem. By the way, from the study on the properties of plants it was found that plants have effective on blocking the sun's rays as well as they effectively maintain the air temperature in the area (Soontorn Boonyathikarn, 1999). So, planting trees to prevent the sun light, being as shades to reduce sun heat to the buildings should be an approach which could be adopted to decrease the use of air conditioning and also energy consumption in the buildings (Trungjai Buranasompob, 2000). This research was aimed (1) to study and create design guidelines on landscape model which conforms to the environment of sunlight and wind in the central region of Thailand and (2) to propose the guidelines on architectural landscape design and plants' setting around the buildings in 8 directions; North (N), Northeast (NE), East (E), Southeast (SE), South (S), Southwest (SW), West (W) and Northwest (NW). The results were found that the landscape model included the setting on plants is being as shades of all side of building envelope during 08.00-17.00 PM of the day throughout the year. These can reduce the air temperature of the building envelope as well as the average temperature inside the buildings decreased 3.95°C or 13.478% compared with the average exterior air temperature of the buildings throughout the year.

Abstract: In literature, some existing studies suggested different proposed approaches that interrupt temporary link/server access. Also, in order to find implications in terms of performance degradation, analytical models are used, as well as failures of the servers. Unlike previous studies, the failures of the servers are considered together with link/server interruptions for renewals. In this study, the authors mainly focused to develop a new framework for the existing authentication protocols by considering them in an unusual fashion. The performance degradations that may be caused by service interruptions are discussed with a new framework to model the interactions between the network and the authentication servers.

Keywords: Kerberos variance, Quality of Service, Performability modelling, Queueing analysis

Introduction

Last three decades use of networked computer system has been increased and become popular. Communication and distribution of large, confidential and classified information are also available electronically, which requires challenge to protect system, data as well as resources. The configuration of the system plays an important role in privacy and data integrity that affects the performance of the underlying networks. The system considered should have the ability to perform sufficient and legitimate access to resources, while considering the applied security resources.

Network authentication is one of the vital methods for network and information security communications. Kerberos which is based on Needham-Schroder Authentication Protocol (Needham1978) commonly used for this purpose. As stated in literature, Kerberos architecture is divided into two core elements Key Distribution Centre (KDC) and Ticket Granting Service (TGS) (Brennen2004). The KDC stores authentication information and uses it to securely authenticate users and services while TGS holds digital tickets to identify the network clients and servers. If an attacker can gain administrative access to the KDC, he would have access to the complete resources of the Kerberos realm. A masquerading TGS (any client) can impersonate the TGS of the network (Kirsal2007b). In addition, Kerberos exhibits some other vulnerabilities widely reported in the literature (Brennen2004).

The design of the proposed protocol, combines the properties of Kerberos and Key-Exchange protocols together, which was considered in developing a specific authentication protocol as part of a previously proposed framework (Kirsal2007a). This combined approach had been proposed to shut down external access to an enterprise network for a period of time to enable the distribution of randomly generated keys (Kirsal2007b), (Schneider1998). In research (Kirsal2007b), while authentication protocol was designed, intruder is modelled as well. While the protocol was modelled, renewing keys at various intervals was considered, in order to block potential intruders. Although the intruder had been given the power to attack, the protocol was successful in preventing replay attacks (Kirsal2007b), (Kirsal2008). Security protocols in distributed systems are time-sensitive. That is to say if time of decrypting messages are increased, intruders could be blocked and prevented. In (Kirsal2008), a new protocol is proposed based on the use of timestamps to delay decryption by potential intruders. Considering the key distribution, external network access is restricted for short time intervals (Kirsal2007b), and (Kirsal2008). This

 Copyright © International Science and Technology Conference (ISTEC)

affects the performance of the network. For this purpose, an analytical model has been developed to evaluate the performability of the proposed approach (Kirsal2007b). While key distribution times depend on network characteristics such as size, and speed, the intervals between key renewals can be determined by the mean values of decryption times.

Related Works

In this section, frequent key renewal protocol, challenges of quality of service, and performability modelling for security protocols will be explain in detail.

Frequent Key Renewal Protocol

As stated in (Kirsal-Ever2013) the proposed protocol is based on frequent key renewal under pseudo conditions. the proposed approach was shutting-down external access to an enterprise network for a period of 140 seconds, to enable the distribution of randomly generated keys to users in a relatively secure way. Details are given in (Kirsal-Ever2013).

Quality of Service Challenges

Quality of Service (QoS) refers to the ability of a network to provide better, more predictable service. It is referred as selected network traffic over various underlying technologies, specifically wireless and mobile networks (Lowe1996), (Saravanan2006), (Song2005). Last two decades wireless and mobile networks have gained widespread popularity mainly because of their low cost and relatively high data rates. In this circumstances, issues with QoS becomes extremely important. In recent years, within the use of a wireless communication system, seamless time sensitive movement of audio and video are demanded by enterprises and users. However, interruptions may be caused because of implemented security mechanisms, which can cause degradation of performance for the traffic.

In addition, as stated in (Hua2004), interruptions in wireless and mobile systems cause the packet loss, latency, congestion and jitter, which are important QoS challenges. Latency is the time delay occurred in speech by the end-to-end user communication system. The lower the latency, the better the QoS (Balsamo2003), (Baghaei2004). In order to increase QoS in terms of packet losses, less interruptions, dedicated bandwidth and controlled jitter should be improved. Researches on good QoS showed that greater levels of interruption introduce more delay and require lower network latency (Lowe1996), (Hua2004).

The major constraint is end-to-end interruption. It requires the delay to be reduced through a packet network. To support traffic reliably and enhance the QoS in WLAN, a network must therefore be able to provide packet forwarding latency, jitter, guaranteed network bandwidth and capacity for communication during periods of network congestion (Kirsal-Ever2013).

Necessity of Modelling Security Protocols for Performability Modelling

Implemented security mechanisms in wireless communication systems are one of the main reason of service interruptions (Ever2009). The wireless variants of existing protocols may prefer to shut the communication while the critical key exchange processes are taking place. That would introduce significant delays, and increased number of request awaiting for authentication.

System or server interruptions depend on the system's nature and can have different impacts on the system performance. The system may not support the ongoing process or the packet efficiently due to the interruptions hence performance may degrade. In order to overcome this problem, availability and performance of the system should be considered together (Jiang2005). In (Trivedi1994) a unified performability and reliability analysis by using Markov Reward model (MRM) is presented. In (Kirsal-Ever2013) existing performability evaluation methods are considered for evaluation of security mechanisms from a performance point of view. A new framework has also been discussed for modelling the interactions between the network and the authentication servers.

Framework

The arrivals of jobs are assumed to be independent and follow Poisson distribution with rate λ. The service times of jobs are distributed exponentially with mean $1/\mu$. The Kerberos server considered can serve jobs only during its

 Copyright © International Science and Technology Conference (ISTEC)

operative periods, which means that the key distribution is being taken place (the system is not shut) and the server is active during this process. The Kerberos server may suffer from failures and inter failure times are distributed exponentially with mean 1/ξ. At the end of this period, the server breaks down and requires an exponentially distributed repair time with mean 1/η. The distribution of time intervals between shutdowns are assumed to be exponentially distributed with given mean value 1/δ. When the system is shut, the server does not provide service to incoming request for an exponentially key distribution time which is given by 1/φ. This system can be modelled as follows:

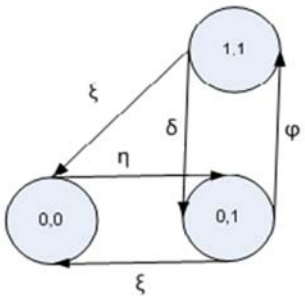

Figure 1. State diagram for availability of standalone Kerberos authentication server

The state (0, 0) denotes the event that the system is shut and the server is broken. In the state (0, 1) the server is not broken and the system is shut. Finally, the state (1, 1) represents the state where the server becomes operative since the system is not shut and the server is active. In case the server is broken in this stage, there is a direct transition from state (1, 1) to the state (0, 0). Therefore, it is assumed that the system is shut and key distribution does not take place while the server is nonfunctional.

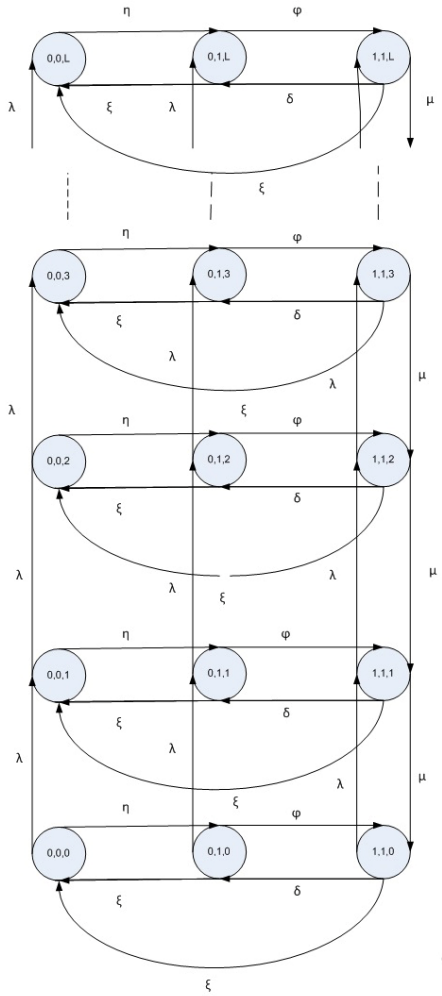

Figure 2. The state transition diagram for the performance and availability model of the system

 Copyright © International Science and Technology Conference (ISTEC)

The system state can be represented by (i, j, k) where i is the system status, j is the number of active server and k is the number of jobs in the system. Please note that i and j can be maximum 1 since there is only one server considered for the proposed model. Therefore, in Figure 2, as long as jobs keep on arriving to the system, the system state changes one state upward until it reaches maximum number of jobs (L) in the system. The upward transition further than the state (i, j, k) is not possible since the jobs are blocked because of the limitation of L, where $k \leq L$. There is forward lateral transition from state (i, j, k) to the state (i, j+1, k) when the server is repaired. Once the system generates key, there is also forward transition from the state (i, j, k) to the state (i+1, j, k). There are two possible backward lateral transition from the state (i+1, j+1, k) to the state (i+1,j,k) and (i, j, k), when the system is shut and the server is broken respectively. Another backward lateral transition can be possible from the sate (i, j+1, k) to the state (i, j, k) in case the server is broken. Finally, when the server is operative, one job is served with a downward transition from the state (i+1, j+1, k+1) to (i+1, j+1, k).

The two dimensional process considered in (Kirsal-Ever2013) can be used for the Spectral Expansion solution method with the matrices A, B and also C as given below. Please note that the matrix A represents the lateral, the matrix B upward and also the matrix C downward transitions.

$$A = A_j = \begin{bmatrix} 0 & \eta & 0 \\ \xi & 0 & \varphi \\ \xi & \delta & 0 \end{bmatrix} \qquad B = B_j = \begin{bmatrix} \lambda & 0 & 0 \\ 0 & \lambda & 0 \\ 0 & 0 & \lambda \end{bmatrix} \qquad C_0 = (0),\ C = C_j = \begin{bmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & \mu \end{bmatrix}$$

Conclusions and Future Work

This paper is concerned with a modelling approach for performability evaluation of Kerberos servers which dynamically renew keys under pseudo-secure conditions as well as security variants over Kerberos authentication protocol as an example to service interruptions in wireless communication systems. As stated earlier, during key distribution, external access to the network is not allowed. The access restrictions happen for short intervals (Kirsal2007), (Kirsal2008). However, any link shut-down costs the network in terms of performance degradation. Therefore, it is essential to evaluate the impact of the proposed approach on system performance. The proposed approach in (Ever2009) also involves temporary interruption to link/server access where it has implications in terms of QoS degradation. Discussions on performance and availability evaluation of some security measures are provided.

Hence in order to enhanced QoS, the existing performance and availability modelling techniques used in the literature can be adapted to modelling of various security protocols considering the server behaviour as well as the characteristics of the networks. In order to evaluate the cost in terms of the degradation of system performance, an analytical method is used. Unlike the previous studies, the server failures are considered as well. Therefore, the approach presented in this study provides more realistic performability measures.

The model developed is highly flexible and it can be used for systems with various failure, repair, and renewal times and times between interruptions. The method can be extended for multiple Kerberos servers and for systems with backup servers especially for the KDC.

Abstract: Hydraulic conductivity is one of the most important properties to be determined for both saturated and unsaturated soils when studying with binary mixtures for use of impervious layer demands. However, determining hydraulic conductivity in laboratory may take much time. Thus, predicting the hydraulic conductivity is a very trending topic for especially timesaving purposes. This study is focused on understanding the hydraulic conductivity behavior of binary mixtures more than prediction. Numerical analysis was run on a flow program based on finite elements method for non-porous and porous grains embedded in a less pervious fine soil. The variety was depended on different mixture ratios for soils and different geometric combinations of grains which were located in the fine soil. The results were compared according to different mixture ratios and different geometric combinations. Finally, it's concluded that if the grains embedded in a less pervious soil were porous, then, the hydraulic conductivity of the mixture was affected due to the contact position of the porous grains. When the porous grains were located as if they were in contact to each other, the hydraulic conductivity of the mixture converged to that of the porous grains showing the lack of less pervious soil that it could not govern the hydraulic conductivity behavior.

Keywords: Hydraulic conductivity, soil mixtures, finite elements, porous grains

Introduction

In this study, it is aimed to make an assessment of ranges of the saturated hydraulic conductivity values of different types of bentonitic mixtures using finite element method (FEM). The hydraulic conductivity of a barrier material is determined from laboratory tests before application. However, these tests are time consuming which may last from several months to years, depending on the value of hydraulic conductivity. Thus, in addition to laboratory investigations, the hydraulic conductivity needs to be modeled as well. The modeling can help rapid assessment of the most suitable barrier material before laboratory tests, prediction of the long term hydraulic conductivity behavior of the selected material and determination of the parametric sensitivity of hydraulic conductivity.

There are limited modeling studies investigating the hydraulic conductivity of binary mixtures in the literature. Most of these studies are related to the modeling of the hydraulic conductivity of sand bentonite mixtures (SBMs) and some rare laboratory studies were done on zeolite bentonite mixtures (ZBMs). However, it is believed that hydraulic conductivity of bentonitic mixtures, including both non-porous and porous granules, such as SBMs and ZBMs, has not been modeled so far. The hydraulic conductivity of compacted clays is generally predicted by statistical models. There are numerous studies that estimate the hydraulic conductivity from correlation analysis which use basic soil index parameters (i.e. consistency limits, activity, clay content) as the independent variables (Benson et al., 1994; Benson&Trast, 1995). In contrast, modeling the hydraulic conductivity of SBMs is rather complex. This is because the amount of bentonite is relatively less than the amount of sand in the SBMs. Therefore, the hydraulic conductivity may be high or low depending on the bentonite content. In the case of low bentonite content, the hydrated bentonite particles are not evenly distributed within the pores, resulting preferential flow path along the inter-granular pores. On the other hand, bentonite starts to govern the hydraulic conductivity when bentonite content (BC) is high enough in the mixture. In this case, the inter-granular pores are blocked by bentonite particles and sand grains are started to dislocate from each other. Hence, the flow occurs between small pores of bentonite particles. Based on above explanation, it is clear that the pore network of the mixture is strongly dependent on bentonite property which directly influences the porosity and void ratio of SBMs. Thus, most of the studies reported in the literature consider these two parameters while modeling the hydraulic conductivity of SBMs (Chapuis, 1990; Kenney et al., 1992; Mollins et al., 1996; Sivapullaiah et al., 2000).

Chapuis (1990) reports hydraulic conductivity test results for 45 SBMs, having various BCs. The obtained hydraulic conductivity is poorly correlated to porosity alone. However, his predictive model suggests a good

 Copyright © International Science and Technology Conference (ISTEC)

relationship between hydraulic conductivity and "efficient porosity" of the mixture, where pore space is available for fast-moving water between bentonite particles. Kenney et al. (1992) investigated hydraulic conductivity characteristics of SBMs in terms of void ratio. In their model, it is assumed that all water is associated with bentonite particles; sand is dry and act as impervious matrix in the mixture; and the fabric of bentonite is unaffected from sand grains. They stated that the hydraulic conductivity of SBMs is a function of bentonite void ratio and thus, bentonite hydraulic conductivity. Sivapullaiah et al. (2000) performed hydraulic conductivity tests on bentonite and SBMs. They applied regression analysis to the obtained results. Based on regression analysis, high correlation was obtained when the hydraulic conductivity is predicted from void ratio and liquid limit of the mixture. Abichou et al. (2004) suggested three pore network models; namely grain coating model (GCM), tube blocking model (TBM) and junction blocking model (JBM), to interpret the laboratory hydraulic conductivity results of SBMs. In the case of GCM, the pore tube diameters decrease as the thickness of the bentonite coating on the sand grains increases, resulting decrease in the hydraulic conductivity. They report similar trends for TBM and JBM. However, Abichou et al. states that the favorable comparisons with respect to hydraulic conductivity are obtained with GCM and JBM.

The laboratory test results presented in the literature revealed that ZBMs have higher hydraulic conductivity values than SBMs. This finding may be tied to a possible reason that is the water movement through zeolite grains and this behavior is the content of this study. The hydraulic conductivity behavior is modeled with Plaxflow Version 1.5, a modeling software using FEM, and the results are compared with the laboratory hydraulic conductivity test results. For comparison purposes with the test results, two different mixtures are modeled which represent SBMs and ZBMs. Sand grains are represented as impervious grains with zero hydraulic conductivity. In contrast, zeolite grains are represented with pervious particles. A range of hydraulic conductivity values are selected to study how the pervious grains affect the hydraulic conductivity of the mixture. The grain shape effect on hydraulic conductivity of binary mixtures was also investigated. Afterwards, the specific hydraulic conductivity value obtained from laboratory tests is selected to represent the zeolite grains in this modeling study. Finally, comparison of the laboratory and modeling results for SBMs and ZBMs are made and presented.

Materials and Methods

The binary soil mixture has two components: the coarse grains and the fine particles. Coarse grains indicate either non-porous granule such as sand or porous granule such as zeolite, whereas fine particles denote only clays, especially bentonites. Coarse grains (C) and fine-matrix (F) mixture (M) will be denoted by CFM corresponding to the universal representation of SBM (sand-bentonite mixture) and ZBM (zeolite-bentonite mixture). Plaxflow Version 1.5 was used while computing the modeled binary mixtures. To begin with Plaxflow, the model geometry should be defined first and then binary mixture components should be symbolized. Since permeameters used in hydraulic conductivity tests, have nearly 1:1 dimension on account of 10.16 cm diameter and 11.64 cm height, the aspect ratio (i.e. the length of vertical axis to the horizontal axis) of the model was set unity to get a symmetric geometry.

The mixture percentage in binary mixtures is generally interpreted in terms of weight ratio. However, in Plaxflow, the mixture percentage can only be defined in terms of area ratio. Therefore, the area ratio, expressed as the ratio of fine-matrix area to the total sample area, is converted to the weight ratio by multiplying the unit width and the respective unit weights of materials. The value given by CFM indicates the fine matrix percentage in mixture. For example, 20% CFM means that 20% of the mixture by weight is fine matrix.

The analyses were run for two different configurations of coarse grains. In the first configuration, "grains which are not in contact" case was considered and analyzed. This represents the case where coarse grains are dislocated from each other, because of high fine-matrix content (FC). For this purpose, all coarse grains were surrounded by fine matrix in the model. In the next configuration, the case of "grains which are in contact" was held and analyzed. This case considers the condition of low FC in the mixture. Note that the inter-granular void spaces are filled with fine matrix and there are no air spaces between the grains.

The Plaxflow analysis was initially run for the case of "grains which are not in contact" model. In order to investigate the influence of the grain shape in a binary mixture, regular (triangle, square etc.) and/or irregular (representing original soil granules) shapes were drawn inside the model geometry, simulating the coarse grains embedded in fine matrix in a binary mixture (Figure 1). As was mentioned, the grains can also be in contact with each other. For this case, the contacted grains formed a network along the cross section. Since contacted grains have higher hydraulic conductivity than that of fine-matrix then, the preferential flow paths occur through the granule network. In this case, the flow path through granules can either be single (Figure 1.a) or multiple (Figure 1.b) as shown with arrows in Figure 1. The upper limit of this network configuration can be modeled with a tube

 Copyright © International Science and Technology Conference (ISTEC)

of coarse grain embedded in less conductive fine matrix at various FCs (Figure 2). Note that thin (Figure 2.a) and thick (Figure 2.b) tubes were drawn at the minimum and maximum allowable limits of grid spacing that was defined by user before, respectively. The analyses were run for different FCs by changing the tube width. This will lead the upper boundary for the hydraulic conductivity of binary mixtures.

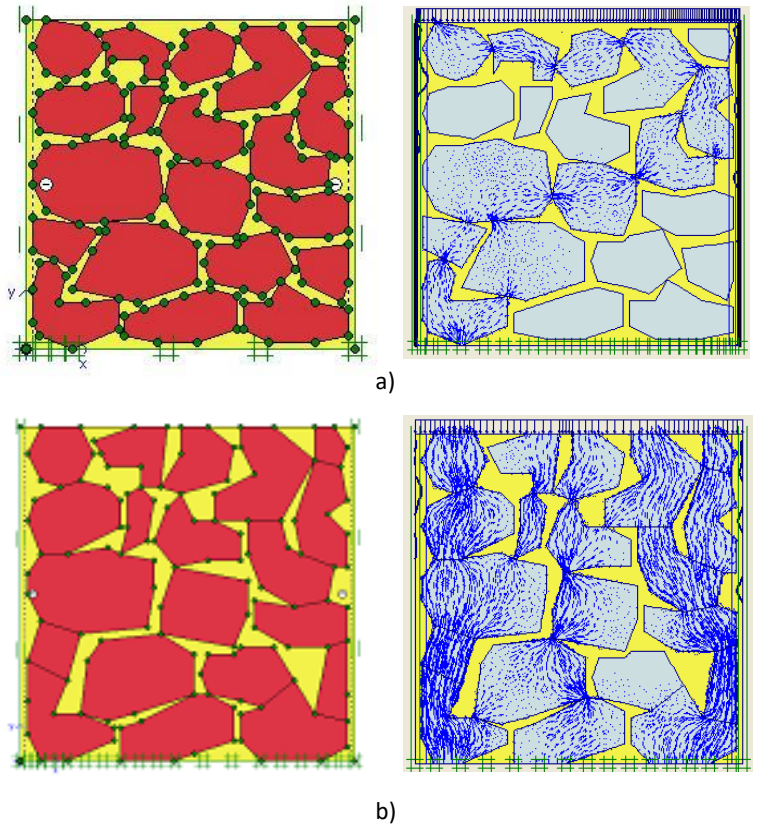

Figure 1. Two examples for the case of "grains which are in contact": visualization of a) single flow path and b) multiple flow paths, in analysis

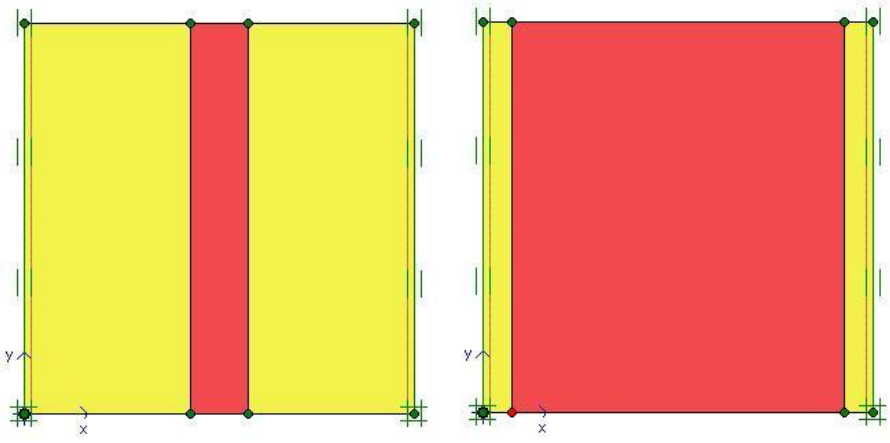

Figure 2. Representation of connected coarse grains with: a) Thin (high fine content) and b) thick (low fine content) tubes. Note that dark and light regions in the models represent coarse grains and fine matrix, respectively

When the binary mixture has low FCs (i.e. lower than 8%), it is probable that voids may occur due to the insufficient swelling of bentonite. These voids would result in preferential flow paths which would cause higher hydraulic conductivities. In order to simulate this condition, a very thin column was defined as a preferential flow path in the model (Figure 3) and the mixtures were run in Plaxflow. The model presented in Figure 3 had a

 Copyright © International Science and Technology Conference (ISTEC)

bentonite content (BC) and flow path percentages of 6.5% and 3.5%, respectively. Coarse grain percentage of the model was 90%.

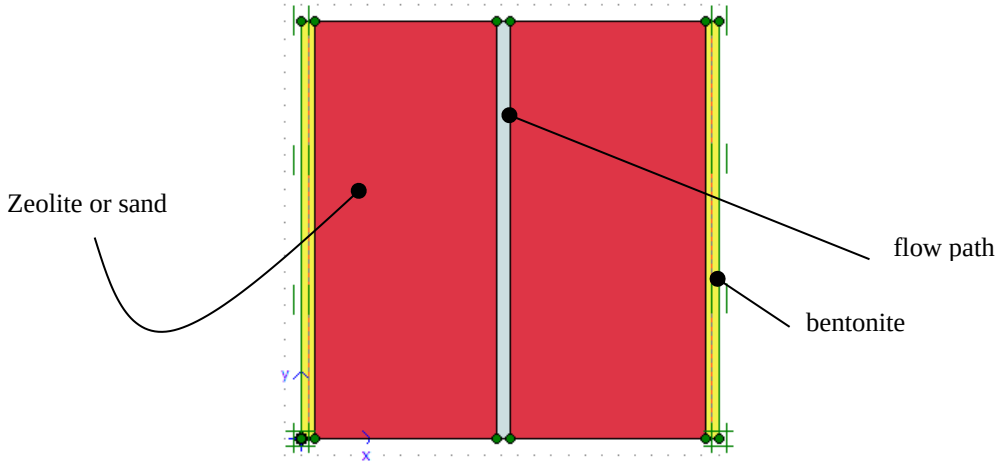

Figure 3. Representation of binary mixture with a preferential flow path

The hydraulic conductivity of the zeolite blocks was found to be 1.31 × 10^{-9} m/s in average (Durukan et al., 2013). Similarly Ören (2011) performed hydraulic conductivity tests on zeolite blocks, having various thicknesses. He showed an increasing trend with decreasing thickness of zeolite block and reports 10^{-9} m/s hydraulic conductivity for the specimen having 1 cm thickness. Therefore, the saturated hydraulic conductivity of porous granules was attained 1 ×10^{-9} m/s when analysis was conducted on ZBMs simulating porous grains-bentonite mixtures. The saturated hydraulic conductivity of fine-matrix is selected as 2 ×10^{-11} m/s, which is typical hydraulic conductivity of Na-bentonite (Chapuis, 1990; Kenney et al., 1992; Sivapullaiah et al., 2000). In a hydraulic conductivity test, the preferential flow rate is limited by the hydraulic conductivity of porous stones and/or geotextiles used at the up and bottom of the test specimen. In this study, geotextiles were considered. The hydraulic conductivity of geotextiles is reported to be in a range of 2x10^{-3} and 10^{-5} m/s. Thus, it is reasonable to use the average of these reported results (10^{-4} m/s) to represent the preferential flow in the model.

Results and Discussion

Grains which are not in contact results

The Plaxflow analysis were run for each shape of coarse grains and at various FCs for "non-porous grains which are not in contact" model. The lowest hydraulic conductivity values were obtained when the coarse grains had triangular shape. However, the hydraulic conductivities of all mixtures slightly differed from each other and were found to be independent of the shape of coarse grains. It can be said that fine matrix have the control of the hydraulic conductivity behavior of a binary mixture and the coarse grains embedded in the fine matrix can be said to increase the hydraulic conductivity of a binary mixture at most 20 times when the grains are not in contact.

The effect of porous grains to the hydraulic conductivity of the mixture is the main question of this study. For this purpose, a range of hydraulic conductivity values were given to the elements to notice its impact on the binary mixture's hydraulic conductivity when the "porous grains were not in contact". For simplicity, the model was the square grains embedded in fine matrix. Three FCs were used, they were 41%, 22% and 12%. The presentation which shows the ratio of binary mixture's hydraulic conductivity to the fine matrix haydraulic conductivity (k_{MIX}/k_F) as a function of CFM (%) having different ratios of coarse grains hydraulic conductivity over fine matrix hydraulic conductivity (k_C/k_F) is given in Figure 4. It is seen from Figure 4 that while the fine matrix percentage decreased the k_{MIX}/k_F in other words k_{MIX} increased. Besides, k_{MIX}/k_F also increased while k_C/k_F increased. However, this increase gradually decreased while k_C/k_F increased and stabilized when k_C/k_F was over 1000. Depending on the modeling results; it can be said that, when k_C/k_F exceeds three orders of magnitude, the overall hydraulic conductivity value held constant. Besides, k_{MIX} became stable around 5, 10 and 20 times of k_F for CFMs of 41, 22 and 12% respectively.

 Copyright © International Science and Technology Conference (ISTEC)

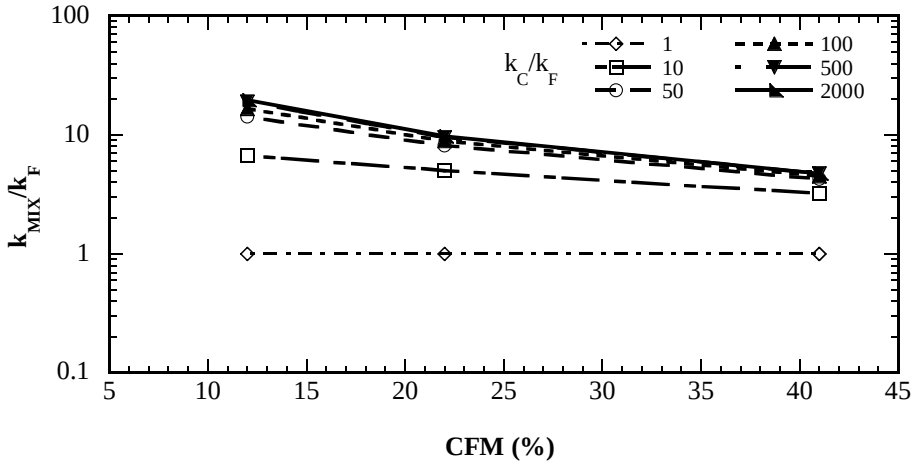

Figure 4. Variation of k_{MIX}/k_F as a function of fine content for different k_C/k_F values

Grains which are in contact results

Non-porous grains are selected to be simulating sand grains and hydraulic conductivity value was attained as "0" (zero) to sand. Porous grains are selected to be simulating zeolite grains and hydraulic conductivity value was attained as "10^{-9} m/s" to zeolite. The same model geometries were used as previously formed for CFM with non-porous Finally, mesh generation was made before running the finite element analysis. The hydraulic conductivity difference for CFM constituted both porous and non-porous grains converge at 100% FC. All results for both porous and non-porous mixtures are presented in Figure 5. The analysis were run both for "grains which are not in contact" and "grains which are in contact" cases depending on their BCs. The analysis results showed that there are three orders of magnitude less hydraulic conductivity with respect to CFM with porous grain obtained at low FCs, when non-porous coarse grain was used in the mixture.

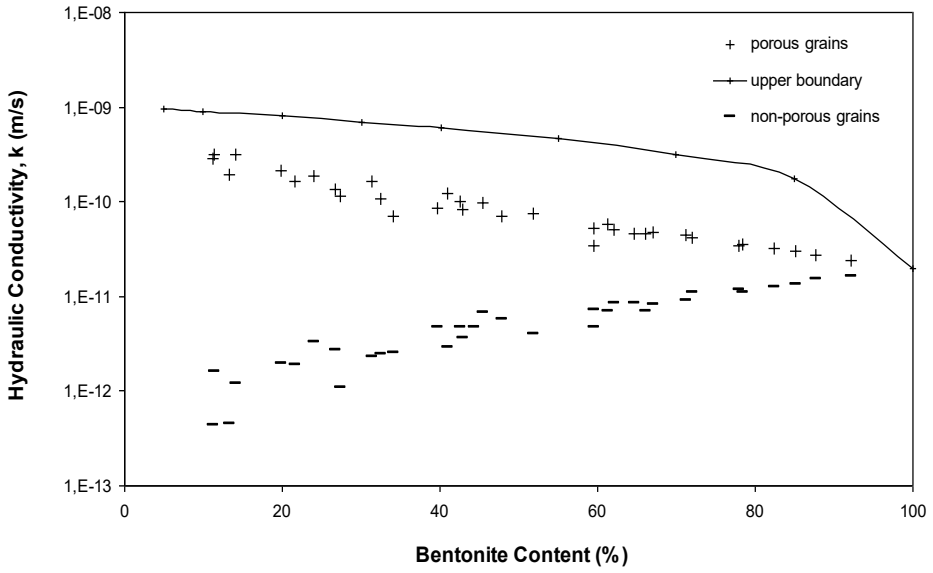

Figure 5. Modeling results of porous and non-porous grains in binary mixtures

Grains which have preferentia flow paths results

In literature, BCs more than 10% were considered as not likely to have preferential flow paths for SBMs (Cho et al., 2002; Yong et al., 1986). However, from the SEM photomicrographs of SBMs Abichou et al. (2002) showed that even 10% SBMs had voids. In addition, from several hydraulic conductivity tests, it is seen that BC of SBMs lower than 8% had relatively higher hydraulic conductivities showing that there were certain preferential flow paths (Kenney et al., 1992; Abichou et al., 2002). Moreover, the findings of the study of Ören et al. (2014) showed that 10% ZBMs could have preferential flow paths. Thus, in this study the ZBM samples having lower BC's than 10% was assumed to have preferential flow paths and modeled as well. Consequently, the upper limit was defined to be the hydraulic conductivities of these models. The comparison of the whole model results and

 Copyright © International Science and Technology Conference (ISTEC)

literature laboratory data are given in Figure 6. The laboratory data fitted well to the modelling findings both for SBMs and ZBMs. The hydraulic conductivity of 10% ZBM samples are found to lay between the upper limit of ZBMs for grains in contact and the limit for preferential flow which shows that 10% ZBMs actually have voids causing transition of water and increasing the hydraulic conductivity.

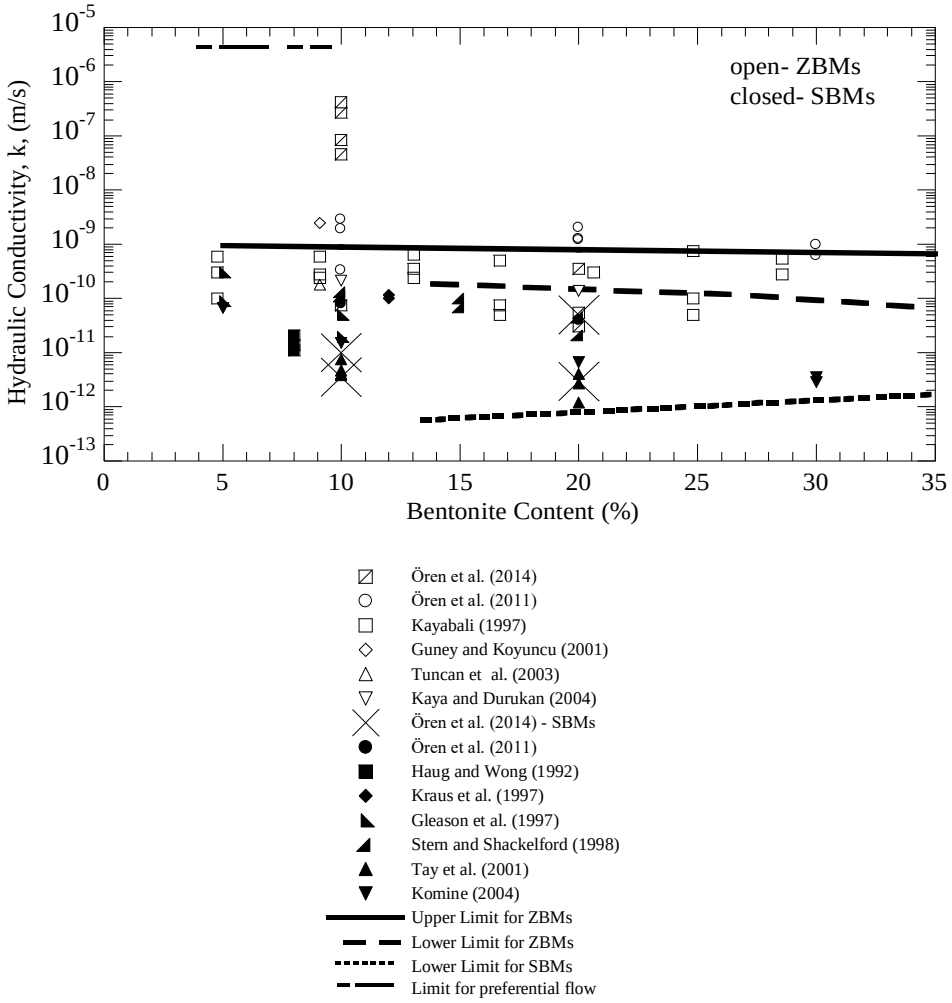

Figure 6. Literature hydraulic conductivity test results in comparison to modeling results for both porous and non-porous grains

Conclusion

A modeling study had been conducted on understanding the mechanisms controlling the hydraulic conductivity of ZBMs in comparison to SBMs. The modeling study investigated the zeolite in ZBMs and sand in SBMs as porous and non-porous grains respectively. During the modelling process, the hydraulic conductivity of zeolite and fine matrix as bentonite was assumed to be 10^{-9} m/s and 2×10^{-11} m/s, respectively, depending on the literature findings. Based on the obtained results in this study, the conclusions are drawn as the following;

- When the ratio of the hydraulic conductivity of the components in a binary mixture (which were not in contact to each other) exceeded three orders of magnitude, the mixture hydraulic conductivity value held constant as it was and did not change anymore.
- The grain shape did not have a notable effect on the hydraulic conductivity of binary mixtures. They differed at most 4 times.
- For porous grains embedded in fine matrix, it's concluded that the contact of the grains to each other had a significant influence on the hydraulic conductivity of binary mixtures.
- ZBMs and SBMs laboratory data clearly fitted the model formed by porous and non-porous grains which corresponded to zeolite and sand respectively. Some of the laboratory data of 10% ZBMs fall into the model boundary which had preferential flows. Showing that 10% ZBMs were insufficient for use of a liner.

MODERN ARAP ŞİİRİNDE SEMBOLİZM AKIMI

Salih Tur
stur@harran.edu.tr

Sembolizm, 19. Yüzyılın ikinci yarısındaParnasizme (gerçekçiliğe) bir tepki olarak Fransa'da doğmuş bir sanat akımıdır. Bilindiği üzere Parnasizmin kaynağı pozitivizm ve bilimsel görüş ve gerçekler olmuştur. İnsanı ve toplumu sadece maddi gerçekliklere dayalı olarak açıklamaya çalışmış ve insanın iç dünyasını görmezlikten gelmiştir. Sembolistler bu anlayışa karşı çıkarak, duygusallığı ve insanın iç dünyasını açıklamaya çalışmışlardır. Varlıkların dış görünüşünden uzaklaşarak onun belli bir çerçeve içinde görmeye ve izah etmeyi amaçlamışlardır. Çünkü dış dünya gözlemlendiği, algılandığı, görüldüğü ve hissedildiği gibi yansıtılması gerektiği düşüncesindedirler.

Batı edebiyatında 1885-1902 tarihleri arasında en parlak dönemini yaşayan sembolizm akımı, Arap dünyasında ilk defa Lübnanlı edebiyatçıların ürünlerinde görülmeye başlanmıştır. Lübnan, nüfusunun bir kısmının Katolik Araplardan oluşması ve misyoner okullarının burada açılması sebebiyle, diğer Arap ülkelerine göre Batıyla, bilhassa Fransa ile çok erken dönemlerde temasa geçmiş ve tarih boyunca hep yakın ilişkiler içinde olmuştur.

Ayrıca Birinci Dünya Savaşı'ndan sonra gerek Lübnan, gerekse Suriye uzun bir dönem Fransız işgalinin altında kalmıştır. Her iki ülkenin entelektüelleri arasında Fransızca, Arapça'dan sonra kullanılan ikinci bir dil olmuştur. Bu da onlara Fransız edebiyatında yaşanan gelişmeleri yakından takip etme olanağı sağlamıştır. Böylece Boudelaire, Rimbaud, Mallarmé, Valéry, Paul Verlaine gibi Fransız sembolist şairlerin şiirlerinin yanı sıra eleştiri türünde ve edebiyat kuramları gibi pek çok eser Arapçaya çevrilmiştir Çevrilen bu eserler, Ebû Şebeke, Sa'îd 'Akl, Yûsuf Gassûb, Salâh Lebkî, Bişr Fâris, Emîn Nahle, Nakûlâ Feyyâd gibi dönemin genç şairleri tarafından büyük ilgi görmüştür.

Arap şiirin de gerek içerik, gerekse biçim yönünden yeniliğe gidilmesi gerektiğini savunan dönemin genç şairlerinin bu isteklerini karşılayan, sembolizm akımı olmuştur. Zira sembolist akım, şiirin klâsik kalıpları zorlaması sonucu ortaya çıkmıştır. Sembolistler, klâsik kalıpların musikiyi, ahengi, sezginin serbest çağrışımını, sembolün gizemini ve sanatkârın bunları elde etme hürriyetini engellediği düşüncesini taşıyorlardı. Onlara göre şiirin yapısı, önceden ve başkaları tarafından belirlenmiş olan değil, bilakis şairin dehası ve yeteneği ve bir ölçüde de şiirin muhtevası tarafından belirlenmelidir. Sembolistlerin bu yaklaşımı, serbest şiirin esas olmasını da beraberinde getirmiştir.

Arap edebiyatında sembolizmin ilk belirtileri, Mehcer edebiyatçıların romantik ürünlerinde görülmüştür. Maddî sıkıntılar, dinî ve siyasî özgürlükler nedeniyle Suriye ve Lübnan'dan Kuzey ve Güney Amarika'ya göç etmiş Mehcer şairleri, Arap şiirinin gerek şekil gerekse muhteva bakımından klâsik anlayışından kurtulması gerektiğini vurgulamışlardır. Bu grubun başını çektiği yenilikçi isimlerinden Cubrân Hâlîl Cubrân olmuştur. Cübran'dan sonra İlyâs Ebû Şebeke, Mîhâ'il Nu'ayme ve İliyyâ Ebû Mâdî'nin eserlerinde sembolü ustaca kullanarak sembolizmin Arap edebiyatında müstakil bir akım olarak gelişmesine zemin hazırlamışlardır.

Bu çalışmamızda, çağdaş Arap şiirinde sembolizmin doğuşuna zemin hazırlayan faktörler, sembolizm ilke ve nitelikleri, özellikleri, benzerlikler ve ilişkiler ilkesi, musiki/ ahenk, mitolojik semboller gibi konular incelenecek ve çeşitli şairlerin şiirlerinden örnekler verilecektir.

Abstract: Considerable effort has been devoted to the design of electrodes for the direct and selective potentiometric determination of various species. Iodine and iodide compounds as essential micronutrient have important roles in brain function, cell growth, neurological activities and thyroid function. Therefore, its determination is an important analytical task.

Carbon nanotubesmodified electrodes, offering advantages of much lower ohmic resistances, very stable response, ease renewal of surface and not requiring internal filling solution, have led us to developeamulti-walled carbon nanotubesmodified glassy carbon iodide-selective electrodebased on a metal complex named [1,1′- bis(diphenylphosphino)ferrocene] dichloropalladium(II).The electrode exhibited linear response in the range of 1.0×10^{-1} -1.0×10^{-5} M with a slope of 59.6±1.1 mV/pI at pH 4.0. Additionally, SEM images of the membrane and impedance studies of the electrode were evaluated. Finally, the electrode was successfully utilized as an indicator electrode for the potentiometric determination of iodide content in pharmaceutical samples.

NÂMIK EKREM'İN *BAHÂR-I EDEB*'İNDE EDEBÎ TENKİT

Ekrem BEKTAŞ

Harran Üniversitesi, Türk Dili ve Edebiyatı Bölümü, Türkiye

ekrembek13@yahoo.com

Özet: Nâmık Ekrem 1877-8 yılında Urfa'nın Birecik beldesinde doğmuştur. Asıl adı Mehmet Ekrem'dir. Ekrem, Tanzimat devrinin önemli şairi Nâmık Kemâl'e olan hayranlığından dolayı Nâmık ismini kullanır. Birecik Rüştiye'sinde eğitime başlayan Nâmık Ekrem, Halep İdadî'sinde yatılı öğrenci olarak öğrenimine devam eder. 1889-9 yılında İstanbul'a giden Ekrem, 1909 yılına kadar orada kalır. Rahatsızlığından dolayı hava değişimi amacıyla İstanbul'dan Birecik'e döner. Birecik'te, Meşrutiyet hakkında toplantılar düzenler. Kısa bir süre sonra İstanbul'a dönen Ekrem, değişik dergi ve gazetelerde yazılar yazar ve eserler neşreder.

1911 yılında Erzurum, Van ve Bitlis bölgesinde maarif müfettişliği göreviyle görevlendirilir. 1914 yılında da Kerkük İdadî Mektebi Müdürlüğüne atanır. Bu görevde iken yakalandığı tifo hastalığından kurtulamayarak 1917 yılında Kerkük'te vefat eder.

Nâmık Ekrem, şair, yazar, eğitimci ve fikir adamı gibi vasıflarıyla öne çıkan bir şahsiyettir. Meşrutiyet'in önemli savunucularından biri olan Nâmık Ekrem edebî ve ilmî birçok eser telif eder. Ekrem'in yazdığı edebî eserlerinden biri de *Bahâr-ı Edeb* adını taşır. Müellif, söz konusu eserin "Musâhabeler" başlıklı sohbet yazılarında, bazı edebî değerlendirmelerde bulunur. Ekrem, yeni yetişen şair ve yazarların yazılarında görülen imlâ, vezin, kafiye, Arapça ve Farsça tamlamalardaki hataları eleştiri konusu yapar ve tenkitçi kimliğiyle öne çıkar. Kısacası bu bildiride, Nâmık Ekrem'in *Bahâr-ı Edeb*'teki yazılarında dile getirdiği edebî tenkitler üzerinde durulacaktır.

Anahtar Kelimeler: Birecikli Nâmık Ekrem, Bahâr-ı Edeb, edebî eleştiri.

LITERARY CRITICISM IN NAMIK EKREM'S *BAHÂR-I EDEB*

Abstract: Namık Ekrem was born in 1877-8 in Birecik-Urfa. His real name is Mehmet Ekrem. Ekrem uses Namık as a name because of his admiration to Namık Kemal who was one of the important poets in Tanzimat reform era. Namık Ekrem began his education career in Birecik middle school and continued his school career as a boarding student in Halep High School. Ekrem went to Istanbul in 1889-9 and stayed the reuntil 1909. He turned back to Birecik in order to change the athmosphere due to his disease. He organise some meetings about constitutional monarchy (Meşrutiyet). After a while, Ekrem turned back to Istanbul and he wote for different journals and newspapers.

In 1911, he worked as an inspector of education in the area of Erzurum, Van and Bitlis. Then he was assigned to directorate of Kerkuk High School. During that mission, he caught typhoid and died in Kerkuk in 1917due to this illness.

Namık Ekrem was an inspirational person as a poet, writer, educator, and intellectual. Namık Ekrem who was one of the major proponents of constitutional monarchy (Meşrutiyet) compiled many literary works and treatises. One of his literal works is called *Bahâr-ı Edeb.* In this book, the writer did some literary critique in the chapter named "Musâhabeler". Ekrem criticised the spelling, prosody, rhyme, Arabic and Persian noun phrase errors in writings of new authors and poets and he is known his critic characteristics. To conclude, literary critiques done by Namık Ekrem in *Bahâr-ı Edeb* is discoursed in this declaration.

Keywords: Namık Ekrem from Birecik, Bahâr-ı Edeb, literary critique.

Giriş

Nâmık Ekrem[1] çok yönlü bir kişiliğe sahiptir. O şair olduğu kadar, nasir, eğitimci, gazeteci, yayıncı ve aksiyon adamıdır. Nâmık Ekrem, II. Meşrutiyetin ateşli savunucularından biri olmasına rağmen edebiyat tarihimizde gereği gibi tanınmamaktadır. Bunun sebebi II. Meşrutiyetin güçlü sanatkârlarının gölgesinde kalmış olmasıyla izah edilebilir kanaatindeyim.

Ayrıca onun taşradan İstanbul'a gitmesi, kabiliyet ve sanat gücünü bir alanda değil de birçok sahada sarf edip eser vermiş olması da fazla tanınmamasına sebep olan etkenlerden bazılarıdır. Nâmık Ekrem, manzum ve mensur edebî eserlerden, ders kitaplarına; seyahat kitaplarından, tercüme eserlerine kadar birçok türde eser vermiştir. Nâmık Ekrem hakkında -dipnotta da belirtildiği üzere- hazırlanmış bir doktora çalışmasından başka ilmî bir çalışma yoktur. Urfa şairleriyle ilgili çalışmalarımızı sürdürürken böylesine velut bir müellifin bugüne değin gereği gibi tanınmamasını bir talihsizlik görerek şairin matbu olan bazı eserlerini lisans öğrencilerine bitirme ödevi olarak verdik. Hatta Ekrem'in manzum-mensur olarak kaleme aldığı *Bahâr-ı Edeb* (Bektaş 2014:)

---

[1] Nâmık Ekrem 1877-8 yıllarında Urfa'ya bağlı Birecik beldesinde doğmuş olup asıl adı Mehmet Ekrem'dir. Babası, Âyânzâde Mehmet Sürurî Efendi'dir. Mehmet Ekrem, Nâmık ismini Tanzimat devrinin büyük şairi Nâmık Kemâl (ö. 1888)'e olan hayranlığından dolayı kullanmıştır.
Nâmık Ekrem, Birecik Rüştiye'sinde eğitime başlar. Burayı bitirdikten sonra Halep İdâdî'sine yatılı öğrenci olarak devam eder ve mezun olduktan sonra da kısa bir süre Birecik'te kalır. Eğitimine devam etmek üzere 1889-9 yılında İstanbul'a giden Nâmık Ekrem, Mühendishâne Mektebine kaydolur ve son sınıfa kadar okur. Son sınıfta iken öğretmen olmak için Dârü'l-mu'alimîn-i Âliye'deki derslere devam eder ve yapılan imtihanı başarı ile vererek buradan mezun olur. Ayrıca bu arada Makriköy Mekteb-i İdâdî'sinde de öğretmenlik yapar. Nâmık Ekrem'in İstanbul'daki hayatı 6 Ağustos 1909 tarihine kadar sürer. İstanbul'da bir handa ikamet ettiği için hastalanan Ekrem, yukarıda verdiğimiz tarihte hava değişimi maksadıyla İstanbul'dan ayrılır. Ekrem, 11 yıl ayrı kaldığı ailesi ve memleketini görmek için 16 günlük meşakkatli yolculuktan sonra 21 Ağustos 1909 tarihinde Birecik'e ulaşır. İki ay kadar Birecik'te kalır fakat burada da boş durmaz. Halkın II. Meşrutiyetin ilânından pek de haberdar olmadığını bir telgrafla Dâhiliye Nezareti'ne bildirir. İttihat ve Terakki Cemiyeti'nin Birecik'teki Kulübüne giderek halkı bilgilendirir.
Tekrar İstanbul'a dönen Ekrem, değişik dergi ve gazetelerde yazılar yazar ve eserler neşreder. Eserlerinde terakki, hürriyet, meşrutiyet, eğitim ve öğretim gibi konuları işler.
Şairliğinin yanı sıra eğitimci kimliğiyle de öne çıkan Nâmık Ekrem, sadece öğretmenlik yapmaz, müfettişlik görevlerinde de bulunur. 1911 yılında Erzurum, Van ve Bitlis bölgesi, maarif müfettişliği göreviyle görevlendirilir.
Nâmık Ekrem 1914 yılında da Kerkük İdadî Mektebi Müdürlüğü görevine atanır. Ancak şairin neden Kerkük'e gittiği hususunda bir bilgimiz yoktur. 3 yıl kadar müdürlük görevini sürdüren Ekrem, bu görevde iken yakalandığı tifo hastalığından kurtulamayarak 1917 yılında Kerkük'te vefat eder.
Velut bir şahsiyet olan Nâmık Ekrem'in kırk civarında eseri olduğu ifade edilir. Fakat bunların bir kısmı kayıp olduğu için günümüze kadar ulaşamamıştır. Yunus Ayata'nın tespitlerine göre Nâmık Ekrem'in eserleri şunlardır:

A) Mensur Eserleri:
1- Ders Kitapları
Fen Hülâsaları (1320), Ziraat Dersleri (1321), Fevâid (1322), Marifet (1322), Makâlât-i Güzîde (1323), Nuhbe-i Kavâid (1325), Fâideli Mesâil -Hesaba Dâir 1- (1326)
2- Seyahat Kitapları
Bir Tercüme Denemesi: Japonya Sularında (1321 Kont Bouvard'tan çeviri), Anadoluda Bir Cevelân (1326)
3- Diğer Kitapları
Dîbâce-i Aşkımdan (1903), Japonlar (1322), Lâyiha (1326/1910), Ahvâl-i Maarif (1326/1910), Âh! Vatan (1325/1909), Mebâhis-i Müfide (1325/1909), Bir Telgrafın Tefsiri (1325/1909), Maskat-ı Re'sim Yahut Birecik (1325/1909), İnkılap (1324)
B) Manzum-Mensur Karışık Eserler
Bahâr-ı Edep (1321/1905), Şi'r-i Hakîkat (1330/1914)
C) Manzum Eserleri:
Zevâhir-i Pejmürde (1321/1905), Yâdigâr (1325/1909), Zafer-i Hürriyet (1325/1909), Osmanlı Ordusuna "10" Temmuz Hâtırası (1325/1909-10)
Bir Mesnevi Denemesi: Hicrân (1326/1910)
Nâmık Ekrem'in hayatı hakkındaki bu kısa bilgiler, Dr. Yunus Ayata taradından Doktora tezi olarak hazırlanıp yayımlanan Âyanzâde Nâmık Ekrem -Eğitime Adanmış Bir Ömür- (Hayatı, Sanatı ve Eserleri) Asitan, 2009, Sivas, adlı eserden alınmıştır. Ayrıca bu çalışmada Nâmık Ekrem'in eserlerinin içeriği tanıtılmış ve bazı değerlendirmelerde bulunulmuştur. (Ayata 2009:)

 Copyright © International Science and Technology Conference (ISTEC)

isimli eserini, Osmanlı Türkçesi dersinde öğrenciler istifade etsinler diye kısmî çevriyazısıyla birlikte tıpkıbasımını yayımladık. Bu bildirinin asıl konusunu da yayımladığımız *Bahâr-ı Edeb*'teki "Musâhabeler" (Bektaş 2014: 109-197) başlığı altında yer alan mensur yazılar oluşturur. Müellifin yer yer tekrara düştüğü ve periyodik olarak kaleme aldığı bu yazılarının toplamı yedidir. Ekrem bu yazılarında, bir münekkid gibi davranarak yeni yetişen şair ve yazarlara ders verir, onların yazdıklarını eleştirir ve bazı tavsiyelerde bulunur. Zaman zaman şiir felsefesini/poetikasını da nazara vererek şiir ile nesirde uyulması gereken kuralları hatırlatır.

Nâmık Ekrem'in tenkitçiliğini detaylı bir şekilde ortaya koymak ancak onun tüm eserlerinin incelenmesiyle mümkün olacağı kanaatindeyiz. Fakat şairin bu eserinde dile getirdiği veya eleştirdiği noktalar, edebiyat ilmiyle uğraşanlar için her zaman rehber niteliğindedir. Şairin *Bahâr-ı Edeb* adlı eserinde tespit ettiğimiz başlıklarla onun eleştirilerini ortaya koymaya çalışacağız:

1) Yeni Yetişen Şair ve Yazarların Eksiklikleri

Nâmık Ekrem, söz konusu yazılarında, yazar veya şair olmak isteyen gençlere tavsiyelerde bulunmayı ihmal etmez. Gençlerin neler yapıp nelere dikkat etmeleri gerektiğini dile getirir. Eline kalem ve kâğıdı alan yeni ediplerin/şairlerin ilk düşündükleri şeyin ünvan (başlık) olduğunu söyleyen Nâmık Ekrem, ünvan kelimesinin nakışlı, süslü ve cezb edici bir kelime olduğunu söyler. Diğer bir ifade ile nev-residegân, şöhret peşinde koştukları için çokça yazıp hemen tanınmak isterler. Oysa Nâmık Ekrem'e göre ilk önce eserin konusu çok yönlü olarak düşünülmeli, sonra seçilen konunun sağlayacağı fayda dikkate alınmalıdır. Yazılanların çok dikkatli bir şekilde mütalaa edilmesi, uygun olmayan kısımların değiştirilmesi, çıkarılması ya da tamamlanmasını önerir. Bütün bu hususlara dikkat edildikten sonra metne uygun bir başlık konulmalı görüşündedir. Böylece konu ile başlık uyumu sağlanmış olur.[2] Bu sayılanlar nazara alınmadan yazılmış bir metnin hatadan eksik olamayacağını ifade eder.[3]

Ekrem, edebiyat heveslilerinin "Şiir nedir? Edebiyat nedir? gibi çok iddialı konularda yazı yazmalarını eleştirir. Çünkü bu edebî türlerin tanımları bugüne kadar birçok kimse tarafından yapılmıştır. Bu yeni heveslilerin, yapılan tanımlara ilâve edecekleri bir şeyleri olmadığı gibi söylenenleri tekrar edip safsatadan öteye gidemeyecekleri görüşünü savunur.[4]

2) Edebiyatta İsti'dad-ı Fitrî

Nâmık Ekrem, bir insanın edip olabilmesinin ilk şartını "isti'dâd-ı fıtrî" yani doğuştan kabiliyet sahibi olmaya bağlar.[5] Ekrem, edebiyata hevesli yeni yetişen bir kimsenin, çok istekli bir şekilde çalıştığı, edebi kitaplar okuduğu ve edebiyatın kural ve kaidelerine uyduğu halde yazdıklarını zevk-i selim sahibi birine beğendiremeyip okuyucuda şevk, heyecan ve rikkat uyandıramıyorsa bunun yegâne nedeninin fitri kabiliyet yokluğu olduğunu söyler.[6]

---

[2] "El-hâsıl âsâr-ı edebiyye nasıl yazılıyor; ser-levha-i eser ne demektir; mevzû' ile mutâbakat etmeli midir? Bunlara dâ'ir hîçbir fikir edinememiş. Yalnız yazıyor, şâ'ir, edîb olmak ğarâm-ı tıflânesiyle yazıyor. Hâme be-dest; 'âlem-i edebiyâtta dolaşıyor. Eee?... Ne yazabilecek bu nev-resîde-i tahsîl!… Mevzû'a göre 'ünvân intihâb edebilecek mi? Yoook! Nerede!..."

[3] "Noksân-ı tetebbu', kıllet-i mütâla'a, fıkdân-ı tahsîl ile yazılan her eser -nesir olsun, nazım olsun- şâ'ibeden, hatâdan sâlim olabilir mi? Hâyır!"

[4] "Yine bir dîğer heveskâr-ı edeb: [Şi'ir nedir? Edebiyât nedir?...] diye başlıyor. Ortaya, bî-ser ü bün, birçok safsatalar döküyor. Hâlbuki bunlar şimdiye kadar defa'âtle söylenmiş, işitilmiş… yazılmış hâyîde şeyler. Ve's-selâm. Hem küçücük bir iktdâr-ı kalemî ile şi'irin, edebiyâtın -ki havsala-i tıflâna sığışmaz- ta'rîf ve teşrîhine girişmek ne büyük bir cür'ettir?!.. Mes'elenin daha ğarâbeti şurasındadır ki: Muharrir-i nev-heves; [edebiyât nedir?] diyor, (edebiyât) kelimesinin elifî üzerine bir de şu (ء) işâreti vaz' ediyor. Bu ne olacak? 'Arabî kelimelerin de böyle kâlıptan kâlıba girecegine cevâz veriliyor mu imiş 'acabâ?."

[5] "Meselâ: Benim edebiyâta, onun riyâziyâta, ötekinin tıbba, daha ötekinin ressâmlığa… İşte böyle her ferdin başka bir cihete isti'dâdı ziyâde bulunur. Yoksa külliyen mahrûm-ı isti'dâd bir mahlûk tasavvur olunamaz.
Kâbiliyet-i fıtriyesinin cevlângâhı olan sâhada pûyân bulunanlar yorulmazlar, bıkmazlar. Belki bir ân akdem-i ser-menzil-i maksûda erişirler. Meslek sâhibi olurlar. San'at ve hizmetlerinde ihtisâs ederler. Rağbet, servet, kemâl kazanırlar.
Evet, bir insân; zîver-i i'tilâyı cilvegâh-ı isti'dâdında aramalıdır. Çünkü onun pertev-i ümîdi orada parlar. Gül-çehre-i şâhid-i terakkîsi orada gülümser.
Yoksa… Kâbilîyet-i meftûresinin 'aksi cihetine hareket edenler ne kadar âheste yürüseler bile yine çâbûk yorulurlar. Mesleklerinde eser-i mahâret göstermezler. Ğayretlerinisbetinde iş göremezler."

[6] "Evvela: [İsti'dâd-ı fıtrî olmalıdır.] nazariyesini kabûl edelim. Fi'l-hakîka bir nev-resîde-i tahsîl -defâ'atle görülmüştür- edebiyâta merâk ediyor. Hevesli hevesli çalışıyor. Edebî kitâplar, risâleler okuyor. Fakat mesâ'isi nisbetinde güzel yazamıyor. Yazdıklarını erbâb-ı zevk-i selîme begendiremiyor. Gerçi hatâsızca yazıyor, eserleri

 Copyright © International Science and Technology Conference (ISTEC)

Nâmık Ekrem, *Bahâr-ı Edeb*'teki bir yazısında, şairlerin ne zaman şiir yazdıkları konusuna değinir. Ekrem, kimi şairlerin bahar mevsiminde, kiminin seher zamanında, kiminin de mehtaplı gecelerde kaleme sarılıp şiir yazdıklarını oysa gerçek şairlerin istedikleri zaman şiir yazabildiklerini ileri sürer.[7]

3) Lisan Öğrenme

Nâmık Ekrem, edebiyat heveslilerinin, fitrî kabiliyetten sonra sarf (kelime bilgisi) ve nahiv (cümle bilgisi) bilgisinden başka hiç olmazsa yeteri kadar Arapça ve Farsça öğrenmelerinin gereğini vurgular. Sadece Türkçe bilmenin edebiyat için yeterli olmadığını dile getiren şair, edebî ve faydalı kitaplarla meşgul olunması ve okunacak eserlerin de hoş, ahlâkî, üslûbu nazîk ve sade eserler olmasına dikkat edilmesi gerektiği kanaatindedir.[8]

Ekrem, edebiyatla uğraşanların, ayrıca Batının faydalı eserleriyle ilgilenmelerini ve Batı dillerinden en az biri özellikle de Fransızca'yı öğrenmelerini tavsiye eder.[9] Bütün bunları gerçekleştirmenin de uzun bir zaman gerektirdiğini söyleyen Ekrem, "*ihtimâm-ı ciddî, sebât-ı tahsîl*" ile insanın herşeyi öğrenebileceğini, bütün ilimlerin de çalışma ve gayretle elde edileceği tezini savunur.[10]

4) Eski Edebiyat

Nâmık Ekrem'in yazılarında, doğrudan Eski edebiyatı eleştirdiğine dair bir ifadesine rastlamıyoruz. Ancak Ekrem bir yazısında, artık "gazel-serâ (gazel okuma)"lık zamanının geçtiğini, klasik tarzda şiir yazmanın çok büyük kudret ve kabiliyete bağlı olduğunu, bu kudret ve kabiliyetin de gençlerde bulunmadığını ifade eder.[11] Zaten şairin yaşadığı devirde eski edebiyat toplumdan çekilmiş ve yerini bütün debdebesiyle yeni edebiyata bırakmak zorunda kalmıştır.

5) Şiir

Nâmık Ekrem, "Şiir nasıl olmalıdır? başlıklı yazısında, güzel teşbihlerle şiirin tanımını yapar ve şiirden ne anladığını izah eder:
"Şi'ir; hıyâbân-ı tabî'atın mîve-i şîrîn-i nefâsetidir.
Şi'ir; gülistân-ı fıtratın şükûfe-i 'ıtr-efşân-ı letâfetidir."[12]

---

kavâ'id-i edebiyyeye sanâyi'-i lafziyye ve maneviyyeye bîgâne değil; lâkin her hissi okşamıyor. Her kâri'a, okuduğu zamân -zemînine göre- şevk ü inbisât, rikkât u teheyyüc veremiyor.
Bu neden? Niçin böyle oluyor?...
Vereceğimiz cevap: [İsti'dâd-ı fıtrîsi yok…]"

[7] "Hülâsa: Hakîkî şâ'irler istedikleri zamân yazarlar. Fikirleri hisleri cevelâna başladığı vakit şi'ir söylerler. Sâdırât-ı rûhiyyelerini, mahsûl-i hislerini kâğıd üzerine nakş etmek için ne infilâk-ı seheri ne de iltimâ'-i mihri gözetmezler. İhmirâr-ı şafaka, ibtisâm-ı kamere muntazır olmazlar. Rebî'in kudûmunu, güllerin inkişâfını da beklemezler. Vâridât-ı mülhemeyi yazarlar. Duygularını söylerler. İşte böyle söylenen şi'rlerdir ki ba'zan insânı ağlatır, rikkatlendirir, tehyîc eder. Ba'zan güldürür, neşvelendirir, raksa getirir."

[8] "Ma'lûmdur ki edebiyâtımızın esâsı: üç lisân üzerine kurulmuştur: 'Arabî, Fârisî, Türkî. Yalnız Türkçeyi güzel bilmek kifâyet etmiyor. 'Arabî, Fârisî lisânlarından da her hâlde behredâr-ı vukûf olmak lâzım. - [Yâ ba'zı nev-hevesân-ı edeb; 'Arabî, Fârisî hîç bilmiyorlar da yazıyorlar, bunlara ne diyelim?] gibi- bir su'âl vârid olursa... Cevâbımız hâzır: Evet, bunlar yazmağa yelteniyor, haydi yazıyorlar da diyelim. Fakat yazdıklarında ma'nâsızlıklar, kâ'idesizlikler eksik mi? Bîgânegî-i şîve, 'adem-i insicâm ve sâ'ireye ne kadar tesâdüf olunuyor! Bu da inkâr kabûl eder mi?... Hele bir de isti'dâd-ı fıtrîden mahrûm iseler!... Vay hâline o yazıların!… Artık hezliyyât denilmez de ne denilir onlara! Muhterem kâri'ler de mesrûdâtıma hak verirler zannederim."

[9] "Peki! Bir çocuğun isti'dâd-ı fıtrîsi var. Meh-mâ-emken 'Arabî, Fârisî de biliyor. Bitti mi? O, edîb olabilir mi? Hâyır, hâyır… Daha bitmedi. Biraz da âsâr-ı müfîde-i Garbîyeye imâle-i nazar etmeli. Garb edebiyâtından da bir fikir edinmeli. Bunun için de elsine-i ecnebiyyeden bir kaçını, yâhûd, hîç olmazsa, Fransızca'yı öğrenmeli…"

[10] "[Peki-a'lâ ya! Bunları ögrenmek müddet-i medîdeye mütevakkıf. Nasıl öğrenmeli?] gibi bir su'âl daha, belki, mütebâdir-i hâtır olur…
Cevâben deriz: İhtimâm-ı ciddî, sebât-ı tahsîl ile insân herşey'i öğrenebilir. Dünyâda hîçbir 'ilim yoktur ki sa'y u ğayretin elinden kurtulabilsin. Meğer ki ğayrette kusûr, 'adem-i sebât görüle..."

[11] "Bundan bir kaç sene evvellerine gelinceye kadar ara sıra hakîmâne gazeliyyât… yazılmış bunlar güzel, 'ulvî, şevk ve lezzetle okunur. Lâkin öyle gazelleri söylemek de büyük bir iktidâr ve isti'dâda mütevakkıf. Şimdiki yazanlarımızda hani o iktidâr?! Nerde o servet-i fikr ü hayâl!... Mâdâm ki o kudret ve kâbiliyet mefkûd. Mâdâm ki öyle şi'irler söyleyemeyecegiz… O hâlde yâve-gûluğu bırakalım. Hezl-perdâzlıktan vâzgeçelim. Hissî, nev-tarz neşîdeler yazmağa çalışalım. Daha iyi olmaz mı?"

[12] Şiir, mizaç/huy caddesinin, nefis tatlı meyvesidir. Şiir, fıtrat gül bahçesinin hoş kokular saçan çiçeğidir.

 Copyright © International Science and Technology Conference (ISTEC)

Ekrem, şiir söylemek için insanın tabiatını zorlamasının bir anlam ifade etmediği görüşündedir. Şair, "şiir, insan mizacının çocuğudur" der. Yine şaire göre şiir, fıtrat bahçesinin açılmış çiçeği olmalı ki her kalbe her ruha zevk, rikkat, heyecan ve güzel şeyler bahş edebilsin.[13]

Şaire göre, şiirde ilk aranılacak şey mana ve ruhtur. Daha sonra şiirde incelik, ahenk, renk ve şiiriyet kokusu olmalıdır. Vezin ve kafiye ise sonra aranılacak hususlardır.[14]
Nâmık Ekrem, devrinde yazılan şiirlerde mana ve ruh aramaktan vazgeçildiğini kelime ve terkiplere bile dikkat edilmediğini söyleyerek şu soruları sorar:

> "İşte bakınız:
> [Bir güzel günde: Şûh u sevdâkâr
> Baktın ey zehre-i şeğaf-dîde!
> Handeler serperek, gülümseyerek
> Bu nazar-ı imtidâd-ı sâfiyle…]
> Hani kâfiye ?!"

Nâmık Ekrem, eli kalem tutan genç şairlerin, öğrenim ve mütalaa dönemlerinde şiir ve edebiyat ile ilgilenmelerini doğru bulmaz. Çünkü bu dönemde yazılan şiirlerin anlamsız ve tuhaf olduğunu ifade eder.[15]
Başka bir yazısında da Ekrem, genç ediplerin edebî kabiliyetlerini yanlış kullandıklarını hatta bu kabiliyetlerinin farkında olmadıklarını; oysa ileride bunların mükemmel birer şair ve yazar olabileceklerini nakleder.[16]

Ekrem, başka bir yazısında da şiirde aradığı hususları (ahenk, uyum, vezin sağlamlığı ve üslûp nazikliği) tekrar ederek bu özellikleri taşıyan şiirin ruhlara bûy-ı nezâheti (incelik kokusu) verdiğini söyler. Eğer bir şiirde yukarıda sayılan hususlar yoksa bunun şiir sayılamayacağı fikrini savunur.[17]

Nâmık Ekrem bu yazılarında sadece şairleri eleştirmez, nasirleri de (düz yazı yazanlar) eleştirir. Hatta nev-residegân diyerek kalem oynatan edipleri tenkit eder.

6) Üslûp

Ekrem, gençlerin önemli eksikliklerinden birini de aynı uslûbu tekrar edip durmaları olarak görür. Üslûbun zaman zaman değiştirilmesi gerekliliğinden bahseder. İfade şekline "yeni yeni renkler, farklı farklı incelikler ve güzellikler verilmeli" der. İster manzum ister mensur olsun aynı üslûp, aynı ifade ediş tarzı okuyucunun hoşuna gitmediği gibi bıkkınlık verir. Eserin konusu güzel olsa bile kelime ve üslûp tekrarı usandırır. Zevk-i selim sahibi kimseler bu hususları asla göz ardı etmez. [18]

7) Nâmık Ekrem'in Beğendiği Şair ve Yazarlar

---

[13] "Şi'ir söylemek için cebr-i tabî'at büsbütün bî-fâ'idedir. Zâde-i tâb' olmalı. Şüküfte-i bâğzâr-ı fıtrat bulunmalı, ki her kalbe, her rûha zevk, rikkat, heyecân, incilâ gibi şeyler bahş edebilsin."
[14] "Şi'irde gerçi vehle-i ûlâda aranılacak şey: Rûh-ı me'âl ise de; incelik, âhenk, renk ve bûy-i şi'iriyyet bulunur, evzân ve kavâfîye de ri'âyet edilirse, şi'irin hüsn ü meziyetine renk ve revnak-ı dîğer 'ilâve edilmiş olmaz mı?"
[15] "Tahsîl ve mütâla'aya ihtiyâç zamânlarında şi'ir ve edebiyât ile uğraşmak -bî-me'âl şi'irler meydâna getirmek- tuhaf? Hem pek tuhaf görülür!"
[16] "Fakat nev-resîdegân-ı tahrîr, isti'dâd-ı edebîlerini sû-i isti'mâl ediyorlar. İleride her biri mükemmel bir edîb, gerçekten bir şâ'ir olabilecek nice nev-hevesân edîbimiz var ki… Bunlar mâlik oldukları kâbiliyyet-i meftûre-i edebiyyeden bî-haber… Beyhûde sa'y ile vakit geçiriyorlar. Daha doğrusu 'abesle iştiğâl ediyorlar… Ne gibi"
[17] Beni ağlatma 'arz-ı vuslat kıl!
Ne için sen, beni nizâr etdin
Dili âzâde-i melâmet kıl!
Ne için böyle hâksâr etdin
Ne için böyle dil-figâr etdin!...
mısrâ'larını nazar-ı mütâla'adan geçirelim: Ne diyor? Bir kaç def'a daha okuyalım; "Şi'ir"in rûhlara ilkâ etdigi bûy-ı nezâheti, biz bu mısrâ'lardan istişmâm edebilecek miyiz? Nerede?..."
[18] "Meselâ: Bir heveskâr-ı tahrîr:
[(Aslı)nın derd-i şevk-i 'aşkından:
(Kerem) oldum, (Kerem) gibi yanarım]
gibi udhûkeler/gülünecek şeyler, u'cûbelerle imlâ-yı sahâyif etse bunu kim okur? Okunsa bile bu safsatalardan ne lezzet hissolunur? Hîç!!.
[Küsme yârim, barışalım hep kabâhat bendedir.]
gibi 'Âşık Ömer'imsi birçok gazellerde görülüyor. Artık böyle gazelleri okuyup da zevk alana 'aşk olsun!..."

 Copyright © International Science and Technology Conference (ISTEC)

Nâmık Ekrem'in beğenip de yazılarında ismini andığı şairlerden ilki A. Rahmî Beydir.[19] Ekrem, şairin "Mayıs Sabâhı" adlı manzumesini çok beğenir fakat şiirden örnek vermez. Yine kim tarafından yazıldığı belirtilmeyen Hz. Peygamberin övgüsündeki "Sitâyiş-i Peygamberî" isimli şiirin mükemmel olduğunu ifade eden Nâmık Ekrem, şiirdeki "ulviyyet ve kudsiyyet"in her şairin havsalasına sığmayacağını, "elfâzındaki insicâm ve letâfete, âhengindeki ihtişâm ve nezâhete" hayrân olduğunu söyler ve manzumeden bazı bölümleri örnek verir.[20]

Nâmık Ekrem, şiirde olduğu gibi nesirde de beğendiği yazarların ismini vermekten çekinmez. Ekrem, bu yazarları "gönül süsleyen sima, gönlün kabul ettiği başka bir tarz, ilim sahibi, bilgili, hürmete değer, gönülde taht kuran eşsiz tarz sahipleri" olarak görür. Bu yazarlar Hâlid Ziyâ (ö.1945), Safvetî Ziyâ (ö. ?) ve Ahmed Hikmet (ö.1927) Efendilerdir.[21]
Nâmık Ekrem, özellikle Halid Ziya'nın "kamçılarım" tabirini çok beğenir. Fakat nev-residegânın, üç beş manzume yazan müteşairin (şair geçinenler) bu kelimeyi anlamadığı gibi yerinde kullanmadıklarından yakınır. Hatta "çırpınmak, gıcıklamak, hırpalamak…" gibi kelimeleri, yerinde kullanılması şartıyla tavsiye eder.[22]

8) Kafiye Yanlışları

Tanzimat ve Servet-i Fünûn dönemlerinde şairlerin en çok tartıştığı konulardan biri de kafiyedir. Özellikle Recâi-zâde Mahmut Ekrem (ö.1914) ile Muallim Nâcî (ö.1893) arasındaki "abes-muktebes" tartışmaları (Kolcu 2007: 228-29), eski ile yeni şiirin bir nevi mücadelesi olup edebiyat tarihimizde önem arzetmektedir. Birecikli Nâmık Ekrem, ileri sürdüğü eleştirilerle, kafiyenin göz için olduğu görüşünü savunan Muallim Nâcî'nin izinden gittiği anlaşılır. Bu yönüyle şairimizin divan şiirinde savunulan kafiyeden yana tavır aldığını söyleyebiliriz.[23]

9) Dil Yanlışları

Nâmık Ekrem, *Bahâr-ı Edeb*'teki yazılarında en çok da dil yanlışları üzerinde durur. Ekrem hemen hemen her yazısında bu dil yanlışlarına değinir. İsim vermeden zamanın yeni yetişen şair ve yazarlarını eleştirerek Türkçeyi iyi kullanamadıklarını, gerek mensur ve gerekse manzum eserlerde hataya düşdüklerini ileri sürer. Şairin dile getirdiği hususları alt başlık şeklinde şöyle sıraladık:

A) Farsça Tamlamalar

Ekrem, yeni yetişenlerin Farsça isim ve sıfat tamlamalarını yanlış kullandıklarını örnek vererek eleştirir. Malum olduğu üzere, Farsça isim ve sıfat tamlamaları Arapça tamlamaları gibi muzaf (tamlanan) ve muzafün-ileyh (tamlayan) arasında uyum olmalıdır. Yani biri tekilse diğeri de tekil, biri müennesse diğeri de müennes olmalıdır. Ekrem bu konuda önce kuralı söyler. Sonra yapılan yanlışları doğrusuyla ve gerekçesiyle birlikte örnek vererek açıklar.

a) Muzaf-muzafün-ileyh İlişkisi

---

[19] Bu şahıs hakkında kesin bir bilgi bulamadık.

[20] **"Sitâyiş-i Peygam-berî**

[Bir mihr-i hidâyetle münevver, mütemâdî
Ufk olmada meşhûn-ı füyûzât-ı nühüfte…
Bir müjde-i kudsî vererek derdi münâdî:
"Peygam-ber-i zî-şân-ı İlâhî budur işte…"
Kur'an'ı dedikçe: [Bırakın, şirk ü fesâdı;
Lebbeyk-zen-i tâ'at olurdu o bevâdî]

İşte diyebilirim ki bu da bir şi'ir, bir şi'r-i 'ulvî vü kudsîdir. Hem şi'ir de böyle olmalıdır. Rûhda ba'zan teheyyüc, ba'zan hüzn ü rikkat, ba'zen incizâb u hayret hâsıl etmelidir. Kalbde hiss-i 'ulviyyet, meyelân-ı bedâyi', perestiş-i mehâsin, hubb-i nezâhet beslemelidir."

[21] "…Mütefennin, ma'lûmâtlı şâ'irlerimizin, muhterem edîblerimizin tarz-ı bedî'-i dil-nişînlerini ta'kîb edelim! Ez-cümle Hâlid Ziyâ, Safvetî Ziyâ, Ahmed Hikmet Beyfendîlerinin üslûb-ı merğûb-ı müzeyyinlerini -hüsn-i sûretle- taklîd edecek olursak… Bizim için ne kadar iyi olur!"

[22] "Çırpınmak, gıcıklamak, hırpalamak… lafızları mevki'inde kullanılırsa pek güzel! Bir diyeceğimiz kalmaz. Lâkin bu gibi kelimelerin mevki'-i isti'mâllerini bilmek de 'amîk-i mütâla'a ve tetebbu'a muhtâç olduğunu unutmayalım. Yoksa her kaleme sarılan nev-resîde, her üç beş manzûme yazan müteşâ'ir bunların hüsn-i isti'mâlinde çoook güçlük çeker."

[23] "Birçok kelimelerde (ḥ) ile (ẖ) karıştırılıyor. Meselâ: (meshûr/sihirlenmiş, ḥûr, ḥafr/kazma, ḥazâkat/ustalık, ḥüzn…) gibi kelimelerde (ḥ) üzerine nokta konuluyor. Ve (maẖmûr, ḫaşîn, ḫâre) gibi lafızların (ẖ)larında nokta görülmüyor. Öyle bellenmiş, öyle yazılıyor. Eee; ya ma'nâ degişiyorsa, büyük hatâ olmaz mı?
Bir de "mübhem" ile "ârâm", "esrâr" ile "yer" nasıl takfiye ediliyor?"

 Copyright © International Science and Technology Conference (ISTEC)

"Arabî masdarlardan Türkçede isti'mâl olunanlarının nihâyetlerinde (te) var ise bunlar hem müzekker hem mü'ennes bir sıfat alabilir."

-"safvet-i bâhire": "safvet-i bâhir" ikisi de câ'iz.

-"sükûn-ı dâ'ime" terkîbi yanlıştır; "sükûnet-i dâ'ime" demeli.

-"iktidâr-ı kalemiyye", terkîbi mutâbakatsızdır, "iktidâr-ı kalemî" demeli.

-"tedâvî-i lâzıme, tedâvî-i 'âcile…" gibi terkîbler de yanlıştır. "iktidâr, tedâvî…" kelimeleri müzekkerdir sıfatları niçin müennes olsun?

-"bir leyl**e**-i ğarrâ" yerine "bir leyl-i münevver" demek gerekir.

-"hâl-i ğunûdîsi (istirahat/uyumuş hali)" değil "hâl-i ğunûdunu",

-"nâzî-i yâr": "nâz-ı yâr" yazılmak münasiptir.

-"nevâzî-i dildâr": "nevaziş-i dildâr",

-"menâkıb**ât**-ı ğarâm" (sevda menkıbeleri)

-"müşâfeh**ât**-ı mezheb" (mezhebin yüz yüze konuşması) denilebilir mi 'aceb?!

-"deşt-i hâre": "deşt-i âteşîn" veya "deşt-i hâr",

-"'aşk-ı nâ'imî": (uyumaya mensup aşk),

-"rûh-ı sâhirî": (gece uyumayan ruh) terkîb-i tavsîfîleri de hatâlıdır. Zâten (nâ'im, sâhir) sıfat makâmında müsta'meldir. Bir de yâ-yi nisbî ilâvesine ne gerek var?" der.

-"mest-i sûr!" (düğün/sevinç sarhoşu) terkîbi manîdârdır.

Nâmık Ekrem, tamlamayı oluşturan kelimelerin yani muzaf ve muzafün-ileyhin aynı dilden olmasını önemser. Fakat Osmanlı Türkçesi'nde Arapça'nın bu kuralına pek de uyulmadığı bilinir. Hatta Türkçe kelimelerle Farsça tamlama oluşturulduğu da görülür (alay-ı Hümâyûn gibi). Şair şağıdaki örnekleri vererek eleştiride bulunur:

-"ıztırâbât-ı derûniyye: "ıztırâbât-ı kalbiye",[24]

-"sirişk-i lâmi'a": "sirişk-i nûrânî",

-"fevka'l-ümîd" denilemez. (ümîd) kelimesi Fârsîdir. Ne harf-i tâ'rîf ve ne de tenvîn kabûl eder. Buna bedel "fevka'l-me'mûl", denilse febihâ /ne güzel..."

-"ahvâl-i **nâ**-marziyye",

-"âfâk-ı **nâ**-mer'iyye" gibi terkîbler kural dışıdır. Farsça olumsuzluk edadıtı (nâ)'nın yersiz kullanıldığını ifade eder.

-"ahvâl-i ğayr-ı marziyye…" diyelim, daha muvvâfıktır.

b) Galat Terkipler

Osmanlı Türkçesi'nde galat kullanımların yaygın olduğu bilinir. Hatta "Galat-ı meşhur lügat-ı fasihten evladır." sözü durub-ı emsal hükmüne geçmiştir. Nâmık Ekrem bu konuda da bazı kullanımları eleştirir:

-"tırâzende-i hüsn": (güzel donatıcı) "hüsn-i tırâzende" (süsleyici güzel),

-"tâbende-i cemâl": "cemâl-i tâbende", (parlayan güzel) demenin daha uygun olduğunu söyler.

-"tarab-ı sâz": "tarab-sâz" (neşe ve sevinç veren, nağme düzen)

-"hüsn-i lâmi'a": (parlayan güzel) terkîbi de ğalattır. "Hüsn-i tâbân", "hüsn-i münevver", "hüsn-i ziyâ-bâr" gibi terkîblerden biri kullanılmalı.

-"kenâr-ı mâder" de ma'nîdârdır. "Âğûş-ı mâder" denilecek olsa şiirin veznine halel gelir. Bunu lisân-ı şi'ire vâkıf olanlar tecvîz etmezler.

-"nevâ-yi lâmi'a": (parlayan neva, ahenk) terkîbini kullanmakta ne mecbûriyet var?! der.

-"Bir tefelsüf-i perrân" (uçucu felsefe sözleri söyleme). İşte cicili bicili bir terkîb size... İşiniz yoksa anlamağa çalışınız.

-"Galeyânî-i hissiyât" terkibindeki (galeyân) kelimesinin âhirinde (ye) ne arar? Bî-lüzûmdur.

-"Müntesebîn-i erbâb-ı fünûndan biri…" ibâresinde dürüst bir ma'nâ anlayamadık. 'Acabâ "erbâb-ı fünûnun-âşinâlarından biri...] denilmek mi isteniliyor?

-"bahr-ı şîrîn-mezâk" (tatlı zevk denizi) yeni işitilen bir sıfat olduğunu dile getirir.

10) Farsça Kelimelere Arapça Ek Getirmek

Nâmık Ekrem, Osmanlı Türkçesi'nde normal karşılanan bazı tasarrufları eleştiri konusu yapar. Farsça "mâh, bahâr ve mâtem" gibi kelimelere Arapça "-iyyet" mastar ekinin getirilerek kullanılmasının uygun olmadığını söyler. Bunların yerine, aynı anlama gelen Arapça kelilerin kullanılmasını önerir. Örneğin "Mâtemiyyet"

[24] "Ba'zı âsâr-ı mensûrede görülen [ıztırâbât-ı derûniyye] terkîbi yanlıştır. Çünkü (ıztırâbât) 'Arabî, (derûn) Fârisî. Bunlar arasında mutabâkat câ'iz olamaz."

 Copyright © International Science and Technology Conference (ISTEC)

kelimesini "Fârisî bir kelimenin âhirine (-iyyet) masdar alâmeti ilâve olunur mu hîç?!..." diyerek bu kullanımı yanlış bulur. [25]

11) Anlam Yanlışlıkları

Şair, yeni yetişenlerin, anlamı düşünmeden kelimeleri yerli yersiz kullandıklarını ifade ederek şu örnekleri verir:

-"bir eşi'a" (bir aydınlıklar):" bir şu'â"[26]
-"ahmerîn": (kızıllı),
-"asferîn": sarılı) gibi kelimelerin nihâyetindeki (în) fazla değil midir? diye sorar.
-"bir zerrâ'" (bir ekinci, ekin yapan, çiftçi) denilemez, kâ'ideten "bir zârî (bir çiftçi)" yâhûd "bir zirâ'atkâr" demeli.
-"perestîde-i kalb" (kalp sevgili),
-"nev-resîde-i hayâtıma" (hayatın yeni yetişeni),
-"nedîme-i rûhuma" (ruh arkadaşı) ifadelerini hezeyan olarak değerlendirir.[27]
-"teşfîye (iyileştirme) ve teşmîl" kelimelerine mukâbil "işfâ', ta'mîm" yazılmak muvâfık görülüyor.
-"sûzişter" olamaz! "sûzişînter" yazılmalı.

12) Arapça Kelime İle Türkçe Yardımcı Fiil Uyumu

Arapça isimlerin Türkçe yardımcı fiirlerle kullanımı çok yaygındır. Ancak her Arapça isme her Türkçe fiil getirilemez. Nâmık Ekrem haklı olarak, aşağıdaki örneklerin Türkçenin söyleyişine ve akıcılınağa uymadığını söyleyerek eleştirir:

-"ta'zîz kılacak" (izzetlendirme kıl-) ,
-"telzîz kılacak…": (lezzetlendirme kıl-)
-"Rüzgâr hafîf hafîf vezân ediyor"**:** (vezân oluyor.)
-"Vakit güzerân ediyor": (güzerân oluyor.)
-"sebkat eden" (geçme, ilerleme eden): "sebk eden" (ileri geçen, kazanan) olmalı.

13) Yanlış Edat Kullanımı

Ekrem, Arapça "a'lâ ve evlâ" gibi kelimelerin önlerine Türkçe "daha" edatı getirerek "daha a'lâ", "daha evlâ" gibi yazmak kural bilmemekten kaynaklandığını söyler.[28]

"Kat-ender-kat" denilemez. (ender) edâtı Fârsçadır, iki Türkçe kelimenin arasına sokuşturulamaz. (Kat kat) diyelim yine ma'nâ-yı te'kîd (pekiştirme) anlaşılır.

-"gün-be-gün", ta'bîri de böyledir. "Günden güne", denilirse ne hoş!
-"ey cânâ!" denilemez. "cânâ"nın nihâyetindeki elif harf-i nidâ (seslenme edatı)dır. (Ey) getirmeye lüzûm yok.

14) Yanlış Bağlaç Kullanımı

Yeni yetişenlerin "de" bağlacıyla "-de" ekini bile katıştırdıklarını oysa "de" bağlacının her zaman ayrı yazılması gerektiğini vurgular.

15) Arapça Kelimeleri Yanlış Telaffuz Etme

Alıntı kelimelerin Osmanlı Türkçesi'nde telaffuzu başlı başına bir mevzudur. Ekrem, vezinli olarak okunan Arapça kelimelerin Türkçe'de nasıl dikkat edilmeden kullanıldığına bir kaç örnek verir:

-"Avân" Arapça "ân" kelimesinin çoğuludur. Zamân gibi okunur "Âvân" şeklinde okunmamalıdır.
-Kandîl'in çoğulu "kanâdîl"dir, "kânâdîl" olamaz der.

Nâmık Ekrem, Türkçe kelimeleri herkes istediği gibi kullanabilir ancak Arapça kelimeleri istediği gibi kullanma salahiyetine/yetkisine sahip olmadığı görüşündedir. Mesela Arapça "mukmir" kelimesini yanlış kullanıldığını

[25] "Mâhiyye, bahâriyye...) misillü kelimelerin nihâyetlerine (ye) nereden geliyor? (Mâh, bahâr) kelimât-ı Fârsiyedendir. Bu sûrette isti'mâlleri câ'iz olamaz. Bunlara bedel 'aynı ma'nâda (rebî'iyye, kâmeriyye…) demiş olursak hoşa gitmez mi?"

[26] "Hele bir eşi'a: hîç denilemez… Kâ'ideten (bir şu'â') denilmeli."

[27] -"Güzelsin sevdigim bir nev-nihâlin ebr-i alından"
ma'nâ aranıldıkda: [Sevdigim! Sen, yeni bir fidânın al bulutundan güzelsin…] şeklinde nesre aktarılabilen mısradaki "al bulut/kırmızı bulut" ifadesinin anlamsız olduğunu mananın lafza feda edildiğini söyler.

[28] [A'lâ, evlâ] gibi kelimelerin evvellerine bir (daha) edâtı getirerek (daha a'lâ), (daha evlâ) sûretlerinde yazmak da kâ'ide nâ-şinâslık sayılır.

 Copyright © International Science and Technology Conference (ISTEC)

söyler. Çünkü "mukmir" "ef'âl" bâbından "ism-i fâ'ildir" "tef'îl" bâbından "ism-i mef'ûl" şeklinde anlaşılmamalıdır. Bu tür yanlış kullanımlara özellikle şiirde dikkat edilmesinin gereğinden bahseder.[29]
Yine Arapça "tıbk, ayn ve ba'z" kelimelerinin kullanımına dair bir kural hatırlatır. Bir isimle birlikte kullanıldığında "tıbkı, aynı ve ba'zı" şekillerini örnekle izah eder.[30]

16) Çoğulun Çoğulu (Cem'u'l-Cem')

Nâmık Ekrem, Türkçe'de özellikle alıntı kelimelerde görülen çoğulun çoğulu kullanımının biçimsiz olduğunu söyler. Alıntılanan dilde çoğul olduğu halde Türkçenin çoğul eki olan "-ler, -lar" ekinin ilavesiyle bu durum ortaya çıkar. Bu kelimelerin bir kısmı dilimizde galat olarak kullanılmaktadır.

-"Ma'âlîyât" (yüksek fikirler, ululuklar) yerine "ulviyyât (yücelikler) kelimesinin daha uygun olduğunu dile getirir. Ma'âliyyât kelimesi çoğulun çoğuludur. Bu da (masârifât) gibi biçimsiz...

-"Melâ'ikeler, masârifler, 'ameliyâtlar..." kullanımı yanlıştır. [Melekler, masraflar, 'ameliyeler…] diyelim.

17) Arapça Kelimeleri Yanlış Yazmak

Edebiyat kelimesinin elifî üzerine hemze (ء) işâreti koyarak yazmak. Yine Arapça "lâkin" kelimesindeki elif yazılmadığı halde uzun okunuşundan dolayı bu kelimeyi (لاكن) şeklinde yazmanın yanlışına dikkat çeker.[31]

Sonuç

Görüldüğü üzere Nâmık Ekrem, yaşadığı devrin eli kalem tutanlarının yazılarında yaptıkları yanlışları görmezden gelmeyerek o yazıları dikkatle okur; kendince tespit ettiği imlâ, kelime ve kelime grubu yanlışlarını yazılarında işleyerek yeni yetişen gençlere yol gösterir. Nâmık Ekrem bu eleştirileri yaparken isim vermeden ve kimseyi incitmeden bir münekkit duyarlılığıyla tespitlerini ortaya koyar. Böylece yeni yetişen şair ve yazarlara yol göstererek muallimlik ve münekkitlik görevini deruhte eder.

NEAR-FAULT, FAR-FIELD GROUND MOTION EFFECTS ON THE EARTHQUAKE PERFORMANCE OF RC BUILDINGS CONSIDERING VARIOUS CONCRETE STRENGTHS

Seda COŞKAN*, Murat Emre KARTAL, Muhammet KARABULUT, Murat ÇAVUŞLİ

[1]Lecturer., Zonguldak Vocational School, Bülent Ecevit University, Kilimli, Zonguldak, TURKEY, sedacoskan@beun.edu.tr

Abstract: Earthquakes can cause a high risk in reinforced concrete (RC) structures. The reasons of the damage can be very various- the two of them are the distance between the buildings constructed in active faults and concrete strength. After Van Earthquake occurred on 23rd of October 2011 and 9th of November 2011 in Van, demolished or damaged buildings were determined. As a result, one of the most important reasons of damage was that concrete strength was too lower than the expected strength. As the distance from a structure to epicentre is near so the effects of near-fault earthquake motions on structures are bigger. The main purpose of this study is to examine the change of the structural performance of existing buildings having the same reinforced concrete (RC) load-bearing system but different concrete strengths in a seismic zone considering different distances to the epicentre. For this purpose, various concrete strengths have been selected among the reports which were prepared after Van earthquake and 1989 Loma Prieta earthquake accelerograms have been used in this study. Structural performances of three story buildings with three bays which have various concrete strengths and the different distances to epicentre are compared. Time history analyses of a multi-story building by mode superposition method are performed in the numerical solutions. The maximum internal forces and relative displacements in the scenarios are compared to evaluate earthquake performance of the frame systems. National specification TEC-2007 is used in the numerical analyzes and evaluations. According to the obtained numerical results, the distance from RC building which has different concrete strength to the epicentre has significant effects on the behavior of the RC load-bearing system.

Keywords: Concrete strength, Earthquake performance, Far-field effect, Near-fault effect, Reinforced concrete structure

FARKLI BETON DAYANIMLARINA SAHİP BETONARME YAPILARIN YAPISAL PERFORMANSINDA YAKIN FAY ETKİSİNİN ARAŞTIRILMASI

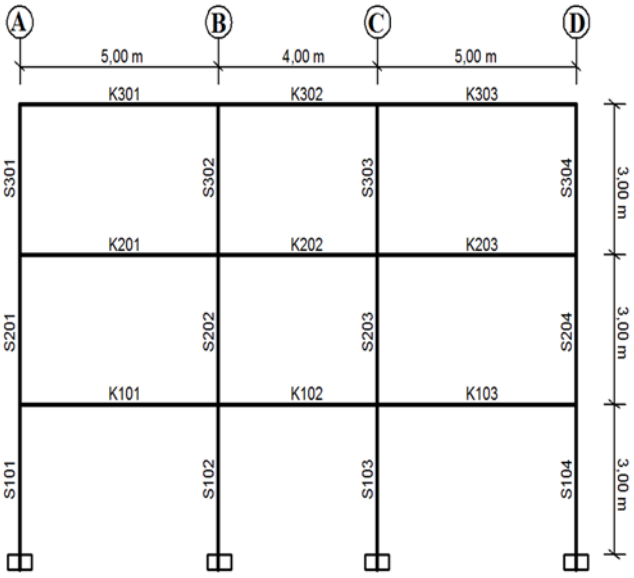
Özet: Depremler betonarme yapılar için büyük risk yaratırlar. Betonarme yapılarda hasara yol açan sebepler çok çeşitli olmakla birlikte yapının beton dayanımı ve aktif faylara olan uzaklık bu sebeplerden bazılarıdır. 23 Ekim ve 9 Kasım 2011'de Van'da meydana gelen depremlerden sonra hasarlı ve yıkılan binalarda incelemeler yapılmış ve hasara sebep olan en önemli etkilerden birisi olarak, elde edilen beton dayanımının beklenenin çok altında çıkması gösterilmiştir. Yapının depremin odak noktasına (episentır) yakınlığı yakın fay etkisi olarak isimlendirilir ve eğer sistemde yakın fay etkisi mevcutsa yapının maruz kalacağı deprem etkisi de o kadar büyük olur. Sözkonusu çalışmanın amacı episentıra farklı uzaklıklardaki aynı taşıyıcı sisteme fakat farklı beton dayanımlarına sahip yapıların yapısal performanslarını ortaya koymaktır. Bu amaçla Van Depremi sonrasında yapılan çalışmalardan çeşitli beton dayanımları seçilmiş, Loma Prieta (1989) deprem ivme kayıtları kullanılmıştır. Üç katlı, üç açıklıklı, farklı beton dayanımlarına sahip ve episentıra farklı uzaklıklarda olan çerçeveler karşılaştırılmıştır. Sayısal çözümlerde mod birleştirme yöntemi dikkate alınarak zaman tanım alanında dinamik analizler gerçekleştirilmiştir. Gerçekleştirilen sonlu eleman analizleri sonucunda, deprem etkileri altında çerçevede oluşan en büyük kesit tesirleri ve rölatif deplasmanlar karşılaştırılarak binanın yapısal performansı değerlendirilmiştir. Çözümleme ve değerlendirmelerde DBYBHY-2007 kullanılmıştır. Elde edilen sayısal sonuçlara göre, farklı beton dayanımlarına sahip binaların depremin odak noktasına olan uzaklıklarının betonarme taşıyıcı sistem davranışı üzerinde belirgin etkilerinin olduğu görülmüştür.

Anahtar Kelimeler: Beton dayanımı, Betonarme yapı, Deprem performansı, Yakın fay etkisi.



Giriş

Türkiye dünyadaki aktif deprem kuşaklarından biri olan Alp-Himalaya Deprem Kuşağında yer almaktadır. Dolayısıyla ülkemizde yapılar için en büyük riski depremler oluşturmaktadır. Binalar henüz proje aşamasında iken deprem etkileri dikkate alınarak tasarım yapılmaktadır. Ancak, fayların türü, kırılma şekli, derinliği vb. etkenlere bağlı olarak depremlerin enerjileri dolayısıyla da yapılardaki etkileri değişmektedir. Bu etkileri indirgemek için fayları tanıyarak özelliklerini bilmek gerektirmektedir. Depremin yapılarda sebep olduğu etkiyi belirleyen en önemli faktörlerden biri de yapının depremin merkez üssüne olan uzaklığıdır. Merkez üssüne 10 km den daha yakın depremler yakın fay yer hareketi olarak adlandırılırken, daha uzaktakiler uzak fay yer hareketi etkileri olarak adlandırılmaktadır (Bayraktar vd., 2009). Deprem hareketi yapının zorlanacağı deprem kuvvetini oluştururken, yapının bu kuvvete karşı direnme kabiliyetinin de yeterli olarak tasarlanmış olması gerekmektedir. Ülkemizde son yıllarda 23 Ekim 2011 tarihinde Van'da yaşanan 7.1 Mw büyüklüğündeki deprem ile 9 Kasım 2011'de 5.7 Mw büyüklüğündeki depremler sonrasında büyük can ve mal kayıpları yaşanmıştır (Teknik Rapor, 2011). 604 kişi ölmüş, 4.152 kişi yaralanmış, 11.232 yapı hasar almış ve 60.000 kişi evsiz kalmıştır (AFAD, 2011). Yerinde yapılan incelemelerde bu yıkıcı etkiye sebepler ise yanlış projelendirme, hatalı işçilik ve yetersiz malzeme dayanımları olarak belirtilmiştir (Di Sarno vd.). Hasarlı yapılardan alınan karot numunelerin çıkarılamadan parçalandığı dolayısıyla beton dayanımlarının çok sıkıntılı olduğu da ifade edilmiştir. Söz konusu çalışmanın amacı farklı mesafelerden elde edilen deprem ivme kayıtlarını kullanarak betonarme çerçevelerin deprem performanslarının belirlenmesidir. Burada aynı geometri ve kesit özelliklerine fakat Van Depremi'nden sonra hazırlanan raporlardan seçilmiş farklı beton dayanımlarına sahip olan betonarme çerçeve sisteme farklı deprem kayıtları uygulanmıştır. Sayısal çözümlerde mod birleştirme yöntemi dikkate alınmıştır. Zaman tanım alanında dinamik analizler yapılmıştır.

Analitik Model

Söz konusu çalışmada fay etkilerinin ve beton basınç dayanımının binaların performanslarına olan etkileri ortaya koymak istenmiştir. Bu amaçla basit bir çerçeve sistem oluşturulmuştur (Şekil 1).

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 1. Çerçeve genel görünüşü

Çerçevede, ikinci değişken parametre olarak beton basınç dayanımları değiştirilmiştir. Seçilen beton basınç dayanımları Tablo 1'de belirtilmiştir.

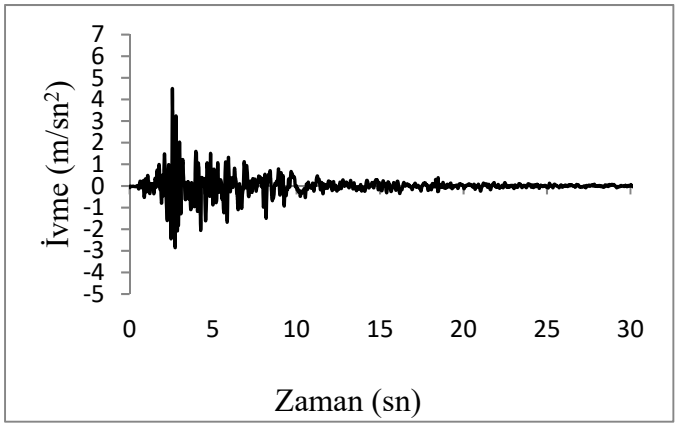
Tablo 1. Beton malzeme özellikleri

No	Basınç Dayanımı (MPa)	Elastisite Modülü (MPa)
1	20	28000
2	4.7	10840

Çerçevenin mevcut eski yapıları temsil ettiği düşünüldüğünden S220 sınıfı çelik kullanıldığı kabul edilmiştir. Çerçeve elemanlarının donatılarına ait özellikler de Tablo 2'de gösterilmiştir.

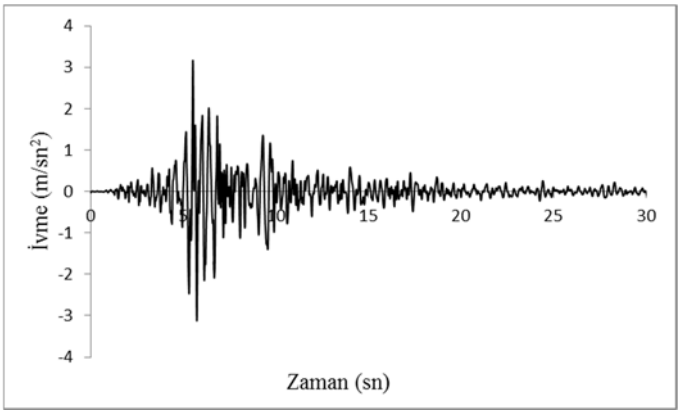
Tablo 2. Kolon ve kiriş donatı özellikleri

Eleman Tipi	Benzeri Elemanlar	Boyut (cm/cm)	Boyuna Donatı		Etriye	Paspayı (mm)
S 101	S104	40/40	8Ø16		Ø8/200	30
S 102	S103	50/50	10Ø16		Ø8/200	30
K101	K102 K103	25/50	770 mm^2 462 mm^2	770 mm^2 462 mm^2	Ø8/200	30



Deprem etkisi olarak yapıların faylara olan uzaklıkları baz alınmıştır. Merkez üssüne 10 km den daha yakın yapıların yakın fay, 10 km den daha uzak yapıların ise uzak fay etkisinde oldukları kabul edilmektedir (Bayraktar vd., 2009). Söz konusu çalışmada, diğer değişken parametre olan aktif faya uzaklığın yapıların deprem performansına etkisini ortaya çıkarmak için Loma Prieta (1989) Depreminin merkez üssüne 5.1 km, 24.2 km, 93.1 km uzaklıklardaki, aynı taşıyıcı kesit özelliklerine sahip yapıyı etkilediği varsayılmıştır. Dolayısıyla çerçevenin üç farklı mesafelerde ve iki farklı beton basınç dayanımına sahip olduğu kabul edilerek analizler yapılmıştır (Tablo 3).

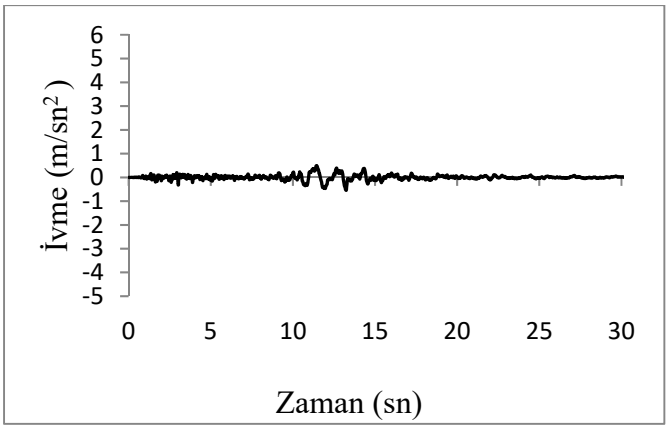
 Copyright © International Science and Technology Conference (ISTEC)



Tablo 3. Analiz senaryoları

Senaryo No	Fay Uzaklığı	Moment Büyüklüğü	Maksimum Yer İvmesi (g)	Beton Basınç Dayanımı (MPa)
Senaryo 1	5.1 km	6.9	0.644	20
Senaryo 2	5.1 km	6.9	0.644	4.7
Senaryo 3	24.2 km	6.9	0.226	20
Senaryo 4	24.2 km	6.9	0.226	4.7
Senaryo 5	93.1 km	6.9	0.124	20
Senaryo 6	93.1 km	6.9	0.124	4.7

Her bir senaryo için SAP 2000 programında zaman tanım alanında mod birleştirme yöntemi dikkate alınarak sonlu analizler yapılmıştır. Bu amaçla senaryolara ait çerçeveler programda modellenmiştir. Daha sonra çerçeve 17 Ekim 1989 tarihinde California'da gerçekleşen Loma Prieta depreminden alınan, merkez üssüne göre farklı uzaklıklardaki deprem ivme kayıtlarına (Şekil 2-4) maruz bırakılmıştır(Peer, 2013). SAP 2000 programında doğrusal çözümler yapılarak faya olan uzaklığa ve beton dayanımına göre çerçevede oluşacak hasar seviyeleri belirlenmiştir. Hasar sınıflandırması ise DBYBHY 2007 Bölüm 7'ye göre yapılmıştır.



Şekil 2. Loma Prieta depreminin 5.1 km için doğu-batı bileşenin ivme zaman grafiği

Şekil 3. Loma Prieta depreminin 24.1 km için doğu-batı bileşenin ivme zaman grafiği

Şekil 4. Loma Prieta depreminin 93.1 km için doğu-batı bileşenin ivme zaman grafiği

Sonuçlar

DBYBHY 2007'ye göre binanın herhangi ardışık iki kat arasındaki yer değiştirme farkını ifade eden kolonların göreli kat ötelemeleri hasar sınırını belirlemektedir. Buna göre herhangi bir kattaki kolonun alt ve üst uçları arasındaki yer değiştirme farkının o kat yüksekliğine oranı 0.01'den küçükse Minimum Hasar Sınırı (MN), 0.01 ile 0.03 arasında ise Güvenlik Sınırı (GV), 0.03 ile 0.04 arasında ise Göçme Sınırı (GÇ) ifade etmektedir. Dolayısıyla katlar arasındaki yerdeğiştirme miktarları önem arz etmektedir. Deprem kuvveti altında senaryolarda meydana gelen yerdeğiştirmeler Tablo 4'de verilmiştir. Tablo 4 incelendiğinde; senaryolar arasında en büyük yerdeğiştirme 21.624 cm ile senaryo 2'de; en küçük yerdeğiştirme ise 1.214 cm ile 5 nolu senaryoda gerçekleşmiştir. Buna göre yerdeğiştirmenin büyük olmasının sebebi çerçevenin merkezüssüne yakınlığı yani yakın fay etkisi ile beton basınç dayanımının en küçük değer olan 4.7 MPa olmasıdır. (Şekil 7).

Tablo 4. Katlarda meydana gelen yerdeğiştirmeler

Senaryo No	Fay Uzaklığı	Beton Basınç Dayanımı (MPa)	1.Kat Yatay Yerdeğiştirmesi (cm)	2.Kat Yatay Yerdeğiştirmesi (cm)	3.Kat Yatay Yerdeğiştirmesi (cm)
Senaryo 1	5.1 km	20	6.356	13.886	20.002
Senaryo 2	5.1 km	4.7	7.895	14.998	21.624
Senaryo 3	24.2 km	20	1.335	3.327	4.189
Senaryo 4	24.2 km	4.7	1.402	3.389	4.296
Senaryo 5	93.1 km	20	1.214	2.668	3.783
Senaryo 6	93.1 km	4.7	1.225	2.762	3.982

DBYBHY 2007'ye göre belirlenen hasar sınıflarına ait değerler ise Tablo 5'de verilmiştir. Söz konusu tablo incelendiğinde en büyük göreli öteleme oranı 0.0263 ile Senaryo 1'de gerçekleşmiştir. Daha önceden de belirtildiği üzere öteleme oranı 0.01 Minimum Hasar Sınırı ile 0.03 Güvenlik Sınırı arasında kalmıştır. Bu sebeple kesit belirgin hasar almıştır. Bu hasarın sebebi ise yapının depremin merkez üssüne yakın olması ve beton basınç dayanımının çok düşük olmasıdır. Yakın fay haricindeki (Senaryo 1 ve 2) diğer bütün senaryolarda kesitlerdeki hasar Minimum Hasar Sınırından küçük değerler almıştır, dolayısıyla sistem minimum hasar bölgesindedir. Sonuçlar açıkça göstermektedir ki yapı depremin merkez üssüne ne kadar yakınsa, depremde göreceği hasar da o kadar etkilidir.

 Copyright © International Science and Technology Conference (ISTEC)

Tablo 5. DBYBHY 2007'ye göre hesaplanan göreli kat öteleme oranları ve hasar sınıfları.

Senaryo No	Fay Uzaklığı	1.Kat Göreli Öteleme Oranı	2.Kat Göreli Öteleme Oranı	3.Kat Göreli Öteleme Oranı	Hasar Sınıfı
Senaryo 1	5.1 km	0.0211	0.0251	0.0203	MN<GV
Senaryo 2	5.1 km	0.0263	0.0236	0.0221	MN<GV
Senaryo 3	24.2 km	0.0044	0.0066	0.0028	<MN
Senaryo 4	24.2 km	0.0047	0.0066	0.0030	<MN
Senaryo 5	93.1 km	0.0040	0.0048	0.0037	<MN
Senaryo 6	93.1 km	0.0041	0.0051	0.0040	<MN

Deprem etkileri altında sistemin çözümlenmesi sonucunda herbir senaryoya ait bütün kesitlerdeki momentler incelenmiştir. Maksimum momentlerin ait olduğu kesitler belirlenerek Tablo 6 oluşturulmuştur. Tablo 6'ya göre, en büyük moment 1674 kNm ile senaryo 2'de ortaya çıkarken, en küçük moment ise 223.18 kNm ile senaryo 5'de ortaya çıkmıştır. Yine beklendiği üzere en büyük iç kuvvet yakın fay etkisinde ve en zayıf beton basınç dayanımına sahip olan senaryoda ortaya çıkmıştır. Buradan da açıkça görülmektedir ki, merkez üssüne yaklaştıkça moment değerleri de artmaktadır.

Tablo 6. Maksimum momentler ve ait olduğu kesitler.

Senaryo No	Maksimum Moment	Yeri
Senaryo 1	1568 kNm	S101,S102
Senaryo 2	1674 kNm	S101,S102
Senaryo 3	317.68 kNm	S101,S102
Senaryo 4	326.85 kNm	S101,S102
Senaryo 5	223.18 kNm	S101,S102
Senaryo 6	252.87 kNm	S101,S102

Söz konusu çalışmada, yakın ve uzak fay etkilerine maruz iki farklı beton dayanımına sahip betonarme çerçeve sistemlerin mod birleştirme yöntemiyle zaman tanım alanında çözümleri yapılmıştır. Tablolar incelendiğinde açıkça görülmektedir ki yapının depremin merkezüssüne yakınlığı arttıkça hasar seviyesi de artmaktadır. Ayrıca beton dayanımının düşmesi de davranışı olumsuz yönde etkileyen faktörlerin başında gelmektedir. Proje aşamasında aktif faylar incelenerek yapının faya yakınlığına dikkat edilmelidir. Şantiyede dökülen beton dayanımının projede belirtilen değerden az çıkmamasına dikkat edilmelidir.

NEIGHBOR INTEGRITY OF HARARY GRAPHS

Goksen BACAK-TURAN, Ferhan Nihan ALTUNDAG

Manisa Celal Bayar University, Department of Mathematics, Manisa, TURKEY

goksen.turan@cbu.edu.tr, ferhannihanaltundag@ogr.cbu.edu.tr

Abstract: A network is a series of interconnected centers and transmission paths. A system like transportation, communication, computer, logistics, etc., constitutes a network. Failure of the links between stations, break down the centers, software faults on the network, hardware malfunctions, transmission errors that may occur in various centers affect the quality of service to be received over a network, more importantly, it causes a long interruption. In such a situation, to know the vulnerability, the resistance of the network to disruption of operation after the failure of certain stations or links until the system break down completely, is becoming important. A network can be modelled by a graph representing the centers by vertices and the links between the centers by edges. Various vulnerability parameters were defined in graph theory to study the vulnerability of the networks. Connectivity, integrity, toughness, tenacity, scattering number and rupture degree are some of the vulnerability parameters defined in graph theory. But in spy networks, if a spy or a station is revealed, then the adjacent stations cannot be trusted. Neighbor integrity is a vulnerability parameter that considers the neighborhoods and hence can be applied to the spy networks. The neighbor integrity of a graph G is defined to be $NI(G) = \min_{S \subseteq V(G)} \{|S| + c(G/S)\}$ where S is any vertex subversion strategy of G, and c(G/S) is the order of the largest connected component of G/S. In this study, we deal with the problem of computing the neighbor integrity of Harary graphs which are the graphs having maximum possible connectivity with the minimum number of edges and hence many researchers are interested in studying its stability properties.

Keywords: Graph Theory, vulnerability, neighbor integrity, Harary graphs.

Introducton

A network consists of centers and lines which connect the centers. A network can be divided into different networks or it can be formed by many sub networks. Failure of / break down the links between centers, failure of the centers, software faults on the network, hardware malfunctions, transmission errors that may ocur in various centers affect performance of a network more importantly. They can cause an interruption on the received service over a network for a long time. The resistance of the network to disruption of operation after the failure of certain stations or links until performance of the network completely stops is called vulnerability. To learn about the vulnerability of the network is very important for the network designers and network analysts. It provides the construction of the network to be designed both in the most appropriate way possible against the threat and in a manner which provides the reconstruction of the network exposed to a damage in a short time. There are different network topologies such as path, tree, star topology and each network topology has advantages and disadvantages. When a network topology need to be modelled mathematically, usage of graph theory emerges as one of the ways of modelling. In a network topology, a network can be modelled by a graph representing the centers by vertices and the links between the centers by edges. Various vulnerability parameters were defined in graph theory to study the vulnerability of the networks. These parameters can be evaluated by using the number of the elements that are not working, the number of the sub networks, and the number of elements in the remaining largest network that can still mutually communicate. Connectivity (Harary, 1969), integrity (Barefoot, 1987), toughness (Goddard, 1990), tenacity (Cozzens et al., 1995), scattering number (Jung, 1978) and rupture degree (Li, 2005) are some of the vulnerability parameters defined in graph theory. Some informations about the vulnerability of the network modelled by graphs can be obtained by using these graph parameters.

The basis of these parameters is the connectivity which is the minimum number of centers that must be removed to disconnect the network. Network designers and network analysts want to design a network which is more reliable or less vulnerable. So they want maximum possible connectivity whereas they want minimum number of edges for the lowest cost network.

For any fixed integers m and n such that $n \geq m + 1$, Harary constructed the class of graphs $H_{m,n}$ which are m-connected with the minimum number of edges on n vertices. So Harary graphs have the maximum possible

 Copyright © International Science and Technology Conference (ISTEC)

connectivity with the minimum number of edges and hence many researchers are interested in studying its stability properties (Harary, 1962). Three cases are followed to create Harary graphs:

Case 1: If m is even, let $m = 2k$, then $H_{m,n}$ has vertices $0,1,2,\dots,n-1$, and two vertices i and j are adjacent if and only if $|i-j| \leq k$, where the addition is taken modulo n.

Case 2: If m is odd $(m > 1)$ and n is even, *let* $m = 2k+1$ $(k > 0)$, then $H_{m,n}$ is constructed by first drawing $H_{2k,n}$ and then adding edges joining vertex i to vertex $i + \frac{n}{2}$ for $1 \leq i \leq \frac{n}{2}$.

Case 3: If m is odd $(m > 1)$ and n is odd, let $m = 2k+1$ $(k > 0)$, then $H_{2k+1,n}$ is constructed by first drawing $H_{2k,n}$ and then adding edges joining the vertex i to $i + \frac{n+1}{2}$ for $0 \leq i \leq \frac{(n-1)}{2}$.

Note that under this definition, the vertex 0 is adjacent to both the vertices $\frac{(n+1)}{2}$ and $\frac{(n-1)}{2}$. Again note that all vertices of $H_{m,n}$ have degree m except for the vertex 0, which has degree $m+1$.

In particular, if a vertex loses its function in the security system or in spy networks then adjacent vertices become disfunctional in the same way. With this in mind, many neighbor vulnerability parameters were determined. One such parameter is the neighbor integrity. The concept of neighbor integrity was introduced by Cozzens and Wu in (Cozzens et al., 1996).

Let G be a simple graph without loops and multiple edges and let u be any vertex in G. The set $N(u) = \{v \in V(G); v \neq u, v$ and u are adjacent$\}$ is the open neighborhood of u and $N[u] = \{u\} \cup N(u)$ denotes the closed neighborhood of u. A vertex u in G is said to be subverted if the closed neighborhood of u, $N[u]$, is removed from G. A set of vertices $S = \{u_1, u_2, u_3, \dots, u_m\}$ is called a vertex subversion strategy of G if each of the vertices in S has been subverted from G. If S has been subverted from the graph G, then the survival subgraph is disconnected, a clique or an empty graph. The survival subgraph is denoted by G/S. The neighbor integrity of a graph G is defined to be

$$NI(G) = \min_{S \subseteq V(G)} \{|S| + c(G/S)\}$$

where S is any vertex subversion strategy of G and $c(G/S)$ is the maximum order of the components of G/S (Cozzens et al., 1996).

Neighbor Integrity of Harary Graphs

In this section, we investigate lower and upper bounds of the neighbor integrity for the three cases of the Harary graphs.

Theorem 1. Let $H_{m,n}$ be a Harary graph with $m = 2k$ and $n \geq 3$. Then the neighbor integrity of $H_{m,n}$ is

a) If $1 \leq k \leq \left\lfloor \frac{n}{2} \right\rfloor$, then

$$NI(H_{m,n}) = \begin{cases} \lceil 2\sqrt{n} \rceil - (2k+1), & \text{if } 1 \leq k \leq \dfrac{\sqrt{n}-1}{2} \\ \left\lceil \dfrac{n}{2k+1} \right\rceil, & \text{otherwise.} \end{cases}$$

b) If $k > \left\lfloor \frac{n}{2} \right\rfloor$, then $NI(H_{m,n}) = 1$.

Proof. It is obvious that $H_{m,n} \cong C_n^k$. Thus we have $NI(H_{m,n}) = NI(C_n^k)$.

a) For $1 \leq k \leq \left\lfloor \frac{n}{2} \right\rfloor$ we get $NI(H_{m,n}) = NI(C_n^k) = \begin{cases} \lceil 2\sqrt{n} \rceil - (2k+1), & \text{if } 1 \leq k \leq \frac{\sqrt{n}-1}{2} \\ \left\lceil \frac{n}{2k+1} \right\rceil, & \text{otherwise.} \end{cases}$

since it was proved by Cozzens and Wu in (Cozzens, 1998).

b) For $k > \left\lfloor \frac{n}{2} \right\rfloor$, $diam(C_n) = \left\lfloor \frac{n}{2} \right\rfloor \leq k$. Thus we get $C_n^k \cong K_n$. Therefore we obtain

 Copyright © International Science and Technology Conference (ISTEC)

$$NI(H_{m,n}) = NI(C_n^k) = NI(K_n) = 1.$$

Theorem 2. Let $H_{m,n}$ be a Harary graph with $m = 2k + 1$ and n even, and let $n \geq (4k + 2)(2k + 2)$ and $k \geq 2$. Then the neighbor integrity of $H_{m,n}$ is

$$2\left\lceil\sqrt{n - (2k + 2)}\right\rceil - (2k + 1) \leq NI(H_{m,n}) \leq \gamma(H_{m,n}).$$

Proof. Let S be a subversion strategy of $H_{m,n}$ and let $|S| = r$.

If r vertices are removed from $H_{m,n}$, then we have at least $r - 1$ components and $c(H_{m,n}/S) \geq \frac{n-(2k+2)r}{r-1}$. Hence

$$|S| + c(H_{m,n}/S) \geq r + \frac{n-(2k+2)r}{r-1} \text{ and}$$

$$NI(H_{m,n}) \geq \min_r \left\{r - (2k + 2) + \frac{n-(2k+2)}{r-1}\right\}.$$

The function $f(r) = r - (2k + 2) + \frac{n-(2k+2)}{r-1}$ takes its minimum value at $r = \sqrt{n - (2k + 2)} + 1$. Consequently, we obtain

$$NI(H_{m,n}) \geq 2\sqrt{n - (2k + 2)} - (2k + 1).$$

As the neighbor integrity is integer valued, we round this up to get a lower bound and get

$$NI(H_{m,n}) \geq \left\lceil 2\sqrt{(n - (2k + 2)}\right\rceil - (2k + 1).$$

Fort he upper bound, let S be the minimum dominating set of $H_{m,n}$ and the domination number be $\gamma(H_{m,n})$. Then $N[S] = V(G)$ and therefore we have $c(H_{m,n}/S) = 0$. Since according to the definition we have $NI(G) \leq |S| + c(G/S)$, we obtain an upper bound as $NI(G) \leq \gamma(H_{m,n})$.

Theorem 3. Let $H_{m,n}$ be a Harary graph with $m = 2k + 1$ and n odd, and let $n \geq (4k + 5)(2k + 2)$ and $k \geq 2$. Then the neighbor integrity of $H_{m,n}$ is

$$2\left\lceil\sqrt{n - (2k + 3)}\right\rceil - (2k + 1) \leq NI(H_{m,n}) \leq \gamma(H_{m,n}).$$

Proof.. Let S be a subversion strategy of $H_{m,n}$ and let $|S| = r$.

If r vertices are removed from $H_{m,n}$, then we get at least $r - 1$ components and $c(H_{m,n}/S) \geq r + \frac{n-1-(2k+2)r}{r-1}$. Hence we obtain

$$|S| + c(H_{m,n}/S) \geq r + \frac{n-1-(2k+2)r}{r-1} \text{ and}$$

$$NI(H_{m,n}) \geq \min_r \left\{r - (2k + 2) + \frac{n-(2k+3)}{r-1}\right\}.$$

The function $f(r) = r - (2k + 2) + \frac{n-(2k+3)}{r-1}$ takes its minimum value at $r = \sqrt{n - (2k + 3)} + 1$. Consequently we get

$$NI(H_{m,n}) \geq 2\sqrt{n - (2k + 3)} - (2k + 1).$$

Since the neighbor integrity is integer valued, we round this up to get a lower bound and obtain

$$NI(H_{m,n}) \geq 2\left\lceil\sqrt{n - (2k + 3)}\right\rceil - (2k + 1).$$

For the upper bound, the proof is very similar to that of the previous theorem.

Conclusion

 Copyright © International Science and Technology Conference (ISTEC)

Connectivity is a basic measure used to determine the vulnerability of a graph. And it is equal to the minimum number of vertices removed from the graph to make the graph disconnected. We always prefer a stable and durable network which has maximum connectivity. Increase in the connectivity also requires an increase in the number of edges but we prefer to use minimum number of edges for a lowest cost network. Ultimately, we have to balance the cost and stability. Harary graphs which have the maximum possible connectivity with the minimum number of edges provide this balance. In this paper we obtained lower and upper bounds for the neighbor integrity of the three cases of the Harary graphs.

Abstract: The aim of this paper is focused on the generation, by using Ansys code, of a FEM 3D model, able to design a new cuff bladder. The work has its origin from the observation that commercial cuffs can produce considerably uneven around the arm pressure distributions. So it is born with the goal of designing a new cuff suitable both for generate a circumferential pressure distribution whose non uniformity is limited and known, and for be used without rotational or towards limitations. The code was validated in previous circumstances and here implemented by the insertion of the bladder in several configurations. The desidered configuration provides for a uniform pressure distribution around the arm. The Young's modulus was extrapolated from the measurements conducted on top forearm by Zheng (1999), taking account of the greater tissue thickness on the mid-arm. For this situation the occlusion pressure of the arterial vessel equal to 17300 Pa (≈ 130 mmHg) has been determined. Then, further 5 configurations, obtained by dividing the bladder in 2, 4, 8, 12 and 16 equal sectors, were analyzed. For each configuration, finally, it was evaluated the pressure required to occlude the arterial vessel in different positions. Regardless of the number of sectors the maximum error that can be made is always less than 1300 Pa (≈ 10 mmHg). This error may be automatically corrected in the NIBP monitor firmware.

Keywords*:* Arm-cuff FEM model, blood pressure measurement.

Introduction

In the bibliography it is well emphasized that numerous factors may influence the accuracy of blood pressure measurements. The use of a wrong bladder size to arm circumferences ratio is the most common cause of measurement inaccuracy. The specific bibliographic field is quite large and articulated, mainly including clinical measurements, recommendations of regulatory Bodies and researches about modeling and simulation. Numerous authors have highlighted the reading differences that it is possible to obtain comparing cuffs of different sizes.
Iyriboz et al. (1994) quantified the reading differences obtained using 12/23 and 15/33 cuffs. Bakx et al. (1997) determined the effects using cuffs having different width and length. Marks and Gronch (XX) came to the conclusion, based on the comparison between auscultatory and direct pressure measurements, that the measurement error can be minimized by using a bladder having width equal to 46% of the arm circumference. Jilek and Stork (2010) analyzed the influence of the bladder width during the use of the radial site. In Reid and Chantler (2002) the corrections made by Maxwell have been reported. Maxwell was one of the first to suggest in 80% the optimum ratio between the bladder length and the arm circumference.
The American Heart Association (AHA) (Pickering 2005) sets four cuff standard sizes, moreover it established that “the ideal cuffs should have a bladder length of 80%, and a bladder width of at least 40% of the arm circumference”. A width/length ratio of 1:2 appears to be optimal, especially regarding the insertion problem around the arm that smaller ratios might entail.
The European Society of Hypertension (ESH) (O’Brien 2003) advises the three cuffs mentioned by the British Hypertension Society (BHS) and refers to the dimensions standardized by the AHA.
Other authors have found that if the cuff bladder does not completely encircle the arm, the resulting not uniform pressure, can be an additional source of error depending upon the depth and the location of the artery. This aspect has been confirmed by King (1967) who found falsely high blood pressure readings when the bladder failed to encircle the arm. As evidenced by Bakx (1997) not always different experiences of blood pressure measurements lead to consistent conclusions.
Other sources of error due to the incorrect use of the cuff have been explored by Mersich and Jobbagy (2009). They state that the cuff length should cover the entire circumference of the arm. According to O'Brien (2003) they also suggest to affix the cuff as tightly as possible. Then they conclude their work stating that the cuff transfer functions differ considerably, regardless of size, when used in tight or loose mode of affixation.
Vallascas and Usai in the work (2014) showed that the circumferential pressure distribution is deeply uneven. This fact determines errors in pressure measurement in function of the cuff rotation angle relative to the recommended position. They also showed the variations in the pressure distribution as a function of the cuff affixation mode. When you consider the possibility of overlap of these two effects to the miscuffing, it is not unlikely that the errors can be up to ± 1300 Pa (≈10 mmHg). By what it is evident, not as much the need for emanation of the usage standards, underused in domestic operation of automated NIBP monitors, as the availability of easy to operate and reliable tools.

 Copyright © International Science and Technology Conference (ISTEC)

In this paper the authors have focused their attention on the implementation of a 3D FEM model with the aim of designing a new cuff bladder able to limit the above highlighted negative aspects. More precisely a bladder that is suitable to: 1) completely surround the arm, 2) generate a circumferential pressure distribution whose not uniformity is limited and known, 3) be used without rotational or towards limitations. In fact, as shown in the following paragraph, all the commercial cuffs produce not uniform circumferential pressure distributions. This is due to the possibility that the bladder can generate lobes in order to locally load the arm.
This work is divided into several sections: the first is the introduction, the second section shows the circumferential pressure distribution measured by several commercial cuffs, the third one describes the FEM model and the forth shows the achieved results.

Pressure distributions exercited by the cuff on the arm

The determination of the circumferential distribution of pressure around the arm, during the blood pressure measurement process, was conducted using tools and methods described in the papers (Vallascas 2014) and (Vallascas 2015) to which the reader is addressed for more information. 25 different cuffs have been used, some of which are shown in Fig.1. All the cuffs have been identified by a cardinal number.

Figure 1. Cuffs object of the experimentation.

The arm circumference, on which the measurements were conducted, was measured equal to 260 mm on the cuff insertion site. The arm had been instrumented with 10 pressure sensors, Fig. 2, previously calibrated by comparison with an aneroid manometer that derives the traceability by a mercury differential U manometer.

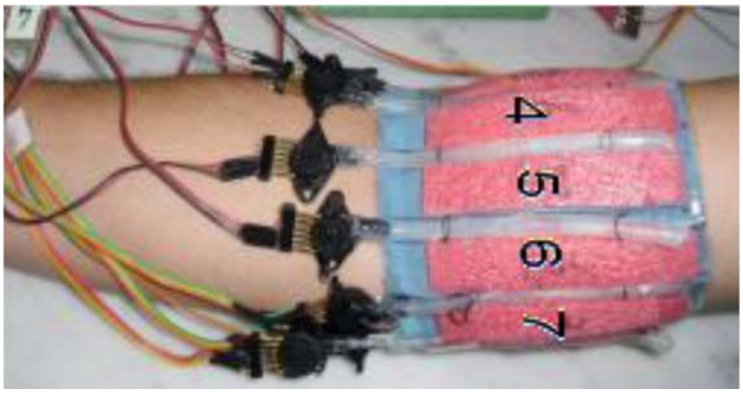

Figure 2. Arrangement of the sensors around the arm.

For each cuff, in order to make more visible the distribution of the pressure around the arm, it was decided to bring the values detected by the sensors in a circular diagram in correspondence of 130 mmHg of deflation pressure. The circular pressure diagrams for the cuffs marked by numbers 9, 10, 15 and 16, are shown, for demonstration purposes only, in Fig. 3.

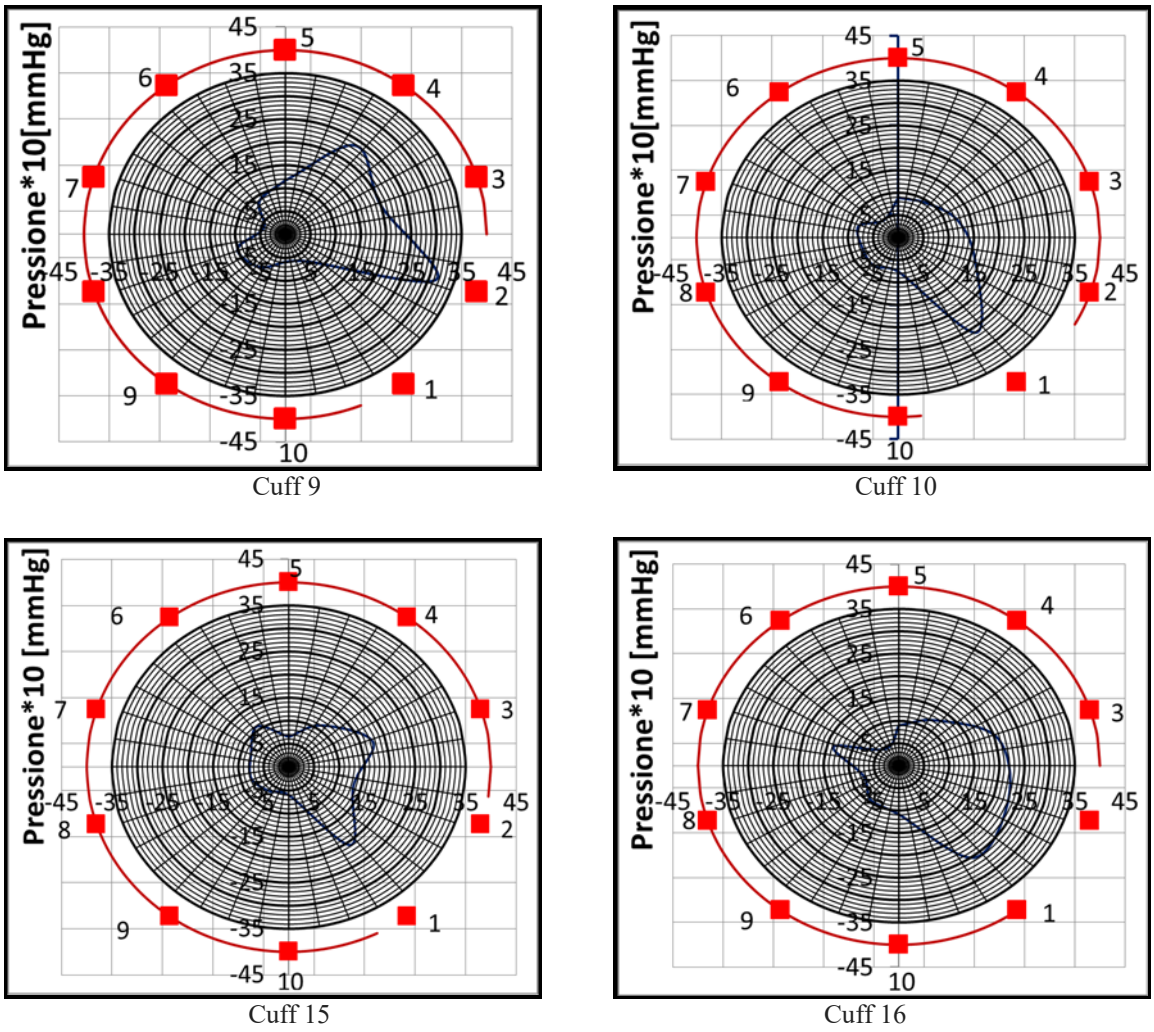

Figure 3. Pressure distributions in correspondence of 130 mmHg inside the bladder.

A red line indicates the bladder length. The red squares show the location of the pressure sensors. Sensor 5 is placed at the antecubital fossa, on the brachial artery, the other sensors follow every 36 degrees in clockwise. It is particularly evident the remarkable lack of uniformity in the pressure distribution around the arm.

FEM 3D Model

The FEM 3D arm simulation model was developed by using Ansys code. It is considered a quarter of the total volume, assuming the model symmetry both to the YZ plane (cross-section) and to XY plane (longitudinal section). In reference to the cross-section, quoted in Eycleshymer and Schoemaker (XX), a configuration built with a tissue with a circular section, placed in a uniform way around the bone and containing the brachial artery and the basilica vein, along the same diameter has been considered.

The arm tissue has been assumed homogeneous and elastic, this because, after the “pressurization” accomplished by the cardiac pump, the arm is able to resume the initial configuration. It has been molded as forming a set composed of skin, muscle, nerves and fat, all to be homogeneous, elastic and isotropic. A modulus of elasticity E = 19000 Pa was assigned to this set. The Young's modulus was extrapolated from the measurements conducted on the top forearm by Zheng (1999) taking account of the greater tissue thickness in correspondence of the mid-arm. However, it does not constitute a critical parameter because the design approach is comparative.

It is also wanted to keep the presence of the basilica vein inside of the tissue for a better correspondence to a real situation, in order to form a possible preferential breakdown point to facilitate the artery collapse.

The external bone diameter has been assumed equal to 28 mm, the external arm diameter has been considered equal to 108 mm, the artery inner diameter has been taken equal to 4 mm with a thickness of 0.6 mm, while the inner diameter of the vein has been assumed equal to 7 mm with thickness equal to zero. As mentioned, the analyzed structure concerns a quarter of the entire volume of the arm, and the following constraints and loads were applied to that.

 Copyright © International Science and Technology Conference (ISTEC)

A uniform pressure of 100 Pa was imposed to the discharge zone of the arm. A pressure of 200 Pa is supposed within the vein. The condition of symmetry is applied both on the transverse surface, which contains the cuff, and on the longitudinal surface, while all the points of the cross section, on the shoulder side, were left without constraints. In all the sectors of the bladder the same pressure was applied.
In order to further reduce the number of the nodes and the number of the elements, only the bone outer surface, removing the whole volume has been considered. The rigidity has been imposed to the bone outer surface through the CERIG command.
The more complex numerical model consists of a total of 5 volumes, 76 areas, 170 lines, 117 key points, 453845 nodes and 295214 elements Solid92, plus 1 Target170 for the pilot node.
A static analysis for small deformations has been done. Various tests have been made, and it was verified that using the mesh level value, equal to 5, the numerical method allows to converge to the results in a range between 7 and 10 minutes of computation, using a 2 GHz portable PC with 4 GB of RAM and 220 GB of hard drive.

Method Results and Conclusions

The reference key points for the design of the new cuff bladder are: bladder length equal to the arm circumference, controlled formation of lobes and around the arm pressure distribution as uniform as possible. First an occlusion pressure of the arterial vessel was found equal to 17300 Pa (≈ 130 mmHg) for the ideal bladder[1]. Then the configurations shown in Fig. 4 were analyzed. They were obtained by dividing the entire bladder in 2, 4, 8, 12 and 16 equal sectors .

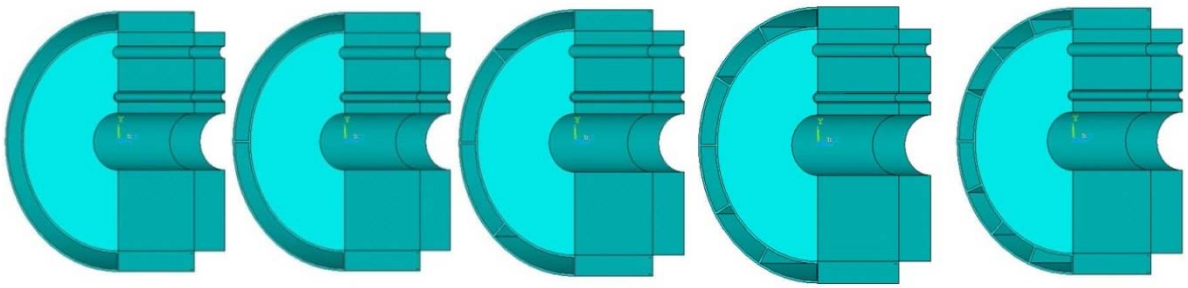

Figure 4. Drawings of the 5 analyzed configurations: 2, 4, 8, 12 and 16 sectors .

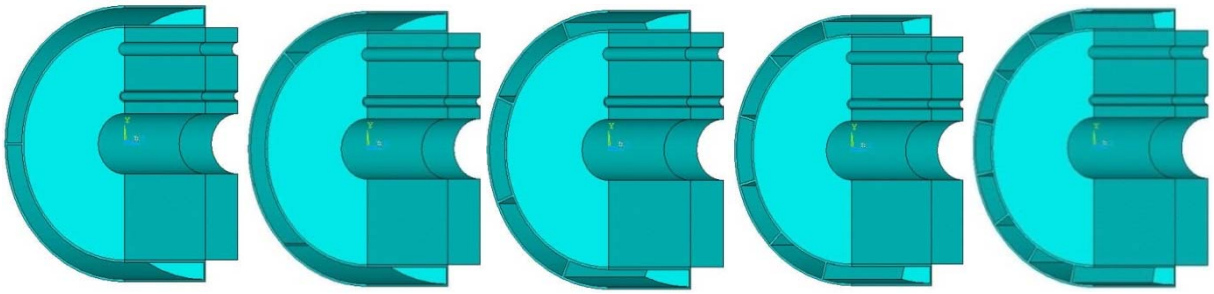
Then, to determine the maximum pressure variations that can occur by rotating the cuff it was necessary to reshape all geometries performing for each one a rotation of the middle sector, Fig.5.



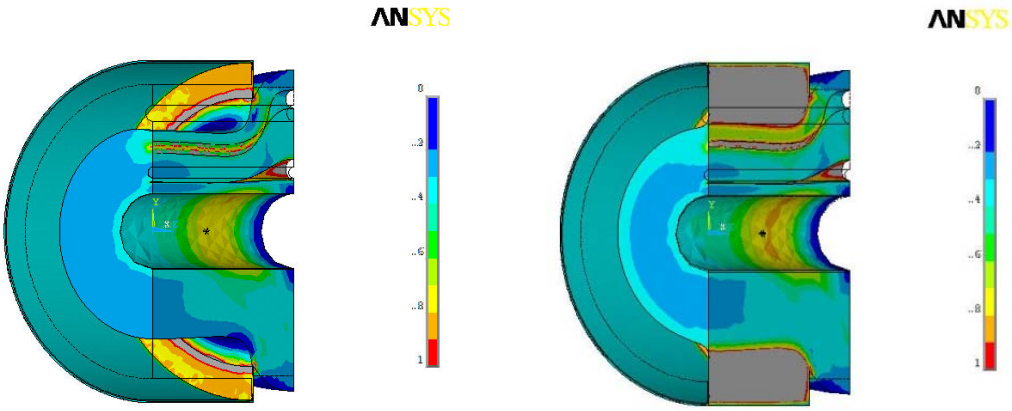


Figure 5. Drawings of half sector rotated configurations: 2, 4, 8, 12 and 16 sectors.

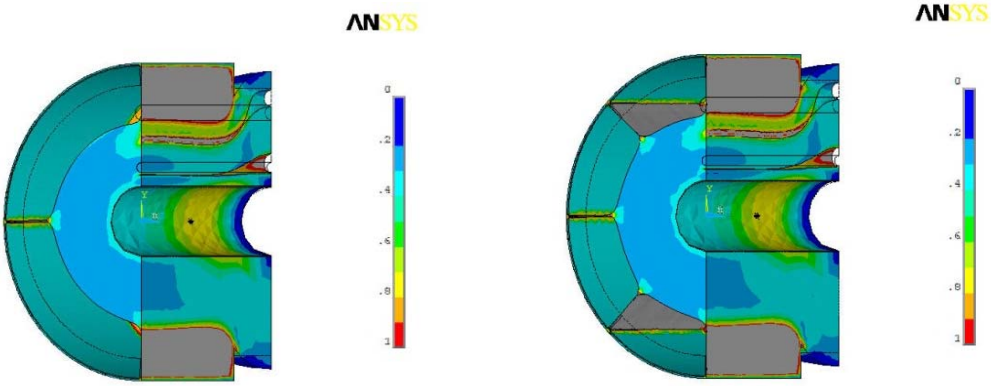

For each configuration the pressure required to occlude the arterial vessel in two extreme positions was evaluated. In Figs. 6a,b,c and 7a,b,c the total mechanical strain diagrams, according to Von Mises, in every cases, when the artery is completely occluded, are shown. The results obtained are summarized in the table 1.

Table1. Occlusion pressures of the arterial vessel.

Sectors number	1	2	4	8	12	16
Not rotated [Pa]	17300	17900	17800	17700	18300	18600
Rotated [Pa]	17300	17100	17100	17500	18200	18600
Uneven [Pa]	0	800	700	200	100	0

Regardless of the number of sectors or the placement of the cuffs on the arm, the maximum error, with reference to the ideal cuff bladder[1], is always less than 1300 Pa (≈ 10 mmHg). Excluding the bladders with few sectors which could form secondary uncontrolled lobes, the other three configurations are preferred in order to be carried out. That one with eight sectors introduces a maximum error of about 400 Pa (≈ 3 mmHg). The others with twelve and sixteen sectors show a greater uniformity but are more complex to build.
In conclusion, the FEM simulation has allowed us to demonstrate that it is possible to realize a cuff bladder with controlled lobes, suitable to load about uniformly the arm. Namely it is able to avoid the formation of irregular, random lobes that can result in unknown errors during the domestic blood pressure measurement. It should also be emphasized that the error may be corrected automatically in the NIBP monitor firmware.

Abstract: In addition to being a versatile class of functional dyes, a great attention has been paid on phthalocyanine derivatives in many fields such as photodynamic therapy, liquid crystals, chemical sensors, catalysts for oxidative degradation, electrochromic displays, information storage systems, nonlinear optics, Langmuir-Blodgett films. In order to improve mechanical properties of phthalocyanine (Pc) moiety, the incorporation of these materials into polymeric structures as side chain, network or main chain is of interest [1]. To address pharmacological, biomedical, environmental and agricultural concerns, the issue of sustainability and ever-limited petroleum resources, aliphatic polyesters such as polyglycolide, polylactides, poly(ε-caprolactone) (PCL) have received considerable interests in polymer science [2].

In this work the ring-opening polymerization of ε-caprolactone initiated by 2-(benzylthio)ethanol was carried out in bulk at 115 °C in presence of stannous octanoate ($Sn(Oct)_2$) as a catalyst. The –OH end group of 2-(benzylthio)ethoxy poly(ε-caprolactone) was then converted into its corresponding the phthalonitrile derivative via a base-catalyzed nucleophilic aromatic nitro displacement of 4-nitrophthalonitrile in order to prepare its corresponding the phthalocyanine derivatives. The electrical conductivities of the polymers were measured in vacuum and in air-atmosphere. All the polymers have been characterized by UV-Vis, FT-IR and NMR spectral data and GPC, DSC, TGA techniques.

ON THE HISTORY OF SOME LINEAR ALGEBRA CONCEPTS: FROM BABYLON TO PRE-TECHNOLOGY

Sinan AYDIN

Kocaeli University, Kocaeli Vocational High school, Kocaeli – Turkey

sinanaydin1704@yahoo.com

Abstract: Linear algebra is a basic abstract mathematical course taught at universities with calculus. It first emerged from the study of determinants in 1693. As a textbook, linear algebra was first used in graduate level curricula in 1940's at American universities. In the 2000s, science departments of universities all over the world give this lecture in their undergraduate programs.

The study of systems of linear equations first introduced by the Babylonians around at 1800 BC. For solving of linear equations systems, Cardan constructed a simple rule for two linear equations with two unknowns around at 1550 AD. Lagrange used matrices in his work on the optimization problems of real functions around at 1750 AD. Also, determinant concept was used by Gauss at that times.

Between 1800 and 1900, there was a rapid and important developments in the context of linear algebra. Some theorems for determinant, the concept of eigenvalues, diagonalisation of a matrix and similar matrix concept were added in linear algebra by Couchy. Vector concept, one of the main part of liner algebra, first used by Grassmann as vector product and vector operations. The term 'matrix' as a rectangular forms of scalars was first introduced by J. Sylvester. The configuration of linear transformations and its connection with the matrix addition, multiplication and scalar multiplication were studied first by A. Cayley.

After the 1900s, the improvement of linear algebra was more technique and in a way that more correlative with other disciplines of mathematics than past. Heisenburg used matrix algebra for quantum mechanics. Von Neuman and Turing introduced stored-program computers.

Keywords: linear algebra, history, matrix, vector, determinant, linear equation

Introduction

It is a general and an open-ended question that when and where did mathematics begin? The answer is depended on what do you mean by the word 'mathematics'? Then, we restrict 'mathematics' to logical-deductive tradition. In ancient times, written materials of new mathematical developments have come to known only in a few places (Avital, 1995; Boyer, 1985; Freudenthal, 1991; Jons, 1995 & Katz, 1995). As a scientific discipline, mathematical studies began in the middle of sixth century (Freudenthal, 1991 & Sfard, 1991). The old mathematical materials were registered in mathematical papyrus between 2500-1700 BC. The context in these material were designed with geometry as Pythagorean Theorem and some relations about lines. In the modern ages, mathematical developments had a periodic time points as the golden age of Islamic mathematics in the 11th century and renaissance mathematics in the 16th century.

According many mathematicians, we couldn't see a consensus on the history of linear algebra (Dorier, 2000; Freudenthal, 1991; Katz, 1995 & Kleiner, 2007). Some of them say that linear algebra history starts with matrix and the others say that main starting point is vector spaces. But we see a main linear algebra concept in these approaches that the formulation of linear system of equations and their solutions. In this study we give some basic points of the history of linear algebra concepts. The concepts are linear equations, matrices, determinants, vector spaces.

 Copyright © International Science and Technology Conference (ISTEC)

Linear Equations

System of linear equations are not only the basic concept of linear algebra but also it has a wide using area in many sub branch of mathematics. Moreover, solving of linear equations with two or three unknown and 2-5 equations is a basic part of middle school algebra and college mathematics.

The study of system of linear equations first introduced by the Babylonians around at 1800 BC. For solving of system of linear equations, Cardan constructed a simple rule for two linear equations with two unknowns around at 1550 AD. Cardano (or Cardan), an interesting and colorful personality, published the mathematics book "Ars Magna". In this book, Cardano with Tartaglia first used the numbers which are known as complex numbers. Lagrange used matrices in his work on the optimization problems of real functions around at 1750 AD. Metric systems, some of mathematicians consider Lagrange as the founder of the metric systems, was used widely in the context system of linear equations. Also, determinant concept was used by Gauss at that times. He formulated the set of errors to be minimized as a system of linear equations.

In ancient China at BC, it was used different ways of solving system of linear equations system (Shen, Crossley & Lun, 1999). These solution methods were not fully different each other and some of them could be used only for two or three equations whit the same number unknowns. Also ancient Chinese made some correlations between the number equations and the number of unknowns for unique solutions and more than one solution. According to the authors, there are many examples, application problems and their solutions in the old text books.

Matrices

The history of matrix goes back to ancient times at BC. But we can say that the word "matrix" was not used clearly until 1855. İt was born from the formulating of the system of linear equations by English mathematician Sylvester. Sylvester and Cayley published their famous text on matrices at these times. In this text, they used matrices by means of system of linear equations (as seen below) and introduced some theories and relation in the context of matrix as matrix addition, multiplication and inverse.

$$X = ax + by + cz$$

$$Y = dx + ey + fz$$

$$Z = kx + ly + mz$$

and

$$(X, Y, Z) = \begin{pmatrix} a & b & c \\ d & e & f \\ k & l & m \end{pmatrix} (x, y, z).$$

Gauss gave some elementary formulations for solving system of linear equations but do it without using matrices. When the mathematicians focused on studying determinants, this motivation turned out to be the term 'matrix'. At the end of the 1900's, Matrices were used not simply for solving systems of linear equations, but also in concepts of liner algebra. Moreover, they have wide speared of using in physics, engineering and some social area as phycology. By the effective using of technology in linear algebra, all solution methods created by Cayley, Gauss, Sylvester moved backward benefiting them in linear algebra lectures.

Determinants

J.L. Dorier (2000) stayed that the concept 'determinant' was used separately in different two places in both Asia and Europe. Also Dorier stressed that in ancient times at BC for solving system of linear equations was benefited from some geometric figures as called counting boards to represent problems. Mikami (1974) claimed that a special version of determinant to solve nonlinear system of equations at 1700's. According to him, this solution method was formulated in a way that registered in a rectangular array the positions of coefficients of equations. Mikami redesigned this formulation from the historical text for 2x2 and 3x3 square matrices (figure1)

 Copyright © International Science and Technology Conference (ISTEC)

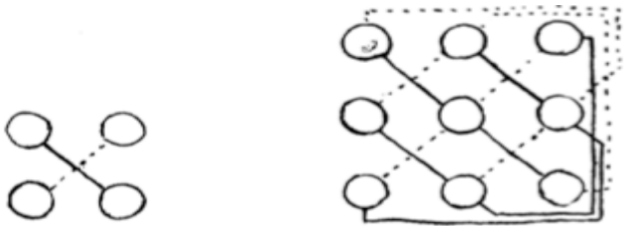

Figure 1. Mikami's redesign of determinant of matrices 2x2 and 3x3.

Determinants were used by Leibnitz, known as the founder of calculus, in 1700's. Lagrange used determinants in his working on Lagrange multipliers about maximum and minimum problems. In 1750's, Cramer formulated solution of some special system of linear equations, called 'Cramer's rule', and used determinant as a variable in this characterization.

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - bc$$

By analyzing historical text, we can say that there are four mathematical subject which are directly connected determinants; matrices, solution of system of linear equations, elimination of a matrix of a system of linear equations and linear transformations. But, it is not clear to give any definite connection between general determinant formulas and the other linear algebra subjects. After the Cramer, determinants of the square matrix were used first time as known modern characterization.

Vector Spaces

In geometrical format, vector spaces in R^2 and R^3 were firs represented by Descartes and Fermat. Italian mathematician Peano defined the known modern definition of vector space concept in 1900's (Katz, 1995). After Peana, another Italian mathematician Weyl used vector spaces more efficiently and attractively in his studies that registered 'vector spaces and transformations view' of linear algebra and 'our axioms characterize the basis of our operations in the theory of system of linear equations by composing the coefficients of the unknowns in a system of linear equations as vectors. Lebesgue used real function spaces as vector space in his work. After than Lebesgue, Hilbert and Banach formulated and developed functions spaces as 'Hilbert and Banach spaces'.

Bourbaki (1975) stayed that Hawkin suggested a reasonable and methodological presentation for the matrix theory, from starting with systems of differential equations by lagrange to theoretical presentation by Weierstrass. According to Baurbaki, the theory of vector spaces had the same methodological procedure. For the explicit formulation of vector spaces, studies on the systems of linear differential equations played basic role (Helgason, 977). As mentioned above, Piano made the axiomatic formal definition of vector spaces over real number fields. We understand that the study of differential equations helped to formulating of vector space concept. Bourbaki (1975) stated that the study of function spaces formulated by Hilbert, but he focused on the kernels of integral equations and generalizations of their matrices. Also, we can say that the difficulty and complexity of infinite vector space directed mathematicians to focusing on the finite dimensional vector spaces.

Famous Frenchman mathematician Galova used the finite dimensional vector spaces to formulate his famous theory called Galois Theory. The linear combinations of algebraic numbers was an extension of the rational numbers. This mean that the defining of vector space over the field of real numbers was a methodological result (Kiernan, 1971). Kiernan expressed that Dedekind motivated seriously at the structure of fields, the number theory. According to him, by the effect of this motivation, he formulated the similarity of algebraic numbers and algebraic function theory. He remarked that the vector space theory played an essential role for the modern reformulation of Galois Theory.

Result

It is not possible to give all historical developments with a research paper about linear algebra concepts. We only dealt with some basic point of linear algebra concepts in this paper. More general search could be available from history of linear algebra text books or research papers (Benzi, 2009, Dorier, 2000 & Kleiner, 2007). It is clear that there is a powerful connection between mathematics concepts especially linear algebra concepts. And we can see this connection in the ancient times in which mathematicians formulated or characterized this concepts. Maybe, mathematicians had become infatuated with the connection of the concepts of mathematics.

OPEN GREEN SPACES FUNCTION IN DESTINATION BRANDING: THE CASE OF BARTIN

Deniz ÇELİK

Bartin University, Vocational High School, Programme of Landscape and Ornamental Plants, Bartin-Türkiye

dcelik@bartın.edu.tr

Abstract: Open green spaces are greatly important for the creation of sustainable cities in social, cultural, economical and ecological sense. In our days, they have assumed other duties in diverse areas in addition to these properties including the creation of urban identity and destination branding. Destination branding is the indicator of the properties that differentiate that destination from other destinations and describe its natural, cultural and man-made properties. The aim of the study is to determine the principles of design for open green spaces focusing on branding and identity in the process of branding of cities on the special example of Bartın. The study has been carried out in the scope of a method consisting of five stages including literature review and obtaining data, analysis of existing open green spaces in Bartın City with land surveys, carrying out a questionnaire using the Analytical Hierarchy Process (AHP); evaluating all the data obtained and submitting the results and recommendations. In conclusion, open and green spaces are effective in the creation of destination branding and the identity of the city.

Keywords: Destination Branding, Open Green Spaces, Tourism

Introduction

Urban spaces comprise the building blocks, open green areas and roads connecting these spaces. Within the city, all the spaces without any buildings on them and water surfaces are considered as open areas, while urban areas largely covered with plantation areas arranged as parks, playgrounds, play areas, sporting areas or squares to provide the citizens with the possibility of active and passive recreation are defined as green areas (Yücel, Aslanboğa, Korkut, 2008). Open green areas have multiple functions in the city that can be outlined as follows: they provide balance for the city in physical sense (mass-space), act as buffers between different utilization areas including dwellings, trade and industry, clear the air, absorb noise and dust, contribute to the protection of biodiversity, provide the city with microclimatic properties, reduces the risk of flood and erosion, facilitate circulation, provides pedestrians with safe transport possibility, provide the possibility of active and passive recreation, , contribute to the esthetic appearance of the city, and are effective in the creation of city identity (Öztan, 1968; Selitsaniotis, Nikolaou, 2009; Ely, Pitman, 2014). Together with this, trees, shrubs, herbaceous, and aquatic plants used in green areas host animals, reduce the speed of rainwater, filter the rainwater and decreases carbon emission (Vegetation in the Built Environment, 2007).

In our days, the open green areas in cities serve not only for the habitants of cities, but also for domestic and foreign tourists. Tour operators organize city tours with touristic purposes to cover especially such spaces. For example, Central Park in New York, Güell Park in Barcelona, Hyde Park in London, Schönbrunn Palace Gardens in Vienna, Alhambra Palace Gardens in Spain, Spaniard Stairs in Rome, tulip gardens in Holland, Emirgan Woods in Istanbul, San Marco Square in Venice, and the Red Square in Moscow have all become attraction points for tourists. However, lately destinations with similar natural and physical characteristics are focusing on bringing their properties that will represent them and differentiate them from other destinations and becoming a brand. The purpose here is to increase their competition power and to attract more tourists.

In the Turkish Tourism Strategy 2023 also, importance of making cities with strong cultural and natural assets to become brands and making them attraction points for tourists is mentioned among the Tourism Strategies for strengthening the tourism sector (Anonymous, 2007). Not only products, but cities, regions or countries can have brands. Characteristics that must be possessed by a product brand are outlined below. The brand name must remind the benefits of the brand. Of the properties of the product, it must remind the action or color. It must be easy to say and remember. It must be distinguishing. It must not have a bad meaning in different countries or languages. Powerful brands have a word, a slogan, a color, a symbol and a story. All these elements are effective in giving an identity to a brand (Kotler, 2011).

 Copyright © International Science and Technology Conference (ISTEC)

While branding a destination is similar to branding a product, there are also aspects that they differ. Destinations mostly attempt to become a brand by bringing their properties to the forefront to become attractive centers for tourists. Comprehensive market and consumer surveys are required to be successful when creating a brand. Determining the target markets and positioning the brands are important (Günlü, İçöz, 2004). Characteristics such as the landscape, zoning structure, infrastructure, identity and culture are effective for branding places (Vuignier, 2015).

The brand of a destination is formed by bringing together the brand elements including name, symbol, slogan, color, architecture, cultural inheritance, language, and myths and legends that defines a destination and differentiates it from others (Taşçı, 2007). Brand both ensure distinguishing a destination from other destinations and are the quality symbol of that destination. At the same time, it provides the destination with an identity, and ensures physical and psychological attraction of tourists to that destination (Yılmaz and Çizel 2000).

Identity comprises the elements that differentiate a place from others (Lynch, 1960). Identities of cities are formed based on the natural, socio-cultural and physical identity elements (Köylü, Kiper, 2007). According to Ocakçı (1994), elements constituting the city identity are listed as elements arising from natural, humane manmade sources. Identity elements arising from the natural environment are data including the topographic structure, climate, plant cover, geologic structure and presence of water. Humane data comprise the demographic structure, corporate structure and cultural structure, which can be listed as the population structure, attitudes of individuals, cultural accumulation and experiences, thoughts and expectations related to future, equipments and requests, political, managerial and legal structure and customs and traditions. Manmade environments include buildings, bridges, squares, parks and similar made to meet the requirements of individuals (Önem, Kılınçaslan, 2005).

Another purpose of destination branding is to develop a positive image for the destination (Taşçı, 2007). Tourists form a brand image in their minds depending on the brand identity. Destination's identity and image mutually affect each other. Destination identity is developed and re-structured based on this image. Destination image is critically important in the formation of the definitive and positive brand identity (Qu, Kim, Im, 2011). Image includes the identity formed by the elements used to distinguish that place from others. Identity represents individuality and not being the same with others. Image is formed by the looker. Destination must have some practical or emotional meaning for the looker (Lynch, 1960).

According to Evans (2012), two similar stages are seen in the branding of national, regional or local historical cities. In the first of these, architectural and cultural activity areas, public buildings, dwellings and commercial buildings, shopping centers, transport facilities are re-constructed, or the existing ones are renewed. In the second stage, city design including the public areas such as parks and open areas, squares, cultural, historical and creative areas and transport roads are improved (Evans, 2015).

Ensuring the satisfaction of tourists in issues including accommodation, security and cleaning is also important to be a powerful destination brand. Tourist who leaves the destination satisfied will strengthen the brand even more. With this reason, cooperation must be ensured between public and private sectors to provide for tourist satisfaction in different areas in the destination (Bordas, 2007).

Destination brand also bears an identity and is used as a marketing tool. Since TV and radio are mostly used as communication tools, importance of music and movies for the promotion of a destination is great. Creating brands for destinations and developing strategies to protect the images can be possible by making long-term plans and implementing them. At this stage, public entities and institutions at relevant locations, representatives of the private sector, nongovernmental organizations and local people must work together and in coordination (Günlü, İçöz, 2004). Providing economical support, developing branding strategies targeting the services for the local people and tourists and determining public policies can be possible depending on such potentials (Vuignier, 2015).

Urban quality and feeling of space are effective elements on branding. Urban quality means much more as compared to the physical characteristics of buildings, open green areas and roads. The urban quality is formed by bringing the architectural form, scale, squares, open green areas, landmark, vistas and similar together with the spatial psychology. In short, urban quality is closely related to the social, psychological and cultural properties of the destination (Montgomery, 1998).

In this context, the aim of this study is to determine the principles of design focusing on branding and identity for cities in branding process on the special example of Bartın. In this context, answers have been searched for questions such as "Why is the importance of the branding process for Bartın Province?", "What is the

 Copyright © International Science and Technology Conference (ISTEC)

importance of open green areas in the branding process of Bartın Province? and "What can be done?" In conclusion, elements representing the city identity of Bartın have been determined and principles of design for open green areas have been suggested.

Materials and Methods

The main materials of the study comprise the open green areas in the Bartın city center and Bartın Province (Figure 1). Bartın Province is located in the Western Black Sea Region between 41°37' northern latitude and 32°22' eastern longitude. Its surface area is 2143 km^2, and the mean altitude is 25 m (Anonymous, 2008). Bartın Province is established on the plain formed by Kocaçay and Kocanaz Creeks that make the Bartın River. Bartın Province has 104 parks in varying sizes in the scope of open green areas. These parks have been built by the Bartın Municipality. These parks have areas such as sporting areas, playgrounds, resting places and jogging tracks (Bartın Municipality, 2014). Furthermore, old photographs of Bartın, land expeditions and data obtained through questionnaires have also been used as materials.

Since the Bartın Province has the potential of being a branded city with its civil architectural structures reflecting the Ottoman Period, shipyards for building of wooden yachts and boats, traditional handcrafts including "tel kırma" (traditional ornamentation technique special for Bartın) and local dishes in addition to its natural beauties, it has been selected as the subject matter of the study.

a b

Figure 1. a) Bartın's location (URL1, 2013).
b) Bartın's neighbors (URL2, 2013).

Methodology of the study has been determined after a review of the studies (Montgomery, 1998; Qu, H., Kim L. H., Im, H. H., 2011; Akpınar Külekçi, Bulut, 2012; Çelik, Gökçe, Koca, 2013) in the literature. In this frame, this study was carried out using a method consisting of five stages. The first stage was the literature review and obtaining the data. In this stage a literature review was carried out on domestic and foreign literature on subjects including open green areas and their functions, branding, destination branding, and the study area. Plans, reports and visual data related to existing open green areas were obtained from the Bartın Municipality, Directorate for Parks and Gardens. The second stage was analyzing the open green areas within the development zones of the Bartın Province with land surveys. In this stage, the then-current situations of open green areas included in the zoning sheets were analyzed on-site and observations were made. Six parks out of 104 in different sizes were included in the study. These parks were selected because they had many functions including playgrounds, sporting areas and resting areas and addressed the entire city. The third stage was the poll carried out using the AHP by the experts of the relevant stakeholders. According to Russell and Taylor (2003), AHP method is the listing of alternatives based on multiple criteria and using this list in selection. It will thus be possible to determine the brand identity and principles of design based on the questionnaire applied. Data obtained in the survey carried out by the author and colleagues (Çelik, Gökçe, Koca, 2013) were used when preparing the questions in the questionnaire. The reason for this was to determine the priority sequence of the data obtained for the identity of Bartın. It will be possible to develop the design criteria for the open green areas for branding based on this sequence. Stakeholders considered as relevant for the subject matter of the study and that the questionnaire is planned to the applied to included Bartın Provincial Governorship, Bartın Provincial Directorate of Environmental and Water Affairs, Bartın Provincial Directorate of Culture and Tourism, Bartın Municipality, Bartın University, Bartın Provincial Directorate of Environment and Urbanization and relevant professional chambers. The fourth stage was the evaluation of all the data obtained from a perspective of landscape architecture so as to overlap with the objective of the study. The fifth stage was preparation of conclusions and recommendations based on the literature review, land analyses and results of the questionnaire.

Results and Discussion

In the frame of the functions of the open green areas in destination branding, findings obtained from relevant public entities and organizations and questionnaire are outlined below in two sections. These sections include the findings related to the Bartın City and open green areas and findings of the questionnaire.

Findings related to the Bartın City and open green areas: Bartın Province is located amongst Zonguldak, Karabük and Kastamonu Provinces and the Black Sea. City center is located in the hinterland, at a distance of 12 km to the sea. Economy of the city depends on animal husbandry and forestry. Bartın Province has four districts including the central district, Amasra, Ulus and Kurucaşile. Bartın has a marine climate with cool summers and warm and rainy winters. In the city, a natural protected area along the river banks and an urban protected area in the city center are present. Furthermore, there are 258 registered wooden houses in the central district (Anonymous, 2007).

Bartın Province has the properties of a destination with historical, cultural and natural potentials. These potentials allow diverse touristic activities. There are plateaus that serve mountain and highlands tourism including the mountains and plateaus of Uluyayla, Zoni and Ardıç. Furthermore, Mugada Lava Columns and Kastamonu-Bartın Küre Mountains National Park also serve various touristic activities including photo-safari, biking tours or bird observation with mountain tourism in the first place. Bartın has a past of 3000 years, and was first established by Gaskas in the 14th century B.C. Later, it was domineered by various kingdoms with Hittites, Lidia, Byzantine, Seljuk and Ottomans in the first place. While it was a district of Zonguldak in 1924, it was made province in 1991 (Bartın Municipality, 2014).

There are one hundred and four parks in different sizes in Bartın city that can be included in the scope of open green areas. Of these parks, Alibaysal Park, Gazhane Park, Karaçay Picnic Area, Sevgi Park, Municipality Park and Republic Square have been included in the study (Figure 2). These parks have sporting areas, playgrounds, resting areas, jogging tracks and similar areas, and they address the entire city (Figure 3). These parks have been built by the Bartın Municipality. Maintenance, repair and renewal works for parks are implemented by Bartın Municipality Directorate for Parks and Gardens.

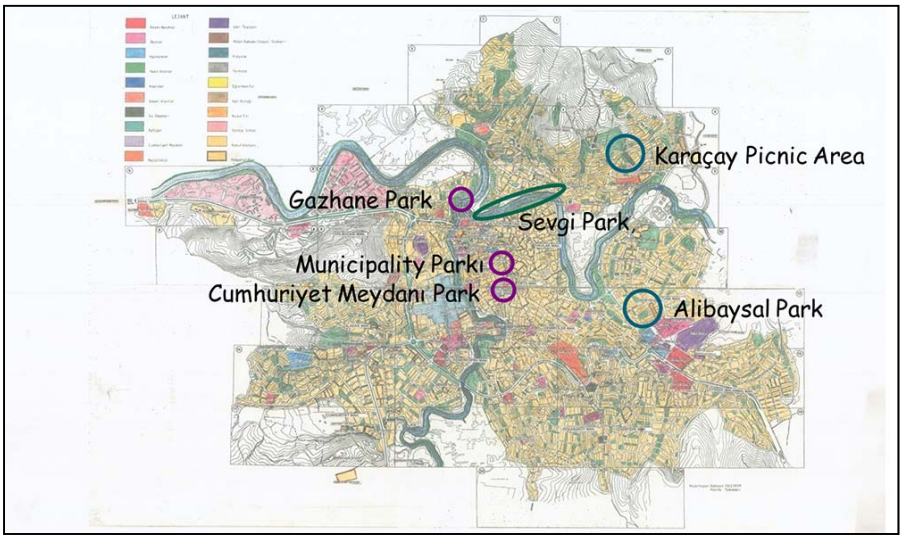

Figure 2. Open Green Areas of Bartın City.

A questionnaire was carried out in the aim of the study with the participation of experts in relevant stakeholders to determine the priority levels of elements representing the Bartın city using AHP. The design principles focusing on branding and identity special for the Bartın Province were determined based on data obtained from the questionnaire. Bartın Provincial Governorship, Bartın Provincial Directorate of Environmental and Water Affairs, Bartın Provincial Directorate of Culture and Tourism, Bartın Municipality, Bartın University, Bartın Provincial Directorate of Environment and Urbanization and relevant professional chambers are the relevant stakeholders that questionnaire will be applied to. A questionnaire was held on 10 experts from these public entities and organizations. Results of the questionnaire carried out using AHP are summarized below.

Figure 3. Bartın River and parks included in the study.

The Expert Choice (EC) program was made use of for the use of AHP method and calculations. Priority order or weights were found for main criteria with the use of this program. The questionnaires carried out were

 Copyright © International Science and Technology Conference (ISTEC)

considered as significant since the Consistency rates of questionnaires were found under 0,1. The purpose of the questionnaires was to determine the order of the main criteria. The identity components and brand components for Bartın Province, which are among the main criteria, are given in Table 1.

Table 1: Main criteria used in the questionnaire

IDENTITY COMPONENTS	BRAND COMPONENTS THAT CAN BE USED IN THE DESIGN		
	Color	**Symbol**	**Slogan**
Historical Buildings	Blue	Historical houses	City of rivers
River	Green	Strawberry	Amasra
Natural beauties (flora, fauna, endemic plant species, geologic formations, etc.)	White	Bartın River	City nested in nature
Strawberry festival	Yellow	Water balance	
Hıdrellez festival	Red	Falls	
Traditional handcrafts including "Telkırma"	Brown		
Presence of local dishes			
River running through the city			
A city nested in nature			

Experts were asked to make evaluations between the criteria with comparisons in couples based on the basic scales given in Table 2.

Table 2: Priority levels and definitions to be used in comparisons in couples between the criteria

Priority Levels	Value Definitions
1	Equally important
3	Important in medium level
5	Strongly important
7	Very strongly important
9	Definitely important
2, 4, 6, 8	Intermediary values

Experts from different professions including landscape architects, architects, urban and regional planners, tourism professionals, and communication and marketing experts working in relevant public entities and organizations participated in the questionnaire. All the participants have the opinion that open green areas are important in the creation of identity. Participants listed the parks they considered important among the open green areas in Bartın with the following order:, Gazhane Park, Sevgi Park, Karaçay Picnic Area, Municipality Park, Alibaysal Park and Republic Square.

The binary comparison matrix that the experts compared each basic criterion related to the identity components is given in Table 3. These values are attributed by the experts participating in the study.

Data obtained from Table 3 are summarized below. In this table, criteria given in lines are compared with the criteria in columns. These comparisons have been asked in the questionnaire in the form questions. Historical buildings have been attributed 5 points (strongly important) when compared to local dishes. However, when the criterion of historical building was compared with the criteria of natural beauties of the Bartın City, river running through the city and city nesting in nature, all these three criteria were attributed 5 points (strongly important). This value has been expressed as 1/5 because of the overlapping of lines and columns in the table. That is, importance of historical buildings is less when compared to these three criteria. Comparison of the criterion of river with the criterion of hıdrellez festival had given 5 points (strongly important) and the same with the presence of local dishes had given 3 points (important in medium level). The criterion of natural beauties of the city was attributed 7 points (very strongly important) when compared to the criteria of strawberry festival and hidrellez festival. Strawberry festival was attributed 5 points (strongly important) when compared to the criteria of river and hıdrellez festival. The traditional handcraft, "tel kırma" was attributed 7 points (very strongly

 Copyright © International Science and Technology Conference (ISTEC)

important) when compared to the hıdrellez festival. The criterion of presence of local dishes was attributed 3 (important in medium level) when compared to hıdrellez festival. However, when presence of local dishes was compared with the criteria of river running through the city and city nested in natures, these two criteria were attributed 7 points (very strongly important) and these values were expressed as 1/7 in the table. In summary, experts considered the criteria of river running through the city and city nesting in nature more important as compared to criteria of presence of local dishes, hıdrellez festival, strawberry festival and "tel kırma".

Table 3: Binary comparison matrix for basic criteria

CRITERIA	Historical buildings	River	Natural beauties	Strawberry festival	Hıdrellez Festival	Tel kırma	Local dishes	River running in the city	City nesting in nature
Historical buildings	1	3	1/5	3	3	1	5	1/5	1/5
River	1/3	1	1/5	1/5	5	1/3	3	1/3	1/3
Natural beauties	5	5	1	7	7	5	5	1	1
Strawberry festival	1/3	5	1/7	1	5	1/3	3	1/3	1/5
Hıdrellez festival	1/3	1/5	1/7	1/5	1	1/7	1/3	1/7	1/7
Tel kırma	1	3	1/5	3	7	1	3	1/3	1/3
Local dishes	1/5	1/3	1/5	1/3	3	1/3	1	1/7	1/7
River running in the city	5	3	1	3	7	3	7	1	1
City nested in nature	5	3	1	5	7	3	7	1	1

When the identity components for Bartın that can be used in the design are sequenced by experts based on weight ratios, the criterion with the highest weight (0.195) was the criterion of "river running through the city". Other criteria were, respectively:

- Natural beauties (weight ratio 0,174),
- River (weight ratio 0,142),
- Historical buildings (weight ratio 0,133),
- City nesting in nature (weight ratio 0,119),
- Presence of traditional handcrafts including "Telkırma" (weight ratio 0,104),
- Presence of local dishes (weight ratio 0,055),
- Strawberry festival (weight ratio 0,041),
- Hıdrellez festival (weight ratio 0,014).

Data related to brands components that can be used in the design according to experts are given in figures below.

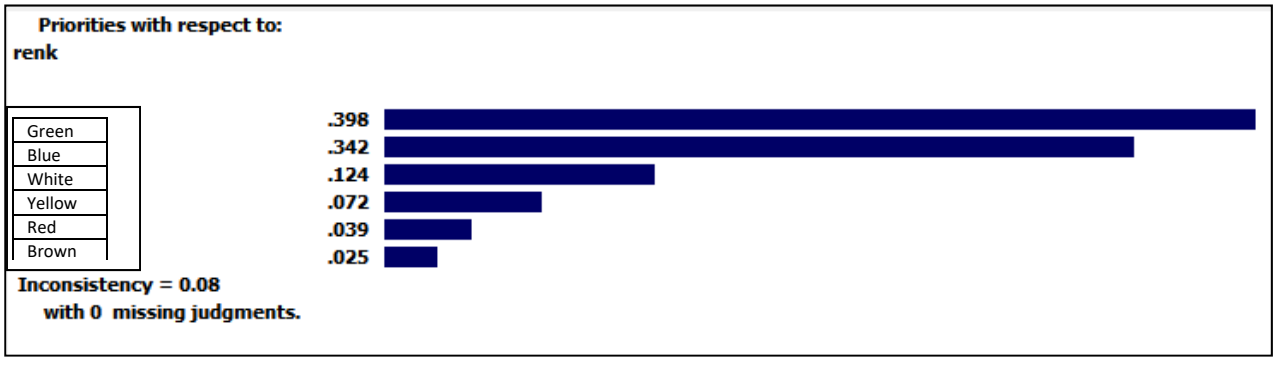

Figure 4. Weights attributed to color main criteria.

 Copyright © International Science and Technology Conference (ISTEC)

Based on Figure 4, levels of priorities of color main criteria are sequences as green (weight ratio 0,398), blue (weight ratio 0,342), white (weight ratio 0,124), yellow (weight ratio 0,072), red (weight ratio 0,039) and brown (weight ratio 0,025). The sum of the weight ratios of criteria is "1". Since the TO shown in the lowest part of the screen is 0,08 < 0,1, the comparison is consistent. The first three colors considered by experts to represent Bartın are green, blue and white, in this order.

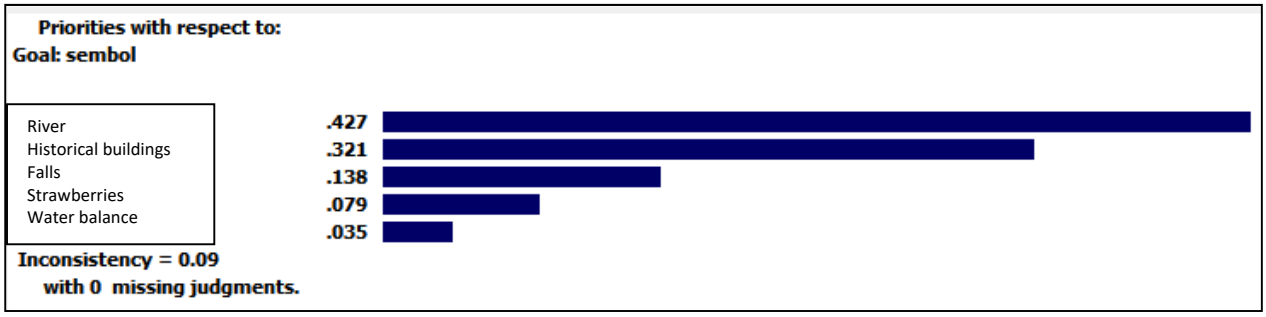

Figure 5. Weight values attributed to symbol main criteria.

According to Figure 5, priority levels for symbol main criteria are sequenced as the Bartın River (weight ratio 0,427), historical buildings (weight ratio 0,321), Falls (weight ratio 0,138), strawberry (weight ratio 0,079) and water balance (weight ratio 0,035). The sum of the weight ratios of criteria is "1". Since the TO shown in the lowest part of the screen is 0,09 < 0,1, comparison is consistent. Experts have selected the river, historical houses and the Falls as the symbols representing Bartın, in this order.

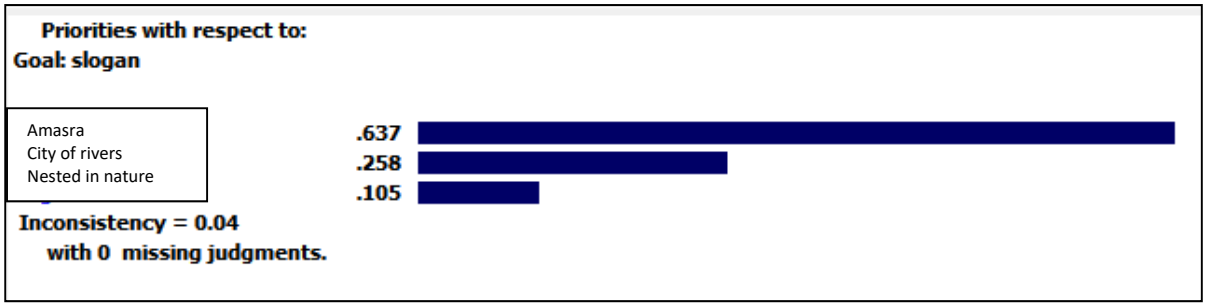

Figure 6. Weight ratios attributed to slogan main criteria.

According to Figure 6, priority levels for slogan main criteria are sequenced as Amasra (weight ratio 0,637), city of rivers (weight ratio 0,258) and city nested in nature (weight ratio 0,105). The sum of the weight ratios of criteria is "1". Since the TO shown in the lowest part of the screen is 0,04 < 0,1, comparison is consistent. Experts have selected Amasra, city of rivers and city nested in nature as the slogans that can be used in the logo representing Bartın, in this order.

In conclusion, each criterion has been compared with others in couples, and the matrix of this comparison has been considered satisfactorily consistent based on the AHP method. In the outline of all the results, the criterion "river running through the city" has the highest priority level with 0.195. Based on the color criterion, green has been found to be in the first place with 0,398 priority level. The most important criterion among the symbol criteria is the criterion of Bartın River and has a priority level of 0,427. Among the slogan criteria, the most important criterion is the criterion of Amasra with a priority level of 0,637.

Identity components and brand components for the Bartın province have been sequences based on the data obtained from the questionnaire. Based on these data, principles of design focusing on branding and identity for open green areas for Bartın are recommended as follows.

- Identity, color, symbol and slogan criteria obtained from the results of the questionnaire can be given as the definitive criteria for the design to be made for open green areas.
- Open green areas can be designed with nature as the theme.
- Photograph take areas can be created in the open green areas with the symbols of "Bartın River", "historical houses" and "Falls" as plastic objects.

 Copyright © International Science and Technology Conference (ISTEC)

- Symbols can be used and slogans “Amasra”, “City of Rivers” and “City Nesting in Nature” can be written on flooring.
- Adventures parks with the theme of river can be constructed in playgrounds.
- Plant arrangements in green, blue and white colors can be designed.
- Designs can be developed for urban equipment elements in harmony with the identity, color and symbol components.
- Water element can be used together with plant arrangements.
- Bartın River can be made use of as a whole with its potential of transport and structure convenient for recreational organizations.
- Footing and jogging tracks, resting areas, photograph take points and playgrounds can be constructed along the Bartın River banks, and existing ones can be improved.
- Stands reflecting the civil architecture characteristics can be created in open green areas to sell traditional handcraft products and local dishes.
- Squares can be designed for open green areas to hold the celebrations such as strawberry festival or hıdrellez festival.
- The Bartın logo suggested based on the data obtained is presented in Figure 7.

Figure 7. The Bartın logo suggested (illustration by Murat Sarı, graphic drawing by Mustafa Semih Saraoğlu).

Revising the existing open green areas according to the recommended design criteria and developing the new designs also according to these criteria are important in the branding process of Bartın. Public and private sectors, nongovernmental organizations, Bartın University and local people must work together in a multidisciplinary fashion in order to achieve success.

Although Amasra had taken the first place among the slogans that could be used for branding of Bartın in the data obtained from the questionnaire, Amasra was not used in the suggested logo. The reason for this is that the element remembered first upon mention of Bartın was Amasra till today. However, the slogan “Bartın, City of Rivers” was used with the purpose of diminishing or wiping off this judgment and ensuring that Bartın will be called with its own name and branding with its own identity components and creating its new image. The branding strategies in tourism focusing on urban landscape have been determined for the Bartın City in the study of Çelik and other (2013). In the study carried out, the colors to be used in Bartın logo depending on focusing on natural beauties of Bartın have been determined by the majority of participants as blue for the river and sky and green for nature. No sequencing of criteria was asked in the questionnaire. This sequencing was made based only on the numerical superiority of the participants of the questionnaire. In the present study however, participants were asked to sequence colors. The same colors were preferred in this study also; however, order of colors has been changed. Green has taken the first place and blue has taken the second places in this study. A regards the slogan, including the word “Amasra” in the slogan as an important destination, which is considered as a strong aspect of Bartın, and “City of Rivers” since a river runs through the city has been preferred by the participants. Sequencing of the slogan was the same in the previous study and the present study. While river and natural beauties had been preferred as symbols in the first study, river and historical houses have been preferred by the participants of the questionnaire in this study. River has taken the first place in both studies as the symbol to

 Copyright © International Science and Technology Conference (ISTEC)

represent Bartın. In this scope, uses focusing on the river and its surroundings must be developed in planning and design studies to be carried out for Bartın city landscape and open green areas, and the existing ones must be improved. Natural landscape elements included in the identity components of the Bartın City have taken their places in the front in both studies. Cultural landscape elements including historical houses, handcrafts, local dishes, strawberry festival and "Hıdrellez" festival are in the second place.

Conclusion

Open green spaces of the city, as well as many other factors are effective in the destination branding. Open green spaces are such spaces that serve the city both in functional and esthetic aspects. Use of natural and socio-cultural landscape elements reflecting the city identity for the design criteria of such spaces will positively affect branding. Increase in the recreational esthetic and physical values result in the increase in the attractiveness of cities or touristic destinations. Since branding gives rise to being preferred, national policies are being used lately for the branding of cities, regions and countries.

Furthermore, while branding imposes values on destinations such as quality and confidence, it also establishes positive relations with tourists to create brand dependence. Creating unforgettable travel experiences related to a certain destination is possible through the establishment of emotional connections between the tourist and the destination (Taşçı, 2007). Moreover, brand positioning activities must be supported by carrying out both qualitative and quantitative studies focusing on both tourism and its demand (market structure and tendencies and profiles of tourists, etc.). The entire sector including the public and private sectors and all the entities must act in cooperation action plans must be prepared and common strategies must be developed.

Lastly, the brand identity is formed together with the city identity during the destination branding. Open green areas are effective on both destination branding and creation of the city identity. Brand image is created together with identity.

As regards the brand image, the consumer/tourist attributes a meaning to the product/destination in his/her mind as a results of his/her experiences related to the product/destination and identifies with an object. Brand components, advertisements and similar issues are effective on perceptions of tourists. The short-term objective when creating the image is to influence the tourists, while the long-term objective is to be an assuring brand (Ak, Sağdıç, 2009).

Acknowledgements

I would like to express my thanks for their support and assistance to Murat Sarı, Teaching Assistant in Bartın University Vocational High School Department of Graphics Design, who prepared the illustration of the Bartın logo suggested, and to Teaching Assistant Mustafa Semih Saraoğlu, who carried out the graphic drawing.

yurdusev@cbu.edu.tr

Abstract: Building a new sewer system network is an expensive investment. The complexity of the design and operations for trying to decrease the cost leads to the usage of the optimization techniques for the infrastructure design.
Urban sewer systems consist of manholes and pipes connecting manholes. The design of these systems can be investigated in two phases: network system and hydraulic design of the network.
In this study hydraulic optimization is performed using genetic algorithm to obtain the least cost and to get the most proper values of pipe diameters and slopes. Different genetic algorithm parameters have been tried and the algorithm is tried on a real project prepared by only engineering experiences.
The used sewer network is 8.253 m. long and having 158 intersection points and 204 lines. The total real cost without optimization is found to be 1.355.400,- TL while it has become 1.255.100,4- TL after hydraulic optimizations. When comparing the results of with and without optimization, it is seen that burying amount is approximately 6% less in with optimization. In some lines the diameters are less than being in the original project. All these cause a 7.4% decrease in the total real cost with using optimization.

Keywords: Genetic algorithm, Sewer networks, Optimization, Hydraulic Design

Introduction

Sewer systems are important facilities in urban living. Because it's directly related to public health and safety (Cetin and Yurdusev, 2013). Building a network that are containing manholes and pipes connecting manholes is costly. To decrease the network cost, optimization techniques are used for the infrastructure design. The design of sewer systems consists of two phases: network system (the plan) and hydraulic design of pipes in the network Weng et.al., 2005, Weng and Liaw, 2007, Tekeli and Belkaya, 1986, Moeini and Afshar, 2012, Haghighi, 2012) which includes calculating flows, velocities, pipe diameters, slopes and burying depths. Even many researchers have used many optimization techniques for hydraulic optimizations, genetic algorithm based on getting the least cost with several trials is mostly used.

Siriwardene and Perera, (2006), Afshar, (2006), Pianese et al., (2011), Brand and Ostfeld, (2011), Afshar, (2012), Haghighi and Bakhshipour, (2012), Cimorelli et.al., (2012), Ogidan and Giacomoni, (2015), Zimmer et.al, (2015), Afshar et.al, (2006) and Beraud et.al, (2010) are also used genetic algorithm for optimization. While some researchers used only genetic algorithm, some other researchers used it within hybrid algorithms. Weng et al., (2005), Weng and Liaw, (2007), Guo et.al., (2006), Pan and Kao, (2009), Rohani and Afshar, (2015) and Liang et.al, (2004) are also used genetic algorithm together with different algorithms.

In this study, hydraulic optimization by using genetic algorithm to obtain the least cost and to get the most proper values of pipe diameters and slopes is performed. Different genetic algorithm parameters have been tried while doing and the algorithm is tried on a real project prepared by only engineering experiences.

Materials and Methods

1. Optimization of Hydraulic Calculations

A software based on genetic algorithm is developed for hydraulic optimization. Elevation levels, lengths, flows and discharge points, pipe-types, diameters allowed to be used in the project, allowable minimum and maximum slopes, minimum and maximum burying depths and flow rates for each diameters, data about manholes, quantities

 Copyright © International Science and Technology Conference (ISTEC)

necessary for estimations and also cost values of each issue that are information about manholes and pipes between manholes in the project are inputs of this program (Cetin, 2014). The network design and manhole places are taken from the real projects as it's being.

Genetic algorithm is a searching optimization technique depending on the natural selection. Performing cross and mutation operations on the population of N chromosomes, a new generation is got. By comparing total cost of the sewer system, the optimal solution is investigated. Formulas given below are used for the construction cost of sewage projects:

$$\text{Total Pipe Cost} = \sum_{i=1}^{N} L_i \times M_{pipe} \quad (1)$$

$$\text{Total Manhole Cost} = \sum_{i=1}^{N-1} h_{avg_manhole_i} \times M_{manhole_to_depth} \quad (2)$$

$$\text{Total Burying Cost} = \sum_{i=1}^{N} L_i \times h_{avg_pipe_i} \times M_{burying} + \sum_{i=1}^{N-1} h_{avg_manhole_i} \times M_{burying} \quad (3)$$

$$\text{Total Network Cost} = \text{Total Pipe Cost} + \text{Total Manhole Cost} + \text{Total Burying Cost} \quad (4)$$

Where N is the total number of line in the network, L_i is the distance between to neighbor manhole, M_{pipe} is the unit price per meter of a pipe, $M_{manhole_to_depth}$ is the unit price per a depth meter of a manhole, $h_{avg_pipe_i}$ is the average buried depth of each line, $h_{avg_manhole_i}$ is the average buried depth of each manhole, $M_{burying}$ is the unit price per a depth meter of burying.

The pipe diameter and the quantity of excavation that is defined as burying depth are two main elements effecting the cost directly. The burying depth is obtained by the slope of the pipe. So parameters of the hydraulic optimization are the pipe diameter (D) and the slope (S). Generated randomly D and S as binary values in the program with different lengths are used for each chromosome.

Binary values of diameters and slopes are decoded to real values as follows:

$$D_{calc} = D_{\min} + (D_{\max} - D_{\min}) * D_{random} \quad (5)$$

$$S_{calc} = \frac{1}{S_{\max} + (S_{\min} - S_{\max}) * S_{random}} \quad (6)$$

Where D_{min} is the minimum diameter value of allowable pipe diameters, D_{max} is the maximum diameter value of allowable pipe diameters, D_{random} is the real number value of randomly generated diameter, D_{calc} is the pipe diameter calculated from randomly generated diameter values, S_{min} is the minimum allowable slope value of calculated diameter D_{calc}, S_{max} is the maximum allowable slope value of calculated diameter D_{calc}, S_{random} is the real number value of randomly generated slope, S_{calc} is the slope value calculated from randomly generated slope values.

Adaptive strategy that is known as random values of the pipe diameter and the slope are checked before calculations to eliminate values ending with improper solutions and to reduce the calculation time is used in the algorithm (Haghighi and Bakhshipour, (2012), Pan and Kao, (2009)). Randomly generated values are replaced with the adapted diameter and slope values according to criteria to eliminate values ending with improper solutions.

2. Application of Genetic Algorithm

Population size, comparison values for tournament selection algorithm, elitism rates, crossover methods, crossover rates, mutation rates that are parameters of genetic algorithm are taken alternatively.

Tournament selection method that is randomly picking a small subset of chromosomes, two or three as tournament number, from the mating pool and then making "tournament" is preferred in the program. The tournament repeats for every parent needed (Haupt and Haupt, 2004). Uniform, single-point and double-point algorithms (Haupt and Haupt, 2004) are used for crossover operations. Selected crossover algorithm is used for both diameter and slope chromosomes according to their own bit-length.

In which chromosome and in which bit number mutation operation that is taking the opposite of the binary number

 Copyright © International Science and Technology Conference (ISTEC)

in the chromosome will be performed are defined randomly. Mutation rate can be taken as constant (Siriwardene and Perera, (2006), Afshar, (2006), Pan and Kao, (2009), (Haupt and Haupt, 2004, Mitchel, 1999) or variable like linearly increased from a value (Haupt and Haupt, 2004, Mitchel, 1999) or linearly decreased from a value (Haghighi and Bakhshipour, (2012), Haupt and Haupt, 2004, Mitchel, 1999) during the genetic algorithm operation. To reduce the number of trials especially for mutation rates and to obtain the optimum value in less time, dynamic mutation rate method is used also in this study.

A minimum and a maximum mutation rates are chosen as control mutation rate values. When the program started, a minimum mutation rate is accepted as used mutation rate. At each generation calculations, the most proper cost value is compared with the previous proper cost value. If there is only %1 or less change in the cost value at adjacent 50 generations, used mutation rate is increased by %1. If the cost value at any generation is changed more than %1, the 50 generation control interval has started from the beginning and used mutation rate is decreased by %1. Mutation rate can be increased till the maximum mutation rate value while it can be decreased till the minimum mutation rate value by value of %1. (Cetin and Yurdusev, 2016-2)

All operations are repeated as 1000 times.

3. Case Study

To test the program, a sewer network taken from a real project is used in hydraulic optimization. The real project was designed with only engineering experiences as mentioned in Guo et.al. (2008). The cost obtained in the real project is compared with the cost value result obtained by hydraulic optimization program.

The used sewer network from a town in Turkey is 8.253 m. long and having 158 intersection points and 204 lines. The schematic view of the network is given in Figure 1.

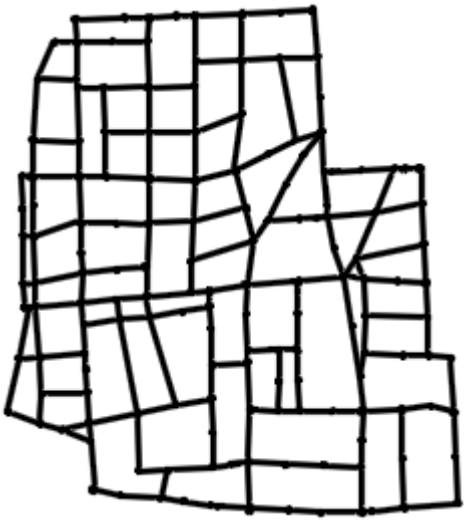

Figure 1. The schematic view of the network

Flow values, commercial pipe diameters that could be allowed to be used and allowable minimum and maximum slope values in lines, the minimum and the maximum allowable velocity values are taken from the original project. The original cost value obtained without any optimization technique is 1.355.400,- Turkish Liras (TL).

Different values for each genetic algorithm parameters are tried in this study and are shown in Table 1. The genetic algorithm parameters are 60, 80, 100, 120 and 140 for population size, %1, %2, %5 and %10 for elitism rate, 0,5 and 0,75 for tournament rate, uniform, single-point and double-points algorithms for crossover operation, %30, %50, %70 and %90 for crossover rates, %1, %2, %3, %5, %7 and %10 for mutation rates. Also dynamic mutation rate is taken into account as described before with minimum mutation rate %1 and maximum mutation rate %11, %1 increase in mutation rate, 50 generation for %1 or less change in the cost value. To compare the results of the dynamic mutation rate value and the other mutation rate values, the optimum mutation rate obtained from trials is not considered when taking the minimum and the maximum mutation rate values as %1 and %11.

After all combinations of trials being performed, it is observed that values of the population size as 80 (Figure 2), %2 as elitism rate value (Figure 3), 0,75 as tournament rate (Figure 4), single-point algorithm as crossover method (Figure 5), %70 as crossover rate (Figure 6), %2 as mutation rate (Figure 7) have the optimum solution for this

 Copyright © International Science and Technology Conference (ISTEC)

project. Figures 2-7 show differences between different values of a genetic algorithm parameter. While having results for these figures, genetic algorithm parameters other than mentioned at each figure are taken as optimum values obtained after trials. For example, while trying different values (60, 80, 100, 120 and 140) for population size (Figure 2), optimum values of other genetic algorithm parameters such as %2 as elitism rate value, 0,75 as tournament rate, single-point algorithm as crossover method, %70 as crossover rate, %2 as mutation rate are taken.

Table 1: Genetic algorithm parameters used for hydraulic optimization

Generation number	1000
Ending	After all population
Bit number	According to different diameter and slope values
Population size	60, 80, 100, 120, 140
Elitism rate	%1, %2, %5, %10
Selecting Parents	Tournament
Tournament rate	0,50, 0,75
Tournament number	2
Crossover method	Uniform, single point, double points
Uniform	Each bit to offspring1 or offspring2 according to a random number
Single point	Cutting at a random number
Double points	Cutting at two random numbers
Crossover rate	%30, %50, %70, %90
Mutation rate	%1, %2, %3, %5, %7, %10
Dynamic Mutation Rate Use	Difference in the cost value at adjacent monotonous generations <%1

Results and Discussion

The cost obtained by using hydraulic optimization is 1.255.100,4 TL while the original project cost obtained without any optimization is 1.355.400,- TL. This shows the optimization procedure integrated in hydraulic calculation has provided approximately 7.4% savings.

Trials on different genetic algorithms on the sample project, have shown that population size 80, elitism rate %2, tournament rate 0,75, single-point algorithm as crossover method, %70 crossover rate, mutation rate %2 are suitable for that project. Even though mutation rate %2 has just a little better result compared to the result of dynamic mutation rate, it is clear that to obtain the optimum mutation rate more than one trial should be performed.

When comparing the results of with and without optimization, it is seen that burying amount is approximately 6% less in with optimization. In some lines the diameters are less than being in the original project. All these cause a 7.4% decrease in the total real cost with using optimization.

Conclusion

The aim of this study is to get the optimum cost value of a sewage project by using genetic algorithm that is used for optimization of hydraulic design. All needed characteristics of sewer networks are taken into consideration. These characteristics are flows and discharge points, lengths, elevation levels, diameters allowed to be used in the project, allowable minimum and maximum slopes, pipe-types, minimum and maximum burying depths and flow rates for each diameters, data about manholes, quantities necessary for estimations and also cost values of each issue in the project and also the velocity formula needed for the flow velocity preferred by governmental offices.

Pipe diameters and slope values are main inputs to the algorithm developed for hydraulic optimization. These values are defined randomly. To reduce the calculation time of the program, random values of the pipe diameter and the slope are checked prior to calculations to eliminate values ending with improper solutions. With using cost formulas special to the project performed, the optimum pipe diameters and slope values are obtained. The developed program has run on a real project solved without optimization. Different methods and values have been tried for genetic algorithm parameters such as population size, comparison values for tournament selection algorithm, elitism rates, crossover methods, crossover rates, mutation rates during optimization operation.

The genetic algorithm parameters are 60, 80, 100, 120 and 140 for population sizes %1, %2, %5 and %10 for elitism rate, 2 for tournament number, 0,5 and 0,75 for tournament rate, uniform, single-point and double-points algorithms for crossover operation, %30, %50, %70 and %90 for crossover rates, %1, %2, %3, %5, %7 and %10 for mutation rates. To reduce the number of trials especially for mutation rates and to obtain the optimum mutation rate value in less time, a method called “dynamic mutation rate method” is also used in this study.

After all, the most optimum genetic algorithm parameters such as 80 as the population size, %2 as elitism rate value, 0,75 as tournament rate, single-point algorithm as crossover method, %70 as crossover rate, %2 as mutation rate have chosen for the project. Also it is seen from the results that the use of dynamic mutation rate is effective to get the most optimum genetic algorithm parameters and to obtain the optimum solution.

The outcome of this study has shown that, the cost value obtained with the developed program is less than the original cost value which means the algorithm developed is successful.

OPTIMIZATION OF EFFECTS OF CUTTING PARAMETERS AND CUTTING TOOL PATH WIHT TAGUCHI GREY BASED

Mustafa AY[1], Gültekin BASMACI[2]

[1]Teknoloji Fakültesi / Marmara Üniversitesi, muay@marmara.edu.tr
[2] Mühendislik Fakültesi/ Mehmet Akif Üniversitesi, gbasmaci@mehmetakif.edu.tr

ABSTRACT

In this study, an experimental investigation on surface roughness and cutting forces in milling of PMD 23 cold work-tool steel using multi-layered coated TiAlN cutting tools was presented. The influences of the feed rate, tool path strategy and depth of cut on surface roughness and cutting force were examined. In order to optimize the milling process, Taguchi Grey-based optimization method was used. The influence of each parameter on obtained results was determined by using analysis of variance (ANOVA). The relationship of the dependent parameters and independent parameters was modeled with Regression analysis. The optimal machinability of PMD 23 cold work-tool steel using multi-layered coated TiAlN cutting tool was successfully determined in this study.

Key Words: Cutting Path Strategies, Taguchi, Grey Relation Analysis, ANOVA, Regression Analysis

Introduction

Among the modern machining tools, CNC milling machines are extensively used in machining. Various CAM software programs are used for programming CNC milling machines. Tool path machining programs are introduced by using these programs while many forms are proposed such as one-way, zigzag, spiral, etc. for the machining form. Selection of these methods affects also machining time and surface quality of the machined material (Kris, 1999; Toh, 2004; Sotiris, 2009).

High-strength materials are achieved with the developments in materials technology. It is required to choose the suitable cutting tool among these materials in order to provide the maximum efficiency during machining (Kris, 1999; Nurul, 2008; Brandao, 2008; Koshy, 2002; Arsecularatne, 2006; Ghani, 2004; Abou-El-Hossein, 2007; Coldwell, 2003). Determination of tool material and cutting geometry is very essential. Efficiency is reduced when the machining conditions is non-standard, even if the suitable tool is selected. Theoretical studies should be carried out for each material to be machined and each type of cutting tools in order to provide high efficiency and be able to make economical machining (Kris, 1999; Toh, 2004; Nurul, 2008; Brandao, 2008; Tsao, 2002; Ghani, 2004). It is specified that determination and application of cutting tool strategies and movements are critical in milling of volume casts, aeronautical and cutting casts (Kris, 1999; Toh, 2004; Sotiris, 2009; Pateloup, 2004; Hinds, 2004; Göloğlu, 2008). Selection of the suitable cutting strategy and movement provides a reduced machining time and increased surface quality, tool life, production cost and efficiency. In particular, tool displacement types affect the cutting forces. It was indicated that tool displacement errors should be minimized in order to reduce the cutting forces occurred.

In this study, surface roughness and cutting forces were investigated experimentally in milling of PMD 23 cold work-tool stee (which is used in many fields such as cast and die manufacturing industry) by multi-layered coated TiAlN cutting tools. Effect of tool path, feed and cutting depths on surface roughness and cutting forces was examined. Taguchi Grey technique was used for optimization of the milling process. Also, a variance analysis (ANOVA) was used for determination of effect of each parameter on the results obtained. In conclusion, the relationship between the dependent and the independent variables was modeled with regression analysis.

Material and Method

Material

PMD 23 cold-work tool steels used in the mold industry in the industry. PMD 23 cold-work tool steel is high temperature stability, thermal conductivity toughness and wear resistance Specimens used in the experimental study are PMD 23 cold work-tool steel material and PMD 23 cold work-tool steel whose chemical compositions and mechanical characteristics are given in Table 1 and Table 2 respectively was used as the test specimen. In experiments, JOHNFORD VMC-850/550+APC CNC Fanuc 0T x-y-z axis CNC Milling Machine with a motor power of 30 HP was used.

Table 2. Mechanical Characteristics of PMD 23 cold work-tool steel

Tensile Strength (Mpa)	Yield Strength (Mpa)	Elongation (%)	Density(kg/m^3)	Hardness(HB)
460	530-650	24	25-36	460

In experiments, following are used; JOHNFORD VMC-850/550+APC CNC Fanuc 0T x-y-z axis CNC Milling Machine, multi-layered coated TiAlN end-mill inserts, MAHR-Perthometer surface roughness tool for surface roughness measurement, KISTLER 9265B dynamometer for cutting force measurement, KISTLER 5019b type charge amplifier and DynoWare software for the analysis.

Method

Experiment was designed by using Taguchi technique. By this way, it has been possible to achieve more comprehensive results with less number of experiments. In this case, time and cost have been saved. As surface roughness of the surface to be measured and cutting force rates are required to be minimum in determination of the quality characteristics, the principle "the smallest is the best" was used for the quality values expected to be found as a result of the experiments. In this experimental study, tool path, feed and cutting depths were chosen as parameters. Multiple-layer TiAlN coated end-mills were used in all experiments and the parameters and their levels are presented in Table 2 while L9 experimental design and the surface roughness and cutting forces obtained from the experiments are given in Table 3. Experimental setup is sketched in Figure 1.

Table 1. Experimental Variables

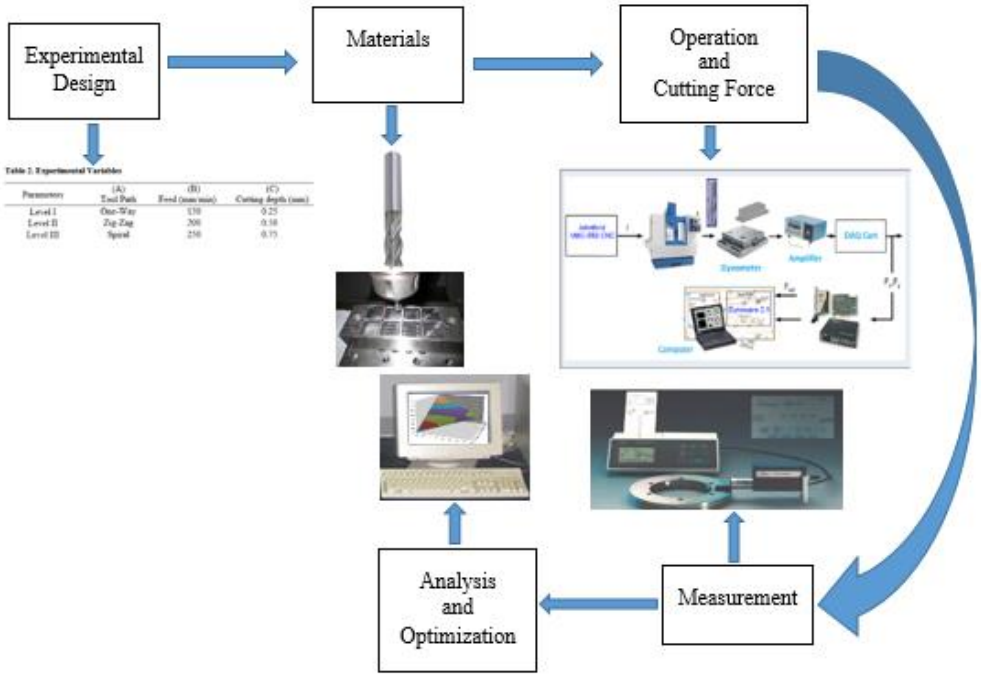

Figure 1. Experimental Setup

Taguchi Based Grey Relational Analysis Method

The obtained experimental results and the determined parameters were optimized with Grey Based Taguchi method. Using regression model, researches were carried out calculating an equation between dependent parameters and independent parameters. The Taguchi method uses a special design of orthogonal arrays to study the entire parameter space with a small number of experiments only.

Experimental design was done using Taguchi method. Hence, it has been possible to reach more comprehensive results with doing less experiment. In this sense, time and money have been used more efficiently [Chung-Chen, 2002, Venkatesan, 2014]. While only outcome is optimized in the Taguchi Method, multiple outcomes can be optimized in a Grey Relational Analysis [Kurt, 2012]. In this study, Taguchi Method was used in the experimental design step, Grey Relational Analysis Method was used in the optimization step.

Grey relational analysis optimization process was carried out in the following three steps [Kurt, 2012];

1. Normalization of experimental results (the lowest-the best)
2. Calculation the Grey Relational Coefficient
3. Calculation of the Grey Relational Degree
4. Determination of optimal experiment parameters

In the normalization step, the experimental results were normalized using the blow equation according to 'the lowest-the best'.

$$x_i(k) = \frac{\max y_i(k) - y_i(k)}{\max y_i(k) - \min y_i(k)} \qquad (2)$$

Where, $x_i(k)$ refers to the value at the i series and k row after normalization process, $\min y_i(k)$ refers to the minimum value at the i series, $\max y_i(k)$ refers to the maximum value at the i series and $y_i(k)$ refers to the original value at the i series and k row.

The step 2, Grey Relatinoal Coefficient was calculated via equation (3);

$$\xi_i(k) = \frac{\Delta min + \zeta \Delta max}{\Delta 0_i(k) + \zeta \Delta max} \qquad (3)$$

Here, ζ is a distinguishing coefficient between 0 and 1. $\Delta 0_i$ is the amount of deviation between the reference series and the normalization values. Δmin refers to the minimum value of the deviation sequence from the reference series and Δmax refers to the maximum value of deviation sequence from the reference series.

 Copyright © International Science and Technology Conference (ISTEC)

The step 3, Grey Relational Degree was calculated by equation (4);

$$\gamma_i=\frac{1}{n}\sum_{k=1}^{n}\xi i\,(k) \qquad (4)$$

Results and Discussions

Grey Relational Analysis

Grey Relational Analysis Method was applied to the experimental results shown in Table 4, and the first step (normalization) results were given in Table 4.

Table 4. Normalization results

Exp. No.	Variables	Surface Roughness, Ra (µm)	Cutting Force (N)
1	$A_1B_1C_1$	1,000	1,000
2	$A_1B_2C_2$	0,583	0,546
3	$A_1B_3C_3$	0,022	0,277
4	$A_2B_1C_2$	0,939	0,513
5	$A_2B_2C_3$	0,576	0,000
6	$A_2B_3C_1$	0,000	0,462
7	$A_3B_1C_3$	0,766	0,219
8	$A_3B_2C_1$	0,482	0,740
9	$A_3B_3C_2$	0,104	0,101

Then, the deviations from the reference series were calculated and the results were given in Table 5.

Table 5. Values of the deviation from the reference value

Exp.No.	Surface Roughness, Ra (µm)	Cutting Force (N)
1	0,000	0,000
2	0,417	0,454
3	0,978	0,723
4	0,061	0,487
5	0,424	1,000
6	1,000	0,538
7	0,234	0,781
8	0,518	0,260
9	0,896	0,899

The Grey Relational Coefficients were calculated using the equation 2 and shown in Table 6.

Level 2	0,515	0,515	0,530
Level 3	0,489	0,380	0,449

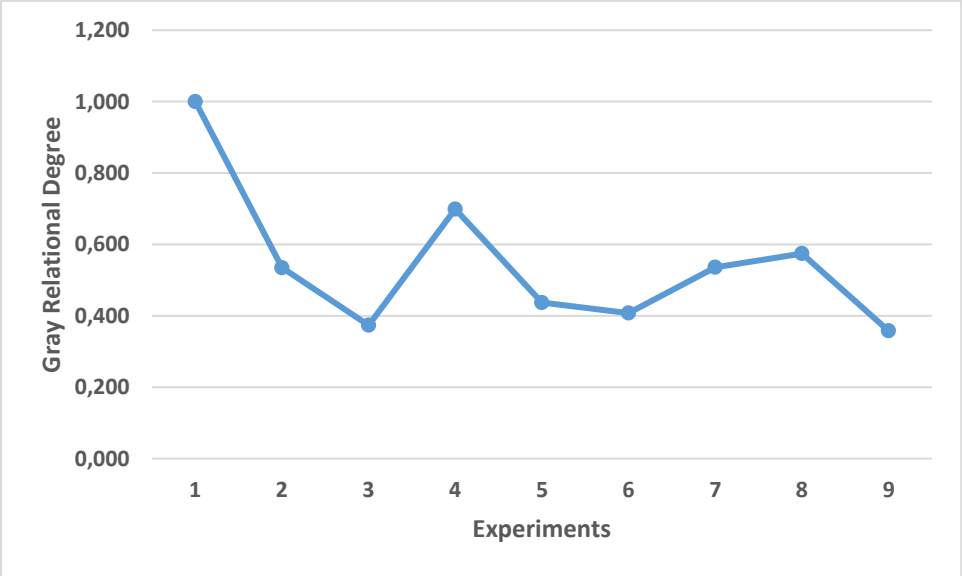

Figure 2. Grey Relational Degrees for each experiments

Variance Analysis

Nine experiments were performed in milling of PMD 23 cold-work tool steel by using three different factors at three different levels, and, at the end of each experiment, Ra respond values were found to be different from each other. Variance analysis was used in order to specify whether these variations are purely coincidental or they result from the factors and determine effect of each factor on the response. As given in Table 8, the most effective factor is the feed with a value of 98.04% in formation of roughness on the machined surface as a result PMD 23 cold-work tool steel machined by multiple-layer TiAlN coated end-mills cutting tools.

Table 8. ANOVA results depending on Ra values

Notations	Degree of Freedom	**Sum of Squares**	Variables	**F rate**	Percentage (%)
A	2	0,000839	0,000419	0,56	0,95
B	2	0,086550	0,043275	57,72	98,04
C	2	0,000891	0,000445	0,59	1,00
Error (e)	2	0,001500	0,000750		0,01
Total	8	0,089779			100

As given in Table 9, the most effective factor is the feed with a value of 63.95% in formation of cutting force on the machined as a result PMD 23 cold-work tool steel machined by multiple-layer TiAlN coated end-mills cutting tools.

Table 9. ANOVA results depending on N values

Notations	Degree of Freedom	**Sum of Squares**	Variables	**F rate**	Percentage (%)
A	2	1105,6	552,8	4,49	18,90
B	2	1003,1	501,6	4,07	17,13

 Copyright © International Science and Technology Conference (ISTEC)

C	2	3741,5	1870,7	15,19	63,95
Error (e)	2	246,3	123,2		0,02
Total	8	6096,5			100

Regression Analysis

Linear regression analysis was used in order to generate the estimating equation between the control factors (tool path, feed and cutting depth) used for machining and that of respond (Mean surface roughness) and to be able to define the relationship between them. Ra equation obtained for this experimental study is given below.

Ra (μm) = 0,0236 + 0,0117 A + 0,120 B + 0,0055 C+ (ε) $R^2 = 0{,}965$ (3)

Cutting Force (N) = - 20,0 + 11,1A + 12,9B + 24,8C + (ε) $R^2 = 0{,}89$ (4)

where A: tool path, B: feed and C: cutting depth. Also, ε gives the error. R^2 value which is the coefficient of determination of surface roughness and cutting dorce equations were found as 0.965 and 0.89. R^2 value approaching 1 reflects proximity of estimation model to the real relationship and the case where an R^2 value equals to 0.8 and above is accepted as a strong relationship. As R^2 value in the estimating equation obtained from this study is above 0.8, it is within the acceptable limits and has a strong relationship.

CONCLUSIONS

Useful results were obtained from this study in which machinability of PMD 23 cold-work tool steel with multiple-layer TiAlN coated end-mills cutting tool was investigated. Criteria taken into account for machinability were surface roughness and cutting force. Three control factors (tool path, feed and cutting depth) which are considered to be effective for realization of these criteria at the most ideal conditions were chosen at three different levels and applied in the experimental study. Results obtained are summarized as follows:

- The most effective factor in machining of PMD 23 cold-work tool steel with multiple-layer TiAlN coated end-mills cutting tools is the feed for the surface roughness value occurred on the machined surface. The optimum value is obtained by taguchi based grey relational analysis when the machining parameters are as follows: one-way tool path, 150 mm/min feed and 0.25 mm cutting depth.
- As a result of the performed study, Taguchi optimization technique was found to be an efficient technique in experimental study of PMD 23 cold-work tool steel machinability and optimization of the parameters and provide respond values range at the desired rates.
- The issue with respect to which control factor has what significance level in obtaining the results from the experimental study was determined successfully by the variance analysis (ANOVA). According to that, feed is noticeable with a value of 98.04% in formation of roughness.
- The Ra and cutting force estimating equation were obtained with an accuracy of 96.5% and 89% by regression analysis for such an experimental study.
- When the obtained results are evaluated by also considering the literature, it is found that multiple-layer TiAlN coated end-mills cutting tools made positive contribution to machinability of PMD 23 cold-work tool steel and, in particular, accelerated the improvement of the cutting tool performance. Another result obtained from this study is that PMD 23 cold-work tool steel can be produced by dry milling with multiple-layer TiAlN coated end-mills cutting tools.

ORTADOĞU BÖLGESİNİN JEOEKONOMİK AÇIDAN İKİ STRATEJİK ENERJİ KAYNAĞI: PETROL VE DOĞALGAZ

TWO STRATEGIC ENERGY SOURCE OF MIDDLE EAST REGION IN TERMS OF GEOECONOMIC PERSPECTIVE: PETROLEUM AND NATURAL GAS

Özet

Bu çalışmada, Ortadoğu bölgesinin sahip olduğu enerji kaynaklarından petrol ve doğalgaz ele alınmış ve bu enerji kaynaklarının jeoekonomik açıdan önemi irdelenmeye çalışılmıştır. İlk medeniyetlerin kurulduğu bir alana tekabül etmesi ve üç semavi dinin (Musevilik, Hristiyanlık ve İslamiyet) çıkış yeri olması gibi faktörler, Ortadoğu bölgesinin her dönemde cazip bir bölge olmasına neden olmuştur. Ortadoğu'yu önemli kılan bir diğer faktör bölgenin sahip olduğu zengin yer altı kaynaklarıdır. 19.yüzyılın sonlarından itibaren petrol ve doğalgaz kaynaklarının bölgede tespit edilip kullanılması, bölgenin önemini daha da arttırmıştır. Dünyadaki petrol rezervinin %46'sı, doğalgaz rezervinin %44'ü Ortadoğu'da yer almaktadır. Ortadoğu, Dünyada üretilen petrolün yaklaşık %33'ünü üretmekte, üretilen bu petrolün büyük bir bölümü (%70) bölge dışına ihraç edilmektedir. Petrole göre az da bölgede üretilen doğalgazın bir bölümü de ihraç edilmektedir. Dolayısıyla dünya enerji talebinin karşılanmasında Ortadoğu bölgesi, dünyadaki en önemli havza konumundadır.

Dünya genelinde enerjiye olan ihtiyaç sürekli bir artış göstermektedir. Rusya enerji kaynakları ihraç eden bir ülke konumunda iken, ABD'nin yakın gelecekte kendi enerjisini sağlayabilecek bir noktaya geleceği tahmin edilmektedir. Ancak ABD Ortadoğu bölgesindeki enerji kaynakları ile ilgili birtakım stratejiler geliştirmektedir. Hızlı bir gelişme sürecine giren ve dolayısıyla enerjiye olan talebi hızla artan Hindistan ve Çin, bölgedeki enerji kaynaklarına yönelmektedirler. Öte yandan günümüzde olduğu gibi bundan sonraki süreçte de petrol ve doğalgaz ihtiyacının büyük çoğunluğunu dışardan karşılayan AB için Ortadoğu ve yakın çevresindeki enerji kaynakları daha anlamlı hale gelecektir. Rusya'nın zaman zaman AB ülkelerine ihraç ettiği doğalgazı siyasi ve ekonomik bir baskı aracı olarak kullanması da AB ülkelerini bölgedeki enerji havzalarına yöneltmektedir.

Günümüzde Ortadoğu bölgesi ve yakın çevresindeki (Kuzey Afrika ve Hazar Havzası) enerji kaynakları üzerinde hem bölgesel hem de küresel güçler arasında büyük bir jeoekonomik mücadele sürmektedir. Bundan sonraki süreçte de Ortadoğu bölgesi, dünya küresel güç rekabetinin en önemli sahalarından birini oluşturacaktır. Dolayısıyla Ortadoğu'nun jeoekonomik öneminin giderek artacağı ve buna bağlı olarak son yıllarda bölgede cereyan eden hadiselerin yoğun olarak devam edeceği tahmin edilmektedir.

Anahtar Kelimeler: Ortadoğu, Enerji kaynakları, Petrol, Doğalgaz, Jeoekonomi

Abstract

In this research two strategic energy source of Middle East region petroleum and natural gas are handled and geoeconomical importance of these resources are scrutinized. Being the homeland of first civilizations and birth place of three divine religions (Judaism, Christianity and Islam) made Middle East region attractive. Another important factor that makes Middle

[1] Sorumlu Yazar

 Copyright © International Science and Technology Conference (ISTEC)

East significant is rich underground sources it possesses. As from the 19th century detection and usage of petroleum and natural gases increased the importance of the territory. In the world 46% of petroleum reserves and 44% of natural gas reserves are in Middle East. 33% of worldwide petroleum reserves are produced in Middle East, and 70% of produced petroleum are exported outside of the region. Compared to petroleum natural gas are exported very little to outside of the region. Therefore, Middle East region is one of the integral basin in terms of meeting energy demand.

The need for energy is continuously increasing worldwide. While Russia is an energy exporting country, it is expected that in the near future USA will be able to produce its own energy. Still USA building strategies about the energy resources in the Middle East. China and India with a rapid economic development turn to Middle East for their energy need. Besides, as in today, in the future energy resources in Middle East and surrounding will be important for EU since it is still a foreign dependent in terms energy. Because sometimes Russia uses natural gas as a political and an economic leverage against EU, EU tries to have a word about Middle East energy resources.

At the present, there is a great geoeconomical challenge between both national and international forces about energy sources in the Middle East and surroundings (North Africa and Hazar Basin). In the future Middle East region still will be one of the most integral competitive power region. Thereby, it is estimated that the geoeconomic importance of Middle East will increase and events as it continuos today will intensely go on.

Key Words: Middle East, Energy Resources, Petroleum, Natural Gas, Geoeconomy

1.Giriş

Ortadoğu bölgesi, doğal sınırlarla ayırt edilebilen coğrafi bir bölge özelliği taşımamaktadır. Ortadoğu bölgesinin sınırları bölge üzerinde etkin olmak isteyen ülkelerin amaçlarına göre değişiklik göstermektedir. Ortadoğu kavramı, batılı devletlerin çıkarları doğrultusunda ortaya çıkmış, zamanla bölge halkı tarafından da benimsenerek kullanılmıştır (Meriç, 1980:71). Günümüzde İngiltere'nin belirlediği sınırların daha fazla kabul gördüğü ve dolayısıyla Ortadoğu denilince bu sınırlar içerisinde kalan alanların akla geldiği bilinmektedir.

Batılı devletler 15.yüzyılın sonlarından itibaren Hindistan ve Çin'in zenginliklerine kavuşmak için yeni yollar aramaya başlamışlar ve Coğrafi keşiflerle Doğu Avrupa üzerinden veya Afrika'nın güneyinden geçen yolları keşfetmişlerdir. Ancak, bu yollar uzun olup, en kestirme yollar Osmanlı toprakları üzerinden geçiyordu. İngilizler seyahatleri sırasında Hindistan ve Çin ülkelerine *Uzakdoğu*, Osmanlı ülkelerine ise *Yakındoğu (Near East)* adını vermişlerdir. 1889'da Süveyş Kanalı'nın açılmasıyla yeni bir ticaret yolu açıldı ve İngilizler bu dönemde bölgeye Yakın Doğu yerine *Ortadoğu (Middle East)* adını verdiler (Özey, 2009:2-3).

Temelde *Ortadoğu (Middle East)* kavramının *Doğu (Şark; East)* ve *Yakındoğu (Near East)* kavramları gibi Batı merkezli ve sübjektif bir kavramlaştırmanın ürünü olarak ortaya çıktığı ve kullanım sahasına girdiği söylenebilir. Bu kavramlaştırmayı yönlendiren ana bakış, Avrupa'yı dünyanın merkezi olarak kabul eden ve dünyanın diğer bölgeleri bu merkeze olan uzaklıklarına göre *yakın, orta, uzak* şeklinde kategorize eden bakıştır (Dursun, 2003). *Ortadoğu* kavramı ilk olarak 1902 yılında Amerikan deniz tarihçisi ve stratejisti Alfred Thayer Mahan tarafından kullanılmıştır. Mahan, National Review'de yayınlanan "The Persian Gulf and International Relations" isimli yazısında, Arabistan ile Hindistan arasındaki bölgeyi ifade etmek için *Ortadoğu* kavramını kullanmıştır. Bundan sonra İngiliz gazetesi olan The Times gazetesinde "Ortadoğu'nun Problemleri" başlığı ile bazı makaleler yayınlanmıştır (Lewis, 1964:75; Dursun, 2005:1233). 1939 yılına kadar dar ve kapalı bir anlam taşıyan *Ortadoğu* kavramı bu tarihten itibaren İngiltere'nin resmi kaynaklarında kullanılmaya başlanmıştır (Özey, 2009:2-3).

Kuzey Afrika, Kafkaslar, Afganistan ve bazı kaynaklarda Orta Asya, Ortadoğu bölgesi içerisinde gösterilmektedir. Özellikle ABD bölgenin sınırlarını geniş tutmaktadır. Kuzey Afrika, Kafkaslar ve Orta Asya bölgeleri, coğrafi özellikleri itibariyle farklı olması nedeniyle kabul görmüş ve sınırları belli olan bölgelerdir. Ortadoğu kavramı dar anlamda Arabistan Yarımadası, Basra Körfezi ülkeleri, Mezopotamya, İran, Türkiye ve Mısır'ı içine alacak şekilde kullanılmaktadır (Dursun, 2003). Asya kıtasının güneybatısına tekabül eden bu bölge coğrafyacılar tarafından Güneybatı Asya olarak adlandırılmaktadır (Gözenç, 1996:4). Bugünkü Ortadoğu kuzeyde Türkiye, batıda Mısır, doğuda İran ve güneyde Yemen ülkeleriyle çevrili bölgeyi içine almaktadır. Günümüzde Ortadoğu; Türkiye, İran, Irak, Suriye, S.Arabistan, Kuzey Kıbrıs Türk Cumhuriyeti, Güney Kıbrıs Rum Kesimi, Mısır, Ürdün, Lübnan, İsrail, Filistin, Kuveyt, Bahreyn, Katar, BAE, Umman ve Yemen olmak üzere 18 devletten ibarettir (Özey, 2009:3-5). (Harita 1).

 Copyright © International Science and Technology Conference (ISTEC)

Harita 1: Ortadoğu bölgesinin lokasyon haritası

Ortadoğu bölgesi jeostratejik konumu nedeniyle geçmişte olduğu gibi günümüzde de önemli bir bölge özelliğindedir. Ortadoğu bölgesinin cazip bir bölge olmasında çeşitli faktörler etkili olmaktadır. Medeniyetlerin beşiği olarak kabul edilen ve en eski yerleşmelerin kurulduğu bölgelerden biri olan Ortadoğu'da Asurlular, Urartular, Persler, Makedonlar, Araplar, Selçuklular, Eyyübiler ve Osmanlılar büyük devletler kurmuşlardır. Dolayısıyla insanlığın ilk ortaya çıktığı yerlerden biri olan bölge, ilk medeniyetlerin kurulduğu bir alana tekabül etmektedir.

Ortadoğu bölgesini önemli kılan bir diğer faktör üç semavi dinin (Musevilik, Hristiyanlık ve İslamiyet) çıkış yeri olmasıdır. Bölgede yer alan *Kudüs, üç dinin kutsal merkezi konumunda olup, bu yönüyle sadece bölgesel nitelikli bir bunalım alanı değildir. Küdus'te yaşanan sorun, dünyanın her tarafına yayılmış üç din mensubunun sorunu haline gelmektedir* (Davutoğlu, 2001). Dolayısıyla Ortadoğu bölgesi, yukarıda adı geçen üç semavi din mensupları için şimdiye kadar olduğu gibi bundan sonraki dönemlerde de önem arz eden bir bölge olacağı düşünülmektedir.

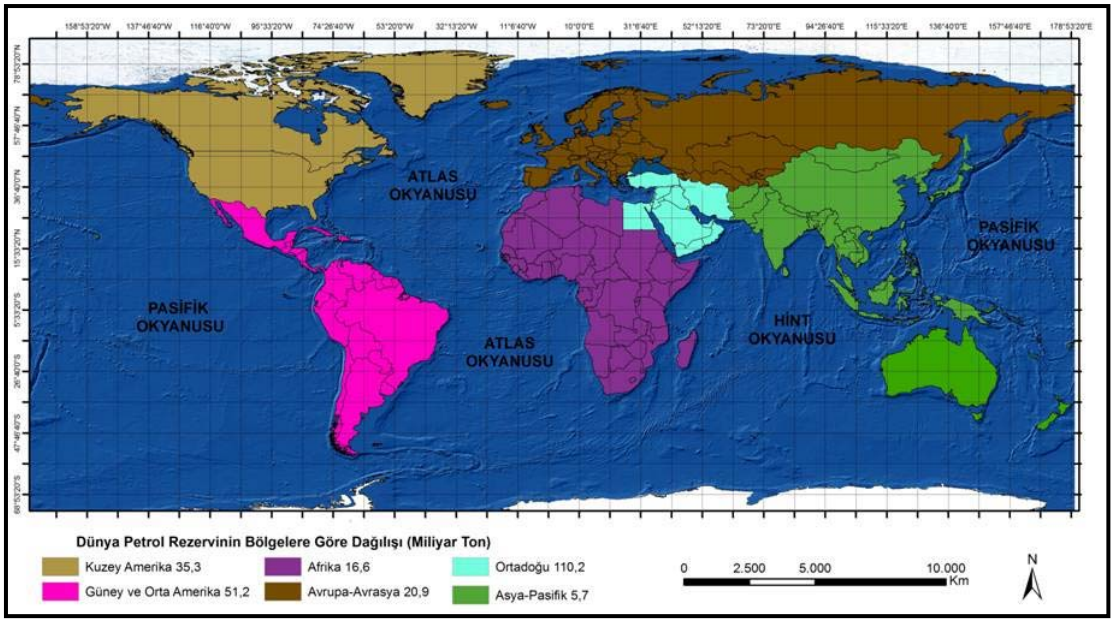
Günümüzde Ortadoğu'yu cazip kılan önemli faktörlerden biri de enerji kaynaklarıdır. 20.yüzyılın başlarından itibaren petrol ve doğalgaz kaynaklarının kullanılmaya başlanmasıyla bölgenin önemi daha da artmıştır. I.Dünya savaşından sonra bölgenin siyasi hayatında büyük ölçüde meydana gelen değişiklikler (Osmanlı devletinin zayıflaması ve yıkılması neticesinde yeni devletlerin kurulması gibi) ile Ortadoğu bölgesi, gerek politika ve strateji, gerekse petrol ve doğalgaz kaynaklarının varlığına bağlı olarak ekonomi alanında dünyanın en dikkat çekici bölgelerden biri haline gelmiş ve dolayısıyla bölge, büyük devletlerin siyaset ve ekonomi alanında bir rekabet sahasına dönüşmüştür (Öngör, 1965:1-2).

Ortadoğu bölgesi petrol, doğalgaz, kömür gibi fosil yakıtlar ile hidroelektrik, jeotermal, rüzgar, güneş enerjisi gibi alternatif enerji kaynakları bakımından zengin bir bölgedir. Ancak günümüzde bölgeyi küresel enerji sektörü açısından cazip hale getiren en önemli enerji kaynakları şüphesiz petrol ve doğalgazdır. Dolayısıyla bu çalışmada Ortadoğu bölgesinin iki stratejik enerji kaynağı olan petrol ve doğalgaz kaynakları, jeoekonomik[2] açıdan irdelenmiştir. Ortadoğu'daki petrol ve doğalgaz kaynakları, Hazar Denizi Havzası ve Kuzey

[2] Jeoekonomi, en kısa ve genel tanımıyla *bir bölge veya ülkenin, uluslararası ekonomik ve politik ilişkileri içerisinde coğrafya ve ekonomisinin teknolojik öğelerinin de dikkate alınarak stratejik kullanımıdır*. Jeoekonomiye asıl önem atfeden durum uluslararası alandaki güç mücadelelerindeki temel başvuru stratejisi olmasıdır (İnan, 2011:87).

 Copyright © International Science and Technology Conference (ISTEC)

Afrika'daki kaynaklar ile birlikte değerlendirildiğinde bölgenin dünya enerji sektörü bakımından çok daha önemli bir merkez konumunda olduğu anlaşılmaktadır.



2. Ortadoğu'daki Enerji Kaynakları

Sanayi devrimi ile birlikte başlayan yoğun enerji kullanımı sanayinin gelişmesiyle sürekli artış göstermektedir. Günümüzde nüfusun artışına ve teknolojik gelişmelere bağlı olarak enerjiye olan talep artmaktadır. Özellikle gelişmiş ve hızlı kalkınma sürecine girmiş olan ülkeler, bütçelerinin en önemli kısmını oluşturan enerji kullanımı nedeniyle büyük miktarlarda enerji kaynaklarına ihtiyaç duymaktadırlar. Ülkelerin artan enerji ihtiyacı, insanları enerjinin tasarruflu kullanmaya ve yeni kaynak arayışlarına sevk etmektedir. Son yıllarda enerjiye en fazla ihtiyaç duyan ülkelerin büyük bir bölümünün kendi enerji kaynaklarının yeterli olmadığı, bu ihtiyaçlarını çeşitli enerji havzalarından karşılamaya çalıştığı görülmektedir.

Dünya enerji üretiminde petrol ilk sırada yer almaktadır. Petrolü daha önce tartışmasız en büyük enerji kaynağı olan fakat şimdiki payı düşen maden kömürü; üçüncü sırada da dünya enerji üretim ve tüketimindeki payını sürekli arttıran doğal gaz izlemektedir (Tümertekin ve Özgüç, 2012:350). Günümüzde dünyada tüketilen çeşitli enerji kaynakları içerisinde bu üç fosil kaynak en büyük paylara sahiptir. Nitekim petrol (%33), kömür (%30) ve doğalgaz (%24) kaynakları tüketilen tüm enerji kaynaklarının %87'si gibi büyük bir oranına karşılık gelmektedir (Türkiye Petrolleri Strateji Geliştirme Daire Başkanlığı, 2015:4). Dolayısıyla bu çalışmada Ortadoğu özelinde ele aldığımız petrol ve doğalgaz kaynakları dünya enerji tüketiminin yarıdan fazlasını (%57) karşılamaktadır.

2.1.Petrol

Dünyadaki petrol rezervleri belirli bölgelerde yoğunlaşmaktadır. 2014 yılı itibariyle dünya ham petrol rezervi toplamı 239,9 milyar tondur. Bu rezervinin yarıya yakını (%46'sı) Ortadoğu'da yer almaktadır. Dünya petrol rezervinin %21'i Güney ve Orta Amerika'da, %15'i ise Kuzey Amerika'da bulunmaktadır (Harita 2, Tablo 1, Şekil 1). Bu üç bölgenin toplam rezervinin oranı %82'dir. Petrol rezervi açısından Ortadoğu bölgesi ülkeleri iki kategoride ele alınabilir. Bunlardan petrol rezervi açısından zengin olan ülkeler Suudi Arabistan, İran, Irak, Kuveyt, Birleşik Arap Emirlikleri ve Katar'dır. Bu ülkeler içerisinde en büyük rezerve sahip olan ülke dünya petrol rezervinin %15.7'sini bulunduran S.Arabistan'dır. Bölgedeki diğer ülkeler petrol kaynakları açısından fakir olan ülkelerdir (Tablo 2).

Harita 2: Dünya petrol rezervinin bölgelere göre dağılışı (milyar ton)

*Diğer Ortadoğu ülkelerinden Türkiye (38,3 milyon ton) ve İsrail (10,1 milyon ton) en fazla petrol tüketen ülkelerdir.

Dünya ham petrol rezervlerine ülke bazında bakıldığında rezervlerin Ortadoğu bölgesi ile Amerika Kıtasında yoğunlaştığı görülür. BP'nin 2014 yılı istatistiklerine göre dünya ham petrol rezerv sıralamasında Venezuela (%17,5) ilk sırada yer almaktadır. S.Arabistan (%15,7), Kanada (%10,2), İran (%9,3), Irak (%8,8), Rusya Federasyonu (%6,1), Kuveyt (%6,0), Birleşik Arap Emirlikleri (%5,8), Çin (%5) petrol rezervi açısından zengin olan ülkelerdir. ABD'nin petrol rezervi oranı ise %2,9'dur. Rezerv oranlarına göre ham petrol rezervinin yaklaşık %80'i Ortadoğu bölgesi, Venezuella, Kanada, Rusya Federasyonunda yer almaktadır. Bu oranlar da önümüzdeki yıllarda başta Ortadoğu bölgesi olmak üzere petrol rezervi zengin olan alanların jeoekonomik açıdan dikkatlerin üzerinde olacağı bölgeler olacağını göstermektedir.

Enerjiye olan talebin artışına bağlı olarak dünyada üretilen ham petrol miktarı da giderek artış göstermektedir. 2004 yılında toplamda 3904,8 milyon ton olan dünya ham petrol üretimi, 2014 yılında 4220,5 milyon tona yükselmiştir. 2014 yılı itibariyle en fazla üretim 1374,2 milyon ton (%33) ile Ortadoğu bölgesinde

 Copyright © International Science and Technology Conference (ISTEC)

gerçekleştirilmiştir. Kuzey Amerika (%21) ve Avrupa-Avrasya (%20) bölgeleri petrol üretiminin fazla olduğu diğer bölgelerdir (Tablo 3). Ortadoğu bölgesi dışında ülke bazında petrol üretimine bakıldığında en büyük payın Rusya Federasyonu'nda (%12,7) olduğu görülür. Petrol rezervi %2,9 oranında olan ABD %12,3 oranıyla en fazla üretim yapan ikinci ülke konumundadır. Kanada (%5), Çin (%5), Venezuella (%3,8) petrol üretiminde önde gelen diğer ülkelerdir (BP, 2015). Dünya petrol üretiminin %33'ünü sağlayan Ortadoğu bölgesinde en fazla üretim yapan ülkeler S.Arabistan (543,4 milyon ton), İran (169,2 milyon ton), Birleşik Arap Emirlikleri (167,3 milyon ton), Irak (160,3 milyon ton) ve Kuveyt (150,8 milyon ton) gibi zengin rezerve sahip olan ülkelerdir (Tablo 2). Bu oranlara göre günümüzde ham petrol rezervinde olduğu gibi üretimde de Ortadoğu önemli bir merkez konumundadır. Petrol rezervi açısından zengin olan Ortadoğu ülkelerinin de içerisinde yer aldığı OPEC (Petrol İhraç Eden Ülkeler Örgütü) dünya petrol rezervlerinin dörtte üçüne (%75) sahiptir. OPEC'in üretimden aldığı pay ise %45 civarındadır (Öztürkler, 2009:76). Dolayısıyla küresel petrol ticaretinde OPEC'in, belirleyici bir rol oynadığı söylenebilir.

Tablo 3: Dünya petrol üretiminin bölgelere göre dağılışı (milyon ton)

Ülke Adı	**2004**	**Oran (%)**	**2014**	**Oran (%)**
Kuzey Amerika	660,2	17	866,8	21

Dünya Toplamı	**3904,8**	**100**	**4220,5**	**100**

Kaynak: BP (2015).

Bilindiği üzere enerji tüketimi, herhangi bir ülke veya bölge ekonomisinin en önemli performans göstergelerinden biridir. Enerji tüketimi, nüfus artışına ve dolayısıyla enerjiye olan ihtiyacın artmasına bağlı olarak sürekli bir artış kaydetmektedir (Karakaş, 2014:847). Bu bağlamda petrol tüketiminde sürekli bir artış olduğu görülmektedir. Nitekim, 2004 yılında 3870,8 milyon ton olan petrol tüketimi, 2014 yılında 4211,1 milyon tona yükselmiştir. 2014 yılı itibariyle dünya ham petrol rezervi toplamı 239,9 milyar ton ve yıllık tüketim miktarı 4211,1 milyon ton olduğu dikkate alındığında petrolün yaklaşık 57 yıllık bir ömrü olduğu ortaya çıkmaktadır.

Dünyada petrolün en fazla tüketildiği bölgeler Asya-Pasifik (%34), Kuzey Amerika (%24), Avrupa-Avrasya (%21) bölgeleridir (Tablo 4). Avrupa-Avrasya bölgesinde AB ülkeleri önemli birer tüketici konumundadırlar. Avrupa'nın (Rusya Federasyonu hariç) petrol tüketimi yaklaşık %15'tir. Ülke bazında petrol tüketimine bakıldığında ABD (%19,9), Çin (%12,4), Japonya (%4,7), Hindistan (%4,3) ve Rusya Federasyonu'nun (%3,5) en fazla petrol tüketen ülkeler olduğu görülür. Petrol rezervinin %46'sına sahip olan Ortadoğu bölgesinin petrol tüketim oranı %10'dur. Ortadoğu bölgesinde dünya petrol rezervinin %15,7'sine sahip olan S.Arabistan'ın tüketim payı %3,7'dir (BP, 2015). Petrol konusunda dikkat çeken en önemli hususlardan biri Rusya Federasyonu haricinde ABD, Çin, Japonya, Hindistan, AB ülkeleri gibi petrolü en fazla tüketen ülkelerin büyük oranda dışa bağımlı olmalarıdır. Dolayısıyla günümüzde olduğu gibi yakın gelecekte de petrole olan talebi sürekli artan bu ülkelerin başta Ortadoğu coğrafyası olmak üzere petrol rezervlerinin bulunduğu havzalar üzerindeki baskıları yoğunlaşarak devam edeceği öngörülmektedir.

Tablo 4: Dünya petrol tüketiminin bölgelere göre dağılışı (milyon ton)

Ülke Adı	**2004**	**Oran (%)**	**2014**	**Oran (%)**
Kuzey Amerika	1125,9	29	1024,4	24
Güney ve Orta Amerika	236,5	6	326,5	8
Avrupa-Avrasya	961,8	25	858,9	21
Ortadoğu	**306,3**	**8**	**431,7**	**10**
Afrika	105,5	3	140,7	3
Asya-Pasifik	1134,8	29	1428,9	34
Dünya Toplamı	**3870,8**	**100**	**4211,1**	**100**

Kaynak: BP (2015).

Ortadoğu bölgesi, dünyada petrolün yaklaşık %33'ünü üretirken, üretilen dünya petrolünün %10'unu tüketmektedir. Dolayısıyla bölgede üretilen petrolün büyük bir bölümünün bölge dışında tüketildiği

 Copyright © International Science and Technology Conference (ISTEC)

anlaşılmaktadır. Nitekim, 2014 yılında bölgede üretilen 1374,1 milyon ton petrolün yaklaşık %30'u (421,5 milyon ton) bölge içerisinde tüketilirken, geriye kalanı (%70) bölge dışına ihraç edilmiştir (Tablo 2).

Dünya petrol ithalatı ve ihracatı bölge ve ülkelere göre farklılık göstermektedir. Sanayileşmiş ve enerjiye ihtiyacı hızla artan ve kendi kaynakları yeterli olmayan ülke/bölgeler ithalatın daha fazla gerçekleştiği alanlardır. ABD, Avrupa ve Japonya 2004 yılında petrolün %62'sini ithal etmiştir. 2014 yılına gelindiğinde bu üç bölgenin ithalatı %46'ya gerilemiştir. İthalatta en büyük düşüş ABD'de gerçekleşmiştir. Nitekim ABD, 2004 yılında dünya petrolünün %26'sını ithal ederken, 2014 yılında %16'sını ithal etmiştir (Tablo 5). Bunun temel nedenlerinden birisi ABD'nin son yıllarda şeyl (kaya) gazı başta olmak üzere kendi enerji kaynaklarını daha fazla kullanmaya başlamasıdır. Yeni alternatif enerji kaynaklarının devreye girmesi nedeniyle de ithalat oranları düşmüştür. Dünya petrol ithalatında yeni aktörlerin ortaya çıkmasının da yukarıda belirtilen ABD, Avrupa ülkeleri ve Japonya'nın ithalat oranlarının düşmesine neden olduğu söylenebilir.

Tablo 5: Dünya petrol ithalatı (bin varil /gün)

Ülke Adı	**2004**	**Oran (%)**	**2014**	**Oran (%)**
ABD	12898	26	9221	16
Avrupa	12538	25	12601	22
Japonya	5203	11	4333	8
Diğer Ülkeler	18651	38	30581	54
Dünya Toplamı	**49290**	**100**	**56736**	**100**

Kaynak: BP (2015).

Dünya petrol ihracat durumuna bakıldığında en fazla ihracatın petrol rezervlerinin fazla olduğu bölgeler ve enerji talebinin nispeten az olduğu gelişmekte olan bölgeler olduğu görülür. Ortadoğu ve yakın çevresi (Kuzey Afrika ve Hazar Havzası) en fazla ihracatın yapıldığı bölgedir. Ortadoğu bölgesi, 2004 yılında dünya petrolünün %40'ını (19630 bin varil/gün), 2014 yılında ise %35'ini (19761 bin varil/gün) ihraç etmiştir. İhracat miktarında az da olsa bir artış olmasına rağmen diğer bölgelerin daha fazla ihraç etmesi nedeniyle ihracat oranında bir düşüş yaşanmıştır. Günümüzde Ortadoğu, Eski Sovyetler Birliği ve Kuzey Afrika bölgeleri ihracatın yarısından fazlasını gerçekleştirmektedir (Tablo 6). Dolayısıyla fazla enerji tüketen ABD, Avrupa Birliği ülkeleri, Japonya, Çin, Hindistan gibi ülkelerin Ortadoğu ve yakın çevresindeki petrol kaynaklarına olan taleplerinin devam edeceği öngörülmektedir.

Tablo 6: Dünya petrol ihracatı (bin varil /gün)

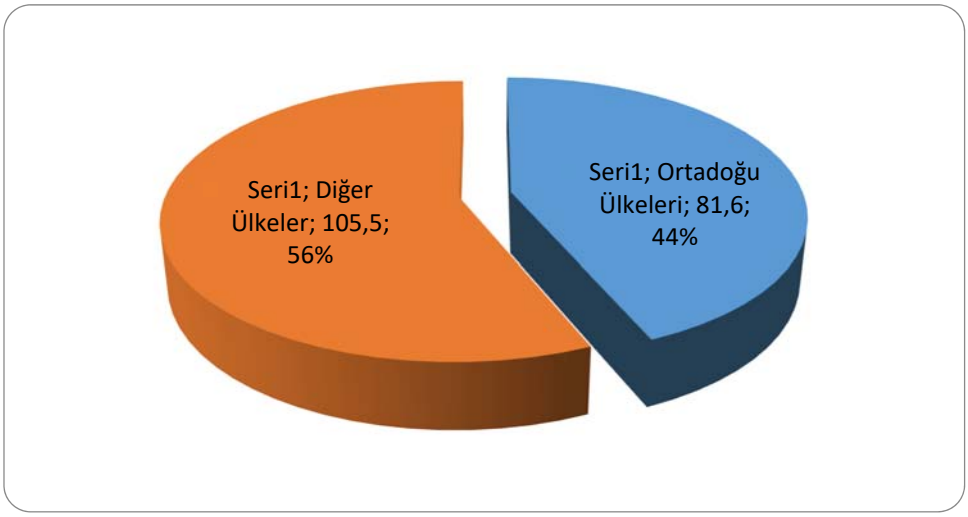
2.2.Doğalgaz

Ortadoğu'da bulunan enerji kaynaklarından biri olan doğalgaz rezervleri de dünya üzerinde dengesiz bir dağılış göstermektedir. 2014 yılı itibariyle dünya doğalgaz rezervi 187,1 trilyon m^3 'tür. Bu rezervin 81,6 trilyon m^3 'ü Ortadoğu'da yer almaktadır. Ortadoğu'daki doğalgaz rezervleri, Dünya doğalgaz rezervinin %44'üne tekabül etmektedir. Ortadoğu'dan sonra Avrupa-Avrasya en fazla doğalgaz rezervi olan ikinci bölgedir. Dünya doğalgaz rezervinin %31'inin (58 trilyon m^3) bulunduğu bu bölge içerisinde Rusya Federasyonu 32,6 trilyon m^3 ile en büyük paya (Dünya doğalgaz rezervinin %17,4'ü) sahiptir (Harita 3, Tablo 7, Şekil 2).

 Copyright © International Science and Technology Conference (ISTEC)



Harita 3: Dünya doğalgaz rezervinin bölgelere göre dağılışı (trilyon m^3)

Şekil 2: Ortadoğu ülkeleri ve diğer ülkelerin doğalgaz rezervi (%)

Ortadoğu bölgesinde doğalgaz rezervi açısından zengin olan ülkeler İran ve Katar'dır. İran 34 trilyon m^3 ile en fazla doğalgaz rezervi olan ülkedir. Katar'ın doğalgaz rezervi 24,5 trilyon m^3 'tür. S.Arabistan, BAE, Irak gibi aynı zamanda petrol zengini olan diğer ülkeler ile Mısır doğalgaz rezervi bakımından nispeten zengin olan ülkelerdir. Diğer Ortadoğu ülkeleri ise daha az miktarda doğalgaz rezervlerine sahiptir (Tablo 8). Ülke bazında

 Copyright © International Science and Technology Conference (ISTEC)

doğalgaz rezervlerine bakıldığında İran'ın (%18,2) ilk sırada yer aldığı görülür. İran ile birlikte Rusya Federasyonu (%17,4), Katar (%13,1), Türkmenistan (%9,3), ABD (%5,2) ve S.Arabistan (%4,1) dünya doğalgaz rezervi açısından önde gelen ülkelerdir. AB ülkelerinin doğalgaz rezervi %3, Çin'in doğalgaz rezervi ise %1,8'dir (BP, 2015). Bu bilgilere göre dünya doğalgaz rezervinin %60'tan fazlası (%62,4) Ortadoğu ve yakın çevresinde yer alan beş ülkede bulunmaktadır. Bu da jeopolitik ve jeoekonomik açıdan önemli bazı sonuçlar doğurmaktadır (Akpınar ve Başıbüyük, 2011:124).

Tablo 8: Ortadoğu'da doğalgaz rezervi, üretimi ve tüketimi (2014)

Ülke Adı	**Rezerv (Trilyon m^3)**	**Üretim (Milyar m^3)**	**Tüketim (Milyar m^3)**
Bahreyn	0,2	16,9	
Birleşik Arap Emirlikleri	6,1	57,8	69,3
Irak	3,6	1,3	
İran	34	172,6	170,2
Katar	24,5	177,2	44,8

Ortadoğu'nun Dünya Toplamındaki Oranı (%)	**44**	**19**	**15**

Kaynak: BP (2015).
* Diğer Ortadoğu ülkelerinden Türkiye (48,6 milyar m^3), İsrail (7,6 milyar m^3) en fazla doğalgaz tüketen ülkelerdir.

2014 yılı itibariyle dünyadaki doğalgaz rezervi 187,1 trilyon m^3, yıllık tüketim miktarı 3393 milyar m^3 (3,4 trilyon m^3)'tür (BP, 2015). Buna göre küresel doğalgaz rezervinin 55 yıllık bir ömrü vardır. Uluslararası Enerji Ajansının 2012 yılı raporuna göre dünyanın doğalgaz talebinin 2035 yılında 5,1 trilyon m^3'e ulaşacağı öngörülmektedir (IEA, 2012). Başta ABD olmak üzere son yıllarda konvansiyonel doğalgaz yanında konvansiyonel olmayan doğalgaz (şeyl gazı, kömür yataklı metan, sıkı kumtaşı gazı) üretimi de yapılmaktadır. 2035 yılında büyük bir bölümü şeyl gazından oluşan yıllık konvansiyonel olmayan doğalgaz üretiminin 1,7 trilyon m^3 olacağı tahmin edilmektedir. Buna göre 2040 yılına doğru konvansiyonel olmayan doğalgaz üretiminin toplam doğalgaz üretiminin yaklaşık %33'ünü karşılayacağı ortaya çıkmaktadır. Bu da doğalgaz piyasasında ABD'nin yanında, şeyl gazı rezervi olan diğer ülkelerin de söz sahibi olacağını göstermektedir.

Dünya doğalgaz üretimine bakıldığında talebe bağlı olarak sürekli bir artış kaydedildiği görülür. Nitekim, 2004 yılında 2711,3 milyar m^3 olan doğalgaz üretimi 2014 yılında 3460,6 milyar m^3 'e yükselmiştir (Tablo 9). Buna göre 10 yıllık bir süre içerisinde doğalgaz üretiminde %22'lik bir artış sağlanmıştır. 2014 yılı itibariyle doğalgaz üretiminin %75'i Avrupa-Avrasya (%29), Kuzey Amerika (%27) ve Ortadoğu (%19) bölgelerinde gerçekleşmiştir. Ülke bazında doğalgaz üretiminde başta gelen ülkeler ABD (%21,4), Rusya Federasyonu (%16,7), Katar (%5,1), İran (%5), Kanada (%4,7), Çin (%3,9), Norveç (%3,1), S.Arabistan (%3,1) ülkeleridir (BP, 2015).

Tablo 9: Dünya doğalgaz üretiminin bölgelere göre dağılışı (milyar m^3)

Ülke Adı	**2004**	**Oran (%)**	**2014**	**Oran (%)**

Dünya doğalgaz üretiminin % 19'unu sağlayan Ortadoğu bölgesinde en fazla üretim yapan ülkeler Katar (177,2 milyar m^3), İran (172,6 milyar m^3), S.Arabistan (108,2 milyar m^3), Birleşik Arap Emirlikleri 57,8 (milyar m^3) ve Mısır (48,7 milyar m^3) gibi zengin rezerve sahip olan ülkelerdir (Tablo 8). Günümüzde doğalgaz rezervinin %44'üne sahip olan Ortadoğu, üretimin %19'ünü karşılamaktadır. Bundan sonraki süreçte Ortadoğu bölgesinde, zengin doğalgaz kaynakları nedeniyle üretimin giderek artacağı ve dolayısıyla enerji talebi artan ülkelerin baskısına maruz kalacağı öngörülmektedir.

Doğalgaz tüketimine bakıldığında üretimle bir paralellik gösterdiği görülür. Dünya doğalgaz tüketiminin en fazla olduğu bölgeler Avrupa-Avrasya (%30), Kuzey Amerika (%28), Asya-Pasifik (%20) bölgeleridir (Tablo 10). 2014 yılı itibariyle Ortadoğu bölgesi tüketimde %15 oranıyla dördüncü sırada yer almaktadır. Doğalgaz tüketiminde ABD (%22,7), Rusya Federasyonu (%12), AB ülkeleri (%11), Çin (%5,4), İran (%5,2), Japonya (%3,3), S.Arabistan (%3,2), Kanada (%3.1), Meksika (%2,5) ve Katar (%1,3) başta gelen ülkelerdir (BP, 2015).

Tablo 10: Dünya doğalgaz tüketiminin bölgelere göre dağılışı (milyar m^3)

Ülke Adı	**2004**	**Oran (%)**	**2014**	**Oran (%)**
Kuzey Amerika	783,7	29	949,4	28
Güney ve Orta Amerika	119	4	170,1	5
Avrupa-Avrasya	1077,9	40	1009,6	30
Ortadoğu	**291**	**11**	**513,2**	**15**
Afrika	49,4	2	72,1	2
Asya-Pasifik	377,7	14	678,6	20
Dünya Toplamı	**2698,7**	**100**	**3393**	**100**

Kaynak: BP (2015).

Dünya genelinde olduğu gibi Ortadoğu bölgesinde de doğalgaz tüketimi sürekli bir artış göstermiştir. Nitekim, 2004 yılında bölgede 291 milyar m^3 olan doğalgaz tüketimi, 2014 yılında 513,2 milyar m^3'e yükselmiştir. Buna göre 2004 yılında dünya doğalgaz tüketiminin %11'i, 2014 yılında ise tüketimin %15'i Ortadoğu'da gerçekleşmiştir. Ortadoğu'da üretilen doğalgazın büyük bir bölümünün bölge içerisinde tüketildiği söylenebilir. Nitekim 2014 yılı itibariyle Dünya'da üretilmiş olan 3460,6 milyar m^3 doğalgazın %19'u bölgede üretilmiştir. Dolayısıyla petrolün aksine bölgede üretilen doğalgazın büyük bir bölümü bölgede tüketilmiştir (Tablo 9).

Doğalgaz ticaretinde petrolde olduğu gibi ithalat ve ihracatın yapıldığı ülke/bölgeler farklılık göstermektedir. 2014 yılı itibariyle doğalgaz ticareti 997,2 milyar m^3 olarak gerçekleşmiştir (Tablo 11). Bunun %67'si (663,9 m^3) boru hatlarıyla, geriye kalanı ise LNG ile gerçekleştirilmiştir. Doğalgaz ticaretinde Avrupa ülkeleri en büyük paya sahiptir. Nitekim bu ülkeler dünya toplam doğalgaz ithalatının %42'sini gerçekleştirmiştir. İhracatta Rusya (%20) ve ABD (%16) en büyük paylara sahiptir. Ortadoğu bölgesi ihracatın %16'sını karşılamaktadır. Ortadoğu bölgesi doğalgaz ticaretinde önemli bir bölge konumunda olmakla birlikte Rusya doğalgaz ticaretinde söz sahibi konumundadır. ABD de son yıllarda özellikle şeyl gazının devreye girmesiyle önemli bir ülke konumuna gelmiştir.

Doğalgaz ticareti için en önemli hususlardan biri üretilen doğalgazın tüketim bölgelerine naklidir. Bilindiği üzere doğalgaz, üretim alanlarından uzak bölgelere boru hatlarıyla (pipeline) ve tankerlerle taşınmaktadır. Denize kıyısı olmayan ülkeler için boru hattı taşımacılığı tek seçenektir. Bunun yanında denizaşırı doğalgaz ithalatı yapan ülkeler için de istisnalar dışında (Mavi Akım gibi) tanker taşımacılığı bir zorunluluktur. Tanker taşımacılığı yüksek maliyetli olduğu için zorunlu haller dışında fazla tercih edilmemektedir. Bu çerçevede LNG taşıyan tankerlerin kullandığı belli başlı geçitler ile boru hattı güzergâhları jeoekonomik ve jeopolitik bakımdan büyük öneme sahiptir. Örneğin hâlihazırda Rus doğalgazının AB ülkelerine naklinde Ukrayna birinci derecede önemli bir konumdadır. Türkiye ise Ortadoğu ve Hazar Havzası doğalgazını Avrupa ülkelerine akıtacak olan bir kısmı tamamlanmış, bir kısmı ise inşa ve proje aşamasında olan pek çok boru hattının düğüm noktasında yer almaktadır. Şüphesiz bu durum fırsatlar ve olanaklar kadar, bazı riskleri ve tehditleri de beraberinde getirmektedir (Akpınar ve Başıbüyük, 2011:131-134).

3.Sonuç ve Değerlendirme

Günümüzdeki kullanım miktarına göre petrolün 57, doğalgazın 55 yıllık bir ömrü olduğu ortaya çıkmaktadır. Yeni rezervlerin bulunması, şeyl gazının giderek yaygınlaşması ve alternatif enerji kaynaklarının yaygın kullanılmaya başlanması neticesinde petrol ve doğalgaz rezervlerinin ömrünün daha fazla olacağı tahmin edilmektedir. Ancak mevcut rezervler dikkate alındığında önümüzdeki yarım yüzyıl boyunca petrol ve doğalgaz kaynaklarının dünya enerji piyasasının gündeminde olacağı öngörülmektedir.

Dünyadaki petrol rezervinin (239,9 milyar ton) %46'sı, doğalgaz rezervinin (187,1 trilyon m^3) ise %44'ü Ortadoğu'da yer almaktadır. Ortadoğu bölgesi, dünya ham petrolünün yaklaşık %33'ünü üretmekte, üretilen bu petrolün büyük bir bölümünü (%70) bölge dışına ihraç etmektedir. Bölgenin dünya doğalgaz üretimindeki payı %19, tüketimdeki payı ise %15'tir. Dolayısıyla bölgede üretilen doğalgazın büyük bir bölümünün bölge içerisinde tüketildiği anlaşılmaktadır.

2014 yılı itibariyle dünya ham petrol rezervinin %15'ine sahip olan Kuzey Amerika tüketimde %24'lük bir paya sahiptir. Bu bölgede yer alan ABD'nin petrol rezervi %2,9, petrol tüketimi ise %19.9'dur. Avrupa'nın (Rusya hariç) petrol rezervi %0,6 iken petrol tüketimi yaklaşık %15'tir. Ham petrol rezervinin %5'inin yer aldığı Çin'de petrol tüketimi %12,4'tür. Petrol rezervinin %46'sına sahip olan Ortadoğu bölgesinin petrol tüketim oranı %10'dur. Ortadoğu bölgesinde dünya petrol rezervinin %15,7'sine sahip olan S. Arabistan'ın tüketimdeki payı %3,7'dir.

 Copyright © International Science and Technology Conference (ISTEC)

Doğalgaz rezervinin %6'sının yer aldığı Kuzey Amerika'da, doğalgazın %28'i tüketilmektedir. ABD'nin doğalgaz rezervi %5,2, doğalgaz tüketimi ise %22,7'dir. Dünya doğalgaz rezervinin %17,4'ünün yer aldığı Rusya Federasyonu'nun doğalgaz tüketim oranı %12'dir. AB ülkelerinin doğalgaz rezervi %3, doğalgaz tüketim oranı %11'dir. Dünya doğalgaz rezervinin %1,8'inin yer aldığı Çin'in doğalgaz tüketimi %5,4'tür. Doğalgaz rezervinin % 44'üne sahip olan Ortadoğu bölgesinin doğalgaz tüketim oranı ise %15'tir. Ortadoğu bölgesinde %18,2 oranında doğalgaz rezervi olan İran'ın tüketim oranı %5,2, doğalgaz rezerv oranı %13,1 olan Katar'ın tüketim oranı %1,3'tür.

Görüldüğü üzere gelişmiş olan, petrol ve doğalgaz rezervi az olan ülkeler (Rusya Federasyonu haricinde) en fazla bu enerji kaynaklarını tüketen ülkelerdir. Özellikle ABD, AB ülkeleri ve Çin, hem ham petrol hem de doğalgaz tüketiminde en büyük paya sahip olan ülkelerdir. Petrol ve doğalgaz rezervi fazla olan Ortadoğu bölgesi ise tüketimin az olduğu bir bölgedir. Dolayısıyla bundan sonraki süreçte enerji talebinin karşılanmasında Ortadoğu bölgesi, dünyadaki en önemli havza konumundadır. Enerji ve hammadde konusunda ham petrol ve doğalgaza sahip olma bakımından tabiri caiz ise Ortadoğu coğrafyası ve ülkeleri bir üretim merkezi, AB ülkeleri ile ABD ve Çin birer tüketim merkezi olarak uluslararası alanda dikkati çekmektedir. Sahip olduğu enerji kaynakları nedeniyle Ortadoğu coğrafyasının sürekli olarak siyasi ve ekonomik istikrarsızlık yaşaması ve işgal ve savaşların da devam etmesi, gelecek yıllarda dünya enerji piyasasında ham petrol ve doğalgaz krizlerine sebep olacak gibi gözükmektedir (Elmas, 2012:35).

Öte yandan Ortadoğu bölgesi, nüfus yoğunluğunun düşüklüğü ve ekonomik kalkınma düzeyinin yetersizliği nedeniyle sahip olduğu enerji kaynakları rezervlerinin ve üretiminin az bir kısmını öz tüketim için kullanmakta, büyük bir bölümünü dünyanın diğer ülkelerine özellikle de ABD, AB ülkeleri ve Çin gibi gelişmiş ülkelere ihraç etmektedir. Özellikle Çin'in piyasa ekonomisi temelli yapısal dönüşümü ile içerisine girdiği ekonomik büyüme ve gelişme süreci, çok büyük oranda enerji kaynaklarına ihtiyaç duymasına neden olmuştur (Öztürkler, 2009:79). ABD'nin yanında gelişmiş olan ve enerji ihtiyacı sürekli artan AB ülkeleri, Japonya ve Çin enerji konusunda önemli stratejiler gelişmektedirler. Adı geçen ülkelerin üzerinde yoğunlaştıkları başlıca bölge de Ortadoğu'dur.
Bugün için en önemli gelişmelerden biri dünyada enerjiye duyulan ihtiyacın artmasıdır. Bu açıdan enerji çeşitli jeopolitik yaklaşımlara temel oluşturmaktadır. Günümüzde adı koyulmamış olsa da, "Enerji havzalarına ve iletim kanallarına hakim olan, dünyaya hakim olur" şeklinde ifade edilebilecek enerji hakimiyet teorisinin özellikle ABD tarafından uygulanmakta olduğunu söylemek mümkündür (Ural, 2009:132). ABD dünya genelindeki enerji kaynaklarına hakim olmak istemekle birlikte özellikle, Ortadoğu ve yakın çevresindeki enerji kaynaklarını kontrolünde tutmak istemektedir. Ortadoğu ve yakın çevresine egemen olabilecek ve böylece ABD'ye meydan okuma yeterliliğine sahip olacak bir rakibin ortaya çıkması ABD'nin üstünlüğünü devam ettirmesi açısından tehlikeli görülmektedir. Bu nedenle, ABD bölgedeki enerji kaynaklarını ve ulaşım yollarını kontrol ederek enerji bakımından bu bölgelere bağımlı olan ve gelecekte ABD'ye rakip olabilecek güçleri frenlemek istemektedir. Bu da enerji vanalarını kontrol ederek mümkün olabilecektir. ABD rakiplerini devre dışı bırakabilmek için bu bölgedeki enerji kaynaklarını rakiplerine kaşı bir silah olarak kullanmak istemektedir (Kuloğlu ve Salkaya, 2004:25).

Dünyanın ham petrol ve doğalgaz kaynaklarının yaklaşık yarısının Ortadoğu bölgesinde bulunması ABD'nin yanında AB ülkeleri, Çin, Hindistan gibi enerjiye olan talepleri hızla artan ülkelerin bu bölge üzerinde politikalar geliştirmeye devam edeceklerini göstermektedir. Önemli petrol ve doğalgaz rezervlerine sahip olan Rusya Federasyonu da bölge ile ilgili bazı stratejiler geliştirerek bölgedeki denkleme dahil olmaktadır.

Günümüzde Ortadoğu bölgesi ve yakın çevresindeki (Kuzey Afrika ve Hazar Havzası) enerji kaynakları üzerinde hem bölgesel hem de küresel güçler arasında büyük bir jeoekonomik mücadele sürmektedir. Bundan sonraki süreçte de Ortadoğu bölgesinin, dünya küresel güç rekabetinin en önemli sahalarından birini oluşturacaktır. Dolayısıyla Ortadoğu'nun jeoekonomik öneminin giderek artacağı ve buna bağlı olarak son yıllarda bölgede cereyan eden hadiselerin yoğun olarak devam edeceği tahmin edilmektedir.

ORTADOĞU'DAKİ ENERJİ KAYNAKLARININ JEOEKONOMİK AÇIDAN DEĞERLENDİRİLMESİ

Necmettin Elmastaş
elmastas@harran.edu.tr

Veysi Günal
vgunal@harran.edu.tr

Mehmet Sait Şahinalp
sahinalp@harran.edu.tr

Bu çalışmada, Ortadoğu bölgesinin sahip olduğu enerji kaynaklarının jeoekonomik önemi irdelenmeye çalışılmıştır. İlk medeniyetlerin kurulduğu bir alana tekabül etmesi ve üç semavi dinin (Musevilik, Hristiyanlık ve İslamiyet) çıkış yeri olması gibi faktörler, Ortadoğu bölgesinin her dönemde cazip bir bölge olmasına neden olmuştur. Ortadoğu'yu önemli kılan bir diğer faktör bölgenin sahip olduğu zengin yer altı kaynaklarıdır. 19.yüzyılın sonlarında petrolün bölgede keşfedilmesi, 20.yüzyılın ortalarında doğalgaz kaynaklarının tespit edilmesi bölgenin önemini daha da arttırmıştır. Dünyadaki petrol rezervinin %46'sı, doğalgaz rezervinin %43,6'sı Ortadoğu'da yer almaktadır. Ortadoğu, Dünyada üretilen petrolün yaklaşık %33'ünü üretmekte, üretilen bu petrolün büyük bir bölümü bölge dışına ihraç edilmektedir. Bölgede üretilen doğalgazın büyük bir bölümünün bölge içerisinde tüketildiği anlaşılmaktadır.

Dünya genelinde enerjiye olan ihtiyaç sürekli bir artış göstermektedir. Rusya enerji kaynakları ihraç eden bir ülke konumunda iken, ABD'nin yakın gelecekte kendi enerjisini sağlayabilecek bir noktaya geleceği tahmin edilmektedir. Türkiye, Hindistan, Çin gibi hızlı bir gelişme sürecine giren ülkelerin enerjiye olan talebi artmakta, dolayısıyla enerji açısından dışa olan bağımlılıkları da artmaktadır. Öte yandan AB enerji ihtiyacının %55'ini ithal etmektedir. Günümüzde petrol ve doğalgaz ihtiyacının büyük çoğunluğunu dışardan karşılayan AB'nin, 2030 yılında bu ihtiyacının daha fazla olacağı tahmin edilmektedir. Rusya'nın zaman zaman AB ülkelerine ihraç ettiği doğalgazı siyasi ve ekonomik bir baskı aracı olarak kullanması, AB ülkelerini Kuzey Afrika ile birlikte Ortadoğu'daki enerji havzalarına yöneltmektedir.

Günümüzde Ortadoğu bölgesi ve yakın çevresindeki (Kuzey Afrika ve Hazar Havzası) enerji kaynakları üzerinde hem bölgesel hem de küresel güçler arasında büyük bir jeoekonomik mücadele sürmektedir. Bundan sonraki süreçte de Ortadoğu bölgesinin, dünya küresel güç rekabetinin en önemli sahalarından birini oluşturacaktır. Dolayısıyla Ortadoğu'nun jeoekonomik öneminin giderek artacağı ve buna bağlı olarak son yıllarda bölgede cereyan eden hadiselerin yoğun olarak devam edeceği tahmin edilmektedir.

ORTAÖĞRETİMDE MATEMATİK EV ÖDEVLERİ: ÖĞRENCİ GÖRÜŞLERİ

Sinan AYDIN
Kocaeli Üniversitesi, Kocaeli Meslek Yüksekokulu, Kocaeli-Türkiye
sinanaydin1704@yahoo.com

Özet: Ödevler öğrencilere sorumluluk kazandıran, okulda öğrenile derslerin pekiştirilmesini sağlayan ve okul ile ev arasında köprü görevi gören sosyal ve bilimsel aktivitelerdir. Takviye niteliğindeki ev ödevleri öğrenme amaçlı iyi bir faktör olmakla birlikte, mutluluk ve ruhsal dengenin temel öğeleri olan iyi dinlenme, aile ve sosyal ilişkiler gibi akademik olmayan önceliklerle de uyum içinde yürütülmelidir. Bu çalışmada ortaöğretim öğrencilerinin matematik ödevleri hakkındaki düşünceleri araştırılmaktadır. Bu amaçla, 2015-2016 eğitim-öğretim yılında Kocaeli il merkezindeki ortaöğretim okullarından seçilen 185 öğrenci belirlenmiştir. Genel tarama modeli ile yürütülen araştırmada 20 maddelik bir ölçek kullanılmıştır. Araştırma bulgularına göre, öğrenciler ödevleri yaptıklarında hem öğrendikleri konuları pekiştirdiklerini hem de bir sonraki konuya daha kolay adapte olabildiklerini ifade ettiler. Öğrencilerin ödevleri yapmadıklarında ya da yapamadıklarında ise derslerde motivasyon sorunu yaşadıkları ve kendilerini huzursuz hissettikleri belirlenmiştir.
Anahtar kelimeler: ortaöğretim, ev ödevi, matematik dersi

Giriş

Öğrencilerin bireysel aktiviteleri olarak ifade edebileceğimiz ödev çalışmaları (ev ödevleri), eğitim öğretim faaliyetleri içerisinde her zaman vaz geçilmez bir bileşen olmuştur. Öğrenilen kavramların özümsenmesi, kavramların anlaşılıp anlaşılmadıklarının test edilmesi ve kavramların kalıcılığının sağlanması gibi temel amaçlarla öğrencilerden ödev çalışmaları yapmaları istenmektedir (Otto, 1950). Ödev çalışmalarının hedeflenen amaçlara erişilebilmesi için, ödev çalışma süresi, zorluk düzeyleri, sınıfta yapılan örnek ve uygulama çalışmalarına benzerliği, zorluk düzeyleri gibi birçok pedagojik noktaya dikkat edilmelidir (Kralovec, Buell, 2000). Üzerinde yoğunlaşma, düşünce faaliyetleri uygulama, araştırma-inceleme yöntemlerini uygulamaya uygunluk, neden-sonuç ilişkilerini içerme ve problem çözme yeteneklerini geliştirme gibi kişisel gelişimi destekleyen bileşenleri içermeyen ödev çalışmaları boşuna zaman kaybı olarak değerlendirilebilir (Cooper, 1989).

Öğretmen merkezli eğitim öğretim sisteminde ödev çalışmalarının, öğrenci merkezli sisteme göre çok daha anlamlı ve gerekli olduğunu söyleyebiliriz. Öğrenci merkezli sınıf uygulamalarında, öğrencilerin aktif, düşünen, analiz eden, tartışan, fikir yürütün ve fikirleri tartışan pozisyonda oldukları göz önüne alındığında, ödev çalışmalarında hedeflenen amaçların sınıf ortamında gerçekleştirildiği söylenebilir. Dolayısıyla, son 10 yılda Türkiye de uygulamaya konulan öğrenci merkezli eğitim sisteminde ödev çalışmalarının etkisinin, öğretmen merkezli sisteme göre daha az olduğunu söyleyebiliriz. Ödev çalışmaları hedeflenen amaçlara ulaşılabilmesi için aşağıdaki temel özellikler göz önünde bulundurularak hazırlanmaları gerekmektedir (Brown, Oke & F. E. Brown, 1982);

- Sınıfta öğrenilenlerin pekiştirilmesi,
- Bir sonraki konuya hazırlık özelliği taşıması
- Öğrencinin bireysel öğrenme yeteneğini geliştirmesi
- Ödev çalışmalarına karşı olumlu tutuma sahip olmayı güçlendirmesi
- Öğrencinin bilişsel özelliklerini güçlendirme

Ülkemizde, 1989 yılından beri yürürlükte olan, ders dışı etkinlik, eğitim-öğretim faaliyetlerinin kapsamı ve temel özellikleri ilgili bir yönetmelik (Yücel, 2004), ödev çalışmaları içinde temel alınabilir. Bu yönetmelikte geçen özellikler, Brown, Oke ve F. E. Brown (1982) tarafından ifade edilen özelliklerin biraz daha geniş kapsamlı versiyonu olduğunu söyleyebiliriz.

- ✓ Ödevi özenle yapma ve zamanında teslim etme alışkanlığı kazandırmak,
- ✓ Plan yapma bilgi ve becerisini geliştirmek,
- ✓ Gerekli bilgi, araç-gereç veya malzemeyi toplayabilmek ve bunları amacına uygun olarak kullanabilmek,
- ✓ Ödevin, çeşitli kişi ve eserlerden faydalanmakla birlikte, öğrencinin kendini geliştirmek maksadıyla bizzat yapması gereken bir görev olma şuurunu kazandırmak,

 Copyright © International Science and Technology Conference (ISTEC)

- ✓ Ödev yapılırken yararlanılan kaynakları, kendisinden bilgi alınan kişileri belirleme alışkanlığı kazandırmak,
- ✓ İletişim kurabilme, kaynaklardan faydalanabilme ve kullanabilme alanlarındaki yeteneğini geliştirmek,
- ✓ Ödevde varılan sonuçların, kullanılan kaynak ve yöntemlere bağlı olduğunu fark ettirmek,
- ✓ Konulara, değişik açılardan bakabilme, danışabilme, tartışabilme ve soru sorabilme davranışları kazandırmak,
- ✓ Birlikte çalışma davranışı kazandırmak,
- ✓ Düşünce gücünü geliştirmek,
- ✓ Bilmediğini araştırıp bulmaktan ve öğrenmekten zevk almayı sağlamak,
- ✓ Gözlem, deney ve yeni buluşlara yönelik çalışmalar yapmaktan zevk almayı sağlamak,
- ✓ Başarmanın hazzını tatma duygusu kazandırmak

Bu çalışmanın amacı; ortaöğretim 10. sınıfta öğrenim gören öğrencilerin, matematik derslerinde verilen ev ödevleri hakkındaki tutum ve düşüncelerinin belirlenmesidir.

Yöntem

Bu çalışmanın örneklemini, Kocaeli il merkezinde, 5 farklı ortaöğretim okulunda 2015-2016 eğitim öğretim yılı güz döneminde öğrenim gören 185 öğrenci oluşturmaktadır. Araştırma verilerinin toplanmasında, betimsel tarama yöntemlerinden genel tarama modeli kullanılmıştır. Genel tarama modeli, "çok sayıda elemandan oluşan bir evrende, evren hakkında genel bir yargıya varmak amacıyla, evrenin tümü ya da ondan alınacak bir grup, örnek veya örneklem üzerinde yapılan tarama düzenlemeleridir" (Karasar, 1994). Veriler SPSS 15,0 istatistik paket programı yardımıyla t-testi ve F testi kullanılarak hesaplanmıştır. Çalışmada, öğrencilerden anket yoluyla veriler toplanmış daha sonra öğrencilerin ev ödevleri hakkındaki düşüncelerini belirlemek için random tekniğiyle 10 öğrenci seçilmiş ve bu öğrencilerle mülakat yapılmıştır.

Araştırmanın bağımlı değişkeni cinsiyet, bağımsız değişkeni ise ev ödevleri hakkındaki görüşlerdir. Araştırmanın veri toplama aracını belirlemek üzere bu alanda hazırlanmış olan anketler incelenmiş (Aladağ, Doğu, 2009; Cahit, Doğan, 2009; Fehrman, Keith, Reimers, 1987; Wildman, 1968 & Yücel 2004) ve bu incelemenin sonucunda öğrencilerin matematik ev ödevleri hakkındaki görüşlerini belirlemek üzere bir anket oluşturulmuştur. Anketin geçerliliği kapsamında ilgili alanda çalışan iki öğretim üyesinin görüşlerine başvurulmuş daha sonrada gerekli düzenlemeler yapılarak veri toplama aracına son şekli verilmiştir. Anketin Cronbach Alpha iç güvenirlik katsayısı 0,90 olarak hesaplanmıştır.

Anket derecelendirilmesi, beşli likert türünde (1) Kesinlikle Katılmıyorum, (2) Katılmıyorum, (3) Kararsızım, (4) Katılıyorum, (5) Kesinlikle Katılıyorum, şeklinde toplam 20 sorudan oluşmaktadır.

Bulgular

Araştırmaya katılan toplam 185 ortaöğretim 10. sınıf öğrencisinin cinsiyetlerine ilişkin sayısal değerleri; erkek öğrencilerin sayısı N=102 kişi (% 55,14), bayan öğrencilerin sayısı N=83 kişi (% 44,86) dir. (Tablo 1).

Cinsiyet	N	%
Erkek	102	%55,14
Bayan	83	%44,86
Toplam	185	%100

Tablo 1: Öğrencilerin cinsiyete göre dağılımları

Ortaöğretim öğrencilerinin matematik derslerinde verilen ev ödevlerine ilişkin görüşleri arasında cinsiyet değişkenine bağlı olarak anlamlı bir farklılık olup olmadığını belirlemek için bağımsız örneklemler için t-testi uygulanmıştır (Tablo 2).

Cinsiyet	N	X	Ss	Sd	T	P
Erkek	102	76,24	10,21	183	1,19	0,25
Kadın	83	77,46	9,53			

Tablo 2: Öğrencilerin cinsiyet değişkenine göre t-testi sonuçları (p>0,05)

Tablo 2'deki istatistiksel sonuçlar incelendiğinde, ortaöğretim 10. sınıf öğrencilerinin matematik derslerinde verilen ev ödevlerine ilişkin düşüncelerinin cinsiyete göre farklılaşmadığı görülmektedir (p>0,05).

Son olarak, araştırmada kullanılan anketin her bir maddesine ait aritmetik ortalama değerler aşağıdaki tabloda ayrı ayrı verilmektedir (Tablo 3).

 Copyright © International Science and Technology Conference (ISTEC)

Anket soruları	Arit. Ort. (X)
Matematik ev ödevlerini yaparken çok mutlu oluyorum	3,44
Matematik ev ödevlerinin günlük hayat uygulamalarına yönelik olması benim ilgimi daha çok çekiyor	4,21
Alıştırma türündeki ev ödevleri matematik konularını daha iyi anlamama katkı sağlıyor	3,51
Ev ödevlerinin kontrol edilmesi öğretmen-öğrenci iletişimini pozitif yönde geliştirir	4,23
Matematik ev ödevlerini yaparken çok dikkatliyim	3,66
Matematik ev ödevlerinin derste çözdüğümüz örnek ve problemlere benzer olması durumunda, ev ödevlerini yapabileceğime inanıyorum	3,98
Matematik ev ödevleri, benim için diğer ödevlere göre daha öncelikli bir yere sahiptir	3,71
Matematik ev ödevlerini yapmam matematik sınavlarında bana çok olumlu katkı sağlıyor	4,15
Matematik ev ödevlerinin araştırma ağırlıklı olması matematik dersi hakkında pozitif düşünmeme sebep oluyor	3,68
Matematik ev ödevlerinin uygulamalı türden olanları daha çok dikkatimi ve ilgimi çeker	4,28
Matematik ev ödemlerinde internetten faydalanabilmem ben mutlu eder	4,12
Matematik ev ödevlerinin üretkenliğimi ve düşünce yapımı geliştirdiğini düşünüyorum	4,06
Matematik konularına ön hazırlık ev ödevleri öğrenme motivasyonumu artırıyor	3,92
Ev ödevlerinin matematik konularını anlamamda ve kavramamda etkili olduğunu düşünüyorum	4,17
Dönem ve yılsonu ödevlerimi matematik dersinden seçerim	2,81
Matematik ev ödevlerini yapmak analiz etme ve ilişkilendirme becerilerimi geliştirdiğini düşünüyorum	3,72
Matematik ev ödevlerinin öğretmen tarafından kontrol edilmesi çok önemlidir.	4,21
Matematik ev ödevlerine ilgi durumumuz öğretmenimizin kanaatini etkilediğini düşünüyorum	4,26
Araştırma ağırlıklı matematik ev ödevleri konuları daha iyi anlamama ve öğrenmeme katkı sağlıyor	3,61
Matematik ödevlerini yaparken motivasyonum üst düzeyde oluyor	3,12

Tablo 3. Anket maddelerinin ortalama puanları (Genel ortalama = 76,85)

Anketteki toplam 20 maddenin genel aritmetik ortalaması 3,84 olarak bulunmuştur. Bu değere göre orta öğretim 10. sınıf öğrencilerinin matematik dersi ev ödevleri hakkındaki tutumlarının olumlu yönde olduğunu söyleyebiliriz. 20 maddenin genel ortalaması 76,85 olarak hesaplanmıştır.

 Copyright © International Science and Technology Conference (ISTEC)

20 madde içerisinde en yüksek ortalamaya sahip (4,28) maddenin "Matematik ev ödevlerinin uygulamalı türden olanları daha çok dikkatimi ve ilgimi çeker" olduğu göz önüne alındığında, öğrencilerin somut ve ne anlama geldiğini anladıkları ödevlerin, problemlerin ve konuların daha çok ilgilerini çektiği söylenebilir. Yine en yüksek ortalama puanlara sahip benzer iki anket maddesi, "Matematik ev ödevlerine ilgi durumumuz öğretmenimizin kanaatini etkilediğini düşünüyorum" (4,26) ve "Ev ödevlerinin kontrol edilmesi öğretmen-öğrenci iletişimini pozitif yönde geliştirir" (4,23) olarak belirlenmiştir. Öğrenciler, matematik ödevlerinde gösterdikleri performansların öğretmen tarafından dikkate alındığını ve matematik başarı puanlarını belirlemede değerlendirmeye katıldığını düşünmektedirler.

Araştırmadaki en düşün puana (2,81) sahip madde "Dönem ve yılsonu ödevlerimi matematik dersinden seçerim" olduğu görülmektedir. Bu puan değeri, öğrencilerin matematik dersine karşı tam bir özgüvene sahip olmadıklar şeklinde yorumlanabilir. Matematik ödevlerinin öğrencilerin kendi başına yapabilecekleri düzeyde olması, ve araştırma kaynaklarından kolay sonuca gidilebilir türde seçilmeleri, daha çok öğrenci tarafından dönem sonu ve yıl sonu ödevlerinin matematik dersinden seçilmesine sebep olabilir. En düşük puana (3,12) sahip diğer bir madde ise "Matematik ödevlerini yaparken motivasyonum üst düzeyde oluyor" odluğu görülmüştür. Bu motivasyon düşüklüğünün sebebi olarak, öğrencilerin yapamadıkları düzeyde ev ödevleriyle daha çok karşılaştıkları ve çözemedikleri yada zorlandıkları sorulara motive olmada sıkıntı yaşamaları olarak ifade edilebilir.

Sonuç

Ev ödevleri hemen hemen bütün ülkelerde ve bütün eğitim sistemlerinde eğitim öğretimin bir parçası olarak hep var olmuştur. Farklılık, ev ödevlerine yüklenen misyon ve ev ödevlerinin sistemin içinde var olma biçimidir. Bu çalışmadan elde edilen temel sonuçlardan bir tanesi, orta öğretim öğrencilerinin, öğretmenlerinin ev ödevlerini çok önemsediklerini düşünmeleridir. Diğer önemli bir sonuç ise öğrencilerin dönem ya da yıl sonu ödev tercihlerinde matematik dersini fazla tercih etmemeleridir. Öğretmenlerin ödevlerin amaç, kapsam ve işlevleri konusunda daha bilinçli davranmaları öğrencilerin tutumlarını pozitif yönde etkileyeceği aşikardır

OSMANLI DEVLETİNDE ARAPÇILIK VE TÜRKÇÜLÜK DÜŞÜNCESİNİN ORTAYA ÇIKIŞI

Fethi NAS

Bartın Üniversitesi, Sosyoloji Bölümü, Bartın-Türkiye

fethinas@yahoo.com

ÖZET

Osmanlı elitleri, devleti daha etkin ve güçlü kılmaya yönelik bir çaba olarak Batılılaşma hareketi ile birlikte ulusçuluk düşüncesinin de etkisi altına girmişlerdir. Osmanlı Devletinin en büyük iki etnik grubu olan Arap ve Türk kökenli elitler Osmanlıcılık ve İslamcılık ideolojilerinin geçerliliğini yitirmesi sonucunda etnik-ulusal temelli siyasal dayanışma biçimlerinin Batılılaşmada daha etkin bir siyasal model olacağına inanmaya başlamışlardır.

Hem Arap ve hem Türk kökenli Osmanlı reformcuları, ulusçuluk düşüncesinin Avrupalıların güçlenmesine ve ilerlemesine katkı sağladığını ileri sürmüşlerdir. Türk kökenli Osmanlı reformcuları, devletin bütün unsurlarını tek bir millet (Milleti Hakime - Egemen Millet) çatısı altında bir araya getirmeye çalışmışlardır. Buna karşılık Arap kökenli reformcular, Arap ulusunun merkezde olduğu İslamcı bir ideolojiyi ortaya atmışlardır. Esas olarak her iki düşünce Osmanlı Devleti"nin modernize edilmesi sürecinde ortaya çıkan ulusçuluk düşüncelerinden türemişlerdir. Her ikisinin ortak özelliği, Batı medeniyetinin egemen olduğu bir dünyada ilerleme ve gelişme sürecine ayak uydurmaya çalışmış olmalarıdır.

Çalışmada Arap ve Türk kökenli elitlerin ulusçuluk düşüncesini savunmasını sağlayan Batılı düşünsel yapılar ile almış oldukları Batı tarzı eğitimin etkisi ele alınmaktadır.

Anahtar Kavramlar: Batılılaşma, Arapçılık, Türkçülük, Ulusçuluk.

Giriş

19. yy'ın sonlarına kadar pek çok etnik ve dinsel cemaatten oluşan Osmanlı toplumuna mensup bir çok kişi kendisini Osmanlı Devletinin bir tebaası veya yurttaşı olarak görmüştür fakat yaşanan tarihsel olaylar (Balkanlarda Osmanlı Devletinden ayrılmalar) Osmanlı Devletinin elitleri arasında farklı bakış açılarının gelişmesine neden olmuştur. Osmanlı toplumunu oluşturan Müslüman ve gayrimüslim cemaatler arasındaki ulusçuluk düşünceleri birbirleri eşzamanlı olarak ortaya çıkmamışlardır. Dinsel özelliklerinden ötürü çoğunluğunu Hıristiyanların oluşturduğu Osmanlı Devletinin gayrimüslim cemaatleri Batılı tarzda ulusçuluk düşüncelerini Müslümanlara nazaran daha erken bir dönemde benimsemişlerdir.

Osmanlı Devletinde aydınlar arasında kimlik tartışmaları 19. yüzyıldan itibaren yoğun biçimde yaşanmaya başlamıştır. Özellikle Osmanlı toplumunu oluşturan en kalabalık Müslüman iki grup olan Araplar ve Türkler arasındaki ulusçuluk düşüncelerinin içeriği ve kapsamı oldukça karmaşıktır. Örneğin, Ahmet Mithat'a göre Türkler en az gelişmiş ve en az eğitilmiş gruptur bundan dolayı Mithat, Türklerin Avrupa'daki millet-devlet sistemine benzer bir şekilde örgütlenip, kültürel haklarına ve etnik özelliklerine sahip çıkmaları gerektiğine inanmıştır. Namık Kemal ise, Türklerin Osmanlı Devleti'nin kurulmasında ve korunmasındaki rolüne inanmasına rağmen, etnik kökene vurgu yapmamış, övünç kaynağının, devlete bağlılıktan ve İslamiyet'i gönülden desteklemekten geçtiğine inanmıştır. Yanı sıra, Osmanlı Devleti'nin devamının sağlanması yönünde bütün Müslümanların Türkleştirilmesi suretiyle birliğin sağlanabileceğini savunmuştur (Karpat, 2001:660). Buna

 Copyright © International Science and Technology Conference (ISTEC)

mukabil Suriyeli Arap bir Hıristiyan olan Necip Azuri, Müslüman ve Hıristiyan Arapların ulusal bir Arap devleti altında birleşmeleri gerektiğini savunmuştur (Hourani, 1983:79).

Türk Ulusçuluğu

Tarihsel ve siyasal olaylar, Türk ulusçuluğunun bilimsel, edebi ve politik alanlardan geçerek geliştiğini göstermektedir (Kuran, 1995:155). Bilimsel alandan Türkçülük, Rusya'nın Orta Asya'yı işgal etmesi sonucunda, Türk aydınlarının dikkatini çekmesi ile başlamıştır. Orta Asya'da yaşayan Türk kökenli toplulukların Osmanlı Devleti ile akrabalığına vurgu yapılarak, Türkçenin önemi ve bu iki coğrafyadaki halkları birleştirme hayali üzerine kurgulanmıştır. Buradan hareketle Türk dili ve tarihi alanında pek çok çalışmalar yapılmış ve eserler yayınlanmıştır. Edebi alanda Türkçülük ile ilgili olarak, Türk milletinin kahramanlıkları ve devletlerinin üstünlüğü işlenmiştir. Politik alanda ise Türkçülük, dünya üzerinde yaşayan bütün Türklerin birliğini savunan politik bir ideoloji olarak savunulmuştur. Bu aşama ise Cumhuriyetin kurulmasından önce Jön Türklerin İttihat ve Terakki Hükümeti içerisinde örgütlenmesi ve bir sisteme bağlanması ile sonuçlanmıştır.

II. Abdülhamit 1877'de, Kırım Savaşı ve doğurduğu olumsuz koşulları gerekçe göstererek Kanuni Esasi'yi yürürlükten kaldırınca, Beyrut, Kahire ve Şam gibi Osmanlı Devletinin görece gelişmiş şehirlerinde; daha sonra Paris ve Londra gibi Avrupa kentlerinde II. Abdülhamit yönetimine muhalif çok sayıda cemiyetler kurulmuştur. Zamanla bu muhalefetin içerisinde yer alanlar "Jön Türkler" olarak tanınmıştır. Paris'te bir araya gelen Jön Türklerden oluşan bir grup, 1889 yılında İttihat ve Terakki Cemiyetini kurmuştur (Karpat, 1996:35). İttihat ve Terakki Cemiyeti, zamanla yönetime muhalif subay ve devlet memurlarından oluşan çeşitli grupları birleştirerek gücünü arttırmıştır. Bu birleşmeye Osmanlı Devleti sınırları içinde yaşayan hem Hıristiyanlar hem de farklı etnik yapılara mensup Müslümanlar da destek vermiştir. Hıristiyan azınlıklar kurulacak meşruti yönetim sayesinde bağımsızlıklarını kazanmak ümidiyle İttihat ve Terakki'yi desteklemişlerdir. Böylece Jön Türk hareketine destek verenlerin görünürdeki amaçları; Sultan II. Abdülhamit'in baskıcı yönetimine son vermek ve Kanuni Esasi ilkelerini tekrar yürürlüğe koymak suretiyle Osmanlı Devleti'nin bütünlüğünü korumak olmuştur (Davison, 1981:110).

İttihat ve Terakki Cemiyeti içinde örgütlenen Jön Türk hareketi, Genç Osmanlıların 1860-70 yılları arasında ileri sürdüğü Padişah'ın yetkilerini kısıtlayacak bir yönetim ve tüm Osmanlı tebaası azınlıklara kanun önünde eşitlik gibi siyasal yenilikleri savunmuştur (Ahmad, 1971:37). Hareketin önde gelenleri II. Abdülhamit'in baskısından kurtulmak amacıyla Avrupa'da çeşitli ülkelere iltica etmiştir. İlk kongrelerini 1902 yılında Paris'te II. Abdülhamit'e karşı olan muhalefeti birleştirmek amacıyla farklı din ve etnik yapılara mensup 47 üyenin katılımı ile gerçekleştirmişlerdir. Kongrede; hareketin amacının, II. Abdülhamit'i tahttan indirip anayasal yönetimi kurmak, büyük bir felaket ile karşı karşıya gelen Osmanlı Devleti'nin Türk, Arap, Arnavut, Ermeni, Makedonyalı, Rum, Kürt, Musevi ve diğer yurttaşların güçlerini bir araya getirerek dış müdahalelere karşı koymak olduğuna karar verilmiştir (Dündar, 2008:50).

1908'de II. Abdülhamit tahttan indirilip, Jön Tük Hareketi iktidarı ele geçirince, devletin ortak bir dilin birleştiriciliği etrafında yeniden yapılandırılması fikri belirginleşmiştir. Bu dilin Osmanlı Devleti'nde en etkin grup olan Türklerin dili olması gerektiğine vurgu yapılmıştır. Buna ilk tepkiler Şam'da eğitim görmüş bazı Müslümanlardan ve daha sonra Lübnanlı bazı Hıristiyan yazarlardan gelmiştir (Hourani, 364). Jön Türklerin etnik temele dayalı bir Türkçülüğü gündeme getirmesinin gerisinde, II. Meşrutiyet'in ilan edilmiş olması etkilidir. II. Meşrutiyet ile birlikte Osmanlı Devletinde parlamenter sisteme geçiş yapılmıştır. Ülkede seçimlerin yapılması ile sayıca az olan Türk unsurların meclisteki çoğunluğu, diğer çoğunluk gruplarına (Hıristiyan ve Müslüman Araplara) kaptıracağı endişesi artmıştır (Georgeon, 2006: 32). Bu konu ile ilgili Hüseyin Cahit Yalçın'dır fikirleri İttihat ve Terakki Cemiyeti'nin resmi yayın organı olan Tanin'de yayınlanmış ve dönemin Jön Türkleri arasında yayılmıştır. Yalçın (1908), 7 Kasım 1908 tarihli makalesinde, "Milleti Hâkime" kavramını ortaya atarak, Osmanlı toplumunda mutlak anlamda hâkimiyetin Türklerin elinde bulundurulması gerektiğini savunmuştur.

 Copyright © International Science and Technology Conference (ISTEC)

20. yüzyılda Osmanlı Devleti'ni oluşturanların nüfusunun 22 milyon civarında olduğu tahmin edilmiştir. Nüfusun 10,5 milyonunu Arapların, 7.5'ini Türklerin, geri kalan 4 milyonluk nüfusun ise diğer etnik gruplardan oluştuğu ileri sürülmüştür (Antonius, 1945:104). İttihat ve Terakki Cemiyeti, Meşruti yönetim gereği ülkede yapılacak seçimlerde, nüfus yapısındaki bu dağılımın sonucunun Meclisi Mebusan'da Türklerin aleyhine bir tablonun oluşmasına yol açacağını hesap ettiğinden, ülke genelinde çoğunlukla Türk kökenlileri aday göstermek suretiyle seçimleri kendi lehine çevirmeye çalışmıştır.

Hüseyin Cahit Yalçın gibi Yusuf Akçura da, dönemin en geçerli siyasi oluşumunun etnik temele dayalı bir yapılanmadan geçtiğini savunmuştur. Bu doğrultuda, Osmanlıcılık ile İslamcılığın; Osmanlı tebaası olan Türkleri, Arapları, Rumları ve Ermenileri artık tek bir millet haline getirmeyeceğine işaret etmiştir. Türklerin çoğu Müslüman olduğu için, İslamiyet, Türk milletinin oluşumunda çok önemli bir unsurdur (1976:19). Batı'da ve laik eğitim kurumlarında eğitim gören, dönemin elitleri arasında bu düşünce geniş kabul görmüştür. Osmanlı Devleti'nin yönetimi altındaki farklı bölgelerde yaşayan Türk ve özellikle Arap elitleri bu düşüncelere daha fazla önem vermeye başlamıştır. Etnik ulusalcılığa dayanan bir birliktelik yavaş yavaş kendini hissettirmeye başlamıştır. İstanbul, Beyrut, Kahire, Kudüs ve Şam gibi önemli kentlerde bu fikirler açıkça dile getirilmiştir.

Jön Türk hareketinin düşünceleri ve uygulamaları, Osmanlı yönetimi altındaki diğer etnik grupları, özellikle Arapları iyiden iyiye endişelere sevk etmiştir. Çünkü Abdülhamit, kendisine bağlı ve sadık olacak bürokratik kadrolara farklı etnik gruplardan – özellikle Araplardan oluşan - pek çok yeni memurlar atamıştır. İttihat ve Terakki Cemiyeti, iktidara geldikten sonra II. Abdülhamit tarafından tesis edilen bürokratik kadroların çoğunu tasfiye etmiştir (Mansfield, 2000:32).

Arap Ulusçuluğu

Islahat hareketlerinin beklenen hedefleri gerçekleştirememesi, ıslahatların doğurduğu mali yükümlülükler ve Batı karşısında yaşanan askeri başarısızlıklar, Arap elitlerinin geçmişte atalarının ulaştığı zaferlere, yüksek kültür ve medeniyete katkılarına nostaljik bir bilinç geliştirmesine neden olmuştur. Arap elitleri, İslam'ın varlığını sürdürmesine ve Müslümanların tek bir çatı altında kalmasında büyük bir katkısı olan Osmanlı hanedanın askeri gücünü takdir etmekle birlikte, artık duraklama dönemine girdiğine ve git gide İslami ilkelerden uzaklaştığına dair kanaatler geliştirmişlerdir (Hourani, 1983:130). Arap elitleri arasında ulusalcı ve İslami düşünceler Türkçülükten önce ortaya çıkmıştır fakat İslami duygu ve düşüncelerin daha ağır basması ve ulus kavramının Batı kaynaklı olması, uzun bir süre çok az kişi tarafından benimsenmesine neden olmuştur.

Etnik temellere dayanan Arap ulusçuluk hareketlerinin ilkinin, 1875'li yıllarda Beyrut'ta bulunan Suriye Protestan Okulu bünyesinde kurulan bir derneğe dayandırılabilir Bu derneğin kurucularının tamamı Hıristiyan Araplardan oluşmuştur. (Antonius, 1945:101). II. Abdülhamit zamanında, Osmanlı merkezi yönetimine ve daha sonra İttihat ve Terakki Cemiyetine karşı en sert muhalefet Suriyeli Hıristiyan Araplardan gelmiştir. Suriyeli Arap elitler Osmanlı Devleti'nden ayrı bir Arap birliğinin kurulması gerektiğini savunmuşlardır. Özelikle Beyrut'ta faaliyet gösteren Amerikan ve Fransız misyoner okullarında yetişen Hıristiyan Araplar Batılı ülkeler ile yakın temaslar içerisine girerek Klasik Arap edebiyatının canlanması konusunda yoğun çalışmalar yapmıştır. Bunlardan en önemlisi İbrahim Al-Yaziji'dir. Al-Yaziji'ye göre; Arap kültür ve medeniyeti, Türklerin egemenliği altına girdikten sonra gerilemiştir (Dawn, 1961).

Balkan Savaşları sırasında Osmanlı Devleti'nin neredeyse bütün eyaletlerinde ekonomik sorunlar yaşanmış, savaşın maliyeti yüzünden vergiler attırılmış, borç talepleri ve savaşın maliyeti yükselmiştir. Sosyal ve ekonomik dengelerin bozulması sonucunda ürün fiyatlarında artışlar meydana gelmiştir. Pek çok vilayette bu duruma karşı protestolar ve hükümet aleyhine gösteriler düzenlemiştir. Bu koşullardan hareketle Arap bölgelerinde İttihat ve Terakki hükümetine karşı muhalif hareketler çoğalmış ve sonucunda özerklik veya bağımsızlık talepleri başlamıştır. Bunlara karşı İttihat ve Terakki Hükümeti, ülke genelinde baskıcı bir yönetim izlemiştir. Söz konusu talepleri savunanların bazıları idam edilmiştir (Kayalı, 1998:150). Bu ve buna benzer çeşitli olaylar sonucunda Arap elitleri, Türklere karşı hem dinsel hem de laik teoriler ileri sürmeye başlamışlardır. Arap halkının ilk Müslüman topluluk olduğunu ve geçmişte pek çok başarılar ve zaferler elde ettiğini iddia etmeye ve Arapların tarih sahnesindeki etkin konumlarını kaybetmelerinin suçlusu olarak Türkleri görmüşlerdir (Lewis, 1953).

 Copyright © International Science and Technology Conference (ISTEC)

Muhafazakârlar Arap ise, İslami kaynaklardan uzaklaşılmış olmasının etkili olduğunu düşünmüşlerdir. Bu sebepten ötürü İslam'ın asli kaynaklarına ve İslam'ın geçmişte yaşanılan biçimlerine geri dönmenin, İslamiyeti tekrar yükselişe geçirmenin en doğru yol olduğunu ileri sürmüşlerdir. Müslümanların sorunlarını çözmenin yolunun Kuran'ı tekrar anlamaktan geçtiğini savunmuşlardır. Bu amaçla Araplara, Arapça olarak indirilen Kuran'ın iyi bir şekilde anlaşılabilmesi için Arap edebiyatı ve Arap dili kurallarını iyi öğretmek gerektiği fikri ön plana çıkmıştır. Arap modernleşmesini savunan bazı entelektüeller Osmanlı Devleti'nin Batı emperyalizmi karşısında zayıf düşmemesi için Osmanlı hanedanının desteklenmesi gerektiğini düşünmüştür. Türklerin halifeliğini (son zamanlarda özellikle halife olarak II. Abdülhamit'i) desteklemekle birlikte Arap asıllı bir halifenin seçilmesinin İslami kurallara daha uygun olduğunu ileri sürmüşlerdir (Birinci, 1990:223).

Türk ve Arap kökenli elitlerin siyasal bakımdan karşı karşıya gelmelerini sağlayan etkenlerin başında ise Batı kökenli düşüncelerin etkisi başat olanıdır. Batı ülkelerinde eğitim gören veya Batılı ülkeler tarafından Osmanlı Devletinin çeşitli şehirlerinde kurulan okullardan mezun olanlar liberal, özgürlükçü ve özellikle pozitivist akımlardan yoğun biçimde etkilenmişlerdir (Kayalı, 1998:31). Bundan dolayı modern zamanlara özgü etnik temelli siyasal bir birliktelik olarak bağımsız ulusal devletlerin kurulması gerektiği fikri yoğun biçimde savunulmuştur.

Sonuç:

II. Meşrutiyetin ilan edilmesinden sonra, iktidara gelen İttihat ve Terakki Cemiyeti, Osmanlı Devletinin Devletini geniş toprakları üzerinde merkezi bir yönetim tesis etmeye yönelik bir çaba sarf etmiş, Osmanlıcılık ve İslamcılık fikirleri yerine Türkçülüğü ön plana çıkarmıştır. Ayrıca Jön Türkler, devleti sekülerize etmeye ve devletin içerisinde çoğunluğu oluşturan Arapları yönetici gruptan uzaklaştırmaya çalışmışlardır. Bu durum ise Arap elitlerini, etnik ve dilsel kökenlerinin ön planda olduğu geçmişlerine ve Arap toplumlarını bir araya getirebilecek siyasal bir kurgu üretmeye yöneltmiştir.

Arap ulusalcılığının ilk savunucuları Hıristiyan Araplar veya Avrupa eğitim görmüş olanlardır. Türk ulusçuluğunun en ateşli savunucuları ise Rusya ve Avrupa'dan İstanbul'a gelen Türk kökenli göçmenler olmuştur. Her iki ulusçuluğun düşünsel arka planı ve siyasal teorisi ise Müslümanların Batı karşısında gerilemesine yönelik modern bir kaygıdan ve Batı karşısında yenik düşmekten kaynaklanan bir motivasyondan mülhemdir.

İlk olarak Balkan toplumları arasında etkili olmaya başlayan ulusçuluk akımı, Batılı ülkeler karşısında bütün kurumları ile zayıf düşmüş olan Osmanlı Devleti'nin zayıflamasına ve zaman içinde dağılmasına sebep olmuştur.

OTIZM SPEKTRUM BOZUKLUĞU OLAN ÇOCUKLARDA GÖZLEYEREK ÖĞRENME

Serhat Odluyurt
syildiri@anadolu.edu.tr

Melih Cattik
mcattik@anadolu.edu.tr

Bu çalışma ile Otizm Spektrum Bozukluğu (OSB) olan çocuklarda gözleyerek öğrenmeye yönelik temel kavramları incelemek ve gözleyerek öğrenme düzeylerini belirlemeye yönelik yapılan araştırmalara ilişkin güncel bilgileri aktarmak amaçlanmıştır. Bu amaçla detaylı bir alanyazın taraması yapılarak ulaşılan OSB olan çocukların gözleyerek öğrenme düzeylerini inceleyen deneysel ve yarı deneysel araştırmaların yöntem, bulgu ve sonuçları belirlenen inceleme ölçütlerine göre incelenmiştir.

Bu çalışma kapsamında internet üzerinden ERIC, Ebsco Host, Academic Seearch Complete, Google Scholar veri tabanlarında "Gözleyerek Öğrenme ve Otizm Spektrum Bozukuğu (Observational Learning and Autism Spectrum Disorder)" anahtar kelimeleri ile bir alanyazın taraması gerçekleştirilmiş ve konuyla ilişkili 2000-2016 yılları arasında yayımlanmış makalelere ulaşılmıştır. Ulaşılan makaleler, belirlenen makale inceleme ölçütleri kullanılarak betimsel analiz yöntemi ile analiz edilmiştir.

Alanyazın taraması sonucunda ulaşılan makaleler, demografik ve yöntemsel özelliklerine göre incelenmiştir. Ayrıca gözlemciler arası güvenirliği bağımsız bir gözlemci tarafından yapılmış ve güvenirlik yüzdesi belirlenmiştir. Elde edilen tüm bulgular tablo ve grafikler yardımıyla görselleştirilmiş olup; sunum sırasında katılımcılarla paylaşılacaktır.

OTOMOBİL KLİMALARINDA PCB SEVİYELERİNİN BELİRLENMESİ

Demet ARSLANBAŞ, Ebru KOCASLAN NARCI

Kocaeli Üniversitesi Mühendislik Fakültesi, Çevre Mühendisliği Bölümü, İzmit/Kocaeli
demetars@gmail.com

Özet: Poliklorlu bifeniller (PCB), Kalıcı Organik Kirleticiler (KOK) sınıfına ait önemli bir kirletici olarak son yıllarda çokça araştırılan bir kirletici grubudur. PCB'ler özellikle biyolojik birikim yapabilme ve kanserojen olmaları açısından çok önemlidir. Antropojenik faaliyetler sonucu havaya salınan bu kirleticiler toksik etkilerinin fark edilmesiyle birlikte 20. yy son çeyreğinden itibaren Amerika Birleşik Devletleri ve Bazı Avrupa ülkelerinde kullanımı kısıtlanmaya ve yasaklanmaya başlamıştır. Bu çalışmada farklı markalara ait 15 adet otomobil klimalarınının filtrelerinden alınan toz örneklerinde 15 poliklorlu bifenil seviyeleri incelenmiştir. Toplanan toz örnekleri GC-ECD (Agilent Technologies 5977A) ile analiz edilmiştir. Analiz sonuçlarında toplam PCB olarak en düşük 44,6 ng/g, en yüksek 3242 ng/g değer bulunmuştur.

Anahtar Kelimeler: Poliklorlu Bifeniller, İç ortam, Otomobil

1. GİRİŞ

Antropojenik faaliyetler sonucu havaya salınan Kalıcı Organik Kirleticilerin (KOK) toksik etkilerinin fark edilmesiyle birlikte çokça araştırılan bir kirletici grubu haline gelmiştir. KOK grubu içerisinde yer alan poliklorlu bifenil (PCB) bileşikleri fotolitik, biyolojik ve kimyasal bozunmaya karşı dirençli sentetik organik bileşikler olup, doğada uzun süre kalabilir ve uzun mesafeler boyunca taşınabilirler. PCB'ler termal kararlılığı yüksek, asit ve baza karşı dirençli bileşiklerdir.. 20. yy son çeyreğinden itibaren Amerika Birleşik Devletleri ve Bazı Avrupa ülkelerinde kullanımı kısıtlanmaya ve yasaklanmaya başlamıştır. Bu yasaklanma tedbirlerine rağmen kirlenmiş bölgelerden buharlaşma yoluyla ve atık yakma gibi nedenlerle atmosfere salınımları olabilmektedir. (Bozlaker vd.,2008; Breivik vd.,2002). Uzun yarılanma ömürlerine sahip olmaları PCB'lerin biyolojik olarak birikim yapmalarına, kalıcı olmalarına, toksik etki göstermelerine ve uzun mesafe taşınabilmelerine olanak sağlamaktadır.

PCB'ler, değişik karbon atomlarına bağlanmış iki benzen halkası ile tek bir zincirden oluşan kararlı organik kimyasallar arasında yer alan aromatik klorlu bileşik olarak kabul edilirler. Diğer organik kirleticilerle karşılaştırıldığında PCB'ler toprakta daha çok birikim yapmaktadırlar (Batterman vd. 2009). Şehir merkezleri, sanayi alanları, yaşamsal bölgeler ve yeşil alanlardır PCB konsantrasyonlarının yüksek konsantrasyonlarda bulunduğu bölgelerdir.
(Wang vd.,2008).

PCB'ler özellikle biyolojik birikim yapabilme ve kanserojen olmaları açısından çok önemlidir. Atmosfere atılan partikül veya gaz fazındaki PCB emisyonları, kısa veya uzun mesafeli taşınımla ve ıslak yada kuru çökelme ile atmosferden uzaklaşarak toprak, sucul ortam ve bitki örtüsünde birikirler. Sucul ortamda biriken bileşiklerin bir kısmı buharlaşarak sudan uzaklaşırken, bir kısmı sucul ortamda partiküllere tutunarak sedimentlerde birikir, bir kısmı da su canlılarında birikim gösterirler. Bitkilerde ve su canlılarında biriken bileşikler besin zinciri yoluyla insana kadar ulaşabilmektedirler (ATSDR, 2000). Toprakta biriken PCB bileşikleri toprağın organik fraksiyonuna çok sıkı tutunur ve yağmur suyu gibi etkenler olsa da toprakta çok fazla hareket etmez ve yıllarca toprakta kalabilir (Çetindamar vd., 2014). Tüm bu özellikleri nedeniyle 2001 Stockholm sözleşmesi kapsamında Kalıcı Organik Kirleticiler içinde "Ek A Ortadan kaldırılması söz konusu maddeler" grubuna alınarak kullanımı yasaklanmıştır. Türkiye sözleşmeyi 2001'de imzalamıştır. 2006 da hazırladığı eylem planı kapsamında 2025 yılına kadar tüm sorumluluklarını yerine getirmekle yükümlüdür (Dönmez 2012).

Dünya sağlık örgütü her yıl 2.4 milyon insanın hava kirliliği nedeniyle öldüğünü tahmin etmektedir Kirli havanın solunmasıyla astım ve kardiyovasküler hastalıklarına yakalanma riskleri artmaktadır. Birçok ülke hava kalitesi kontrol yasalarınıgüçlendirmekte ve otomobil içindeki emisyonlara daha fazla odaklanmaktadır (Müller vd., 2011). Kapalı ortamlar insanların zamanlarının yaklaşık %80-90'ını geçirdiği konutlar, okullar, resmi

 Copyright © International Science and Technology Conference (ISTEC)

binalar, hastaneler, kütüphaneler, kapalı spor salonları, eğlence yerleri, otomobiller, metrolar, trenler, uçaklar vb. taşıtlardır. Günümüzde teknolojideki değişiklikler, doğal ürünlerden sentetik ve kimyasal ürünlere geçiş, yaşam biçimi değişiklikleri, yerleşim yerlerinin çalışma ortamlarına uzak olmasından dolayı araç içinde geçirilen süre artmıştır. Günümüzde şoförlerin ve yolcuların farkında olmadığı bazı tehlikeler vardır. Koltuklar, döşemeler, kol ve baş yastıkları, yer döşemesi, aksesuarlar, otomobil parfümleri ve plastikten yapılmış pek çok parça tehlikeli kimyasalları içermektedir.

Kapalı ortam hava kalitesine bağlı olarak ortaya çıkan sorunlar, Çevre Koruma Örgütü'nün (Environmental Protection Agency, EPA) toplum sağlığına zararlı çevresel etmenler içinde belirttiği riskler arasında 5. sırada yer almaktadır. İnsanların en fazla zaman geçirdiği kapalı ortamlar sırasıyla ev, işyeri ve otomobillerdir. Amerika'da yapılan bir araştırmada, araştırmaya katılanların büyük çoğunluğunun günde yaklaşık 100 dakikalarını otomobillerinde geçirdikleri belirlenmiştir. Türkiye'de özellikle büyük şehirlerde, işe gidiş ve dönüş saatlerinde otomobillerde geçirilen süre çok daha uzun olabilmektedir (Lagalante vd., 2011, Vaizoğlu vd, 2010).

2. MATERYAL METOD

2.1. Örneklerin alınması

Çalışmada otomobil klimalarında biriken toz örneklerini üzerinde PCB konsantrasyonunun belirlenebilmesi amacıyla 5 farklı markalardaki otomobillerin bakım süreçleri esnasında çıkartılan hava ya da polen filtreleri dış faktörlerden korunması amacıyla kapalı bir şekilde laboratuar ortamına getirilmiştir. Daha sonra laboratuar şartları altında temiz bir fırça yardımıyla toz örnekleri alınarak amber cam şişelerde buzdolabında saklanmıştır.

2.2. Numune hazırlama

Laboratuvar ortamında saklanan numunelerin hazırlığı için önce kalibrasyon çalışması yapıldı. Kalibrasyon için 15 izomerden oluşan PCB karışımı ve geri kazanım (recovery) standartı olarak sertifikalı 2,4,6-Triklorobifenil ve 2,2',3,4,4',5,5',6-Oktaklorobifenil izomerleri Absolute'dan temin edildi. Numuneler öncelikle kıl, çöp gibi maddelerden temizlenerek tartılmıştır.

Ekstraksiyon için 2 gr tartılan numunelere recovery standard enjekte edilerek 15 ml aseton:hegzan karışımı ilave edilip bütün gece oda sıcaklığında bekletildi. Ertesi gün numuneler ultrasonik banyoda 1 saat boyunca işlemden geçirildi. Örneklerin sıvı fazı alınarak üzerine hegzan ilave edilerek solvent değiştirme yapıldı ve sonrasında azot gazı altında önzenginleştirme işlemi için miktarları 1-2 ml'ye kadar düşürüldü.

2.3. Clean-up (temizleme)

Temizleme kolonu için silika jel, alumina ve susuz sodyum sülfat kullanılmıştır. Bu kimyasalların kolon için hazırlanması aşağıdaki gibidir:

Silika jel, 130 ^{0}C'de etüvde bütün gece (16 saat) bekletilir. Desikatörde soğutulduktan sonra balon jojoye alınır. Daha sonra deiyonize su ile ile ıslatılıp iyice çalkalanarak % 5 oranında deaktive edilir. Her 3 gr slica gel için 140 µL deiyonize su koyulur. İyice çalkalanır. Oda sıcaklığında karanlıkta 1 saat bekletilir ve daha sonra 12 saat içinde kolonda kullanılır.

Alumina ve sodium sulfate 450 C"lik fırında 6-7 saat yakılarak aktive edilir: Her 2 gr alumina için 125 µL deiyonize su koyulur ve %6 oranında deaktive edilmiş olur. Cam yünü ise hekzan ile yıkanıp süzüldükten sonra etüvde kurutulur.

Temizleme kolonunda (L: 20 cm, D:1 cm) sırasıyla 1 gr cam yünü, 3 gr slika jel, 2 gr alumina ve en üstte sodyum sülfat ile hazırlanır. Kolonlar GC derece saflığında 20 ml Dikolorometan ve arkasından 20 ml Petrolyum Eteri ile ön yıkama yapılarak solvent akış hızı 0,1 ml/sn olarak ayarlanır. Daha sonra önzenginleştirilme yapılmış örnek (2 ml) gas-tight şırınga ile kolona verilir. Örnek kolona verildikten sonra kolondan 50 ml petrolyum eteri geçirilerek PCB ve PBDE örneklerinin ayrılması sağlanır. Kolondan geçirilmiş olan PBDE ve PCB örnekleri önce rotary ile hacmi 5 ml düşürülür daha sonra azot gazı altında miktarları azaltlıp hegzan solventi ilav edilir. Örnekler 250 ul'ye kadar uçurulur, 250 ul kalan örnek viallerde GC analizi için buzdolabında bekletilir

 Copyright © International Science and Technology Conference (ISTEC)

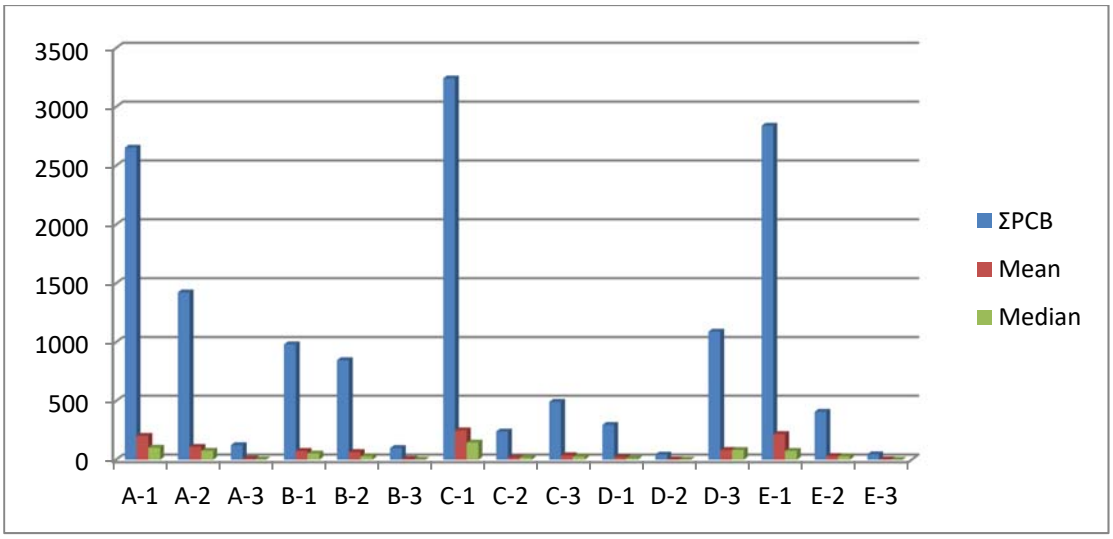
2.4. Analiz

Temizleme işlemi ile hazır hale getirilen örnekler, konsantrasyonlarının belirlenmesi amacıyla GC-ECD (Agilent Technologies 5977A) cihazında analiz edilmiştir. Cihazın kalibrayonu 15 hedef PCB bileşiği (Absolute 94567) ve 2 recovery stdandard için 6 farklı konsantrasyonda hazırlanmış kalibrasyon çözelti karışımları ile yapılmıştır. Kalibrasyon çözeltisi kondantrasyonları 25, 50, 100, 250 ve 500 µg/ml olarak hazırlanmıştır. Fırın sıcaklığı 80 C'de 2 dakika bekleme, 30 C/dak'lık artışla 200 C ye çıkıp en son 10 C/dakikalık artışla 310 C'ye çıkmıştır. 320 C'de 10 dakika beklemiştir. Enjeksiyon port sıcaklığı 300 C'dir. Analiz için HP-5MS kolon (30 m×250 µm×0.25 µm) kullanılmıştır.

Ektraksiyon ve temizleme işlemleri sonucunda PCB izomerlerinin geri kazanım oranları %80-%120 aralığında hesaplanmıştır. LOD değerinin belirlenebilmesi için şahit kütlesi 3 ile çarpılarak hesaplamalar yapılmıştır.

3. BULGULAR ve DEĞERLENDİRME

5 farklı marka (A-B-C-D-E) otomobil filtresinden alınan 15 adet numunede 15 adet PCB izomeri için (PCB18, PCB31, PCB28, PCB20, PCB52, PCB44, PCB101, PCB149, PCB118, PCB105, PCB153, PCB138, PCB180, PCB170, PCB194) toplam, ortalama ve ortanca değerler aşağıdaki gibidir. Sonuçlar Tablo 1'de verilmiştir



Tablo 1. PCB izomerlerine ait ortalama, ortanca, en düşük ve en yüksek değerleri

	ΣPCB	Ortalama	Ortanca
A1	2652,66	204,05	102,54
A2	1424,00	109,54	76,15
A3	125,14	9,63	2,91
B1	981,84	75,53	53,41
B2	848,02	65,23	28,78
B3	99,48	7,65	2,25
C1	3242,14	249,40	145,94
C2	240,87	18,53	18,53
C3	492,90	37,92	26,95
D1	296,72	22,82	12,86
D2	44,65	3,43	1,95
D3	1090,41	83,88	84,24
E1	2839,77	218,44	75,42
E2	408,19	31,40	29,30
E3	47,33	3,64	0,48

Tüm araba filtrelerinde PCB izomerlerine rastlanmıştır. PCB değerleri 3242,14 ile 47,3 arasında değişiklik göstermiştir.

Örnek toplanan arabaların her birinden 3 adet seçilerek marka bazında bir farklılık oluşup oluşmadığının belirlenmesi amaçlanmıştır. Analiz sonuçları markalar arasında kayda değer bir farklılık olmadığını göstermiştir. Klima tozları araba bakım servislerinden alındığından arabalara ait çok detaylı anket çalışması yapılamamakla beraber yaptıkları kilometreler değerlendirmede kullanılmak üzere istenmiştir. Bu veri ile yapılan korelasyon çalışmaları da çok net bir bulgu oluşturmamıştır.

Copyright © International Science and Technology Conference (ISTEC)

Şekil 1. PCB izomerlerine ait ortalama, ortanca, en düşük ve en yüksek değerleri grafiksel gösterimi

4. TARTIŞMA VE ÖNERİLER

Farklı mikroçevrelerde kalıcı organik kirleticilerin belirlenmesi son yıllarda sıkça çalışılan konular arasında yer almaktadır. Ev ve ofis klimalarının yanında araba klimalarında da bu tip tehlikeli kirleticilere yönelik araştırmalar mevcuttur ancak PCB bazında değerlendirme bulunmamaktadır. Arabalarda önemli sorunlardan biri olan PBDE lere yönelik çalışma hem araba içlerinden toplanan tozlarda hem de klima filtrelerinden toplanan tozlarda çalışılmıştır.

Bu çalışmanın devamında aynı toz örneklerinde PAH ve PBDE kirleticileri de bakılarak KOK kirleticileri daha kapsamlı bir biçimde ele alınacaktır. Aynı çalışma içerisinde ev ve ofis klimalarından toplanan örneklerde de PCB, PAH ve PBDE ler incelenerek KOK lara yönelik detaylı bir tarama yapılması amaçlanmaktadır.

Araba klimalarından elde edilen sonuçların daha verimli sonuçlandırılabilmesi için araçların kullanıldığı yoldan, araç içi detaylarına kadar çokça verinin toplanarak değerlendirilmeye katılması daha uygun olacaktır. Özellikle kamyon yakıtı olarak kullanılan bazı mazotların PCB seviyesini yükselttiğine dair çalışmalar bu şekilde daha net bir şekilde ortaya konabilecektir

Özet: Bilgi güvenliği, günümüz insanın en büyük sorunları arasında yer almaktadır. Son 10 yılda internet teknolojilerinin hızlı bir şekilde gelişimiyle tüm bilgi sistemleri internet ortamında çalışır hale gelmiştir. Kurumsal ve kişisel bilgilerin internet ortamında yer alması kolaylıkların yanında tehditleri de beraberinde getirmektedir. Genellikle kurumsal bilgi sistemlerinin ve verilerin bulunduğu ortamlar çeşitli yöntemler ile güvenli hale getirilmektedir. Fakat çoğunlukla kişisel bilgilerin bulunduğu ortamlar korumasız kalmaktadır. Bu durum kişisel bilgi güvenliği farkındalığının önemini arttırmaktadır.

Bu çalışmada kişisel bilgi güvenliği kavramları örnekler ile incelenmiştir. Ayrıca öğrencilerin konu ile ilgili görüşleri alınarak konu detaylandırılmıştır. Sonuçlar bölümünde kişisel bilgi güvenliği için bazı önerilerde bulunulmuştur.

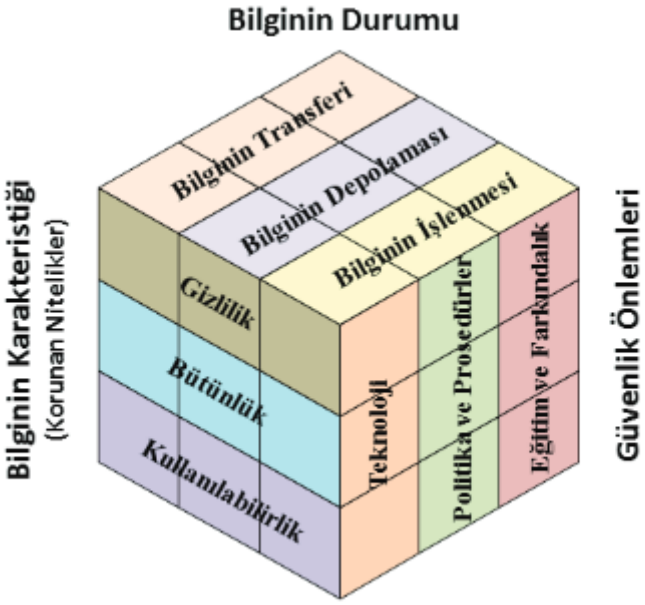
Anahtar Kelimeler: Bilgi Güvenliği, İnternet, Davranış Analizi

GİRİŞ

Bilgi ve iletişim teknolojileri 21.yy insanının hayatında vazgeçilmez bir yere sahiptir. Sektörde yaşanan hızlı gelişmeler klasik hizmet sunumunu tamamıyla değiştirmiştir. Bilgi teknolojilerinin sunduğu kolaylıklar geri dönülmez bir şekilde kişileri teknolojiye bağlamış ve çoğu zaman hayatlarını kolaylaştırmıştır. Teknoloji ile yaşamak ve gelişmeleri takip etmek artık günümüz insanının yaşam tarzı haline gelmiştir. Özellikle son 5 yılda mobil teknolojilerin gelişmesi ile neredeyse tüm sektörler bu ortamlara taşınmıştır. Yakın gelecekte nesnelerin interneti, bulut bilişim, büyük veri, yeni internet protokolü (ip V6) gibi teknolojilerin kullanımı yaygınlaşacaktır. Yaşadığımız yüzyılın başından itibaren e-devlet, e-ticaret, e-bankacılık, e-öğrenme e-eğlence gibi hizmetler geliştirilmiş ve bilgilerin kâğıtlar üzerinde değil sunucular üzerinde dijital olarak saklanması sağlanmıştır.

Türkiye İstatistik Kurumunun verilerine göre, Türkiye'de 16-74 yaş grubunun bilgisayar kullanım oranı %54,8, İnternet kullanım oranı %55,9'dur. Hanelerin 2015 yılı Nisan ayında %96,8'inde cep telefonu veya akıllı telefon bulunurken, sabit telefon bulunma oranı %29,6 oldu. Aynı dönemde hanelerin %25,2'sinde masaüstü bilgisayar, %43,2'sinde taşınabilir bilgisayar ve %20,9'unda İnternete bağlanabilen TV bulunmaktadır. İnternet kullanım amaçları dikkate alındığında, 2015 yılının ilk üç ayında internet kullanan bireylerin %80,9'u sosyal medya üzerinde profil oluşturma, mesaj gönderme veya fotoğraf vb. içerik paylaşırken, bunu %70,2 ile online haber, gazete ya da dergi okuma, %66,3 ile sağlıkla ilgili bilgi arama, %62,1 ile kendi oluşturduğu metin, görüntü, fotoğraf, video, müzik vb. içerikleri herhangi bir web sitesine paylaşmak üzere yükleme, %59,4 ile mal ve hizmetler hakkında bilgi arama takip etmektedir (Hanehalkı Bilişim Teknolojileri Kullanım Araştırması, 2015). Ocak 2016 tarihi itibarıyla yaklaşık 28 milyon kayıtlı e-Devlet Kapısı kullanıcısı, 252 farklı kurumdan 1522 adet hizmeti İnternet üzerinden alabilmektedir (turkiye.gov.tr, 2016).

Elbette bu kadar büyük bir siber ortamda güvenlik ciddi bir sıkıntı haline gelmektedir. Sistemlerin hizmet dışı kalması ve/veya kötüye kullanımları sonucunda büyük ölçekli ekonomik zararlar, kamu düzeninin bozulması, can kaybı ve ulusal güvenlik zafiyetlerinin oluşması gibi durumlar söz konusu olabilmektedir.



Bilginin korunmasını sadece kurumsal olarak düşünmek en büyük hatalardan birisidir. Siber ortamda sadece kurumlar veya devletler bilgilerini saklamazlar. Bunun yanında milyarlarca kişisel internet kullanıcısı önemli oranda bilgi alışverişi yapmakta ve hizmet almaktadır. Sadece sosyal medya düşünüldüğünde bile 2.3 milyar aktif kullanıcısı olduğu tahmin edilmektedir. Her gün 1 milyon aktif mobil sosyal medya kullanıcısı dünyadaki ekosisteme eklenmektedir. Bu noktada bilgi güvenliği veya siber güvenlik kavramları önem kazanmaktadır.

Bilgi güvenliği en temel manada bilginin korunduğu bilgi sistemlerinin ve sistemin içerdiği bilginin yetkisiz erişimine, kullanımına, ifşa edilmesine, değiştirilmesine, incelenmesine, hasar verilmesine veya yok edilmesine karşı korunması ve buna ilişkin tedbirlerin bütünü olarak tanımlanabilir (Güngör, 2015).

 Copyright © International Science and Technology Conference (ISTEC)

Bilgi güvenliğinin unsurlarının boyutlarını gösteren ve gruplandıran McCumber'in bilgi güvenliği modeli, 1991 yılından bu yana geçerliliğini korumuş ve daha sonra geliştirilen modellere de temel olmuştur. Buna göre bilgi güvenliği karakteristiği 3 ana temel üzerinde kurulur. Bunlar:

- Gizlilik: Bilginin yetkisiz kişilerin veya sistemlerin erişimine kapalı olması ya da bilginin yetkisiz kişilerce açığa çıkarılmasının engellenmesidir.
- Bütünlük: Bilginin yetkisiz kişilerce değiştirilmesi, silinmesi ya da herhangi bir şekilde tahrip edilmesi tehditlerine karşı içeriğinin korunmasıdır.
- Kullanılabilirlik: Bilginin ihtiyaç duyulduğu anda kullanıma hazır durumda olması anlamına gelmektedir.

Şekil 1 McCumber Bilgi Güvenliği Modeli *(McCumber, 1991)*

McCumber'in modeline göre güvenlik bilginin transferi, depolaması ve işlenmesi durumunda da sağlanmalıdır. Dolayısı ile sadece depolama esnasında alınan güvenlik önlemleri yeterli olamaz, tüm durumlar düşünülmelidir. Öte yandan McCumber geliştirdiği modelde güvenlik önemlerini de tanımlamıştır. Buna göre teknoloji, politikalar/prosedürler ve eğitim/farkındalık bilgi güvenliği için gerekli güvenlik önlemleridir.

SİBER ORTAM VE TEHDİTLER

Siber ortamda kişisel bilgi güvenliğini tehdit unsurları gün geçtikçe farklılaşmakta ve gelişmektedir. Bu sebeple bazı tehditleri ve ortamları tanımak önemlidir.

Sosyal Mühendislik

Sosyal Mühendislik, insanlar arası iletişimde ve insan davranışlarındaki açıkları anlayıp, kişilerin bilgilerini elde etmeyi veya kişilerin kimliklerine bürünmeyi sağlayan müdahalelere verilen isimdir. Başka bir deyişle kişilerin bilgilerine ulaşmak için kişilerin hassasiyetlerini kullanan bir yöntemdir. Sosyal mühendisliği kullanan saldırgan kimliği tespit edilmeyecek şekilde e-posta, sosyal medya, telefon gibi kanallardan hedefi ile iletişim kurar. Saldırgan sahte senaryolar uydurarak hedefinin bilgisine ulaşmak isteyebilir. Sıkça kullandıkları bir yöntem olarak, saldırgan güvenilir bir kaynak olduğu izlenimini vererek hedefin bilgilerini vermek zorunda olduğu hissini uyandırır. Bir başka yöntem olarak saldırgan yardım, eşantiyon ve ödül önererek bilgi talebinde bulunabilir. Saldırgan hedefi ile belirli süre iletişimde kalarak hedefin güvenini kazanarak açıklarını elde edebilir. Öte yandan saldırgan omuz sörfü (Shoulder Surfing) yöntemi ile hedefinin bilgilerini, izleme yöntemi ile elde edebilir. Örnek verilen sosyal mühendislik yöntemlerinde tek amaç hedefin bazı bilgilerini elde etmektir.

Virüsler

Bilgisayar virüsleri çalıştırıldığında bilgisayara zarar vermeyi veya bilgi çalmayı hedefleyen zararlı program parçalarıdır. Günümüzde virüsler çok hızlı bir şekilde her türlü dijital ortamdan rahatlıkla bulaşabilmektedir.

 Copyright © International Science and Technology Conference (ISTEC)

Bilgisayar virüsleri, can sıkıcı mesajlar ile çalışmaları engelleyebilir, bilgilerin depolandığı disklerin bir bölümünü yada tamamını silebilir, dosyaları bozarak çalışmamasını sağlayabilir, kullanılan programların çalışmamasını sağlayabilir.

Solucanlar

Solucanlar virüsler gibi bilgisayarlara zarar vermeyi yada yavaşlatmayı hedefleyen yazılımlardır. Bu tip programlar bilgisayarda bir açık oluşturarak saldırganın uzaktan erişim ile denetimi ele almasını sağlayabilir, bilgisayar sisteminin internet, disk, bellek gibi kaynaklarını zorlayarak gereksiz şekilde harcama yapılmasına neden olabilir, bilgileri kopyalayarak saldırganlara iletebilir.

Trojan

Bilgisayarın kontrolünü saldırgana devretmek için yapılmış zararlı yazılımlardır. Herhangi bir ortamdan (İnternet, CD, DVD, taşınabilir bellek) yüklenen zararsız görünen yazılımların içerisinde gömülü olarak çalışan bu programlar bilgisayarın kontrolünü saldırganın alması için bir kapı açarlar. Bu şekilde bilgisayar içinde yapılan klavye tuşlamaları, ekran tıklamaları, web sitesi hareketleri gibi tüm aktivitelerin görünmesi saklanılarak, tüm bilgilerin saldırganın eline geçmesine olanak verilir.

Sanal Dolandırıcılık

Sanal dolandırıcılık, kredi kartı bilgileri, web sitelerinin şifreleri, kişisel bilgiler gibi tüm kurumsal veya kişisel verilerin elde edilmesi için hazırlanan bir dolandırıcılık türüdür. En sık rastlanılan sanal dolandırıcılık türü password (şifre) ve fishing (balık avlama) kelimelerinin birleşimi ile oluşturulan Phising yöntemidir. Bu yöntem ile saldırgan hedefe güvenli bir kaynaktan geliyormuş gibi bir mesaj iletin ve bilgilerini göndermesi veya bir bağlantıya tıklaması istenir.

BotNet, Zombi Bilgisayar

İnternet üzerinden yapılan saldırılara bilinçsizce dahil olan bilgisayarlara zombi bilgisayar denir. Yüklenen bir yazılım ile bilgisayar BotNet üyesi olur. Komut verildiğinde bilgisayar istemsizce hedefe saldırır. Kullanıcılar bilgisayarlarının BotNet üyesi olduğunu çoğu zaman anlayamazlar. Genellikle bir sunucuya yoğunluk yaratmak için yapılan saldırılar için kullanılır. BotNet'i kontrol eden yöneticinin komutu ile tüm bilgisayarlar tek bir hedefe saldırarak yoğunluk yaratır ve servis dışı bırakmaya çalışır. Aynı zamanda istenmeyen e-postalar göndermek için yine BotNet'ler kullanılmaktadır.

En riskli ortamlar

İnternet Bankacılığı

Günümüzde banka şubelerinden yapılan tüm işlemler internete erişebilen herhangi bir cihaz ile gerçekleştirilebilmektedir. Bilgilerin çalınması sonucunda kişilerin en fazla zarar gördükleri ortamdır. Bankalar günün getirdiği tehditlere karşı yeterli önlemleri almak durumundadır. Fakat yapılan araştırmalara göre başarılı saldırılar son kullanıcı düzeyindeki açıklardan kaynaklanmaktadır. Kullanıcıların yaptıkları ihmaller ve saldırganların uyguladıkları sosyal mühendislik yöntemleri sayesinde internet bankacılığı riskli bir ortamdır.

İnternetten Alışveriş

Tüketicilere sunulan önemli esneklikler dolayısı ile oldukça tercih edilen internetten alışveriş, internet bankacılığı gibi kullanıcıların kendi ihmalleri nedeniyle riskli bir ortamdır. Öte yandan alışveriş yapılan sitelerin altyapılarının güvenlik düzeyi doğrudan riski oluşturmaktadır.

E-Posta

Günümüzde neredeyse tüm yazışmalar e-posta aracılığı ile yapılmaktadır. Bu sebeple e-posta bilgilerini ele geçirmek saldırganların ilk hedefi olmaktadır. E-posta hesaplarının güveliğini arttırmak 21.yy insanının siber ortamdaki risklerini önemli derecede düşürmektedir. Kolay çözülebilir parolalar, istenmeyen e-postalar gibi tehditler riskleri arttırmaktadır.

İnternet Bağlantısı

İnternete erişmek için kullanılan kablosuz iletişim sunduğu eşsiz esneklikler ile vazgeçilmez olmuştur. Yeterli güvenlik ayarları yapılmayan internet bağlantısı, sinyale erişen herkese açık hale gelebilir. Bu durumda saldırgan rahatlıkla hedefin internet ağına dâhil olabilir. Bu durumda bağlantı hızı düşebilir, internet faturası artabilir ve daha kötüsü saldırganın yaptığı diğer saldırıların hukuki sonuçları internet ağı sahibine yıkılabilir. Yapılan araştırmalarda, saldırganlar planladıkları eylemleri başkalarının internet ağı üzerinden yapmaktadırlar. Bu ve benzeri nedenler ile internet bağlantı ortamları risk barındırmaktadır.

 Copyright © International Science and Technology Conference (ISTEC)

Sosyal Medya

Sosyal medyanın gücü günümüzde tartışılamaz boyutlardadır. Neredeyse tüm kurumlar ve kişiler bilgilerini rahatlıkla sosyal medya üzerinden paylaşmaktadır. İnternet denildiğinde çoğu zaman sosyal medya siteleri akla gelmektedir. Sosyal medya ortamında 60 saniyede yüz binlerce paylaşım aynı anda yapılmaktadır. Çoğu insan özel bilgilerini sosyal medya siteleri üzerinde saklamakta ve/veya paylaşmaktadır. Son zamanlarda kullanım kolaylığı sağlamak için, internette tek kullanıcı hesabı mantığı ile tüm sitelerin kullanıcı hesapları en çok kullanılan sosyal medya hesapları ile eşleştirilmektedir. Bu sebeplerden dolayı sosyal medya ortamı kişisel bilgi güvenliği açısından ciddi risk oluşturmaktadır. Saldırganlar sadece zevk için bile hedeflerinin sosyal medya hesaplarını ele geçirmeye çalışmaktadır.

ÖĞRENCİ GÖRÜŞLERİ

Bu çalışmada 407 öğrenci ile görüşülerek bilgi güvenliği hakkındaki görüşleri alınmış ve derlenmiştir. Görüşmelerde Öğütçü'nün geliştirdiği ölçek kullanılmıştır (Öğütçü, 2010). %47'si kadın %53'ü ise erkek olan grubun %88'i 18-20 yaş aralığındadır. Öğrencilerin %91'i her zaman internet erişimi olduğunu beyan etmişler ve sadece %10'u son 3 yıldır yeni yeni interneti kullandığını diğerleri ise uzun zamandır internette zaman geçirdiklerini belirtmişlerdir. Grubun %96'sı daha öncesinde bilgi güvenliği ile ilgili bir eğitim almadığını veya tecrübe yaşamadığını ifade etmişlerdir. Öğrencilere bilgi güvenliği hakkında riskli davranışlar, korumacı davranışlar, suça maruz kalma ve tehlike algısı ile ilgili sorular yöneltilmiş ve cevapların dağılımı Tablo 1, 2, 3 ve 4'te verilmiştir.

Tablo 1: Riskli Davranış Ölçeği ile ilgili Soruların Frekans Dağılımları

Sorular	Her Zaman	Sık sık	Bazen	Nadiren	Hiçbir Zaman
Msn Messenger, GTalk, Skype ve benzeri sohbet programlarını kullanırım.	32%	20%	24%	20%	3%
Bir iletişim aracı olarak elektronik posta (e-mail) kullanırım.	24%	12%	22%	22%	19%
Kurumsal e-posta adresimi günlük işlerde de kullanırım.	33%	19%	19%	9%	20%
İnternette e-posta gruplarına üye olurum.	37%	15%	15%	19%	14%
Facebook, Twitter ve benzeri sosyal ağ sitelerini kullanırım.	20%	17%	11%	18%	34%

SONUÇLAR

Siber ortam olumlu çok büyük imkanları beraberinde getirmekle beraber bir çok tehlikeyi de barındırmaktadır. İşletmeler ve devlet kurumları çoğu zaman asgari düzeyde gerekli önlemleri almaktadırlar. Fakat son kullanıcılar tehditler konusunda genellikle çözümsüz ve bilgisiz kalmaktadır. Çalışmada üniversite öğrencilerin bilgi güvenliği ile ilgili bilgi birikimi ve farkındalığı test edilmeye çalışılmıştır. Sonuçlardan da anlaşılacağı gibi öğrenciler siber ortamda tehlike barındırabilecek davranışlar sergilemektedir. Büyük çoğunluğu tehlikenin ne olduğunu ve tehdidin nereden geleceğinin farkında değillerdir.

Siber dünya durdurulamaz ve kontrol edilemez ölçüde büyümektedir. Elbette kişisel bilgi güvenliğini sağlamının teknolojik birçok yolu mevcuttur fakat eğitim ile farkındalık oluşturulmadan bilginin korunabilirliği neredeyse imkânsızdır. Bu sebeple özellikle lise ve üniversite çağındaki öğrencilere özel olarak bilgi güvenliği ile ilgili kurs ve dersler planlanmalıdır. Bunun yanında aşağıda verilen önlemler ile bilgi güvenliği temel düzeyde rahatlıkla sağlanabilir.

- İşletim sistemi, internet tarayıcısı ve çeşitli güvenlik yazılımları mutlaka kısa aralıklar ile güncellenmelidir.
- Yazılımların daima orijinal lisanslı olması gerekmektedir.
- Bilgisayar ve/veya akıllı cihazların teknik servis hizmetine verilirken bilgilerin ulaşılabilir olduğu göz önüne alınmalıdır.
- Veriler önem düzeyine göre birkaç yere yedeklenmelidir.
- Bankacılık bilgileri, kişisel önemli bilgi ve şifreler bilgisayar ortamında dosyalara kaydedilmemelidir. Eğer böyle bir durum zorunlu ise güvenli saklama yazılımları kullanılmalıdır.
- Arızalanmış her türlü akıllı cihaz, CD, DVD, bellek ürünleri atılacak ise mutlaka kullanılamayacak duruma getirildikten sonra atılmalıdır. Mümkünse imha edilmelidir.
- Hassas bilgilerin internet sohbet ortamlarında, e-posta, SMS gibi iletişim kanalları ile paylaşılmamalıdır.

Özet: Biyolojik ritim; insanların, hayvanların, bitkilerin hatta mikroorganizmaların vücutlarının çalışmasını, bedensel aktivitelerini ve davranışlarını etkileyen döngüsel değişimlerin doğal ritmi olarak tanımlanmaktadır. Biyolojik ritim düzeninin bir kısmı doğa ve çevre olaylarından kaynaklansa da, birçoğu içsel periyodik değişimlerle ilgilidir. Kişilerin kendilerine özgü periyodik ritimlerinden biri de sirkadiyen ritimdir. İnsanlar önemli fonksiyonları gerçekleştirmek için günün doğru zamanını seçerken kendilerine özgü bu biyolojik ritmi kullanırlar. Öğrencilerin okul içindeki akademik faaliyetleri, sosyal ilişkileri, kısmi zamanlı işleri ve projeleri gibi faktörler biyolojik ritimlerini etkilemektedir. Öğrencilerin özellikle ara sınav ve final dönemlerinde biyolojik ritimleri değişebilmektedir. Çeşitli akademik çalışmalarda biyolojik ritmin fiziksel, mental ve sosyal sağlığı etkilediği belirlenmiştir. Bu çalışmanın amacı öğretmen adaylarının biyolojik ritimleri ve uyku kalitesi ile akademik başarı arasındaki ilişkiyi belirlemektir. Bu çalışma Eğitim Fakültesi Fen Bilgisi Öğretmenliği bölümünde öğrenim görmekte olan 99 öğrenci ile gerçekleştirilmiştir. Araştırma kapsamında öğrencilerin vize sınavları sonrasında biyolojik ritim ölçeği ve uyku kalitesi ölçeği uygulanmıştır. Aynı zamanda öğrencilerin iki hafta boyunca girdikleri sınavlarında elde ettikleri notlar değerlendirmeye alınmıştır. Biyolojik ritim ölçeğine göre öğrencilerin puan sabahçıl ve akşamcıl özellikleri arasında dağılım gösterdiği söylenebilir. Öğrencilerin yaklaşık yarısını sabahçıl olarak tanımlamasına karşın, sadece %36'sı kendini akşamcıl olarak tanımlamaktadır. Öğrencilerin uyku kalitesi indeksine göre kötü uyku kalitesine sahip oldukları söylenebilir. Öğrencilerin sadece %33'ü iyi uyku kalitesine sahiptir. Öğrencilerin vize notları puan ortalamaları ile uyku kaliteleri ve biyolojik ritimleri arasında anlamlı bir korelasyon bulunamamıştır.

Anahtar Kelimeler: Biyolojik ritim, sirkadiyen ritim, uyku kalitesi, akademik başarı

EFFECTS OF BIOLOGICAL RHYTHM AND SLEEP QUALITY ON PRE-SERVICE TEACHERS' ACADEMIC PERFORMANCE

Abstract: Biological rhythm is defined as the natural rhythm of circular changes of human, animals and even microorganisms which has an effect on body's working, physical activities and behaviors. Although some portion of the biological rhythm system depends on natural and environmental factors, much of it is related to internal periodical changes. One of the periodic rhythm of humans is Circadian rhythm. People use this specific rhythm when they choose the right time to perform important functions. Students' academic activities in school, social relationship, part time jobs and projects have an effect of their biological rhythm. Students' biological rhythms can change especially during midterm and final exams. In some papers it is argued that biological rhythm has an effect on physical, mental and social health. This research aim is to determine the relationship between pre-service teacher's biological rhythms, sleep quality and academic performance. This research was carried out with 99 students who study in Education Faculty Science Teacher Education program. After the exam period the students were asked to fill the biological rhythm scale and sleep quality index. Also the grades of students from midterm exams were recorded. According to the biological rhythm scale the points of the students were distributed among morning person and evening person type. Nearly half of the students identified themselves as morning person as well as only %36 of them as evening person. İt can be stated that students have poor sleep quality. Only %33 of the students have adequate sllep quality. A meaningful relationship between academic success and sleep quality and biological rhythm wasn't found.

Keywords: Biological rhythm, circadian rhythm, sleep quality, academic success

Giriş

Evrende ve onun parçası olan dünyamızda bir düzen ve ritmin, üzerinde yaşayan canlılarda da biyolojik bir ritmin varlığı söz konusudur. İnsanlardaki zamana bağlı döngüsel değişiklikler yüzyıllardır gözlenmektedir (Waterhouse, 1999). İnsan organizması, fizyolojik olaylar, beslenme, metabolizma olayları ve yaşam alışkanlıklarına bağlı olarak gelişen günlük bir ritme sahiptir (Bayraktar & Kurtoğlu,2009).

Biyolojik ritim; insanların, hayvanların, bitkilerin hatta mikroorganizmaların vücutlarının çalışmasını, bedensel aktivitelerini ve davranışlarını etkileyen döngüsel değişimlerin doğal ritmidir (Marshall Cavendish Corporation, 2000). Biyolojik ritimler, düzenli çevresel değişmelerin vücut üzerindeki etkilerinin öngörülmesini sağlar. Dolayısı ile çevre tarafından oluşturulan bedensel değişikliklere olan yanıtın geribildirim mekanizmalarından farklıdır. Biyolojik ritimler birçok alanda, çevreye uyumu ve kontrolü sağlamaktadır (Çalıyurt, 2001). Biyolojik ritimlerin bir kısmı doğa ve çevre olaylarından kaynaklansa da birçoğu içsel periyodik değişimlerle ilgilidir (Kumar, 2002).

Kişilerin kendilerine özgü periyodik ritimlerinden biri de sirkadiyen ritimdir İnsanlar önemli fonksiyonları gerçekleştirmek için günün doğru zamanını seçerken kendilerine özgü bu biyolojik ritmi kullanırlar (Kumar, 2002). Sirkadiyen ritimler, yaklaşık bir gün süren ritimlerdir (Lat: circa=yaklaşık, dies=gün). İnsanın en belirgin sirkadiyen ritmi uyku ve uyanıklığın ritmik değişimidir. Erişkin bir insan günde ortalama 16 saat uyanıkken 8 saat uykudadır. Bunun dışında vücut metabolizma hızı da gün boyunca değişir. (Çalıyurt 1998).

Kleitman (1939), sirkadiyen tipi "sabahçıl tip", "akşamcıl tip" ve "ara tip" olmak üzere üç kategoride değerlendirilmiştir (aktaran; Pündük, Gür ve Ercan, 2005). Sirkadiyen tip sınıflamasına göre sabahçıl tipler akşam erken yatıp sabah erken kalkar, sabah saatlerinde kendilerini daha iyi hissederler. Sabahçıl tipler sabah saatlerinde akşam saatlerine göre daha iyi performans gösterirler. Akşamcıl tipler ise gece geç saatte yatar, sabah erken saatlerde uyanmakta zorluk çeker ve kendilerini günün öğleden sonraki saatlerinde daha iyi hissederler. Günün bu saatlerinde bedensel ve zihinsel etkinliklerinde daha iyi performans gösterirler (Tankova ve Buella, 1994).

Öğrencilerin okul içindeki akademik faaliyetleri, sosyal ilişkileri, kısmi zamanlı işleri ve projeleri gibi faktörler biyolojik ritimlerini etkilemektedir. Öğrencilerin özellikle ara sınav ve final dönemlerinde biyolojik ritimleri değişebilmektedir. Çeşitli akademik çalışmalarda biyolojik ritmin fiziksel, mental ve sosyal sağlığı etkilediği belirtilmiştir.

Meijer ve ark. (2000) öğrencilerin %43'ünün sabah kalkmada zorluk yaşadıklarını, %15'İnin uyku sorunları olduğunu ve %25'inin okulda dinlenmiş hissetmediklerini belirtmişlerdir. Uyku kalitesinin ve uyku düzeninin okuldaki faaliyetleri olumlu yönde etkilediğini aktarmışlardır.

Uykuyla ilgili alan yazında yer alan bulgular; uyku süresi yeterli olan öğrencilerin karmaşık matematik problemlerini yetersiz uyku uyuyan öğrencilerden iki kat daha iyi çözebildiklerini, uykuyla ilişkili solunum problemlerinin akademik başarı, dikkat, hafıza ve zeka üzerinde olumsuz etkisinin olduğunu ve davranış problemlerini artırdığını, sabah uyanmada zorluk yaşamayan öğrencilerin başarı motivasyonunun daha yüksek olduğunu, gece uyuma süresi ile akademik performans arasında pozitif bir ilişki olduğunu ve gece beş saatten daha az uyuyan öğrencilerin not ortalamasının daha düşük olduğunu göstermektedir (Koçoğlu ve ark., 2010).

Biyolojik, psikolojik, sosyal ve kültürel gereksinimleri olan insanın varlığını sürdürebilmesi için bu gereksinimlerinin karşılanması gerekir. Karşılanması gereken bu temel gereksinimlerden biri de uykudur (Özer, 2000; Öztürk, 2001). Uykunun insan ömrünün yaklaşık üçte birini oluşturduğu bilinmektedir (Özgen, 2001). Uyku, bireyi, yaşam kalitesini ve iyilik durumunu etkileyen, sağlığın önemli bir değişkeni olarak görülmektedir (Engin ve Özgür, 2004; Ertekin ve Doğan, 1999). Uyku kalitesi iyi olanlarla karşılaştırıldığında kötü uyku kalitesine sahip öğrencilerin fiziksel ve psikososyal sağlık problemlerini anlamlı şekilde daha fazla deneyimledikleri bildirmektedirler (Lund ve ark., 2010). Uyku bozuklukları beden ve ruh sağlığını, sosyal yaşamı olumsuz etkileyen, akademik başarıda ve iş verimliliğinde düşüşe, kazalarda artışa neden olabilen, sıklığı açısından dikkat çekici bir halk sağlığı sorunudur. Uyku kalitesinin tanımlanması ve nesnel olarak ölçülmesinin güç olduğu bildirilmektedir. Uyku kalitesi, uyku latensi, uyku süresi ve bir gecedeki uyanma sayısı gibi uykunun niceliksel yönlerini içerdiği gibi, uykunun derinliği ve dinlendiriciliği gibi öznel yönlerini de içerir (Lafçı, 2009). Üniversite öğrencilerinde uyku kalitesi fizyolojik ve psikolojik sağlığın korunması, verimliliğin artması açısından önemlidir (Aysan ve ark., 2014).

Uyku birçok fizyolojik süreci etkiler. Aynı zamanda bedenimizdeki fizyolojik değişikliklerin de uykuyu etkilediği görülür. Sirkadiyen değişiklikler, tıbbi, nöropsikiyatrik bozukluklar, çevresel koşullar ve ilaçlar gibi birçok etmen uykuyu etkilemekte ve uyku ile ilgili yakınmalara neden olmaktadır. Bir belirti olarak hemen hemen her hastalıkta karşılaşılan uyku sorunları, hekimlerin yıllardır üzerinde durduğu alanlardan birisidir. Ortaya çıkan uyku yakınmalarının; bireylerin günlük mesleki ve sosyal performanslarında, bilişsel işlevlerinde, yaşam kalitelerinde düşme ve olumsuz ekonomik sonuçlara neden olması, bu yakınmaların ciddi olarak ele alınmasını gerektirmektedir (Işık ve ark., 2008).

Uyku genç bireylerin sağlığında önemli yer tutar. Yetersiz uyku sağlık için tehdit oluşturmasının yanında bilişsel, psikomotor ve duygusal fonksiyonlarda azalmaya neden olur (Abdulkadiroğlu, Bayramoğlu ve İlhan, 1997; Orzech ve ark., 2011). Bu nedenle, yeterince uyku uyuyamayan öğrencilerin fiziksel, bilişsel ve duygusal olarak

 Copyright © International Science and Technology Conference (ISTEC)

olumsuz etkilenmeleri söz konusudur. Ayrıca, öğrencilerde uykusuzluğun akademik başarıyı olumsuz etkilediği de bildirilmektedir (Curcio, Ferrara ve Gennaro, 2004). Bunun yanında uyku kalitesi kötü olan öğrencilerin dinlenmiş olarak uyanmadıkları ve derslerde uyukladıkları belirlenmiştir (Aysan ve ark.,2014).
Koçoğlu ve ark. (2010) ise ilköğretim 2.sınıf öğrencileri ile yaptıkları araştırma sonunda öğrencilerin uyku alışkanlıklarının ve uyunan çevrenin olumsuz özelliklere sahip olduğunu, öğrencilerin uyku sorunları yaşadıklarını ve bu durumların okul fonksiyonları üzerinde olumsuz etkisi olduğunu belirtmişlerdir.
Üniversite öğrencilerinde uyku sorunlarının sık görüldüğü ve uyku kalitelerinin kötü olduğu bilinmektedir. Öğrenciler üzerine yapılan çalışmalarda; uyumak için yatağa gitme zamanlarının düzensiz olduğu, yetersiz uyudukları, uyku kalitelerinin kötü olduğu, uykularını düzenlemek için sıklıkla alkol ve hatta reçetesiz ilaç kullandıkları, uyanık kalmak için de uyarıcılar kullandıkları ve hatta araç kullanırken uykuya daldıkları ya da uyku sorunları nedeniyle araç kazaları yaptıkları bildirilmektedir (Kang ve Chen, 2009; Taylor ve Bramoweth, 2010; Lund ve ark., 2010).
Yine öğrencilerin uykusuzluk sonucunda konsantre olmada zorlanma, yorgunluk, sinirlilik, anksiyete ve depresyon gibi sorunlar yaşadıkları bildirilmektedir (Fernández-Mendoza ve ark., 2009).
Ülkemizde ise üniversite öğrencilerinde uyku konusundaki çalışmalar sınırlıdır. Aysan ve ark.(2014), çalışmasında hemşirelik, tıp ve eczacılık fakültelerinde öğrenim görmekte olan öğrencilerin uyku kalitesinin kötü olduğu saptanmıştır.
Saygılı ve ark. (2011) tarafından yapılan çalışmada da üniversite öğrencilerinin uyku kalitesinin kötü olduğu bildirilmiştir. Mayda ve arkadaşları (2012) tıp fakültesi öğrencilerinde uyku kalitesini inceledikleri çalışmaları sonucunda, öğrencilerin yarısından fazlasının uyku kalitesinin kötü olduğu saptanmıştır.
Sarı ve ark. (2015) gerçekleştirdikleri araştırmada bir üniversite yurdunda kalan öğrencilerin %41,1'inin uyku kalitesinin düşük olduğu belirlenmiştir. Özellikle ilaç kullanan öğrencilerde kötü uyku kalitesine daha sık rastlanmıştır. Erkek öğrencilerde kötü uyku kalitesi sıklığına daha fazla rastlanmıştır. Aynı zamanda çalışmaya katılan öğrencilerin yaklaşık üçte birinin gündüz uykululuk sorunu yaşadıkları belirlenmiştir. Uyku sorunu yaşayan katılımcıların dörtte üçünün uyku kalitesinin kötü olduğu görülürken, uyku sorunu yaşamanın uyku kalitesinin kötü olması sıklığını 12,74 kat arttırdığı görülmüştür.

Amaç

Öğrencilerin okul içindeki akademik faaliyetleri, sosyal ilişkileri, kısmi zamanlı işleri ve projeleri gibi faktörler biyolojik ritimlerini etkilemektedir. Öğrencilerin özellikle ara sınav ve final dönemlerinde biyolojik ritimleri değişebilmektedir. Çeşitli akademik çalışmalarda biyolojik ritmin fiziksel, mental ve sosyal sağlığı etkilediği belirtilmiştir. Biyolojik, psikolojik, sosyal ve kültürel gereksinimleri olan insanın varlığını sürdürebilmesi için bu gereksinimlerinin karşılanması gerekir. Karşılanması gereken bu temel gereksinimlerden biri de uykudur. Uykunun insan ömrünün yaklaşık üçte birini oluşturduğu bilinmektedir. Uyku, bireyi, yaşam kalitesini ve iyilik durumunu etkileyen, sağlığın önemli bir değişkeni olarak görülmektedir. Uyku kalitesi bireyin uyandıktan sonra kendini zinde, formda ve yeni bir güne hazır hissetmesidir. Uyku kalitesinin tanımlanması ve nesnel olarak ölçülmesinin güç olduğu bildirilmektedir. Uyku kalitesi, uyku latensi, uyku süresi ve bir gecedeki uyanma sayısı gibi uykunun niceliksel yönlerini içerdiği gibi, uykunun derinliği ve dinlendiriciliği gibi öznel yönlerini de içerir. Uyku kalitesinin bozulması bireylerin duygu, düşünce ve motivasyonunun bozulmasına neden olabilir. Uyku kalitesi iyi olanlarla karşılaştırıldığında kötü uyku kalitesine sahip öğrencilerin fiziksel ve psikososyal sağlık problemlerini anlamlı şekilde daha fazla deneyimledikleri bildirmektedirler. Uyku bozuklukları beden ve ruh sağlığını, sosyal yaşamı olumsuz etkileyen, akademik başarıda ve iş verimliliğinde düşüşe, kazalarda artışa neden olabilen, sıklığı açısından dikkat çekici bir halk sağlığı sorunudur. Üniversite öğrencilerinde uyku kalitesi fizyolojik ve psikolojik sağlığın korunması, verimliliğin artması açısından önemlidir. Uyku kalitesi ve gündüz uykululuğun akademik performansta düşmeye neden olduğu bilinmektedir. Aynı zamanda alan yazında sirkadiyen ritimdeki bozulmaların ekstra strese neden olduğu belirtilmiştir.
Bu çalışmanın amacı öğretmen adaylarının biyolojik ritimleri, uyku kalitesi ve uyku düzenleri ile akademik başarı arasındaki ilişkiyi belirlemektir. Bu çalışma eğitim fakültesi fen bilgisi öğretmenliği bölümünde öğrenim görmekte olan adaylarla gerçekleştirilmiştir. Öğretmen adaylarının olası uyku bozuklarının, düşük uyku kalitesinin, biyolojik ritimlerinin ve bu faktörle akademik başarılarının ilişkisi olup olmadığının belirlenmesi, bu yönde düzeltici çalışmalara ışık tutacaktır. Özellikle kötü uyku kalitesi olan bireylerde uyku hijyeni eğitimleri düzenlenerek, uyku kalitelerinin artması sağlanabilmektedir.

Materyal ve Method

Bu araştırmada nicel araştırma modellerinden genel tarama modeli uygulanacaktır. Tarama modeli, Karasar (2008) tarafından "geçmişte ya da halen var olan bir durumu var olduğu şekliyle betimlemeyi amaçlayan araştırma yaklaşımı" olarak tanımlanmaktadır. Tarama modelinde; araştırmaya konu olan olay, birey ya da nesne, kendi koşulları içinde ve olduğu gibi tanımlanmaya çalışılmaktadır. Bu amaçla, önce her iki durumun belli değişkenler açısından ayrıntılı betimlemeleri yapılmakta, sonrasında ise ortak ölçütlere göre yapılan bu betimlemeler karşılaştırılmaktadır (Karasar, 2008).

 Copyright © International Science and Technology Conference (ISTEC)

Araştırmada veri toplama amacıyla Öğülmüş ve ark. (2008) tarafından geliştirilen "Günlük Biyolojik Ritim Ölçeği" (GBRÖ) ve Buysse ve ark. (1988) tarafından geliştirilen "Pittsburgh Uyku Kalite İndeksi" (PUKİ) kullanılmıştır.

GBRÖ iki bölümden oluşan bir ölçme aracıdır. Ölçme aracının birinci bölümünde yaş, cinsiyet, bölüm/ program adı ve sınıf gibi kişisel bilgiler yer alırken ikinci bölümde likert tipi hazırlanmış 20 adet madde yer almaktadır. 21. Maddede ise "sabahçıl", "akşamcıl" tanımı yapılmış ve kendilerini hangi tipe yakın gördüklerini soran ölçüt maddedir. Bu maddeden alınan puanlar analizin dışında tutulmuş, ölçüt geçerliği için kullanılmıştır. Sabahçıl ve akşamcıl olma özelliklerinin birbirine zıt özellikler olması sebebi ile ölçek maddeleri çift kutuplu olarak oluşturulmuştur. Maddeler likert tipi hazırlanmış ve bir maddeden alınabilecek puan 1 ile 4 arasında değişmektedir. Maddelerden yüksek puan almak akşamcılık özelliğini temsil etmektedir. Bu doğrultuda ölçekteki 4, 5, 6 ve 20. maddeler tersten puanlanmaktadır (Öğülmüş ve ark., 2008).

PUKİ bireyde uyku kalitesini, uyku miktarını ve uykudaki bozulmaları değerlendirebilmek amacıyla Buysse ve ark. (1988) tarafından geliştirilmiştir. Ölçek; son bir aydaki uyku kalitesini değerlendiren, 19'unu kişinin kendisinin cevapladığı, beşini ise oda arkadaşının cevapladığı 24 sorudan oluşmaktadır. Kişinin kendisinin cevapladığı 19 soru; uyku kalitesi, uyku süresi ve uykuya dalma süresi, uyku ile ilişkili sorunları yedi alt başlıkta değerlendirmektedir. Her bir madde 0-3 puan arası değer almaktadır. Yedi alt başlıktan elde edilen 0-21 arası puan, toplam PİKU skorunu oluşturmaktadır. Beş ve altında elde edilen puan, uyku kalitesinin 'iyi' olduğunu belirtmektedir. Ölçeğin Türkçe geçerlik-güvenirlik çalışması Ağargün ve ark. (1996) tarafından yapılmış ve Cronbach alfa değeri 0,80 olarak hesaplanmıştır. Toplanan veriler bilgisayar ortamına aktarılarak güvenirlik analizleri, t testi, tek yönlü varyans analizi gibi istatistiksel teknikler kullanılarak analiz edilmiştir.

Bulgular ve tartışma

Çalışmaya toplam 113 öğrenci katılmış ama doldurulan ölçekler incelendikten sonra 99 adet değerlendirilebilecek ölçek olduğu görülmüştür.

Tablo 1: Araştırmaya katılan öğrencilere ilişkin demografik veriler.

Değişkenler		n	%
Cinsiyet	Kadın	80	80,8
	Erkek	19	19,2
Sınıf	2	61	61,6
	3	38	38,4
Toplam		99	100

Fen bilgisi bölümünde okuyan öğrencilerin büyük çoğunluğunun cinsiyetinin kadın olması sebebiyle çalışmaya katılan öğrencilerin büyük çoğunluğu (%80,8) da kadınlardan oluşmaktadır. Ders yoğunluğunun az olması sebebiyle 4. sınıf öğrencileri çalışmaya dahil edilmemiştir.

Tablo 2: Öğrencilerin GPRÖ puanları.

	Minimum	**Maximum**	**Ortalama**	**Standart Sapma**
GPRÖ	1,85	3,35	2,4692	,0296

Bu ölçekten alınan 1 puan sabahçıl özelliği, 4 puan akşamcıl özelliği temsil etmektedir. Öğrencilerin GPRÖ puanlarının ortalaması (2,46) araştırma grubunda sabahçıl ve akşamcıl özelliklere tam bir yığılma olmadığını göstermektedir. GBRÖ'den alınan puan cinsiyet ve sınıf değişkenlerine göre anlamlı bir farklılık göstermemektedir.

 Copyright © International Science and Technology Conference (ISTEC)

Tablo 3: Öğrencilerin GPRÖ puanları.

	n	%
Tam bir "sabahçıl" sayılırım	12	12,1
"Sabahçıl" tipe daha yakınım	39	39,4
"Akşamcıl" tipe daha yakınım	29	29,3
Tam bir "akşamcıl" sayılırım	6	6,1
Diğer	13	13,1

Öğrencilerin %51,5'i kendilerini sabahçıl tipe yakın olarak tanımlamaktadır. Araştırma grubundaki tüm öğrenciler normal öğretim öğrencisi olduğu halde %35,5'ü ise akşamcıl tipe yakın olarak tanımlamaktadır.

Tablo 4: Öğrencilerin PUKİ puanları.

	Ortalama	Standart Sapma
Öznel uyku kalitesi	1,52	0,719
Uyku latensi	1,21	0,84
Uyku süresi	0,75	0,93
Alışılmış uyku etkinliği	0,09	0,38
Uyku Bozukluğu	1,54	0,62
Uyku ilacı kullanımı	0,12	0,47
Gündüz işlev bozukluğu	1,46	0,90
Toplam puan	6,70	2,56

PUKİ'de beş ve altında elde edilen puan, uyku kalitesinin 'iyi' olduğunu belirtmektedir (max. 21). Araştırmaya katılan öğrencilerin PUKİ puan ortalaması 6,70 olarak tespit edilmiştir. Üstelik öğrencilerin sadece %33'ü 5 ve altında puan almıştır. Dolayısıyla araştırmaya katılan öğrencilerin uyku kalitesi sorunları yaşadığı söylenebilir. PUKİ'den alınan puan cinsiyet ve sınıf değişkenlerine göre anlamlı bir farklılık göstermemektedir.

Tablo 5: Sınıflara göre vize puan ortalamaları

Sınav Puan Ortalamaları	Ort.	Std.sp.
2.Sınıf	67,48	9,22
3.sınıf	70,99	5,39

2. ve 3. sınıf öğrencilerinin aldıkları dersler farklı olduğu için ortalamalar genel olarak hesaplanmamış, sınıflar için ayrı ayrı hesaplanmıştır. Sınıflar arasında yaklaşık 3,5 puanlık bir fark bulunmaktadır.

Tablo 6: Akademik başarı ve GBRÖ-PUKİ İlişkisi

	GBRÖ	PUKİ
2.sınıfların not ortalaması	0,129 (sig 0,321)	0,109(sig 0,402)
3.sınıfların not ortalaması	-0,112(sig 0.502)	-0,054 (sig 0,749)

Sınıfların ortalamaları ve ölçeklerden elde edilen puanlar arasında ilişki olup olmadığının belirlenmesi amacıyla gerçekleştirilen korelasyon analizinde puanlar arasında anlamlı bir ilişki belirlenememiştir.

Sonuç

Öğrencilerin yarısı kendini sabahçıl tip olarak tanımlamaktadır. Kendini akşamcıl olarak tanımlayanların oranı %35' dir. Öğrencilerin GBRÖ puan ortalamaları 2,46'dır. Öğrencilerin %35lik bir kısmı akşamcıl ve bu duruma yakın olduklarını belirttikleri için bu durum özellikle sınav ve ders programlarında dikkate alınabilir.

Öğrencilerin PUKİ puan ortalaması 6,70'dir. Öğrencilerin büyük çoğunluğunun uyku kalitesinin düşük olduğu söylenebilir.

Öğrencilerin sabahçıl-akşamcıl durumlarının akademik başarıyı etkilemediği söylenebilir. Öğrencilerin uyku kalitelerindeki bozukluğun da akademik başarıyı etkilemediği söylenebilir. Literatürde özellikle uyku kalitesinin

 Copyright © International Science and Technology Conference (ISTEC)

akademik performansı etkilediği yönünde çalışmalar bulunmasına rağmen, bu çalışmada GBRÖ ve PUKİ puanları ile öğrencilerin vize ortalamaları arasında anlamlı bir ilişki bulunamamıştır. Öğrencilerin %66'lık kısmının uyku kalitesi açısından sorunlar yaşadığı belirlenmiştir. Bu oranın düşürülmesi için uyku hijyeni eğitimleri düzenlenerek, öğrencilerin bu konudaki farkındalıkları arttırılabilir.

ÖĞRETMEN ADAYLARININ GÖZÜYLE ÇOCUK HAKLARI

Nuray Kurtdede Fidan
nkurt@aku.edu.tr

Geleceğin öğretmenleri olacak sınıf öğretmeni adaylarının çocuk haklarına ilişkin farkındalıklarının, yeterlilik düzeylerinin, çocuk haklarını çocuklara kazandırmak için sınıf içi ve dışı gerçekleştirebilecekleri etkinliklerin ve kullanabilecekleri araç gereçlerin neler olabileceğini keşfetmek amacıyla gerçekleştirilmiş bu araştırma tarama modelinde betimsel bir araştırmadır. Araştırmanın çalışma grubunu, bir devlet üniversitesinde eğitim fakültesi sınıf öğretmenliği anabilim dalı üçüncü ve dördüncü sınıfında öğrenim görmekte olan 180 öğretmen adayı oluşturmuştur. Araştırmada veri toplama aracı olarak, araştırmacı tarafından geliştirilen açık uçlu anket formu kullanılmıştır. Araştırma verilerinin çözümlenmesinde nitel veri çözümleme yaklaşımlarından betimsel analiz tekniği kullanılmıştır. Araştırma sonucunda, sınıf öğretmeni adaylarının, çocuk hakları konusunda orta düzeyde bilgiye sahip olduğu belirlenmiştir. Öğretmen adayları toplumda ihlal edilen çocuk haklarını eğitim hakkı, çocuk istismarı, çocukların çalıştırılması, cinsel istismar, yaşama hakkı, oyun oynama haklarının engellenmesi, sağlık hakkı şeklinde belirtmişlerdir. Bununla birlikte öğretmen adayları ihlal edilen çocuk haklarına yönelik toplumda farkındalık yaratmak için halkın bilgilendirilmesi, seminer, afiş, radyo/TV, kamu spotu, konferans, broşür şeklinde etkinlikler düzenlenmesi gerektiğini vurgulamışlardır. Ayrıca, sınıf öğretmeni adayları; çocuk hakları konusunda bilgili olmanın ve farkındalık kazandırmanın sağlıklı bir toplumun oluşması ve gelişmesi için önemli olduğunu ve öncelikli olarak öğretmenlerin bu hakları geliştirici etkinlikler düzenlemeleri gerektiğini düşünmektedirler.

ÖĞÜTÜLMÜŞ ATIK PETLER İLE ISLAH EDİLEN ZEMİNLERDE SERBEST ŞİŞME POTANSİYELİNİN DEĞİŞİMİ

Mehmet SÖYLEMEZ* & Osman GÜNAYDIN

[1] Adıyaman Üniversitesi, Mühendislik Fakültesi, İnşaat Mühendisliği Bölümü, Adıyaman-TÜRKİYE

*msoylemez@adiyaman.edu.tr

Özet: Kumlu ve siltli zeminler, boşluklarındaki hava ile suyun yer değiştirmesi sonucunda, hacim değiştirmeksizin su alabilirler. Killi zeminlerde ise, su muhtevasının artması sonucunda, kil taneleri birbirlerinden uzaklaşarak hacmi artıracak bir itki kuvvetini oluşturmakta ve hacimde şişme şeklinde artış meydana gelmektedir. Bu çalışmada ince öğütülmüş pet atıkları hacimce %15, %30, %45 ve %60 oranlarında killi bir zemin ile karıştırılarak zamana bağlı serbest şişme potansiyeli incelenmiştir. Çalışmalar sonucunda Pet oranının artmasıyla hem şişme miktarında azalma görülmüş hem de muhtemel şişmeye daha kısa zamanda ulaşıldığı görülmüştür.

Anahtar Kelimeler: Konsolidasyon, şişme basıncı, killi zemin, atık pet

Giriş

Zemin terimi, çok yumuşak, organik çökellerden killere ve kumlardan yumuşak kayalara kadar geniş bir aralığı kapsayan ve bu nedenle çok farklı mühendislik davranışları gösterebilen malzemeleri ifade etmektedir. Şişen zemin terimi ise, değişen su muhtevası koşulları altında, hacim değiştirme (şişme – büzülme) potansiyeline sahip olan zeminler için kullanılmaktadır. Kuru bir zemin, boşluklarındaki hava ile suyun yer değiştirmesi sonucunda, hacim değiştirmeksizin su alabilir. Bu durum genellikle kumlu ve siltli zeminlerde meydana gelmektedir. Şişme ise, su muhtevasının artması sonucunda, kil tanelerini birbirlerinden uzaklaştırarak hacmi artıracak bir itki kuvvetini gerektirmektedir (Yong ve Warkentin, 1975). Şişme, sadece su varlığı nedeniyle hacimdeki artış eğilimini değil, suyun kaybolması sonrasında hacimdeki azalmayı veya büzülmeyi de vurgulamaktadır.

Kurak ve yarı kurak bölgelerde, çoğu zeminin doğal su muhtevası, şişme meydana getirebilecek su muhtevası aralığının içindedir ve eğer bu bölgelerde şişen zeminler de mevcutsa, nem değişiklikleri hacim değişikliklerini beraberinde getirir. (Dif ve Bluemel, 1991; Hardcastle, 2003).Yağış ve nem açısından büyük mevsimsel değişikliklere maruz bu bölgelerde, şişen zeminler üzerine oturan çeşitli yapılarda; önemli hasarlar meydana gelebilir.

Şişen zemin problemleri ve bu zeminlerin yol açtığı hasarlarla ilgili olarak farklı ülkelerde bir çok çalışma yayınlanmıştır (Jones ve Holtz, 1973; Ruwaih, 1987; Chen, 1988; Nelson ve Miller, 1992). Bu çalışmalarda ifade edilen ortak görüş, bu zemin problemi nedeniyle tüm dünyada yılda milyarlarca dolarlık hasarın meydana geldiğidir. Şişme problemi nedeniyle meydana gelen hasarın; deprem, tayfun ve taşkınları içine alan doğal afetlerden daha büyük boyutta olduğu belirtilmektedir.

Şişme; litolojiye, kil kısmın yüzdesine, kil kısmın mineralojik bileşimine ve bu minerallerin kil zemin içerisindeki dizilim veya yönelimine bağlı olarak değişebilir (Thomas, 1998). Bir zeminin şişme potansiyelinin doğru şekilde tahmin edilmesi; şişme nedeniyle meydana gelebilecek hasarların engellenebilmesi için gerekli tasarım kriterlerinin veya zemin iyileştirme yönteminin seçilmesinde en önemli aşamadır (Popescu, 1979; Chen, 1988).

Plastik ve türevleri kolay üretimi, elde edilebilirliği, ekonomik oluşu, zamana ve yıpranmaya karşı dayanıklılığı nedeniyle günümüzde birçok alanda kullanımı artarak devam etmektedir. Kullanım işlevi sona erdikten sonra atık plastik ürün sınıfına giren bu ürünler ısı, nem ve diğer atmosferik etkilere dayanıklılığından dolayı yüzyıllarca doğada bozunmadan kalabilmektedirler. Plastik atıklar içinde en çok yer tutanlar Polietilen (PE), Polipropilen (PP), Polietilen Tereftalat (PET), Polivinil Klorür (PVC) ve Polistrendir (PS) (Gavela vd., 2004).

PET yoğunluğu 1.33-1.38 gr/cm3, maksimum kullanılabilir sıcaklığı 60°C ve orta sertlikte en çok kullanılan plastiklerden biri olup, termoplastik polyester reçinesi özellikteki bir ambalaj malzemesidir. PET Polyester; alkol, etilen glikol (EG), asit ve teraftalik asit (TPA)'ten oluşmuştur ve kimyasal ismi Polietilen Tereftalat (PET)'tır (Plastics Europe, 2008).

Dünyadaki yıllık plastik üretiminin % 8 ini PET oluşturur ve bu da yaklaşık 15 milyon tondur (Shen vd., 2010). Yıllık PET üretiminin 3,5 milyon tonu özellikle ambalaj sanayinde şişe ve kavanoz olarak kullanılmaktadır (Reis

 Copyright © International Science and Technology Conference (ISTEC)

ve Carneiro, 2012). Smithers Pira' nın makalesinde küresel PET tüketiminin 2017 yılında yaklaşık 19,1 milyon ton olacağı öngörülmektedir (Brooks, 2012).
Son zamanlarda palastik atıklarla zeminlerin iyileştirilmesi ve güçlendirilmesi konularında birçok çalışma yapılmıştır (Kalkan, 2013; Tang vd., 2010, 2007; Akbulut vd., 2007; Cetin vd., 2006; Park and Tan, 2005; Pierce and Blackwell, 2003; Prabakar and Sridhar, 2002; Kaniraj and Havanagi, 2001; Santoni vd., 2001; Nataraj and McManis, 1997; Ranjan vd., 1996; Charan, 1995; Maher and Gray, 1990; Gray and Ohashi, 1983). Bu çalışmada ince öğütülmüş pet atıkları hacimce %15, %30, %45 ve %60 oranlarında killi bir zemin ile karıştırılarak zamana bağlı serbest şişme potansiyeli incelenmiştir.

Malzeme ve Yöntem

Deney çalışmalarında Niğde ilinin kuzeyinde Fesleğen yöresinde Üst Miyosen yaşlı Melendizdağı Tüflerinin alterasyonu sonucu oluşan MH tipi yüksek plastisiteli killi zemin kullanılmıştır (Şekil 1).

Şekil 1.Çalışmada kullanılan killi zemin.

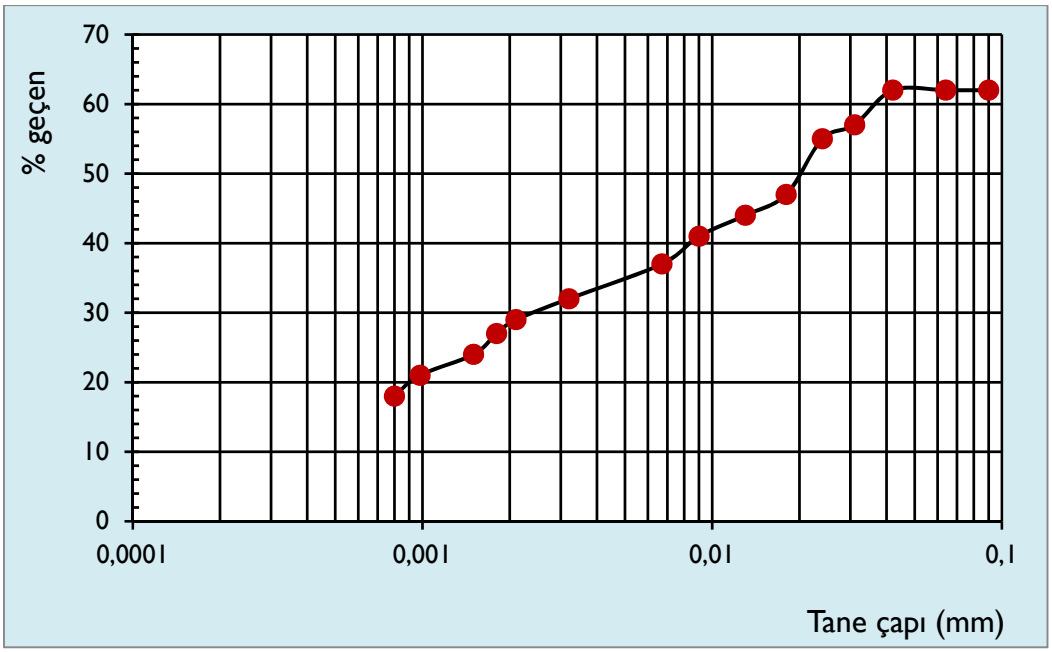
Killi zemine karıştırılacak PET ise piyasada bolca bulunan memba suyu atık şişelerinin öğütülmesinden elde edilmiştir (Şekil 2).

Şekil 2.Çalışmada kullanılan öğütülmüş PET malzeme

 Copyright © International Science and Technology Conference (ISTEC)

Killi zemine öğütülmüş PET % 15, %30, %45 ve %60 oranlarında karıştırılarak PET içeriğinin şişme potansiyeline etkisinin araştırılması için, optimum su içeriğinde kompakte edilmiş ve sıkıştırılmış bu karışımdan ödometre testleri için numuneler alınmıştır (Şekil 3).

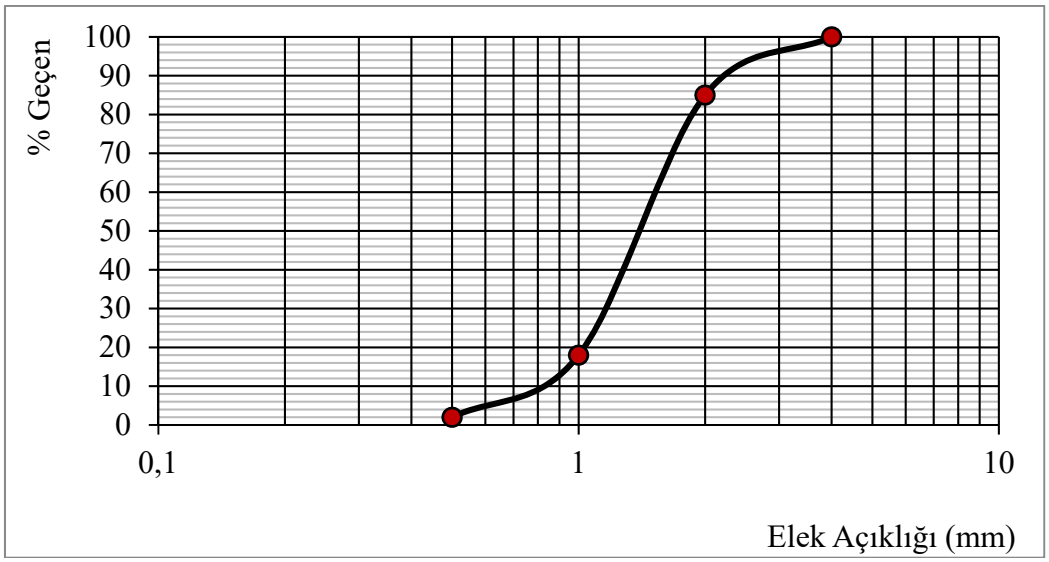
Şekil 3.Çalışmada kullanılan killi Zemin ve öğütülmüş PET'in karıştırma aşamaları.(a) seçilen orandaki öğütülmüş PET ile killi zeminin karıştırılması, (b) karışımın optimum su içeriğinde kompakte edilmesi, (c) kompakte edilen karışımdan ödemetre ringi ile numune alınması, (d) ödometre cihazıyla karışımın serbest şişme potansiyelinin ölçülmesi



Araştırma Bulguları

Killi Zemin ve PET deney malzemesi (ASTM D 422-63), tane boyu dağılım yöntemine göre, kıvam limitleri (ASTM D 427-98) göre, zemin sınıflandırması ise Birleştirilmiş Zemin Sınıflandırması'na göre yapılmıştır (Şekil 4, Tablo 1).

Tablo 1. Killi zeminin kıvam limitleri ve Zemin sınıfı

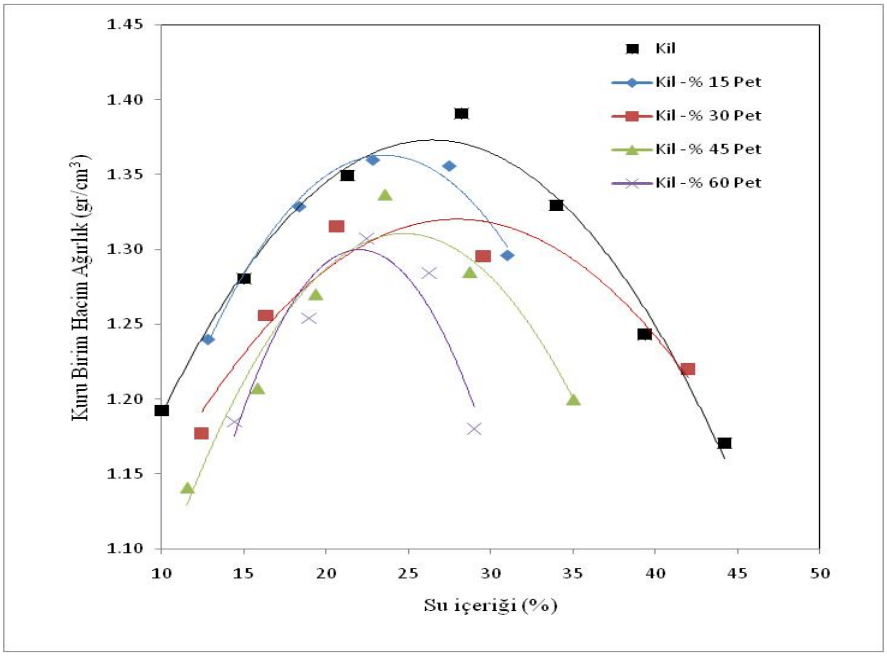


Kil+Silt %	LL %	PL %	PI %	G_s	Zemin Sınıfı
62	53	30	23	2.69	MH

 Copyright © International Science and Technology Conference (ISTEC)

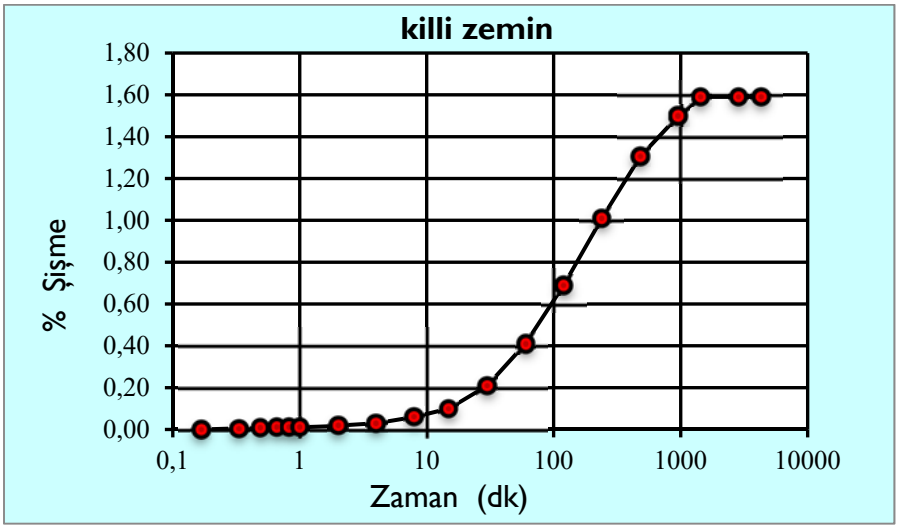
Şekil 4.Çalışmada kullanılan killi zeminin granülometri eğrisi.

Killi zemine katılacak öğütülmüş PET boyutu 0,5mm-4mm aralığında seçilmiştir (Şekil 5).



Şekil 5.Çalışmada kullanılan öğütülmüş PET'in granülometri eğrisi.

Kompaksiyon testlerinde killi zemine PET ilavesiyle optimum su muhtevasının ve kuru birim hacim ağırlığının azaldığı görülmüştür. Bunun nedeninin öğütülmüş PET'in esnek yapıda oluşu ve tane boyutunun 0,5 mm-4 mm aralığında seçilmesinden kaynaklandığı düşünülmektedir (Şekil 6).

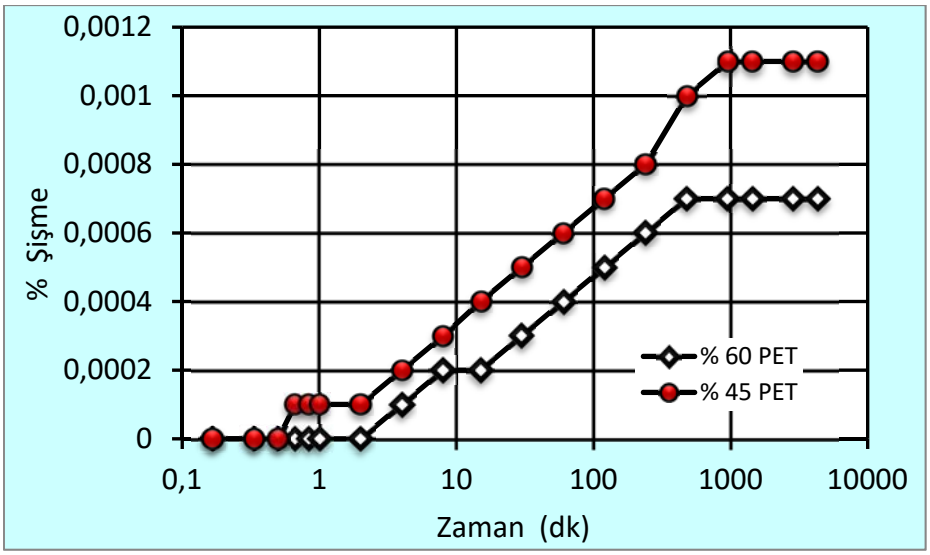


Ödometre ile yapılan serbest şişme deneylerinde (ASTM D 698-00) her karışımdaki malzeme 1000 dakikada nihai serbest şişme kapasitesine ulaşmıştır. Karışımsız killi zemin nihai serbest şişme miktarı olan %1,60'a 1000 dakikadan daha uzun sürede ulaşmıştır (Şekil 7)

PET karışım yüzdesi arttıkça nihai şişme miktarına yaklaşık 1000 dakikada ulaşsa da şişme miktarında azalma meydana gelmektedir (Şşekil 8, 9)

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 6.Çalışmada kullanılan killi zemin ve öğütülmüş PET karışımlarının kompaksiyon eğrileri (Gunaydin vd.,)



Şekil 7. Çalışmada kullanılan killi zeminin zaman-serbest şişme ilişkisi.

Şekil 8. %15 ve %30 oranında PET karışımlı killi zeminin zaman-serbest şişme ilişkisi.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 9. %45 ve %60 oranında PET karışımlı killi zeminin zaman-serbest şişme ilişkisi.

Sonuçlar ve Öneriler

Kompaksiyon testlerinde killi zemine PET ilavesiyle optimum su muhtevasının ve kuru birim hacim ağırlığının azaldığı görülmüştür. Bunun nedininin öğütülmüş PET'in esnek yapıda oluşu ve tana boyutunun 0,5mm-4 mm aralığında seçilmesinden kaynaklandığı düşünülmektedir. Kuru birim hacim ağırlığının arttırılması için kullanılacak öğütülmüş PET'in tane boyutunun dolgularda kullanılacak zeminin iri tane boyutundan daha küçük seçilmelidir.

PET katkısız killi zemin nihai serbest şişme miktarına 1000 dakikada ulaşmakta ve bu oran % 1,60 olmaktadır. Killi zemindeki PET oranı arttıça nihai şişme süresine ulaşmada belirgin bir hızlanma gözükmese de, serbest şişme miktarında çok büyük azalma oluşarak % 0,0007 ye kadar düşmektedir. Bu sonuç katı atık PET'lerin öğütülerek özellikle karayollarında kaplama altı zemin dolgusuna karıştırılarak şişme ve büzülme en aza indirilebilir ve atık PET'in çevreye olan olusuz etkilerinin bertaraf edilmesine katkı sağlayabilir.

PERCEPTIONS OF BUSINESS PROFESSIONALS TOWARDS MOBILE DEVICE USAGE

Süphan Nasır

Istanbul University - TURKEY

suphan@istanbul.edu.tr

Bengi Kurtuluş

Istanbul Kemerburgaz University - TURKEY

bengi.kurtulus@kemerburgaz.edu.tr

Abstract:
In today's world, mobile devices became an inevitable part of our lives. The main purpose of this study is to find out perceptions of business professionals towards use of their mobile device in the workplace as well as at the business meeting settings. To understand business professionals' mobile phone usage at the workplace, an online survey was conducted with Turkish business professionals, who are members of Linked-in social network. Findings of the study indicate the fact that, mobile phone usage at work is positively welcomed in general. Respondents especially appreciate "the flexibility" and "the ability of doing a better job" through accessing corporate emails and other business apps outside official working hours and they strongly believe that "mobile phone usage at work is necessary". However, they slightly believe that their colleagues inappropriately use mobile phone at workplace. "Bringing phone to the meeting", "Excusing oneself to take a call", and "Checking time" are among the most appropriate mobile phone actions during the formal business meetings. On the other hand, "Checking a social media account", "Taking a call without excuse", and "Browsing Internet due to boredom" are seen inappropriate by most of the respondents.

Keywords: Bring-Your-Own-Device (BYOD), mobile phone usage, smartphone.

Introduction

Mobile technologies are promisingly evolving and becoming essential in our lives. Mobile device usage and smartphone ownership continues to increase in the world. Based on the Guardian research, China, India, U.S, Indonesia, Brazil, Japan, Russia, Mexico, Vietnam, Germany, and Turkey are the top countries where smartphone penetrations grow fastest and create the largest number of new owners (Arthur, 2014). Smartphone adoption continues to be more popular among 25-34 year olds and followed by 35-44 year olds segment in both US and Europe (ComScore, 2012). In today's world, mobile devices became an inevitable part of our lives. People now expect to access information anytime, anywhere, and in real-time. Fear of missing out, or FOMO in short, is the main driver behind our mobile addiction. Not to miss out from anything, 31% of mobile phone owners state that they never turn their phone off and 45% of owners rarely turn it off (Rainie & Zickuhr, 2015). Smartphones have been becoming so important that 42% of Turkish people indicate they would prefer to give up TV rather than their smartphones (Google Ipsos MediaCT, 2013).

Mobile technologies can be considered as one of the major forces that contribute to change in the way of doing business. Employees are increasingly becoming mobile, and they use mobile devices such as smartphones and tablets to do their work at the office, at home, and while traveling. Employees currently use their smartphones and tablets for the following work related activities: accessing employee intranet / portal, accessing to e-mail and/or calendar, reading or viewing documents, spreadsheets, or presentations, accessing social networking, watching video, taking work-related photos and/or videos, team portals, editing documents, spreadsheets, or presentations, web meeting, instant messaging, processor-intensive activities like analytics or modeling, videoconferencing, and company- or industry-specific application that is created by the company (Cisco Systems, 2012). Findings of the Ovum Multi-Market BYOD research shows employees appreciate flexibility of access to key tasks out of office

 Copyright © International Science and Technology Conference (ISTEC)

hours and majority of them believe that accessing to corporate emails and content outside of office hours improves their ability to do their job well (Absalom, 2013).

The use of employee-owned devices in the workplace is clearly rising and companies are increasingly supporting the Bring-Your-Own-Device (BYOD) trend in order to save costs associated with providing devices themselves. BYOD is defined as "using a personal smartphone or tablet for any activity other than making calls or sending texts, therefore accessing corporate data" (Drury, 2012). Regardless of the company's location, size or industry, BYOD will be a common reality in the workplace (Symantec, 2013). A significant number of employees want to use a single device in all areas of their life. Ovum Multi-Market BYOD research indicates that approximately 57% of all employees worldwide are accessing corporate data in some form on a personal smartphone or tablet (Absalom, 2013). The findings of Rapid7 revealed that 64% of respondents allow personally-owned mobile devices to be used at work; however nearly half of all respondents indicated they were unaware of how many mobile devices on average each employee is using to access company data (Rapid7, 2013). Although "Always-on" access to corporate data is seen as more of a benefit; some companies do not allow personally-owned mobile devices to be used for work because of security risks.

Employees use their mobile phone during the business meetings that they attend. There are several studies on the use of mobile devices in the business settings such as business meetings (Broughton et al., 2010; Washington, Okoro, & Cardon, 2013; Bradberry, 2014; Wahla & Awan, 2014). While some people show tolerance for mobile phone use in business settings; some people think it's inappropriate and annoying to use mobile phone during business meetings. Three out of four people indicated that checking texts or emails is unacceptable behavior in business meetings; while 87% of people declared that answering a call is rarely or never acceptable in business meetings. Even at more informal business settings, the majority of people said that writing or sending a text message is inappropriate (Washington, Okoro, & Cardon, 2013). According to some research results, elder people with higher positions tend to approve mobile phone use in meetings less than their colleagues at lower positions do (Washington, Okoro, & Cardon, 2013; Bradberry, 2014).

In this study, perceptions of Turkish business professionals towards use of their mobile device in the workplace as well as at the business meeting settings will be analyzed. The Consumer Barometer Report (2015) results reveal that Turkey is the 6th country among the world regarding the personal internet usage and as first half of the 2015, mobile phone penetration rate reached to 92.9% in Turkey (Bilgi Teknolojileri ve İletişim Kurumu, 2015). It is obvious that smartphone penetration is on the rise in Turkey. Therefore it is worthwhile to analyze perceptions about the use of mobile device in business settings.

Research Methodology

The main purpose of this study is to find out perceptions of business professionals towards use of their mobile phone in the workplace as well as at the business meeting settings. To understand business professionals' mobile phone usage at the workplace, an online survey was conducted with Turkish business professionals, who are members of Linked-in social network, in June-July 2016. The main advantage of conducting the survey with the members of Linked-in social network is to reach people who are really business professionals. In this online questionnaire attitude toward mobile device usage in the business settings was measured with 14-item, five-point Likert-type scale (1= "strongly disagree" to 5= "strongly agree"), which is adapted from the study of Wahla and Awan (2014). The Cronbach's Alpha for this 14-item scale is 0.814; so it can be argued that scale reliability is quite high. Perceived appropriateness of mobile phone actions during formal business meetings was measured with 11 item, five-point Likert-type scale which is adapted from the study of Washington, Okoro, and Cardon (2013). This 11-item scale is highly reliable with a Cronbach's Alpha score of 0.862.

383 respondents answered the online questionnaire and 42 respondents who do not work currently are eliminated from the analysis. A total of 341 usable responses was gathered and demographic characteristics of the respondents are presented as frequencies and percentages in Table 1.

The distribution of gender groups are quite fairly distributed. Among the 341 respondents, 55.7% of the respondents consists of females while 44.3% consists of males. Majority of the respondents (55.1%) are between the ages of 30-39, 29% of respondents between the ages of 20-29, and finally 11.4 % of them are between the ages of 40-49. Regarding their occupations, 80.9% of respondents are working at private sector, while 15.8% of them are working at public sector. The majority of the respondents (51.9%) have graduate, and 38.1% of the respondents have bachelor degree.

 Copyright © International Science and Technology Conference (ISTEC)

Table 1 Demographic profile of the respondents

		N	%			N	%
Education	Primary School	2	0.6	**Gender**	Male	151	44.3
	High School	12	3.5		Female	190	55.7
	2-years University	20	5.9	**Age**		**N**	**%**
	Undergraduate	130	38.1		Below 20	2	0.6
	Graduate	177	51.9		20 - 29	99	29.0
		N	**%**		30 - 39	188	55.1
Occupation	Private	276	80.9		40 - 49	39	11.4
	Public	54	15.8		50 - 59	12	3.5
	NGO	3	0.9		60 and over	1	0.3
	Other	8	2.4				

As it is illustrated in the Table 2, employers (9.4%), senior executives (10.9%), middle managers (27.6%), lower level of managers (13.8%), employees (20.8%), and teaching staff (15.5%) are among the participants of the online survey.

Table 2 Position of the respondents

Position	N	%
Employer	32	9.4
Senior Executive	37	10.9
Middle Manager	94	27.6
Lower Level Manager	47	13.8
Employee	71	20.8
Teaching Staff	53	15.5
Other	7	2.1
Total	341	100

Results and Discussion

Majority of the respondents (98.5%) who attended the survey own a smartphone. 70.6% of the respondents stated that they use their personally-owned mobile devices for both business and personal usage. Some of the respondents (21.9%) use two mobile phones, one is for personal purposes the other is for business use. While, 7.5% use corporate phone both for personal and work-related purposes. 37.5% of the respondents indicated that their work-related phone calls are paid by their corporation. When the respondents were asked whether their corporation allows them to use their personal mobile phone for work, 14.7% of the respondents told that it is not permissible.

 Copyright © International Science and Technology Conference (ISTEC)

Respondents were asked 14 questions (see Table 3) about their attitude towards mobile device usage in the business settings. 9 of the scale items remarked with "R" in Table 3 were asked with negative statement towards mobile device usage, and then had been coded as reverse questions for the ease of analysis. The statements that respondents mostly agree with are "I like the flexibility of being able to access corporate emails and other business apps outside official working hours" (μ: 4.29), "Mobile phone usage at work is necessary" (μ: 4.23), "Being able to access corporate emails and other business apps outside official working hours enables me to do my job better" (μ: 4.17) and "Employer does not have a legal right to restrict use of mobile phone in office" (μ: 3.96). On the other hand, the statement that respondents least agree with is "I don't think my colleagues inappropriately use mobile phone at workplace" (μ: 2.63). And for the statements "Mobile phone usage does not cause distraction in workplace" (μ: 2.99) and "Personal mobile phone usage in staff and team meetings should be allowed" (μ: 2.92), people tend to neither agree nor disagree with a mean score near 3.

Table 3 Attitude toward mobile device usage in the business settings

	Mean	**Std. Dev**
I like the flexibility of being able to access corporate emails and other business apps outside official working hours	4.29	1.009
Mobile phone usage at work is necessary	4.23	1.019
Being able to access corporate emails and other business apps outside official working hours enables me to do my job better	4.17	1.127
Employer does not have a legal right to restrict use of mobile phone in office (R)	3.96	1.316
If my employer strictly bans use of mobile phone it will have negative impact on my morale	3.79	1.259
Supervisor does not have a responsibility to monitor the appropriateness of mobile phone usage (R)	3.77	1.385
Employer should not apply restriction on use of mobile phone in office timing (R)	3.75	1.254
Using mobile phone at work improve your efficiency	3.57	1.182
Mobile phones can be used for personal purposes at work (R)	3.37	1.301
Unproductive use of mobile phone like calls to friends and family will not be harmful for organization and employees' performance (R)	3.37	1.239
It is not necessary to make personal phone calls only during breaks and lunch time (R)	3.23	1.412
Mobile phone usage does not cause distraction in workplace (R)	2.99	1.342
Personal mobile phone usage in staff and team meetings should be allowed (R)	2.92	1.507
I don't think my colleagues inappropriately use mobile phone at workplace (R)	2.63	1.238

Table 4 illustrates the professionals' attitude towards mobile device usage in formal business meetings. The most acceptable actions are "Bringing phone to the meeting" (μ: 3.78), "Excusing oneself to take a call" (μ: 3.53) and "Checking time" (μ: 3.35). On the other hand, "Checking a social media account" (μ: 1.90), "Taking a call without excuse" (μ: 1.90) and "Browsing Internet due to boredom" (μ: 2.12) are not seen appropriate by most of the respondents.

 Copyright © International Science and Technology Conference (ISTEC)

Table 4 Perceived appropriateness of mobile phone actions during formal business meetings

	Mean	Std. Dev
Bringing phone to the meeting	3.78	1.227
Excusing oneself to take a call	3.53	1.162
Checking time	3.35	1.341
Checking incoming calls	3.07	1.295
Writing text messages or emails	3.05	1.312
Reading text messages or emails	2.99	1.392
Using a mobile app	2.58	1.316
Making calls	2.44	1.439
Browsing Internet due to boredom	2.12	1.233
Taking a call without excuse	1.90	1.192
Checking a social media account	1.90	1.217

Conclusion

In this study, perceptions of business professionals towards use of mobile phone in the workplace as well as at the business meeting settings were analyzed. Findings of the study indicate the fact that, mobile phone usage at work is positively welcomed in general by most of the professionals. Professionals especially appreciate "the flexibility" and "the ability of doing a better job" through accessing corporate emails and other business apps outside official working hours and they strongly believe that "mobile phone usage at work is necessary". However, they slightly believe that their colleagues inappropriately use mobile phone at workplace. The use of mobile phone in formal meetings is questioned as well. To some extent, it is acceptable for professionals to bring phone to the meeting, excusing oneself to take a call and checking time. However, checking a social media account, taking a call without excuse and browsing Internet due to boredom are regarded as inappropriate in formal business meetings.

PESTİSİT UYGULAMALARINDA KİŞİSEL KORUYUCU EKİPMANLARIN ÖNEMİ

Nigar Yarpuz-Bozdogan
nyarpuzbozdogan@cu.edu.tr
Çukurova Üniversitesi, Teknik Bilimler Meslek Yüksekokulu, Misis/Adana

ÖZET

Tarımda pesitisit (tarım ilacı) uygulamalarının amacı kaliteli ve verimli tarım ürünleri elde etmektir. Pestisit kullanımı insan ve çevre sağlığını olumsuz etkilemektedir. Özellikle operatörlerin (pestisit uygulaması yapan kişiler) sağlığı risk altındadır. Operatörler ilaçlama sırasında pestisitlerden üç farklı şekilde etkilenmektedir. Bunlar; deri, solunum ve ağız yolu şeklindedir. Bu nedenle operatörlerin ilaçlama sırasında pestisitlerden etkilenmemesi için eldiven, yüz maskesi, uzun pantolon, uzun gömlek, bot vb uygun kişisel koruyucu ekipmanlar (KKE) kullanması gerekmektedir. Kişisel koruyucu ekipman; ilaç hazırlama, karıştırma-depo doldurma, ilaçlama sırasında ve ilaçlama sonrasında pestisit maruziyetini azaltmaya yardımcı olan ve insan sağlığını koruyan ekipmanlardır. Dünya'da ve ülkemizde pestisit uygulaması yapan kişilerin kişisel koruyucu ekipmanların önemi hakkında araştırmalar yapılmış ve ilaçlama yapan kişilerin KKE kullanımı konusunda bilinçlendirilmesi amaçlanmıştır.

Bu çalışmada, dünyada ve ülkemizde pestisit uygulaması yapılırken karşılaşılan sağlık sorunları, kişisel koruyucu ekipmanların önemi ve operatörlerin kişisel koruyucu ekipmanlara olan bakışı ayrıntılı olarak incelenecektir.

PHENOLIC COMPOUNDS IN POMEGRANATE VINEGARS

Serkan SELLİ

Cukurova University, Faculty of Agriculture, Department of Food Engineering, 01330, Adana, Turkey

sselli@cu.edu.tr

Abstract: Pomegranates are widely researched fruits for their nutritional and health benefits as well as their organoleptic properties. Pomegranate juices are rich in vitamins, minerals and phytochemicals. In addition, pomegranate juices contain potentially bioactive compounds and they are a great source of phenolic compounds such as flavonoids and phenolic acids. The use of second quality pomegranate for vinegar production can be a proper method to reduce losses due to discard of fruits. There has been growing interest in the beneficial health effects of certain fruits, wines and their by-products, like vinegars. In this study, the main phenolic compounds of pomegranate vinegars were determined by HPLC–DAD–ESI-MS. Diode-array detection (DAD) has been used for screening of the different classes of phenolic compounds, whereas MS and MS^n fragmentation data were employed for their structural characterization. Most of the compounds detected were mainly anthocyanins such as delphinidin, cyanidine and pelargonidine, and ellagitannins such as ellagic acid, punicalagin and punicaline. Additionally, phenolic acids were detected. Antioxidant activities of pomegranate vinegars were measured by using the DPPH (2,2-diphenyl-1-picryl hydrazyl) and ABTS (2,2′-azino-bis-3-ethyl-benzothiazoline-6-sulphonic acid) assays. The results showed strong correlations between antioxidative capacities and total phenolic content of pomegranate vinegars.

Keywords: Pomegranate vinegars; phenolic compounds; antioxidant capacity; DPPH.

Introduction

Modern life styles have driven consumers away from healthy dietary routines. In point of fact, their increasing concern about their health has prompted the industry to become involved in the need for food products which contribute to the prevention of illness. Pomegranate fruits are widely consumed fresh and in other processed forms as juice, jam, jelly, vinegar, wine, oil and in extract supplement. Actually, pomegranate fruits are a source of carbohydrates, minerals, crude fibres, and various biologically active compounds, such as vitamin C, and certain phenolic compounds as punicalagin, ellagic acid, gallotannins, anthocyanins (Zaouay et al., 2012). Brewed vinegar, a commonly used condiment of food, also has medicinal uses by virtue of its physiological effects, such as promoting recovery from exhaustion, regulating blood glucose, blood pressure, aiding digestion, stimulating the appetite, and promoting calcium absorption (Xu et al., 2007). Vinegar is traditionally produced from grapes by means of double fermentation (alcoholic and acetic acid). There are several advantages of using fruits for vinegar production, such as their health and organoleptic properties. The quality of vinegars changes according to the raw material, acidification system and ageing procedure (Tesfaye et al., 2002). The consumer demands for natural and high quality food products have increased the characterization and quality control these products (Cerezo et al., 2008). Nonetheless, there is no detailed information on phenolic and antioxidant properties of pomegranate vinegar. Therefore, the objectives of the present study were to evaluate phenolic profiles and antioxidant capacities of pomegranate vinegar. In addition, antioxidant capacity was measured using two common antioxidant activity methods (DPPH and ABTS).

Material and Methods

Samples and Chemicals

Pomegranate vinegar sample was obtained from domestic markets in Adana, Turkey. HPLC-grade solvents; methanol, acetonitrile, formic acid, and cyclohexane were purchased from Riedel-deHaen (Switzerland). All other reagents used were of analytical grade. Ultrapure water generated by the MilliQ system (Millipore, Bedford, MA) was used. Phenolic were obtained from Sigma-Aldrich (Steinheim, Germany).

LC-DAD-ESI-MS/MS analysis of phenolic compounds

Samples were filtered through a 0.45-µm pore size membrane filter before injection. An Agilent 1100 HPLC system (Agilent Technologies, Palo Alto, California, USA) operated by Windows NT-based ChemStation software was utilized; the HPLC equipment was used along with a diode array detector (DAD). The system

 Copyright © International Science and Technology Conference (ISTEC)

comprised a binary pump, degasser, and auto sampler. The column used was a Phenomenex reversed-phase C-18 column (4.6 mm × 250 mm, 5 µm) (Torrance, California, USA). The mobile phase consisted of two solvents: Solvent A, water/formic acid (99.5:0.5; v/v) and Solvent B, acetonitrile/solvent A (60:40; v/v). Phenolic compounds were eluted under the following conditions: 0.5 ml min^{-1} flow rate with temperature set at 25 °C; isocratic conditions from 0 to 5 min with 0% B; gradient conditions from 0% to 5% B in 20 min; from 5% to 15% B in 18 min; from 15% to 25% B in 14 min; from 25% to 50% B in 31 min; from 50% to 100% B in 3 min; followed by washing and reconditioning of the column. The ultra-violet-visible spectra (scanning from 200 nm to 600 nm) were recorded for all peaks. Triplicate analyses were performed for each sample. The identification and assignation of each compound was performed by comparing retention times and UV spectra to authentic standards; and confirmed by an Agilent 6430 LC-MS/MS spectrometer equipped with an electrospray ionization source. The electrospray ionization mass spectrometry detection was performed in negative ion mode with the following optimized parameters: capillary temperature 400°C, N_2 12 L/min; nebulizer pressure, 45 psi (Kelebek et al., 2015a). Data gaining was performed using the Multiple Reactions Monitoring (MRM) method that solely monitors specific mass transitions during preset retention times.
Individual compounds were quantified using a calibration curve of the corresponding standard compound. When reference compounds were not available, the calibration of structurally related substances was used, including a molecular weight correction factor. The stock solution was diluted to a series of appropriate concentrations with the same solvent, and an aliquot of the diluted solution was injected into the HPLC apparatus for analysis. The limits of detection (LOD) and quantification (LOQ) under the present chromatographic conditions were determined at a signal-to-noise ratio (S/N) of about 3 and 10, respectively.

Measurement of antioxidant activity

DPPH Assay: 0.1 mL of diluted vinegar was mixed with 3.9 mL of DPPH solution (2.36 mg/100 mL methanol) and vigorously vortexed. The solution was held in the dark at ambient conditions for 15 min. The absorbance was measured at 517 nm by a UV-Visible spectrophotometer (Shimadzu UV-1201, Kyoto-Japan). Trolox calibration curve was used to calculate the antioxidant activity of the vinegar extracts and to express the antioxidant capacity in mM Trolox equivalent per l of vinegar. The mean and standard deviation were calculated for the three replicates.

ABTS Assay: The ABTS solution was created at a concentration of 7 mM and mixed with 2.5 mM of potassium persulphate, and stored after incubation at 23 °C in the dark for 12–16 h. The ready-made solution was diluted with 80 % methanol to measure an absorbance of 0.7±0.01 at 734 nm. Then, 3.9 mL of ABTS solution was added to 0.1 mL of the vinegar samples and mixed vigorously. Finally 10 min. were waited to ensure reaction and the absorbance was monitored at 734 nm. The calibration curve equations related to the Trolox standard were $y=0.0004x + 0.0089$ with $R^2= 0.9996$ for ABTS and $y=0.0004x + 0.0082$ with $R^2= 0.9995$ for DPPH within a concentration range from 5 to 150 µmol/L.

Results and Discussion

Phenolic compounds of pomegranate vinegar

The phenolic compounds belonging to different families were identified according to the information provided by HPLC-DAD-ESI-MS/MS analysis: retention time, λ_{max} in the ultraviolet region, molecular ion, main fragment ions in MS/MS, and tentative identification as listed in Table 1. A total of 23 compounds were identified, including six anthocyanins (delphinidin-3,5-glycosides, cyanidin-3,5-glycoside, pelargonidin-3,5-diglucoside, cyanidin-3-glycoside, pelargonidin-3-glycoside and cyanidin pentoxide), two hydrolysable tannins (galloyl hexose and digalloyl hexose), ten ellagic tannins (ellagic acid, HHDP-hexoside, ellagic acid-hexose, ellagic acid pentose, ellagic acid-deoxyhexose, galloyl-HHDP-hexose, bis-HHDP-hexose, digalloyl-HHDP-hexose, ellagic acid derivative and galloyl-HHDP-glycoside), two gallagyl esters (gallagyl-hexose and HHDP-gallagyl-hexose) and three hydroxycinnamic acids (caffeic acid-hexose, caffeic acid-hexose derivative and caffeic acid derivative). Composition of phenolic compounds in pomegranate vinegar was similar to fruit and juice of the fruit.

Anthocyanins are natural colorants belonging to the flavonoid family. LC-ESI-MS/MS MRM chromatograms of some of the identified anthocyanins in pomegranate vinegar were shown in Figure 1. As displayed in Table 1, the molecular ion and its fragments were used to confirm the identity of the anthocyanins isolated. The retention time 26.5 minutes, showed a molecular ion m/z 449, suggesting the presence of cyanidin-3-O-glucoside, which was confirmed by the fragment ion m/z 287, which corresponds to aglycone cyanidin.

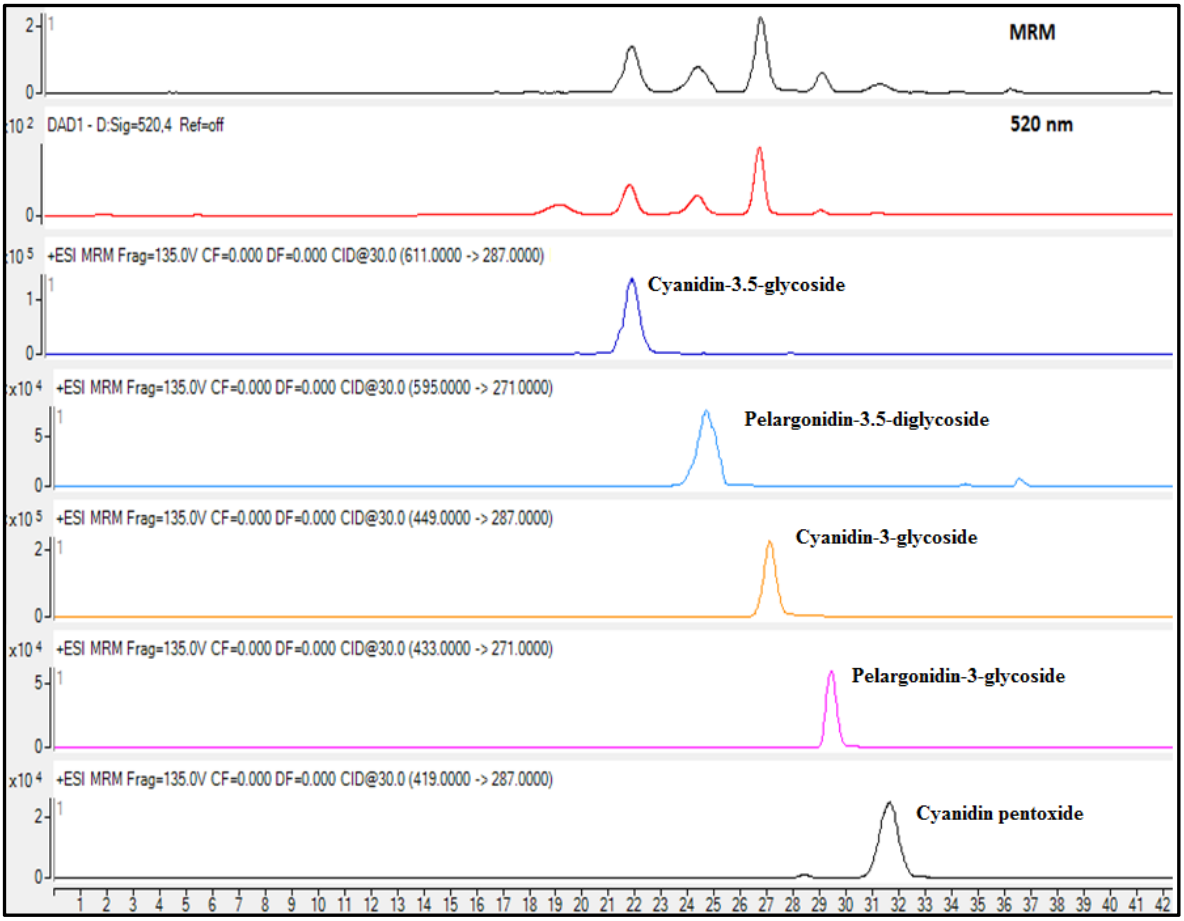

Figure 1. LC-DAD and LC-ESI-MS/MS MRM chromatograms of the identified anthocyanins. Peaks correspond to compounds in Table 1.

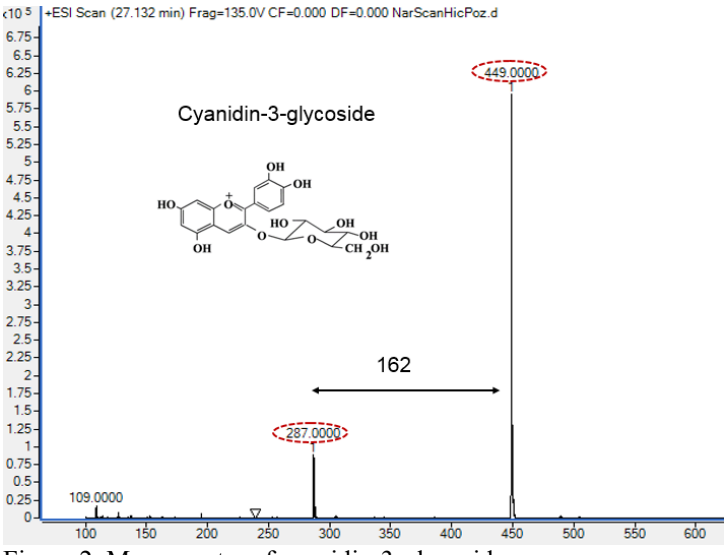

Figure 2. Mass spectra of cyanidin-3-glycoside

Anthocyanins are widely distributed among flowers, fruits (particularly in berries), and vegetables (Wang et al., 1997). Total amount of anthocyanins was found as 11.86 mg l^{-1} in pomegranate vinegar. In the study about functional constituents comparison of pomegranate juices after alcoholic and acetic acid fermentation by Ordoudi et al. (2011), total anthocyanin content of pomegranate vinegar was found close to fresh juice composition. This result displays that anthocyanins penetrate from the pomegranate to vinegar.

 Copyright © International Science and Technology Conference (ISTEC)

Among the identified anthocyanins, cyanidin-3-glycoside was the major phenolic compound in vinegar followed by cyanidin-3,5-glycoside and pelargonidin-3,5-diglucoside as they constituted the large proportion of total anthocyanin content. These compounds have already been identified by previous studies in different parts of pomegranate. Cyanidin-3- glycoside (C3G), also known as kuromanin, is probably the most notable compound among the investigated cyanidin-glycosides. Generally, this compound exists as a free form that would be of sure benefit to its antioxidant activity. Due to their strong antioxidant properties, anthocyanins are of considerable interest to the scientific community and consumer market. The naturally electron- deficient chemical structure of anthocyanins makes them highly reactive toward free radicals and, consequently, makes them powerful natural antioxidants (Nasr et al., 1996; Gómez-Caravaca et al.,2013).

Ellagitannins were the most abundant group of the pomegranate vinegar phenolic composition. Ellagitannins and hydrolysable ellagitannins are both implicated in protection against atherogenesis, along with their potent antioxidant capacity. It has been suggested that ellagitannins may prevent chronic diseases such as cancer and cardiovascular diseases. These protective activities are attributed to both classes of phytochemicals, which are thought to provide antiproliferative, anti-inflammatory, and antioxidant activities and to function as glycemic regulators (Aviram and Rosenblat, 2013). Similar to our study, ellagitannins have been found as the major phenolic group of the pomegranate juice (Gómez-Caravaca et al., 2013). Among this group galloyl-HHDP-hexose was overwhelmingly the major compound having a concentration 11.10 mg l^{-1}. The compound followed by an ellagic acid derivative, bis-HHDP-hexose and galloyl-HHDP-glycoside with the concentration 8.18 mg l^{-1}, 6.90 mg l^{-1} and 6.23 mg l^{-1} respectively.

Gallagyl-hexose (punicaline) and HHDP-gallagyl-hexose (punicalagin) compounds were identified as gallagyl esters. Between these compounds punicalagin has the majority having a concentration of 13.90 mg l^{-1} (Fig 3). Among the phenolic compounds detected in the pomegranate, highest antioxidant activity was observed for punicalagin. This compound is also abundant in the fruit husk and during processing is extracted into pomegranate juice in significant quantities reaching levels of > 2 g/L juice (Gil et al., 2000).

Antioxidant activity of pomegranate vinegar

Antioxidant capacity was measured by two methods namely, ABTS and DPPH assays. The results were found as 9.78 mM Trolox/l vinegar using DPPH assay and 12.87 mM Trolox/l vinegar by ABTS assay in average while the maximum values were 9.84 mM Trolox/l and 13.01 mM Trolox/l respectively. As it can be seen from the results, ABTS assay stated better the antioxidant activity of phenolic compounds than DPPH assay as the method gave higher values. DPPH is a free radical scavenging method, being simple, rapid and repeatable, preferably used in determining the antioxidant activity of compounds. On the other hand, ABTS is used more in the food and agriculture industry which is clearly the better method for evaluating the antioxidant capacity of pomegranate vinegar (Kelebek et al, 2015b). Zaouay et al. (2012), studied antioxidant activity of different cultivars of pomegranates. In this research antioxidant activity of the fruits were detected between 11.24-21.52 µM Trolox/l with ABTS and 11.91-22.50 with DPPH methods. Likewise, a strong correlation was observed between phenolic contents and antioxidant activities. Ordoudi et al. (2014) determined the phenolic content and antioxidant activity of pomegranate juice, wine and vinegar in comparison of two methods (DPPH and CUPRAC). Reported results displayed that antiradical potential of pomegranate vinegar showed a decrease about 55% from the fruit juice. This loss can imply that radical scavengers may degrade during fermentation. This information also shows parallelism with our results. In the very same study, punicalagin and cyanidin-3-glycoside were reported to be the main contributors in antioxidant activity. Pomegranate vinegars are stated to have higher antiradical potential from apple vinegar whereas persimmon vinegars have the highest activity among this group (Sakanaka et al., 2007; Ordoudi et al., 2014).

Conclusion

In this study, the main phenolic compounds and antioxidant activities of pomegranate vinegars were determined by HPLC–DAD–ESI-MS. Various phenolics were determined in the sample and ellagitannins were responsible for the majority with a concentration of 44.42 mg l^{-1}.Ellagitannins are known to have beneficial effects to human health due their antioxidant activities. Punicalagin were the most abundant compound in overall phenolics, hence the highest antioxidant activity was observed for this compound. Antioxidant activities of pomegranate vinegars were measured by using the DPPH and ABTS assays. ABTS method was found to evaluate better the antioxidant activity of pomegranate vinegars. The results showed correlations between antioxidative capacities and total phenolic content of pomegranate vinegars. It is deducible that the change in antioxidant activity of pomegranate vinegars depends on the phenolic content and concentration of pomegranates. However, further researches are advised to have a better understanding in pomegranate vinegars.

PHYSICAL AND ECONOMIC ANALYSIS OF THE POTENTIAL WIND ENERGY PLANT IN SINOP/ TURKEY

Yalçın ALCAN

Vocational School, Department of Electric and Energy, Sinop Uni., 57000, Sinop, TURKEY

yalcinalcan@sinop.edu.tr

Abstract

The use of renewable energy sources is rapidly increasing in the world and in Turkey. Wind energy from these sources, is more attractive to investors when compared to other renewable energy sources due to the installation and operation costs. Electrical energy from wind sources in the coastal area usually has production potential. For instance, if the wind map of Turkey is examined it can be seen that electrical energy production from the wind sources in the coastal area has production potential. Sinop, which is located in the Black Sea coastline, is an efficient point for wind energy investment because of its geographical structure. In this study, in order to be a model, potential points for the electric power from wind sources in the Sinop have been identified. Then, the scale and size of a potential power plant from wind energy which can be installed in Sinop have been investigated. Lastly, its installation and operation costs have been calculated.

Key words: Sinop province, Wind power plant, Physical Analysis, Economic Analysis, Renewable Energy

1. Introduction

Today, electric power is a kind of energy needed continuously as well as being the main input for industry and is an indispensable factor for quality of life (Saidur et al., 2011). Need for electricity is increasing with each day due to the rapid growth of human population in the world (Hepbasli and Özgener, 2004). Due to many factors such as depletion of fossil fuel resources on Earth, the rising costs of energy production and environmental pollution, it has been increased the orientation for new sources (Kenisarina et al., 2006*)*. Renewable energy sources are defined as the kind of energy sources which present in the next day due to the nature of its cycle even if it is consumed every day. Solar, wind, hydroelectric, geothermal, wave, ocean, hydrogen and biomass energy are some forms of renewable energy in this class (Acaroğlu, 2013). Being in many parts of world, having low cost, being clean, not being harmful to the environment are the some important features of these resources (Köse et al., 2004). In many countries in the world, a growing orientation toward these sources are in existence (Bacak et al., 2009). In these resources, wind energy has the most convenient forms in terms of commercial and feasibility (Oner et al., 2009). Therefore, in recent years many studies on wind energy have been done. Studies have generally focused on the importance, the potential and the evaluation of wind energy (Hayli, 2001, Bilgili et al., 2004, Togrul and Ertekin, 2011, Genç and Gökçek, 2009, Güler, 2009). Sinop that is located in the Black Sea coastline is considered to have efficient points for wind energy investments because of its geographical structure. In this study, in order to be a model, potential points for the electric power from wind sources in the Sinop have been identified. Then, the sc
ale and size of a potential power plant from wind energy which can be installed in Sinop have been investigated. Lastly, its installation and operation costs have been calculated.

2. Materials and Method

Provincial Based Wind Energy Potential Atlas (REPA) is used as the main tool, in order to determine the place for the establishment of WPPs in our country (Anonim1, 2016). In Figure 1, shown the areas that are not suitable for HPP investments in Sinop (gray). In determination of prohibited areas; Hunting and Wild Animals and Their Habitat Protection Implementing Regulation, Procedures and Principles of Pest Combating Implementing Regulation (Anonim2, 2016) the Environmental Noise Assessment and Management Regulation (Anonim3, 2016) the Military Forbidden Zones and Security Zones Regulation (Anonim4, 2016) have been used. As the material in study, REPA point source information is used, that was obtained from the Ministry of Energy and Natural Resources Renewable Energy the Directorate General dated 27/02/2013 (Anonim1, 2016). In information of point sources, primarily the coordinates of a point is determined from REPA. Average wind speed and wind directions is determined on specified point, at 30-50-70-100 meters (m) heights (Anonim1, 2016).

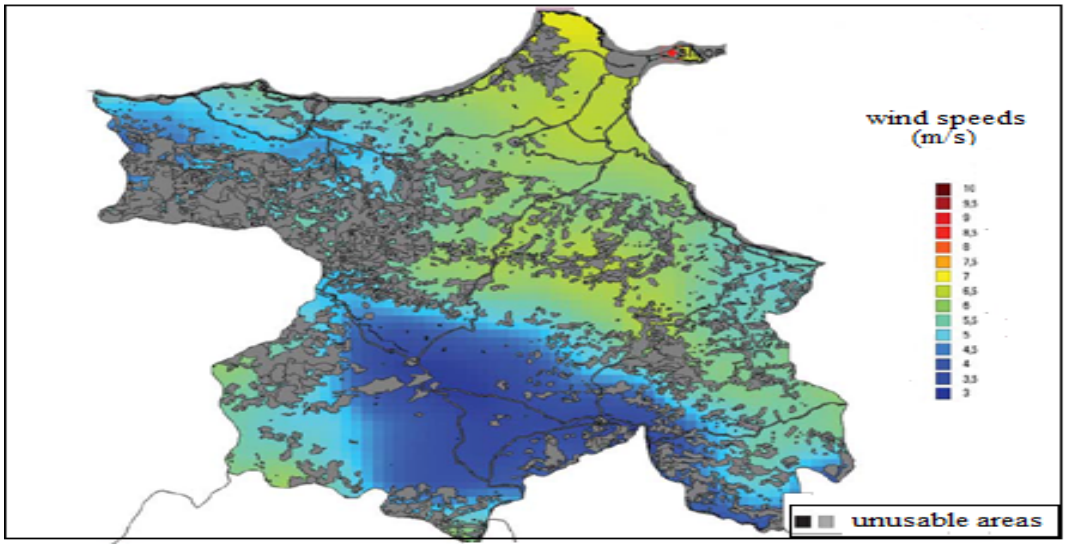

Figure 1: Wind Energy Potential Atlas (Anonim1, 2016).

In this height, the detected average wind speed and wind directions have been calculated with the Weibull distribution method (Anonim1, 2016). This distribution is composed with the scale and shape parameters is a two-parameter distribution (Anonim5, 2013). Weibull distribution function, which is in general form, is given in

$$f(v)=\left(\frac{k}{c}\right)\left(\frac{v}{c}\right)^{k-1}\exp\left[-\left(\frac{v}{c}\right)^{k}\right] \quad (1)$$

For wind speed. In this function, f (v), k and c shows the probability of observing wind speed v, Weibull shape parameter and reference value of wind speed respectively. C is also said Weibull scale parameter (Zeytinoğlu, 2009). Then the 50m and 100m annual power density (W / m²) and annual capacity factors (%) are obtained. In line with these values, electricity production has been calculated by taking up reference Suzlon S64 / 1000 turbine model at 50m height (Anonim1, 2016).

 Copyright © International Science and Technology Conference (ISTEC)

While making an economic analysis, are taken into consideration of average investment cost which variable differ from as a nature of the establishment place, distance from the substation, pre-feasibility costs, and design costs etc. The average investment cost wind energy production is considered to be 1000-1200 US dollars / kW (Bayraç, 2011). If the number of turbines is less, the initial investment cost is more than about 10%
(Taşkın, 2013). Therefore, a 1 MW wind turbine has been recognized as a cost of US $ 1,320,000. The investment of working-life has estimated as a 25. year. Calculations have been made through two different funding models. Firstly, it has assumed invested as 100% elf-funded equity and calculations have been made. Secondly; it has been assumed invested 25% equity 75%. Credit and calculations have been made. Repayments totally 10 years, have been considered as 2 years grace period and 8 years payback period, and calculations have been to be paid annually. Credit financing model is based on data of the Energy Market Regulatory Authority (EMRA) (Erdem et al., 2015). Operating costs have been determined as 1.2% (Anonim6, 2016). The corporate income tax has been taken as base 20% (Anonim7, 2016). If the electricity has been produced within the scope of renewable energy sources (RES), sales price is taken 7.3 US $ / kW, and sales revenues have been calculated annually.

3. Results

Sinop, in the middle of the Black Sea, is located between 41 ° 12 'and 42 ° 06' north latitude and 34 ° 14 'and 35 ° 26’ east longitude (Anonim8, 2016). Altitude of the province from sea level is just 50m and longitude of province at Black Sea coastline is 175km long (Ceylan, 2010).

Sinop has been established between the two capes named Inceburun and Boztepe. Sinop as can be seen in Figure 2; is founded on a tombolo formed by a merging island and mainland (Ceylan, 2010). To as an example, suitable areas for installation of wind power plant in Sinop can be in figure 2.

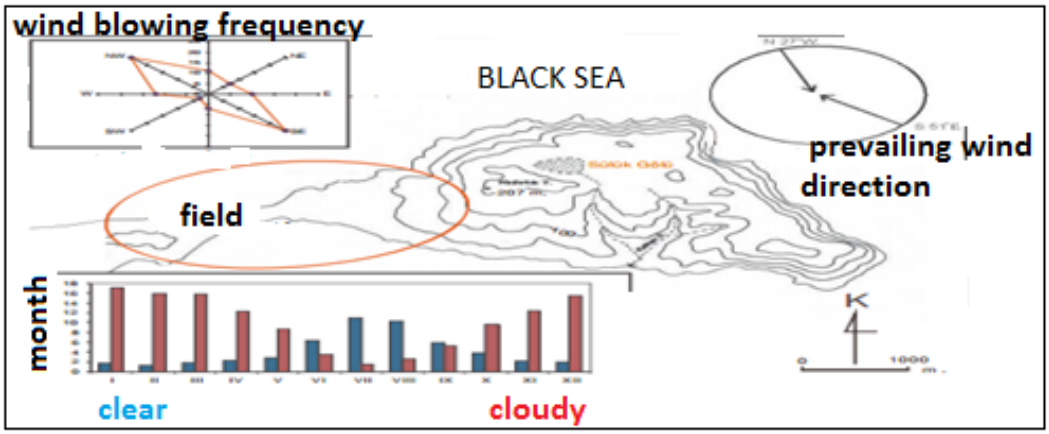

Figure 2: Sinop topography and wind direction (Şahin and Kaya , 2011).

Figure 3 illustrates the distribution of mean wind speeds of 50m. For economic investment, 7 m / s wind speed or over is required. Wind speed in areas with Yellow is 7 m / s. This rate is seen more dominant mostly in north-facing part of the Sinop coast.

 Copyright © International Science and Technology Conference (ISTEC)

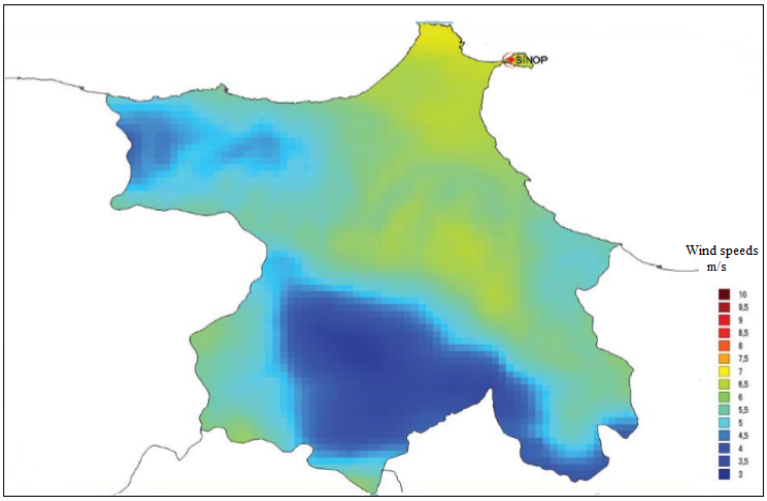

Figure 3: illustrates the distribution of mean wind speeds of 50m (Anonim1, 2016).

Although dominant direction is differ from seasons ,it's blows of annual average is northwest and %25.7 In Sinop, it was observed that dominant direction wind. Planning of the wind power plant depends mainly on the amount of energy that can be generated from the power plant site selected. In this study, a point has been determined in Sinop Dibekli village in North Latitude 42.0025513345238 Longitude 35.0127371674451 East coordinates. This point is at an altitude of 78m above sea level and the direction of the point is north-west (Anonim5, 2013).

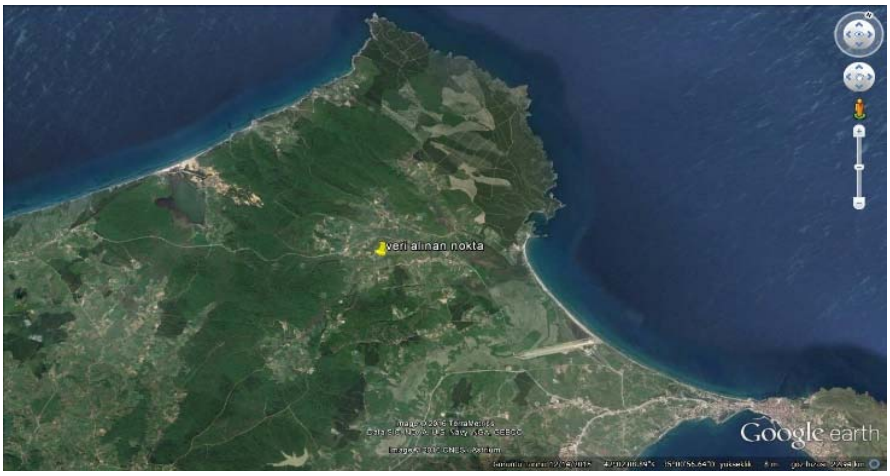

Figure 4: Is given the satellite view of point.

The construction of WPP, wind capacity factor is an effective distribution parameter as well as the wind speed distribution in Sinop, wind capacity factor distributions are shown in Figure 5.

 Copyright © International Science and Technology Conference (ISTEC)

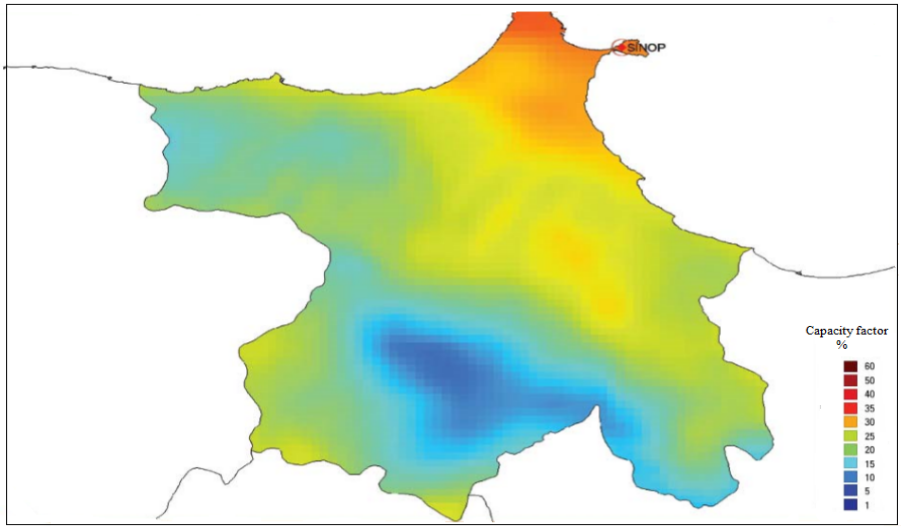

Figure 5: capacity factor distribution in 50m height (Anonim1, 2016).

The average wind speed of Sinop has been calculated as; 5.84 m / s at 30m, 6.42 m / s at 50m, 6,69 m / s at 70m, 6.99 m / s at 100m. With the rise from sea level, wind speed has increased directly proportional. In Figure 6, the prevailing wind direction and frequency information is shown for the relevant point.. In Figure 6, red color shows wind power and the blue color shows the wind blowing frequency. Prior to the installation of wind turbines, one of the important steps is to determine the prevailing wind direction. It is shown in Figure 6 that the prevailing wind direction for the province of Sinop is northwest (NW) and southeast (SE).

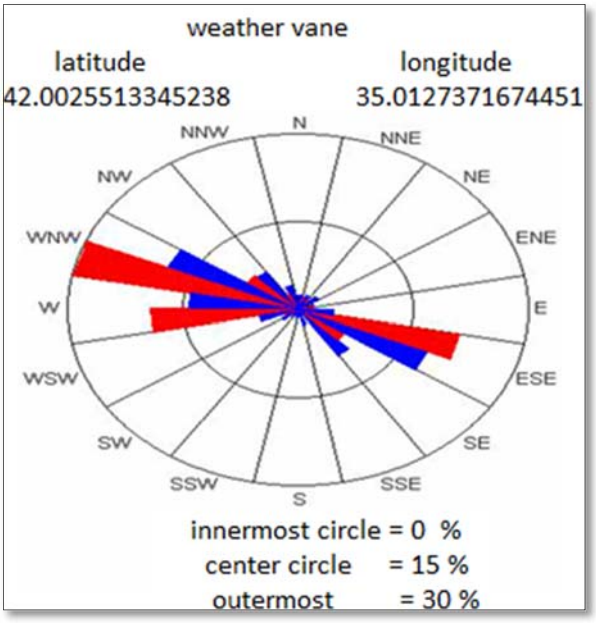

Figure 6: Dominant wind intensity of getting data (Anonim5, 2013).

 Copyright © International Science and Technology Conference (ISTEC)

Weibull C-parameter is; 6.80532 at 30m, 7.24459 at 50m, 7.54666 at 70m and 7.87815 at 100m. Weibull scale parameter (c)'s, is observed to be high similar to the average wind speed at the same height. Weibull k-parameter is 2,12802 at 30m, 2,01701 at 50m, 1,94953 at 70m and 1,88172 at 100m.When the Weibull's parameter is high without too many changes at wind speed shows that the wind blows as a fixed. In wind's force line with the changes occurring in the day, the change in the average power density occur. For Sinop the annual power density 50m and 100m was recorded as 305.12 W / m², 421.27 W / m² respectively. Annual capacity factor; for 50m was realized as 32.471% (Anonim1, 2016). This value is an acceptable level for sustainable Economic WPP investment. For Sinop, energy production based on wind data taken at 50m height is calculated 2,844,492 kWh / year (Anonim5, 2013). Total paid corporation tax realized as 1.038.240 US dollars and it has been reduced from gross income. The net income has been calculated as USD 4,152,598 of WPP considered for establishment in Sinop.

4. Discussion

In this study, a point has been determined in Sinop Dibekli village in North Latitude 42.0025513345238 Longitude 35.0127371674451 East coordinates. It has been taken annual with speed and direction information of this point. With received data; average speed, direction and energy calculations were performed. It has been investigated as a sample can be installed in a wind power plant in Sinop installation and operating costs have been calculated. Resource (Anonim5, 2013) has been used for place selection of WPP which considered to be established in Sinop. While doing cost analysis at economic analysis are taken into consideration of the nature of the place was founded,distance from the substation,pre-feasibility costs,design costs and so on.It is assumed two different financing models as 100% equity and 25% equity - 75% investment credit would be done and calculations have been made.

In 100% self-owned investment; it has been estimated that fixed investment costs are $ 52,800 per year while annual operating costs are $ 15.840. Annual net profit after expenses are expected to be 97 478 USD. Total profit for 25 years for $ 2,436,958 is to occur, breakeven point will be the 9th year. In 25% equity,75% investment credit model, investment cost varies according to year, realizes as $ 195,360 annually between 3th and 12th years, other years realizes $ 13,200. The net profit calculated on the total income is estimated to be $ 1,605,358, excluding capital increase. The breakeven point is envisaged at 14. years, excluding the capital increase.

Conclusions

As a result of the study, it can be said making an investment using 100% equity would be more profitable WPP investment determined at the point of in Sinop Dibekli village, than 75% credit-based financing model.

For Sinop, energy production based on wind data taken at 50 m height, is calculated 2,844,492 kWh / year.

With the installation of wind power plants; they will reduce dependence on foreign sources to meet Turkey's energy needs and are expected to contribute to increased energy diversity.

PHYTOCHEMICAL STUDY OF KAEMPFERIA ROTUNDA: FROM ETHNOMEDICINE TO DRUG DISCOVERY

Sri Atun Atun
Atun_1210@yahoo.com

Retno Arianingrum Arianingrum
arianingrum_uny@yahoo.com

Kaempferia rotunda is a species under the Zingiberaceae family. The plants is widely found in Asian countries where it is commonly used as a food ingredient and in ethnomedicinal preparation.Thisstudy was conducted to isolate some bioactive compounds and to testas antioxidant, antimutagenic, and anticancer. Antioxidant was tested by DPPH method. Antimutagenic activity test was observed in vivo based on the number of micronucleated polychromatic cell erythrocytes (MNPCE) from male Balb-c mice (8-12 week) induced by cyclophosphamide. The in vitro cytotoxicity test was done on human cancer cell lines by MTT ([3-(4, 5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide] assay. In-vivo activity assay was done by xenografting female Balb C mice with human breast cancer T47D cell implantation into the mamae fat-pad. From the crude extracts and isolated compounds from *K. rotunda* showed significant antioxidant, antimutagenic, and cytotoxic activity against T47D breast cancer cell lines. In-vivo study showed of bioactive compounds from *K. rotunda* can repair breast tissue histopathology, and suppress c-Myc expression on mice with T47D breast cancer xenograft. The rhizome of *K. rotunda* have potential to develope as new drug from nature.

Keywords: Kaempferia rotunda; antioxidant; antimutagenic; cytotocix effects

POLLEN MORPHOLOGY OF TWO MONOTYPIC SPECIES FROM APIACEAE GROWING IN TURKEY

Nagehan Saltan
ndagdeviren@anadolu.edu.tr

Ayla Kaya
aykaya@anadolu.edu.tr

Apiaceae is represented by approximately 450 genera and 3700 species in the world. Turkey has the highest species density with 480 species in Asia and probably in the World.Apiaceae family in Turkey has 15 monotypic endemic genera. In this study, two monotypic species belonging to the family Apiaceae [1], *Crenosciadium siifolium* Boiss. et. Heldr. (endemic) and*Glaucosciadium cordifolium* (Boiss.) Burtt. et Davis were investigated pollen morphology for the first time by scanning electron microscopy (SEM), and the features of pollen grains were described and illustrated. Pollen morphology of the examined specimens exhibits some variation in size, shape and sculpture. The pollen grains of *C. siifolium* are isopolar, tricolpate. P (polar axis)/E (equatorial axis) 2.25-2.70 µm. The shape of pollen grains is perprolate and exine sculpturing is rugulate. The pollen grains of *G. cordifolium* are isopolar, tricolpate. P/E 1.80-2.05 µm. The shape of pollen grains is euprolate-perprolate and exine sculpturing is rugulate.

POLY (LINOLEIC ACID) GRAFT COPOLYMER IN METAL/POLYMER/SEMICONDUCTOR DIODE APPLICATIONS

Muharrem Gökçen
muharremgokcen@duzce.edu.tr

The conformity in electronic applications of novel poly(linoleic acid)-g-poly(caprolactone)-g-poly(t-butyl acrylate) graft copolymer as an active interfacial layer was investigated. For this purpose this polymeric material was coated between a silicon (Si) semiconductor and metal (Au) Schottky contact to obtain its improvement effect. The polymer was resolved in a solvent to spray by an electrostatic spraying system. The polymeric interfacial layer was coated basis on Si single crystal wafer by electrostatic spraying system after the metal ohmic contact formation on the back side of the Si wafer. About 200-300 nanometer in diameter nano fibers were obtained on Si wafer. Nanofiber characteristic of this layer was indicated through Field Emission Gun Scanning Electron Microscope (FEG-SEM) micrographs. Later, metal rectifying contacts have formed on these polymeric layers by a metal evaporator system in high vacuum conditions. Obtained metal/polymer/semiconductor (MPS) diodes' electrical characteristics have realized by current–voltage (I–V) measurements conducted in dark and various illumination intensity levels at room temperature. The main electrical parameters of these diodes such as series resistance, ideality factor, reverse saturation current and zero-bias barrier height of the structures were obtained from forward-bias I–V data.

POSTAL MARKET LIBERALISATION AND ITS IMPACT ON THE MAIL SUPPLY CHAIN: THE CASE OF TURKEY

Mehmet Yiğit TÜRKMEN

PTT Corp. Department of International Relations, Ankara-TURKEY

mehmet.turkmen@ptt.gov.tr

Abstract: As a candidate country for European Union membership, Turkey is on the way towards liberalising its postal market. Not only will such liberalisation introduce competition in the postal market in which Post and Telegraph (PTT) Corporation, was the monopoly, but also it will result in spreading out of the new entrants into the PTT Corp's supply chain in several ways. The literature has barely touched upon the impact of the technological substitution and incoming liberalisation on the supply chain of the Turkey's ex-monopoly. Providing examples from the ex-monopolies of the European Union, the purpose of this study is to examine the effects of the liberalisation of the postal market in Turkey on the PTT Corp's supply chain. The study highlights the ways in which the new entrants penetrate into the postal market using desk-based research. Moreover, it investigates the competition from a supply chain perspective.

Key Words: Liberalisation, Postal Market, Turkey, Supply Chain, Turkish Post and Telegraph Corporation, Mail

Introduction

Turkey, a candidate for the European Union (EU) membership, is adapting its bodies and legislation to the EU. The accession negotiations started in 2005 and Turkey aims to keep up with all the EU acquis, before the membership and even before opening chapters, to accelerate the negotiations (Ministry for EU Affairs, 2014). While the country was busy with reforms, EU started to liberalise its postal market gradually to complete the single postal market project in 1998 and finished it in 2013.

The liberalisation process aimed to open the postal market to competition and introduced Universal Service (US) for postal services, independent regulation authority and ways to compensate the US burden. With three directives along the way, the postal market was changed dramatically. Today, the EU postal market is mostly competitive and innovative. Ex-monopolies, mainly with Universal Service Obligation suffered from competition with supply chain disruption and technological substation in this period.

After the liberalisation, several EU country's examples illustrate that either the incumbent was forced to open its supply chain to the new entrants for a price less than the uniform one by regulation authorities or the new entrants bypassed it in the free market conditions. Additionally, with the declining mail demand and the competition, the incumbents lost market share and revenue.

All these developments in Europe will have reflections to the Turkish postal market. Already, the liberalisation process has begun, and Turkish postal legislation is affected by the European counterparts. Add to these; several acts came into force in recent years and more to come.

In the light of European experience about the liberalisation and competition, it would be possible to make some predictions about race and its effect on the PTT Corp.'s supply chain.

Using desk based research and EU member and company examples, objectives of this paper are:

- What would be the effects of liberalisation of the postal market to the PTT Corp.?, and
- How its supply chain would be affected by this process?

This paper gives insight information about the types of market entry in the EU postal market with illustrating the postal supply chain and Turkish market situation to address these questions. In the discussion part, the paper tries to stimulate the future situation in Turkey which the literature scarcely mentioned. Moreover, it highlights the competition on the mail supply chain and focuses on its effects on the supply chain.

 Copyright © International Science and Technology Conference (ISTEC)

Types of market entry in the EU

The Postal sector as a network industry employs more than 1.2 million people across the Europe, and only the letter post itself accounts 0.34 of the GDP (European Commission, 2016a). It is a quite important part of the economy. As a consequence, the Europe has recently liberalised this market to acquire an efficient market and now many companies are competing in it. In this, the companies are operating their supply chain and the product's value chain plays an important part as well.

Jaag (2014) divides the postal value chain into four sections which are the collection, sorting, transport and delivery. He also emphasises that none of them are essential, and the competitors can duplicate it easily. As a result, the new entrants can enter the market quickly. On the other hand, De Donder (2006) argues that the delivery network is a bottleneck in the supply chain and needs the economies of scale to be profitable. Therefore, not so easily to duplicate. The postal supply chain can be simply illustrated as follows:

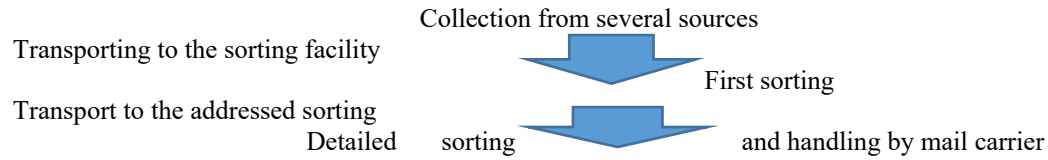

Figure 1 Source: the author.

Mail collection can be done from several places such as post boxes, post offices. Bulk mail customers tend to use the first sorting facilities directly. After first sorting, the mail goes to the secondary sorting places for the detailed sorting and there a mail carrier handles it.

EU published three directives (Directive 97/67EC), (2002/39/EC), (2008/06/EC) for the liberalisation of the postal market which led to a gradual liberalisation and opened it to the competition. The directives defined the universal service, liberalised it and created national regulation authorities (European Commission 2016b). The process was finished in the year 2013. All of them affected the mail supply chain illustrated above and allowed new entrants to compete with the incumbents. The mail supply chain disruption can be defined as follows:

- *Bypass*: It is the entry type that the new entrant bypasses the incumbent's supply chain where it is profitable and establishes its own. De Donder (2006) points out that it is usually not profitable to serve in the low-density areas, and new entrants choose to provide services to the high-density ones such as the major cities. The writer points out that doing this will cause economies of scale. Additionally, Schuster (2013) emphasise that supply chain infrastructure cost would be lower in the high populated areas. Therefore, after the liberalisation of the postal market, many new entrants started to compete in the high-density cities by bypassing the incumbent's supply chain.

Where the Universal Service obligation forces its provider to serve all of the countries without any discrimination, the new entrants are free of the USO and can serve in only profitable areas. This action is called "cream skimming". De Donder calls it as a selective bypass. The Royal Mail (US Provider of the U.K. competes in its big cities such as London and Manchester with TNT Post, the same competition occurs in Sweden by City Mail.

Quiros's (2011) study illustrates that there is a high correlation between the market opening, independent regulation authority and the efficiency increase. These factors lead to the second type of entry to the market by the regulations.

- *Access:* The second type of entry is access. The third directive (2008/06/EC) article 11a forces the countries to allow fair competition and to protect the user's rights by opening the postal infrastructure and the postal network to the new entrants without any discrimination. As a consequence, this article leads to *access* type of entry where the incumbent is forced to open its supply chain to the competitors. Mostly, it is linked with the cream-skimming effect where the new entrant uses incumbent's infrastructure to distribute the mail to the small populated areas while using its downstream supply chain where profitable. Villemeur et al. (2007) explain that as the competition only occurs in the downstream of the supply chain where the incumbent distributes the mail for a uniform price.

New entrants use access type of entry because of the cost advantage. The Uniform mail rates consist of all of the upstream and the downstream cost of the mail (Armstrong 2008). However, in access, only one part of the

 Copyright © International Science and Technology Conference (ISTEC)

incumbent supply chain is used so the price would be lower than the uniform price. In this respect, if the cost of the one part of the supply chain is cheaper than the incumbent, the new entrant can acquire an advantage in the competition.

In Europe, access can be done to several postal infrastructures such as postcodes, post office boxes, delivery boxes, address database, change of access database, USP redirection and return services, downstream access (Wik Consult, 2013). Several countries allow different access levels, and it mostly depends on the regulation authority.

Case of Turkey

Legislation and the Current Situation in the Market

Turkey is updating its legislations for a more liberalised postal market and recently it changed some of the primary laws. One of this legislation is 6475 Postal Services Legislation. It came into force on the May 2013 and started the renewal process. With this, PTT Corp. became the postal monopoly by law and was assigned as Universal Service Provider. The reserved area is limitless now.

The company acquired many rights such as the monopoly on communication mail's all supply chain, letter of notification supply chain, Turkish Army's postal services and stamp services.

Additionally, BTK (Information and Telecommunication Technologies Authority) was assigned as the regulation authority to oversee the market and acquired the right to give the licence to operate in the postal market.

A compensation fund was established as the %2 of the revenue of all permit holders. Ministry of Transport, Maritime Affairs and Communications manages this fund, and it aims to compensate the Universal Service Cost of the PTT Corp. Most of the countries have Universal Service Fund. However, it is not usually activated by the authorities. As an example, Germany hasn't enabled the Universal Service Fund.

After this, in February 2016, The Postal Universal Service legislation came into force to define the Universal Service Obligation (USO) of the provider. It represents the USO, how to acquire money from the fund and the calculation of the US Cost.

So far, with these two legislations, PTT Corp. is the USP of Turkey and postal service monopoly. The gradual liberalisation is about to start. However, there is no mentioned weight limit which ensures the monopoly in the market.

BTK is still giving licenses for the incoming liberalisation. Until now, 28 company acquired the licence. Of them, four is for İstanbul, one for İzmir, one for Ankara and the rest is national licenses including PTT Corp.
Despite the current monopoly situation and the reserved area is not mentioned in the legislation yet, Some competitors have already active in the market especially in İstanbul and breaching the law using their cost advantage.

PTT Corp.

PTT Corp. is the government-owned postal monopoly of Turkey. Established in 1840, the postal giant employs around 40,000 people with more than 4482 offices in Turkey which are consist of self-operated stores and agencies.

There are three operation sides of the company First and the most important one is Post Division (1,500 million TL in 2014) which it creates most of its revenue. The others are Logistics Division (200 million TL) and Postal Payment system.

The postal division operates in a monopolistic market while the logistics sector conditions were liberal. Therefore, it can be seen that the postal market is critical for the company.
The addressed bulk mail demand is decreasing rapidly around 10%. On the contrary, the revenue is increasing mostly due to the price increasing and increase in the registered mail and the letter of notice.

Discussion

After the liberalisation, it could be seen that the supply chain of PTT Corp. will be disrupted by two type of market entry.

 Copyright © International Science and Technology Conference (ISTEC)

In bypass type, the new entrants will choose big cities such as İstanbul, Ankara and İzmir. From these three, İstanbul will be the most important one because nearly all of the bulk mail customers such as banks and telecommunication companies based on there. Additionally, it is the densest area in the country. With the increase technological substitution, this would be a double revenue and volume loss for the company. So far, with the price increases, the amount lost seems to be compensated. However, after the liberalisation, it won't be easy to raise prices because of the competition. The Uniform Price tag could be an obstacle in this situation. It can be said that, as in United Kingdom or Sweden, the cream-skimming effect can be seen in İstanbul Ankara as well. It is also important that 4 of the 28 licences are for İstanbul only, and the competition is ready to start.

High competition means lower volumes because the market is not growing. These small amounts would make the incumbent's supply chain less profitable and it can even put the US in danger if the company can't compensate it with the E-Commerce increase.

The second disruption will come from the access type of entry. Where the new entrants find unprofitable to operate, they would use the incumbents supply chain. In this scenario, it would be mostly the downstream supply chain of the PTT Corp.. These would cause incumbent to lose more revenue because the price of the access would be lower than the uniform price.

Overall, the liberalisation will affect the PTT Corp.'s mail supply chain from two sides. First, the new entrant could bypass the incumbents supply chain and establish its own in densely populated areas. Second, they can use PTT Corp. supply chain where they find unprofitable such as downstream in the small populated areas. These facts could lead to loss of revenue. With the technological substitution, even the universal service would be in danger. PTT Corp.'s should, therefore, focus on more efficient and lean supply chain. It should also listen to customer expectations more carefully and design the post offices for that reason.

Conclusion and Further Study

While this study does not give an exact answer to the future event, it gives some clear answers about what would happen to the PTT Corp.'s supply chain in the case of liberalisation and the possible types of market entry using the examples from EU cases. If the policy makers knew what would happen to their supply chain and how to react it with a plan, it would be easier to compete and they can be ready for the incoming liberalisation. Therefore, this paper would fill the gap on the deregulation effect of the mail supply chain in Turkey and give additional options for policymakers. The further study would include the calculation of the future demand and prediction of the competition by using mathematical models.

PRECONCENTRATION AND DETECTION OF SOME METALS WITH CLOUD POINT EXTRACTION VIA 5,7-DIIODO-8-HYDROXYQUINOLINE LIGAND BY USING USN-ICP-OES AND INTERNAL STANDARD TECHNIQUE

Huseyin Altundag
altundag@sakarya.edu.tr

Mustafa Şahin Dundar
dundar@sakarya.edu.tr

Celal Caner
ccaner@sakarya.edu.tr

Ferhat Kaptan
ferkap56@hotmail.com

In this study, a method was developed in order to preconcentration some heavy metal ions (Cu^{+2} Zn^{+2}, Ni^{+2}, Cd^{+2}, Co^{+2}, Pb^{+2}) in water samples via cloud point extraction and detected by using USN-ICP-OES (Ultrasonic Nebulizer Inductively Coupled Plasma-Optical Emission Spectrometry) technique. During this process, the metal ions which were complexed with 5,7 diiodo-8-hydroxyquinoline in Triton X-114 surfactant environment. Then, they were imprisoned in the mycelium, after phase separation via centrifuge, rich in surfactant phase and diluted with 2 M HNO_3 and determined by USN-ICP-OES technique. In order to reduce noise and errors internal standard was used. pH, surfactant concentration, ligand concentration, equilibration time, temperature and foreign ion effects have been searched for optimum conditions. LOD rates of the metals(Cu^{+2}, Zn^{+2}, Ni^{+2}, Cd^{+2}, Co^{+2} and Pb^{+2}) at optimum conditions (pH=7, 0.1 mmol L^{-1} 5,7-diiodo-8-hydroxyquinoline, 0.06 % (w/v) Triton X-114) were found as 0.076, 0.300, 0.081, 0.022, 0.033 and 0.049 µg L^{-1}. RSD % was determined between 2.08 % and 6.28 % (n=10). Developed method has been successfully applied to certified reference material and real water samples.

Keywords: Preconcentration; Cloud point extraction; Triton X-114; 5,7-diiodo-8-hydroxyquinoline; ICP-OES.

PREDICTION OF ASH CONTENT FOR COARSE CLEAN COAL PREPARED WITH HEAVY MEDIUM DRUM BY ARIMA(1,0,1) MODEL

Adem TAŞDEMİR

Eskişehir Osmangazi University, Department of Mining Engineering, Eskişehir- TURKEY

atasdem@ogu.edu.tr

Abstract: The aim of this research is to model the ash content of +18 mm clean coal product obtained by a heavy medium drum at Dereköy coal preparation plant in Turkey by a time series model. The drum was operated 355 days in 2010 and its one year of daily as-received ash content data of +18 mm clean coal was used for evaluation by an ARIMA time series model. The ash data was found non-normal distribution and to fit log-normal distribution well. The ARIMA(1,0,1) time series model determined for the log-transformed data was the best model to represent the ash content of +18 mm coal. This model was shown to be used conveniently within the 95% confidence interval for estimating the ash contents that will be produced in short time period.

Keywords: Coal preparation, heavy medium drum, ash content, lognormal distribution, ARIMA(1,0,1) model

Introduction

Coal is one of the most important energy sources in the world. Turkey has about 12.88 billion tons of coal reserves (Özbayoğlu, 2013). The 11.56 billion tons of these reserves are low quality lignite and the rest is bituminous coals (Özbayoğlu, 2013). Prior to usage of coals, it is necessary to remove some constituents which cause problems during their combustion process in terms of recovery and environmental aspects. This is done by applying coal preparation techniques. Coal washing is the most important method to improve coal quality. In general, coals are washed by using density differences between coal and ash bearing constituents. Depending on the particle size of coals, heavy medium drums and vessels are used for the coarsest coals, heavy dense cyclones are used for relatively fine coals and spirals are used for the fine coals treatment.

During the desired quality coal production, it is necessary to estimate the coal quality for near future and hence to model the coal quality data obtained. The data structures in nature obtained from mineral processing are suitable for time series modeling since data characteristics are random and probabilistic (Ketata and Rockwell, 2008; Ganguli & Tingling, 2001) and these continuous processes can be considered discrete processes (Trybalski & Cieply, 2000). Some examples of time series model applications on coal production have existed in the literature (Cheng, et. al., 1982; Ganguli & Tingling, 2001; Gleit, 1985; Huang, et., al., 2002; Taşdemir, 2012; Taşdemir, 2013; Taşdemir, 2016).

In this research, ash content data obtained from heavy dense drum device at Dereköy coal washing plant in Soma, Turkey were used. Previous studies that carried out for Dereköy coal preparation plant showed that ash content of coals could be modelled successfully by ARIMA(1,0,2) model for -0.5+0.1 mm clean coal product of spiral (Taşdemir, 2013), ARIMA(2,0,0) or AR(2) model for the -18+10 mm and -10+0.5 mm clean coal products of the first heavy dense cyclone (Taşdemir, 2016a and 2016b). In addition, moisture content and ash contents of -18+0.5 mm middling product of second heavy dense cyclone have been found to be modelled by ARIMA(1,0,1) and ARIMA(0,1,2) time series model respectively at Tunçbilek coal washing plant in Turkey (Taşdemir, 2012).

Since, there is no information about time series models in literature that can be used for the estimation of ash content for the coals prepared with heavy medium drums, this research aims to model ash content data of clean coarse coals produced by a heavy medium drum at Dereköy coal preparation plant. By using one year ash content data of +18 mm clean coals prepared by heavy media drum, the most suitable time series model that can be used for the prediction of ash content have been determined and actual ash contents are compared with ash contents predicted by ARIMA model.

Materials and Methods

Daily ash content of +18 mm coarse clean coals were obtained from Dereköy coal preparation plant in Soma, Turkey. The ash content data belong to 2010 year. Simplified flowheet of plant is presented in Figure 1. This flowsheet is modified from Şengül (2008). As seen, particle size of run of mine coals is first reduced to -150 mm and then screened by 18 mm sieve. The +18 mm fraction is washed by a heavy medium drum with two

 Copyright © International Science and Technology Conference (ISTEC)

compartments. The cleanest coals are produced in the first compartment of drum and the materials which are sunk in the first compartment are send to second compartment to obtain middling and shale products. In this research, the ash content of +18 mm clean coal data was used. Sample point of this product is shown as star symbol in Fig. 1. The data 355 ash content data in total were used in this work.

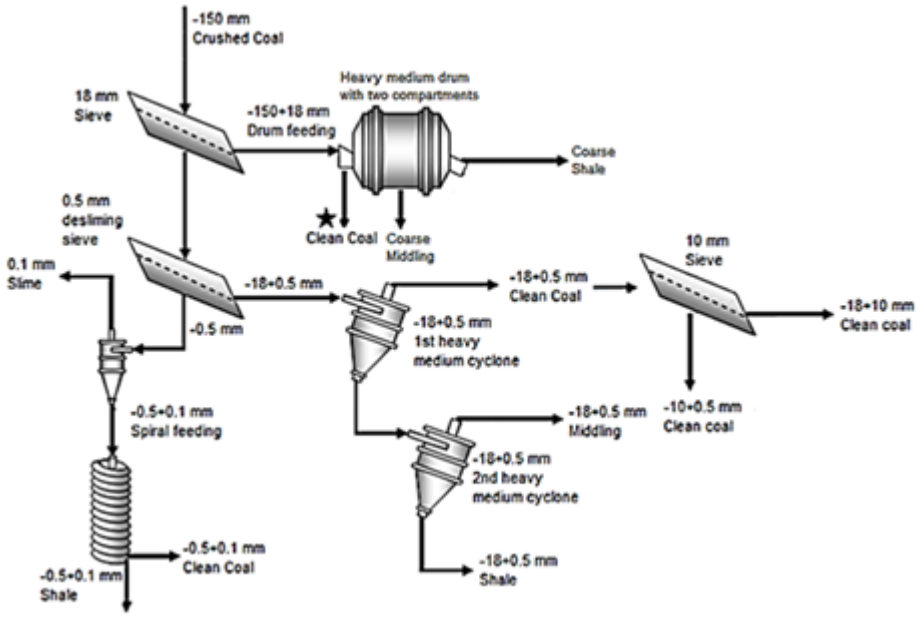

Figure 1. Flowsheet of Dereköy coal washing plant showing +18 mm coarse clean coal product of heavy medium drum which is shown as a star symbol. Modified from Şengül (2008).

The ash content data were evaluated by ARIMA(*p,d,q*) time series models. The model which gave the lowest AIC (Akaike information criterion) was chosen as the best describing time series model for the +18 mm clean coals. Many published books exist about data analysis by ARIMA models. Detailed information about ARIMA time series models and model selection methods can be found in books of Montgomery et al., (2008) and Montgomery & Runger (2011) therefore more information will not be presented again in detail here. Trial versions of Statgraphics XV and Minitab 16.0 software were used for determining of data properties and time series model.

Results and Discussion

Data Properties of +18 mm Ash Content Data

Summary of ash content of +18 mm data is given in Table 1.As seen in Table 1, average of one year ash content data produced by heavy dense drum is 12.85 with a standard deviation of 1.90. The standardized skewness and standardized kurtosis values can be used to determine whether the sample comes from a normal distribution. For a normal distribution, values of these statistics should be inside the range of -2 to +2. Standard skewness and kurtosis values of +18 mm coal ash content were 7.89 and 13.99 respectively. These results indicate that ash content data departure from normality significantly.

Table 1: Summary Statistics for the ash content of +18 mm clean coal

Count	355
Average	12.85
Standard deviation	1.90
Coeff. Of variation	14.78%
Minimum	8.41
Maximum	23.72
Range	15.31
Stnd. skewness	7.89
Stnd. kurtosis	13.99

Box-Whisker and histogram plots for +18 mm ash content are given in Fig. 2. These plots show that the data have important outliers

 Copyright © International Science and Technology Conference (ISTEC)

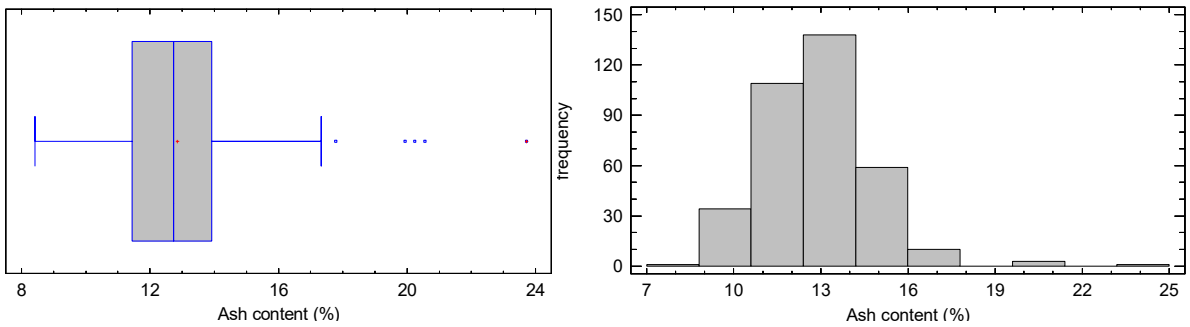

Figure 2. Box-Whisker and histogram plots for +18 mm ash content

Normal probability and symmetry plots of ash content are presented in Fig. 3. Whole plots in Fig. 2 and Fig. 3 support the information in Table 1. As seen in Box-Whisker plot in Fig. 2, there are many outliers and it can easily skew normally distributed data. This may be the reason for non-normality distribution of ash content data. Both normal probability plot and symmetry plots in Fig. 3 support this. The ash content data skewed to right (Fig. 3b) and Anderson-Darling (AD) test confirm non-normality since *p* value of AD test is <0.005 (Fig. 3a).

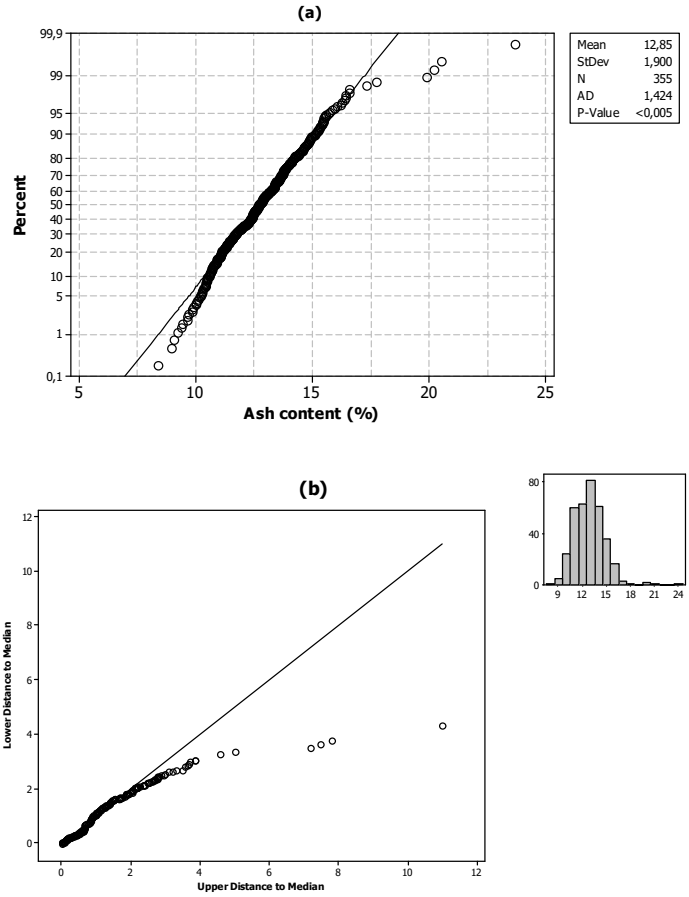

Figure 3. Normal probability (a) and symmetry (b) plots for +18 mm ash content

The ash content data were tested by some distribution functions and transformation methods. The probability plots of results obtained are given and compared with normal distribution plot and Anderson Darling (AD) test results in Fig. 4. Lognormal distribution, Box-Cox and Johnson transformation have *p* values higher than 0.05 (Figs. 4b, 4c and 4d). However, both lognormal distribution (Fig.4c) and Johnson transformation (Fig.4d) have the same *p* values of 0.176 and give better results than Box-Cox transformation (Fig.4b). In this research, lognormal distribution was chosen since it is more simple transformation method than Johnson transformation.

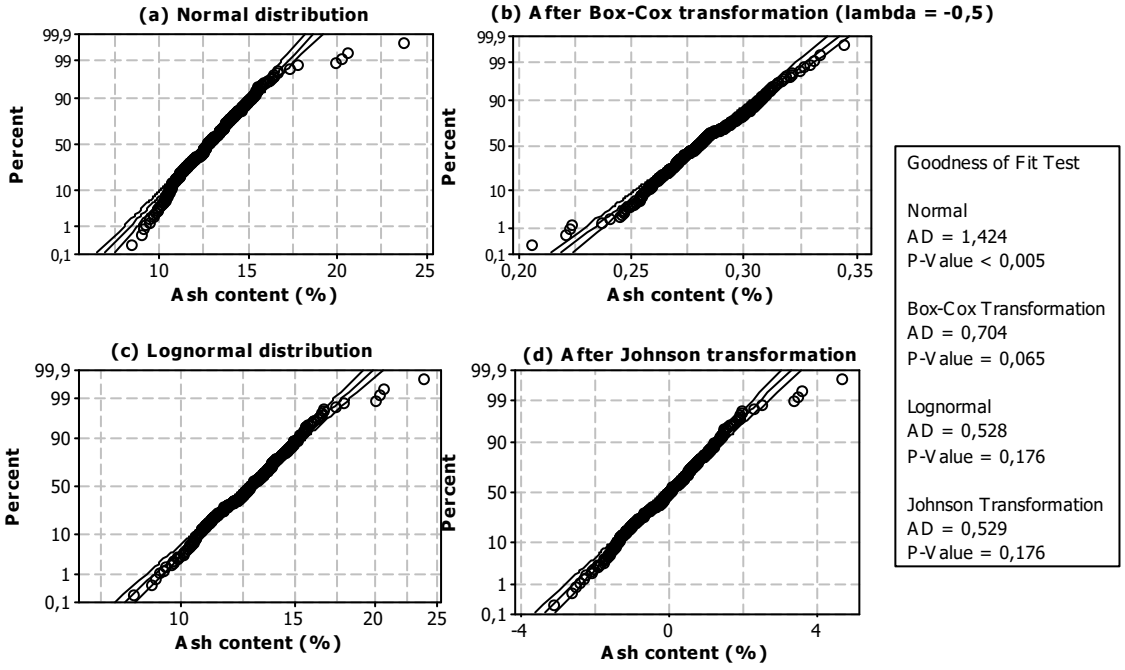

Figure 4. Probability plots for +18 mm clean coal with 95% confidence interval

Time Series Analysis of Ash Data

Time series plots of original and log transformed ash content data are comparatively presented in Fig. 5a and 5b respectively. Since original ash data do not obey normal distribution, log transformed ash content data in Fig. 5b will be considered during the determination of ARIMA(*p,d,q*) time series model. As seen the data are stationary indicating that there is no need to take any difference to make data stationary. Therefore, the *d* value is zero (0) in the ARIMA(*p,d,q*) model, i.e. the model will be ARIMA(*p,0,q*).

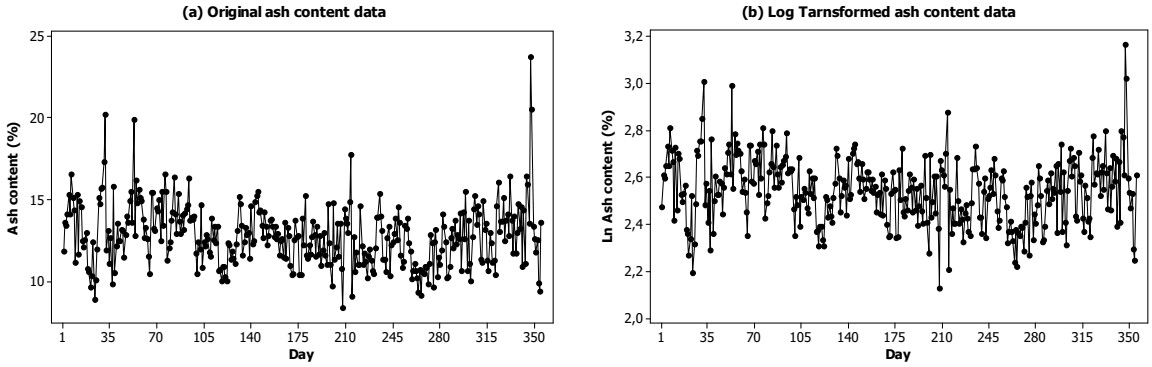

Figure 5. Time series plots of original (a) and log transformed (b) ash content data

Fig. 6 show scatter plot presenting the possible correlation of current log transformed ash data value (*T*) with its previous log transformed ash data (*T-1*). As seen clearly, there is a considerable correlation between two consequent ash data values. In order to determine the correlation degree, autocorrelation function (ACF) and partial autocorrelation function (PACF) plots were generated for 60 lags. The results of ACF and PACF plots with 5% significance level are shown in Fig. 7a and 7b respectively. According to PACF plot in Fig 7a, autocorrelation decays after few lags and then remains 95% confidence limits indicating the data stationary as determined previously. Fig. 7b shows that the ash content data have one important autocorrelation at first lag and then at the second lag. We estimated autocorrelation coefficients of ash content data at first lag is 0.388 and second lag is 0.325 (Fig. 7a). These results indicate that ash content data have considerable autocorrelation and should be taken into account.

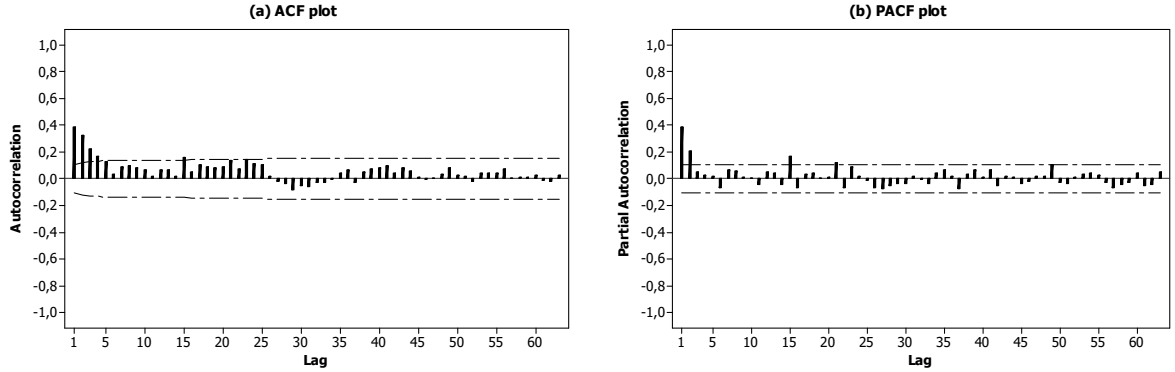

Figure 7. Autocorrelation function (ACF) (a) and partial autocorrelation function (PACF) (b) plots of log transformed ash content data with 5% significance limits

Table 2 compares the results of fitting different time models to the ash content of +18 mm clean coal data. As seen in Table 2, ARIMA(1,0,1) model is the lowest value of the Akaike Information Criterion (AIC), therefore it has been selected to generate the ash content forecasts. Parameters of ARIMA(1,0,1) model is shown in Table 3. Table 3 summarizes the statistical significance of the terms in the forecasting model of ARIMA(1,0,1). Terms with *p* values less than 0.05 are statistically significantly important at the 95% confidence level. The *p* values for the AR(1), MA(1) and mean terms were found less than 0.05, all of them are significantly different from 0 (Table 3). The estimated standard deviation of the input white noise equals 0.1289.

Table 2: Time series model comparisons for ash content estimation

Models	*RMSE**	*AIC*
ARIMA(1,0,1)	0.129306	-4.07425
ARIMA(2,0,0)	0.129393	-4.07289
ARIMA(2,1,1)	0.129451	-4.072
ARIMA(1,1,2)	0.129592	-4.06983
ARIMA(2,0,1)	0.129366	-4.06769

**: Root Mean Squared Error*

For a good time series model, the residuals should be independent and identically distributed (*i.i.d*). To determine these properties, diagnostic tests were carried out whether the residuals of the model obey normal distribution and have no autocorrelation to determine the model adequacy for the ash content data. Fig. 8 shows the normal probability ARIMA(1,0,1) model residuals. The model residuals fit the normal distribution very well according to the AD normality test result (*p*=0.640) (Fig. 8). Residuals were also controlled for the autocorrelation. The generated ACF and PACF plots for the model residuals within the 5% significance limits are presented in Fig. 9a and 9b respectively. As seen clearly, the autocorrelations are within the 95% confidence intervals suggesting that there are no autocorrelations between consecutive residual values. All these results indicate that the ARIMA(1,0,1) model is adequate enough to forecast ash content of +18 mm coals obtained by heavy dense drum.

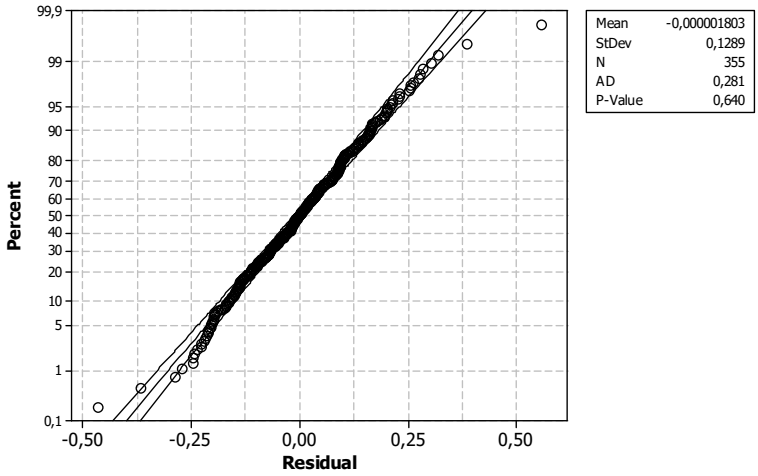

Figure 8. Residual normal probability plot of ARIMA(1,0,1) model for log transformed ash data

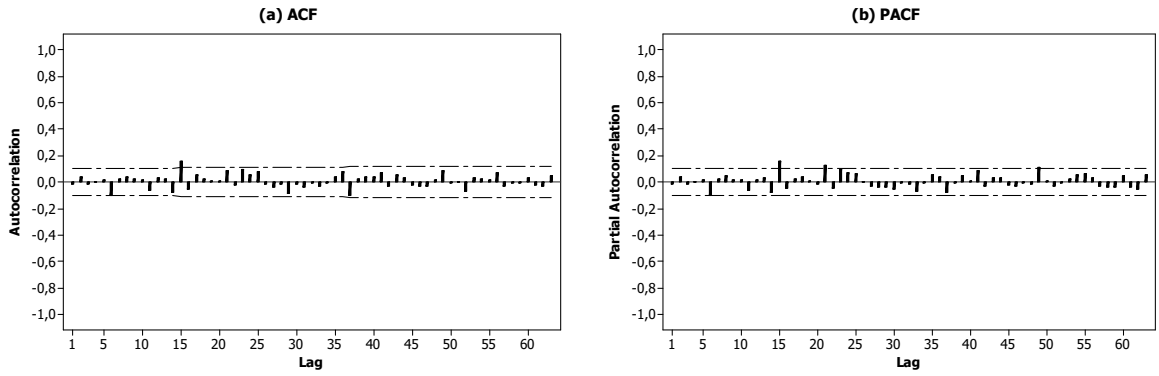

Figure 9. Autocorrelation function (ACF) (a) and partial autocorrelation function (PACF) (b) plots of residuals for ARIMA(1,0,1) model with 5% significance limits

As stated above, the ash content of +18 mm clean coal produced by heavy medium drum, X_t, can be modelled by ARIMA(1,0,1) or ARMA(1,1) model well. General description of ARIMA (1,0,1) model is (Castagliola and Tsung, 2005):

$$X_t = (1-\phi)\mu_0 + \phi X_{t-1} + \theta a_{t-1} + a_t \qquad (1)$$

Where X_t is the observation at time t=1, 2, ,…, a_t is the random noise or white noise at time =1, 2, ,… which is assumed to have mean of zero (0) and standard deviation of σ_a, ϕ is the autoregressive parameter of the model which corresponds to p term in the model, θ is moving average parameter which corresponds to q term in the model and μ_0 is the nominal mean of the process and δ is the constant calculated from $\mu_0(1-\phi)$, (Castagliola and Tsung, 2005).

 Copyright © International Science and Technology Conference (ISTEC)

The ash content data can be modelled by applying ARIMA(1,0,1) process with $\mu_0 = 2.5428$, $\phi = 0.7688$, $\theta = 0.4609$, where the a_t have a normal distribution with mean of zero and $\sigma_a = 0.1289$. Therefore, the ARIMA(1,0,1) time series model that can be used for the ash content of +18 mm clean coal produced by heavy medium drum is:

$$X_t = 0.5879 + 0.7688X_{t-1} + 0.4609a_{t-1} + a_t \quad (2)$$

Where, X_t is the log transformed ash value at time, a_t is the random noise which have distribution of N(0, 0.1289). Fig. 10 shows the actual and forecasted log transformed ash contents by ARIMA(1,0,1) model (Eq. 2). There are good agreement between the actual and forecasted ash content values in Fig. 10. This result indicates that ARIMA(1,0,1) model determined is adequate enough for the near future prediction of ash content.

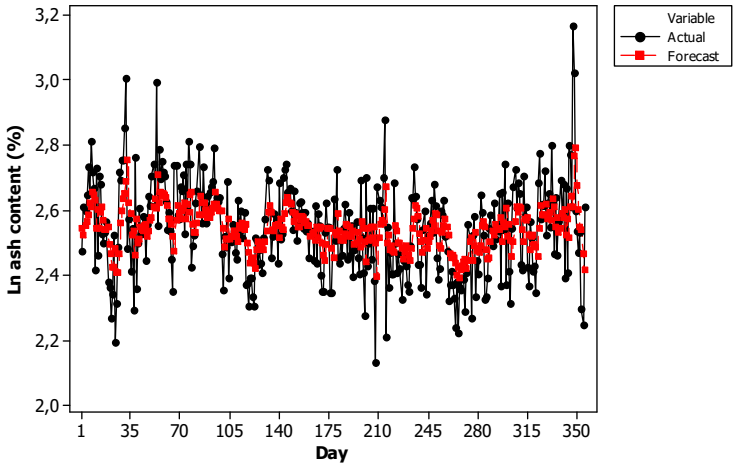

Figure 10. Actual Ln ash content versus forecasted ash content by ARIMA(1,0,1) time series model

Conclusion

Detailed examination of daily ash content of +18 mm clean coal product produced by heavy medium drum showed that ash content data obtained were not obey normal distribution due to the outliers. The ash content data were determined as skewed to the right. The normality can be achieved by both lognormal distribution and Johnson transformation. Since taking natural logarithm was easier than Johnson transformation, ARIMA time series model selection was applied log transformed ash values. No differencing operation was applied to ash data since the data were stationary with time. According to the AIC values of times series tested, the ARIMA(1,0,1) or ARMA(1,1) was determined the best time series model to forecast of ash content values for +18 mm clean coal product. The residuals of model have a distribution of $N(0, 0.1289)$ and no autocorrelation. Since the actual and forecasted ash values are good agreement, the ARIMA(1,0,1) model can be used conveniently for near future estimation of the ash content of +18 mm clean coal to be produced by heavy medium drum. It is suggested that time series models that can be used for the other quality characteristics of coal such as moisture, calorific value, sulphur content etc. can be developed to forecast them.

PREPARATION OF ACTIVATED CARBON FROM APRICOT STONES WASTE AS LOW-COST ADSORBENT FOR REMOVAL OF FOOD DYE FROM AQUEOUS SOLUTION

Fatma OGUZ ERDOGAN and Taner ERDOGAN

Kocaeli University, Kocaeli Vocational School, Department of Chemistry and Chemical Processing Technologies, Kocaeli- TURKEY

foerdogan@gmail.com

Abstract: Activated carbon is one of the most widely used adsorbents due to their high adsorption capacity. As a result, the demand for activated carbon is increasing. However, activated carbon is expensive which limits its large-scale application. A potential method to reduce its cost is to produce activated carbon from low-cost materials and methods. In this study, activated carbon as a novel adsorbent was prepared from low cost and locally available source such as apricot stones. The surface properties of this new adsorbents were identified with various techniques such as BET and SEM analysis. The use of activated carbon obtained from apricot stones prepared by KOH activation with microwave treatment for the removal of FD&C Red 40, from aqueous solitions at different adsorbent dosage, contact times and solution temperatures was investigated. FD&C Red 40 is used in food, pharmaceutical and cosmetics industries. The experimental adsorption equilibrium data were compared with the Langmuir, Freundlich, DR (Dubinin-Radushkevich) and Temkin isotherm models and the isotherm model parameters were determined. Pseudo-first-order and pseudo-second-order equations were fitted to the kinetic data, and the rate constants were evaluated. It was found that kinetics followed a pseudo-second-order equation. Thermodynamic study showed that the adsorption was a spontaneous and endothermic process.

Keywords: Activated carbon, Adsorption, Food Dye, FD&C Red 40, Isotherm, Microwave, KOH Activation, Apricot Stones.

Introduction

Dyes are widely used in food, textile, printing, leather, paper, dye, plastic, rubber, cosmetic, and automotive industries. There are more than 100,000 commercially available dyes with over 700,000 tons produced annually. It is estimated that more than 70,000 tons of dye are discharged from textile industries in the world every year. The discharged of colored wastewater causes serious environmental problems (Erdogan and Oguz Erdogan 2016). In addition, some dyes are classified as toxic or harmful chemicals and may cause allergies, irritation, and cancer in humans. For the removal of dyes from wastewater, adsorption methods are economical, successful, and efficient. Activated carbon is one of the most widely used adsorbents due to their high adsorption capacity. As a result, the demand for activated carbon is increasing. However, activated carbon is expensive which limits its large-scale application. A potential method to reduce its cost is to produce activated carbon from low-cost materials and methods. Various materials such as almond shells (Nabais et al. 2011), pistachio shells (Foo and Hameed 2011b), oil palm fruit bunches (Foo and Hameed 2011d), date Stones (Foo and Hameed 2011c), peanut hulls (Zhong et al. 2012), orange peels (Foo and Hameed 2012c), durian shells and jackfruit peels (Foo and Hameed 2012a), date sphates (Emami and Azizian 2014), cherry stones (Oguz Erdogan 2016; Erdogan and Oguz Erdogan 2016) and peach stones (Uysal et al. 2014) have been used in activated carbon production as dye adsorbents. In recent years, microwave heating has been employed for activated carbon preparation. The main advantages are the short activation time and lower energy consumption. The preparation of activated carbon under microwave radiation from sewage sludge, cotton stalks, bamboo, mangosteen, coconut shells and cherry stones by $ZnCl_2$ activation, H_3PO_4 activation, KOH activation, NaOH activation and K_2CO_3 activation were reported in previous studies (Deng et al. 2010; Liu et al. 2010; Yang et al. 2010; Foo and Hameed 2012b; Lin, Cheng, and Chen 2012; Erdogan and Oguz Erdogan 2016; Oguz Erdogan 2016).

The main objects of this study are: (i) to study the feasibility of using the activated carbon produced from apricot stones as a low-cost adsorbent for the removal of FD&C Red 40 dye , (ii) to determine the various parameters affecting sorption, such as contact time, amount of adsorbents and temperature, (iii) to determine the applicability of various isotherm models ((i.e., Langmuir, Freundlich Temkin and DR) to find out the best-fit isotherm equation, and (iv) to determine thermodynamic and kinetic parameters and explain the nature of adsorption.

Materials and Methods

Adsorbate

The commercial food dye FD&C Red 40 ($C_{18}H_{14}N_2O_8S_2Na_2$, molecular weight 496.4 g/mol, C.I. 16045, λmax=500 nm, pKa= 11.4, chemical structure shown in figure 1) was supplied by Sigma-Aldrich. Distilled water was used to prepare all solutions.

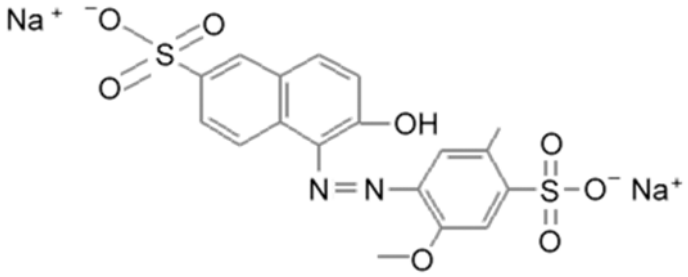

Figure 1. Chemical structure of FD&C Red 40.

Adsorption equilibrium studies

Adsorption of FD&C Red 40 on activated carbon was studied by batch experiments. Equilibrium adsorption studies were conducted in a set of 50 mL capped volumetric flasks containing different amounts of adsorbent weights in the range of 0.02-0.035 g/L, 20 mL initial concentrations of FD&C Red 40 solutions (150 mg/L). Flasks were shaken in a mechanical shaker (GFL 1086) at 100 rpm and different temperature (30, 40 and 50°C). After adsorption, samples were filtered and then the concentrations of FD&C Red 40 in the supernatant solution was analyzed. All concentrations were measured by using UV spectrophotometer (LaboMed Inc.) at 500 nm. The adsorption efficiency E is calculated using Eq. (1):

$$E = \frac{(C_0 - C_e)}{C_0} 100 \quad (1)$$

where C0 and Ce (mg/L) are the liquid-phase concentrations of dye at initial and equilibrium, respectively. The FD&C Red 40 uptake at equilibrium, qe (mg/g), was calculated using Eq. (2):

$$q_e = \frac{(C_0 - C_e)V}{W} \quad (2)$$

where V (L) is the volume of the solution, and W (g) is the mass of adsorbent used. The equilibrium data were simulated using the Freundlich, Langmuir Temkin and DR isotherm models.

Adsorption kinetics

Kinetic adsorption experiments were carried out by adding 0.02 g/L adsorbent to 20 mL of 150 mg/L FD&C Red 40 dye aqueous solutions at 30, 40 and 50°C at optimum pH. The uptake of FD&C Red 40 at time t, q_t (mg/g) was calculated by the following equation:

$$q_t = \frac{(C_0 - C_t)V}{W} \quad (3)$$

where C_t (mg/L) is the liquid-phase concentration of dye at time t (min).

In order to predict adsorption behavior of FD&C Red 40 on activated carbon, pseudo-first-order and pseudo-second-order kinetics equations which are described as Eqs. (4) and (5), respectively, were applied for modeling experimental data [6, 10-11]

$$log\left(q_e - q_t\right) = log\, q_e - \frac{k_1 t}{2.303} \quad (4)$$

 Copyright © International Science and Technology Conference (ISTEC)

$$\frac{t}{q_t} = \frac{1}{k_2 q_e^2} + \frac{t}{q_e} \quad (5)$$

where k_1 (1/min) and k_2 (g/mg min) are the adsorption rate constants of the pseudo-first-order and pseudo-second-order, respectively.

Adsorption Thermodynamics

To describe thermodynamics behavior of the adsorption of FD&C Red 40 dye onto activated carbon, thermodynamics parameters including the change in free energy (ΔG°), enthalpy (ΔH°) and entropy (ΔS°) were calculated as per the following equations:

$$\Delta G° = -RTlnKc$$

$$lnK_C = -\frac{\Delta H^\circ}{RT} + \frac{\Delta S^\circ}{R}$$

where R is the universal gas constant (8.314 J/mol K), T is the temperature (K) and $K_C = C_{ads}/C_e$ is the equilibrium constant of the FD&C Red 40 adsorption equilibrium (which is a ratio of C_{ads}, the FD&C Red 40 concentration in the adsorbent, and C_e, the FD&C Red 40 concentration in the adsorbate.

Results and Discussion

The surface physical properties of activated carbon were characterized with an automated gas sorption apparatus using N_2 as adsorbate at 77.4 K. Nitrogen adsorption is a standart technique widely used for the determination of porosity of adsorbent. Figure 2 shows the pore size distribution from Density Functional Theory (DFT) of the activated carbon. The pore structure of the activated carbon was calculated by the t-method analysis from the adsorption branch of the nitrogen isotherms (Oguz Erdogan 2016; Erdogan and Oguz Erdogan 2016).

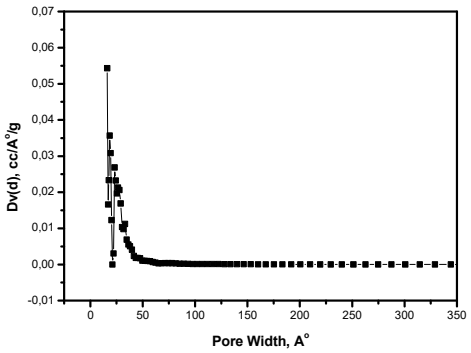

Figure 2. Pore size distribution of the activated carbon produced from apricot stones.

Table 1 shows the BET and Langmuir surface areas, total pore volume, micropore volume and avarage pore size for the produced activated carbon. The average pore size of the activated carbon was 26.99 Å with micropores and mesopores. The presence of micropores in combination with mesopores is expected to play significant role in adsorption of large molecule such as FD&C Red 40 dye.

Table 1: Textural parameters of the produced activated carbon.

Properties	produced activated carb**on**
Brunauer-Emmett-Teller Surface Area (m^2/g)	1100
Langmuir Surface Area (m^2/g)	1780
Total Pore Volume (mL/g)	0.598
Micropore Volume (mL/g)	0.402
Average Pore Size (Å)	26.99
Microporosity (%)	67.2

The surface morphology was characterized by scanning electron microscopy (SEM). An image of the microstructures of the activated carbon is shown in Figure 3, showing many cavities and pores of various sizes and shapes.

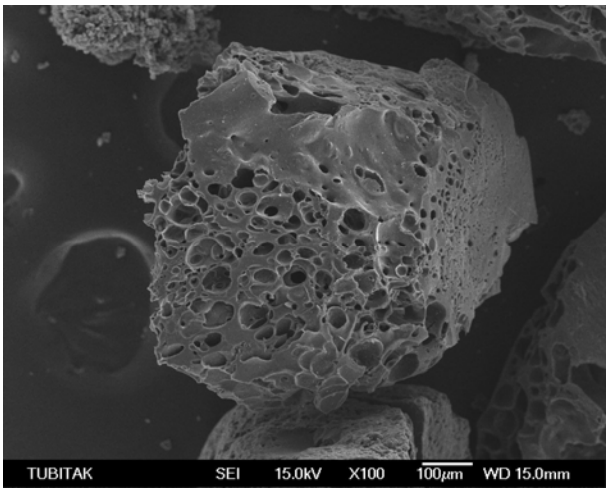

Figure 3. SEM micrographs for the apricot stones-derived adsorbent.

Figure 4 showed that the adsorption capacities at equilibrium (q_e) decreased with an increase in adsorbent dose from 0.02 to 0.08 g/L. This is explained as a consequence of partial aggregation, which occurs at high adsorbent amount resulting in decreased active sites. A similar phenomenon was reported by Huang et al., Rubin et al., and Nweke and Okpokwasili. In a batch of adsorption studies, the adsorption efficiency (E) increased from 49.59% to 73.06% when the adsorption dosage of activated carbon increased from 0.02 to 0.08 g/L at 40 °C. Similar results have also been observed in other temperatures. This finding agrees with the recent work by Huang et al. and Kosa et al.

 Copyright © International Science and Technology Conference (ISTEC)

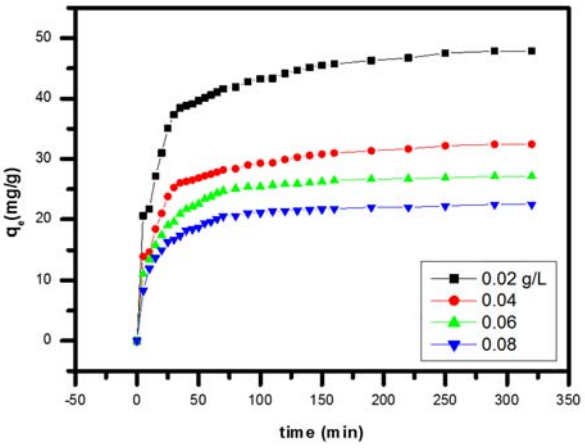

Figure 4. Effects of adsorbent dosage and contact time on the adsorptive uptake of food dye onto the apricot stones-derived adsorbent (conditions: C0=150 mg/L; temperature=40 °C).

The temperature dependence of FD&C Red 40 sorption onto apricot stones-based activated carbon was studied at optimum adsorbent dosage of 0.02 g/L. Figure 5 shows that the food dye adsorption increased with temperature, which may be attributed to the enhanced reaction rate with higher temperature. A possible explanation is that high temperature extends the pore volume and surface area and provides more chances for FD&C Red 40 dye to pass the external boundary layer and penetrate more easily. This corroborates the reports of our previous study (Erdogan and Oguz Erdogan 2016) . Similar behavior has been reported in the literature (Huang et al. 2015; Emami and Azizian 2014).

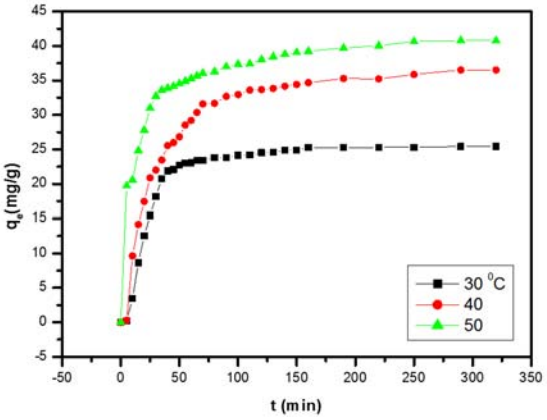

Figure 5. Effect of solution temperature on the adsorption food dye onto the apricot stones-derived adsorbent (conditions: W=0.02 g/L; C0=150 mg/L).

Adsorption Isotherms

The equilibrium adsorption isotherms are essential to the practical design and optimization of adsorption process. The adsorption isotherm describes how adsorbates interact with adsorbents. The equilibrium data of food dye adsorption on to activated carbon was explored using the isotherm model of Langmuir, Freundlich, DR and Temkin. The parameters obtained of the four isotherm models were calculated and represented in Table 2. The correlation coefficients descended in the order of: Langmuir> Freundlich> Temkin> DR. The results revealed that the adsorption of food dye on apricot stones-based activated carbon was best described by the Langmuir isotherm, indicating the adsorption was homogeneous and a monolayer was present.

Table 2: Freundlich, Langmuir, Temkin and DR isotherm constants for the adsorption FD&C Red 40 onto apricot stones-derived adsorbent at 30 °C

Isotherms	Parameters		
Freundlich	K_F (mg/g)(L/mg)$^{1/n}$	n	R^2
	1.37	1.08	0.873
Langmuir	Q_0(mg/g)	K_L (L/mg)	R^2
	278.75	0.00218	0.888
Temkin	A (L/g)	B	R^2
	0.053	86.33	0.868
DR	qm(mg/g)	E(kJ/mol)	R^2
	48.55	15.09	0.833

Langmuir adsorption isotherm constant related to adsorption capacity, Q_0 were found as 278.75 mg/g. To confirm the favorability of the adsorption, the separation factor R_L was calculated by

$$R_L = \frac{1}{1+K_L C_0}$$

where the adsorption process to be either unfavorable ($R_L > 1$), linear ($R_L = 1$), favorable ($0 < R_L < 1$) or irreversible ($R_L = 0$). Here, the value of R_L was found to be 0.752, which further confirmed that the Langmuir isotherm was favorable for of food dye on the produced activated carbon. Similar observation was reported for the adsorption of methylene blue dye onto the safflower seed derived activated carbons (Angın et al. 2014). On the basis of obtained results, it can be concluded that this agricultural by product could react with KOH to make effective activated carbon. Similar behavior has been reported in the literature (Soleimani and Kaghazchi 2014). The value of the free energy estimated from the DR model for apricot stones-based activated carbon 8<E<16 kJ/mol indicating that sorption process follows chemical ion-exchange.

Kinetics of adsorption

Adsorption kinetics provides an understanding of the mechanism of adsorption, which in turn governs mass transfer and the equilibrium time. Food dye was adsorbed on activated carbon as a function of time. Pseudo first order and pseudo second order kinetic models were obtained at 30, 40 and 50 °C. The regression coefficients (R^2) were evaluated for both models. Kinetic parameters for the removal of food dye by low-cost activated carbon at 30, 40 and 50 °C for different amounts of adsorbent weights in the range of 0.02-0.08 g/L are presented in Table 3. The higher regression coefficients indicated that the pseudo second order model was a better fit than the pseudo first order model, suggesting the presence of chemisorption. The calculated q_e values obtained from the second order kinetics agree with the experimental q_e values better than the first order kinetics model, indicating adsorption following second order kinetics. The avarage value for k_2 0.00372, 0.00285 and 0.00299 at 30, 40 and 50 °C, respectively. This corroborates the reports of our previous study (Erdogan and Oguz Erdogan 2016). Similar behavior has been reported in the literature (Belaid et al., 2013).

Adsorption Thermodynamics

The values of ΔH° and ΔS°were determined from slope and intercept or the plot of lnK_C vs 1/T are reported in Table 4. The negative values of ΔG° at different temperature studied, are due to the fact that the adsorption of food dye is spontaneous and feasible. The increase in the magnitude of ΔG° with increase in temperature showed an increase in the feasibility of adsorption at higher temperatures (Huang et al. 2015; Rahman and Sathasivam 2015). The positive value of ΔH° indicates an endothermic process which is supported by the increase adsorption of food dye with rise in temperature. The magnitude of ΔH° is very useful in describing the type of adsorption. If the heat of adsorption is between 2.1-20.9 kJ/mol, then the process is physical and if is between 20.9-418.4 kJ/mol, then the adsorption process is chemical. For the this study, the value of ΔH° is 23.874 kJ/mol, which indicate that the adsorption followed the chemical process. This was also supported by DR isotherm results with the 8<E<16 kJ/mol values of food dye onto activated carbon. Furthermore, positive values ΔS° are suggestive of increased randomness at the solid-solution interface during the adsorption process of the food dye on the active sites of adsorbent.

Table4: Thermodynamic parameters for the adsorption of food dye onto apricot stones-derived adsorbent

Conclusion

Apricot stones-based activated carbon was used as the low-cost adsorbent to remove food dye from aqueous solutions at various temperature. The adsorption capacity of activated carbon for food dye increased while the temperature of solution was increased. Two kinetic models were tested to analyze the mechanism of adsorption and it was found that pseudo second order kinetic model agreed very well with the dynamic behavior for the adsorption of food dye onto activated carbon. The Freundlich, Langmuir, Temkin and DR isotherm models were used for the mathematical description of the adsorption of food dye onto activated carbon at various temperatures and the results suggested that the adsorption equilibrium data fitted well to the Langmuir model.

Thermodynamic constants were also evaluated using equilibrium constants changing with temperature. The negative value of $\Delta G°$ indicated the spontaneity and it confirm a favorable adsorption of food dye onto activated carbon. As the temperature increased from 30 to 50 °C, the positive values of $\Delta H°$ confirmed that the process was endothermic. The positive value of $\Delta S°$ suggested the increased randomness of the food dye adsorption onto apricot stones-based activated carbon. This study has revealed that apricot stones-based activated carbon can be used as a highly efficient and economically viable adsorbent for FD&C Red 40 dye removal from aqueous solutions.

PROJE YÖNETİMİ STRATEJİ OLUŞTURMA ETKİNLİĞİNİ ARTTIRACAK BİR MODEL ÖNERİSİ

İlker DOĞAN

Kara Harp Okulu, Savunma Bilimleri Enstitüsü, Ankara – Türkiye

ilker_dogan@windowslive.com

ÖZET

Özet: Bu bildiride, proje yönetimi strateji oluşturma etkinliğini attıracak bir model üzerine yapılan çalışma sonuçları sunulmuştur. Süreçlerin görünürlüğünün ve bireyler arası iletişimin arttırılarak hedeflere daha kolay odaklanılması model ile amaçlanmıştır. Hedeflere odaklanmanın sağlanması neticesinde ise yönetimin daha etkin biçimde gerçekleşebileceği beklenmektedir.

Anahtar Kelimeler: Proje Yönetimi, Strateji Oluşturma, Proje Etkinliği, Strateji Hazırlık Düzeyi

Giriş

Küreselleşmenin hemen her alanda hissedilmesi neticesinde kurumların varlıklarını sürdürebilmeleri ancak daha etkin daha yenilikçi sistemler uygulamasına bağlı hale gelmiştir. Kurumlar tarafından icra edilen faaliyetlerin birer proje olarak ele alınarak en etkin biçimde yönetilmesi konusu ise mevcudiyetlerinin devamı noktasında hayati bir süreç olarak karşımıza çıkmaktadır. Her biri ayrı özellik gösteren projelerin yönetimi ise kendine has zorluklar içermektedir. Mevcut zorlukların üstesinden gelmek için uygulanan stratejiler bu noktada önem kazanmaktadır. Proje yönetimi esasları dahilinde strateji oluşturulmasına ilişkin konuların ve süreçlerin etkinleştirilmesi maksadıyla yapılan model önerisi çalışmanın esasını oluşturmaktadır.

Strateji nedir? Kapsamı ne olmalıdır?

Strateji kelime olarak Yunanca "stratos" (ordu) ve "ago'' (gütmek) kelimelerinden elde edilmiştir. Esas itibariyle ise belirli bir amaca ulaşmak için izlenen temel yol veya yaklaşım (Strateji Nedir [web], 2016) anlamını ifade etmektedir. Türk Dil Kurumu tarafından izlem (TDK [web], 2016) olarak Türkçeye çevrilmiştir. Strateji, Fransızca kökene sahip bir terim olup, bir ulusun veya uluslar topluluğunun barış ve savaşta benimsenen politikalara destek vermek amacıyla politik, ekonomik, psikolojik ve askerî güçleri bir arada kullanma bilimi ve sanatı olarak tanımlanmıştır (TDK [web], 2016) . Kelimenin kökeninden de kolayca anlaşılabileceği üzere strateji konusuna ilişkin ilk gelişmeler askeri alanda yaşanmıştır. Bu konuda dünyanın en eski strateji kuramları olarak kabul edilen Sun Tzu'nun düşünceleri Savaş Sanatı (Griffith, 1971) isimli kitapta toplanmıştır. "Mükemmellik her savaşta çarpışarak kazanmak değildir. En iyi strateji savaşmadan kazanmaktır. Akıllılar dövüşmeden kazanır, cahiller kazanmak için dövüşürler." (Demir, 2008) gibi daha çok askeri söyleme dayanan düşünceler ile strateji oluşturmaya ilişkin kuramların temelleri atılmıştır.

Stratejinin gelişimi ilk olarak kendini askeri alanda göstermiş olsa da ilerleyen süreçte diplomasi, politika, ekonomi, yönetim, teknoloji, lojistik gibi çok çeşitli alanlara yayılmış bir kavram olarak karşımıza çıkmaktadır. Stratejiye ilişkin olarak Johnson ve Scholes, pazar ihtiyaçlarını karşılamak ve menfaattarların beklentilerini tatmin etmek üzere, değişen çevre koşullarında kaynakların yönlendirilerek uzun vadede organizasyon için avantaj elde etmek üzere oluşturulan bakış açısı ve yoldur (Johnson&Scholes, 1999) şeklinde açıklama getirmişlerdir. Organizasyonun avantajları ele geçirme sürecinde faaliyetlerini projeler oluşturarak hayata geçirmesi gerekliliği ise net bir şekilde ortadadır. Uygulanacak projelerin belirli bir yöntem ve uzmanlık alanı olduğu ise sarihtir. Bu bağlamda proje yönetim aşamalarını belirli standartlar altında ve kalite anlayışı çerçevesinde gerçekleştirmeyi hedefleyen kurumlardan birisi olarak Project Management Institute önem kazanmaktadır (PMI [web], 2016). Bu kurum tarafından proje yönetiminde oluşturulacak stratejilerin kapsamını; pazar, iş ve müşteri ihtiyaçları, yasal ve sosyal gereklilikler ile teknolojik ilerlemeleri kapsayacak şekilde karar verilmesi konularını içerecek şekilde yapılmasının gerekliliğine değinilmiştir (PMBOK, 2000).

Stratejinin Elementleri

Modern stratejik düşüncenin kurucusu ve stratejik yönetimin babası olarak kabul edilen Rus asıllı matematikçi Igor Ansoff'un düşünceleri stratejilerin yönetilmesi hususunda önemli bir yol gösterici konumdadır (Livvarçin&Kurt, 2014). Hatta öyle ki onun bir takım fikirleri daha sonra bu alanda tanınan kişiler tarafından

 Copyright © International Science and Technology Conference (ISTEC)

daha da belirgin hale getirilmiştir. Strateji yönetimi alanında saygın kişileri etkileyen fikirlerine genel olarak bakacak olursak rekabetçi avantaj, temel yetenekler, ürün ve pazar alanının net bir şekilde belirlenmesi olarak sıralayabiliriz. Igor Ansoff'un belirttiği bu düşünceler sırasıyla Michael Porter, Gary Hamel ve Coimbatore Krishnarao Prahalad, Tom Peters tarafından ele alınarak bir üst aşamaya taşınmaya gayret gösterilmiştir.

Stratejinin sahip olması gereken elemetler yine Ansoff tarafından 4 başlık altında belirlenmiştir. Bunlar sırasıyla ürün-pazar faaliyet alanı, büyüme vektörü, rekabetsel avantaj ve sinerji olarak sınıflandırılmıştır (Ansoff, 1957).

Stratejinin Sınıflandırılması

Micheal Porter tarafından rekabetçi avantajın şirketler tarafından sağlanması hususuna yönelik stratejinin sınıflandırılması oluşturulmuştur. Stratejik güç ve stratejik kapsamı içeren sınıflandırmanın, organizasyonların hedeflerine ulaşmak için uygulayacağı yöntemin belirlenmesinde önemli bir hususu teşkil etmektedir. Pazar koşulları ve organizasyonel yeteneklerin konumlandırılması neticesinde hedeflerin belirlenmesi maksadıyla üç çeşit strateji geliştirmenin mümkün olduğunu ifade etmektedir. Gerçekleştirilebilecek stratejilerin ise sektörün belirli alanına odaklanma ile sektör genelinde farklılaşma ve maliyet liderliği şeklinde olabileceği belirtilmiştir (Porter, 1980).

Stratejinin Görselliği

Belirsizliklerin hâkim olduğu olumsuz ortamdan kurtulabilmenin en etkili yöntemi şirketin sahip olduğu bütün becerilerini en etkin şekilde kullanabileceği bir strateji oluşturmaktan geçmektedir. Strateji oluşturma safhasında, görsel tablolar meydana getirmenin şirket amaçlarının belirlenmesi ve stratejik planların yapılması aşamalarında iletişimin sağlanması açısından çok büyük önem taşımaktadır. Stratejinin görselleştirilmesinde kullanılan adımlar sırasıyla görsel uyanış, görsel keşif, stratejik uygunluk ve iletişim olmalıdır (Kim&Mauborgne, 2002). Ayrıca görselleştirilen tablolarda rakiplerin konumlarını görme ve rekabet koşullarına göre strateji belirleme konusunda da yardımcı olmaktadır. Tablolarda mevcut ve muhtemel rakiplerin yatırım yapabileceği, gelişme sağlayabileceği alanları da görülebilir hale gelmektedir. Bu alanların değerlendirilmesi neticesinde kararın verilmesi çok daha etkili bir şekilde yapılabilmektedir. Yapılan değerlendirmeler sonucunda oluşturulacak stratejinin ise 3 adet etkili niteliğe sahip olması gerekmektedir. Bunlar sırasıyla odaklanma, farklılık ve etkili bir slogana sahip olmasıdır (Kim&Mauborgne, 2002).

Strateji Oluşturma

Bu bölüme kadar strateji nedir, kapsam nasıl olmalıdır, elementleri nelerdir, strateji nasıl sınıflandırılır ve stratejinin görselleştirilmesi neden ve nasıl yapılmalıdır süreçleri içinde stratejinin tarihsel gelişimi, çeşitleri, uygulanma alanlarına ilişkin çeşitli görüşlere yer verilmiştir. Ancak bu bilgilerin günümüz dünyasına uyarlanması gerekmektedir. Mevcut koşulların nasıl oluştuğu, dünyanın küreselleşme konjonktürü içerisindeki şartların değerlendirilmesi gerekmektedir.

1980 yılından itibaren çokuluslu şirketlerin ve doğrudan yabancı yatırımın faydalı olduğu görüşü teknoloji transferinin liberalleşmesine olanak sağlamıştır. Ticaretin liberalleşmesi ise, iç pazar odaklı doğrudan yabancı yatırımın bölgesel odaklı müşterek ağlara yönelmesi ile gerçekleşmiştir (Radosevic, 1999). Pazar imkânlarının artmasına paralel olarak rekabet edilecek firma sayısının da artması beklenen bir durumdur. Belirsizleşen, hızla değişim gösteren piyasa koşullarına uyum sağlamak ise hayati öneme sahiptir. Gerekli uyumun sağlanması konusunda şirketlerin uygulayacağı stratejiler ise daha fazla önem kazanmaktadır. Öyleyse strateji nasıl oluşturulmalı ve bu süreçte nelere odaklanılmalıdır?

Strateji oluşturmak için öncelikle strateji geliştirme süreçlerine dikkat edilmelidir. Milan Zeleny (2008) çalışmasında strateji oluşturma sürecini beş adımda ifade etmiştir. Organizasyonlar öncelikli olarak aktivite haritalarını oluşturarak hangi faaliyetlerde bulunduğunu belirlemelidir. İkinci olarak kıyaslama aşamasına geçmelidir. Bu aşamada müşteri istekleri, rakiplerin performansları, endüstri standartları ve kurumsal tutku konularını incelemelidir. Sonraki aşamada ise değer eğrilerine ilişkin grafik ve şemalarını oluşturmalıdır. Bu grafikleri hazırlamadaki amaç rakiplerden ayrışmaları bulmak ve farklılaşmaktır. Dördüncü adım değiştirilecek faaliyetlerin belirlenmesidir. Bu adımı gerçekleştirmek için öncelikle nelerin değişmeyeceğine karar verilmelidir. Ancak bu şekilde neleri değiştirmenin mümkün olduğu belirlenebilmektedir. Son olarak görevler ve hedefler net şekildeki ifadeler ile belirlenmelidir. İfadelerin hedeflere uygun saptanıp organizasyon içinde belirgin hale getirilmesi daha iyi iletişimi sağlamaktadır. Bu aşamalardan geçmeden oluşturulan tanımlamalar, gerçekleştirilmek istenen faaliyetleri tam olarak ifade edememektedir. Stratejilerin piyasadaki koşullara uyum sağlaması aşamasında öne çıkmış olan başlıca iki görüş mevcuttur. Bu görüşler Porter tarafından detaylı olarak incelenen rekabetçi avantaj ve Hamel ile Prahalad tarafından irdelenen temel yeteneklerdir.

 Copyright © International Science and Technology Conference (ISTEC)

Beş Güç Analizi

Bu kavram piyasaya dayalı stratejiyi temel alarak, organizasyon dışından içine doğru geliştirilmiş biçimde Michael Porter tarafından ortaya koyulmuştur. Rekabet koşullarının belirli bir alanda faaliyet gösteren veya göstermek isteyen kişilerin stratejilerini belirlemeleri açısından öneminin çok fazla olduğunu belirtmiştir. Rekabetçi stratejiyi temel alan görüşlerini 5 güç analizi modelinde ifade etmektedir (Porter, 1990). Oluşturduğu modelde analiz edilmesinin önemine değindiği maddeler sırasıyla alıcıların ve tedarikçilerin pazarlık gücü, ikame ürünlerin ve yeni katılanların gücü ile rekabet olarak ifade edilmiştir. Beş başlık altında sade bir şekilde toplanan bu niteliklerin dikkatlice analiz edilmesi sonucunda sektörde yeni stratejilerin geliştirilmesi ve yeni sektöre girilmesine ilişkin kararların verilebilmesi mümkün olabileceği belirtilmiştir.

Temel Yetenekler

Bu kavram kaynağa dayalı stratejiyi temel alarak, organizasyon içinden dışarı doğru geliştirilmiş biçimde Hamel ve Prahalad tarafından ortaya koyulmuştur. Firmanın belirli bir alanda faaliyet gösteren diğer firmalara göre çok daha iyi ve güçlü olduğu beceri, uzmanlık ve yeteneklerin tümünü kapsamaktadır (Hamel&Prahalad, 1990). Temel yetenekler modeli ağaç metaforu üzerinden kurgulanmıştır. Ağacın kökleri şirketin sahip olduğu temel yetenek ve uzmanlığını, gövdesi şirket tarafından üretilen temel ürünü anlatmaktadır. Ağacın dalları şirket içindeki küçük iş birimleri olarak belirlenmiştir. Yaprakları şirket tarafından temel yetenek alanına dayanılarak üretilen nihai ürünleri göstermektedir.

Stratejinin Gerçekleşme Serüveni

Henry Mintzberg, Bruce Ahlstrand ve Joseph Lampel (2009) tarafından ortaya konulan modelde stratejilerin ancak bir kısmının planlandığı şekilde gerçekleştirilebildiği belirtilmektedir. Kavramsal modellerden gerçek hayata yakınsadıkça bu durumun ne kadar gerçekçi bir yaklaşım olduğu daha net bir şekilde görülebilmektedir. Strateji oluşturma safhasında hemen her detayın düşünülebilmesi pek mümkün değildir. Ancak düşünülebildiği varsayımını kabul etsek dahi piyasa koşullarının stabil durumda kalmasını beklemek pek olası bir durum değildir. Koşulların optimum düzeyde planlamaya dahil edildiği stratejilerin en kısa zamanda uygulamaya geçilmesi gerekmektedir. Aksi takdirde hedeflere ulaşmak için amaç olması gereken strateji oluşturma süreci başlı başına bir amaç haline gelebilir.

Bilme Yapma Farkı

Bilgi çağının bilgelik çağına doğru ilerlediği bu dönemde verilerin işlenmesi ve bunun sonucunda anlamlandırılması ile işlerlik kazanabilir hale dönüştürülmesi çok büyük önem taşımaktadır. Keşif, faaliyet ve açıklama şeklinde tekrarlanan araştırma döngüsünün ilerletilmesi, işlerliğe ulaşma konusunda katkı sağlamaktadır. Dijital çağda sanal gerçekliği gerçekmiş gibi algılamaya daha meyilli olduğumuz çıkarımından hareketle konuşmanın yapmaya eşdeğer olduğu gibi bir varsayıma kapılmaktayız (Zeleny, 2008). Şirketlerin de bu durumu destekleyici şekilde davranması sonucunda yöneticiler daha göz alıcı ve etkileyici sunumlar hazırlamak için fazladan zaman harcamaktadır. Ancak faaliyetlerin planlandığı sunumların, nasıl hayata geçirileceği konusundaki eksiklik devamlı surette artmaktadır. Zaten planların hayata geçişi aşamasında ne derece gerçekleştiği kısmını bir önceki başlık altında incelemiştik.

Hemen her alanda artık daha az tahmin edilebilir bir dünyada yaşamaktayız. Bu nedenden dolayı zaman alıcı analizler yapmaktan ziyade sürekli eylemde bulunmaya odaklanmalıyız. Gerçekleştireceğimiz eylemleri de belirli bir strateji çerçevesinde oluşturmalıyız. Çünkü strateji yaptıklarımızdır, yapacağımızı söylediklerimiz değildir (Zeleny, 2008).

Model Önerisi

Bu alanda yapılan araştırmalar incelendiğinde temel olarak piyasa ve kaynağa dayalı olmak üzere organizasyon içine ve dışına doğru iki yönde ilerleyen stratejilerin geliştirilmiş olduğu gözlemlenmektedir. Aslında bu iki yönünde birbirinden ayrılamayacağı, bu stratejilerin dinamik bir yapıda sentezinin gerekliliği üzerine strateji hazırlık seviyesinin belirlenmesini temel alan "Yol Modeli" oluşturulmuştur. (Şekil 1)

 Copyright © International Science and Technology Conference (ISTEC)

Analiz / Yol	Pazar	Rakip	Teknoloji	Müşteri İhtiyaçları	Ürün Konumu	Üretim	Politika	Kaynak	Sosyal	Yenilik Yapabilme

Asfalt	x	x	x	x	x	x	x	X		
Otoban	x	x	x	x	x	x	x	x	X	X

Şekil 1. Model Önerisi "Yol Modeli"

Modelde 10 farklı analiz için sıralama yapılmış ve 6 çeşit yol ile ilişkilendirilmiştir. Kategorilendirilen yollar çeşitli kalite düzeylerini simgelemesi ve akılda kolay kalması maksadıyla bu şekilde bir tasnif yapılmıştır. Belirli bir yol için önerilen analizlerin minimum düzeyinden daha fazlasının analiz edilmesi sonucunda etkisinin artması büyüyen simgelerle temsil edilmiştir. Yol modelinin oluşturulmasındaki amaç sadece kavramsal olarak kalmanın ötesinde hem üretimi gerçekleştirilen/gerçekleştirilmek istenen ürünler hem de uygulamalar için standart hale getirilen hazırlık düzeylerinin belirlemesine imkân tanımaktır. Standartlaşma neticesinde strateji oluşturma sürecinde dikkat edilmesi gereken noktalar daha gözlenebilir hale gelecektir. Yol modeli kullanılarak süreçlerin tümündeki ilerlemelerin izlenebilmesi, geliştirmeye ihtiyaç duyulan noktaların kolayca tespit edilebilmesini mümkün hale getirmektedir. Sistemin bütün olarak değerlendirilmesinin yanı sıra onu oluşturan ve geliştiren stratejilere ilişkin verilecek kararlardaki belirsiz noktaların aydınlatılması da hedeflenmiştir.

Neden Yol Modeli Şeklinde Oluşturuldu?

Organizasyonun stratejisi, mevcut konumundan ulaşmak istediği hedeflere ulaşma sürecinin nasıl olacağına ilişkin sistemli görüşlerinin tümüdür. Aslında hedeflere ulaşmadaki stratejinin özünde izlenecek yol vardır. Bu yolu ulaşım için kullandığımız şekliyle inceleyecek olursak, ilk göze çarpan yol çeşitliliğinin çok fazla oluşudur. Bu çeşitlilik içinde gidilecek yolun kalitesi önem taşımaktadır. Yollardaki fazlaca dönemeç ve engelin yanı sıra diğer araçların yoldaki konum ve miktarı da yol seçiminde önem taşımaktadır. Hedefe ulaşmak ancak belirli bir süre sonunda gerçekleşebilir. Bu süreç yolun koşulları, hava şartları ve yolda giden kişinin maharetine bağlı olarak değişir. En önemli konu ise gidilen yol aynı olsa dahi hiçbir yolculuk diğer şartların değişmesinden ötürü bir öncekinin aynısı olamaz. Her yolculuğun kendine has özellikler taşıması sebebiyle her bir süreç dikkatli bir şekilde ele alınmalıdır. Organizasyonların da esasen yapmak istediği hedeflerine ulaştıracak yolu kullanmaktır. Piyasaya ilişkin bazı koşulların belirlenmesine karşın birçok ilave şart onu belirsiz ve düzensiz hale getirmektedir. Bu belirsizlik içinde gidilen yollardan sapma olması, yolun dışına çıkılması muhtemeldir. Ancak bu sürecin sürekli ve dinamik bir şekilde takip edilmesi neticesinde yolun kalitesi asfalttan toprağa düşmesi halinde onu eski haline nasıl getirebileceğimizi gösteren bir ölçek şeklinde değerlendirme imkânı bulması yol modeli ile mümkün hale gelebilmektedir. Bu ölçekten faydalanmak suretiyle organizasyonlar gittikleri ve varmak istedikleri yolları çok daha belirgin bir hale getirebilmektedirler. Çünkü seçtiğimiz strateji ilerleyeceğimiz yoldur.

Sonuç

Proje yönetiminde belirsizliklerin en aza indirilmesi ve yapılan faaliyetlerin görünür kılınarak yönetim etkinliğinin arttırılması maksadıyla "Yol Modeli" oluşturulmuştur. Süreçlerin standartlaştırılması ile bireyler arasındaki iletişimin arttırılması ve artan iletişim neticesinde hedefe odaklanmanın daha kolay yapılabilmesi hedeflenmiştir.

PROPERTIES OF MORTARS USED IN OTTOMAN PERIOD HISTORICAL BUILDINGS; AN EXAMPLE OF DENIZLI İLBADE CEMETRY

Adem Solak
asolak@pau.edu.tr

In this study, properties of masonry and plaster mortar used in the walls of the Namazgah Mosque and Dervish Lodge constructed in Denizli İlbade cemetery during Ottoman period are investigated. Basic physical, mechanical, hydraulic, micro, raw material, mineralogical and chemical properties of mortars are determined. All the investigated mortars show that they are lime mortars. Masonry mortars have pure lime and non-pozzolanic aggregate. Furthermore, they do not have hydraulic properties. Plaster mortars are produced with a combination of artificial pozzolan and pure lime and they have hydraulic properties. It is specified that plaster mortars are more competent than masonry mortars. It is concluded that plaster mortars's hydraulic properties are responsible for competence difference between plaster mortars and masonry mortar.

Abstract: Shape dynamics is a theory first proposed by Julian Barbour which states that physics happen uniquely in the reduced configuration space of a theory. So far, studies in the area have focused on gravitational systems. Here we first contemplate on the implications of this idea on quantum mechanics. We summarize the idea of shape dynamics and then give physical configurations of multi qubit systems. Our aim in the grand picture, is to initiate a research program translating classical shape dynamics to quantum realm.

Keywords: Shape Dynamics, Qubits, Relational Physics

Introduction

Mach's principle may refer to many ideas. Hermann Bondi and Joseph Samuel list eleven distinct versions of the Mach's principle that can be found in the literature (Samuel, 1997). We adopt the Julian Barbour's definition (Barbour, The Definition of Mach's Principle, 2010).

First of all there is the configuration space of a theory. By removing the gauge degree of freedoms we obtain the reduced configuration space of a theory where all degrees of freedom are physical. This space is called the *shape space*. The Mach's principle states that (Barbour, The Definition of Mach's Principle, 2010) a point and a direction or a tangent vector in shape space determine the evolution of the system uniquely.

According to classical shape dynamics, in the Newtonian N-body problem the physical configurations are obtained when the rotation and scale degrees of freedom are removed (Barbour, Shape Dynamics. An Introduction, 2011). Hence for one or two particles in an empty universe there is no degree of freedom. Non-trivial Shape dynamics apply to the cases of three or more particles. For an introduction to shape dynamics, reader may refer to (Barbour, Shape Dynamics. An Introduction, 2011) and (Mercati, 2014).

So far the studies on shape dynamics focused on gravitational (Henrique Gomes, 2015) and classical aspects such as the arrow of time (Julian Barbour, 2014). Beginning with this paper, we would like to initiate a research endeavor that investigates consequences of classical shape dynamics in quantum phenomena.

Shapes of Qubits

We discuss quantum shape kinematics of multi qubit systems beginning with the cases of a single and double qubit systems. In this section qubits do not occupy positions in spacetime. Hence they have only internal degrees of freedom.

Single qubit system

We consider there exists only one qubit in the Minkowski spacetime and nothing else. The quantum state of the particle can be written as:

$$|\psi\rangle = \alpha|\uparrow\rangle + \beta|\downarrow\rangle, \exists \alpha, \beta \in \mathbb{C}.$$

However by rotating the coordinates and multiplying with a complex number we can always map $|\psi\rangle \mapsto |\uparrow\rangle$. Therefore we conclude that for one qubit there is no physical degree of freedom apart from its mere existence.

Double qubit system

 Copyright © International Science and Technology Conference (ISTEC)

Here we suppose there are two qubits in the universe. The basis vectors are $|\uparrow\uparrow\rangle$, $|\downarrow\downarrow\rangle$, $|\uparrow\downarrow\rangle$ and $|\downarrow\uparrow\rangle$. Because all we have is the angles between spins, the first two correspond to parallel spin case, $|parallel\rangle$, and the last two correspond to anti-parallel spin case, $|anti-parallel\rangle$. We can always rotate the state of first qubit into $|\uparrow\rangle$. Hence the direction of the first spin is used to fix a direction in space. The physical basis vectors are $|\uparrow\uparrow\rangle$ and $|\uparrow\downarrow\rangle$.

Multiple qubit systems

In this part we suppose there are N qubits in the universe. The basis vectors of the system are $|a_1\rangle \otimes |a_2\rangle \otimes \cdots \otimes |a_N\rangle$ where $|a_i\rangle$ for $1 \leq i \leq N$ can be either $|\uparrow\rangle$ or $|\downarrow\rangle$. Whatever the value of $|a_1\rangle$ we can always rotate it to $|\uparrow\rangle$. Hence we reduce one degree of freedom. We call the first qubit as *the reference qubit*. N qubit system has the degrees of freedom of $N-1$ qubit system. This is true for all $N \geq 1$.

Possible Objections

Interactions

One may object to this classification with the counter example of interacting two qubits via the Hamiltonian $-\gamma\overrightarrow{\sigma_1} \odot \overrightarrow{\sigma_2}$. The eigenstates of the systems are $|\uparrow\uparrow\rangle$,$|\downarrow\downarrow\rangle$ and $|\uparrow\downarrow\rangle + |\downarrow\uparrow\rangle$ with energy eigenvalue $-\gamma$, whereas the state $|\uparrow\downarrow\rangle - |\downarrow\uparrow\rangle$ has energy 3γ. The seemingly paradoxical point is that the states $|\uparrow\downarrow\rangle - |\downarrow\uparrow\rangle$ and $|\uparrow\downarrow\rangle + |\downarrow\uparrow\rangle$ have different energies though they should correspond to the same $|anti-parallel\rangle$ state vector.

We need to note that in order for two qubits to *interact*, we need to introduce additional structure. In quantum shape dynamics, time evolution should be reached by considering the whole state of the universe. It will be a holistic theory.

For simplicity suppose that the interaction between the qubits requires another qubit. All in all the system becomes a triple qubit system. Here the physical states are such that the additional qubit has always the state $|\uparrow\rangle$. Basis vectors are $|\uparrow\rangle \otimes |a\rangle \otimes |b\rangle$ where $|a\rangle$, $|b\rangle$ can be $|\uparrow\rangle$ or $|\downarrow\rangle$. It is now that the states $|\uparrow\uparrow\downarrow\rangle - |\uparrow\downarrow\uparrow\rangle$ and $|\uparrow\uparrow\downarrow\rangle + |\uparrow\downarrow\uparrow\rangle$ are physically different and there is no paradox for them having different energy values. The problem is solved once we take into account the whole system.

Choice of the reference qubit

The choice of the reference qubit, the qubit whose state is fixed, is arbitrary. By definition it has no dynamics, though it may evolve relative to subsystems.

Conclusion

In this study, we removed the rotation gauge degrees of freedoms from multi qubits systems and what have remained are the quantum shapes of the system. We observed that one qubit can be put in a fixed state by rotating the space, hence it has no degree of freedom. In the general case of an N qubit system, the degrees of freedom turned out to have the degrees of freedom of $N-1$ qubit system.

Future works may expand our discussion by including quantum shape kinematics of molecules or higher spin systems. Quantum shape dynamics solution for the Hydrogen atom would be an interesting example to see. It seems that there will be a difference on the formation of a single hydrogen atom in the universe compared to formation of $N \gg 1$ hydrogen atoms.

RANDOMIZED RESPONSE TECHNIQUES AND ITS APPLICATION

Nilgün Özgül
nozgul@hacettepe.edu.tr

Hülya Çıngı
hcingi@hacettepe.edu.tr

Randomized Response(RR) is an interview technique that is used when sensitive questions are asked and respondents are reluctant to answer directly. in surveys on sensitive topics, respondents may decide not to reply at all or to incorrectly answer. The main use of randomized response technique(RRT) is to encourage respondents to respond, and then to provide truthful response in such a way that the real status of the respondent can not be identified. So, RRT is designed to reduce both response bias and non-response bias in such surveys.Warner, for the first time, introduced the RRT for the proportion of a population characterized by a sensitive variable. Later, many versions of RRT have been developed that can deal with binary responses. In this paper, we introduce various RRTs for the estimation of population proportion of sensitive variable. We illustrate one of these techniques with an original survey. We present the results of the original survey and we find out RRT is an effective technique on studying sensitive topics.

REAL ESTATE VALUE CHANGES ACCORDING TO FACTOR OF URBAN TRANSFORMATION

Şükran Yalpir
sarici@selcuk.edu.tr

Aslı Bozdag
aslibozdag@nigde.edu.tr

Urban areas are changing due to economical, social, cultural, physical and political reasons. In this process of change, it is important to increase the quality of life, restructure urban areas, reinvigorating economies of the cities, improve environmental values, and preserve historical values. In Turkey, urban transformation projects are being used as an important device in spatial planning applications to achieve these goals. However, the failure of distribution income which is constituted the dynamic of urban transformation studies have negative implications for the sustainability and eventual success of urban transformation in Turkey. Also determining real estate values objectively, truly and safely; is great importance for expropriations, land-area arrangements, taxing, distribution incomes, etc. process of the application.

In this study, urban transformation projects are examined with social, cultural and economical structure in the project process (before-after) in Meram Municipality one of the central districts of Konya/Turkey city. There are three completed, two continuing and three project phase urban transformation applications in Meram Municipality. Applications are investigated to get answer the questions of how, how much and what rate surrounding real estates' are effected from urban transformation. Also economical gainers and their rates are studied in the project areas.

In the studythese areas have become planned, high welfare level and proper for urban living. However people have had difficulty in adapting because of their cultural differences from new living environments. Also there has been a great increase in real estate values with urban transformation.

RELATIONSHIP BETWEEN STOCK MARKET INDICES AND GOOGLE TRENDS

Aysun Bozanta, Mustafa Coskun, Birgul Kutlu, Meltem Ozturan
aysun.bozanta@boun.edu.tr, mustafa.coskun@boun.edu.tr, birgul.kutlu@boun.edu.tr, meltem.ozturan@boun.edu.tr

Abstract: This study analyzes the relationship between stock market indices and Google trends. For this purpose, 12 stock market indices whose domestic market capitalization values are more than 1.5 billion USD were chosen. Their historical adjusted close values were collected in weekly basis for 2014 and 2015. Additionally, for the same period, weekly Google search data for those indices were collected. Results showed strong correlations between number of searches and rates of stock market indices. Correlation coefficients for relations are mostly positive which implies that the stock market indices are searched more while stock market values are increasing.

Keywords: stock market, stock market index, Google trends, search query

Introduction

Recent technological developments have connected people all around the world more than ever before and provide latest information about any progress instantly. People are likely to surf the web for information retrieval using search engines. Search engines have also been used for financial issues. Stock market movements are one of the popular topics that people especially investors want to monitor.

In June 2016, 70.16 percent of worldwide Internet users searched the web without bots using online search engine Google (NetMarketShare, 2016). It is claimed in literature that large scale online data can be the predictor of public perception on various contexts such as presidential elections (Tumasjan et al., 2010), commercial sales (Mishne & Glance, 2006; Choi & Varian, 2012), and influenza epidemics (Culotta, 2010). Thus, each rise or fall in stock markets may be reflected in Google searches by investors. The volume of queries in search engine can be used as a measure of investors' attention on the stock market (Da, Engelberg & Gao, 2011).

The volume of search queries for Dow Jones reached to eleven times greater than average search volumes when its volatility has become an almost record high of over 150% annualized on October 10, 2008 (Dimpfl & Jank, 2016). When Lehman Brothers disclosed bankruptcy in September 2008, the volume of Google searches on "Lehman" was 24 times higher than the average (Ramos, Veiga & Latoeiro, 2013). In November 2009, the number of submitted searches for "Dubai World" increased six-fold, when Dubai World rescheduled a debt due to accumulated losses (Ramos, Veiga & Latoeiro, 2013). After a year, when British Petroleum caused an environmental disaster in the Gulf of Mexico, the frequency of Google searches on "BP" became three-fold during this period (Ramos, Veiga & Latoeiro, 2013).

These facts show that financial actions may cause collective behavior in online environments. Therefore, the relationship between financial events and online behaviors has become an attractive topic for researchers. Various online data sources such as social media platforms and search engines were used to analyze different relationships. Twitter is one of the mostly used social media platform for this purpose. For instance, public mood states which were measured from Twitter were found as the predictive of changes in Dow Jones Industrial Average closing values (Bollen, Mao &, Zeng, 2011). Zhang, Fuehres and Gloor (2011) collected six-month Twitter feeds and analyzed collective hope and fear for each day. It is found that emotional tweet percentage significantly negatively correlated with Dow Jones, NASDAQ and S&P 500, but displayed significant positive correlation to VIX (Zhang, Fuehres & Gloor, 2011).

Online news sources are also analyzed whether they are the predictor of financial metrics. Gilbert and Karahalios (2010) used a blog dataset consisting a stream of all LiveJournal posts and shown that a broad index of mood from an online community has novel predictive information about the stock market. In another study, a positive correlation was found between the daily number of mentions of a company in the Financial Times and the daily transaction volume of a company's stock both on the day before the news is released, and on the same day as the news is released (Alanyali, Moat & Preis, 2013).

 Copyright © International Science and Technology Conference (ISTEC)

Search engine queries are other sources of information that can be used as the predictor of fluctuations in stock market indices. It was found that weekly transaction volumes of S&P 500 companies were correlated with weekly search volume of corresponding company names (Preis, Reith & Stanley, 2010). In a sample of S&P 500 firms over the period 2005-2008, it was found that, over a weekly horizon, online search intensity reliably predicts abnormal stock returns and trading volume, and that the sensitivity of returns to search intensity is positively related to the difficulty with which a stock can be arbitraged (Joseph, Wintoki & Zhang, 2011). Bordino and his colleagues (2012) shown that daily trading volumes of stocks traded in NASDAQ-100 were also correlated with daily volumes of queries related to the same stocks. In another study, the volume of Google search queries were found as the predictor of foreign currency rates (Smith, 2012). Another interesting study in 2013 showed that there is a relationship between subsequent stock market moves and the historic data relating to politics or business from the search engine Google and online encyclopedia Wikipedia, as well as judgments from the service Amazon Mechanical Turk (Curme et al., 2014). In particular, they found that increase in search volume of the topics tends to precede stock market falls. Arditi, Yechiam, and Zahavi (2015) analyzed the relationship between stock-specific events and associated Google searches using daily data of 13 stocks from the Dow-Jones and NASDAQ100 indices, over a period of 4 trading years. They found a correlation between the magnitude of stock returns at the beginning of the period and the volume, peak, and duration of search generated during that period. That study revealed that losses improved the fit between people's search behavior and the extent of real-world events triggering the search (Arditi, Yechiam & Zahavi, 2015).

In this study, the relationship between stock market indices and Google trends is analyzed. Since previous studies have mostly focused on stock market indices in USA such as NASDAQ or S&P500, this study aims to analyze stock indices from different countries.

Materials and Methods

As it is mentioned before, the main aim for this exploratory study is to find out possible correlations between stock market indices and Google Trends for a period of two years, 2014 and 2015. For this purpose, the biggest stock markets were chosen according to their market capitalization. Thus, December 2015 market capitalization value of 1.5 million USD was chosen as the cut off point for market capitalization. Then, based on the World Federation of Exchanges Members statistics, 12 stock market indices from America, Europe and Asia were chosen with domestic market capitalizations listed in Table 1 (WFE, 2016).

Table 1: Chosen Stock Market Indices and Countries

Stock Market Index	**Country**	**Domestic Market Capitalization Value (Dec, 2015)**
NYSE	USA	17,786,787.40
NASDAQ	USA	7,280,752.17
Nikkei225	Japan	4,894,919.10
SSE Composite Index	China	4,549,288.00
LSE.L	England	3,878,774.20
Shenzhen Stock Exchange	China	3,638,731.30
Euronext 100	European Union	3,305,901.40
HKEX	Hong Kong	3,184,874.20
Deutsche Boerse AG	Germany	1,715,800.50
TMX Group Limited	Canada	1,591,928.60
SIX Swiss Exchange	Switzerland	1,519,323.50
S&P BSE SENSEX	India	1,516,216.70

 Copyright © International Science and Technology Conference (ISTEC)

After stating the stock market indices for the study, the weekly adjusted close values of them were collected for a chosen time interval of 104 weeks, from first week of 2014 to last week of 2015. Since the trending search data for terms can be collected from Google Trends web site (GoogleTrends, 2016) in weekly time interval, the stock market data was collected in same proportion.

There are several sources in the World Wide Web for collecting finance data but for being consistent and reliable in the analysis, the most popular finance data source Yahoo Finance (YahooFinance, 2016) was chosen. The historical prices of the chosen stock markets were collected for 104 weeks from first week of 2014 to last week of 2015.

After collecting weekly stock market index data of those 12 biggest markets, the trending search data of them were gathered from Google Trend web site. In this perspective, the keywords were stated carefully for those stock markets. Accordingly, first of all, the official web sites of those stock markets were examined. Then, the official abbreviations of those stock market indices were used as trending data keyword. In fact, Google also informs users about the type of keyword while searching. Therefore, Google trend keyword type "stock exchange" and related country were chosen during trend data search.

Moreover, it should be stated that Google gives the search trend data in 1-100 scale. This means Google standardizes the search trend of the chosen term for the chosen time interval into a scale of 1 to 100. The most popular (trending) week is given a value of "100" and the others are declared accordingly.
Lastly, the main purpose of this study is to examine the possible predictive effect of Google trend on stock market indices. For this purpose, Google trend and following week's adjusted close values of stock market indices were gathered.

Results

Results showed the existence of correlation between adjusted closed values of stock market indices and their Google search volumes. Out of 12 separate correlations of different indices, 6 of them were positively correlated, 3 of them were negatively correlated and remaining 3 were not correlated with Google search volume data.

Table 2: Google Searching Trend vs. Adjusted Closed Values of Stock Market Indices

Stock Market Index	Country	Correlation Results		
		Pearson Correlation Coefficient	Significance (2 Tailed)	Direction of Relation
NYSE	USA	-0.076	0.445	-
NASDAQ	USA	-0.789	0.000**	Negative
Nikkei225	Japan	0.358	0.001**	Positive
SSE Composite Index	China	0.661	0.000**	Positive
LSE.L	England	-0.508	0.000**	Negative
Shenzhen Stock Exchange	China	0.211	0.033*	Positive
Euronext 100	Europe	0.452	0.000**	Positive
HKEX	Hong Kong	0.498	0.000**	Positive
Deutsche Boerse AG	Germany	-0.125	0.209	-
TMX Group Limited	Canada	-0.197	0.047*	Negative
SIX Swiss Exchange	Switzerland	-0.159	0.107	-
S&P BSE SENSEX	India	0.360	0.000**	Positive

* significant at 5% alpha level; ** significant at 1% alpha level

 Copyright © International Science and Technology Conference (ISTEC)

When domestic results sorted in terms of their correlation values, the most significant and the correlated one appears as NASDAQ. This result shows that NASDAQ index has the most impact on Google in terms of peak and trough points. Another finding for NASDAQ is that the correlation is negative which explains that when people search NASDAQ more, the adjusted close value decreases.

SSE Composite Index with correlation value 0.661 follows NASDAQ as the second mostly correlated index. However, its direction of correlation is positive which means when people search this index more than the adjusted close score is also increasing.

LSE.L which is London stock market index is negatively correlated with a correlation value of -0.508. HKEX, Euronext 100, S&P BSE SENSEX, Nikkei225, and Shenzen stock market indices are significantly correlated with related Google search volume data in a positive manner. Lastly, TMX Group Limited is negatively correlated with a correlation value of -0.197.

Discussion and Conclusion

Search engine query data provides great insights into many areas such as presidential elections, commercial sales, and influenza epidemics. Financial issues have been also studied with the data from search engines. In this study, the relationship between adjusted closed values of stock market indices and the search volume of related indices has been investigated. For this purpose, correlation analysis between adjusted close values of 12 stock market indices, of which daily domestic market capitalization values are more than 1.5 billion USD, and Google search volume data for those indices has been applied for the two year period, 2014 to 2015 on weekly basis.

The results of the correlation analysis showed that out of 12 market indices, 9 of them were significantly correlated and 3 of them were not.

One of the uncorrelated indices was NYSE. This might be because of the global structure of NYSE where the investment funds in NYSE are more about global companies and firms rather than individual players. The other two uncorrelated indices were Deutsche Boerse and SIX Swiss Exchange. The reason for these results could be the effect of Euronext that has been formed as a merger of the Amsterdam, Brussels, and Paris Bourse, in order to take advantage of the harmonization of European Union financial markets and which has become the possessor of the market capitalization value in Europe. Hence foundation of Euronext might have decreased the attractiveness of these two indices and therefore has affected their correlations with the Google search volume data.

When the significantly correlated market indices are considered, it was seen that, in line with the previous studies (Curme et al., 2014; Arditi, Yechiam & Zahavi, 2015), there were negative correlations for indices that have dominancy in the stock market. These indices are NASDAQ, LSE.L and TMX Group Limited.

For other countries rather than USA, Canada and England, positive correlations were found between stock market indices and Google search volume data which implies when there is an increase in search volume this may indicate an increase in stock market indices.

The main limitation of the study is the weekly collection of stock market index value due to the weekly retrieval ability of Google search volume data. For this reason daily correlation analysis could not be applied.

In this study, Google search volume data was used as the predictor of stock market index which was measured one week after Google trends. In future studies, this analysis may be applied for other time horizons. On the other hand, only the names of stock market indices were used as the keywords in Google search queries. Other keywords such as names of companies related to those indices can also be used and their effect can be investigated.

RELEVANT TERMS AND XML DOCUMENTS RELEVANT: RESEARCH AND EXTRACTION.

Abdeslem Dennai
De_selam@yahoo.fr

Three classes of documents, based on their data, circulate in the web: Unstructured documents (.Doc, .html, .pdf, ...), semi-structured documents (.xml, .Owl ...) and structured documents (Tables database for example). A semi-structured document is organized around predefined tags or defined by its author.

However, many studies use a document classification by taking into account their textual content and underestimate their structure. We attempt in this paper to propose a representation of these semi-structured web documents based on weighted vectors allowing exploiting their content for a possible treatment. The weight of terms is calculated using: The normal frequency for a document, TF-IDF (Term Frequency - Inverse Document Frequency) and logic (Boolean) frequency for a set of documents. To assess and demonstrate the relevance of our proposed approach, we will realize several experiments on different corpus.

Keywords: Semi-structured web document, term weighting, term frequency, TF-IDF and logic frequency

ROBUST NETWORK FLOW PROBLEM WITH TWO MULIPLICATIVE OBJECTIVE COEFFICIENT

Taehan Lee
myth0789@jbnu.ac.kr

Keunho Lee
lk00@jbnu.ac.kr

We consider the robust minimum cost network flow problem with two multiplicative objective coefficient under the interval uncertainty. In minimum cost network flow problem, we assume that the flow cost of an arc is the multiplication of two factors and the factors have independent uncertainty. Bertsimas and Sim have studied the robust problem with uncertainty of single objective coefficient. They show that an approximate solution can be obtained by solving nominal problems. The robust shortest path problem under the uncertainty of two multiplicative objective coefficient is performed by Kwon et al. In this paper, we give the counterpart of the robust optimization problem and we show that the inner problem can be transformed to a nominal minimum cost network flow problem under some conditions. And we show that an approximate optimal solution can be obtained by solving the nominal problems repeatedly. The uncertainty of two factors can be considered that they are not independent. Then we use the multiplication of the two factors as a single coefficient. To check the validity of the independent uncertainty, we give the comparison results between the two cases with randomly generated data.

Abstract: Technological developments on wireless communication systems and sensors productivity-enhancing wireless sensor networks have led the development of new algorithms. Wireless sensor devices (nodes) were developed along with the use of these two cases, and data collected has been achieved forwarded to a central location. Studies in the literature were shown that, WSN (wireless sensor networks) systems are focused on the detection the position of the nodes in the network and worked for energy efficiency. One of the major activities in the wireless sensor network is to create their own organizing clusters with selected cluster head, each cluster can send the data. Cluster head selection is based on a random number that is above the threshold value is calculated by the addition of the number, etc. parameters of nodes in the network or having highest energy value. In this study, the cluster head selection is performed by calculating a distance between nodes in the cluster. Distance information is obtained from RSSI (Received Signal Strength Indicator). Each node in the network, all nodes can communicate with them on the record and finds the average RSSI level. The highest average per cluster node is selected and published in this case to the other node. The cluster head node will include its own cluster the node that is lower than the average RSSI. Cluster head selection and clustering process continues with iterations until all nodes clustering in the network. Experimental studies conducted with simulation program developed C # .net environment and network efficiency are investigated. In the results, the cluster is first created which settled in the center of the network, and the center population was determined to be more than others. In this case, a threshold value must be determined for correcting the data next to the average RSSI. So, accordingly the necessity of re-aggregation network is detected.

Keywords: RSSI, clustering, Wireless Sensor Network

Introduction

Wireless Sensor Networks (WSN) that on sensor, battery, processor and communication unit which is to collect data from the environment they have created networks of small nodes. Wireless Sensor Networks aim of Madiran delivered to the collection point of data collected from the environment. The studies in the literature on this topic can be collected in the localization and energy efficiency, data routing. One of the important work areas in WSN is to select a cluster head (CH) in self-organized clusters create their own clusters and each cluster can send the data. Clustering algorithms basic principle, the energy of the nodes in the network to select a CH in order to use the highest efficiency and the data are included in the set is based on its submission to him. If the selected cluster head transmits data from the central node.

Cluster head (CH) selection on the calculated energy to generate a random number with the participation threshold of parameters such as the number of nodes in the CH node or that the network is based on a high. But choosing themselves a CH node of a clustering algorithm clusters close to each other based on the distance from the node would lead to less energy will be more accurate than logically. When analyzed studies on the subject, which appears to be related to the selection algorithm Leach per cluster. LEACH algorithm was developed in 2002 by Heinzelman and CH selection was built. In another study that was made by Heinzelman in the same year, due to the not to be homogeneous distance between CH and nodes in cluster, the CH of the energy efficiency of the nodes has been mentioned is low (Heinzelman, 2002). There are studies about the measurement of the battery capacity with distance information and the distance estimation between nodes and determine the position of movable

objects in confined spaces with RSSI. (Arias, 2004, Saxena, 2008, Chung, 2009, Wessels, 2010, Blumrosen, 2010, Faheem, 2010, Blumrosen, 2013, Chakrabortya, 2013, Zheng, 2011, Heurtefeux and Velois, 2012).

In a study conducted in 2015 by Kannan, RSSI value between the central station and node is taken and the average RSSI value has been calculated for the selection of CH. Energy levels and the average RSSI value of the node to obtain a threshold value are added together. If the average RSSI per cluster node is above this threshold value is selected. Clustering is carried out by the center (Kannan,2015).

An alternative method is presented for the selection of clusters head in the network with RSSI data in a study conducted by Fazackerley. Simulation studies related to work was performed and was compared with Leach algorithm. Nodes was calculated the average RSSI data from the node in around and gets the P_{fact} value. If P_{fact} value is above the predetermined value $RSSI_{thres}$ then this node is the CH node (Fazackerley, 2009).

As a result of analysis of the literature, RSS data between nodes in a wireless sensor network; routing the data transmitted to the central station, finding location of the nodes in the network and is used for the purpose of election of the head of the network cluster to cluster. In this study, a clustering algorithm is proposed for CH selection and clustering with RSSI values of the network. The proposed algorithm consists of two main parts. The first part, the selection of CH node will be the creation of clusters and the other. CH selection was provided with development of Kannan (2015) algorithm.

Materials and Methods

Cluster Head Selection

CH selection algorithm implemented at once spread to areas of the network has been developed in accordance with self-organizational approach. For CH selection, each node communicates with other nodes for obtaining average value of $RSSI_{avrg}$. Value $R\square SI_{avrg}$ is obtained by the equations given in Equation 1.

$$RSSI_{avrg} = \begin{cases} \sum_{k=1}^{n} \frac{RSSI_k}{n} & n > 0 \\ \infty & n = 0 \end{cases} \quad \text{(1) Kannan(2015)}$$

Here; n the number of nodes being communicated, the $RSSI_k$ value represents the RSSI value of *k.th* nodes. Nodes that calculate average $RSSI_{avrg}$ transmits their average to network. All nodes repeat the same process and records the average $RSSI_{avrg(i)}$ values from the other nodes. This is an average; it is likely to be the most effective parameters of the CH node. If $Node \quad RSSI_{avrg} < RSSI_{avrg(i)}$, $i.th.$ node becomes the CH node.

Clustering Algorithm

In this phase, the selected CH defines its own set. CH, compares the value of $CH_{RSSI_{avrg}}$with $RSSI_i$ values between other nodes that are stored in the memory. If $RSSI_i < CH_{RSSI_{avrg}}$, $i.th.$ node would be included in the cluster nodes. This process continues until all nodes clustering in the network. Clustering algorithm flow chart is given in Figure 1.

Results and Discussion

Experimental studies in order to see quick results of the algorithm are made by developed simulation program. Nodes are derived by adding the memory unit, the microcontroller and transmitter / receiver units. The register units are planned in the memory unit containing the identification information, the distances between other nodes and CH ID information. Randomly distributed nodes simultaneously employ algorithm specified in the Material and Methods section. Experimental studies were performed on four different networks consisting 10, 20, 50 and 100 nodes. Each node was assumed to be able to communicate there between. Distance between nodes is treated as RSSI data. CH selection and clustering capacity of 4 different networks consisting of 10, 20, 50 and 100 nodes is shown in respectively Figure 2, Figure 3, Figure 4 and Figure 5. Selected CHs in the network are indicated with a circle formed. Also cluster heads and with the number of nodes that are subject to them, and as Table 1, Table 2, are given in Table 3 and Table 4.

The simulation results of clustering and network characteristics are examined, it is seen that in a number of different iterations of the network cluster. Looking at the corresponding table showing the distribution of the network node of the cluster was observed within the first iteration of the population is higher than others. This will increase the data density of traffic throughout the cluster and the CH job. It will also cause decreased efficiency of the network and will negatively affect the energy efficiency of nodes. Also, in previous iterations of the nodes included in a cluster, in subsequent iterations have been observed at a distance closer to the other CH is selected.

 Copyright © International Science and Technology Conference (ISTEC)

Conclusion

In this study, an algorithm has been developed to selection of CH with RSSI values and clustering of the network. Algorithm results have been observed that in a successful by not leaving outside any node cluster in the network. However when node count increases in the network, the node populations of the first cluster were found to be too high of the others. In addition, the number of clusters to be created cannot be interfered with. In addition, the number of clusters to be created cannot be interfered with. For optimizing the number of nodes in the cluster to remove and eliminate these drawbacks, which must be on the set $Node \quad RSSI_{avrg} < RSSI_{avrg(i)}$ it has been identified the need to update the rules. In future studies, the desired number of clusters to be created, a threshold value is calculated using the number of nodes in the cluster so the network parameters to be included in the rules is planned to examine the clustering efficiency.

[(2)] *King Abdulaziz City for Science and Technology (KACST) (Saudi Arabia).*

The lack of sufficient available water resources has already affected every continent and thus represents a significant global problem. In the last years, desalination of sea- and brackish water to obtain sweet water in arid regions has gained a growing interest [1]. In this context, membrane distillation is able to efficiently treat also high concentrated brines, allowing to increase the overall fresh water production with respect to actual reverse osmosis plants [2].

For desalination purposes the MFI zeolite topology is appropriate having a pore size (about 5.5 Å) lower than the major kinetic diameters of different hydrated ions.

In this work, for the first time, tubular silicalite (MFI) membranes with a length of 30 cm were prepared using the secondary growth method coupled with the cross flow seeding procedure. Subsequently, the prepared membranes were characterized and then applied in desalination process by vacuum membrane distillation to verify if their performance was comparable to that of shorter membranes [3].

The obtained results showed that it is possible to reach a good reproducibility in the preparation of uncalcined defect-free membranes and a remarkable performance in desalination by VMD for feed salt concentrations in the range of 0.2 M-0.9 M.

SCREENING OF PKS/NRPS GENE REGIONS ON MARINE DERIVED ACTINOBACTERIA

Kadriye ÖZCAN

Giresun University, Faculty of Engineering, Department of Genetic and Bioengineering, Giresun - TURKEY

kadriye.ozcan@giresun.edu.tr

Abstract: Marine derived actinobacteria are very valuable organisms because of unique abillities. The goal of this study was to investigate potential of production bioactive metabolite from marine derived actinobacteria. Eight actinobacteria were screened by PCR based techniques. Results showed that many isolate positive for NRPS (62,5%) and PKS (37,5%) genes. According to the PCR screening marine erived actinobacteria from Black Sea have significant biosynthetic potential. As a results highlighted that marine sediments represented potential sources for discovery of bioactive secondary metabolites.

Keywords: PKS,NRPS, PCR screening, actinobacteria

Introduction

Actinobacteria are gram positive bacteria wih high G+C content. Actinobacteria are known for their unique ability to produce novel compounds of clinical and pharmaceutical importance (Li&Vederas,2009). Through the many actinobacterial genera, *Streptomyces*, *Micromonospora*, *Nocardiopsis*, and *Rhodococcus* are the most efficient producers of secondary bioactive metabolites (Reimer et al., 2015). Actinomycetes are found in a variety of habitats and are particularly abundant in soil. Because of the exhaustion of the usual terrestrial sources, the discovery rate of new compounds from actinobacteria has steadily decreased and the re-isolation of known compounds was subsequently increased. This progress has led to a declining trend in the discovery of unknown natural products derived from microorganisms (Khan et al., 2010; Lam, 2006; Watve et al., 2001) For this reason, efforts focused increasingly on expanding the isolation sources beyond just terrestrial soils.

The marine biosphere is one of the earth's richest innumerable habitats and is expected to be an excellent sampling point due to microbial diversity in the seawater and sediment (Berdy, 2005; Fenical and Jensen, 2006). It has been shown that marine actinobacteria species are physiologically and phylogenetically distinct from their terrestrial relatives, and were found to represent a rich source for novel, chemically multifarious bioactive secondary metabolites with potential applications in antimicrobial and anticancer therapy (Bull et al., 2005; Lam, 2006; Maldonado et al., 2005). Marine actinomycetes produced a multitude of novel lead compounds with medicinal and pharmaceutical applications (Becerril-Espinosa, 2013). Although research on marine actinobacterial natural products is still at its early stage compared to what is known about terrestrial relatives, the enormous potential of marine strains as producers of bioactive secondary metabolites has already been proven and till date it remains matchless (Lakshmipathy et al., 2010).

Various natural products belong to the chemical families polyketides and non-ribosomal peptides (Droghazi & Metcalf, 2013). Polyketide synthases (PKS) and nonribosomal peptide synthetases (NRPS) are multi-domain megasynthases that are involved in the biosynthesis of a large fraction of diverse microbial natural products known as polyketides and nonribosomal peptides, respectively (Donadio et al., 2007). Besides, PKS and NRPS gene region screening on genome use for determine bioactive secondary compounds. In this way, ability of bioactive compounds production of microorganism are determined (Pathom-Aree, 2006). Marine derived actinobacteria have PKS and NRPS pathways for secodary metabolite production. For this reason they have ability of production diverse components as terpens, terpenoids, polyketides, peptids, caprolactones, quinons and alkaloids (Solanki et al., 2008).

Marine derived actinobacteria that obtained from Black Sea sediments were investigated in terms of potency of secondary metabolite pruduction by using PCR based approach in this study.

Materials and Methods

Actinobacteria strains

Eight marine derived actinobacteria strains that have antimicrobial activity in our lab were selected for PCR screening

DNA isolation

DNA isolation from actinobacteria was done by using Fast Spin DNA Isolation Kits (MP) with instruction manual.

PCR screening

i. NRPS gene region screening

Two primer sets A3F/A7R and ADEdom5/ ADEdom3 (Table 1) were used for PCR screening of NRPS gene region. All PCR reactions were performed 50 µl total volume. The PCR mixture was contained 10 µl 10X PCR buffer, 2 µl each primer (10 pM), 2 µl dNTPs (10 mM), 3 µl $MgCl_2$, 0.25 µl Taq DNA polymerase (5 U/µl; GoTaq Hot Start DNA polymerase), 1 µl genomic DNA, and 5 µl DMSO. To amplify the 450 bp segment encoding the NRPS, we used the primers ADEdom5 (5'- ACSGGCNNNCCSAAGGGCGT-3') and ADEdom3 (5'-CTCSGTSGGSCCGTA-3') (Busti, 2006). PCR conditions that after a 5 min incubation at 94 °C, 10 cycles (each of 1 min at 94 °C, 45 s at 50°C and 1 min at 72 °C) were followed by 20 cycles under identical conditions, except that the annealing temperature was raised to 55 °C. All PCR reactions were terminated with a 5 min elongation at 72 °C. To amplify the 700-800 bp segment encoding the NRPS, we used the primers A3F(5'-CSTACSYSATSTACACSTCSGG-3') and A7R (5'-SASGTCVCCSGTSCGGTAS-3') (Ayuso-Sacido, 2005). After a 5 min incubation at 94 °C, 30 cycles (each of 1 min at 94 °C, 1min at 58 °C and 1 min at 72 °C) All PCR reactions were terminated with a 5 min elongation at 72 °C.

ii. PKS gene region screening

K1F/M6R primers (Table 1) were used for PCR reactions. PCR reactions were performed 50 µl total volume and PCR mixture was contained 10 µl 10X PCR buffer, 2 µl each primer (10 pM), 2 µl dNTPs (10 mM), 3 µl $MgCl_2$, 0.25 µl Taq DNA polymerase (5 U/µl; GoTaq Hot Start DNA polymerase), 1 µl genomic DNA, and 5 µl DMSO. To amplify the 1200-1400 bp segment encoding the PKS, we used the primers K1F (5'-TSAAGTCSAACATCGGBCA-3') and M6R (5'-CGCAGGTTSCSGTACCAGTA-3') (Ayuso-Sacido, 2005). After a 5 min incubation at 94 °C, 30 cycles (each of 1 min at 94 °C, 2 min at 58 °C and 1.5 min at 72 °C) All PCR reactions were terminated with a 5 min elongation at 72 °C.

Table 1: Primers and their feature

primers	sequences	target gene	amplicon lenght (bp)	literature
K1F	5'-TSAAGTCSAACATCGGBCA-3'	PKS	1200-1400	Ayuso-Sacido, 2005
M6R	5'-CGCAGGTTSCSGTACCAGTA-3'

Results and Discussion

PKS and NRPS screening are used as a collateral strategy for discovering bacterial natural product diversity (Pathom-Aree, 2006). Because natural product diversity are a reflection of bacterial genetic diversity. Prescreening of these target genes are beneficial approach for determine to new and useful secondary metabolites (Ketela et al., 2002). In this study eight strains were used for PCR based screening. Firsty, NRPS PCRs were done using A3F/A7R primers sets and appropriate conditions (Table 1). But PCRs were not run. For this reason other primer sets were tried for NRPS. ADEdom5/ ADEdom3 primers (Table 1) were used for NRPS PCR and 5 positive bands (≈450bp lenght) were detected on %1 agarose gel (Table 2). K1F/M6R primers (Table 1) were used for PKS PCR and 3 positive bands (≈1200-1400bp lenght) were were detected on %1 agarose gel (Table 2).

Table 2: PCR results of target genes

Actinobacteria strain	PKS PCR (K1F/M6R)	NRPS PCR (A3F/A7R)	NRPS PCR (ADEdom5/ ADEdom3)
S1	-	-	-
S2	-	-	-
S3	-	-	-
S4	+	-	+
S5	+	-	+
S6	-	-	+
S7	+	-	+
S8	-	-	+

According to results, many isolate were found positive for NRPS (62,5%) and PKS (37,5%) genes. Besides PKS and NRPS were found with together some samples (37,5%). Thus this marine derived actinobacteria have a great potantial for production of bioactive secondary metabolites.

Conclusion

PCR screening of PKS or NRPS gene regions were not functional strategy. On the contrary of fermentation based studies, active compounds were not isolated at the end of the PCR screening. But prescreening of these gene regions were found very effective approach for genetic research. Results of PCR screening can use for upper studies. Also these results might be guide similar studies

SEISMIC BEHAVIOR OF MULTI-STORY REINFORCED CONCRETE BUILDINGS WITH SHEAR WALLS ALONG THE PERIMETER OF BUILDING

Nihat Cetinkaya
ncetinkaya@pau.edu.tr

Mohamad Kinan Othman
limitless.company@gmail.com

The use of reinforced concrete shear walls for seismic resistant design of multi-story, tall buildings is becoming a most efficient method. Most effective location of the shear walls in plan is along the perimeter of the buildings. These shear walls may have openings for Windows.

In this study, 5, 10, 20 and 30 story reinforced concrete buildings with frame and Frame and Shear Wall systems are modelled. The models are prepared 3 dimensionally. Analysis is performed with ETABS which uses the Finite Element Method. Response spectrum analysis and Equivalent static load methods are used for seismic load calculations.

The period, lateral displacement, shear force, bending moment, stiffness values are obtained from the analysis for all the models and compared with each other. The results are given in detail on graphs.

ÖZET

Akıllı telefonlar ile GPS uyduları sayesinde coğrafi konum bilgileri elde edilebilmektedir. Ancak GPS uydu sinyalleri kapalı olmayan alanlarda alınabilmektedir. Kapalı alanlarda ve sık ormanlık yerlerde uydu sinyalleri sağlıklı bir şekilde alınamadığından, GPS ile konum belirlemek olanaksız hale gelmektedir. Yeterli GPS sinyali alınamayan yerlerde konum bilgisi elde etmek için farklı yöntem ve teknolojiler geliştirilmiştir. Bu teknolojilerden birisi de bluetooth düşük enerji teknolojisi ile çalışan, belirli bir mesafeye kadar ayırt edici veriler (UUID, Majör, Minör) göndererek kapalı veya açık alanda konum belirlemede kullanılabilen iBeacon' lardır. Yapılan çalışmada iBecaon yardımı ile çalışma ofisi konumlarına göre öğretim elemanı ders programı, izin durumu, müsait olup olmadığı, uzmanlık alanı, özel mesajı vb. gibi birçok bilgi ofise yaklaşınca otomatik olarak elde edilebilmektedir. Sistem Android tabanlı mobil telefon bluetooth iletişim yardımıyla iBeacon'dan elde edilen UUID, Majör, Minör verileri kullanılarak istenen personel bilgileri sunucu bilgisayardan web servisleri yardımıyla elde edilerek gösterilmiştir. Personel, kendi akıllı cep telefonundan kendi bilgilerini ve durumunu güncelleyebilmektedir. Geliştirilen yazılım, iBeacon, android uygulaması, veri tabanından ve web servisi sunucusundan oluşan entegre bir sistemdir.

Anahtar kelimeler: Android, iBeacon, Web Servis, Bluetooth Low Energy, Kampus Otomasyon.

ABSTRACT

Location data is available thanks to mobile phones and GPS satellites however, its signals can only be received within open field. Since satellite signals cannot be received properly in closed areas or dense forests, determining location with GPS is impossible. Different methods and technologies have been developed to obtain coarse location data where GPS signals cannot be received. One of these technologies is iBeacon which operates with low energy technology and sends distinctive data (UUID, Major, Minor) up to a designated range used in open fields and closed areas. In the study conducted, information such as teaching staff syllabus, vacation status, availability, expertise, private messages etc. will be received automatically with proximity. The system is to show the data acquired from UUID, Major, Minor with the help of iBeacon to android based mobile phones via the web services of the server. Teaching staff will have the ability to input personal data via the his/him smart mobile phone/tablet. The software developed, is an integrated system of iBeacon, android application, database and web services server.

Keywords: Android, iBeacon, Web Service, Bluetooth Low Energy, Campus Automation.

GİRİŞ

Akıllı cep telefonlarının gelişmesi ile birlikte, kullanım alanları da artmıştır. Günümüzde cep telefonları; eğitim, sağlık, eğlence, sosyal medya, oyun, pazarlama, bilgi edinme gibi pek çok alanda kullanılmaktadır. Dolayısıyla cep telefonu pazarı en hızlı büyüyen sektörlerden biridir (IDC,2015). Andrew (2105) aktardığına göre cep telefonuna 2014 yılında 901 milyar dolar harcanmıştır ve bu hızla devam ederse 2019 yılına kadar bunun 1.2 trilyon dolar olacağı tahmin edilmektedir.

Akıllı mobil cihazların yaygınlaşması ile birlikte cihazların işlevsel özellikleri ve mobil uygulama programlarının çeşitliliği, etkinliği ve kullanım alanları artmıştır. Günümüzde akıllı cep telefonları; ışık, basınç, sıcaklık, yerçekimi, konum, jiroskop vb. gibi algılayıcıların entegre hale gelmesiyle, çevresi ile etkileşim kurabilen interaktif cihazlar halini almıştır. Bunun yanında elektronik bileklik, RFID (radio-frequency identification – radyo frekansı ile tanımlama), beacon gibi harici cihazlarla (giyilebilir cihazlar) da iletişim kurarak kendisine çok farklı kullanım alanları oluşturmaktadır. Cep telefonu konuma bağlı bilgi edinme teknolojileri kullanarak, yol tarifi, bilgi edinme, yakındaki bulma vb. gibi birçok farklı uygulama alanı bulmuştur.

 Copyright © International Science and Technology Conference (ISTEC)

Halen cep telefonu ile konuma bağlı işlem yapmak için farklı tekniklerden yararlanılmaktadır. Bunlardan birisi; global konum belirleme (Global Positioning System -GPS) uyduları sayesinde bir-iki metre hassasiyetinde küresel konum belirleme işlemi yapılabilmektedir (Misra ve Enge, 2011). Ancak GPS uydu sinyalleri kapalı alanlarda yeterince alınamadığından, u gibi yerlerde konum bulma işlemi sağlıklı olamamkatadır (Gast,2014,p:3,6). Mobil telefon ile konum belirlemek için GPS sinyallerini yanında onun kadar hassas ölçüm yapamayan, kabaca yer belirlemek için baz istasyonları ve internet bağlantısından faydalanılmaktadır. Kapalı yerlerde hassas konum bilgisi elde edebilmek için beacon gibi teknolojilerden faydalanılır. Beacon Apple firması tarafından geliştirilmiş (iBeacon) bluetooth düşük enerji (Bluetooth Low Energy-BLE) teknolojisi ile iletişim kuran, belirli bir mesafeye kadar ayırt edici veriler (UUID, Majör, Minör) göndererek kapalı veya açık alanda konum belirlemede ve yaklaşım tabanlı uygulamalarında kullanılabilen elektronik bir cihazdır (Gast,2014). GPS ile daha çok neredeyim, Beacon ise mikro mesafeler (birkaç santimetreden birkaç metreye kadar), ne kadar yakınındayım için daha iyi sonuçlar elde edilebilir (Kohne ve Siech, 2014). iBeacon farklı amaçlar için kullanılabilmektedir. Köhne ve Sieck (2014), hava alanında birden çok kişinin valizinin, iBeacon teknolojileri kullanarak akıllı cep telefonu ile takibini gerçekleştirmişlerdir. Yang, Wang ve Zhang (2015), hastane kapalı ananında, servisler ve hasta odalarını konum bilgisine göre hasta bilgilerini elde edilmesi iBeacon teknolojisi ile yapmışlardır. Merode, ve diğ. (2015), çalışmalarında, kampüsün belirli noktalarına yerleştirilen iBeacon'lar ile konum hakkında cep telefonu üzerinden bilgi alınmasını sağlamışlardır. Li (2016) yüksek lisans tezinde hastanede hemşire ofisleri bina içi navigasyonu iBeacon teknolojileri yardımı ile gerçekleştirmişlerdir.

Bu çalışmada; kampus içerisinde açık/kapalı alanlarda, öğrencilerin veya misafirlerin akademik veya idari personel ofisine yaklaşınca, akıllı cep telefonu/tablet marifetiyle otomatik bilgi edinebilmesi sağlayan, bu bilgileri personel kendi akıllı cep telefonundan istediği zaman güncelleyebildiği dinamik bir yapı iBeacon teknolojileri kullanılarak web servisi destekli, Android tabanlı mobil uygulama geliştirilmiştir.

BEACON TEKNOLOJİLERİ

iBeacon cihazı Apple firması tarafından ilk defa 2013 World Wide Developer Conference (WWDC) duyurduğu Bluetooth Low Energy (BLE, Bluetooth 4.0) teknolojisini kullanan kendine özgü veri protokolü olan, yaklaşım temelli giyilebilir bir cihazdır. iBeacon, bir takım kimlik bilgiler içeren, tek yönlü sinyal yayan, bir adet yassı pil (saat pili) ile yıllarca çalışabilen, içerisinde işlemeci bulunan elektronik bir aygıttır (Şekil-1). Bluetooth 4.0 destekleyen, iBeacon algılama uygulaması olan herhangi bir cihaz, iBeacon kapsama alanına (bölgesine) girdiğinde çevresindeki iBeacon'ları algılayabilir.

Şekil-1. Estimote iBeacon yapısı (Blagdon, 2013).

Tablo-1'de görüldüğü gibi bir iBeacon veri protokolü toplam 25 Byte uzunluğunda veri ile temsil edilir (Köhne ve Sieck, 2014). Protokol verisini iBeacon üretici bilgisi ve içerik bilgisi olarak ele alırsak: Üretici bilgisi bölümünde; farklı üreticilere ait iBeacon ve farklı iBeacon tiplerini belirtir. Bu alanlar iBeacon ile işlem yaparken gerekli değildir. Daha çok ürün hakkında bilgi edinmek için kullanılır. iBeacon içerik bölümünde ise, herhangi bir iBeacon tanımlama bilgileri (ID) ile birlikte yayın mesafesini belirleyen *RSSI (Received Signal Strength Indication Mesaurement Power)* bilgileri mevcuttur. iBeacon veri formatını şu şekilde açıklayabiliriz;

Company ID (Üretici Firma Tanımlama Bilgisi): 16 Bit uzunluğundadır. iBeacon üreticilerinin kimlik bilgisini gösterir. iBeacon teknolojileri Apple firması tarafından lisanslandığından, farklı firmalar iBeacon üretmek için Apple tarafından üretici firma ID numarası almalıdır.

Type: Farklı tiplerde iBeacon üretilebilmesi için kullanılan 1 Byte uzunluğunda bir alandır.

Data Length: iBeacon içerik uzunluğunu belirtir. iBeacon içerik veri uzunluğu 21 Byte olduğundan buradaki değer 21Byte değerinin onaltılı sayı sistemi karşılığı olan 0x15'dir.

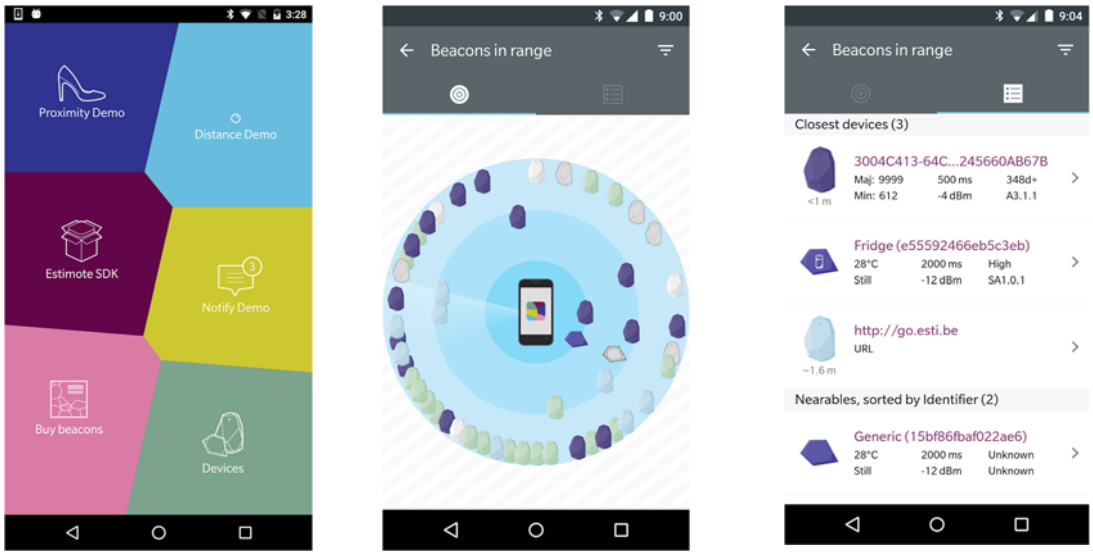
 Copyright © International Science and Technology Conference (ISTEC)

iBeacon ile bir tanımlama yapılacaksa "beacon içerik verisi" alanında bulunan 21 Byte uzunluğunda, kimlik bilgisi (ID) olarak adlandırılan UUID, Majör, Minör verilerinden faydalanılır. Tablo-1'in son 21 Byte'lık alanı (RSSI hariç) bu iş için kullanılır. iBeacon içerik verisi için kullanılan veriler şu şekilde açıklanır;

Universal Unique Identifier (UUID): 128 Bit uzunluğunda ve eşsiz (unique) bir değerdir. Tanımlamada en üst kimliği ifade eder.

Majör: 16 bit uzunluğunda bir alandır. Bir alt kimliği veya grubu ifade eder. Bu alan 0 (reserve) hariç 1 ile 65535 arasında bir değer verilebilir. Başka bir deyişle Bir UUID altında 65535 farklı Majör alt grubu tanımlanabilir.

Minör: En alt grubu ifade eder. 16 bit uzunluğundadır. Dolayısıyla 1- 65535 arasında değer alabilir 0 değeri rezervedir. Her Majör değeri için 65535 farklı minör değeri tanımlanabilir.



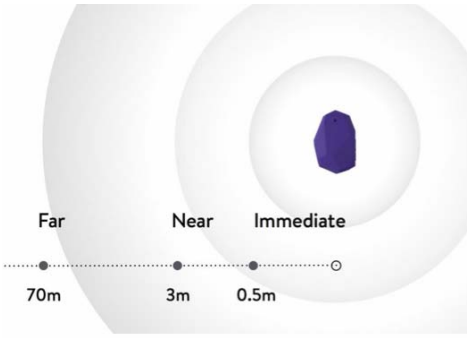
20 Byte uzunluğundaki iBeacon içerik verisi (UUID, Majör, Minör) ürün/personel kimlik tanımlaması için kullanılır. Tablo-2'de görüldüğü gibi UUID üst kimliği ifade eder. Öreğin;C743365A-C141-4C43-8A45-E258F7755D5B UUID değeri X firmasını temsil etmektedir. Majör değeri bir grubu ifade eder. Tabloya göre Majör değeri X firmasının illerdeki mağazalarını göstermektedir. Minör değeri ise her bir Majörün bir alt kimliğini temsil etmektedir. Tablo-2'ye göre Minör değerleri, X firmasının her ildeki; Giyim, Beyaz Eşya, Elektronik, Mobilya gibi alt gruplarını oluşturur. Örneğin; UUID: C743365A-C141-4C43-8A45-E258F7755D5B, Majör:2 ve Minör:30 şeklindeki kodlanmış bir iBeacon ID değeri, X firmasının Ankara şubesindeki Elektronik eşyayı gösterir. UUID, Majör, Minör kimlik tanımlama değerleri varsayılan olarak üretici firma tarafından belirlenmiştir. Ancak bu değerleri üretici firmaların özel uygulama yazılımları yardımıyla değiştirmek mümkündür. Yapılan çalışmada kullanılan Estimote marka iBeacon'ların UUID, Majör ve Minör değerleri, Estimote Android (Şekil-3) uygulaması (GooglePlay,2016) ile değiştirilerek kullanılmıştır (Şekil-7.B).

Tablo-1. iBeacon veri formatı yapısı.

Üretici bilgileri ile birlikte iBeacon içeriği						
Üretici bilgileri			Beacon içerik verisi			
Company ID(0x004C) 2 Byte	Type (0x02) 1 Byte	Data Length (0x015) 1 Byte	UUID 16 Byte	Majör 2 Byte	Minör 2 Byte	Measured Power 1 Byte

Tablo-2.X firması ürünleri iBeacon kodlaması

Konum		İstanbul	Ankara	İzmir	Adana
UUID		C743365A-C141-4C43-8A45-E258F7755D5B			
Majör		1	2	3	4
Minör	Giysi	10	10	10	10
	Beyaz Eşya	20	20	20	20
	Elektronik	30	30	30	30
	Mobilya	40	50	50	50



Şekil-3.Estimote Android-iPhone uygulaması arayüzü (GooglePlay,2016)

 Copyright © International Science and Technology Conference (ISTEC)

RSSI (Received Signal Strength Indication) Mesaurement power (8 bit): RSSI, iBeacon yayın alanı mesafesini belirlemek için kullanılır. Yüksek çıkış gücü daha uzak mesafe yayın alanı ancak daha kısa pil ömrü demektir. Sinyal yayma sıklığı ile ilgili olarak; daha sık sinyal daha kararlı çalışmayı getirir ancak daha fazla enerji tüketecektir. Bu değerler üretici firma özel uygulaması yardımıyla değiştirilebilmektedir. Çalışmada kullanılan Estimote marka iBeacon sinyal gönderme periyodu 100 ms ile 2000 ms arasındadır. Bu değer iPhone veya Android tabanlı akıllı cep telefonum/tablet üzerinde çalışabilen Estimote uygulaması (Şekil-3) ile izlemek ve değiştirmek mümkündür.

Bir iBeacon algılayıcı cihazın iBeacona olan mesafesini tam olarak hesaplamak tam olarak mümkün değildir. Bu yüzden tam bir mesafe hesaplamaktan daha çok; dibinde, yakınında, uzağında gibi ölçekler kullanmak daha uygundur. Dibinde (immediate): 0.5 metreye kadar olan mesafede, yakınında (near): 3 metre mesafeye kadar olan yayın alanı, uzağında(far): 70 metreye kadar olan mesafe ve 70 metreden daha uzak mesafede ise bilinmiyor (unknown) gibi ölçekler kullanılır (Şekil-2). Bu mesafeler arada herhangi bir engel yok ve açık alan için geçerlidir.

Şekil-2. Estimote iBeacon etki alanı (Estimote, 2016.B)

iBeacon Özellikleri

1. Apple firması lisanslıdır ve 2013 yılında ilk defa tanıtılmıştır.
2. Bluetooth Low Energy (Bluteooth 4.0, 2.4 GHz) iletişim sağlar.
3. BLE-Chip 'e sahip herhangi bir cihaz iBeacon olarak kullanılabilir. Örneğin: BLE-USB Stick, Ardunio board, Rasspberry ve hatta bir cep telefonu,
4. Eğer bir cihaz iBeacon olarak kullanılacaksa Apple firmasından lisans alınması gerekir.
5. ID ve mesafe ölçüm bilgisi RSSI olarak tek yönlü sinyal yayar.
6. iBeacon ile karşılıklı iletişime geçilemez. Sadece üretici firma uygulamaları vasıtasıyla UUID, Majör, Minör bilgileri gibi bir takım ayarlamalar yapılabilir.
7. Sinyal yayama periyodu (100 ms ile 2000 ms), bunun sıklığı pil ömrünü belirler.
8. iBeacon en az iOS 7.0 ve Android 4.3 versiyonlarını destekler.
9. Kapsama alanı açık alanda 70 m mesafeye kadar ulaşabilir.
10. RSSI ile iBeacon yayın mesafesi belirlenebilir.
11. iBeacon push notifications servisi vermez. Uygulama geliştirici belirli periyotlarla iBeacondan yayılan sinyallerini dinleyerek kendi push notification hizmetini oluşturarak buna göre hareket eder.
12. Halen Estimote, Qualcomm, BlueSense, Gelo, Glimworm vb. gibi ondan fazla iBeacon üretici firma mevcuttur (Nodes,2016).

ÇALIŞMA

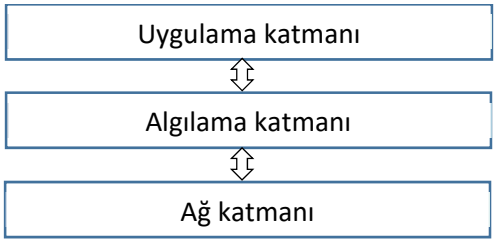
Akademik veya idari personel ofislerin yaklaşınca personel hakkında, görevi, bölümü, uzmanlık alanı gibi bilgilerin yanında, a an için ofiste olup olmadığı, ofiste ise meşgul olup olmadığı veya meşguliyet durumu gibi bilgilerin kimseyi rahatsız etmeden elde edilmesi hem personel, hem de bilgi alacak kişi açısından önemlidir. Bilgi alınacak personelin ofisine yaklaşınca, akıllı cep telefonu marifetiyle hakkında bilgi edinilmesi sağlanarak, akademik veya idari personel gereksiz yere rahatsız edilmeden, kesintisiz çalışma ortamı oluşturulması ve aynı zamanda öğrenci veya misafirlerin de istedikleri kişi hakkında kimseye ihtiyaç duymadan bilgi edinmesi amaçlanmıştır. Bunun için; Estimote Proximity Beacons (Estimote,2016.C) cihazı kullanılarak kampus içerisinde kapalı alanlardaki, personel hakkında konuma bağlı yaklaşım esasına göre çalışan Android tabanlı akıllı cep telefonu ile bilgi edinmeyi sağlayan bir mobil uygulama geliştirilmiştir. Sistem genel olarak şu bileşenlerden oluşmaktadır;

- Estimote iBeacon
- Estimote SDK

 Copyright © International Science and Technology Conference (ISTEC)

- Android Studio 2.1
- MS SQL server (Express)
- .NET web servisi

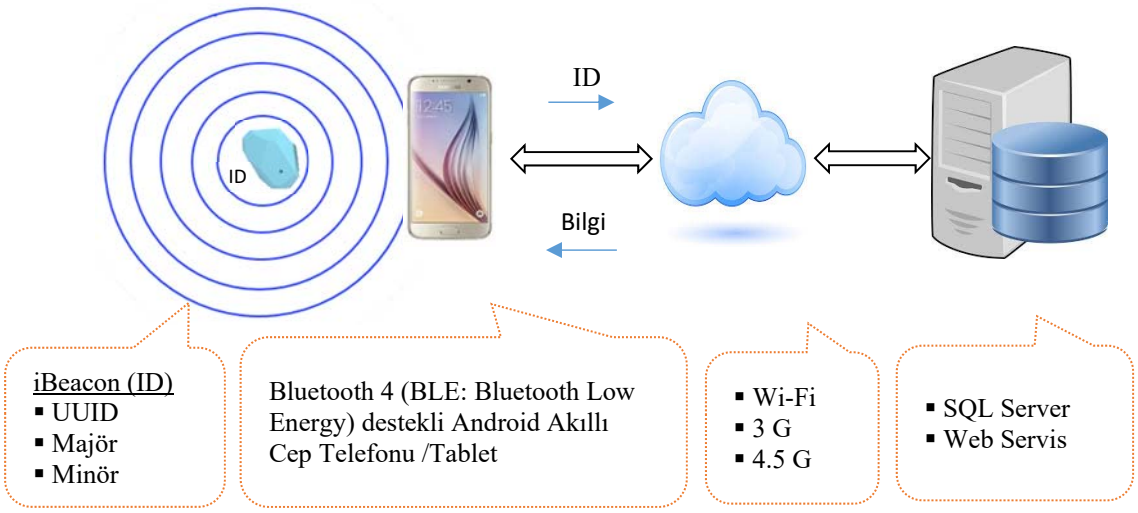
Çalışmada kullanılan iBeacon cihazı Estimote firmasının Proximity Beacon modelidir (Şekil-4). Bu model açık alanda yaklaşık 70 m yayın alanına sahiptir. Bunun yanında; NFC (Near Field Comminaction), motion (hareket), ısı (tempereture) sensörlerini de barındırmaktadır. Çalışmada üç adet iBeacon cihazı kullanılmıştır. iBeacon ile haberleşme ve ID okumak için Estimote SDK Andriod paketi Android Studio 2.1 ile entegre edilmiştir. Veriler yerel test sunucu üzerine kurulu MS SQL Express server tarafından tutulmaktadır. Android tabanlı akıllı cep telefonu ile SQL sunucu arasındaki veri akışı .NET web servisleri yardımıyla gerçekleştirilmiştir. Çalışmadaki sistem üç katmanlı bir mimariye sahiptir (Şekil-5).



Ağ katmanı: Akıllı telefon/tablet ile .NET web servislerini kullanarak veri alış verişi yapabilmesi için gerekli internet bağlantı altyapısını oluşturur. İnternete bağlanma işlemi Wi-Fi veya xG diye adlandırdığımız 3G, 4.5G, 5G vb. kullanabilir.

Algılama katmanı: BLE teknolojisi kullanarak çevresindeki iBeacon sinyallerini algılayıp, bu sinyallerden elde edilen ID (UUID, Majör, Minör) verisini, uygulama yazılımında daha önce tanımlanmış personel bilgileri ile eşleştirip ekrandan listeler (Şekil-8.B).

Uygulama katmanı: Algılanan iBeacon ID bilgilerinden seçilen personel verisini web servisine gönderir ve web servisinden gelen bilgilerin arayüze aktarılarak gösterilmesini sağlar.



Şekil-4. Estimote iBeacon.

Şekil-5. Sistem mimarisi.

Çalışmada kullanılan sistemin mimarisi Şekil-6'da verilmiştir. Akıllı telefon/tablet beacon bölgesine girdiği andan itibaren beacon ID bilgileri algılanır. Eğer birden çok beacon alanlarının kesişim bölgesinde algılama yapılırsa, alanındaki tüm beconlar algılanarak uzaklıklarına göre, an yıkından en uzağa sıralanarak listelenir (Şekil-8.A). Algılanan ID'ler uygulama içerisinde kendisi ile eşleştirilen personel bilgileri ile birlikte görüntülenir (Şekil-8.B). Seçilen ID bilgileri internet altyapısı yardımıyla web servisi sunucusuna iletilir. Web servisi sunucusu bu bilgilerini çözümleyerek gerekli bilgileri SQL sunucudan çekip belirli bir düzende web servisi ile telefona geri gönderir. Gelen bu bilgiler cep telefonu kullanıcı arayüzünde gösterilerek işlem tamamlanır.

Şekil-6. Sistemin blok diyagramı.

 Copyright © International Science and Technology Conference (ISTEC)

iBeacon Tarama Alanı (Region) Belirlenmesi

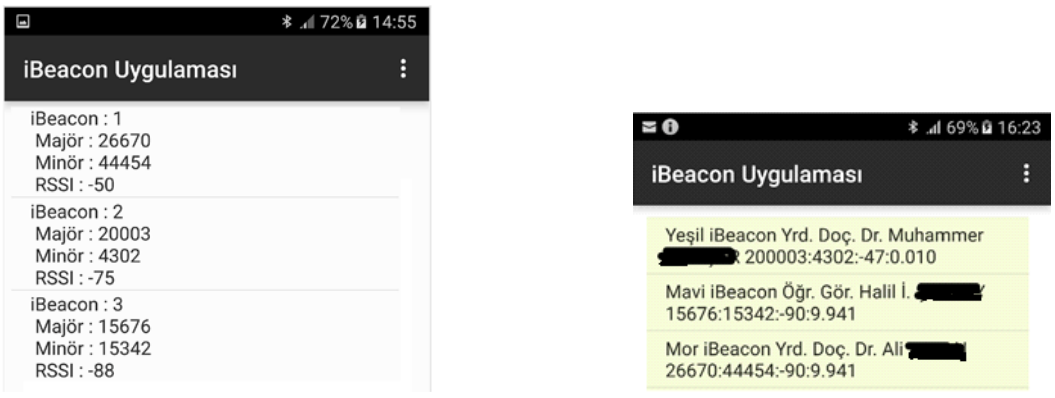
iBeacon algılaması yapılırken öncelikle tarama bölgesini (Region) belirlenmesi gerekmektedir. Bunun için Estimote SDK' da *Region* adında bir sınıf mevcuttur. Bu sınıf içerisinde *UUID, Majör* ve *Minör* değerleri kullanarak tarama bölgesi belirlenir. Bölge tanımlamak için;

Region **region** = new Region(**"**ranged region**"**, *UUID*, *Majör*, *Minör*);

Şeklinde bir kod kullanılabilir. Burada kullanılan *UUID*, *Majör* ve *Minör* değerlerine göre tarama bölgesi belirlenir. Tablo-3'de görüldüğü gibi Estimote firması tarafından üretilen iBeacon'ların tümü algılansın isteniyorsa *UUID, Majör, Minör* değerleri *null* olarak belirlenmelidir. Şekil-7.A de gösterildiği gibi belirli bir *UUID*, belirli bir *Majör* bölgesi algılanacaksa, *UUID* ve *Majör* değerleri belirlenip, *Minör* değeri olarak *null* verilir. Aşağıdaki kodda; en dar kapsamlı tarama bölgesini belirlemek için *UUID*, *Majör* ve *Minör* değerleri kullanılmış ve sonucu Şekil-7.B'de gösterilmiştir.

Region **region** = **new** Region("ranged region", UUID.fromString ("F106C03E-E677-361E-8B1B-AE2A157E9191"), 1, 101);

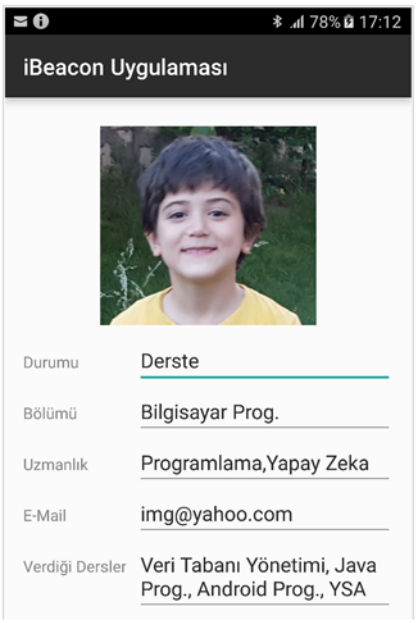
Tablo-3.iBeacon tarama bölgesi belirleme.



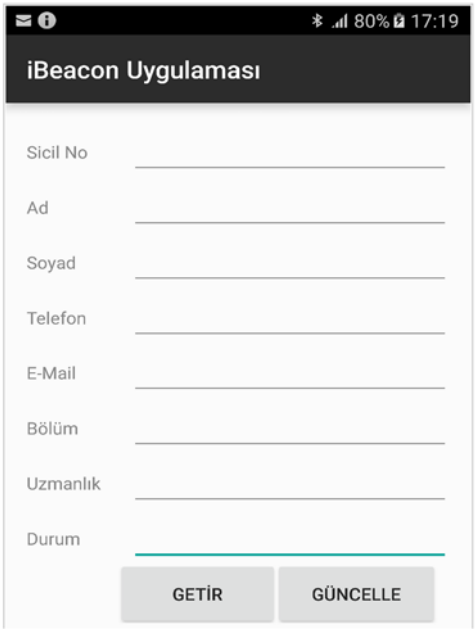
Algılama Bölgesi	UUID	Majör	Minör
Tüm Estimote iBecon'lar	*null*	*Null*	*null*
Belirli bir UUID bölgesi	*UUID*	*Null*	*null*
Bir UUID bölgesindeki, bir Majör alt alanı	*UUID*	*Majör*	*null*
Bir UUID bölgesindeki, bir Majör alt alanındaki belir bir Minör alanı	*UUID*	*Majör*	*Minör*

(A) (B)

Şekil-7. Farklı bölge taramış için algılama sonuçları.



Çalışmada iBeaconlar varsayılan UUID, Majör ve Minör değerleri ile kullanılmıştır. Yazılım içerisinde, Majör ve Minör değerli kullanılarak; yeşil iBeacon Yrd. Doç. Dr. Muhammer, Mavi iBeacon Öğr. Gör. Hail İ. ve mor iBeacon Yrd. Doç. Dr. Ali ile ilişkilendirilmiş ve bu iBeaconlar personel kapı dışlarına, renklerine dikkat edilerek yapıştırılmıştır. Seçilen personel odaları, iBeacon yayın mesafeleri birbiri ile çakışacak şekilde belirlenmiştir. Böylece bir personel odasına yaklaşınca üç iBeacon'da algılanarak, en yakından en uzağa doğru Şekil-8.B deki gibi listelenir. Burada en üstteki personel, bize konum olarak en yakın olan personeldir. Kullanıcı istediği personeli seçerek hakkında bilgi alabilir (Şekil-9). Uygulama kendisine iBeacon ataması yapılan kullanıcıyı, daha önceden sisteme tanıtılan telefon bilgilerinden, tanıyarak normal kullanıcılardan farklı olarak kendi bilgilerini güncelleme ekranını çağırma imkanı sunmaktadır. Böylece kullanıcı bazı bilgilerini güncelleyebilecektir (Şekil-10). Bu şekilde sistem, personel bilgileri sürekli dinamik tutma imkanı sunmaktadır.



(A) (B)

Şekil-8. Birden çok iBeacon algılanarak görüntülenmesi.

Şekil-9 Seçilen personel bilgisi görüntüleme.

Şekil-10. Kişisel bilgilerin değiştirilmesi.

SONUÇ VE ÖNERİLER

Bu çalışmada, iBeacon teknolojileri ve .NET web servisi kullanılarak BLE destekleyen Android işletim sistemli akıllı cep telefonu/tablet üzerinde çalışan bir Android uygulaması geliştirilmiştir. Sistem Samsung S6 Android 6.0.1 sürümü ile test edilmiştir. Sistem Estimote Proximity iBeacon modeli olan üç cihaz (üç farklı konum bilgisi) ile Android Studio 2.1 ve Estimod SDK kullanılarak geliştirilmiş ve çok yakın, yakın, uzak olarak ve iBeacon'lar aynı bölgede kullanılarak test edilmiştir. Uygulama ile; kampüs veya bina içerisindeki, akademik veya idari personel hakkında, konuma bağlı olarak (yaklaşınca) bilgi alınabilmektedir. Öğrenci veya misafir kampüsteki akademik veya idari personel hakkında herhangi bir yardıma ihtiyaç duymadan kendi cep telefonundan bilgi edinebilmektedir. Sisteme kayıtlı bir personel aynı uygulama üzerinden, normal kullanıcılardan ayırılarak, otomatik algılama ile kendi bilgilerini güncelleyebilecektir.

Sistem tehlikeli cihazlar için öğrencilere iş sağlığı ve güvenliği (İSG) kurallarını, kullanım talimatını, gerekli kişisel donanım ihtiyaçlarını, dikkat etmeleri gereken bilgileri her seferinde hatırlatarak kazaların azaltılması ve verimli çalışma imkanı sağlayacak şekilde geliştirilebilir. Bunun yanında; yemekhane giriş/çıkışları, öğrenci/personel devam takibi ve dezavantajlı grupların takibi için geliştirilebilir.

SERAMİK SEKTÖRÜNDE İŞ ANALİZİ ve İŞ DEĞERLEMESİ

Selçuk ÖZCAN*, Ahmet Ziyaeddin BULUM*, Muharrem ÜNVER*

Karabük Üniversitesi, Mühendislik Fakültesi, Karabük-Türkiye

selcukozcan@karabuk.edu.tr

muharremunver@karabuk.edu.tr

Özet: İşletmelerde firmanın ücret konusunda izlediği yol sürekli sorgulanmaktadır. Çalışan kendi aldığı ücretten daha çok, aynı işi yaptığı kişiyle aynı ücreti alıp almadığını önemsemektedir. Uygulanan ücret politikası açık ve objektif ölçütlere dayandırılmamışsa, çalışanların kafasındaki belirsizlik onları rahatsız etmektedir. Sözü edilen durum gerçek ve etkin bir araçla yönetim ve çalışan taraflarının ikna edilmesini zorunlu kılmaktadır. Tüm bu belirsizliklerin önüne geçebilmek için de en uygun aracın iş değerlemesi olduğu söylenebilir.

Anahtar Kelimeler: Ücret Sistemi, Değerleme, Puanlama

Giriş

Dünyada arz-talep dengesi incelendiğinde, sanayi devriminden sonra firmalar ürettikleri her şeyi çok rahat bir şekilde satabiliyorken, alıcılar bazı ürünler için uzun süreler beklemek zorunda kalabiliyorlardı. Firmalar taleplere cevap verebilmek için verimlilik yöntemleri ile daha fazla nasıl üretirim sorusuna cevap aramaya başladılar. Piyasada daha fazla ürün olduğu zaman da müşteri seçim yapmaya başladı. Durum böyle olunca da firmalar daha az maliyetle üretim yapmaya çalıştılar. Ürün sayısı ve tercihi arttıkça, müşteriler artık ürünlerin kalitesini sorgulama başladı. Firmalarda ürünlerinin kalitesini arttırmaya yönelik çalışmalar başlattılar. Kaliteli ürün üretebilmede, fark yaratabilmede insan kaynakları faktörü ön plana çıktı. Çalışanın kendisini huzurlu hissettiği yerde daha verimli olduğu bilinen bir gerçektir. Bunun için de adil bir ücret sistemi olmazsa olmazdır.
Bu çalışmada da vitrifiye üretimi yapan bir seramik fabrikası incelenmiş, üretim ve yönetim aşamasında işler analiz edilmiştir. Yapılan işlerin değerlemesi yapılarak her bir iş için gerekli puanlar çıkarılmış ve adil bir ücret sistemi belirleyebilmek için bir altyapı oluşturulmuştur.

İş Analizi

İş analizi, bir işletmede yapılmakta olan işlerle ilgili bilgilerin toplanması, değerlendirilmesi ve örgütlenmesidir. Başka bir deyişle iş analizi, işletmede yapılacak her bir işin niteliği için genel durumu ve özellikleri, işin yapılacağı çevre ve çalışma koşulları hakkında bilgi toplanması, toplanan verilerin sistematik şekilde incelenmesi, değerlendirilmesi ve bunlara ilişkin bilgilerin yazılı hale getirildiği bir süreçtir.
İş analizi çalışmaları sonucunda; işin ne olduğu, çalışanın görevleri ve sorumlulukları ve ne gibi bilgi, kişilik ve zihinsel/fiziksel özelliklere sahip olması gerektiği tespit edilir. Bir iş analizinde:

- İşin gerekleri nelerdir?
- İş nasıl yapılır?
- İş ne zaman yapılır?
- İş nerede yapılır?
- İş neden yapılır? gibi sorulara cevap aranır.

İş Değerlemesi

İş değerleme, işlerin bir işletmedeki diğer işlerle karşılaştırılarak iş değerinin belirtilmesi ve buna uygun ücret yapısının tespit edilmesidir. İş değerleme, işlerin değerlerine uygun adil bir ücret düzeninin kurulmasını amaç edinmiştir(Eraslan, 2004).

İş Değerleme Yöntemleri

İş değerleme yöntemleri ana hatlarıyla iki temel gruba ayrılır. Bunlar sayısal olan ve sayısal olmayan yöntemlerdir. Sıralama ve sınıflandırma sayısal olmayan yöntemlerdir. Puanlama ve faktör karşılaştırması ise sayısal yöntemler arasındadır(Ataay, 1990; 23).

Bu çalışmada kullanılan teknik olan puanlama yöntemi, üretim birimindeki mevcut işlerin göreceli değerlendirilmesi sonucu, oluşan her bir işin faktörlere, alt faktörlere ve faktör derecelerine göre incelenerek puanlanması ve derecelenmesidir. Puanlama yöntemi iş değerleme yöntemleri içinde en çok uygulanandır ve

 Copyright © International Science and Technology Conference (ISTEC)

ülkemizde yapılan birçok iş değerleme çalışmasında da başarılı uygulamaları görülmüştür. Faktör karşılaştırma yöntemi gibi analitik yöntem olan puanlama yöntemi ile işlerin değeri gerek nitelik, gerekse nicelik olarak daha ayrıntılı değerlendirilebilir. İşler puanlara göre değerlendirildiğinden anlaşılması ve uygulanması diğer yöntemlere göre kolaydır(Yıldız, 2006).

Puanlama Yönteminin Aşamaları
İşlerin puanlama tekniği uygulanması neticesinde işler birbirinden ayrılabilmekte ve her iş onun değerini veren bazı faktörler aracılığı ile değerlendirilebilmektedir. Puanlama Yöntemi uygulanırken aşağıdaki adımlar izlenmiştir:

1. İş Değerlendirme Grubunun Oluşturulması
2. Çalışma Planının Hazırlanması
3. Ön Etütlerin Yapılması
4. Eğitim Çalışmaları
5. İş Analizi Çalışmaları
6. İş Değerlendirme Puan Planının Tespiti

Uygulama

Uygulama vitrifiye üretimi yapan bir firmada gerçekleştirilmiştir. 1996 yılında, 15 dönümlük bir alan üzerine kurulan firmanın aylık üretim kapasitesi 50 bin parçadır.

Vitrifiye üretimi incelendiğinde üretimle doğrudan alakalı olan beş ana bölüm karşımız çıkmaktadır. Bunlar; ürünlerin tasarlandığı ve döküm yapılacak kalıpların hazırlandığı Alçı Kalıp Hazırlama Bölümü, döküm yapılacak çamurun ve pişmeden önce parlaklık vermesi için kullanılan sır maddesinin hazırlandığı Çamur ve Sır Hazırlama Bölümü, tezgahlar üzerinde kalıpların bulunduğu ve bu kalıplara dökümün yapıldığı Dökümhane Bölümü, pişmeden hemen önce son rötuşların yapılıp sır atıldığı Çamur ve Sırlama Bölümü ile son olarak bu yarı mamullerin pişirildiği Fırınlama Bölümüdür.

Çalışma yapılırken öncelikle üretim ve yönetim kademesi iki ayrı grup olarak düşünülmüştür. İş gereklilikleri ve puan sistemleri her iki grup için ayrı ayrı değerlendirilmiştir.

1.aşama:
İşletmenin organizasyon şeması göz önüne alınarak üretim ve yönetim aşamasındaki tüm işlerin iyi analiz edilmesi gerekmektedir. Birbiri ile kesişen işler göz önüne alınarak iş sayısını en az tutacak sayıda iş tanımları yapılmalıdır.

2.aşama:
Çalışmada ilk yapılan puan sisteminin nasıl kurulması gerektiğine karar vermektir. Bu koşullar belirlendikten sonra hangi madde için kaç puan verilmesi gerektiği bu işi yapan ekip tarafından, işi yapan kişilerle ve yöneticilerle görüştükten sonra belirlenmelidir.

3. aşama:
Puan sistemi oluşturulduktan sonra en önemli aşama her bir çalışan için bu sistemin nasıl çalışması gerektiğidir. Puan verme noktasında işin içine her hangi bir duygusallık katılmaması çok önemlidir. Hangi puanın karşılığının ne olduğu titizlikle hazırlanmalıdır. İlk iki madde için şu şekilde örnek verilebilir:

7. aşama:
Son aşamada ise bu puanlar belirli gruplara ayrılarak her bir grup için ücret çalışması yapılmasına altyapı hazırlanmış olur.

Tablo 6: İş puanlarına göre grup oluşturulması

İŞ SINIFLARI	SIRALAMA (PUAN ARALIĞI)
1	420 - 440
2	445 - 465
3	470 - 490
4	495 - 525
5	530 - 555
6	560 - 600
7	605 - 615
8	620 - 625
9	630 - 645
10	650 - 690

Sonuç ve Öneriler

Konu ücret olunca, en iyi sistemlere sahip işletmelerde dahi çalışanların kendi aldığı ücretten şikâyet etmese bile, aynı işi yaptığını düşündüğü arkadaşını daha fazla ücret alıyor diye şikâyet ettikleri görülmektedir. Yapı itibarıyla, şirket hep daha az ücret vermek, çalışan ise hep daha çok ücret almak isteyecektir. Dolayısıyla amaç, mümkün olduğunca neye hizmet ettiği hem çalışan hem de şirket tarafından net olarak bilinen, şeffaf, adil ve doğru bir ücretlendirme sistemini oluşturabilmektir. İş değerleme yöntemlerinden birisi olan puanlama yönteminin bu amaca sağlıklı bir şekilde hizmet ettiği görülmektedir.

SHEAR WAVE VELOCITY DETERMINATION FOR SILTY SAND SOILS

Mehmet Inanc ONUR

Anadolu University, Department of Civil Engineering, Eskisehir- Turkey

mionur@anadolu.edu.tr

Abstract: The resonant column test is commonly used in geotechnical earthquake engineering to determine the dynamic behavior of soils. Soil specimen is subjected a wave propagation under different frequencies and wave velocities are determined. In this study, shear wave velocities were measured for reconstituted silty sand samples. Samples were prepared at different relative densities and saturation degrees also test were performed under different confining pressures. The effects of these factors on the shear wave velocities were investigated by comparing the test results.

Keywords: Resonant Column Test, Shear Wave Velocity, Silty Sand

Introduction

When a stress is applied to a body, this effect is spread along the body by stress waves (Das, 2010). Waves are existing when an earthquake occur and pass to the ground mantle with causing some changes in the soil body. Waves are one of the research area due to the soil deformations and structural damages after the earthquakes. Wave velocities are determined at different soil types by using field tests and laboratory experiments. Laboratory experiments are dynamic triaxial test, resonant column test, torsional shear test and bender element test. Field tests are cross-hole test, down-hole test, seismic cone test and etc.

The resonant column test is commonly used in geotechnical earthquake engineering to determine the dynamic behavior of soils. During the resonant column test, a soil specimen is excited under torsional excitation at different frequencies. The velocity of the propagating wave and the degree of the material damping can be derived by measuring the motion. Therefore, the travel times of the shear (S) and the compressional (P) waves are measured on the test samples by using resonant column test device. There are too many study about wave velocity, dynamic soil behavior of soils and resonant column tests.

Baxter et al. (2008) performed a series of dynamic test on the non-plastic silts to develop a correlation between shear wave velocity and dynamic strength. Bartake and Singh (2007) determined the shear wave velocity of sandy soils by using bender element tests. Empirical equations in the literature were compared to the test results. Patel et al. (2008) investigated the shear wave velocity of granular soils and a new formulation was presented. They mixed sand and glass for the preparing test samples. Liquefaction strength of the partially saturated soils are studied by using compressional wave velocity and a relationship was given by Yang et al. (2004). Sugano and Yanagisawa (1992) investigated the all waves induced earthquakes with also relationships between waves and soil strength. And also they developed a new apparatus for the tests. Sykora (1987) presented a new correlation between shear wave velocity and shear modulus. He suggested that geological history, soil type, effective stress, relative density and saturation have great influence on the shear wave velocity. Alla (2009) studied shear wave velocity and liquefaction potential of the unsaturated soil. And also they conducted a series of experiment to determine liquefaction and shear wave velocity dependence. Kumar and Madhusudhan (2010) measured shear wave and compressional wave velocities of dry sand samples under different relative densities and confining pressures. They performed resonant column test for the experiments. Yang (2006) investigated the saturation effect on the shear wave velocity by using field tests. Field seismic test were performed and shear wave and compressional wave velocities were measured. Saturation effects were determined for rock and sandy soils. Andrus and Stokoe (2000) suggested a new procedure to find out liquefaction potential by using shear wave velocity. They prepared some graphs for finer sands, sandy gravels and silty clay type of soils. If the literature is analyzed, it can be easily seen that, shear wave velocity can be used to determine dynamic soil behavior and liquefaction potential.

In this study, the travel times of the shear (S) waves were measured by performing resonant column test. Reconstituted silty sand samples were prepared at different relative densities with confining pressures and saturation degrees. Factors effecting on the shear wave velocity of silty sand samples were investigated by comparing the test results. The results were shown in detail on the basis of laboratory experiments.

 Copyright © International Science and Technology Conference (ISTEC)

Materials and Methods

All test steps were performed according to the ASTM D4015-07. Non-plastic and fine-grained silty sand soil was used for the experiments. Silty sand samples were obtained from the city of Eskisehir, Turkey. Basic soil characteristics are given in Table 1 and also grain size distribution curve is shown in Figure 1. In this study samples were prepared with 10 mm layers by using wooden compacter. The diameter and the length of the test samples are 70 mm and 145 mm, respectively.

Table 1: Properties of silty sand.

USCS	SW-SM
Coefficient of Uniformity, Cu	14,66
Coefficient of Curvature, Cc	2,45
Amount of Gravel	24%
Amount of Sand	66%
Amount of Silt-Clay	10%
Natural Unit Weight	17,8 kN/m^3
Plasticity	Non-Plastic

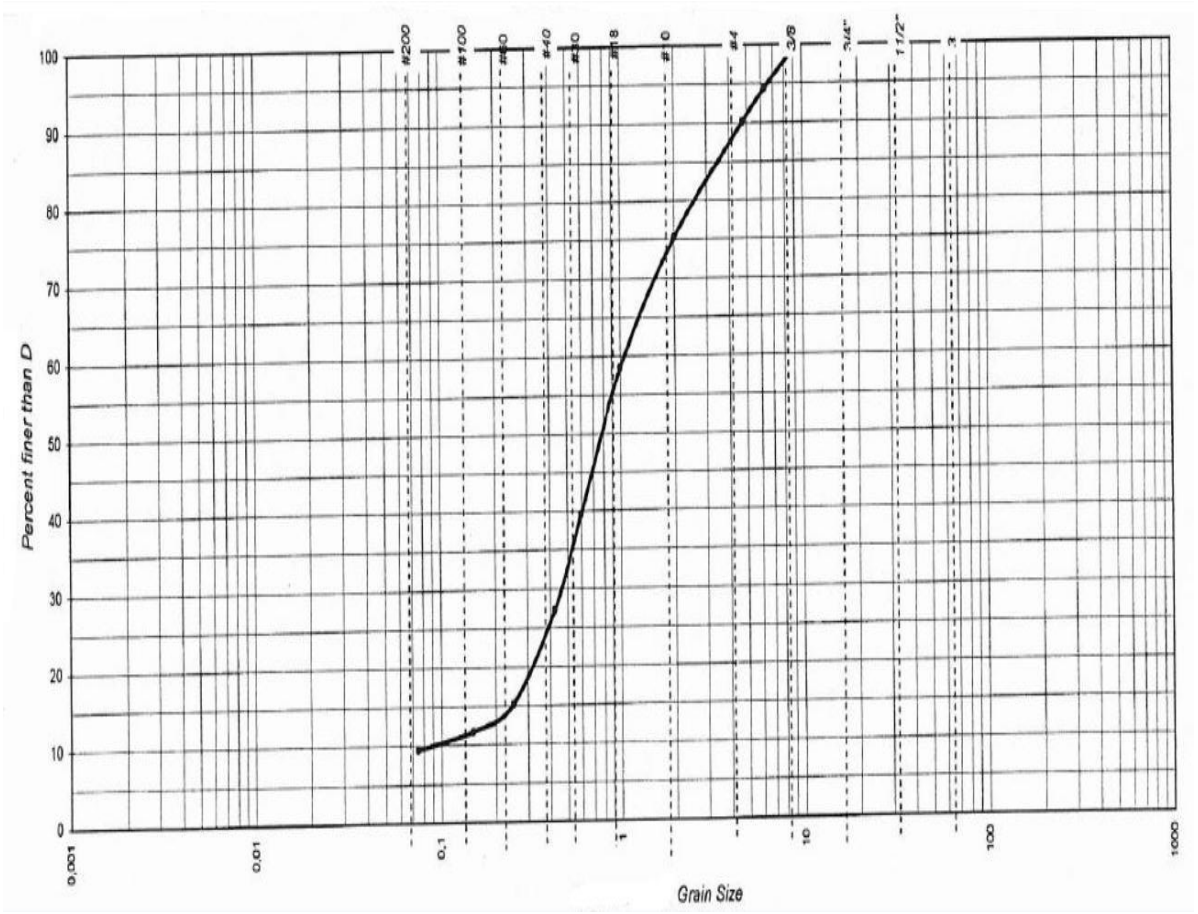

Figure 1. Grain size distribution curve of silty sand samples.

 Copyright © International Science and Technology Conference (ISTEC)

In this study, modified GDS resonant column system was used to perform wave propagation tests. This system is using the fixed-free configuration. A cylindrical specimen is excited in torsion at its fundamental frequency by a drive system. The velocity of the wave can be easily measured. The resonant column system is shown in Fig. 2.

Figure 2. Resonant column test device.

Standard techniques were chosen for saturation and consolidation test steps. Different cell pressures were applied at different saturation degrees and relative densities. Cell pressure were chosen 100 and 200 kPa and saturation degrees were chosen as 40, and 100%. Relative densities were calculated from initial void ratios as 40, 60 and 80 %. All pressure values, saturation degrees, and relative densities were summarized in Table 2.

Table 2: Test details.

Test No	Relative Densities (%)	Saturation Degrees (%)	Confining Pressures (kPa)
Test A	40	40	100 - 200
Test B	40	100	100 - 200
Test C	60	40	100 - 200
Test D	60	100	100 - 200
Test E	80	40	100 - 200
Test F	80	100	100 - 200

Results and Discussion

After performing the resonant column tests, shear wave velocities were determined. S-wave velocities were found between 160 m/s and 240 m/s. Shear wave velocity of the soils are affected from relative density, confining pressure and saturation (Onur et al., 2012). As expected; results showed that confining pressure and relative density have great effect on the wave velocities. Wave velocities increased with increasing of confining pressure and relative density. On the other hand, wave velocities decreased with increasing of saturation degree but the range of differences were small. Results compared with previous studies about shear wave velocity in the literature. Table 1 gives typical values Vs for some soil types.

 Copyright © International Science and Technology Conference (ISTEC)

Table 3: Typical values of Vs (Das, 2010).

Soil Type	Shear Wave Velocity, V_s
Fine Sand	90 – 150 m/s
Dense Sand	220 – 250 m/s
Gravel	180 – 230 m/s
Moist Clay	500 – 550 m/s
Granite	2130 – 3360 m/s

The calculated shear wave velocity values were given in Table 4. It can be seen from the results that test experimental study showed similar behavior with the results of the literature. In addition, some observations were found that silty sand samples having higher relative density showed higher shear wave velocities. Silty sand samples having lower confining pressures give lower shear wave velocity results.

Table 4: Test results.

Test No	Confining Pressures (kPa)	Shear Wave Velocity, V_s
Test A	100	173,9 m/s
Test A	200	196,8 m/s
Test B	100	160,0 m/s
Test B	200	184,1 m/s
Test C	100	197,6 m/s
Test C	200	227,2 m/s
Test D	100	180,5 m/s
Test D	200	207,2 m/s
Test E	100	205,2 m/s
Test E	1200	256,9 m/s
Test F	100	201,4 m/s
Test F	200	239,6 m/s

Conclusion

In this study resonant column device were used to determine the effects of the S-waves velocity of silty sand soils. For this purpose, the travel times of the shear (S) waves were measured on silty sand samples at different relative densities, confining pressures and saturation degrees. Factors effecting on the wave velocities of silty sand samples were investigated by comparing the test results. The study suggests that to determine the arrival times of the S-waves needs much more laboratory experiments and field test as well. In addition to observations, laboratory conditions can affect the test results. Field tests should be done by considering natural site-conditions.

SHORT-TERM MULTI-STEP WIND SPEED PREDICTION USING STATISTICAL METHODS AND ARTIFICIAL NEURAL NETWORKS

İSTATİSTİKSEL METOTLAR VE YAPAY SİNİR AĞI KULLANARAK KISA DÖNEM ÇOK ADIMLI RÜZGÂR HIZI TAHMİNİ

İsmail Kırbaş

Mehmet Akif Ersoy Üniversitesi Mühendislik-Mimarlık Fakültesi
Bilgisayar Mühendisliği Bölümü İstiklal Yerleşkesi - Burdur
ismailkirbas@mehmetakif.edu.tr

Abstract: Bu çalışma kapsamında Antalya ilinde deniz seviyesinden 2500 metre yüksekte yer alan TÜBİTAK T60 ulusal gözlem evi meteoroloji istasyonun Nisan 2016 itibariyle yapmış olduğu ölçümler PHP programlama dili kullanılarak web sitesi üzerinden derlenmiştir. Elde edilen rüzgâr hızı verileri istatistiksel ve yapay sinir ağı metotları kullanılarak incelenmiş ve meydana getirilen zaman serisi üzerinden ileriye yönelik rüzgâr hızı kestirimlerinde bulunulmuştur. Yapılan hesaplamalar ve gerçek veriler ile kıyaslamalar sonucunda incelenen ARIMA modelleri ile yapay sinir ağları arasında belirgin hata oranı farklılıkları tespit edilmiştir. Literatürde yer alan rüzgâr hızı tahmin çalışmaları genellikle sadece tek adım tahmin başarısı üzerinde yoğunlaşırken, önerilen çalışmada sık kullanılan tahmin metotlarının ileriye dönük 12 adım seviyesinde değerlendirilmeleri gerçekleştirilmiştir.

Keywords: Rüzgâr hızı tahmini, ARIMA, NAR, yapay sinir ağı, zaman serileri, kısa dönemli tahmin metotları

SIMILAR AND DIFFERENT FEATURES OF SELF-SIMILAR GROUPS IN THE SENSE OF IFS AND TREE AUTOMORPHISM

Mustafa Saltan
mustafasaltan@anadolu.edu.tr

Bünyamin Demir
bdemir@anadolu.edu.tr

The notion of self-similarity of the automorphism group of a rooted tree is given in the papers of Sidki and Nekrashevych. Saltan and Demir define self-similar groups in the sense of iterated function system (IFS) and investigate the properties of these groups in detail. In this presentation, we give some relations between these two groups and compare them.

Keywords: Tree automorphism, iterated function system, fractal

SOME PROPERTIES OF THE HOMOTETIC MOTION: CHRACTERISTIC POINT AND MINIMAL ACTION

Prof. Dr. Ayhan TUTAR
Kyrgyz-Turkish Manas University Kirghizistan
atutar@omu.edu.tr

Res. Asist Serdar SOYLU
Giresun University Turkey
serdar.soylu@giresun.edu.tr

ABSTRACT

The Kinetic energy formula of the point that mass equal m is

$$S = \int_{t_1}^{t_2} E_{kin}\, dt$$

In this equation, In case of m=1 , motion are defined as

$$S = \int_{t_1}^{t_2} (X'^T \dot{X}')dt$$

The principle of least action requires $S = min$. The point fullfill this called as charasteristic point.

By this point and integral coefficents minimal action are obtained homoteticaly as

$$2S_0(t_1, t_2) = I_T(t_1, t_2) - \frac{{I_{x_1}}^2(t_1, t_2) + {I_{x_2}}^2(t_1, t_2)}{I_R(t_1, t_2)}$$

SOSYAL SORUMLULUK PROJELERİNDE BİR ARAŞTIRMA; ENGELLİ, ENGELSİZ BİRLİKTE YAŞIYABİLİYOR MUYUZ?

Ümmühan AKHİSAR, Hüseyin Akhisar, Furkan Uğur EŞİTTİ

Kocaeli Üniversitesi, Türkiye Beyazay Derneği, Türkiye Beyazay Derneği

ummuhan.akhisar@kocaeli.edu.tr huseyin.akhisar@gmail.com furkanesitti@gmail.com

Özet: Birçok engelli kişi, toplumun kendilerine olan yaklaşımlarından yakınmaktadır. Bireysel yaşamdan sosyal çevreye varıncaya dek, hayatın her alanında yer alan engelli vatandaşların bir kısmı hafif engelli, bir kısmı ise ağır engellidir. Ağır engelli kişiler, çoğu yaşamsal faaliyetini tek başlarına gerçekleştiremezken, hafif engelli kişiler bu anlamda biraz daha avantajlıdırlar. Kocaeli genelinde engellilerle birlikte yaşama kültürünü arttırmak ve engellilerin toplumun bir parçası olduğunu anlatmak ve engelli engelsiz toplumda beraber yaşandığını gösteren faaliyetlerle, belirlenen engelli engelsiz çocukların yer alacağı bir çalışma Türkiye Beyazay Derneği Kocaeli Şubesi işbirliği ile gerçekleştirildi. Engellilerle birlikte yaşama konusunda Kocaeli genelinde yaklaşık 2200 adet ilkokul, ortaokul ve lise düzeyindeki öğrencilere anket yapılmıştır. Bu çalışmada yapılan anket sonuçları yorumlanmış ve seçilen 100 adet engelli ve 100 adet engelsiz çocuğun yer aldığı çeşitli faaliyetler düzenlenmiştir.

Anahtar Kelimeler: Engelli Çocuklar , Anket Çalışması, Engellilerle Yaşam

Abstract: Many disabled people who approach them are close to the community. Individual life from the social environment until it reaches a portion of the light disabilities located with disabilities in all areas of life is severely disabled is a part. Severely disabled people, the most vital activities have achieved alone, mild impaired people are a little more advantageous in this respect. To increase the culture of living with disabilities across Kocaeli and to tell a part of the community of persons with disabilities and the activities showing that happened with disabilities barrier-free society, will take place the children unimpeded designated disability studies Beyazay Association of Turkey was held in Kocaeli branch cooperation. 2,200 units in primary schools across Kocaeli living with disabilities were interviewed students in middle school and high school level. In this study, interpreted the results of the survey and the various activities of the selected 100 and 100 disabled children takes place unimpeded are arranged.

Keywords: Disabled Children, Survey, Living with Disabilities.

Giriş

Türkiye'de özel gereksinimli çocukların kaynaştırma yoluyla eğitim görmelerine ilişkin gereklilikten söz eden ilk yasa 1983'te çıkarılan Özel Eğitime Muhtaç Çocuklar Yasası"dır ve bu yasada "engelli öğrencilerin engelli olmayan akranları ile birlikte eğitim görmeleri ve okul idaresinin konuya ilişkin önlemler alması" gerektiği açıklanmaktadır. 1988'de yayınlanan "Özel gereksinimli çocukların normal sınıflara kaynaştırılması yoluyla eğitimi" konulu genelgede ise kaynaştırma, uluslararası alanyazındaki tanımına uygun şekilde ele alınmış (Uysal, 2003), 1990'da düzenlenen XIII. Milli Eğitim Şura kararları doğrultusunda da 1991'de 1. Özel Eğitim Konseyi toplanarak kaynaştırma programlarının yaygınlaştırılması, bu programlarına alınan engelli öğrencilerin eğitiminin bireysel olarak planlanması, bu eğitimin alanında uzman kişiler tarafından verilmesi ve izlenmesine ilişkin bir karar alınmıştır. (Sucuoğlu 2004)

Birleşmiş milletler rakamlarına göre dünyada yaklaşık 500 milyon engelli insan vardır. Dünya Sağlık Örgütü dünya nüfusunun dörtte birinin hayatlarında bir çeşit engelle karşı karşıya olduğunu belirtir. Yapılan araştırmaya göre (tuik) ülkemiz nüfusunun %12'si engelli bireylerden oluşmaktadır. Farklı nedenlere bağlı oluşan engellilik temel olarak; zihinsel, görme, işitme ve konuşma, ortopedik ve süreğen olmaktadır. Engellilerin karşılaştıkları sorunların başında yoksulluk, eğitim, ulaşım, fiziksel çevre, konut gibi konular gelmektedir. Dünyanın her yerinde engellilerin çoğu toplumun yoksul kesimlerinden gelmekte ve yoksulluk içinde yaşamaktadır. Eğitimdeki eksiklik yoksullukla endeksli olarak ortaya çıkmaktadır. Bu sorunların haricinde en önemli olan sorun ise ailelerin ve çevredeki insanların engellilere bakış açısından kaynaklanmaktadır. Aynı araştırmaya göre, ülkemizde

 Copyright © International Science and Technology Conference (ISTEC)

vatandaşların sadece %12,4'ü engellilere gereken ilgi ve yardımın gösterildiğini düşünmekte ve %28,6'sı kendilerinin engellilere gereken ilgi ve yardımı gösterdiğine inanmaktadır. (Pehlivanoğlu, 2012)

Engellilerin toplumla bütünleşmesinin önünde yoksulluk, eğitim, ulaşım, fiziksel çevre ve konut, rehabilitasyon ve istihdam gibi sorunlar yer almaktadır. Engellilerin özellikle çocuk yaşta yaşadıkları ayrımcılık daha etkin ve kalıcı olmakta, engelli çocukların kendilerine farklı davranılmasıyla ne kadar erken yaşta karşılaşırlarsa engelliliklerini o kadar erken benimsemektedirler. Bireyin fiziksel işlevlerindeki bozukluk ve bunların hareket yeteneğinde yarattığı eksiklik ve güçlük, onu toplumun diğer bireylerinden farklı kılar. Bu farklılık engellilerin yaşadığı ayrımcılığın asıl nedenidir. Bilindiği gibi her türlü ayrımcılığın temelinde farklı olmak vardır. Fiziksel işlevlerdeki bozukluklar ve bunların hareket yeteneği üzerinde yarattığı sınırlamalar bireyi toplumdan uzaklaştırır. Toplumsal destek sistemlerinin yetersizliği, toplumun dışlayıcı tutum ve davranışları da engelli bireyin topluma eşit bireyler olarak katılmasını önler. (Akçamete, Ceber 1999)

Dünyada olduğu gibi ülkemizde de engelli bireyler toplumun önemli bir bölümünü oluşturmaktadır. Günümüzde ülkemizde engellilerin toplumla bütünleşmesi yönünde sorunlar bulunmaktadır. Bu sorunlar engelli bireylerin içinde yaşadıkları toplumla bir bütünlük içinde yaşamalarını güçleştirmektedir. Bu tür sounlar engelli bireylerin kendilerini ifade etmelerine engel olarak düşük yaşam kalitesine neden olabilmektedir. Engelli bireylerin toplumla barışık bir şekilde yaşamalarını sağlamak adına herkesin bu konuda bilinçlenip engelli bireylere karşı önyargılarından arınması gerekmektedir. Bu çalışmada Türkiye Beyazay Derneği aracılığı ile engellilerle birlikte yaşama konusunda Kocaeli genelinde yaklaşık 2200 adet ilkokul, ortaokul ve lise düzeyindeki öğrencilere anket yapılmıştır. Yapılan anket sonuçları yorumlanmış ve seçilen 100 adet engelli ve 100 adet engelsiz çocuğun yer aldığı çeşitli faaliyetler düzenlenmiştir.

Yöntem ve Bulgular

Ülkemizde ve dünyada, dezavantajlı kesimler arasında yer almakta olan engellilere yönelik toplumuzda oluşan olumsuz algıyı yıkmak ve onlara yönelik ayrımı ortadan kaldırmaktır, Engelli ve engelsiz çocukların projeye aktif katılımı ile gelecek nesillerimizin engelsiz bir şekilde yaşayabilecekleri, birlikte üretebilecekleri, ortak çalışma alanları oluşturabilecekleri bir toplum oluşturulmasına katkı sağlamak amacıyla Kocaeli genelinde engellilerle birlikte yaşama kültürünü arttırmak ve engellilerin toplumun bir parçası olduğunu anlatmak ve engelli engelsiz toplumda beraber yaşandığını gösteren faaliyetlerle, belirlenen engelli engelsiz çocukların yer alacağı bir çalışma Türkiye Beyazay Derneği Kocaeli Şubesi işbirliği ile gerçekleştirildi.

Kocaeli ilimizde yaklaşık 2000 öğrenciye engellilerle ilgili ankete tabii tutularak onların engellilere yönelik algıları ve bu algıların değişkenliği tespit edilmiştir. İkinci aşamada anket sonuçları doğrultusunda bir psikoloğun, Dernek başkanı ve Aile ve Sosyal Politikalar Bakanlığı yetkilisinin de yer alacağı önyargıların yıkılmasını sağlamak adına öğrencilere "Önyargıların yıkılması Semineri" isimli seminerler düzenlenmiştir.

Engelli öğrencilerin sosyal hayata aktif katılımı sağlanması adına 50 engelli, 50 engelsiz öğrencilerimiz ve aileleri bir araya gelerek piknik, sinema, spor, tiyatro etkinlikleri gerçekleştirilmiştir. Tanışma ve kaynaşma faaliyetlerini güçlendirmek için ildeki okullar ziyaret edilmiştir. (http://www.birlikteyasiyoruz.com/?)

Table 1: Engelsiz öğrencilere yapılan anket

Soru	Evet /Olumlu	Hayır/Olumsuz
Hiç engelli bir arkadaşınız oldu mu?	%35	%65
Engelli arkadaşınızın olmasını ister misiniz?	%70	%30
Engellileri tanımak ister misiniz?	%90	%10
Engellilerle ilgili düşünceleriniz nedir?	%85	%15
Engelliler ile nasıl iletişim kuracağınzı biliyor musunuz?	%20	%80
Bir engelli ile karşılaştığınızda ne yaparsınız?	%80	%20

 Copyright © International Science and Technology Conference (ISTEC)

Yapılan anket çalışmalarına göre öğrencilerin %31'inin engellilerle ilgili merak ettiği hiçbir şey olmadığı bildirmiştir. Bu sonuç kişilerin engellileri yeterince tanımadığı, anlamadığı, iletişime geçmediğini göstermektedir.

Engellilerle nasıl iletişim kurulabileceğini öğrenmek isteyip istemediklerini sorulduğunda ise %58,1'i Evet yanıtı vermiştir.

Sonuçlar ve Öneriler

Engelli olmak deyince ilk akla gelen işitme, konuşma, görme, yürüme engelli olmak. Benim aklıma bununla birlikte engelli olanların toplumsal yaşam içerisindeki sorunları geliyor. Hem engelli olmaktan kaynaklanan içsel sorunlar, hem de engelsizlerin neden olduğu dışsal sorunlar ve yeni engeller. Görünürde engelli olmayanların, engellileri göz ardı etmesi yüzünden etraflarına örülen ama görünmeyen duvarlar asıl engeli oluşturuyor.

Toplumuzda engellilere yönelik olumsuz bakış açısının ve önyargıların kırılması adına katkı sağlandı. Kocaeli'de engelli ve engelsiz öğrencilerin kaynaşması sağlanarak engellilerin yaşadığı zorluklarla ilgili ve engellilere nasıl davranılması gerektiği konusunda farkındalık oluşturulmasına yardımcı olundu. Engelli ve engelsiz öğrenciler arasında karşılık sevgi ve saygının yerleşmesi ve engellilerle birlilkte yaşama kültürünü geliştirilmesi sağlanarak engelli öğrencilerin sosyal hayata aktif katılımları sağlanarak çeşitli faaliyetler gerçekleştirildi.

Bu çalışma kapsamında Gelecek nesillerin engelli engelsiz birlikte yaşayabilecekleri, birlikte üretebilecekleri bir toplumun oluşmasına katkıda bulunulmaya çalışıldı. Beyazay engelliler Dernek çalışanlar ve üyeleri, kamu kurumları ile işbirliğinin ve fiziksel kapasitesinin geliştirilmesine katkıda bulunuldu.

Engellilere yol açalım, önlerine yeni engeller koymayalım ki, zaten varolan engelli halleriyle baş edebilsinler, toplumsal yaşam içerisinde yer alacak özgüvenlerini yitirmesinler. Onlara da yol açalım ki, yeteneklerinden, bilgi birikimlerinden, yaşam deneyimlerinden ve potansiyellerinden yararlanabilelim. İnsan vücudunun kan damarlarından birini nasıl yok sayamazsak, engelsizler ve engelliler olarak değil de, tüm toplum olarak hep birlikte varolalım ve zenginleşelim.

SOURCES, RISKS AND REMEDIATION TECHNIQUES OF HEAVY METALS IN CONTAMINATED SOILS

Aslı Kurnaz
akurnaz@kastamonu.edu.tr

Soils polluted by the accumulation of heavy metals have become a global concern since 1990's due to increase in anthropogenic activities such as industrialization, high metal wastes, leaded gasoline and paints, fertilizers, sewage sludge, pesticides, wastewater, coal residues and atmospheric deposition. The most common heavy metals at contaminated areas are As, Cd, Pb, Hg, Cr, and Cu. Those metals are important and also have risks because they cause environmental contamination, and associate with health effects for humans. It is well known that such as As and Pb are not essential elements for the metabolic processes and they are associated with the problems of cancer risk, skin damage, kidneys, nervous and circulatory systems. Several technologies exist for the remediation of heavy metal contaminated soil.
These are replacement of contaminated soils, electro kinetic remediation, soil leaching, adsorption, phytoremediation, microbial remediation, animal remediation and other methods. The present paper focuses on whole soil remediation techniques for heavy metal contaminated sites in the developing countries where agriculture, urbanization, and industrialization are leaving a legacy of environmental degradation.

Keywords: Soil pollution, heavy metals, remediation techniques

STABILISING ELASTIC NETWORKS WITH MULTI-AGENT SYSTEMS

Anthony Lucas Smith
anthony.lucas-smith@open.ac.uk

Joseph Webber
josephwebber@outlook.com

Multi-agent systems are regularly applied to problems such as transport scheduling, resource allocation, and networked systems, but have rarely been used to solve physical, mechanical problems. This paper describes an experimental test-bed to investigate the effectiveness of bottom up control of mechanical systems, in comparison with traditional top-down control requiring a fixed internal mapping of the system under control. The basic architecture was designed to be expandable to any degree of complexity, whilst allowing for a wide range of uncertainty to be encountered. Complex problems in real space involving connections, stresses and strains could subsequently be modelled, and are perfect candidates for exploration with autonomous intelligent agents. Discoveries in this field could have effects as far-reaching as improving the performance of axial compressors in jet propulsion and gas distribution.

Keywords: autonomous intelligent agents, complexity, uncertainty, Arduino microprocessors, servo motors.

STAJ EŞLEŞTIRMEYE YÖNELIK KARAR DESTEK SISTEMI KAPSAMINDA GELIŞTIRILEN HAVACILIK STAJ YAZILIMI İNTERNET SITESI KULLANILABILIRLIĞINE İLIŞKIN BIR ARAŞTIRMA

Savaş Ateş
ssates@anadolu.edu.tr

Kadriye Yaman
kyaman@anadolu.edu.tr

Meslek edinecek kimsenin geçirdiği uygulamalı öğrenme dönemi staj olarak tanımlanmaktadır. Staj sayesinde kişiler, akademik bilgilerini gerçek yaşamda kullanma ve deneme şansı bulurlar. Sivil havacılık eğitimi alanında da staj uygulamaları, teorik eğitimin pekiştirilmesine sağladığı katkılar nedeniyle oldukça önemli bir yere sahiptir.

Türkiye'de 2016 yılı verilerine göre sivil havacılık alanında eğitim veren toplam 33 yükseköğretim kurumunda, 12 program altında yaklaşık 3.600 öğrencinin her yıl zorunlu staj yapması beklenmektedir. Mevcut uygulamada staj eşleştirme işlemleri eğitim kurumları, işletmeler ve Sivil Havacılık Genel Müdürlüğü (SHGM) tarafından gerçekleştirilmektedir. Sivil havacılık eğitimine belirli standartlar getirmek amacıyla SHGM ile eğitim alanında düzenleyici bir kurum olan Yükseköğretim Kurulu (YÖK) arasında staj konusunda bir protokol imzalanmış ve yükseköğretim kuruluşlarında staj yazılımı uygulama takvimi kabul edilmiştir. Bu doğrultuda, Ateş, Yaman, Yalçınkaya ve Çukurbağ (2014) tarafından 27.05.2014 tarihinde imzalanan protokol ile toplam süresi 36 ay olarak tasarlanan ve Anadolu Üniversitesi Bilimsel Araştırma Proje Birimi tarafından 1403E101 numarası ile desteklenen "Sivil Havacılık Eğitiminde Ortak Staj Eşleştirme Yeterliliklerinin Belirlenmesi ve Staj Eşleştirmeye Yönelik Karar Destek Sistemi Önerisi" adlı bir proje geliştirilmiştir. Söz konusu proje kapsamında sivil havacılık alanında staj eşleştirme ve atamasına yönelik bir internet sitesi tasarlanarak http://havacilikstaj.anadolu.edu.tr/ adı altında yayına başlamıştır. İlgili internet sitesi, staj eşleştirme ve atamalarında Türkiye'de yükseköğretim düzeyinde sivil havacılık eğitimi veren kuruluşları, sivil havacılık öğrencilerini, havacılık işletmelerini ve staj eşleştirmelerine taraf olan diğer kurumları kapsamaktadır.

Bu çalışmada staj eşleştirmeye yönelik olarak geliştirilen havacılık staj yazılımı internet sitesinin kullanılabilirliğinin değerlendirilmesi amaçlanmıştır. Bu kapsamda Çakmak, Güneş, Çiftçi ve Üstündağ (2011) tarafından geliştirilen "İnternet Sitesi Kullanılabilirlik Ölçeği" çok kullanıcılı etkileşimli mevcut internet sayfasının kullanılabilirliğinin değerlendirilmesine uyarlanmıştır. Araştırmanın birinci bölümünde internet sitesi kullanılabilirlik ölçekleri literatür taraması verilmiştir. İkinci bölümde proje kapsamında geliştirilen internet sayfası bölümleri tanıtılmıştır. Araştırmanın uygulama bölümünde çok kullanıcılı etkileşimli mevcut internet sayfasının kullanılabilirliğinin değerlendirilmesine yönelik olarak uyarlanan İnternet Sitesi Kullanılabilirlik Ölçeği ve uyarlanan bu ölçek ile 1607 öğrenci, 52 işletme ve 80 eğitim kurumu ile yapılan anket sonuçları değerlendirilmiştir.

STANDART YAĞIŞ İNDEKSİ İLE KURAK DÖNEMLER ANALİZİ: MANİSA ÖRNEĞİ

Barış Yılmaz
baris.yilmaz@cbu.edu.tr

İklim değişikliği senaryolarına göre kuraklığın gelecekte özellikle ülkemizin de içinde bulunduğu orta enlemlerde daha da etkili olacağı tahmin edilmektedir. Kuraklığın başta insan olmak üzere tüm canlılar üzerindeki yıkıcı etkileri göz önüne alındığında bu doğal afetin getireceği olumsuz etkileri en az seviyeye indirmek için gerekli tedbirlerin önceden planlanması gerekmektedir. Bu planlamalarda havzalarda yaşanan kuraklıkların şiddetinin, zamansal ve alansal dağılımının belirlenmesi büyük önem taşır. Bu çalışmada, Standart Yağış İndeksi (SYİ) yöntemi ile Manisa-Merkez, Manisa-Salihli ve Manisa-Akhisar bölgelerinde kuraklık analizi yapılmıştır. Analizlerde 3 ve 12 aylık SYİ değerleri kullanılmıştır. Çalışma sonucunda Manisa bölgesinin kuraklığa karşı oldukça hassas olduğu, her üç ilçede de 1985, 1989,1992, 2001 ve 2007 su yıllarında çok şiddetli kuraklıkların yaşandığı, Ocak-Şubat-Mart aylarını kapsayan dönemde meteorolojik kuraklığın daha fazla görüldüğü ve bu mevsimsel kuraklık durumunun özellikle Salihli bölgesinde diğer bölgelere oranla daha sık ve daha şiddetli olduğu belirlenmiştir.

Keywords: Standart Yağış İndeksi (SYİ), kuraklık analizi, Manisa

STATİK YÜK ALTINDA DEMONTE TİPİ KİTAPLIK RAFLARIN RİJİTLİK ANALİZİ

[1]Ali Naci TANKUT, Abdurrahman KARAMAN[2]

[2]Bartın Üniversitesi Orman Fakültesi Orman Endüstri Mühendsiliği Bölümü, Bartın-Türkiye

[2]Uşak Üniversitesi Banaz MYO Ormancılık Bölümü, Uşak-Türkiye

abdurrahman.karaman@usak.edu.tr

Özet: Bu çalışmada, demonte tipi kitaplık raflarında kullanılan ahşap kompozit levhalar ile farklı bağlantı elemanların statik yük altında rijitlik analizi yapılmıştır. Deney örnekleri ahşap kompozit levhalardan, yonga levha ve orta yoğunlukta lif levhalardan (MDF) hazırlanmıştır. Bağlantı elemanı olarak trapez, plastik dübelli minifiks, metal dübelli minifiks, metal T bağlantı, pipo bağlantı ve ay bağlantı kullanılarak kitaplıklar üretilmiştir. Üretilen demonte kitaplıklar, kullanımları sırasında etkisinde kalabilecekleri kritik yükler dikkate alınarak 6 ay statik yük altında bırakılmıştır. Deneyler sonucunda en yüksek rijitlik katsayı değeri yonga levhadan üretilen trapez ve metal dübelli minifiks bağlantı elemanında 2,7; en düşük, MDF' den üretilen plastik dübelli minifiks, metal dübelli minifiks ve ay bağlantı elemanlarında 2,2 elde edilmiştir. Deney sonucu olarak; en iyi sonucun, MDF' den üretilen plastik dübelli minifiks, metal T bağlantı ve ay bağlantı elemanlarında, en kötü sonucun yonga levha dan üretilen trapez ve metal dübelli minifiks bağlantı elemanında olduğu tespit edilmiştir.

Anahtar Kelimeler: Demonte Tpi Mobilya, Statik Yük, Rijitlik.

THE ANALYSIS OF STİFFNESS OCCUR UNDER STATIC LOAD IN DEMONTE TYPE BOOKSHELVES

Abstract: In this study, the creep properties of demonte bookcases, which are produced with different fasteners and wood base materials were investigated. Samples of the experiment particleboard and medium density fiberboard (MDF) were used as wooden composites materials and trapez connector with metal parts, metal minifix connector with metal peg, metal minifix connector with plastic peg, metal T connector, pipe type connector, and corner fitting were used joints. Demonte bookcases were exposed to static loading for six months by considering the critic loads which could effect while in service use. According to the experiment results The highest stiffness value was obtained particleboard with trapez connector and metal minifix connector with metal peg combination 2,7 the lowest stiffness value was obtained medium density fiberboard (MDF) with metal minifix connector with plastic peg, with metal minifix connector with metal peg, and corner fitting combination 2,2. It was determined that the combination of medium density (MDF) with metal minifix connector with plastic peg, with metal minifix connector with metal peg, and corner fitting better than particleboard with metal minifix connector with metal peg combination

Key Words : Demonte Type Bookcase, Static Load, Stiffness.

Giriş

Mobilya imalatında genel olarak, kutu, çerçeve ve kombine üç temel konstrüksiyon kullanılmaktadır. Tablaların kullanıldığı mobilyalar kutu (panel) tipi, masif çerçevelerin yer aldığı mobilyalar çerçeve (iskelet) tipi, hem kutu hemde çerçeve tipinin birlikte kullanıldığı mobilyalar ise kombine konstrüksiyonlu mobilyalar olarak tanımlanmaktadır (Efe, 1994).

Mobilya konstrüksiyonların da çeşitli bağlantı ve bağlama teknikleri kullanılmaktadır. Rasyonel tasarımda, bağlantı elemanları ve birleştirme tekniklerinin kabul edilebilir mukavemet özellikleri önceden bilinmelidir (Efe, 1994).

Kaliteli bir mobilya tasarımında, mekanik özelliklere yüksek ve performansı iyi olan kompozit levhaların kullanılması gerektiğini belirtmektedir (Eckelman, 1999).

 Copyright © International Science and Technology Conference (ISTEC)

Konstrüksiyonda uygulanan birleştirmelerin stabilizesi ve mukavemeti, mobilya sisteminin mukavemetini etkiler. Sağlam ve dayanıklı birleştirmelerin kullanılması taşımaları gereken yüke bağlı olduğunu belirtmektedir (Efe, 1998).
Mobilya kulanım esnasında maruz kalacağı yüklere güvenli bir şekilde direnç gösterebilmeli ve bu yükleri taşıyabilmesi için mühendislik tasarımın hassas ve doğru bi şekilde uygulanması gerekliğini belirtmektedir (Oflazoğlu, 2006).
Yükleme sonucu, malzemenin içinde meydana gelen gerilmeler ile şekil değiştirmeler arasındaki bağıntıların, mühendislik hesaplamalarında önemli bir yeri olduğu ve mühendislik uygulamalarında ise yükler altında doğacak olan şekil değiştirme ve gerilmelerin teorik olarak hesaplanabilmesi, o malzemeye ait gerilme deformasyon denkleminin deneysel olarak tayin edilmesi ile mümkün olabileceğini belirtmektedir (Erman, 1974).
Rafların sabitlenmesinde arkalıktan yapılan vidalamanın, ayrıca rafların sabitlenmesinde vidanın uzunluğu, ve kitaplığın ön cumbasına yapılan kalınlaştırmanın da rafların sehimini azalttığı belirtilmiştir. Elastikiyet modülü yüksek malzemelerin kullanılması ve levha kalınlığının artırılması mevcut tasarımların performanslarının geliştireceğini ve orta yoğunluklu lif levha (MDF) rafların, yongalevha raflarına göre daha dirençli olduğu belirtilmiştir (Denizli, 2001).
Ahşap esaslı kompozit levhalar ile ahşap kirişler arasındaki sünmeyi incelemişlerdir. Bu amaçla yonga levha, MDF ve kontrplak örnekleri ahşap kirişlere çivi ile birleştirilmiştir. Bu malzemeler içinden ençok sünme kontrplak, enaz sünmenin ise MDF levhasında oluştuğunu belirtmiştir (Jang, 1995).
Sünme ile yapılan bir araştırmada %30 luk bir yükleme sonucu toplam sünme iki yılsonunda elastik deformasyonun % 212‟ si kadar olmuştur (Pierce et all., 1985).
Yongalevha örnekleri dirençlerinin % 10 ve % 20‟si oranında yüklemeye maruz bırakılmışlardır. Deneylerde 15 günün sonunda; % 10 oranında yüklenen örneklerde toplam sünme, elastik deformasyonun % 48‟i, % 20 oranında yüklenen örneklerde toplam sünme, elastik deformasyonun % 53‟ü oranında olmuştur (Haygreen et all., 1975).
Kutu konstrüksiyonlu mobilya köşe birleştirmelerinde mekanik özellikleri ile iligili çalışmada, tutkalsız (demonte) birleştirmelerin tutkallı (sabit) birleştirmelere mukavemet açısından üstünlük sağladığını bildirmiştir (Şafak, 2006).
Kutu konstrüksiyonlu mobilyalarda minifiksli köşe birleştirmelerin moment taşıma performansların araştırıldığı çalışmada; malzeme çeşidi ve birleştirme elemanı ikili etkileşimine göre, çekme ve basınç deneylerinde en iyi sonucu metal dübelli kontrplak malzeme vermiş, en kötü sonucun ise metal dübelli yongalevha malzemede olduğunu bildirmiştir (Aslan, 2006).
“32 *mm* Kutu Konstrüksiyonlu Köşe Birleştirmeleri İçin Optimum Kavela Mesafeleri” adlı çalışmada yonga levha ve MDF köşe birleştirmeleri basınç ve çekme yükleri altında test edilmiştir. Basınç ve çekme testlerinde MDF köşe birleştirmeleri yonga levhadan daha dayanıklı olduğu belirtilmiştir (Tankut, 2005).
Bu çalışmanın amacı; demonte tipi kitaplıkların statik yükleme sonucu rafların rijitliklik katsayısını tespit etmek ve ayrıca kitaplık üretiminde kullanılan kompozit levha tipi ve birleştirmede kullanılan bağlantı elemanların, rijitlik katsayına etkilerin belirlenmesi amaçlanmıştır.

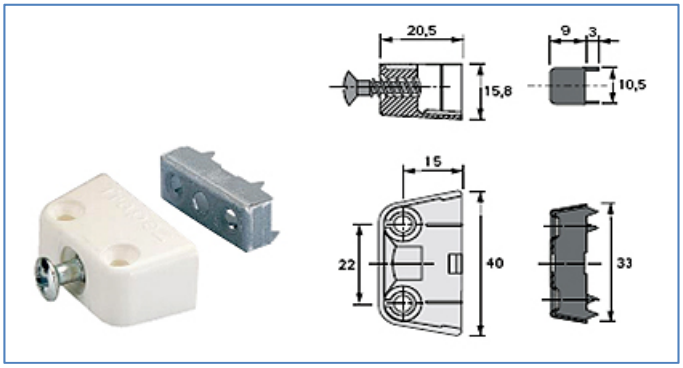
Materyal ve Metot

Ahşap Esaslı Kompozit Malzemeler

Deneylerde ahşap kompozit levha olarak, 18 mm kalınlığında yonga levha ve orta yoğunlukta lif levha (MDF) ve 4 mm kalınlığında orta yoğunlukta liflevha (MDF) kullanılmıştır.

Tablo 1’de ahşap esaslı kompozit levhaların fiziksel ve mekaniksel özellikleri verilmiştir (Bozkurt vd., 1987).

Tablo 1. Kullanılan malzemelerin fiziksel ve mekaniksel özellikleri.



Malzeme	Yoğunluk (gr/cm^3)	Rutubet (%)	Eğilme Direnci (N/mm^2)	Elastikiyet Modülü (N/mm^2)
MDF	0.62	7.1	32.12	2780
Yonga levha	0.58	6.9	16.58	1822

Tablo 1’de demonte tipi kitaplıkların üretiminde kullanılan ahşap esaslı kompozit levhaların fiziksel ve mekaniksel özellikleri verilmiştir. Mobilyanın mukavemeti kullanılan malzemelerin fiziksel ve mekaniksel özelliklerine göre değişim gösterebilir.

Deney örneklerinin hazırlanması

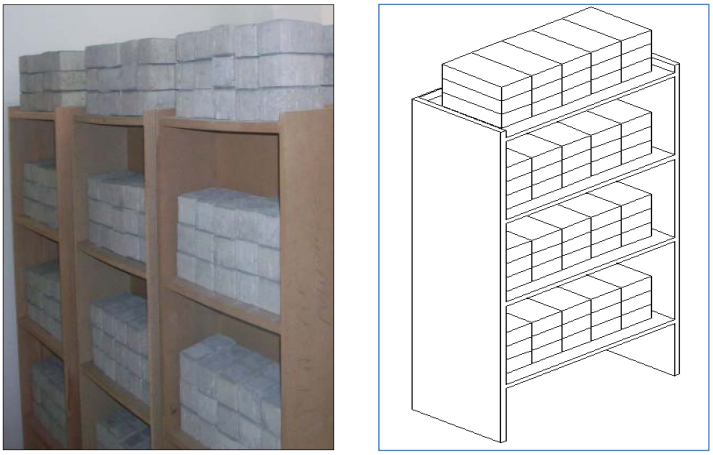
Deneylerde kullanılan demonte tipi kitaplıkların eleman listesi Tablo 2'de verilmiştir.

Tablo 2. Demonte tipi kitaplığın eleman listesi (mm).

Tabla Adı	Tabla Sayısı	MDF (mm)			Yonga levha (mm)		
		Boy	Genişlik	Kalınlık	Boy	Genişlik	Kalınlık
Yan Tabla	2	1350	290	18	1350	290	18
Üst Tabla	1	564	290	18	564	290	18
Alt Tabla	1	564	290	18	564	290	18
Raf	2	564	290	18	564	290	18
Arkalık	1	4×600×1350 mm ölçülerinde MDF					

Demonte tipi kitaplık yapımında 2 çeşit ahşap kompozit malzeme, yonga levha ve MDF Tablo 2'deki kesim listesine göre çizicili yatar daire makinesinda kesilmiştir. Montajı için gerekli delik işlemleri, çoklu delik makinesinda açılmıştır. Farklı bağlantı elemanları (trapez, plastik dübelli minifiks, metal dübelli minifiks, metal T bağlantı, pipo bağlantı ve ay bağlantı) kullanılarak bu parçaların montajı yapılmıştır. Arkalık, 3,5×16 vida kullanılarak sadece yan tablalara montajı yapılarak Şekil 7'de belirtilen ölçülerde kitaplıklar hazırlanmıştır.

Şekil 7. Demonte tipi kitaplık ölçüleri (mm).



Metot

Deney örneklerin hazırlanmasında 2 malzeme çeşidi ve 6 farklı bağlantı elemanı kullanılarak, 4 raflı kitaplıklar hazırlanmıştır.

Deney Öneklerine Yük Konulması

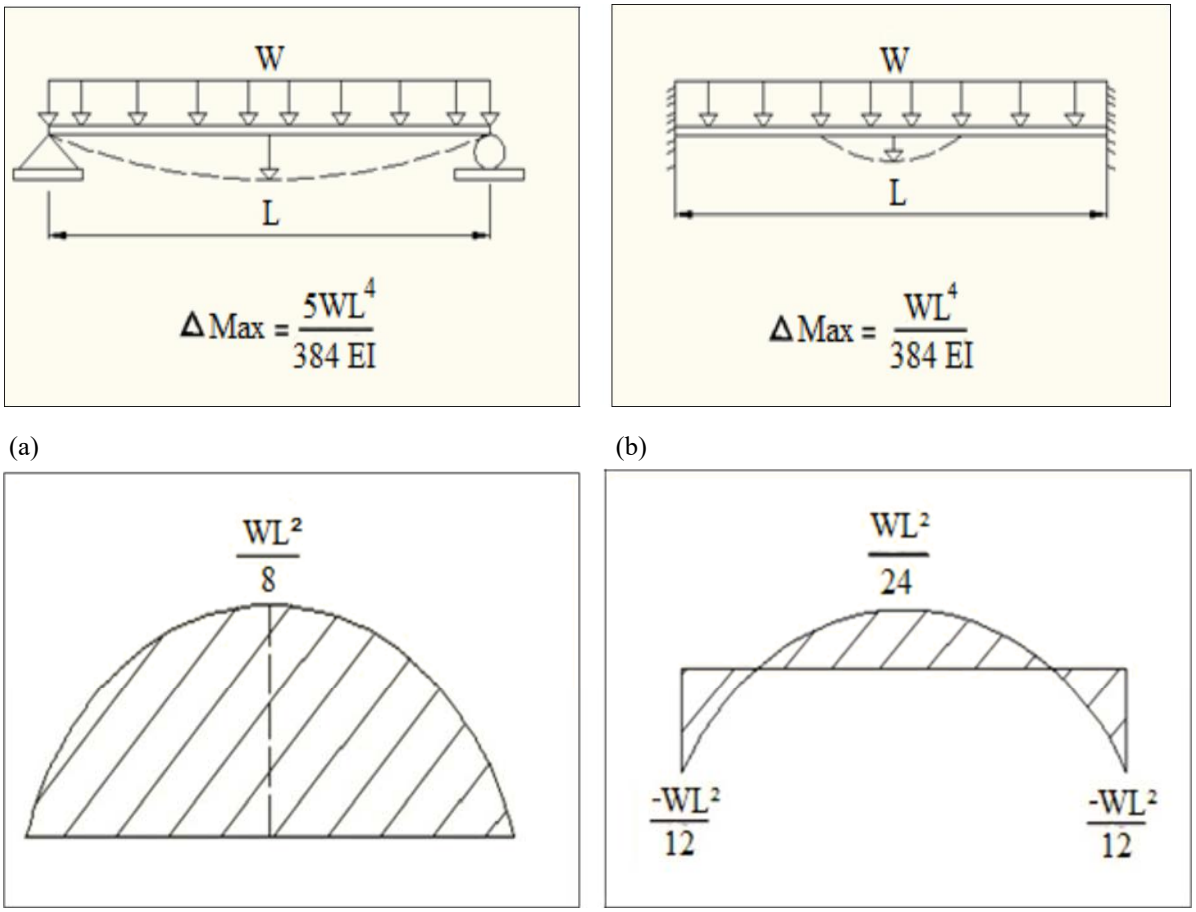
Deney yükü olarak ebatları 60×100×200 mm, ağırlığı 2600 gr, yeknesak ve homojen yapıda briket tuğlalar kullanılmıştır. Her bir rafa, rafın ön ve arka kenarından 50 mm içeride ve yan kenarından ise 32 mm olacak şekilde toplam 15 adet briket tuğlası yerleştirilmiştir. Biritish education standartlarına (BS4875;1975) göre mm^2 ye normal olarak 2,5 kg yük konulması ön görülmektedir. Şekil 8'deki demonte tipi kitaplıktaki her bir rafa toplam 39 kg yük ve toplam da dört rafa ise 156 kg yük konulmuştur.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 8. Deney örneklerine yük konulması.

Sehim Öçülerin Alınması

Sehim ölçümlerinde, 0.001 mm hassasiyetinde ölçüm yapabilen Şekil 9'daki komparatörler kullanılmıştır. İlk önce kitaplık rafların yük konulmadan önceki sehim ölçümleri yapılmıştır. Daha sonra her bir rafa 39 kg yük konulup elastik deformasyonu saptamak amacı ile anlık sehim ölçümleri alınmış ve bu ölçümler 15, 30 ve 60 dakika arayla tekrarlanarak yapılmıştır. Sünme performansını saptamak amacı ile toplamda yüklü halde 180 günlük ölçüm yapılmış, ölçüm aralıkları ilk hafta her gün, daha sonra haftalık ve aylık ölçümler alınarak deneyler tamamlanmıştır.



Şekil 9. Komparatörler ile sehim ölçümlerin yapılması (mm).

Rijitlik

Rjitlik kelimesi İngilizcedeki karşılığı olan *Stiffness* den alınmıştır. Kelime itibariyle rijitlik, eğilmezlik veya bükülmezlik anlamına gelir (Lin, 1963). Düzgün yayılı yükle yüklenmiş basit ve ankastre kirişlerin statik olarakdeformasyon formülleri ve eğilme momenti diyagramları ile ilgili formüller verilmiştir (Şekil 10).

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 10 Düzgün yayılı yükle yüklenmiş basit ve ankastre kirişlerin statik olarak deformasyon formülleri ve eğilme momenti diyagramları (a) Basit kiriş, (b) Ankastre kiriş, (c) Eğilme momenti diyagramı, (d) Eğilme momenti diyagramı (Denizli, 2001).

Statik yük altında rafın ortasında oluşan deformasyon miktarı Eşitlik 1 ve atalet momenti ise Eşitlik 2 ile hesaplanmaktadır (Denizli, 2001).

$$\Delta max = \frac{WL^4}{384EI} \qquad 1$$

$$I = \frac{bh^3}{12} \qquad 2$$

Δmax= rafın orta noktasındaki deformasyon (mm).
W= rafa uygulanan yük (kg).
L= raf uzunluğu (mm).
E= elastikiyet modülü.

I= atalet momenti.
b= raf genişliği (mm).
h= raf kalınlığı (mm).

 Copyright © International Science and Technology Conference (ISTEC)

Rijitlik katsayısı *k* ile gösterilir. Bu değer 1 ile 5 arasında olup, 1 değeri rijit 5 ise rijit olmayan durumu göstermektedir. Rijitlik katsayısı Eşitlik 3 ile hesaplanmaktadır (Denizli, 2001).

$$k = \frac{\Delta max}{\Delta elastik} \qquad 3$$

k= rijitlik katsayısı.
Δmax = rafın orta noktasındaki deformasyon (mm).
Δelastik = Elastik deformasyon (mm).

İstatiksel Analiz

Deneylerden elde edilen veriler SPSS paket programında değerlendirilmiştir. Araştırma kapsamında incelenen etki faktörleri arasındaki farkın belirlenmesinde MANOVA varyans analizi kullanılmış ve gruplar veya kademeler arasındaki farkların anlamlı (P<0,05"e göre) bulunması durumunda Duncan testi uygulanarak değerler arasındaki fark karşılaştırılmıştır. Belirlenen ortalama, üst ve alt değerleri, varyans analizlerine ilişkin değerler, varyans analizinde anlamlı (%95 güven düzeyinde) bulunan gruplara ilişkin Duncan testine ait sonuçlar tablolar halinde verilmiştir.

Bulgular ve Tartışma

Denemeler sonucunda elde edilen rijitlik katsayı değerlerine değerler Tablo 3'de verilmiştir. En düşük rijitlik katsayı değeri 2,2 ile MDF plastik dübelli minifiks, metal T ve ay bağlantı elemanı kullanılarak imal edilen demonte tipi kitaplıklarda, en yüksek rijitlik katsayı değeri 2,7 ile yonga levha trapez ve metal dübelli minifiks bağlantı elemanı kullanılarak imal edilen demonte tipi kitaplıklarda belirlenmiştir.

Tablo 3 Kitaplıkların 6 ay statik yük altında oluşan rijitlik katsayı değerleri.

Malzeme Çeşidi	Bağlantı Çeşidi	Ortalama	Minimum	Maksimum	Standart Sapma
MDF	TÇ	2,3	1,7	2,8	0,22263

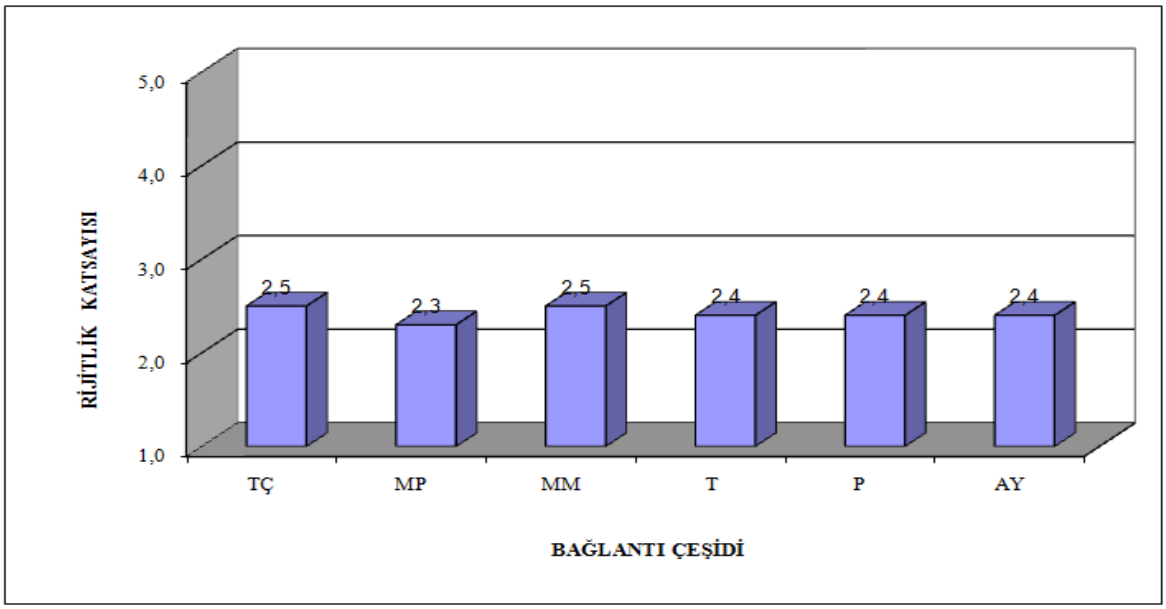
MDF-MM	2,4	A	YL-MM	2,7	A

(TÇ: Trapez, MP: Plastik Dübelli Minifiks, MM: Metal Dübelli Minifiks, T: Metal T Bağlantı, P: Pipo Bağlantı, AY: Ay Bağlantı).



Bağlantı çeşidinin, rijitlik katsayı değerine ait ortalamaların karşılaştırılması Tablo 4,6'da verilmiştir.

Tablo 6 Rijitlik katsayı değerlerinde bağlantı çeşidine ait Duncan testi sonuçları.

Bağlantı çeşidi	X	HG
Plastik dübelli minifiks	2,3	A
Metal T bağlantı	2,4	A
Ay bağlantı	2,4	A
Pipo bağlantı	2,4	A
Trapez	2,5	A
Metal dübelli minifiks	2,5	A

Yapılan Duncan testi sonucuna göre uygulanan bağlantı çeşidi değerleri arasındaki farklılık %95 güven düzeyinde anlamsız olduğu tespit edilmiştir. Tablo 6'daki bağlantı çeşidine göre rijitlik katsayısı, trapez ve metal dübelli minifiks birleştirmelerden (2,5), plastik dübelli minifiks birleştirmeden (2,3), % 8 daha yüksek çıkmıştır. Bağlantı çeşidine ait elde edilen rijitlik katsayı ortalamaları Şekil 11'de gösterilmiştir.
Sonuç olarak Şekil 11'e göre plastik dübelli minifiks birleştirme elemanları, diğer bağlantı elemanlarına göre daha iyi performans göstermiştir..

Şekil 11 Bağlantı çeşidi rijitlik katsayı değerlerine ait ortalamaların karşılaştırılması.

Malzeme çeşidinin, rijitlik katsayı değerine ait ortalamaların karşılaştırılması Tablo 7'de verilmiştir.

Tablo 7 Rijitlik katsayı değerin malzeme çeşidine ait Duncan testi sonuçları.

Malzeme çeşidi	**X**	**HG**
MDFLAM	2,3	A
YYLAM	2,6	A

Malzeme çeşidi değerleri arasındaki farklılık %95 güven düzeyinde anlamlı olduğu tespit edilmiştir. Farklı olan gruplar farklı homojenlik gruplarında Tablo 7'de gösterilmiştir. Malzeme çeşidine göre rijitlik katsayı değeri, yonga levha (2,6), MDF'den (2,3), % 13,04 daha yüksek çıkmıştır. Malzeme çeşidine ait elde edilen rijitlik katsayı değeri ortalamaları Şekil 12'de gösterilmiştir.

Şekil 12 Malzeme çeşidi rijitlik katsayı değerlerine ait ortalamaların karşılaştırılması.

 Copyright © International Science and Technology Conference (ISTEC)

Bağlantı çeşidi ve malzeme çeşidi etkileşiminin sünme değerlerine ait ortalamaların karşılaştırılması Tablo 8'de verilmiştir.

Tablo 8 Bağlantı ve malzeme çeşidi etkileşimine göre rijitlik katsayı ortalama değerleri.

Bağlantı Çeşidi	**Malzeme Çeşidi**	
	MDF	Yonga levha
Trapez	2,3	2,7
Plastik Dübelli Minifiks	2,2	2,4
Metal Dübelli Minifiks	2,4	2,7
Metal T Bağlantı	2,2	2,6
Pipo Bağlantı	2,3	2,4
Ay Bağlantı	2,2	2,6

Bağlantı çeşidi ve malzeme çeşidi etkileşimi bakımından, en düşük rijitlik katsayı değeri 2,2 ile MDF ve plastik dübelli minifiks, metal T ve ay bağlantı bağlantı elemanı kullanılarak imal edilen kutu konstrüksiyonlu mobilyalarda, en yüksek rijitlik katsayı değeri ise 2,7 ile yonga levha ve trapez, metal dübelli minifiks bağlantı elemanı kullanılarak imal edilen kutu konstrüksiyonlu mobilyalarda belirlenmiştir. Yonga levha ve trapez, metal dübelli minifiks bağlantı elemanı kullanılarak imal edilen kutu konstrüksiyonlu mobilyalarda, MDF ve plastik dübelli minifiks, metal T ve ay bağlantı elemanı kullanılarak imal edilen kutu konstrüksiyonlu mobilyalardan % 22,72 daha yüksek çıkmıştır. Bağlantı çeşidi ve malzeme çeşidi etkileşimine ait grafik Şekil 13'de gösterilmiştir.

Şekil13 Bağlantı çeşidi ve malzeme çeşidi etkileşiminin rijitlik katsayı değerlerine ait ortalamaların karşılaştırılması.

Şekil 13 de görüldüğü gibi MDF panel kullanılarak yapılan kitaplık raflarında en iyi performansı plastik dübelli minifiks, metal T ve ay bağlantı bağlantı elemanları ile yapılan birleştirmeler, en kötü performansı ise metal dübelli minifiks bağlantı elemanı ile yapılan birleştirmeler vermiştir.
Yonga levha panel kullanılarak yapılan kitaplıklarda ise en iyi performansı plastik dübelli minifiks ve pipo bağlantı ile yapılan birleştirmeler, en kötü performansı ise trapez ve metal dübelli minifiks bağlantı elemanı ile yapılan birleştirmeler vermiştir.

Tartışma

Malzeme çeşidi bakımından; MDF, yonga levha'dan %13,04 daha rijit bulunmuştur.
Bağlantı elemanı çeşidi bakımından; plastik dübelli minifiks bağlantı elemanı trapez ve metal dübelli minifiks bağlantı elemanından % 8 daha rijit bulunmuştur.

 Copyright © International Science and Technology Conference (ISTEC)

Bağlantı çeşidi ve malzeme çeşidi etkileşimi bakımından; MDF ve plastik dübelli minifiks, metal T ve ay bağlantı bağlantı elemanı kullanılarak imal edilen kutu konstrüksiyonlu mobilya, yonga levha ve trapez, metal dübelli minifiks bağlantı elemanı kullanılarak imal edilen kutu konstrüksiyonlu mobilyagöre % 22,72 daha rijit bulunmuştur.
Kutu mobilyaların köşe birleştirmelerinde mukavemet özelliklerinin belirlendiği çalışmada; MDF, Yongalevhaya göre % 20 daha rijit bulunmuştur (İyiiş 2009).
Kutu konstrüksiyonlu mobilyaların mukavemet özelliklerin belirlendiği çalışmada; MDF ile üretilen örnekler YL ve OKP ile üretilene göre yaklaşık % 8 daha rijit bulunmuştur (İmirzi 2008).
Kutu konstrüksiyonlu mobilyaların mukavemet özelliklerin belirlendiği çalışmada; birleştirme tekniği ve malzeme çeşidi ikili etkileşiminin rijitlik katsayı değerleri sonuçlarına göre; MDF ile üretilen kavelalı vidalı deney örnekleri yüksek rijitlik değeri vermiş, bunu MDF ile üretilen kavelalı birleştirme örnekleri izlemiştir (İmirzi 2008).
Bu sonuçlara göre; kutu konstrüksiyonlu mobilya tasarımında, malzeme açısından ekonomik kriterler de dikkate alınarak malzeme tercihi, MDF ve bağlantı elemanı tercihi ise plastik dübelli minifiks, trapez bağlantı bağlantı elemanın tercih edilmesi edilebilir.

Abstract: This paper proposes a Hybrid Strategic Decision Support System (H-SDSS) for colleges' enrollment capacity planning. Three hybrid subsystems are combined for executing the task of decision making processes. The system includes students' track specified model, colleges' enrollment model and students' capacity forecast model. Data mining knowledge based rules and goal programming based methods are used for building the system. This H-SDSS is expected to help university decision makers for solving problems related to strategic decisions for enhancing university students' admission and enrollment capacity planning to satisfy future of higher educational demands as well as labor market needs.

Keywords: Strategic Decision, DSS, Goal programming, knowledge base rule, Data mining.

Introduction

DSS is an interactive computer-based system intended to help decision makers use communications technologies, data and documents, knowledge and models to identify and solve problems, to complete decision process tasks, and to make decisions. DSS enhances a person and group's ability to make decisions. DSS can be differentiated by the level of decision (Gutierrez, 2008): Strategic where the decision can be taken for two to five years, Tactical; where a decision can be taken within a few months up to two years, Operational; where a decision can be dealt within a few days or a few months, and Dispatching; where a decision can be taken just for some hours.

Standalone DSSs are limited performance and lacks efficiency specially with the fast growing in developed technology. The Hybrid DSS can solve these problems and improve the overall system performance. Hybrid DSS has been used in many specific areas and application such as medical care (Berner, 2009), finance (Kotsiantis, 2006), and architecture (Simmons, 2008). However, the literature did not cover well the HDSS in the area of Higher Education Management. The work proposed in this paper suggested a novel design and implementation for a hybrid strategies DSS. The architecture combines data mining approaches (Han & Kamber, 2006) as well as goal programming (Orumie & Ebong, 2014). This is expected to satisfy Higher Education institutions' decision makers for solving problems related to students' college admission and enrollment effectively and improving universities of achieving their goals for getting optimal capacity that satisfying their future needs.

Most of previous work are based on using single model DSS, and this lacks flexibility, adaptability, and capability. This paper introduces a novel H-SDSS based hybrid subsystem and integrated models for design and implementation for Colleges Enrollment Capacity Planning. The rest of the paper explains the following sections: literature survey, the architecture of the proposed H-SDSS system, the applied case study data resources and system implementation, the H-SDSS system results, and the conclusions, respectively.

Literature Survey

DSSs vary greatly in application and complexity, but they all share specific features. A typical DSS has four components (Power, 2008): data management, model management, knowledge management and user interface management. Decision making in a complex, dynamically changing environment is a difficult task that requires new techniques of computational intelligence for building adaptive, hybrid intelligent decision support systems (HIDSS). These hybrid systems combine several of Knowledge-Based Systems into one system (Kendal & Creen,

 Copyright © International Science and Technology Conference (ISTEC)

2007). They achieve this combination either in a loose coupling, e.g. different modules in the same system use different methods, or in a tight coupling - methods are mixed at a low level, e.g. fuzzy neural networks or fully integrated systems. These are the most promising among standalone DSS. Since, they integrate the advantages of all the methods combined, e.g. dealing with both data and expert rules, using both statistical formulas and heuristics or hints.

Authors (Fong & etal, 2009) proposed a hybrid model of neural network and decision tree classifier that predicts the likelihood of which university a student may enter, by analyzing his academic merits, background and the university admission criteria from that of historical records. Authors (Kasabov & etal, 2016) proposed hybrid intelligent decision support systems and applications for risk analysis and discovery of evolving economic clusters in Europe. Authors (Chen & etal, 2012) proposed a hybrid DSS combining several data mining techniques using an improved weighted majority voting scheme (iWMV). Authors (Mansoul & etal, 2013) proposed a hybrid DSS for application on Healthcare. They used an approach based on using a multi-criteria decision guided by a case-based reasoning (CBR) approach. Authors (Balakrishnan & etal, 2013) developed A hybrid predictive system for retinopathy. They used data mining and case based reasoning (CBR). C5.0 was used to produce the decision tree whereas k-nearest neighbor and Hamming distance algorithms were used to select the three most similar cases for every new case entered into the system.

In this paper, it is proposed to use goal programming method for managing the integrated models subsystem, and using data mining knowledge based for managing the data driven subsystem. Goal programming (GP) is a branch of multi-objective optimization, which in turn is a branch of multi-criteria decision analysis (MCDA). GP is used to perform three types of analysis (Inflibnet , 2016): (1) Determine the required resources to achieve a desired set of objectives, (2) Determine the degree of attainment of the goals with the available resources, (3) Providing the best satisfying solution under a varying amount of resources and priorities of the goals. Data Mining (DM) is the process of collecting, searching through, and analyzing a large amount of data in a database, as to discover patterns or relationships (Han & Kamber, 2006). The most commonly DM methods used in this paper including: student's classification, clustering based on association discovery rules.

Materials and Methods

Figure 1 shows the components of the hybrid SDSS system proposed. The *model management subsystem* works as model driven based DSS, and it includes three integrated models: (1) Tracks Specified model (TSM), (2) Colleges Enrollment Model (CEM) and (3) Capacity Forecast Model (CFM) as explained in details in next sections. The *Data Management subsystem* works as data driven based DSS. The *Knowledge-Base Management Subsystem* can support any of these subsystems. It provides intelligence to augment the decision maker's own. It can be interconnected with the organization's knowledge repository Organizational Knowledge Base. Knowledge can be provided via web servers. Many artificial intelligence methods have been implemented in web development systems which are easy to integrate into the other DSS components as explained in next sections.

User Interface

The *User Interface Subsystem* allows the interaction between the computer and the decision maker. It is used by the user; is part of system; to communicate with and commands the DSS. The web browser provides a familiar and consistent Graphical User Interface (GUI) structure for most DSS. The decision maker; user or manager; can be an individual or a group, depending on who is responsible for the decision, and provides the human intellect. An intermediary allows a manager to benefit form a DSS. For example: University staff assistants have specialized knowledge about management problems and some experience with decision support technology. Expert tool users perform tasks that the problem solver does not have the skill or training to perform. University business analysts have a knowledge of the application area, a formal business administration education and considerable skill in using DSS construction tools. Facilitators control and coordinate the use of software to support the work of people working in groups, and are also responsible for the conduct of workgroups sessions.

The Data Management Subsystem (DMS)

It is connected to several internal and external databases for retrieving the necessarily data required. Five databases are dealt with as shown in Figure 1. (1) Web portal university database is used for retrieving students admitted data such as age, ID, nationality and GPA. (2) The university DB it is used for retrieving the preparatory rules, as explained in (Ragab & etal, 2014). (3) The graduated history DB which help for forecasting, as explained next. (4) The colleges DB used for retrieving enrollment criteria rules explained in (Ragab & etal, 2014). (5) Ministry of higher education DB is used for retrieving the key performance indicators (KPIs) according to future suggested plans that have to be satisfied.

 Copyright © International Science and Technology Conference (ISTEC)

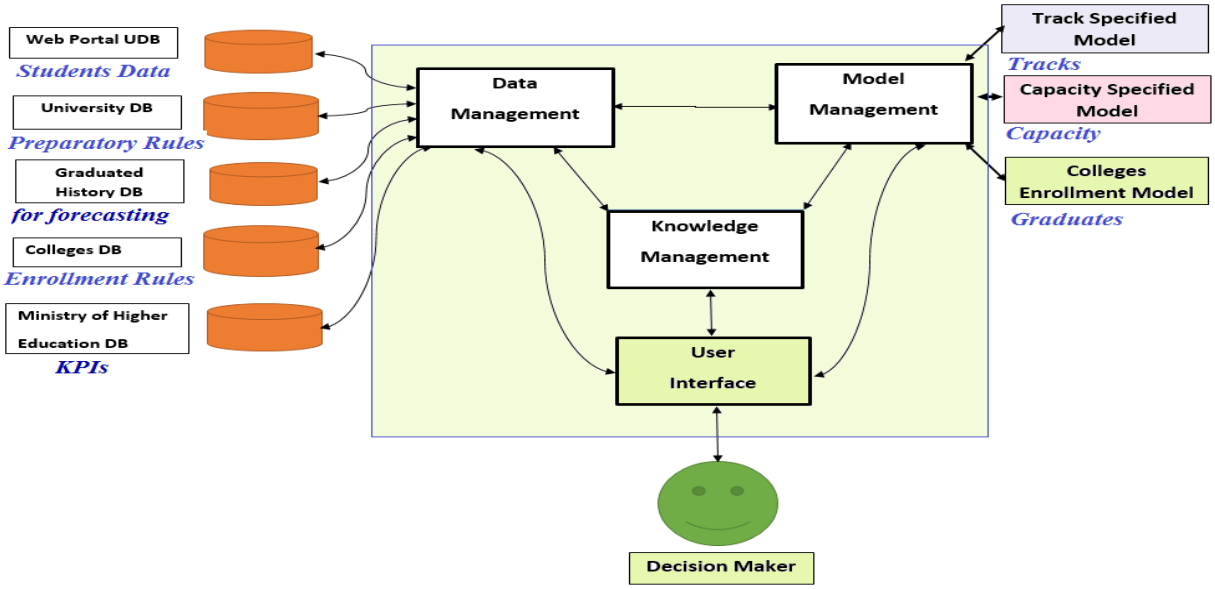

Figure 1. The architecture of the proposed SDSS.

The data Management Subsystem is implemented using data mining (DM) knowledge base rules as explained in (Ragab & etal, 2014). Where, C4.5, PART and Random Forest algorithms gave the highest performance and accuracy with lowest errors. Based on these results, the C4.5 algorithm is used in the implementation. Figure-2 shows a simplified diagram followed for implementing C4.5. A significant cleaning and transformation phase needs to take place so as to prepare the information for DM algorithm. The data we use to construct our DMS subsystem is based on Knowledge Discovery Association Rules. Web usage mining performs mining on student's web data, particularly data stored in logs managed by the web servers. The web log provides a raw trace of the students' navigation and activities on the site. In order to process these log entries and extract valuable patterns that could be used to enhance DMS subsystem and help in system evaluation.

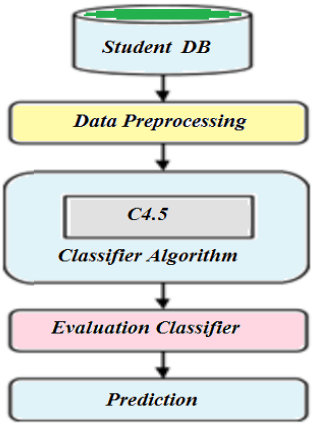

Figure 2. The C4.5 DM algorithm processing steps for implementing DMS.

The Model Management Subsystem (MMS)

It is implemented based on goal programming mathematical model explained in (El-Quliti & etal, 2016). The MMS is consists of three integrated models as follows:

(A) Tracks Specified Model (TSM)

The TSM is used for sorting the preparatory year tracks recommended for fresh students. It contains a sorter and a filter. The sorter used to sort students to several university study tracks available with 60% for Science tracks and 40% for Art tracks. The filter is used to re-arrange students onto two categories. Students who passed all courses successfully will go to college model to be enrolled to suitable colleges. Students who failed in any course are rejected and postponed for services when they are succeeded. The track model executes its' tasks based on the goal programming constrains shown in Table (1) and in the mathematical formulas shown in Appendix-Part (ii).

 Copyright © International Science and Technology Conference (ISTEC)

(B) Colleges Enrollment Model (CEM)

The standard criteria that govern college allocation are based on fulfilling the following four criteria: (1) Success of all preparatory year courses. (2) Minimum score of college prerequisite courses must be satisfied. (3) Weighted Relative Rate must be satisfied. And (4) College capacity must be valid. The CEM contains two internal components; a Classifier and Allocator, respectively. The classifier categorizes students according to their gender and their qualifications. The allocator services students who succeeded in all preparatory year courses and enrolls students into colleges fairly according to the GPA and prerequisite qualified courses stated by specialized colleges. The CEM carries out these tasks based on the goal programming constrains shown in Table (2) and in the Appendix-Part (iii).

(C) Capacity Forecast Model (CFM)

The CFM uses goal programming formulas shown in the appendix to predict the future capacity expected for next upcoming years. For the proposed SDSS forecast purposes, the following goal attributes has been taken into consideration.

1. Annual growth rate for enrolled students.
2. Percentage of the total number of students enrolled in science and engineering programs.
3. Percentage of total enrollment in higher education regardless of age, to the total population in the age group of 18-23 years.
4. Accepted percentage in higher education from high school graduates.
5. Percentage of the total number of students in each discipline of education to the total faculty members.
6. Percentage of the total number of girls to the total number of boys in higher education.
7. Not violating the available resources.
8. Annual growth rate for graduated students.
9. Ratio of graduated students to those enrolled 5 years ago.

Relevant parameters and data for the model related to the applied case study explained in next section.

H-SDSS Case Study Data Specifications

Trusted sources of our applied case study input data included the following: (1) the Kingdom of Saudi Arabia (KSA) Ministry of Education Ninth Development Plan (2010-2014) that adopts the drive towards a knowledge based economy through focusing on human development and education (MHE, 2009, 2016). The main challenges of education are improving enrolment rates, reducing dropout rates at all levels of education, and enabling education to meet the demand of labor market. (2) The twenty-five-year plan (AAFAQ) for KSA Higher Education Development (MHE, 2016). (3) The statistical KSA universities data from the web during years 2004-2015 (ISD, 2014 & CDIS, 2016). Applying these data into the proposed system implemented, the results are obtained as explained next section. The mathematical model will cover the main objectives stated in the KSA Plan and that stated in KSA Strategic Plan (AAFAQ). It will be restricted to a-3 year planning horizon as an example for application, but it can be extended to longer time span with little modifications. To design the decision variables for the case study applied, it is necessary to represent all different problem attributes as defined in Table 1.

Table1: Problem attributes and their values.

Attributes	Values
y = Year of the plan	y = 1 for the first year of the next plan 2016, 2 for the second and 3 for the last year, y = 0 for the last year in the previous plan (current year, 2015), y= -1 for year 2014 and so on.
u = University	u = a university, $u \in$ U, the set of all universities in the country.
i = Status	E for Enrolled and G for Graduated
j = Gender	b for boys section and g for girls section
k = Education Program	m = a college in the medicine specialty, m $\in$ M, the set of all colleges in the Medicine specialty, s = a college in the Science & Engineering specialty, s $\in$ S, the set of all colleges in the Science and Engineering specialty, a = a college in the arts specialty, $a \in$ A the set of all colleges in the Arts specialty and T for the total number in all specialties M, S and A in all universities U.

Table 2: The KPIs input parameters related to the applied case study.

Symbol	Meaning	Value
p_r^y	Annual growth rate for enrolled students in year y of the planned horizon.	4.5%
p_s^y	Percentage of the total number of students enrolled in science & engineering and medical programs to the total number of students enrolled in higher education in year y of the planned horizon.	60%
p_m^y	Percentage of the total number of students enrolled in medical programs to the total number of students enrolled in science & engineering and in year y of the planned horizon.	16.5%
p_p^y	Percentage of total enrollment in higher education regardless of age, to the total population in the age group of 18-23years in the same year y of the planned horizon.	50%
p_h^y	Accepted percentage in higher education from high school graduates in year y of the planned horizon.	55%
p_g^y	Percentage of the total number of enrolled girls to the total number of boys enrolled in year y of the planned horizon.	90%
Percentage of the total number of students in each discipline of university education to the total faculty (*F*) in that specialty in year y of the planned horizon is:		
β_M^y	Medicine	10 :1
β_S^y	Science & Engineering	17: 1
β_A^y	Arts	22:1
β_U^y	Total University	20: 1
q_r^y	Annual growth rate of the number of graduates for year y of the planning horizon.	7.2%.
q_d^y	The planned percentage of students who will complete their studies in year y of the planned horizon to the total number of students enrolled five years ago.	85%

Table 3: The input data in the year 2015, used as current year in the mode.

Symbol	Meaning	Value
$x_{E,b,T}^{y-1,U}$	Total number of boys enrolled in Saudi Arabia in all universities in year y-1 (2015 = last year of the previous National plan).	214,603
$x_{E,g,T}^{y-1,U}$	Total number of girls enrolled in Saudi Arabia in all universities in year y-1 (2015 =last year of the previous National plan)	199,185
$x_{G,b,M}^{y-1,U}$	Number of graduated boys in the Kingdom in year 2015 (medicine)	3,191
$x_{G,b,S}^{y-1,U}$	Number of graduated boys in the Kingdom in year 2015 (science & engineering specialty)	18,103
$x_{G,b,A}^{y-1,U}$	Number of graduated boys in the Kingdom in year 2015 (arts specialty)	13,851
$x_{G,g,M}^{y-1,U}$	Number of graduated girls in the Kingdom in year 2015 (medicine)	3,456
$x_{G,g,S}^{y-1,U}$	Number of graduated girls in the Kingdom in year 2015 (science & engineering specialty)	22,871
$x_{G,g,A}^{y-1,U}$	Number of graduated girls in the Kingdom in year 2015 (arts)	34,797

		2011	**2012**	**2013**
$x_{E,b,M}^{y-5,U}$	Number of enrolled boys (medicine).	8,518	9,370	10,307
$x_{E,b,S}^{y-5,U}$	Number of enrolled boys in year y-5, y-4 and y-3. (science & engineering specialty)	93,807	103,188	113,506
$x_{E,b,A}^{y-5,U}$	Number of enrolled boys (arts specialty)	34,301	37,731	41,504
$x_{E,g,M}^{y-5,U}$	Number of enrolled girls (medicine)	7,114	7,825	8,608
$x_{E,g,S}^{y-5,U}$	Number of enrolled girls (science & engineering)	92,867	102,154	112,369
$x_{E,g,A}^{y-5,U}$	Number of enrolled girls (arts)	38,993	42,892	47,182

Relevant parameters and data for the applied case study are collected and presented in Table 2, (MHE, 2016). Table 3 represents the input data in the year 2015; which considered as current year y in the goal programming model. Table 4 represents the input data for different years needed in the mathematical model. Based on these defined attributes and equations, the results obtained are explained in section 6.

H-SDSS System Implementation

The hybrid integrated models subsystem is implemented based on goal programming method (El-Quliti, 2016). The enrollment part is presented in equations (1-57) shown in the Appendix. The graduation part are solved directly using the inequality relations (58-69). Relevant model parameters and data for the applied case study are represented in the Tables (1-4) in the previous sections. Figure 3 shows a simplified flowchart for the algorithm implemented. Details computations are explained in next sections.

 Copyright © International Science and Technology Conference (ISTEC)

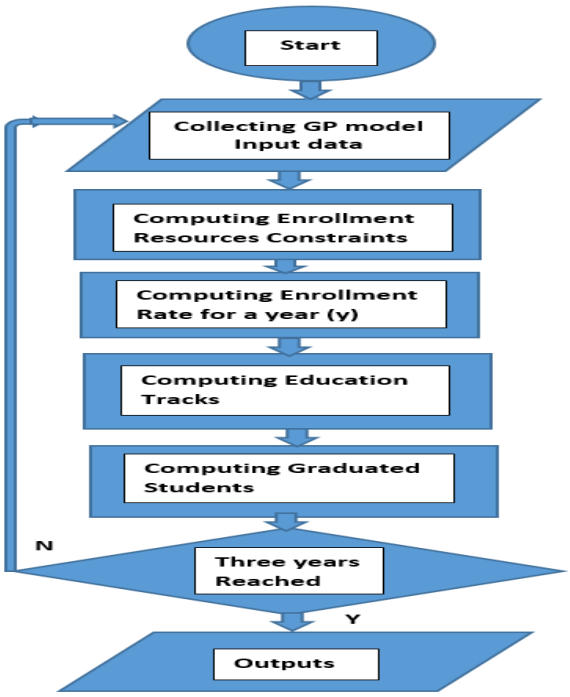

Figure 3. Simplified goal programming followed steps for the H-SDSS algorithm implemented.

Control the Education Tracks

The percentage of the total number of students enrolled in science and engineering and medical programs to the total number of students enrolled in higher education is more than or equal p_s^y and computed as shown in Appendix-part (ii-A). The percentage of the total number of students enrolled in medical programs to the total number of students enrolled in science and engineering is more than or equal p_m^y and computed as shown in Appendix part (ii-B). The Tracks Specified Model (TSM) executes these functions.

Control Students Enrollments and Graduation Rate

All the resources of the teaching process are collected in the total budget required for a University *u* that should not exceed a certain total limit of B_u^y at any year y of the planning horizon.

c_u^y = cost per student in a University *u* in a year *y*, and

B_u^y = Maximum budget for a university *u* in a year *y*,

The percentage of total enrollment in higher education regardless of age, to the total population in the age group of 18-23 years $\geq p_p^y$, and the accepted percentage in higher education from high school graduates in the same year $\geq p_h^y$. It is required to increase the enrollment of students in higher education with an average annual growth rate of p_r^y. The percentage of the total number of enrolled girls to the total number of enrolled boys in higher education $\geq p_g^y$. These values are computed as shown in Appendix part (iv). The number of graduates that will be increase with an average annual rate = q_r^y. Percentage of students who have completed their studies in a given year to the total number of students enrolled in universities five years before that year=q_d^y . These values are computed as shown in Appendix part (v). The Colleges Enrollment Model (CEM) and the Capacity Forecast Model (CFM) process these tasks.

Results and Discussion

Table 5 and Figure 4 show the predicted number of students enrolled and graduated in the years 2016, 2017 and 2018. Results show that the number of enrollment students increase regularly every year. So that decision makers has to take necessarily steps towards supplying required resources to cover this increase. The number of graduated students also increases regularly every year. This increased value has to be taken into consideration by labor market for offering qualified jobs suitable for the graduates excess. It is also noted that the average number of drop out students (E-G) is increases. This value is high and it should be taken care of by university decision makers to be reduced. And Higher Education Ministry plan recommended dropout rate should be within the limit of 1%.

Conclusion

This paper introduced a new architecture of hybrid strategic decision support system (HSDSS) that can be used efficiently for colleges' enrollment capacity planning. This can help university decision makers for tackling problems related to students' college enrollments as well as to suggest required facilities that are helpful to accommodate increasing future demands and needs. The HSDSS uses goal programming methods for predicting future capacity, as well as data mining knowledge base algorithms for determine students' suitable tracks and college enrollment that satisfying students' desires and university criteria. Results; of the applied case study; show that the number of graduated students increases annually. This can be reflected on labor market needs for offering *Science* related jobs with 60% and *Art* specialist related jobs with 40%, as Ministry of Higher Education in KSA plan recommended. In addition, results show that students' dropout also increases functional to the enrollments and this cause a problem. Hence, university decision makers have to take necessarily solutions to limit this increase, the recommended value hoped to be achieved is 1%.

Appendix: Goal Programming Model Computing Equations.

i. Steps for computing Enrollment Rate (p_r^y)

(1) $\frac{\sum_{u\in U}\sum_{k\in K} x_{E,b,k}^{y,u} - \sum_{u\in U}\sum_{k\in K} x_{E,b,k}^{y-1,u}}{\sum_{u\in U}\sum_{k\in K} x_{E,b,k}^{y-1,u}} + d_y^- \geq \boldsymbol{p_r^y}$, y = 1, 2, 3.

(2) $\sum_{u\in U}\sum_{k\in K} x_{E,b,k}^{y,u} - \sum_{u\in U}\sum_{k\in K} x_{E,b,k}^{y-1,u} + d_y^- \geq p_r^y.(\sum_{u\in U}\sum_{k\in K} x_{E,b,k}^{y-1,u})$ y = 1, 2, 3. (1-3)

The **nonlinear** constraints is **linearized** by multiplying both sides with the denominator", then the right hand side will represent the number of students.

(3) $\frac{\sum_{u\in U}\sum_{k\in K} x_{E,g,k}^{y,u} - \sum_{u\in U}\sum_{k\in K} x_{E,g,k}^{y-1,u}}{\sum_{u\in U}\sum_{k\in K} x_{E,g,k}^{y-1,u}} + d_{y+3}^- \geq \boldsymbol{p_r^y}$, y = 1, 2, 3.

(4) $\sum_{u\in U}\sum_{k\in K} x_{E,g,k}^{y,u} - \sum_{u\in U}\sum_{k\in K} x_{E,g,k}^{y-1,u} + d_{y+3}^- \geq \boldsymbol{p_r^y}.\sum_{u\in U}\sum_{k\in K} x_{E,g,k}^{y-1,u}$, y = 1, 2, 3. (4-6)

ii. Computing Education Tracks

(A) Steps for Computing p_s^y:

(1) $\frac{\sum_{u\in U}\sum_{k=m,s} x_{E,b,k}^{y,u}}{\sum_{u\in U}\sum_{j\in J} x_{E,b,j}^{y-1,u}} + d_{y+6}^- \geq p_s^y$, $y = 1, 2, 3.$

(2) $\sum_{u\in U}\sum_{k=m,s} x_{E,b,k}^{y,u} + d_{y+6}^- \geq p_s^y.\sum_{u\in U}\sum_{j\in J} x_{E,b,j}^{y-1,u}$, $y = 1, 2, 3.$ (7-9)

(3) $\frac{\sum_{u\in U}\sum_{k=m,s} x_{E,g,k}^{y,u}}{\sum_{u\in U}\sum_{k\in K} x_{E,g,k}^{y-1,u}} + d_{y+9}^- \geq p_s^y$, $y = 1, 2, 3.$

(4) $\sum_{u\in U}\sum_{k=m,s} x_{E,g,k}^{y,u} + d_{y+9}^- \geq p_s^y.\sum_{u\in U}\sum_{k\in K} x_{E,g,k}^{y-1,u}$, $y = 1, 2, 3.$ (10-12)

(B) Steps for Computing p_m^y:

(1) $\frac{\sum_{u\in U}\sum_{k=m\in M} x_{E,b,k}^{y,u}}{\sum_{u\in U}\sum_{k=s\in S} x_{E,b,j}^{y-1,u}} + d_{y+12}^- \geq p_m^y$, $y = 1, 2, 3.$

(2) $\sum_{u\in U}\sum_{k=m\in M} x_{E,b,k}^{y,u} + d_{y+12}^- \geq p_m^y.\sum_{u\in U}\sum_{k=s\in S} x_{E,b,j}^{y-1,u}$, $y = 1, 2, 3.$ (13-15)

(3) $\frac{\sum_{u\in U}\sum_{k=m\in M} x_{E,g,k}^{y,u}}{\sum_{u\in U}\sum_{k=s\in S} x_{E,g,k}^{y-1,u}} + d_{y+15}^- \geq p_m^y$, $y = 1, 2, 3.$

(4) $\sum_{u\in U}\sum_{k=m\in M} x_{E,g,k}^{y,u} + d_{y+15}^- \geq p_m^y.\sum_{u\in U}\sum_{k=s\in S} x_{E,g,k}^{y-1,u}$, $y = 1, 2, 3.$ (16-18)

(C) Steps for Computing p_h^y.

$\sum_{u\in U}\sum_{j\in J}\sum_{k\in K} x_{E,j,k}^{y,u} + d_{y+18}^- \geq \max[(\frac{1}{5}.p_p^y.N_C^{y-1}), (p_h^y.N_H^{y-1})]$, y = 1, 2, 3 (19-21)

iii. Steps for computing Student-to-Faculty Ratio

(1) $\sum_{u\in U}\sum_{m\in M} x_{E,b,m}^{y,u} - d_{y+21}^+ \leq \frac{1}{t_M}.\beta_M^y.\boldsymbol{F_{b,M}^{y,U}}$, $y = 1, 2, 3.$ (22-24)

(2) $\sum_{u\in U}\sum_{m\in M} x_{E,g,m}^{y,u} - d_{y+24}^+ \leq \frac{1}{t_M}.\beta_M^y.\boldsymbol{F_{g,M}^{y,U}}$, $y = 1, 2, 3.$ (25-27)

Abstract: Polymer technology is producing new solutions for recent needs day by day. The investigations about this subject have increased in recent years. Unused materials have been produced by adding the packing material to the polymer. The connection between the polymer and the core is known to have a big effect on the physical features of the material. Together with this, nano-material is one of the subjects that have been brought about. Nano materials compared to the ingot materials are a bit different and have superior mechanic, electrical, thermal, optics and chemical qualifications properties. In this study is the investigation of the effect of high-intensity polyethylene, which is filled with zinc oxide, magnesium hydroxide, calcium carbonate and silicon dioxide and the impact of this interface interaction on the wear various. High density polyethylene and zinc oxide, magnesium hydroxide, calcium carbonate and silicon dioxide have been mixed at % 5, %10, %15 and % 20 proportion. After the mixing activity the dehydrated materials have been changed into granule by the help of crusher and extrusive machine.

Keywords: Nanoparticle, Tribology, Composite

Introduction

Polymer technologies are generated rapidly. The chancing outcome polymer base new material which play an important role in engineering applications with their desired physical and mechanical properties.

The properties cannot satisfy the required properties for applications. Therefore we improve properties and to lower the cost of polymer products. Polymer composites have become attractive in polymer field. Therefore they are various advantages such as easiness in processing, cost effectiveness and excellent performance. These advantage is manifested over the metals as well as improved mechanical properties. Polymer composite has a special property of self-lubrication as well as low friction coefficient, better wear resistance, lower weight alternatives to other components. These make composites suitable in tribological applications [Sudepan, 2015; Wang, 2008; Rashimi, 2011].

Determined by the literature and the results of similar studies have been examined. Dhoka (2009) examined the effect of the addition of nano ZnO on silicone modified alkyd- based coatings with water based on the mechanical and heat resistance. In this study, nano- ZnO was added in different proportions. Contribute to the increase of the rate of increase has caused the wear rate

In a study conducted; PP - Mg (OH)2 which size is 50 nm were mixed. Mixing ratios caused the reduction of wear. The change in the wear rate of the material has been found to be associated on hardness value. [Saçaklı, 2011].

In another study performed, mechanical and wear behaviour of vinyl ester resins investigated the effect of nano silica filler. In this study, vinyl ester resin was mixed SiO2. This abrasion test was applied to the obtained material. Results of an increase in contribution rates indicate that the wear rate increases. Another study the ZnO nano-composites and aluminium were also examined and compared with SiO_2 and their wear rate comparison with other samples and there result values were found to be better than other nano-material filler composites [Elansezhian, 2011].

Methods

Wear rate that the fragment of material is determined by counting the amount by mechanical rubbing, scraping and erosion. The cylinder is wearing to polymer without overheating wherein the force applied is 10

N. Test, according to the type of the sample, 10, 20 and 40 are made according to one of meters. The result of this operation indicates deliver the ratio of the wear resistance. This value is expressed as volume loss or abrasion [ASTM D638]. Figure 1 shows operating principle of the abrasion tester.

TS EN 12770 as a reference number, containing the abrasion test method, were used in the standard [6]. The device used in the assay is Devotrans brand. This device is located at Marmara University Faculty of Technology and Metallurgy Laboratory. (Fig. 2)

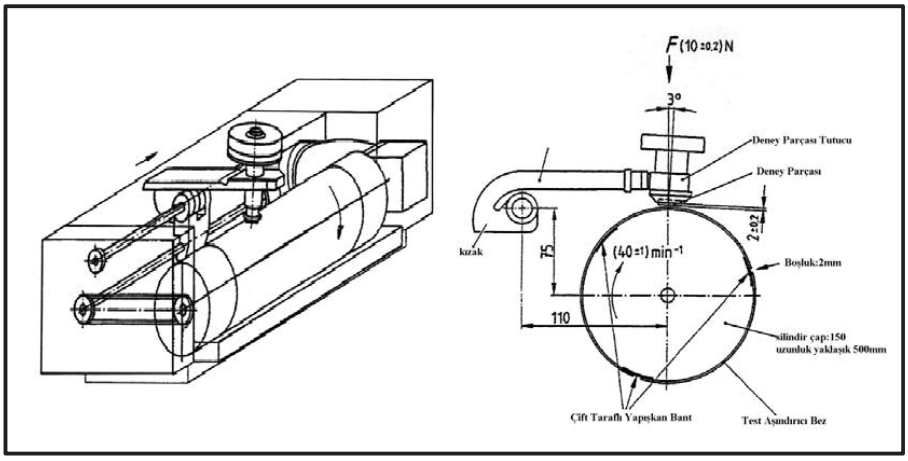

Fig.1. Operating principle of the abrasion test device.

According to TS EN 12770, TS 11007 standards test samples fabricated 4 mm thick and 16 mm diameter. The weight of the test sample is determined. Samples should be in full contact with the abrasive system.

Fig. 2. The abrasion test device

The device reaches 40 meters by 84 cycles. Thereafter the test stops and the part is ejected. And then the weight of the sample is determined. This process is repeated for 5 samples in TS 10731. Wear rate is calculated as follows in standards:

$$Wear \quad Rate = \frac{6m}{q.L.FN}$$

 Copyright © International Science and Technology Conference (ISTEC)

Results and Discussion

The abrasion test result values are presented in Table 1. The results indicate that wear rate value of pure HDPE was identified as 0.000172 cm3/Nm. Material increase in the contribution rate caused by corrosion of the values were determined.

HDPE - ZnO nano-composite examination of the wear rate values which is 5% ZnO reinforced materials was 0.00018 cm^3 / Nm. This corrosion rate is seen that an increase in value arrive 4.6%. ZnO wear rate 10% contribution values has led to an increase of 16.3% (0.00020 cm^3 / Nm). 15% ZnO contributing which is metal-based materials was studied and the wear rate determined 0.00021 cm3/Nm, it increase 22.1% on wear rate ratio. Contribution of 20% ZnO grew by 27.9% in value of the wear rate 0.00022 cm^3 / Nm is. It was observed that the wear rate increases. Contribution of 20% ZnO grew by 27.9% on value of the wear rate (0.00022 cm^3 / Nm).

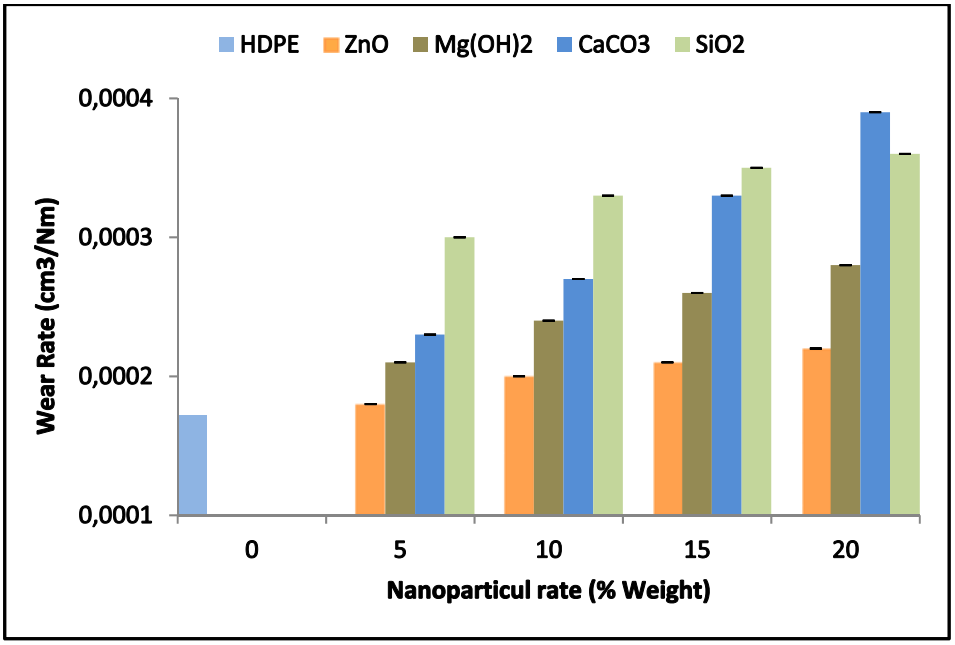

Fig. 3. Wear rate results

Metal materials such as ZnO, which class of Mg $(OH)_2$ addition of HDPE nano composite wear rate values are examined, depending on the surface roughness increased wear rate. Examined the contribution of 5% of this value, the wear rate of 22,1% was observed with the increase in 0.00021 cm^3/Nm. Additives 10% ZnO, the increase in wear rate is 39.5%. The wear rate of 15% ZnO increased 0.00026 cm^3/nm value (51.2%). In 20% of the additive reaches 0.00028 cm^3 / Nm seen.

Organic materials such as $CaCO_3$ and SiO_2 were found to contain high increase in the wear rate. HDPE - $CaCO_3$ contributing 5% of nanocomposite was determined as 0.00023 cm^3/ Nm, Wherein wear rate increased by 33.7%. Wear value with 10% fill rate increased by 57% and reached 0.00027 cm^3 / Nm. Contribution rate of 15% CaCO3 on the wear rate is 0.00033 cm^3 / Nm (91.9% increase). 20% $CaCO_3$ additive caused an increase in the rate of 127%. Here the value of wear rate cm3 / Nm 0.00039

HDPE - SiO_2 by mixing additives with the HDPE increases were observed very high in wear ratio. 5% SiO_2 added increased wear rate value 74.5% (0, 00030 cm^3/Nm). Wear value contribution of 10% SiO_2 was determined to be 0.00033 cm3/nm. Here increase in wear values as 91.8%. Attrition values of 15% of additives identified as 0.00035 cm^3/nm. This indicates an increase in the rate of 103.5%. Contribution rate of 20% indicate that increase wear value as 109.3% (0.00036 cm^3/nm).

Additives used in the study of the ZnO and Mg $(OH)_2$ depending on the contribution rates of nano-powders of the wear rate is understood that a linear increase. $CaCO_3$ and SiO_2 nano powder additives for wear rate was determined at the highest level in test groups.

 Copyright © International Science and Technology Conference (ISTEC)

Conclusion

Wear is the loss of material from the rubbing surfaces and it's calculate quantity, by weight or volume or size reduction. Wear is the loss of material from the rubbing surfaces and it can be calculated quantity, weight and volume or size reduction. In this study; high density polyethylene incorporated nano powders were found to improve wear rate. Contribution rates have increased abrasion values. All material contribution rate, the highest values were observed in the highest wear. ZnO - HDPE composite materials for wear values increased about 20%. This increase were determined at Mg $(OH)_2$ at 27%, 109% in the addition of SiO_2, and 126% of $CaCO_3$ filler respectively.

Özet: Gelişen teknoloji ile birlikte müşteri beklentilerinin artması, araç üreticileri arasındaki rekabeti arttırmıştır. Bu nedenle araç üreticileri ar-ge faaliyetlerine büyük yatırım yapmaktadır. Araç üreticileri satış adetlerini arttırmak için, düşük yakıt tüketimi, ağırlık azaltmanın yanı sıra sürüş konforu ve aracın yol tutuşuna da önem vermektedirler.

Bu çalışmada aracın yol tutuşunu etkileyen süspansiyon sistemi parçalarından olan yay ve damperin etkileri incelenecektir. Yay katsayısı ve damper sönümleme katsayıları yüzdesel olarak değiştirilerek aracın sürüş yol tutuşuna etkileri Adams/Car programında yapılan simülasyonlarla incelenmiştir. Değişen parametrelerin etkisini incelemek için Adams/Car programında ISO Lane Change, ivmelenme ve frenleme simülasyonları yapılmıştır. Çalışmada binek araç ve Formula SAE aracına bu simülasyonlar uygulanmış ve araç tipinin süspansiyon sistemi parametrelerine etkileri incelenmiştir.

Anahtar kelimeler: Yol tutuş, Adams/Car, ISO Lane Change, Formula SAE, yay, damper

Abstract: Increasing customer expectation along with advances in technology raised competition among Automotive Manufacturers. Therefore Automotive manufacturers widely invest in R&D activities. Manufacturers care about ride comfort and handling of the vehicle as well as lower fuel consumption and vehicle weight reduction.

In this study, spring and the damper, parts of suspension system that affect the handling of the vehicle, were examined. Spring coefficient and Damping coefficient were varied by percentage and effects of this variances to handling were analysed by simulations in Adams/Car software. In order to investigate effects of varying parameters, ISO Lane Change, acceleration and breaking simulations were run in Adams/Car software. Simulations were performed for passenger car and Formula SAE car individually and effects of car type to suspension system were invetigated.

Key words: Handling, Adams/Car, ISO Lane Change, Formula SAE, spring, damper

1.Giriş

Otomotiv sektöründe yaşanan gelişmeler ve otomotiv üreticileri arasında yaşanan rekabet dolayısıyla araçların sunduğu konfor ve performans ve her geçen gün giderek artmaktadır. Otomotiv ana sanayi şirketleri araçlarını geliştirmek için ar-ge faaliyetlerine çok büyük yatırım yapmaktadır. Bu yatırımlar araçlarda yakıt tüketimini azaltmayı, sürüş güvenliği arttırmayı, sürüş konforunu arttırmayı, sürüş zevkini arttırmayı gibi birçok farklı alanda yapılmaktadır.

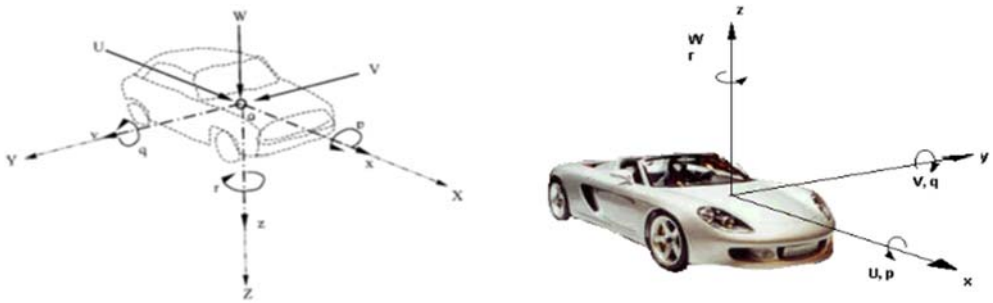
Süspansiyon sistemlerin birbiriyle çelişen iki temel amacı vardır. Bunlar sürüş konforu ve yol tutuştur. Sürüş konforu, araçların seyir halindeyken aracın yol düzgünsüzlüklerinden gelen etkilerin yolcu ve sürücülere olan etkilerini belirler. Yol tutuş ise temel olarak aracın manevra alma kabiliyeti, ani manevralarda gösterdiği performans olarak bilinmektedir. Sürüş konforunda genel olarak beklenen daha yumuşak süspansiyon sistemi ile yol düzgünsüzlüklerinden kaynaklanan etkilerin sürücü ve yolculara iletilmesini engellemek, yol tutuşta ise daha sert süspansiyon sistemi ile aracın savrulmasının ve yan yatmasının az olmasını sağlamaktır. Bu çalışma süspansiyon sisteminin bu özelliklerinden yol tutuş üzerine yapılmıştır.

 Copyright © International Science and Technology Conference (ISTEC)

1980'lerin ortalarında modelleme ve simülasyonu mühendislik uygulamaları için popüler kılan iki yazılım tipi ortaya çıkmıştır (Sayers 2010). Bu yazılım türlerinden ilki Matlab/Simulink gibi kullanıcılarına interaktif benzetim ortamı sunan programlardır. Diğeri ise Adams gibi mekanik çok gövdeli sistem simülasyonu yazılımlarıdır. Bu çalışmada Adams programı üzerinden sanal analizler yapılarak süspansiyon sisteminin etkileri incelenmiştir.

Çalışmada Adams programının araç süspansiyon sistemleri için özelleştirilmiş programı olan Adams/Car programı kullanılmıştır. Bu programda bir binek araç ve bir Formula SAE aracı için ISO Lane Change, ivmelenme ve frenleme simülasyonları yapılmış ve sonuçları karşılaştırılmıştır. Formula SAE aracı, uluslararası bir yarışma olan Formula Student/SAE yarışmaları için üniversite öğrencileri tarafından hazırlanan tek kişilik bir araçtır. Bu araçlardan Formula 1'de olduğu gibi yüksek performans, ani ivmelenme, viraj alma kabiliyeti gibi özellikler istenir. Bu nedenle binek araçlardan kullanım amacı yönüyle ayrılmaktadır ve kullanım amacının araç süspansiyonu üzerine etkileri ve sonuçları da bu çalışmada incelenmiştir.

2.Yol Tutuş



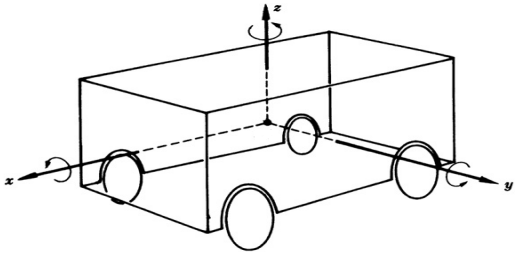
Yol tutuş, sürüş konforundaki dikey hareketlerden ziyade daha fazla yanal kuvvet ve ivmelerle ilgilidir. Taşıt dinamiğinde aracın yanal kuvvetlere karşı verdiği tepkiler ölçülmektedir.

1956 yılında William F.Miliken, David W.Whitcomb ve Leonard Segel yol tutuşun nicel ve teorik analizini birçok çalışma ile sunmuşlardır. Bu çalışmalardan elde edilen makaleler günümüzde hala taşıt hareketi ve kontrolü için referans olarak kullanılmaktadır. Miliken çalışmasında bu konu ile ilgili tarihsel bir genel bakış sunmuş ve ayrıca pek çok tasarım parametresinin etkilerini belirlemek için taşıt testlerine duyulan gereksinimden ötürü lastik tasarımının yol tutuş üzerindeki etkilerinin bilinemediğini belirtmiştir.

S.Hegazy, H.Rahnejat ve K.Hussain yol tutuş analizlerinde çok gövdeli dinamik yaklaşımı çalışmışlardır. Bu çalışma için kurulan model ''Double Wishbone'' tipi ön ve arka süspansiyon sistemleri, dişli ray tipi yönlendirme sistemi, taşıt gövdesi ve tekerleklerden oluşmaktadır. Model doksan dört serbestlik derecesine sahiptir ve modeli oluşturan elemanlar nonlineer bir karakteristik sergilemektedirler. Model Adams ortamında kurulmuştur ve yol tutuş analizlerini gerçekleştirmek için kullanılmıştır. Benzetimler ISO ve İngiliz standartları baz alınarak gerçekleştirilmiştir. R.W.Allen, T.S.Rosenthal, D.H.Klyde ve S.H.Hogue hafif bir taşıtın yanal/yönsel hareketinin bilgisayar benzetimi analizini çalışmışlardır. Bu yönsel harekete etki eden taşıt, tekerlek karakteristikleri ve manevra koşullarının bir çalışmasıdır.

2.1. Taşıt Eksen Takımları

Günümüzde araçların koordinatlarını tanımlarken iki adet koordinat sistemi kullanılmaktadır. Bu koordinat sistemleri ISO koordinat sistemi ve SAE koordinat sistemidir. Koordinat sistemleri aşağıdaki şekillerde gösterilmiştir.



Şekil 1. SAE koordinat sistemi (solda), ISO koordinat sistemi (sağda)

Koordinat sistemlerinde X, Y ve Z aksislerinin doğrultuları aynı fakat yönleri farklılık göstermektedir. Bu farklılıklar ilerleyen aşamalarda problemlere neden olabilir, bu nedenle araç üzerine çalışmalara başlanmadan hangi koordinat sisteminde çalışılacağı seçilmelidir.

 Copyright © International Science and Technology Conference (ISTEC)

2.2. Taşıt Eksen Etrafındaki Hareketleri

Herhangi bir taşıtın dinamik davranışı çalışma esnasında ona etki eden kuvvetler tarafından belirlenmektedir. Bu kuvvetlerin kaynağı tekerlekler, yer çekimi ya da aerodinamik etkenler olabilmektedir (Abe 2009).

Şekil 2. Taşıt eksen takımı (Abe 2009)

Şekil 2'de görülen koordinat takımına göre taşıt gövdesi toplamda altı serbestlik derecesine sahiptir: Bunlar:

1- z ekseni boyunca dikey hareket
2- y ekseni boyunca yanal hareket
3- x ekseni boyunca boylamasına hareket
4- x ekseni etrafında yalpalama hareketi
5- y ekseni etrafında kafa vurma hareketi
6- z ekseni etrafında savrulma hareketi

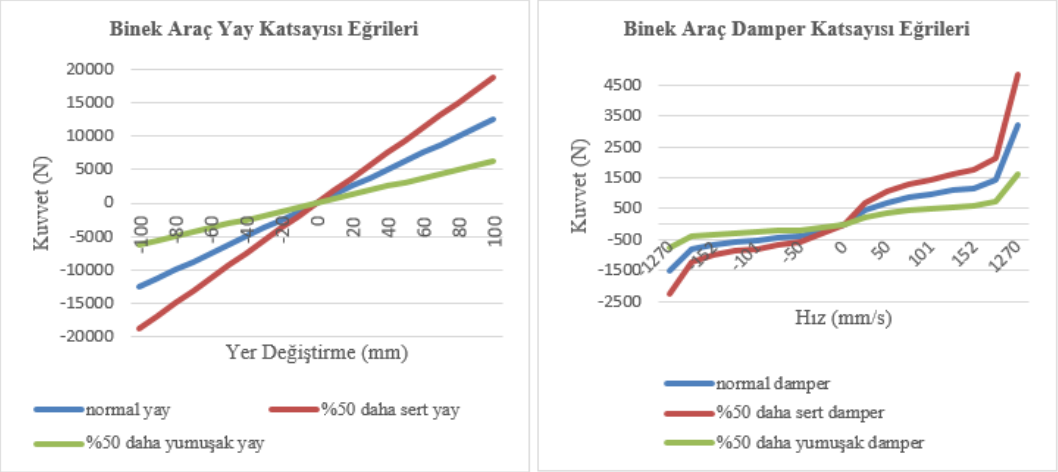
Bu çalışmada 5 numaralı kafa vurma hareketi ve 1 numaralı dikey hareket incelenmiştir.

3. Materyal ve Yöntem

Bu çalışmada Adams/Car programı kullanılmıştır. Adams/Car programıyla ISO Lane Change, ivmelenme simülasyonları yapılmış ve kafa vurma hareketi ve şasinin dikey eksendeki yer değiştirme miktarı incelenmiştir. Bu simülasyonlarda yay ve damper katsayıları değiştirilerek sonuçlar karşılaştırılmıştır.

3.1.Adams/Car

Taşıt tasarımı ve analizi için özelleştirilmiş bir modüldür. Araçların tasarım ve geliştirilme süreçlerinde, standartlaşmış adımların otomatikleştirilmesi amacıyla geliştirilmiştir. (Anonim 1,2016)
Araç, birbirini tanıyarak birleşebilen alt sistemler (süspansiyon, direksiyon, tekerlek vs.) halinde oluşturulur. Bu alt sistemler bağımsız olarak incelenebileceği gibi, bütün araç modeli oluşturularak da incelenebilir. Alt sistemlere ait parçalar parametrik olarak oluşturulduğu için, çok kısa sürede farklı topolojileri analiz etme imkanı sunar.
Otomotiv alanında yaygın olarak kullanılan Adams/Car programlarının temel kabiliyetleri aşağıda belirtilmiştir.



- Kapsamlı şablon ve alt sistem kütüphanesi
- Kapsamlı analiz/sanal test kütüphanesi
- Esnek cisim analizi
- Ağır vasıtalara ait şablon ve alt sistem kütüphanesi
- Aktarma organlarının ayrıntılı olarak modelleme
- Tekerlek ve yol kütüphanesi
- İstenen fiziksel özellikte yol modelleme
- HIL simülasyonu (ESP, ABS vs. kontrol modelleri ile entegrasyon) (Anonim 2,2016)

3.2. Binek Araç Modeli

Bu çalışmada kullanılan binek araç 2560 mm dingil mesafesine, 1520 mm ön aks aralığı, 1594 mm arka aks aralığı ve 1200 kg araç ağırlığına sahiptir. Ayrıca kullanılan binek araç modelinin Adams/Car modelinin yay katsayıları ve damper sönümleme katsayıları sırasıyla şekil 3'de gösterilmiştir. Bu araç üzerinde ISO Lane

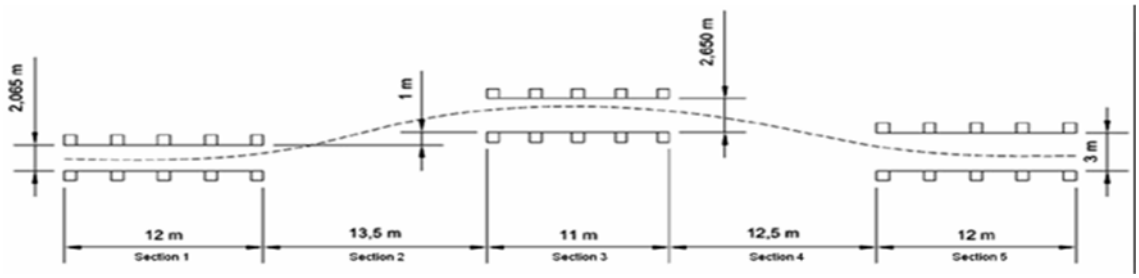
Change ve ivmelenme simülasyonları yay katsayısı ve damper sönümleme katsayıları değiştirilerek binek araç simülasyonları yapılmıştır. (Adams/Car)

Şekil 3. Binek araç yay katsayıları ve damper sönümleme katsayıları

3.3. Formula SAE Aracı Modeli

Bu çalışmada kullanılan Formula SAE aracı 1542 mm dingil mesafesine, 1400 mm ön aks aralığı, 1400 mm arka aks aralığı ve 200 kg araç ağırlığına sahiptir. Ayrıca kullanılan Formula SAE araç modelinin Adams/Car modelinin yay katsayıları ve damper sönümleme katsayıları şekil 4'de gösterilmiştir. Bu araç üzerinde ISO Lane Change ve ivmelenme simülasyonları yay katsayısı ve damper sönümleme katsayıları değiştirilerek binek araç simülasyonları yapılmıştır.



Şekil 4. Formula SAE aracı yay katsayıları ve damper sönümleme katsayıları

3.4. ISO Lane Change analizi

ISO Lane change analizi, trafikte araç sollamayı temsil eden simülasyondur. Bu simülasyonda düz bir yolda gidilirken ani bir manevra ile şerit değiştirilir ve sonrasında tekrar ani bir manevra ile aynı şeride geri dönülür. ISO Lane Change yol prosedürü ISO tarafından standart hale getirilmiştir ve bu standart yol Şekil 5'de gösterilmiştir. ISO Lane Change analizi 70 km/h'lik ilk hızla hem binek araç hem de Formula SAE aracı için yapılmıştır. ISO Lane Change analizinde her iki aracında ön ve arka süspansiyon sistemine ait yay ve damper katsayıları değiştirilerek bu katsayılardaki değişimin yalpalama (roll angle) açısındaki değişime etkisi incelenmiştir.

 Copyright © International Science and Technology Conference (ISTEC)

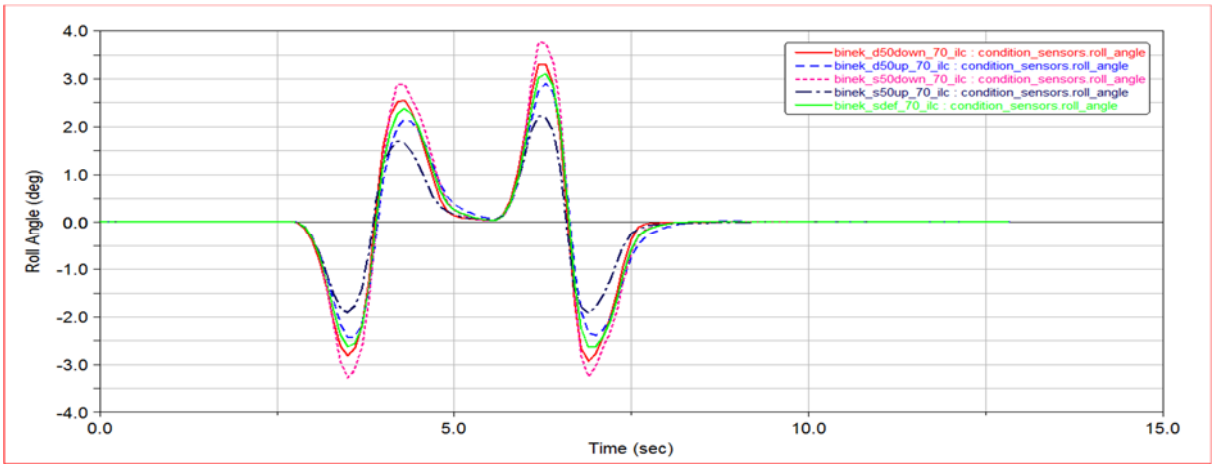
Şekil 5. ISO Lane Change parkuru (Anonim 3, 2016)

3.5. İvmelenme Analizi

İvmelenme analizi aracın düz bir yolda sabit bir hızda giderken bir anda ivmelenmesini temsil eder. İvmelenme analizi için bir standart yoktur, duruma göre veriler girilerek karşılaştırma yapılabilir. İvmelenme analizi binek araç ve Formula SAE aracı içinde aynı şartlarda yapılmıştır. Yapılan çalışmalarda araçlarda 10 km/h'lik giden araç, yedi saniye boyunca 0,5 G lik bir sabit ivme ile hızlandırılmaktadır. Her iki araç içinde yapılan bu analizde, kafa vurma açılarındaki (pitch angle) değişimler araçların ön ve arka süspansiyon sistemlerine ait yay ve damper katsayılarının %50'lik değişimleriyle incelenmiştir.

3.6. Frenleme Analizi

Frenleme analizi aracın düz bir yolda sabit hızla giderken sabit bir yavaşlama ivmesiyle yavaşlamasını temsil eder. Bu analiz için belli bir standart olmayıp değişik koşullarda yapılabilir. Bu çalışmada binek araç ve Formula SAE aracı içinde aynı şartlarda frenleme analizi yapılmıştır. Frenleme analizi başlangıçta 70 km/h'lik ilk hızla giden bir aracın 7 saniye boyunca 1G'lik yavaşlama ivmesiyle frenleme yapılmasıyla gerçekleştirilmiştir. Frenleme analizi sonucunda yay ve damper katsayıları değiştirilen binek ve Formula SAE araçlarının kafa vurma açılarındaki (pitch angle) değişimleri incelenmiştir.



4.Bulgular

4.1. ISO Lane Change

ISO Lane Change analizinde Formula SAE ve binek araç için analiz sonuçları bu kısımda incelenecektir. ISO Lane Change analizi binek araç ve FSAE aracı içinde 5 farklı durum için yapılmıştır. Bu durumlar, normal durum, %50 daha sert yaylı araç, %50 daha yumuşak yaylı araç, %50 daha sert damperli sönümleme katsayılı süspansiyon ve % 50 daha yumuşak damper sönümleme katsayılı süspansiyon sistemi olarak yapılmıştır.

Şekil 6'da binek araç için yapılan ISO Lane Change analizi sonuçları görülmektedir. Eğriler incelendiğinde en fazla yalpalama açısının yay katsayının %50 azaltıldığı durumda en az açının ise yay katsayısının %50 arttırıldığı durumda ortaya çıktığı görülmektedir. Diğer durumlar olan normal araç, %50 daha sert damper sönümleme katsayılı eğri ve %50 daha yumuşak damper sönümleme katsayılı eğri ara değerler sahip olduğu görülmektedir. Bu sonuçlara göre yalpalama açısını yay katsayısındaki değişimin daha fazla etkilediği görülmektedir.

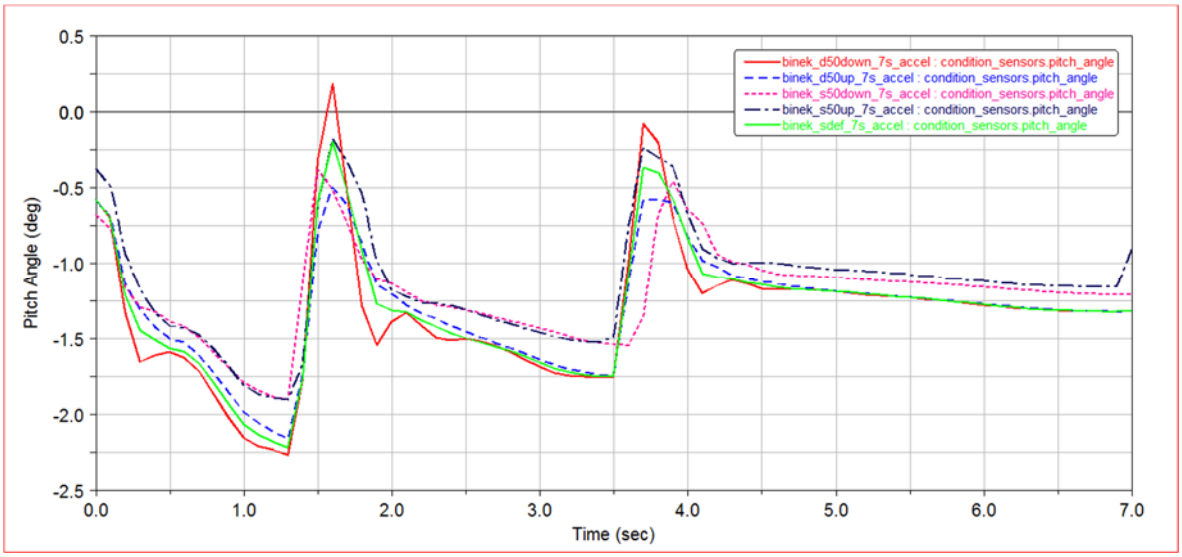
 Copyright © International Science and Technology Conference (ISTEC)

Şekil 6. Binek Araç ISO Lane Change Analizi Yalpama Açısı Eğrileri

Formula SAE için yapılan ISO Lane Change analizinin sonuçları şekil 7'de gösterilmiştir. Bu sonuçlara göre en fazla yalpalama açısının yay katsayının %50 azaltıldığı durumda en az açının ise yay katsayısının %50 arttırıldığı durumda ortaya çıktığı görülmektedir. Normal durum ve damper sönümleme katsayısındaki eğriler ise aynı değerlerdedir. Bu durum Formula SAE araçlarındaki damperin etkisinin binek araçlara göre daha az olduğunu göstermektedir. Diğer bir sonuç ise yalpalama açısında, yay katsayısı damper sönümleme katsayısına göre daha önemlidir.

Diğer bir önemli hususta yay katsayısını azaltmak arttırmaya oranla yalpalama açısına daha fazla etki etmektedir. Bu ise Formula SAE araçlarında sert yay kullanıldığı ve sertliği arttırmanın etkisinin az olduğu fakat sert yaydan yumuşağa geçince ise daha fazla etki ettiğinin göstermektedir.

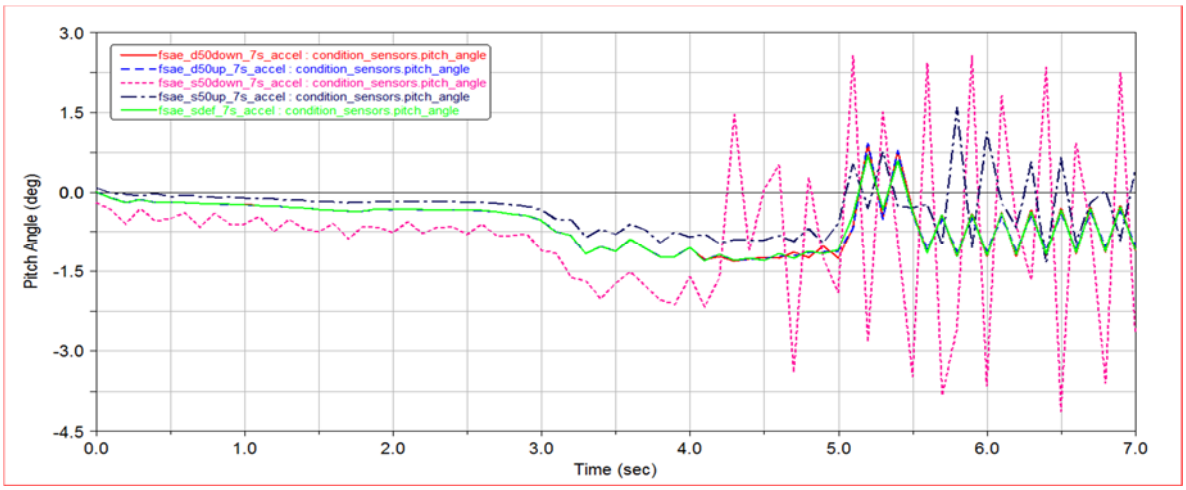
Şekil 7. Formula SAE Aracı ISO Lane Change Analizi Yalpama Açısı Eğrileri



ISO Lane Change analizi sonuçları incelendiğinde binek araçta en fazla yalpalama açısının 3,77° iken Formula SAE aracında 1,93° olduğu görülmektedir. Bu durum Formula SAE gibi yüksek performans ve yüksek manevra kabiliyeti beklenen araçlarda daha sert yay kullanıldığı ve daha düşük yalpalama açısı oluştuğunu göstermektedir.

4.2. İvmelenme

İvmelenme analizi binek araç ve Formula SAE aracı için daha önceki açıklamalarda belirtilen şartlarda yapılmıştır. Bu analizde araçların kafa vurma açıları (pitch angle) incelenerek yorumlanacaktır.



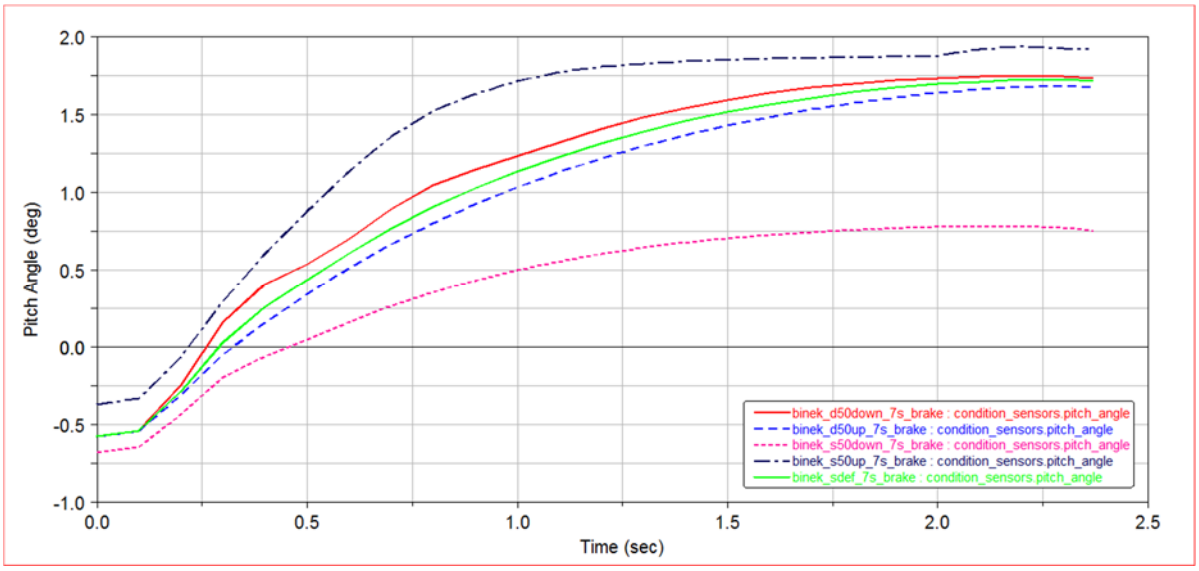
Binek araç için yapılan ivmelenme analizi sonuçları şekil 8'de gösterilmektedir. Eğrilerde oluşan tepeler aracın vites değişimden kaynaklanan kafa vurma açısındaki değişimlerdir. Elde edilen sonuçlara göre en fazla kafa vurma açısı damper sönümleme katsayısının %50 azaltılması durumunda ortaya çıkmaktadır. İncelenen diğer durumlarda ise sonuçlar normal araç şartlarına yakın olarak ortaya çıkmaktadır.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 8. Binek Araç İvmelenme Analizi Kafa Vurma Açısı Eğrileri

Formula SAE aracı için yapılan ivmelenme analizi sonuçları şekil 9'da gösterilmiştir. Sonuçlar incelendiğinde kafa vurma açısında damper sönümleme katsayılarındaki değişimlere göre yay katsayılarındaki değişimin daha fazla etkili olduğu tespit edilmiştir. Yay katsayısındaki sertleşme kafa vurma açısını düşürürken, yay sertliğini azaltmak ise kafa vurma açısını arttırmaktadır.

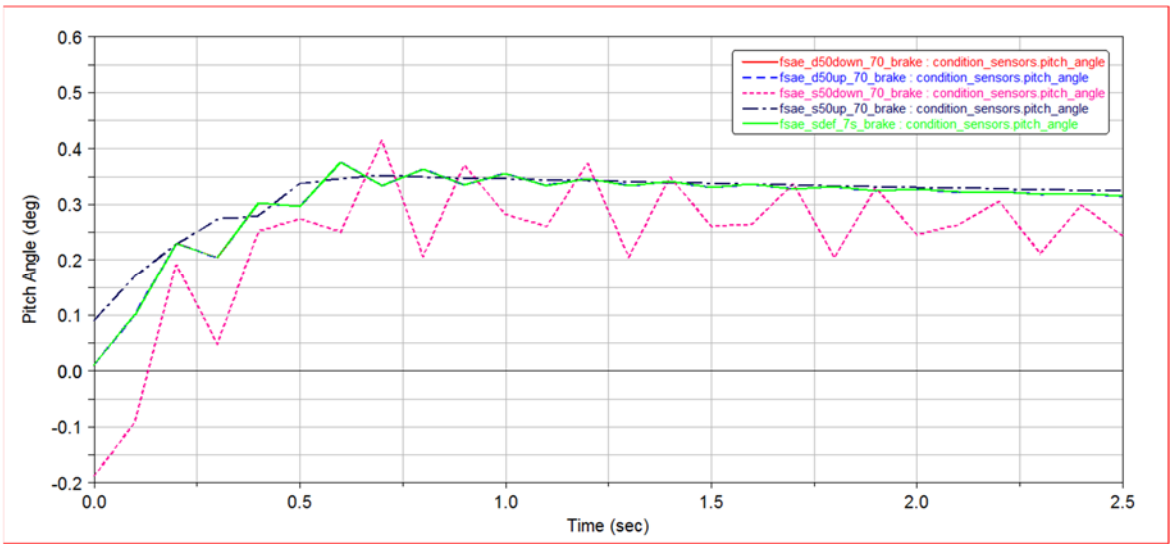
Şekil 9. Formula SAE Aracı İvmelenme Analizi Kafa Vurma Açısı Eğrileri



İvmelenme analizi sonuçları incelendiğinde binek araç için damper değişimindeki etki kısmen fazla olsa da yay ve damper etkileri benzer sonuçlar doğurmaktadır. Fakat Formula SAE Aracı incelendiğinde ise yaydaki değişimin etkileri dampere göre çok daha fazla olmaktadır.

4.3. Frenleme

Bu çalışmanın son analizinde binek araç ve Formula SAE Aracına frenleme analizi yapılmıştır. Frenleme analizinde de ivmelenmede olduğu gibi kafa vurma açısı (pitch angle) incelenmiştir.



Binek aracın frenleme simülasyonu sonuçları şekil 10'da eğriler halinde verilmiştir. Bu eğriler incelendiğinde en fazla kafa vurma açısı değişimi yay katsayısı değiştiğinde ortaya çıkmıştır. En yüksek kafa vurma açısı yay katsayısı arttırıldığında ortaya çıkarken en düşük değerler ise yay katsayısı düşürüldüğünde ortaya çıkmaktadır. Damper sönümleme katsayısındaki değişim ise normal araç ile benzer sonuçları göstermektedir.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 10. Binek Araç Frenleme Analizi Kafa Vurma Açısı Eğrileri

Formula SAE aracının frenleme simülasyonu sonuçları şekil 11'de gösterilmiştir. Bu eğriler incelendiğinde yay katsayısının %50 düşürülmesinde en düşük seviyelere indiği görülürken diğer eğriler benzer karakteristiğe sahiptir. Yay katsayısının %50 arttırıldığı simülasyon sonucunda kafa vurma açısında düşük seviyelerde bir artış olmaktadır. Bu sonuçlara göre yay katsayısını düşürmenin frenlemede salınıma neden olduğu görülmektedir.

Şekil 11. Formula SAE Aracı Frenleme Analizi Kafa Vurma Açısı Eğrileri

Frenleme analizi sonuçlarına göre her iki araç tipi içinde kafa vurma açısında, yay katsayısındaki değişim damper katsayısındaki değişime göre daha fazla değişime neden olmaktadır. Yay katsayısını düşürmek daha az kafa vurma açısına neden olurken yay katsayısını arttırmak ise kafa vurma açısını arttırmaktadır.

5. Sonuçlar

Bu çalışmada binek ve Formula SAE Aracı için süspansiyon sistemlerinin yay ve damper katsayıları %50 oranında değiştirilerek; ISO Lane Change, ivmelenme ve frenleme simülasyonları Adams/Car programında yapılmıştır.

ISO Lane Change analizi sonuçları incelendiğinde her iki araç tipi içinde yay katsayısını değiştirmek damper katsayısını değiştirmeye göre yalpalama açısını değişimi açısından daha etkilidir. ISO Lane Change analizi için

 Copyright © International Science and Technology Conference (ISTEC)

diğer bir çıkarım ise yay katsayısını arttırmak yalpalama açısını azaltırken yay katsayısını azaltmak ise yalpalama açısını arttırmaktadır. İki araç tipi kıyaslandığında Formula SAE aracı binek araca göre daha düşük yalpalama açısına sahiptir, bu durum sebebi ise Formula SAE aracından manevraları binek araca göre daha yüksek hızla dönmesinin hedeflenmesidir.

İvmelenme analizinde ise binek araç için yay ve damper katsayılarındaki değişim kafa vurma açısına benzer oranlarda etki ederken, Formula SAE aracında ise yayın kafa vurma açısına etkisi ise damperin etkisine göre daha fazladır. Yay katsayısını arttırmak ivmelenme analizinde daha düşük kafa vurma açısı oluştururken, yay katsayını azaltmak kafa vurma açısını arttırmaktadır.

Frenleme analizinde ise her iki araç içinde yayın kafa vurma açısına etkisi damperin etkisine göre fazladır. Bu etki binek araçta daha düzgün şekilde gözükürken Formula SAE aracında ise yay katsayısının düşürülmesi kafa vurma açısında dalgalanmaya ve daha büyük farklara neden olmaktadır. Dalgalanmanın sebebi ise Formula SAE aracının sert yaylara uygun olması ve yumuşak yaylarda stabilitesini yitirmesidir.

Genel olarak bütün sonuçlar incelendiğinde ISO Lane Change, ivmelenme ve frenleme analizlerinde yay katsayısını değiştirmek yalpalama ve kafa vurma açılarına damper sönümleme katsayısını değiştirmeye göre daha fazla etki etmektedir.

Bu çalışmada yay ve damper katsayıları değiştirilerek yol tutuşu üzerine etkileri incelenmiştir. Yay ve damper katsayılarının değiştirilerek araç konfor etkileri üzerindeki etkileri ve her iki amaca da uygun olan yay ve damper katsayıları değerlerinin bulunması için optimizasyon çalışmalarının yapılması gerekmektedir.

Abstract: The goal of this study is to apply the synchronization and anti-synchronization of identical Sprott J chaotic flows by using a single sliding mode control signal. Time series, two-dimensional phase plots and three-dimensional phase plane of the Sprott J chaotic flow are presented graphically from its differential equations. A Lyapunov function is assigned for achieving that the sliding mode control signal guarantees the global asymptotic stability of synchronization and anti-synchronization error systems. Numerical simulations are demonstrated to verify the correctness of the theoretical results. Furthermore, they show that two identical Sprott J chaotic flows by starting from different initial conditions are effectively synchronized and anti-synchronized owing to a single state sliding mode controller.

Keywords: Sprott J Chaotic Flow, Sliding Mode Control, Single State Controller, Chaos Synchronization, Chaos Anti-Synchronization

Introduction

Chaotic systems are generally characterized by being very sensitive to their initial conditions and having a dense collection of points with almost periodic orbits. They are unstable and aperiodic which make them naturally harder to identify and to predict (Riaz & Ali, 2008). Since Lorenz (1963) firstly observed the chaotic trajectories from atmospheric dynamics, chaotic attractors have been discovered in chemical, financial, biological, and electrical systems. Chaotic systems are also used in many engineering fields such as secure communications, random number generators, and encryption systems.

Due to the sensitive dependence on the initial conditions, even two identical systems starting from slightly different initial conditions would evolve in time in a completely different manner. For making the states of a chaotic system track the desired chaotic trajectory, synchronization is applied. Synchronization has a significant role in chaotic secure communication. For a long time, it was believed that uncoupled chaotic trajectories cannot be synchronized. Pecora and Carroll (1990) showed that the synchronization of chaotic systems can be achieved. Then, chaos synchronization become one of the major issues in the control science. Anti-synchronization is an important type of synchronization that the states of synchronized system has the same absolute values but opposite signs of the master system. Several impressive methods for synchronizing and anti-synchronizing chaotic systems are proposed such as adaptive control (Al-sawalha, 2013), active control (Njah & Vincent, 2009), passive control (Zhou *et al.*, 2012), sliding mode control (Liu & Song, 2008; Jianwen *et al.*, 2010; Chen *et al.*, 2012; Hou *et al.*, 2012; Vaidyanathan, 2012a; Wang *et al.*, 2013), time-delay, linear, nonlinear feedback control (Liao & Chen, 2003; Li & Liao, 2006; Ikhlef & Mansouri, 2012), and backstepping design (Vaidyanathan, 2013; Loembe–Souamy *et al.*, 2015). Among them, the sliding mode control is one of the most preferred chaos synchronization and anti-synchronization techniques because of its efficiency. Sliding mode control design involves two steps: selection of a stable surface on which sliding motion should be restricted and selection of a control law which makes the switching surface attractive to the state/error space.

Sprott (1994) searched for simple chaotic systems by using a systematic examination of three-dimensional autonomous differential equations with quadratic nonlinearities and uncovered 19 distinct chaotic flows having either five terms and two nonlinearities or six terms and one nonlinearity. Including chaotic phenomena with simple structure makes the Sprott chaotic flows important for engineering applications. Synchronization of some Sprott chaotic flows has been investigated with active control (Xu, 2010; Vaidyanathan, 2012b), adaptive control (Vaidyanathan, 2011a; Vaidyanathan, 2011b; Vaidyanathan, 2011c; Vaidyanathan, 2012c), and linear coupling (Liu & Fei, 2006) methods. A state observer controller is assigned for the anti-synchronization (Liu *et al.*, 2009).

 Copyright © International Science and Technology Conference (ISTEC)

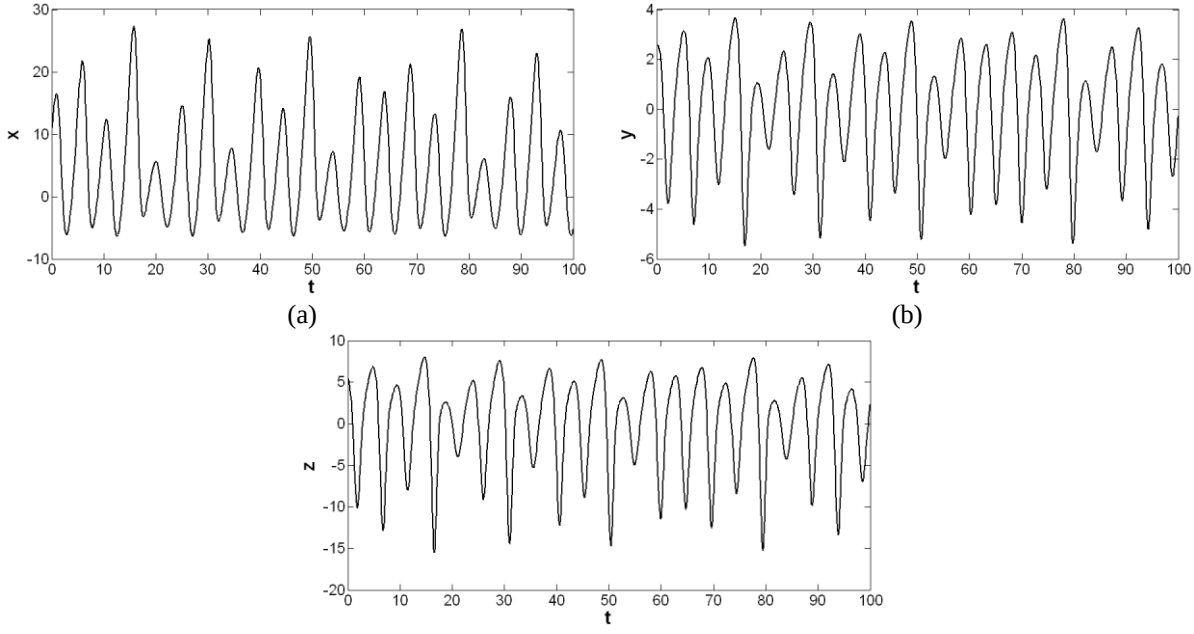
In this study, the sliding mode control theory is applied to derive a single state control function to solve the chaos synchronization and anti-synchronization problem for identical uncertain Sprott J chaotic flows. According to the literature review, this is the first work that uses sliding mode control method for the synchronization and anti-synchronization of a Sprott chaotic flow.

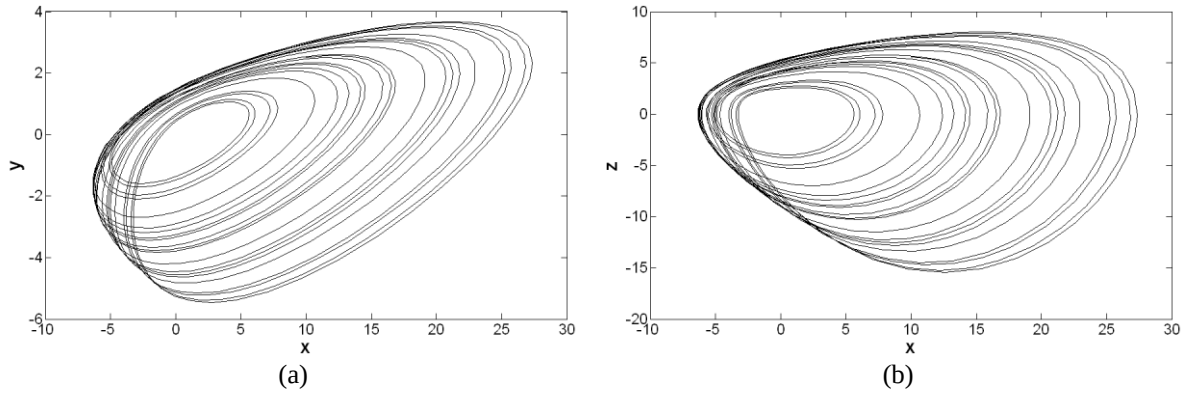
The Sprott J Chaotic Flow

The differential equations of Sprott J system are described by

$$\begin{aligned} \dot{x} &= az, \\ \dot{y} &= -by + z, \\ \dot{z} &= -x + y + y^2, \end{aligned} \tag{1}$$

where x, y, z are the state variables and a, b are the parameters of the system (Sprott, 1994). The Sprott J system (1) has chaotic trajectories when $a = 2$ and $b = 2$ (Sprott, 1994). Its Lyapunov exponents are 0.076, 0, –2.076, and Kaplan-Yorke dimension is 2.037 (Sprott, 1994). This chaotic system has only one equilibrium point: $E(0, 0, 0)$. With the initial conditions $x_0 = 10$, $y_0 = 2.5$, $z_0 = 5.6$, the time series, two-dimensional phase portraits and three-dimensional phase plane of system (1) are shown in Fig. 1, Fig. 2 and Fig. 3, respectively.





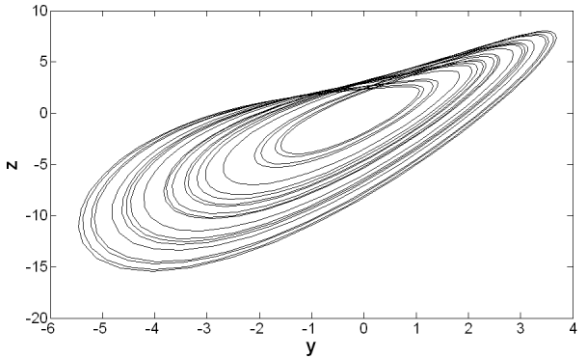


Figure 1. Time series of the Sprott J chaotic flow for signals (a) x, (b) y, (c) z.

(c)

Figure 2. Two-dimensional phase portraits of the Sprott J chaotic flow in phase plot (a) *x*–*y*, (b) *x*–*z*, (c) *y*–*z*.

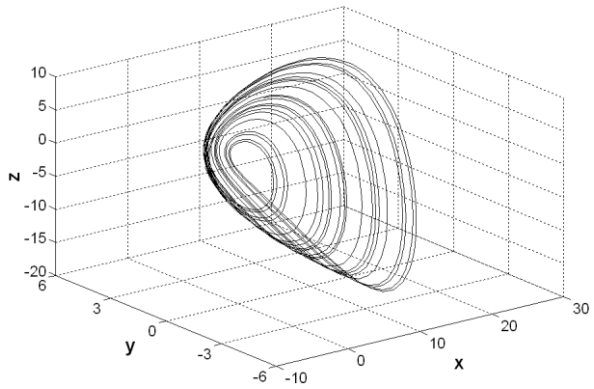

Figure 3. Three-dimensional phase plane of the Sprott J chaotic flow.

The Synchronization of Sprott J Chaotic Flows with Sliding Mode Control

In order to apply the synchronization, two identical Sprott J chaotic flows that have different initial conditions are considered where the master Sprott J flow is denoted by the subscript 1, and the slave Sprott J flow is denoted by the subscript 2. The master Sprott J chaotic flow is described by

$$\begin{aligned} \dot{x}_1 &= az_1, \\ \dot{y}_1 &= -by_1 + z_1, \\ \dot{z}_1 &= -x_1 + y_1 + {y_1}^2, \end{aligned} \tag{2}$$

and the slave Sprott J chaotic flow is described by

$$\begin{aligned} \dot{x}_2 &= az_2, \\ \dot{y}_2 &= -by_2 + z_2, \\ \dot{z}_2 &= -x_2 + y_2 + {y_2}^2 + u, \end{aligned} \tag{3}$$

where u in system (3) is the one state sliding mode control function to be constructed. The synchronization error is defined by $e_1 = x_2 - x_1$, $e_2 = y_2 - y_1$ and $e_3 = z_2 - z_1$. Then, the error dynamics are obtained as

$$\begin{aligned} \dot{e}_1 &= ae_3, \\ \dot{e}_2 &= -be_2 + e_3, \\ \dot{e}_3 &= -e_1 + e_2 + {y_2}^2 - {y_1}^2 + u. \end{aligned} \tag{4}$$

Now, the purpose of synchronization is to ensure the error system (4) asymptotically stable at the origin.

It can be seen from system (4) that when e_3 becomes zero, then $\dot{e}_2 = -be_2$. Therefore, when time goes to infinite, e_2 would converge to zero. An appropriate sliding surface can be designed as

 Copyright © International Science and Technology Conference (ISTEC)

$$s = e_3 + k_1 e_1, \tag{5}$$

where k_1 is a positive constant parameter. The attainability condition for sliding mode is $s\dot{s} < 0$. Providing this condition, the sliding mode control function can be

$$u = e_1 - e_2 - {y_2}^2 + {y_1}^2 - k_1 a e_3 - k_2 s - k_3 \text{sign}(s), \tag{6}$$

where k_2 and k_3 are constant parameters. The 'sign' is a function where

$$\text{sign}(s) = \begin{cases} 1 & \text{for } s > 0, \\ 0 & \text{for } s = 0, \\ -1 & \text{for } s < 0. \end{cases} \tag{7}$$

The designed control function (6) guarantees that system (4) is held on the sliding surface $s = 0$. The sliding surface derivation gives

$$\dot{s} = -k_2 s - k_3 \text{sign}(s). \tag{8}$$

Let the Lyapunov function is chosen as $V = 0.5s^2$, then the derivative of V becomes

$$\begin{aligned} \dot{V} &= s\dot{s} \\ &= -k_2 s^2 - k_3 (s)\text{sign}(s). \end{aligned} \tag{9}$$

Since $s^2 \geq 0$ and $(s)\text{sign}(s) = |s| \geq 0$, $\dot{V} \leq 0$ when $k_2 > 0$ and $k_3 > 0$. These conditions make sure that the constructed sliding surface s would asymptotically stabilize to the zero synchronization error point. Hence, the synchronization of the Sprott J chaotic flows is completed with one state sliding mode controller.

The Anti-Synchronization of Sprott J Chaotic Flows with Sliding Mode Control

In order to apply the anti-synchronization, the master and the slave Sprott J chaotic flows in systems (2) and (3) are again considered. For determining the anti-synchronization errors, instead of subtraction, the master and slave systems are added. So, the anti-synchronization error is defined by $e_1 = x_1 + x_2$, $e_2 = y_1 + y_2$ and $e_3 = z_1 + z_2$. Then, the error dynamics are obtained as

$$\begin{aligned} \dot{e}_1 &= a e_3, \\ \dot{e}_2 &= -b e_2 + e_3, \\ \dot{e}_3 &= -e_1 + e_2 + {y_1}^2 + {y_2}^2 + u. \end{aligned} \tag{10}$$

Now, the purpose of anti-synchronization is to ensure the error system (10) asymptotically stable at the origin.

It can be seen from system (10) that when e_3 becomes zero, then $\dot{e}_2 = -b e_2$. Therefore, when time goes to infinite, e_2 would converge to zero. An appropriate sliding surface can be designed as

$$s = e_3 + k_1 e_1, \tag{11}$$

where k_1 is a positive constant parameter. The attainability condition for sliding mode is $s\dot{s} < 0$. Providing this condition, the sliding mode control function can be

$$u = e_1 - e_2 - {y_1}^2 - {y_2}^2 - k_1 a e_3 - k_2 s - k_3 \text{sign}(s), \tag{12}$$

where k_2 and k_3 are constant parameters.

The designed control function (12) guarantees that system (10) is held on the sliding surface $s = 0$. The sliding surface derivation gives

 Copyright © International Science and Technology Conference (ISTEC)

$$\dot{s} = -k_2 s - k_3 \text{sign}(s). \tag{13}$$

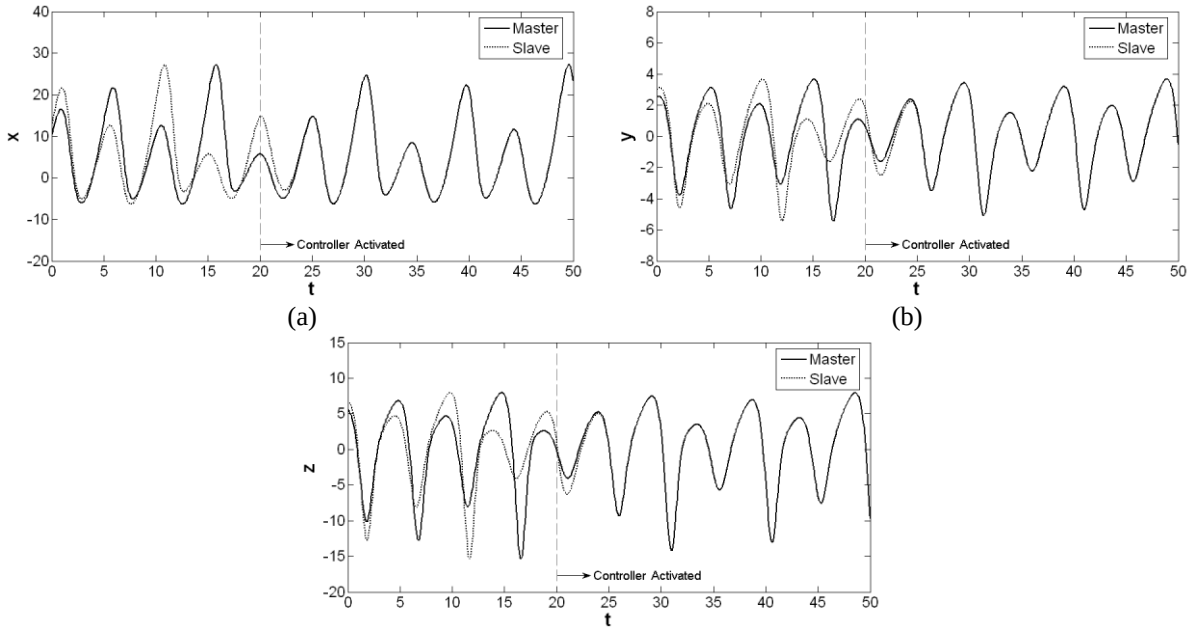
Let the Lyapunov function is chosen as $V = 0.5s^2$, then the derivative of V becomes

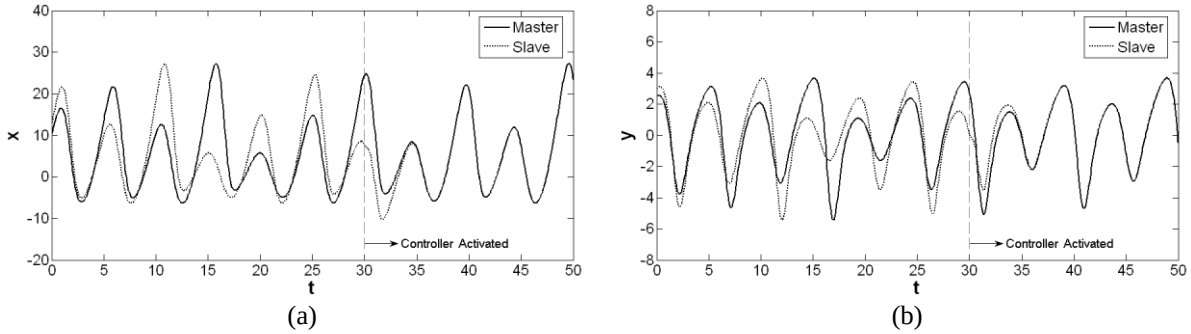
$$\begin{aligned} \dot{V} &= s\dot{s} \\ &= -k_2 s^2 - k_3 (s)\text{sign}(s). \end{aligned} \tag{14}$$

Since $s^2 \geq 0$ and $(s)\text{sign}(s) = |s| \geq 0$, $\dot{V} \leq 0$ when $k_2 > 0$ and $k_3 > 0$. These conditions make sure that the constructed sliding surface s would asymptotically stabilize to the zero anti-synchronization error point. Hence, the anti-synchronization of the Sprott J chaotic flows is completed with one state sliding mode controller.

Numerical Simulations

In this section, numerical simulations are performed to show the synchronization and anti-synchronization of Sprott J chaotic flows by means of one state sliding mode controller. The fourth-order Dormand–Prince method with variable-time step is used in the numerical simulations. The parameter values of the Sprott J chaotic flow are considered as $a = 2$ and $b = 2$ to ensure the chaotic trajectories. The initial values of master system are taken as $x_0 = 10$, $y_0 = 2.5$ and $z_0 = 5.6$. For the slave system, they are taken as $x_0 = 12.5$, $y_0 = 3$ and $z_0 = 6.8$. The gains of sliding mode controller are chosen as $k_1 = 1$, $k_2 = 1$ and $k_3 = 0.1$. When the sliding mode controller is activated at $t = 20$ and $t = 30$, the simulation results of synchronization are demonstrated in Fig. 4 and Fig. 5, respectively. The synchronization errors are shown in Fig. 6.





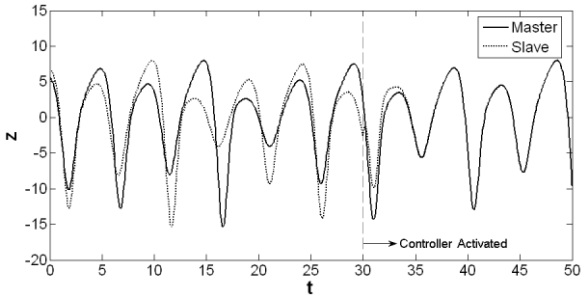


Figure 4. Synchronization time series of the Sprott J chaotic flows when the sliding mode controller is activated at $t = 20$ for signals (a) x, (b) y, (c) z.

(a) (b)

Figure 6. Synchronization errors of the Sprott J chaotic flows when the sliding mode controller is activated at (a) t = 20, (b) t = 30.

When the sliding mode controller is activated at t = 20 and t = 30, the simulation results of anti-synchronization are demonstrated in Fig. 7 and Fig. 8, respectively. The anti-synchronization errors are shown in Fig. 9.

(a) (b)

(c)

Figure 7. Anti-synchronization time series of the Sprott J chaotic flows when the sliding mode controller is activated at t = 20 for signals (a) x, (b) y, (c) z.

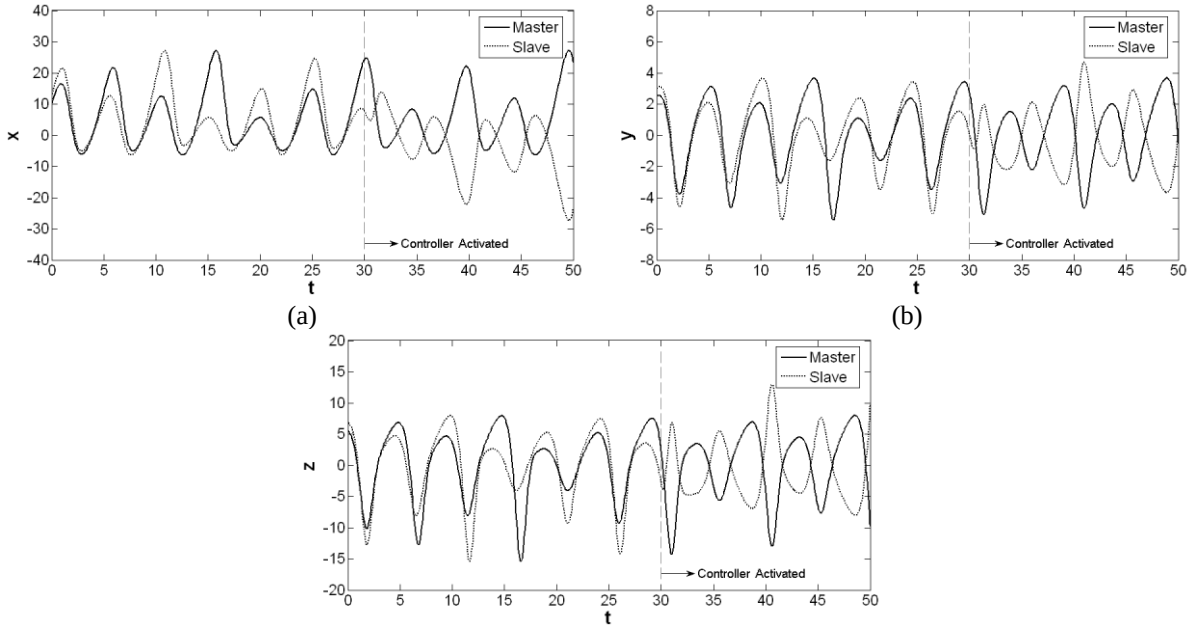

Figure 8. Anti-synchronization time series of the Sprott J chaotic flows when the sliding mode controller is activated at t = 30 for signals (a) x, (b) y, (c) z.

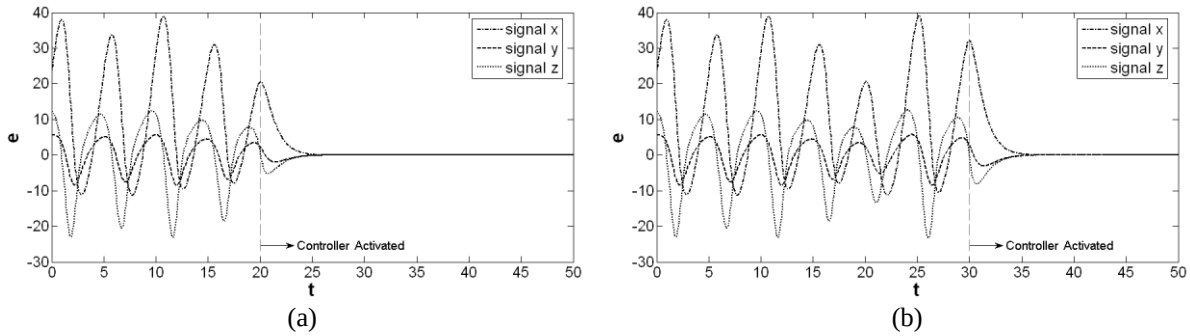

Figure 9. Anti-synchronization errors of the Sprott J chaotic flows when the sliding mode controller is activated at (a) t = 20, (b) t = 30.

As expected, the synchronization and anti-synchronization errors that are shown in Fig. 6 and Fig. 9 converge asymptotically to zero. Thus, the theoretical analyses are confirmed. As seen in Fig. 4 and Fig. 5, when the single state sliding mode controller is activated at t = 20 and t = 30, the synchronization between the master and the slave Sprott J chaotic flows is provided at $t \geq 26$ and $t \geq 36$, respectively. Besides, the anti-synchronization is also observed in 6 time periods in Fig. 7 and Fig. 8. Therefore, the simulation results also validate the effectiveness of proposed one state sliding mode controller.

Conclusion

In this study, the synchronization and anti-synchronization of two identical Sprott J chaotic flows is applied with the sliding mode control method. The stability of the Sprott J chaotic flow at zero synchronization and anti-synchronization errors is guaranteed by applying the appropriate single state sliding mode control functions based on Lyapunov stability theory. Numerical simulations are demonstrated to confirm the theoretical analyses of synchronization and anti-synchronization. The related in Figs. 4–9 have shown that a sliding mode controller provides the synchronization and anti-synchronization of Sprott J chaotic flows in 6 time periods after the controller is activated. Therefore, the proposed sliding mode control method works effectively when synchronizing and anti-synchronizing the Sprott J chaotic flows.

SYNTHESIS AND CHARACTERIZATION OF DOPAMINE SUBSTITUE TRIPODAL TRINUCLEAR S-TRIAZINE COMPLEXES

Şaban Uysal
sabanuysal@karabuk.edu.tr

Ziya Erdem Koç
zerdemkoc@gmail.com

In this work, we aimed to synthesize and characterize a novel tridirectional ligand including three catechol groups and its novel tridirectional-trinuclear triazine core complexes. For this purpose, we used melamine (2,4,6-triamino-1,3,5-triazine) (MA) as starting material. 2,4,6-tris(4-carboxybenzimino)-1,3,5-triazine (II) was synthesized by the reaction of an equivalent melamine (I) and three equivalent 4-carboxybenzaldehyde. 4,4',4''-((1E,1'E,1''E)-((1,3,5-triazine-2,4,6-triyl)tris (azanylylidene))tris (methanylylidene))tris(N-(3,4-dihydroxyphenethyl)benzamide) L (IV) was synthesized by the reaction of one equivalent (II) and three equivalent dopamine (3,4-dihydroxyphenethylamine) (DA) by using two different methods. II, IV and nine novel trinuclear Cr(III), Mn(III) and Fe(III) complexes of (IV) were characterized by means of elemental analyses, 1H NMR, FT-IR spectrometry, LC-MS (ESI+) and thermal analyses. The metal ratios of the prepared complexes were performed using Atomic Absorption Spectrophotometry (AAS). We also synthesized novel tridirectional-trinuclear systems and investigated their effects on magnetic behaviors of [salen, salophen, salpropen Cr(III)/Mn(III)/Fe(III)] capped complexes. The complexes were determined to be low-spin distorted octahedral Mn(III) and Fe(III), and distorted octahedral Cr(III) all bridged by catechol group.

Abstract

SnO_2 thin films have been synthesized on glass substrates by spray pyrolysis technique at substrate temperatures of 300 °C, 350 °C, 400 °C, 450 °C and 500 °C. The evolution of their structural, morphological and optical properties with substrate temperature was investigated. Thicknesses of the Co_3O_4 films were measured in the range of 250 – 498 nm using ellipsometer measurements. The crystallinity and microstructure of SnO_2 thin films have been investigated by x-ray diffraction (XRD). The XRD patterns have revealed that there are shifts of the d values (interplanar spacing) for the samples with respect to standard values. The macro strain and dislocation density vary with substrate temperatures. From field emission scanning electron microscopy results, all samples are compact, dense and adhered well to the substrates.The optical properties of the samples have been studied using the transmittance and reflectance measurements as a function of wavelength between 200 and 3000 nm. The optical band gap is direct and decreases from 3.95 to 3.71 eV as the substrate temperature increases from 300 °C to 500 °C.The refractive index and extinction coefficient as a function of wavelength for the films were investigated from reflectance data by applying the envelope method in the strongly absorbing regime. The optical behaviour of the material, such as dielectric constants (n, k, ε_1 and ε_∞), plasma frequency, ω_p, and carrier concentration, N_{opt}, was also evaluated.

Abstract

The new coordination polymer with saccharinate (sac) and 4,4'-azobispyridine (azpy), namely $[Hg(sac)_2(\mu\text{-azpy})_2]_n$ was synthesized and single crystal X-ray diffraction. Single crystal X-ray analysis reveals that sac ligand acts N-coordinated and 4,4'-abpy ligand exhibits as bridging ligand. In complex, the Hg(II) ion and all ligands are linked by coordination bonds and 4,4'-abpy ligands connect the Hg(II) centers forming a one-dimensional coordination polymer. In complex, the sac ligands N-coordinated to the Hg(II) ion and distorted tetrahedron geometry of Hg(II) ion is completed by bridging 4,4'-abpy ligands.

Keywords: 4,4'-Azobispyridine; Saccharinate complexes; Coordination polymers

Introduction

Saccharine is an important molecule in biological systems and forms a number of complexes with different metal ions rather easily. Moreover, it contains three functional groups, namely imino nitrogen, carbonyl and sulphonyl oxygen (Baran, 2005). All these properties make it a quite preferable ligand in coordination chemistry. The deprotonated form of this molecule, saccharinate anion, usually connected to the metal centers via negatively charged nitrogen atom (Bıyık, 2007). This mode is typically observed in the aquabis (saccharinato) complexes of transition metals (Baran, 2005). This type of metal saccharinates may be useful starting materials for the preparation of mixed-ligand saccharinate complexes. Our interest has been focused on metal–saccharin–azobispyridine system, in which azobispyridine plays an important role in the construction of supramolecular architectures organized by coordinated covalent or supramolecular contacts (such as hydrogen-bonding, π-π interaction etc.) (Li, 2001; Zhuang, 2006). Since, 4,4'-abpy possess a special structure with a larger π-bond conjugated system and two active nitrogen atoms, it is especially suitable to connect remote metal centers in the stepwise construction of polynuclear arrangements (Launay, 1991). 4,4'-abpy ligand has four possible sites of coordination, namely the two pyridine nitrogens and the two azo nitrogens. Pyridine nitrogens are much more accessible for coordination for sterical reasons.

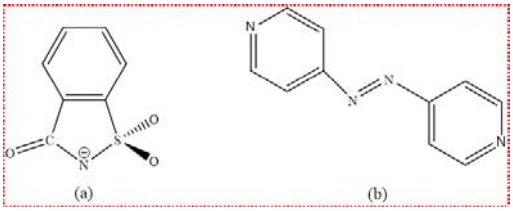
Materials and Methods

All chemicals used were of analytical reagent quality. The 4,4'-abpy ligand was synthesized by oxidation of the 4-aminopyridine with NaOCl according to literature (Kirpal-Reiter method) (Baldwin, 1969). The X-ray diffraction data of complexes were collected with a Bruker Kappa Apex2duo diffractometer. The structures were

 Copyright © International Science and Technology Conference (ISTEC)

solved and refined by full-matrix least-squares techniques on F^2 by using the SHELX-97 program (Sheldrick, 1997]. The absorption corrections were done by the multiscan technique. All non-hydrogen atoms were refined anisotropically. All non-water hydrogen atoms were included in the refinement process by using a riding model.

Results and Discussion



Experimental

Synthesis of 4,4'-azobispyridine

4,4'-abpy was prepared by oxidative coupling of 4-aminopyridine by hypochlorite, using Kirpal-Reiter method (Baldwin, 1969). Sodium hypochlorite (50 ml) was cooled in the solid CO_2-methyl alchol bath. A solution of 4-aminopyridine (2 g) in water was added dropwise to stirred hypochlorite solution. 10 minutes later the resulting deep red solution was immediately extracted with diethyl ether. The solvent evaporated and the solid was recrystallized from petroleum ether.

Synthesis of $[Hg(sac)_2(\mu\text{-}azpy)_2]_n$

For the synthesis of mixed-ligand saccharinate complex with Hg(II), it is a common strategy to apply $[Hg(sac)_2(H_2O)_4]\cdot 2H_2O$ as synthetic precursors. To prepare it, sodium saccharine was dissolved in water and added to the hot water solution of Hg_2SO_4 . The mixture was stirred at 80 °C for 3 h and then cooled to room temperature. The precipitate formed was filtered out and washed with water and dried in a vacuum. The complex was prepared by the direct reaction of 4,4'-abpy with this starting aqua-saccharinate complex in solution. A solution of 4,4'-abpy in ethanol was added dropwise to stirred aqueous solution of $[Hg(sac)_2(H_2O)_4]\cdot 2H_2O$. The mixture was heated under reflux for 2h and afterwards cooled to room temperature. After nearly a couple of weeks, well-formed crystals were selected for X-ray studies.

Scheme 1. (a) Schematic structure of saccharinate anion (sac); **(b)** Schematic structure of 4,4'-azobispyridine (azpy)

Description of Crystal Structures

A summary of crystallographic data, experimental details, and refinement results for the complex is given in Table 1. Selected bond lengths, angles and the hydrogen bonding geometry is given in Table 2.

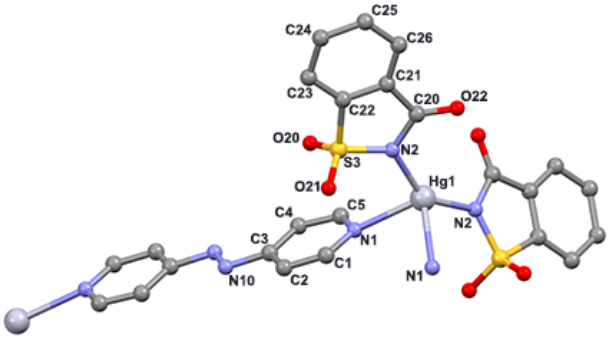


Fig. 1. The crystal structure of the complex showing the atom numbering scheme.

 Copyright © International Science and Technology Conference (ISTEC)

The asymmetric unit of the complex contains one Hg(II) ion, two sac and two 4,4′-abpy ligands (Fig. 1). In complex, the 4,4'-abpy ligands bridge the Hg(II) centers through the nitrogen atoms to form a one-dimensional polymeric structure (Fig. 2.). The sac anions connects to the metal center via the negatively charged nitrogen atom.

Conclusion

The new coordination polymer, $[Hg(sac)_2(\mu\text{-azpy})_2]_n$, was synthesized and structurally characterized by single crystal X-ray diffraction. Azobispyridine plays an important role in the construction of supramolecular architectures organized by coordinated covalent or supramolecular contacts.

SYNTHESIS, IN VITRO INHIBITION EFFECT AND STRUCTURE-ACTIVITY RELATIONSHIP OF NEW THYMOL DERIVATIVES ON CHOLINESTERASES

Fatih SONMEZ

Sakarya University, Pamukova Vocational High School, 54900, Sakarya, TURKEY

fsonmez@sakarya.edu.tr

Abstract: Alzheimer's disease (AD) is a progressive neurodegenerative disease and the most common form of dementia that affects aged people. Acetylcholinesterase is a hydrolase involved in the termination of impulse transmission at cholinergic synapses by rapid hydrolysis of the neurotransmitter ACh in the central and peripheral nervous system. Thymol is a main bioactive monoterpene isolated from many medicinal herbs, such as Thymus vulgaris, Monarda punctate and Origanum vulgare spp. Thymol has been widely used as an active anti-inflammatory ingredient, which can inhibit the isoproterenol induced inflammation in myocardial infarcted rats. Moreover, many studies have reported that thymol has various bioactivities, such as anticancer, anti-bacterial, and antioxidant properties. In this paper, a series of 12 novel thymol substituted carbamate derivatives (**2a-l**) was synthesized and their inhibitory activities on AChE and BuChE were evaluated. Among them, **2k** exhibited the strongest inhibition against AChE with an IC_{50} value of 2.498 µM, which was 183-fold more than that of thymol (IC_{50} = 458.23 µM). The structure-activity relationship were also investigated.

Keywords: Thymol, Cholinesterases, Inhibitor

Introduction

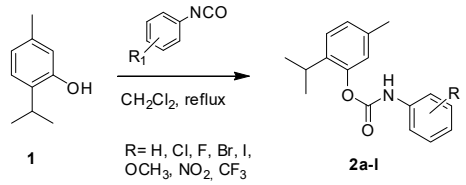
Thymol is a main bioactive monoterpene isolated from many medicinal herbs, such as Thymus vulgaris, Monarda punctate and Origanum vulgare spp. Thymol has been widely used as an active anti-inflammatory ingredient, which can inhibit the isoproterenol induced inflammation in myocardial infarcted rats, attenuate collagenase-induced osteoarthritis, and alleviate allergic airway inflammation in ovalbumin-induced Mouse asthma. Moreover, studies have reported that thymol has various bioactivities, such as anticancer, anti-bacterial, and antioxidant properties. Recent studies focusing on the neuroprotective activities of thymol have shown that it attenuates amyloid or scopolamine induced cognitive impairment in rats (Deng, 2015)

Numerous plants and their constituents have been reputed in traditional practices of medicine to enhance the cognitive function and to alleviate other symptoms of AD, including depression. Besides the *Salvia* species are known as a remedy for cognitive disorders, research on *Thymus vulgaris* essential oil also indicates their neuroprotective effects. Due to their small molecular size and lipophilicity, volatile constituents of essential oils and liberated volatile aglycones from glycosides are likely to readily cross the blood–brain barrier (Jukic, 2007).

Alzheimer's disease (AD) is a progressive neurodegenerative disease and the most common form of dementia that affects aged people (Ruiz, 2005). Acetylcholinesterase (AChE; EC 3.1.1.7) is a hydrolase involved in the termination of impulse transmission at cholinergic synapses by rapid hydrolysis of the neurotransmitter ACh in the central and peripheral nervous system. AChE inhibitors (AChEI) inhibit the hydrolysis of ACh improving both the level and of duration of neurotransmitter (Citron, 2004). Another cholinesterase, butyrylcholinesterase (BuChE; EC 3.1.1.8), primarily localized in plasma, liver and muscle tissues, able of hydrolyzing ACh and other acylcholines differs from AChE for tissue distribution and sensitivity to substrates and inhibitors (Wu, 2012). AChE inhibitors such as galantamine, rivastigmine, and donepezil are the main stay drugs for the clinical management of AD in the early to moderate stage (Catto, 2013).

In this study, a novel series of 12 thymol derivatives (**2a-l**) was synthesized and their inhibitory effects on AChE and BuChE were evaluated. Structure-activity relationship was also investigated.

 Copyright © International Science and Technology Conference (ISTEC)



Materials and Methods

Synthesis of thymol derivatives: Thymol (1 mmol) was dissolved in CH_2Cl_2, then Et_3N (1 mmol) and isocyanate derivatives (1.25 mmol) were added to the solution, respectively. The mixture was refluxed for overnight, cooled and washed with water. The organic layer was dried over Na_2SO_4, and concentrated in vacuo. *2-isopropyl-5-methylphenyl-4-nitrophenylcarbamate (**2k**)*: ^{1}H NMR ($CDCl_3$, 300 MHz) δ/ppm: 1.21 (6H, d, J=7.0 Hz), 2.33 (3H, s), 3.05-3.10 (1H, m), 6.92 (1H, s), 7.07 (1H, d, J=8.0 Hz), 7.23 (1H, d, J=8.0 Hz), 7.53 (1H, s, NH), 7.59 (2H, d, J=9.4 Hz), 8.19 (2H, d, J=9.4 Hz); ^{13}C NMR ($CDCl_3$, 75 MHz) δ/ppm: 21.1, 23.4, 27.3, 118.3, 122.9, 125.4, 126.9, 127.9, 137.1, 137.6, 143.5, 143.8, 147.4, 151.8.

Anticholinesterase activity assays: Acetyl- (AChE) and butyryl-cholinesterase (BuChE) inhibitory activities of the synthesized compounds were determined according to Ellman's method (Ellman, 1961). The IC_{50} was determined by constructing an absorbance and/or inhibition (%) curve and examining the effect of five different concentrations. IC_{50} values were calculated for a given antagonist by determining the concentration needed to inhibit half of the maximum biological response of the agonist. The substrates of the reaction were acetylthiocholine iodide and butyrylthiocholine iodide. 5,5'-dithio-bis(2-nitrobenzoic) acid (DTNB) was used to measure anticholinesterase activity. Stock solutions of the compounds and galanthamine in methanol were prepared at a concentration of 4000 µg/mL. Aliquots of 150 µL of 100 mM phosphate buffer (pH 8.0), 10 µL of sample solution and 20 µL AChE ($2.476x10^{-4}$ U/µL) (or $3.1813x10^{-4}$ U/µL BuChE) solution were mixed and incubated for 15 min at 25ºC. 10 µL of DTNB solution was prepared by adding 2.0 mL of pH 7.0 and 4.0 mL of pH 8.0 phosphate buffers to a mixture of 1.0 mL of 16 mg/mL DTNB and 7.5 mg/mL $NaHCO_3$ in pH 7.0 phosphate buffers. The reaction was initiated by the addition of 10 µL (7.1 mM) acetylthiocholine iodide (or 0.79 mM butyrylthiocholine iodide). In this method, the activity was measured by following the yellow colour produced as a result of the thio anion produced by reacting the enzymatic hydrolysis of the substrate with DTNB. Also, methanol was used as a control solvent. The hydrolysis of the substrates was monitored using a BioTek Power Wave XS at 412 nm.

Results and Discussion

The synthetic procedures to obtain the target compounds **2a-l** are depicted in Scheme 1.

Scheme 1. Synthesis of novel thymol derivatives

The IC_{50} values for AChE and BuChE inhibitions are summarized in Table 1. IC_{50} values against AChE ranges from 2.498 µM to 288,46 µM. Compound **2k** exhibited the strongest inhibition against AChE with an IC_{50} value of 2.498 µM, which was 183-fold more than that of thymol (IC_{50} = 458.23 µM). Also, it approached that of galantamine (IC_{50} = 2.051 µM). Furthermore, most of the synthesized carbamate derivatives (**2a**, **2c**, **2d**, **2e**, **2f**, **2g**, **2h**, **2i**, **2j**, **2k**, and **2l**) exhibited better AChE inhibition (IC_{50} = 2.498 µM – 288,46 µM) than thymol, by 0.6-183 fold. All of the synthesized compounds inhibited BuChE. Compound **2a** exhibited the strongest inhibition against BuChE with an IC_{50} value of 1.65 µM, which was 137-fold more than that of thymol (IC_{50} = 226.13 µM). The following conclusions should be noted regarding the ChEs inhibitory data of Table 1: (i) Moving the fluorine atom at the phenyl ring from the meta-position to the para-position led to a major decline of the inhibitory activity for both ChEs (compared **2c** (R=3-F, IC_{50} = 88.52 and 3.85 µM for AChE and BuChE, respectively) and **2d** (R=4-F, IC_{50} = 288.46 and 405.15 µM for AChE and BuChE, respectively)). (ii) The same decrease of the inhibitory activities of **2a**-**b** was indicated against both ChEs with moving methoxy group from the meta-position to the para-position (compared **2a** (R=3-OMe, IC_{50} = 154.32 and 1.65 µM for AChE and BuChE, respectively) and **2b** (R=4-OMe, IC_{50} = n.a and 59.96 µM for AChE and BuChE, respectively)). (iii) The presence of chlorine atom at the meta-position of phenyl ring led to an increase of the inhibitory activity for both ChEs (compared **2e** (R=3,4-diCl, IC_{50} = 89.53 and 2.54 µM for AChE and BuChE, respectively) with **2f** (R=4-Cl, IC_{50} = 269.8 and 137.41 µM for AChE and BuChE, respectively)).

(iv) Moving the nitro group at the phenyl ring from the meta-position to the para-position led to a major decrease of the inhibitory activity for AChE (compared **2j** (R=3-NO_2, IC_{50} = 82.88 µM) and **2k** (R=4-NO_2, IC_{50} = 2.498 µM)). The opposite effect was observed for inhibition of BuChE (compared **2j** (R=3-NO_2, IC_{50} = 3.31 µM) and **2k** (R=4-NO_2, IC_{50} = 37.71 µM)) (v) Electron-donating groups (methoxy group) at the meta- position of the phenyl ring exhibited lower inhibitory activity than halogens and electron-withdrawing group for AChE (compared **2a** (R=3-OMe, IC_{50} = 154.32 µM) with **2c** (R=3-F, IC_{50} = 88.52 µM) and **2e** (R=3,4-diCl, IC_{50} = 89.53 µM) and **2j** (R=3-NO_2, IC_{50} = 82.88 µM)). On the contrary, methoxy group at the meta position increased

 Copyright © International Science and Technology Conference (ISTEC)

the BuChE inhibitory activity (compared **2a** (R=3-OMe, IC_{50} = 1.65 µM) with **2c** (R=3-F, IC_{50} = 3.85 µM) and **2e** (R=3,4-diCl, IC_{50} = 2.54 µM) and **2j** (R=3-NO_2, IC_{50} = 3.31 µM)). (v) The inhibitor activity on both ChEs seems to be strongly dependent on the size and polarizability of the halogen substituent at the para-position of the phenyl ring (for size and polarizability, I > Br > Cl > F; for AChE inhibitory activity, **2h** (R=4-I, IC_{50} = 31.61 µM) > **2g** (R=4-Br, IC_{50} = 98.56 µM) > **2f** (R=4-Cl, IC_{50} = 269.80 µM) > **2d** (R=4-F, IC_{50} = 288.46 µM); for BuChE inhibitory activity, **2h** (R=4-I, IC_{50} = 4.77 µM) > **2g** (R=4-Br, IC_{50} = 107.22 µM) > **2f** (R=4-Cl, IC_{50} = 137.41 µM) > **2d** (R=4-F, IC_{50} = 405.15 µM)).

Conclusion

A series of 12 novel thymol substituted carbamate derivatives (**2a-l**) was synthesized and their inhibitory activities on AChE and BuChE were evaluated. Among them, **2k** exhibited the strongest inhibition against AChE with an IC_{50} value of 2.498 µM, which was 183-fold more than that of thymol (IC_{50} = 458.23 µM). Additionally, **2a** exhibited the strongest inhibition against BuChE with an IC_{50} value of 1.65 µM, which was 137-fold more than that of thymol (IC_{50} = 226.13 µM).Generally, the presence of carbamate moiety at the thymol increased the both ChEs inhibition. This finding can provide guidance for researches to design new efficient ChEs inhibitors in the future works. The SAR revealed that the inhibitory activity of the synthesized compounds could also be affected by the type and position of the halogen and electron-donating and electron-withdrawing groups substituent on the phenyl ring. Overall these derivatives could be recommended as new chemotypes to develop new ChEIs for the treatment of AD disease by suitably modulating the substitution pattern also in the perspective of multifunctional anti AD agents.

The fluorescence properties of naphthalene and its derivatives are well-known for many years. Thus until today several naphthalene derivative of the ligand or complex have been synthesized. Schiff base complexes are an important group in this complex [1]. Naphthalene derivative of the Schiff base ligand and it's particularly Zn and Mn etc. complexes have the fluorescence, catalytic and selective synthesis properties [2].

In this study, the new type Schiff base ligands of naphthalene derivatives were synthesized and characterization via spectroscopic methods has been performed. Then Zn(II) and Mn(II) complexes were prepared using these ligands by known procedures. The spectra of the complexes have been obtained via FTIR and mass spectroscopy methods. In addition to these the fluoresans properties of the complexes have been attained and interpreted.

Azo dyes constitute a very important class of organic compounds. These compounds are commonly used in different fields of industry due to their various prominent properties. One of the most well-known industries for these dyes is textile owing to dyeing characteristics of these dyestuffs. In this study, novel heterocyclic disazo disperse dyes, substituted with methyl (-CH_3) group at their *o-*, *m-*, *p-* position, synthesizedand applied to poly (lactic acid), polyethylene terephthalate and polyamide 6.6 fibers. All applied synthesized disperse dyes resulted in yellow-red shades on studied fibers. Besides, the position of auxochrome group led to different colorimetric properties, color shades and exhaustion yields. Washing, perspiration, rubbing, sublimation, light, water, sea water fastness properties were generally in the commercially acceptable range. Overall, synthetic dyeing with novel heterocyclic disazo disperse dyes, substituted with methyl group (-CH_3) at their o-, m-, p-position, is applicable for textile industry in terms of color yields and fastness properties.

Abstract

The purpose of this study is the development of a novel system for detection of breast tumors in non-invasive way that can be used by doctors or patients. Our study consist of two parts. The first part is a specialized sensor containing an inductive sensor inside of a tissue-like silicon rubber robotic fingertip and a square shaped multi-metal-array to increase sensitivity. The whole system designed as a probe which has compact design and mobility. The system provides 16-bit resonance impedance and 24-bit inductance values, enabling sub-micron resolution for position-sensing in application. The tissue-like silicon properties were simulated and the linearity of the probe design against the pressure was analyzed. Tissue-like silicon rubber has hyper-elastic specifications. Force-displacement analysis showed %100 linear behavior. Tissue-like rubber silicon has also elastomer properties. The stress-strain analysis was made for 8 different point that showed non-linear behavior. With the current probe design, our detecting system is easy to use for every patients and health clinicians due to its mobility and easy access for different clinical environment. For the second part, to measure our system performance's sensitivity and specificity, comparison simulations will be performed.
In the simulation experiments, tumor-like inclusions embedded in tissue-like cylindrical silicon samples to make Phantom tissue in Virtual environments (VEs) will be designed. In VEs, the tumor-like tissue samples will be used in a various combination of stiffness and depth in phantom tissues. In real phantom experiments, the simulated phantoms will be created by the same silicon-rubber in similar conditions. The system will be embedded with the camera for tracking the every movement of robotic fingertip. The camera will record every location information (x,y) and combine it with the relative stiffness value which is taken from the sensor. And the topographical information of the tissue-like phantoms turned in to 2-D image. Breast examination can be done by human hands which have unique mechanism to sense vibrations called Pacinian corpuscle (response 60-700 Hz) and these sensory systems can be measured around the 200 Hz. In clinics, even though the clinical procedures are performed by the experts, it's difficult to detect small tumors and quantify the shape, location and stiffness. Because of these difficulties, tactile imaging sensors need to be used for diagnosis. As a future study, human palpation performance will be compared by our novel tactile sensor design embedded on a robotic fingertip.

Key words: Medical imaging, tactile sensor, lump detection, breast tumor.

1. Introduction

In recent years Breast cancer is the leading cause of death in western women aged 35-54. It is expected to reach 1 in 7 women by the year 2000 (American Cancer Society, 1997). Survival rates are highest when it is detected early and still confined to the breast. According to the statistics reported in 2008, breast cancer diagnosis has been made with an estimated 1.38 million new cases (23 percent of all the cancers) and the second most common cancer worldwide in both sexes (J.Ferley, 2010). About 1,685,210 new cancer cases are expected to be diagnosed in 2016 and invasive breast cancer will be diagnosed in about 246,660 women and 2,600 men. An additional 61,000 new cases of in situ breast cancer will be diagnosed in women. Breast cancer is the most

*Corresponding author: Address: Faculty of Engineering, Department of Electric and Electronics Sakarya University, 54187, Sakarya TURKEY.

 Copyright © International Science and Technology Conference (ISTEC)

frequently diagnosed cancer in women (American Cancer Society, 1997). It is crucial to detect Breast cancer in early stages. There are many ways to detect Breast cancer. Breast self-examination (BSE), clinical breast examination (CBE), Mammography, Ultrasound and MRI have important role for detecting breast cancer.

Mammography is a low-dose x-ray procedure used to detect breast cancer at an early stage. Numerous studies have shown that early detection with mammography helps save lives and increases treatment options. However, like any screening tool, mammography is not perfect. For example, it can miss cancers, particularly those in women with very dense breasts, and also detects cancers that would never have caused harm, resulting in some over-diagnosis. And also differences in breast tissue, inefficient sensitivity, and small tumor size can cause false-diagnosis which can cause over-diagnosis. Some of the unwanted results of over diagnosis are increasing number of biopsies, higher-rate of invasive procedures, psychological effects of a patient and higher cost. Mammography is not recommended who is under 30 and have breastfed previous year. Because of the age breast tissue is dense and is hard to detect any cancerous tissue with mammography.

Magnetic resonance imaging (MRI) is a noninvasive method that reveals anatomical details in vivo and detects lesions for diagnosis. Although standard breast MRI cannot clearly delineate breast cancer, contrast-enhanced MRI enables the detection of breast masses with high sensitivity. MRI uses a powerful magnetic field and radio waves to produce images of the body. MRI is good at imaging dense breasts of younger women, breasts containing implants, which are often a problem for mammography owing to possible leak in the implant or rupture due to the squeezing, and smaller lesions often missed by mammography. MRI also helps to determine the stage of breast cancer. However, MRI requires the patient to lie down for half an hour to an hour and half without moving, which can be uncomfortable (Kuhl.JK, 1997). The identification of breast cancer using MRI is largely dependent on the enhancement of malignant lesions after IV administration of contrast agent, resulting in visible areas with both morphologic and kinetic features. However, enhancement on MRI is not limited to malignancies or discrete benign lesions of the breast (Müller-Schimpfle M ,1997, Reichenbach JR ,1999, Delille JP,2005). One of the main disadvantages of the MRI is that limiting specificity is the incidence of benign enhancing lesions and benign background enhancement that may be misdiagnosis that leading to an increased false-positive biopsy rate (Imaginis, 2001). Also during the MRI process patients have to lie down without a movement about half an hour which gives them discomfort and with the smallest movement the procedure needs to be repeated.

Ultrasound is a method that uses high frequency sound waves to detect tumors in tissue. There are several types of Ultrasound modes: B-mode, Doppler mode etc. B-mode capture reflected sounds and create and matrix format for the image (C.M. Sehgal,2006, C.F. Nemec,2007). And it can be used in pregnant women whom cannot use Mammography. And the results are depends on the experience of the clinical expert and the situation of the patient. Also clinical procedures have a standardization and interference in procedures have different results. In Doppler mode veins and tissue used for detecting tumors. Frequency shift calculated with the Doppler Effect so that flow can be estimated and visualize the breast tissue(D.O. Cosgrove,1993 , S. Raza,1997).

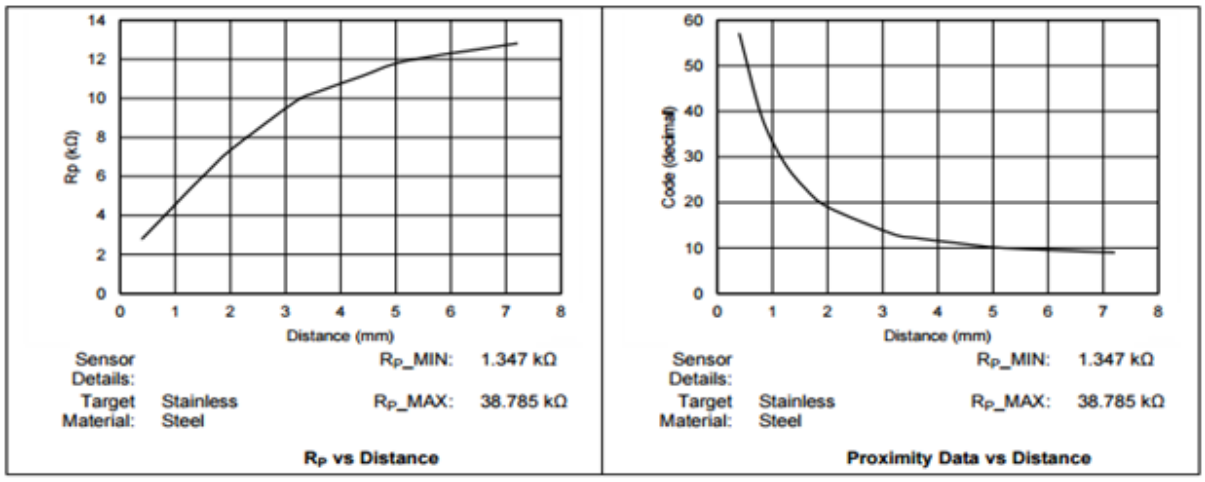
Microwave imaging and Elastography are used for breast cancer detection. Elestography detect different roughness between the tissues. Microwave imaging detect the dielectric constant and conductivity difference between the tissues (G.A. Ybarra, 2007).

Breast Self Examination and Computed Breast Examination uses human palpation. Human sensory feedback has a really important role in human interactions (B. Güçlü,2005, Bolanowski SJ,1988). Unlike the vision of that Human eyes provide us the sensory system in our body (haptic) can sense and respond in their own unique way

 Copyright © International Science and Technology Conference (ISTEC)

towards to every interactions (Gescheider GA,1988, 2002). Haptic systems needs to obtain more data from sensory systems. Haptic system inputs; force, movement needs to be converted as an input/output form for interactions. Developing a sensor with a tactile feedback has some challenges. Vibrations and sensing has its unique values in human touch (M.Z Yıldız,20013, B. Güçlü,2005, Bolanowski SJ,1988, Gescheider GA,1988 & 2002) and making a prosthetic finger human-like modeling is a challenging area which has obstacles like sensing a high frequency vibrations. Human hands have unique mechanism to sense vibrations called Pacinian corpuscle (response 60-700 Hz) and these sensory systems can be measured around the 200 Hz (V. B. Mountcastle 1972, G. Westling 1987, A. J. Brisben 1999). Because of these challenges artificial sensing system development researches has been made which is named Tactile İmaging (TI).

Tactile imaging is a non-invasive procedure that used for detecting cancerous tissue. TI used for mapping the interested area with sensors. TI is superior to BSE and CBE because every examiner can sense different shapes and geometries in different areas so the results are quantative and subjective. Sensors can detect difference between the cancerous tissue and healthy tissue with different sensor types (A. Samani, 2003, P.S. Wellman, 1999, A. Sarvazyan, 1994). With TI size, shape and depth of the cancerous tissue can be detected. Geometric properties and stiffness vary between the benign and malignant tissues as reported in (A.R. Skovorda, 1995) and (T.A. Krouskop, 1998). TI is a method that newly exploited. There is a limited number of device that commercially available (Medical Tactile Inc, 2012). Some study groups work on different sensor types. Accelerometers (R. D. Howe, 1989), piezoelectric polymers (P. Dario, 1994, J. S. Son, 1994, Y. Yamada, 1994 , P. Dario, 1994) magneto-inductance (J. Vranish, 1986), and ultrasonic technologies (B. Hutchings, 1994) , (S. Ando, 1995) sensor array with the photo detector (] M. Ayyıldız, 2013). These sensors used variety of applications however those sensors have some fragile sensing mechanism. With the (Medical Tactile Inc, 2012) product a study has been made about 110 patient (V. Egorov, 2008) and a study has been made with the silicon model along with the patients (C.S. Kaufman, 2006). Their experiments was performed in two consecutive steps: 1) a general examination by linear sliding of the probe, and then 2) a local examination by making circular motions. If any suspicious tissue have seen then the second step performed.



In current design we propose single point tactile detection robotic fingertip embedded with the high resolution camera. The designed probe's every movement is going to be tracked with the camera. The high resolution inductive sensors value combined with the location information which is obtained from the camera. With this method the topographical shape of the interested area is going to be mapped. And 2-D image of the interested area will be revealed without any quantative results. For the experiment part tumor-like properties is going to be placed in tissue-like silicon rubber phantoms. The tumor-like tissue samples used in a various combination of stiffness and depth in phantom tissues. Every sample will be examined according to their relative stiffness. Human hands unique sensing mechanism to sense small objet. An expert clinician can detect some of the lumps in the soft tissue but most of them pass through without any detection. And human palpation can change according to every person which means the results will be subjective if any of the procedure only done by the human hands because of these challenges we designed a system with high sensitivity and specificity. After the ethical committee permission to make non-invasive human studies. The performance will be compared by human hands.

2. Materials and Method

2.1. Design of our TI system

 Copyright © International Science and Technology Conference (ISTEC)

Our tissue-like silicon rubber robotic fingertip designed as a probe. Simulated all probe dimensions and materials are corresponding to the manufacturing technology and available materials on the market. The outer skeleton of probe is produced in 3D printer (thermoplastic polymer. In this part, we focused on design and analysis of a tactile probe molding and mechanical analysis by using Solid works program. SolidWorks is a solid modeler, and utilizes a parametric feature-based approach to create models and assemblies. The outer skeleton of probe we are fabricated in 3D printer (thermoplastic polymer). In this study we also needed a material that is similar to human skin on that part the device should come into contact with a cancerous tumor. But there are ethical and safety issues associated with obtaining alternative method human tissue. However after reviewing, we find dragon skin silicon on the market. Dragon skin silicones are used for a variety of applications ranging from creating skin effects and making production molds for casting a variety of materials. Due to the superior physical properties and flexibility, we decided to use this material in our project. It must be said that, it is used for medical prosthetics and cushioning applications. Particular focus was shown to find a robust tactile sensor that has the sensitivity and response to all tactile sensing modalities found in the human fingertip. Our TI system consist of %100 integrated sensor elements (TI LDC1000 EVM) arranged in a single point shape inductive sensor. The side length and the height of our TI sensor are 1.6 and 2.1 cm, respectively and sensor element is located in 1.4 cm of the silicon layer. Typical characteristic of the sensor shown in Figure 1 and Figure 2 shown the axial sensing of a sensor. Our sensor measures the parallel impedance of an LC resonator and has an Inductance-to-Digital Converter for the task. It accomplishes this task by regulating the oscillation amplitude in a closed-loop configuration to a constant level, while monitoring the energy dissipated by the resonator. The sensor element are powered by an external, regulated power supply (5V DC). Metal pieces was located above and bottom of the sensor and silicon tween them as shown in Figure 3 a

nd characteristics of tactile probe are in table 1. Inductive proximity sensors are used for non-contact detection of metallic objects. The system provides 16-bit resonance impedance and 24-bit inductance values, enabling sub-micron resolution for position-sensing to locate metal array inside of the silicon. After 10 mm of silicon the sensor is not capable of sensing the outside metals.

In this system Data acquisition hardware acts as the interface between the computer and the outside world. It primarily functions as a device that digitizes incoming analog signals so that the computer can interpret them. Other data acquisition functionality includes the following:

· Analog input/output

· Digital input/output

· Counter/timers

· Multifunction - a combination of analog, digital, and counter operations on a single device

In this case our changeable value is Eddie current which happen to change when the metal array moved inside of the tissue-like silicon shown in Figure 4-5.

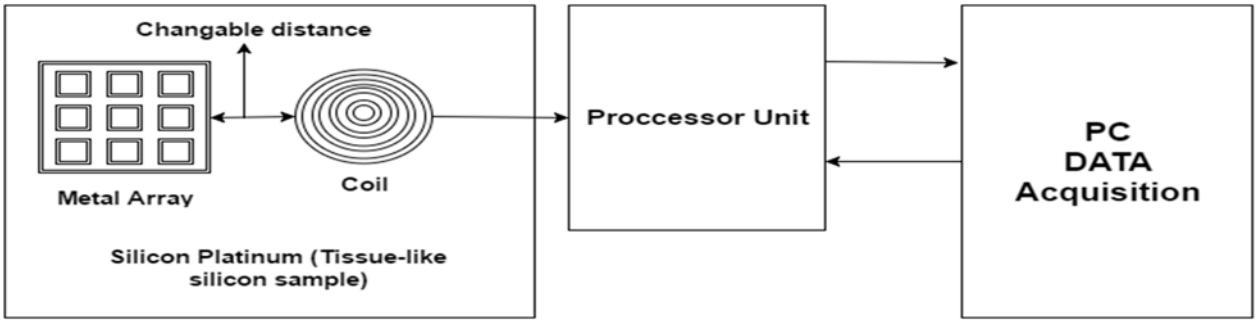

Figure 4a. Data acquisition units of the proposed TI system.

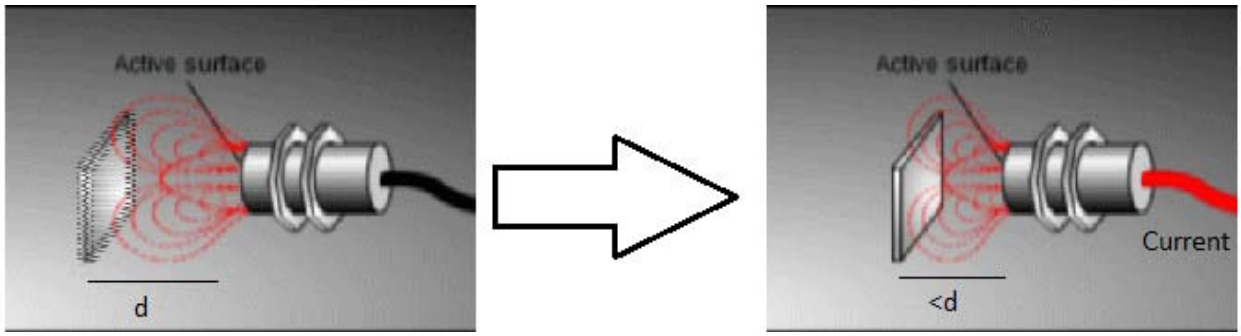

Figure 4b. Eddie current change due to metal array movement.

3. Results

In this section, the simulation results of the proposed sensor are shown. The silicon rubber that used in this study has the hyper-elastic material behavior and by the finite element method, stress and strain relations and displacement-force graphs were plotted. By giving the correct Poisson ratio from the datasheet of the materials to the software (Solid Works), the material showed isotropic linear property. Because the forces were quite low, the silicon rubber stay in the elastic region of the material. Therefore, a multilinear elastoplastic model was not chosen for the static analysis.

 Copyright © International Science and Technology Conference (ISTEC)

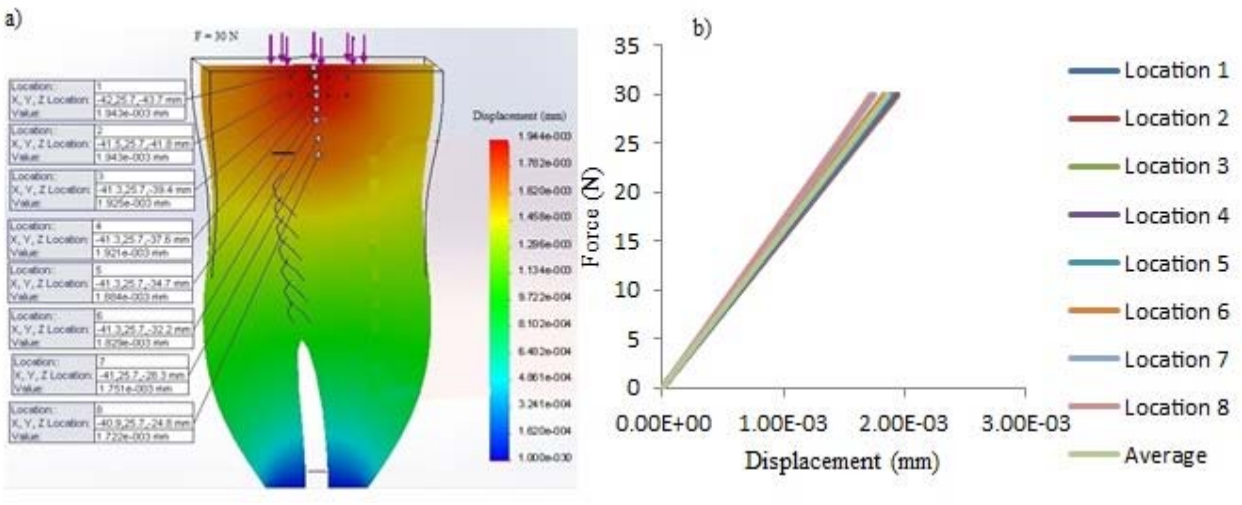

Figure 5. a) Static force (F =30 N) is applied to the silicon. b) Displacement graph of Dragon Skin silicon in the results of applied forces

Elastomers have the non-linear elastic stress-strain behavior and the term "elastomer" is basically used for materials which shows silicon-rubber properties. The reason for this behavior can be explained that, as it is shown on the stress-strain curve, the maximum force applied to the sensor is 30 N. This force is considered quite low level. Upon unloading this small force, there will be any permanent deformation on the material. In practice, this material behavior is considered as incompressible. On the Figure 6, the simulation results shows the stress-strain behavior of our sensor upon the applied forces between 0.1-30 N.

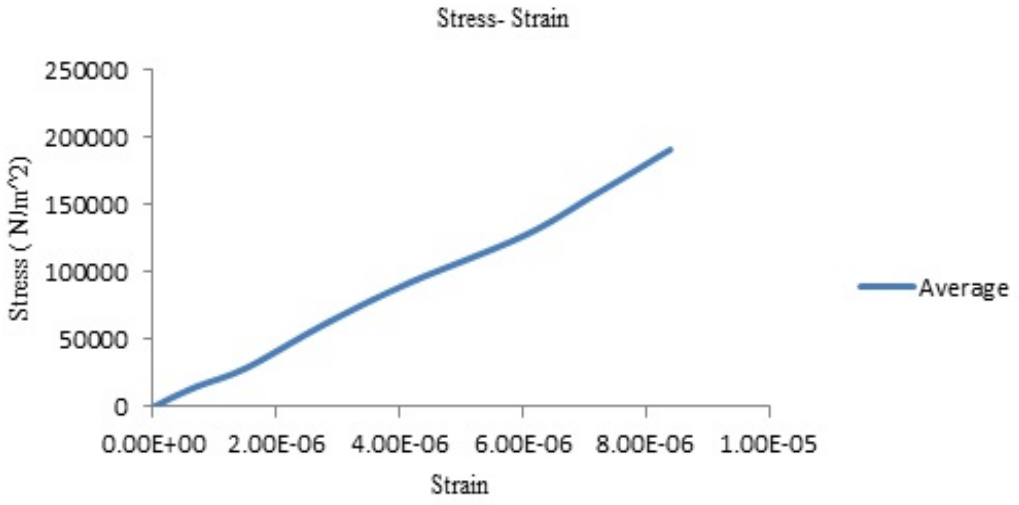

Figure 6. Dragon Skin silicon material behavior.

 Copyright © International Science and Technology Conference (ISTEC)

Elastomers (like Dragon Skin is platinum silicon) typically have considerable strains at small loads (means a very low modulus of elasticity, for example just 30 N). The material is nearly incompressible, so the Poisson's ratio is very close to 0.5. Their loading and unloading stress-strain curve is not the same, depending on different influence factors (time, static or dynamic loading, frequency etc.). In Figure 7, all the stress-strain relation curves were shown for the different depths at the center of the sensor.

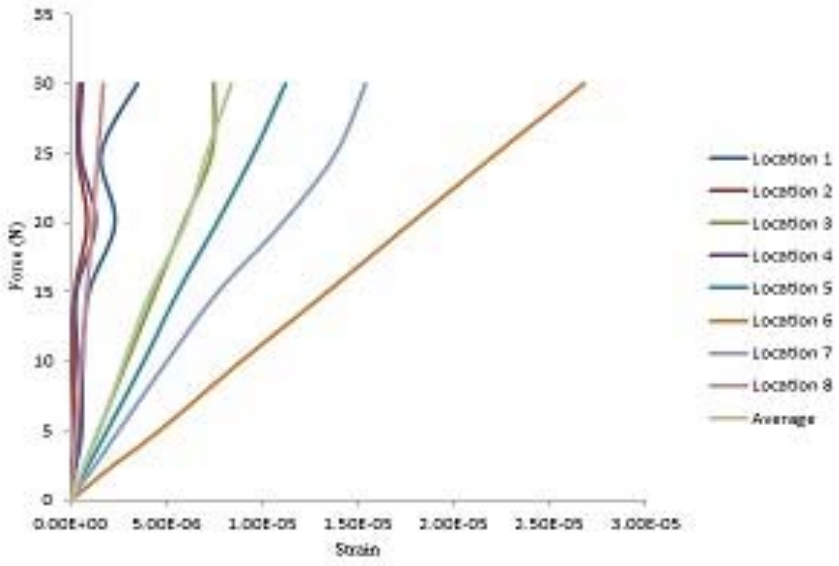

Figure 7: The results of strain in different applied forces to Dragon Skin (platinum silicone) material.

4. Discussion

We carried out our probe simulation in the SolidWorks, because the SolidWorks simulation uses the displacement formulation of the finite element method to calculate component displacements, strains, and stresses under external loads. In the SolidWorks analysis results non-linear hyperelastic materials behavior was observed. The analysis of rubber parts should be carried out using nonlinear stress analysis methods, due to their complex load deformation relationship. Due to the use of low loads, we thought in this area elastic behavior of materials would be remained on the upshot we use SolidWorks module for isotropic materials. In the next stage we are focused on design and analysis of multi module hyperelastic material models. In table 2, we will discuss how the different groups are studied and how we can do it.

Ref.	Method	Figure	Explanation
M. Leineweber et al, 200.	New tactile sensor chip with silicone rubber cover		Actually, the tactile sensor was used in that paper is based on the FhG-IMS pressure sensor and it has advantage and disadvantage. Sensor output is equal to mechanical analysis but the sensor needs to be calibrated for all different geometry.
M. Ayyıldız et al, 2013.	Tactile sensor array with photodiode and tissue like phantom		Sensor array used with led potodetector and with this way the tissue like phantom can be mapped.

Table 2. Different study group that has made tactile sensor for lump detection.

Our current design have some advantages comparison to the other study groups that shown in Table 2. Tissue-like silicon rubber as shown in Figure.8 is 100% linear which means that after the acceptable force (0-30N similar to the human finger) the material will turn in to previous state of the matter. So it can be called as a finger-like probe that can be used numerous times. İnductive sensing is capable of sensing sub-micron changes in distance. And accurate sensing is possible with inductive sensing. With our design we can detect even the smallest particle because our sensor and metal array placed 0-0.5 cm distance to each other as shown in Figure.9. And isolated from the outside interference with our silicon properties which means even the smallest lump detection in soft tissues will be possible.

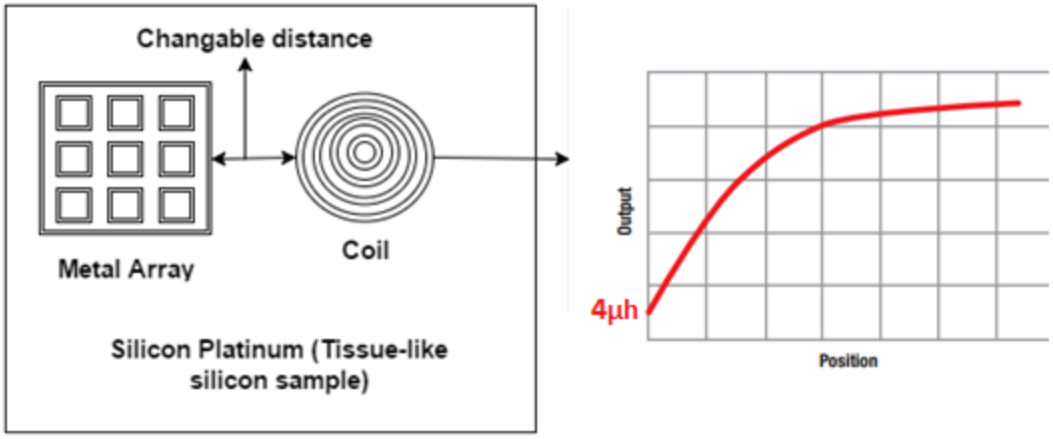

Figure 8. Because of our probe design The starting point of the sensor is 4µh and the our measurement points inside of the linear area of the sensor.

5. Conclusions

In this study, our choice to carry out the probe simulation was the SolidWorks, because the SolidWorks simulation uses the displacement formulation of the finite element method to calculate component displacements, strains, and stresses under external loads. In the SolidWorks analysis results non-linear hyperplastic materials behavior was observed. The analysis of rubber parts should be carried out using nonlinear stress analysis methods, due to their complex load deformation relationship. Due to the use of low loads, we thought in this area elastic behavior of materials would be remained on the upshot we use SolidWorks module for isotropic materials. In the next stage we are focused on design and analysis of multi module hyperelastic material models. These are directions in which we plane to continue our work.

TEACHERS' VIEWS ON THE USE OF INTERACTIVE EDUCATION WEBSITES IN SOCIAL STUDIES CLASSES

Nuray Kurtdede Fidan

Afyon Kocatepe University, Faculty of Education, Afyonkarahisar-Turkey

nkurt@aku.edu.tr

Abstract : This study aims to determine the views of teachers on the use of interactive education websites in social studies classes This study aims to determine interactive education websites used by teachers in social studies classes according to their views. Participants were asked about their opinions on the education websites they used in social studies classes, the benefits to students and teachers, and the problems encountered. The participants of the study were 18 classroom teachers working in the city center and districts of Afyonkarahisar Province in the spring term of the 2015–2016 academic year. Criterion sampling, a purposeful sampling method, was used to determine the participants. A phenomenological design, a qualitative research method, was used and data collection was conducted by using a Semi-Structured Interview Form prepared by the researcher. A content analysis technique was used to analyze the data. The data analysis showed that the interactive education websites used by the teachers in their classes were mostly Morpa Kampüs and Okulistik, Vitamin and partially, EBA. The study found that the teachers reported that the use of interactive education websites in social studies classes offers many benefits to teachers and students.

Keywords: Social studies, class teacher, interactive education websites

Introduction

Today, information and communication technologies are used intensively, and it is unquestionable that knowledge accumulation is increasing each passing day and it is necessary to make greater use of this resource. Along with globalization, the circulation of knowledge and the need to make better use of it have led to the development of information acquisition technologies, such as the Internet (Şahan, 2005). The Internet, the largest communication network used by individuals to acquire, produce and share information, has begun to be used in numerous fields such as education, healthcare, government, industry, and defense. The use of Internet in education has caused many changes. The use of the Internet is continually increasing and Internet-based education has gradually come into prominence. In Internet or Web-based education, teachers and students can connect to their class material via a computer connection, whenever they want and wherever they are. In Turkey, the aim is to form an association between education and technology, as necessities of the information age. In the 2010–2014 strategic plan (MNE, 2009), the Ministry of National Education aimed to enable all schools to have Internet access, to make information technology classes common, to prevent inequality in access to the Internet and, therefore to provide a student-oriented and project-based education for the use and dissemination of new technologies. It is inevitable that teachers will benefit from technology in their classes. Social studies education supported by technology plays an important role in obtaining information that is impossible in conventional classes, and in the acquisition of various skills. It is necessary for today's teachers to benefit from technology in order to increase primary school students' opportunities to learn in social studies classes, and to enable them to establish a connection between past, present and future (Mason, 2000). Today, children's use of technology and the Internet for education and entertainment is increasing. Students benefit from technology in many areas, such as Internet research, and access to videos, images, search engines, maps, social media and games. Because social studies contain the subjects of many disciplines, technology should be used in these lessons as much as possible.
Teachers can develop their students' global awareness, using various effective, appropriate and authentic educational technologies (Crawford and Kibry, 2008). In a study in which Brad et al. (2015) planned to teach social studies subjects via video games, an increase was observed in the children's skills of problem solving, motivation, interest and goal setting and planning. Also, it was found that students better understood concrete concepts and theories used in real life. Marcus et al. (2010), stated that movies play an important role in teaching historical subjects in social studies lessons and should be used by teachers as they enable students to acquire the skills of historical empathy, interpretation and analytical thinking.
In a study conducted by Yeşiltaş and Kaymakçı (2014) to determine the technological dimension of a social studies teaching program, it was found that these programs are structured in a way to provide the opportunity to use technological products in terms of their general purposes, content, learning–teaching processes and assessment–evaluation tools and methods. Having technological knowledge, as well as field knowledge and

 Copyright © International Science and Technology Conference (ISTEC)

teaching skills, affects teachers' views on the inclusion of educational technologies in classes (Crawford and Kibry, 2008). The lack of knowledge and skill in the use of technology in social studies classes leads teachers to teach their lessons in conventional way. The teachers' use of technological applications in their lessons is associated with their skills and self-efficacy in using technology (Friedman and Heafnee, 2010). In Turkey, interactive education software has been produced that can incorporate video, images, documentaries, animations, cartoon movies, and caricatures on subjects in social studies and other education, in compliance with each grade level. The number of teachers who use this kind of software is increasing daily. This study aims to determine the views of teachers on the use of interactive education websites in social studies classes This study aims to determine interactive education websites used by teachers in social studies classes according to their views. Participants were asked about their opinions on the education websites they used in social studies classes, the adequacy of these educational websites, the benefits of using these websites to students and teachers, and the problems encountered. Answers were sought for the following questions:

1. What are the views of classroom teachers about the adequacy of different educational websites that they use in social studies classes?
2. What are the views of classroom teachers about the stage of the social studies class at which they use interactive education websites?
3. What are the views of classroom teachers about why they use different education websites in social studies classes?
4. What are the views of classroom teachers about the benefits to teachers of using different education websites in social studies classes?
5. What are the views of classroom teachers about the benefits to students of using different education websites in social studies classes?
6. What are the views of classroom teachers about difficulties they encounter while using different education websites in social studies classes?

Method

Research Design

A phenomenological design, a qualitative research method, was used in the study. Phenomenology examines the real nature of a phenomenon (Patton, 2014). The aim of phenomenological research design is to reveal the experiences and perceptions of individuals about a phenomenon and the meanings they attribute to it (Yıldırım and Şimşek, 2013). Phenomenological research defines the common or shared experiences about a phenomenon or concept (Creswell, 2015). It focuses on how individuals describe phenomena, what they think about them, how they perceive them and attribute a meaning to them. In this research design, in-depth interviews should be conducted with individuals who have directly experienced the relevant phenomenon, in other words, have experiences about it, in order to collect data (Patton, 2014). In the present study, the phenomenological design was considered as a method which provided an opportunity to assess the interactive education websites used by the teachers in social studies classes, to determine why and how they use them, and the problems they encounter and recommended solutions.

Participants (Study Group)

The participants of the study consisted of 18 teachers working in the city center and districts of Afyonkarahisar Province in the spring term of the 2015–2016 academic year. The criterion sampling method, a purposeful sampling strategy that enables all cases fulfilling some criteria to be selected, was used to determine the participants. Purposeful sampling methods are used to increase transferability in qualitative researches with the aim of revealing incidents and facts, and their features of variability (Yıldırım and Şimşek, 2013). In purposeful sampling, cases are selected for a study because they provide more information and they are enlightening. They can provide important explanatory information about the relevant phenomena studied. Cases that are rich in information provide more data for researchers (Patton, 2014). The criteria determined for participant teachers were as follows; working with fourth graders and participating voluntarily in the study. The effective factor in setting "working with fourth graders" as a criterion for classroom teachers was that there were several questions in the interview form about education websites used at this grade. Social studies classes are included in the fourth-grade curriculum in primary school, requiring the classroom teachers to work with fourth graders. The information about the 18 participants who constituted the study group is showed in Table 1.

 Copyright © International Science and Technology Conference (ISTEC)

Table 1. Information about participants

Variable		f

	Male	11
	Total	**18**
Seniority	0–10 years	4
	11–20 years	9
	21–30 years	3
	30 and above	2
	Total	**18**

Data Collection and Data Collection Tools

The data were collected using a Semi-Structured Interview Form which was developed by the researcher and consisted of 9 open-ended questions. In qualitative research, a semi-structured interview is a commonly used data collection method when the researchers want to analyze a subject in detail and to better comprehend the responses given (Harrell and Bradley, 2009). A Semi-Structured Interview Form with 11 open-ended questions was prepared on the basis of a literature review and given to three experts in different departments of a faculty of education in a state university who examined it to ensure its internal and external validity. These classroom teaching experts were asked to ensure the scope and face validity, and to check whether the questions in the interview form were clear and understandable, and that they involved the topic discussed. As a result of the expert review, two questions were judged to be inappropriate to the research topic and were excluded from the interview form. After the necessary adjustments were made in accordance with the experts' opinions and comments, an interview form consisting of 9 open-ended questions was developed. Later, a pilot interview was conducted with a classroom teacher. An assessment was conducted after this interview was written down, which showed that the questions were understood clearly by the participant.

Data Analysis

The content analysis technique was used to analyze the data. In content analysis, the data obtained in a study is subjected to an in-depth analysis, in order to develop concepts and themes. The process of content analysis consists of stages, including data coding, finding themes which divide codes into certain categories, the organization and description of data according to codes and themes, and the interpretation of findings (Yıldırım and Şimşek, 2013). The interviews were recorded by video camera and transcribed by the researchers. All of the written interview data were coded by two researchers. The interrelated codes were classified by their similarities and differences, and the researchers decided under which sub-themes the data would be grouped and presented. These sub-themes, which were associated with each other, were combined and inserted into the main themes presented in broader dimensions. The consistency between codes established by the two researchers was calculated using the formula, [Agreement / (Agreement + Disagreement) x 100] (Miles and Huberman, 1994). As a result of the comparison between codes, the consistency between encoders was calculated as 0.88. The fact that reliability calculations were found to be above 70% was regarded as reliable for the study (Miles and Huberman, 1994). Code names (T1, T2, T3 ...) instead of the teachers' names were used in direct quotation to support the results obtained.

Results

Information about the interactive education websites mostly used by the teachers in social studies classes is shown in Table 2. Later, the participants' comments and direct quotations about the adequacy of these websites were also presented.

Table 2. The most used interactive education websites in social studies lesson

The most used education websites	Frequency
Morpa Kampus	13
Okulistik	8
Vitamin	5
Eğitim Bilişim Ağı (Education Information Network)	2

As can be seen from Table 2, it was found that the interactive education websites mostly used in social studies classes were Morpa Kampus, Okulistik and Vitamin. The participants reported that these websites are compatible with the acquisitions in social studies teaching programs and they are quite adequate. Also, the participants emphasized that these interactive education websites are highly professional and they are

 Copyright © International Science and Technology Conference (ISTEC)

appreciated by their students. Moreover, it was also reported that Eğitim Bilişim Ağı (Education Information Network) is not used often in social studies because its content is inadequate and complicated, and is incompatible with the acquisitions in social studies teaching programs and is not intended for primary school programs in particular.
The participant teachers reported that the websites such as Okulistik and Morpa Kampus are professional and commonly used in social studies classes. One of the participants, T4, said, "*The websites like Okulistik and Morpa, which were created more professionally, are important sources for me in social studies lessons, therefore I find them quite practical."* Another participant, T12, also said, *"The interactive websites that I use most in social studies and find useful are Morpa Kampus and Okulistik, respectively. These websites go in parallel with the subjects that we teach in lessons. I think they are adequate and it is easy to use them."*

The participants also emphasized that the other interactive education website used in social studies classes is Vitamin. One of the participants, T2, said that, *"My students are pleased when they see me opening Vitamin. Videos, images, and particularly exercises in this website work a lot for me. I find these websites adequate."*

Another participant, T1, reported that EBA does not have any content related to primary school programs and it is not used often in social studies and other classes because its usage is complicated compared to other websites. He/she said, *"The passwords of EBA were also given to us, but I cannot use this website because it is not yet adequate. The data in this website are inadequate because accurate and proper data for primary schools have not been uploaded to the website. I find Morpa Kampus adequate for those who want to use it in terms of visual aspects and information because it offers an opportunity to project books on the interactive whiteboards."*

From the teachers' views, it can be stated that they use mostly the Morpa Kampus and Okulistik education websites in social studies classes, and that the newly-developing EBA program is not preferred because it does not follow the lesson content and acquisitions exactly.

Information about the most commonly used and liked categories of the interactive websites in social studies classes is showed in Table 3.

Table 3. The most commonly used and liked categories of the interactive websites

The most commonly used and liked categories	Frequency
Audible and animated video lectures	16
Assessment exams	12
Homeworks	10
Interactive activities	8
Worksheets	8
Games	2
Music	2
Documentaries	2
Images	2

As shown in Table 3, the category most used by the teachers in social studies classes was audible and animated videos that are based on lectures. The classroom teachers were also found to use images, animations, assessment questions and activities.

One participant teacher, T15, reported using video lessons, saying that, *"There are video lectures created in accordance with each subject of the lessons and their acquisitions. First, I have students listen to these lectures. I deliver the subject by myself sometimes, by pausing the video lecture or after it ends, and reinforce the subject with questions."*

The participants also reported that they use assessment exams in particular. They emphasized that they use tests prepared for each unit or theme, subject screening tests prepared for each subject, and mid-term and end-of-year assessment tests. It was also reported that the assessment questions are so useful and professional that they facilitate the work of teachers. One of the participants, T2, said, *"I like assessment categories most on these websites. In the past, we were working hard and it was so difficult and time-consuming for us to prepare questions accurately according to subjects and units. The exam questions in these websites have been prepared and arranged so professionally that they attract the students' attention. I can easily reach the subjects that I deliver in the lesson. I use animations and exam questions categories a lot, particularly for social studies classes, because it is a verbal class."*

 Copyright © International Science and Technology Conference (ISTEC)

Information about the most commonly used category of the interactive education websites in social studies classes is showed in Table 4.

Table 4. The most commonly used category of the interactive education websites in social studies classes

Stages of the lesson	Frequency
At all stages of the social studies lesson	**12**
Measurement and Assessment	**12**
Worksheets	6
Exercises	2
Tests	2
Subject revision	2
Drawing attention	**8**
Video	6
Music	2
Learning and teaching process	**7**
Lecturing	3
Animation	3
Games	1
Documentary	1

The participants reported that they use interactive education websites at almost all stages of the social studies lesson. In parallel with the results above, the teachers use interactive education websites mostly at the measurement and assessment stage of the social studies lesson. The participants reported that they use assessment exams (worksheets, exercises and tests) and audible and animated video lectures with the aim of subject revision at the end of the lesson. On this matter, one teacher, T6, said, *"I use these materials at the end of the lesson to reinforce what is learned and to make a general revision."* Another teacher, T18, said, *"I use these materials to conduct a revision at the conclusion stage of the lesson and to summarize the subject,"* while T9 said, *"I use these materials at the assessment stage of the lesson for the subject."*

The participants also reported that they use video and music in the second place to draw attention at the introduction stage of the class. One teacher, T15, said, *"I use these materials to attract my students' attention to the subject at the introduction stage of the lesson. I start the lesson sometimes with a song, narration or lecture-based videos. Afterwards, I proceed to the next stage with the textbook."*

The participants stated that they use video lectures, animations, games and documentaries in the learning and teaching process. On this matter, one teacher, T5, said, "*I use the education websites that enable students to become active and participate actively in the learning–teaching process, instead of following and listening to their teachers passively, at the development stage of the social studies lesson. I enable my students to watch the videos on these websites and do exercises. I use documentaries prepared for the social studies lesson, particularly regarding the subjects in the unit, 'I am learning my past'."*

Information about the subjects of the social studies lesson most commonly used in the interactive education websites is showed in Table 5.

Table 5. The subjects of the social studies lesson most commonly used in the interactive education websites

Subjects Used	Frequency
Turkish War of Independence	18
Elements of National Culture	16
Natural Disasters	16
Non-Governmental Organizations	14
Environmental Pollution	10
Developments in Science and Technology	10
National Holidays	9
Introducing other countries and cultures	3
Our individual differences	2

As can be seen in Table 5, the teachers stated that they use the education websites for almost all subjects. They also reported that they benefited mostly from the videos and documentaries related to the Turkish War of Independence within the context of history subjects in social studies classes. The participants also emphasized that they use animations and documentaries in particular for the subjects including elements of national culture,

 Copyright © International Science and Technology Conference (ISTEC)

natural disasters, non-governmental organizations, environmental pollution, developments in science and technology, national holidays, introducing other countries and cultures and our individual differences. On this matter, one of the participants, T6, said, *"Social studies is a verbal lesson, thus I benefit from documentaries generally for historical subjects, especially regarding the Turkish War of Independence, but I also try to use these materials for almost all subjects such as natural disasters, cultural elements from past to present and environmental issues."*

Information about the benefits to the teachers offered by the use of interactive education websites in social studies classes is showed in Table 6.

Table 6. Benefits for teachers of interactive education websites

Benefits for teachers	Frequency
Enabling teachers to be prepared	16
Enabling teachers to prevent the lesson from being monotonous	14
Providing convenience	10
Enabling teachers to draw their students' attention more easily Enabling teachers to reach a large number of examples and images, and further information about the subject	9
Providing teachers with a large number of materials (video, animation, activity)	8
Increasing the teacher's control over the lesson	7
Enabling teachers to concretize the subjects	5
Enabling teachers to reach measurement and assessment sources easily	5

As can be seen in Table 6, the teachers reported that using these websites in social studies and other classes enables teachers to be well-equipped and better prepared for the classes. They also stated that these websites enable social studies classes to be more entertaining, and less monotonous, and that they make it easy for teachers to access the intended information. The participants also emphasized that these websites enable teachers to access relevant information, images, examples, videos, activities, tests and exam questions for measurement and assessment appropriate to each subject. It was also stated that the high number of these sources increases the control of teachers over the classes, enables the subjects to be reified, and improves the motivation of students.

One of the participants, T18, offered the view that these websites enable teachers to be better prepared, saying, "*We could not always access various sources while preparing for the lessons in the past, but now there are materials available, prepared in accordance with the class subjects. The availability of these materials, from video lectures to exam questions, facilitates our works and enables us to be prepared for the classes."* One of the participants, T3, reported that the interactive education websites offer convenience to teachers and assist them, and that they also provide teachers with a large number of material. He/she said, *"They make giving lessons easy for teachers. They provide teachers with a large number of materials and enable them to come to school prepared."* Another teacher, T16, said, *"They provide teachers with different and rich content. They provide us with educational materials which are prepared in accordance with technology."*

One of the participants, T14, reported that using interactive websites enables students to enjoy the class, helps teachers hold their students' attention, and it prevents the lesson from being monotonous. He/she said, "*If I use various games and animations in the lesson, it stops being monotonous. In this respect, I think these websites enable social studies lessons to be enjoyed and listened to with interest by the students; thus, our work gets easier."* On this matter, another teacher, T8, said, *"Using the lecture method, the students become distracted after a while; therefore, these websites become helpful for teachers by enabling them to provide lessons easily."*

One of the teachers, T2, stated that the interactive education websites concretize what teachers teach and enable them to increase their control over the lesson. He/she said, *"Their benefits are considerable if a teacher finds subject-oriented materials for what he or she wants to teach in these websites. They can deliver the abstract concepts in the lesson concretely by using these websites. Therefore, it facilitates the teachers' work, allows them to establish control over the lesson, offers diversity in lecturing and enables teachers to make lessons entertaining, rather than boring*. On this, another teacher, T11, said, *"Thanks to the activities on them, these websites are useful in making the lesson entertaining, giving concrete examples and holding the students' attention."*

One of the participants, T5, reported that the interactive education websites provide teachers with a convenient way to hold their students' attention by saying, "*I think that different education websites are very useful for teachers to teach social studies. They enable us to mentally prepare the children for the lesson and most*

 Copyright © International Science and Technology Conference (ISTEC)

importantly, draw their attention to the subject. I also think that these websites help teachers enable students to comprehend what is taught..."

Information about the benefits to the students offered by the use of interactive education websites in social studies classes is shown in Table 7.

Table 7. Benefits for students of interactive education websites

Benefits for students	Frequency
Enabling permanent learning	15
Drawing attention	12
Leading to individual learning	10
Enabling students to be motivated	10
Enabling students to enjoy social studies classes	8
Enabling students to recognize that they can obtain information in different ways	
Enabling active participation	5
Learning to learn	4
Supporting the students with different learning styles	3
	2

According to Table 7, the participants reported that the use of interactive education websites in social studies classes has various benefits for students, such as enabling permanent learning, drawing their attention, leading them to individual learning, and enabling them to be motivated. They also stated that teaching the lesson by using these websites causes children to like it, enables them to learn the different ways of getting information whenever and wherever they want, and helps them to learn by experience. Moreover, they emphasized that these websites contribute to "learning to learn" by enabling students to access information whenever they want, at their own pace, and to assess themselves by activities and questions, and that they help teachers reach children with different learning skills. On this, one of the participants, ST5, said, *"Students have difficulty understanding abstract concepts. These websites deliver concepts by concretizing them and enabling permanent learning because they appeal to students in both visual and audial ways. Students can get information for their research assignments or preparation for the next class by themselves, without the help of their teacher thanks to different websites. I think these websites are also useful for students because they try to enable students to acquire information in different ways."*

Information about the difficulties encountered while using interactive education websites in social studies lesson is showed in Table 8.

Table 8. Difficulties encountered while using interactive education websites in social studies classes

Difficulties faced	Frequency
Internet outage and low-speed internet connection	15
Inadequate number of activities	10
Inconsistency between the acquisition requirements in the program and the content on the websites	5
Not updating the websites according to the changes in the program	4
Some of the websites require students to pay membership fees	2
The content and usage of some websites is complicated	2

As can be seen in Table 8, Internet outage and low-speed internet connection are the difficulties most faced by classroom teachers. Apart from these, they also reported that they encounter difficulties, such as inadequate number of activities for the subject, inconsistency between the acquisitions in the programs and the content on the websites, websites not reflecting promptly changes in the programs, some websites requiring students to pay membership fees, and the fact that it is complicated to use some websites.

One of the participants, T1, reported having difficulty connecting to the Internet. He/she said, *"I have always difficulty while opening websites, and sometimes I encounter difficulty with the Internet connection. Because of these problems, I fall behind in teaching subjects and I have to teach lessons in simpler way."* Another participant, T3, said, *"I have difficulty with slow Internet speed and outages."* One of the participants, ST5, reported on the inadequacy of content and activities: "*The difficulty that I most frequently encounter is that some of the websites are inadequate in terms of content. Although our textbooks have tens of acquisitions, it is*

 Copyright © International Science and Technology Conference (ISTEC)

impossible to find a video or animation for each acquisition. I also encounter websites which are inadequate not only in terms of delivering lectures, but also educational games or assessment..."

Conclusion and Recommendations

This study aimed to determine teachers' views on the use of different interactive education websites in social studies classes This study aimed to determine the use of different interactive education websites in social studies classes according to the views of teachers. It found that teachers generally use these websites in their lessons and they find them adequate. This study also showed that these interactive education websites are highly professional and that they are appreciated by the students. Moreover, it was found that Eğitim Bilişim Ağı (Education Information Network), which is quite new for the primary school level, is not used often in social studies because its content is inadequate and complicated, and it is incompatible with the program acquisitions and it is not intended for primary school programs in particular. Açıkalın (2010) observed that teachers use websites in social studies classes.

The category on the interactive education websites most frequently used by the teachers for social studies classes was found to be audible and animated video lectures. Tests prepared for each unit or theme, subject screening tests prepared for each subject, and mid-term and end of year assessment tests are also other materials that teachers use most frequently. Moreover, assignments, interactive activities, worksheets, games, music, documentaries and images prepared in accordance with each subject on the interactive education websites are also used and preferred. In a study conducted by Çetin (2010), students reported that the high number of elements, such as activity, experiment, game and animation, within the content of classes delivered using web-supporting teaching methods, makes them happy; the high number of questions in the content provide reinforcement; and web-based teaching can be conducted without constraints in time and place. Based on the study results, the use of interactive education websites by teachers in their classes should be made more common and teachers should be encouraged to use them.

It was found that the teachers use the interactive education websites mostly for the subjects including the Turkish War of Independence, elements of national culture, natural disasters, non-governmental organizations, environmental pollution, developments in science and technology, national holidays, introducing other countries and cultures, and our individual differences. The participants reported that the use of documentaries about historical subjects and videos about natural disasters is effective. Furthermore, images and videos, which contain elements of national culture, and introduce non-governmental organizations and explain their activities within the context of current events, are also used in the lessons. Images for environmental pollution and videos for raising environmental awareness are also used. It is highly important for teachers to include interactive education websites within the content regarding different disciplines in social studies classes so that the social studies education becomes effective and efficient.

The participants reported that using interactive education websites in social studies classes and other lessons enables teachers to be well-equipped and better prepared, makes social studies classes more entertaining and prevents them from being monotonous, and offers convenience to teachers by enabling them to access the intended information more easily. Moreover, the participants emphasized that these websites enable teachers to access relevant information, images, examples, videos, activities, tests and exam questions for assessment appropriate to each subject, increase the control of teachers over the classes, enable the subjects to be reified, and increase the motivation of students.

In a study conducted by Çiftçi, Taşkaya and Alemdar (2013) to determine the opinions of classroom teachers on the Fatih Project, it was found that using Internet software and tablets in education facilitates teachers' access to information, offers a large number of materials and simplifies teachers' work in several aspects, and consequently helps them save time. All teachers should be oriented and encouraged to use these websites. Most of the teachers using EBA reported that the biggest contribution of the platform in terms of its positive effects on teachers is that it positively affects the motivation of students for the lesson because it increases visuality (Türker and Güven, 2016).

The teachers reported that the use of interactive education websites in social studies classes has various benefits for students, such as enabling permanent learning, drawing their attention, leading them to individual learning and encouraging their motivation. The participants also stated that teaching social studies classes by using these websites causes children to enjoy the classes, enables them to learn the different ways of getting information whenever and wherever they want, and helps them to learn by experience. In a study "Exemplary Social Studies Teachers Use of Computer-Supported Instruction in the Classroom," conducted by Açıkalın (2010), the participants emphasized that the use of computers in social studies classes facilitates students' work and enables

 Copyright © International Science and Technology Conference (ISTEC)

them to learn faster. In the same study, most of the participants emphasized that the Internet is very useful because it enables students to gain global and multiple perspectives. In a study conducted by Heafner (2013), the teachers emphasized that it is absolutely necessary to use technology in social studies classes because it makes learning meaningful for children, motivates them to learn, enables them to learn in accordance with their own pace and interests, develops their research skills, and helps them learn by associating the social studies concepts with their lives. In an experimental study based on web-supported teaching, Çetin (2010) found that web applications improved the academic achievement of students significantly and increased their motivation towards the lesson.

Internet outage, inadequate number of activities and inconsistency between content and acquisition are the main difficulties faced by the teachers while using these websites. In a study titled "Secondary Social Studies Teachers' Perceptions of Effective Technology Practice," conducted by Heafner (2013), the participants stated that they experienced difficulties such as Internet outage in social studies classes, which causes loss of time while trying to follow curriculum. The sub-structural deficiencies in schools should be corrected to use these websites in an effective way. Also, the contents of these websites should be developed, organized and updated.

TECHNOLOGICAL SUSTAINABILITY OF MOBILE LEARNING

Abide Coskun-Setirek[1], Zuhal Tanrikulu[2]
Bogazici University, Department of Management Information Systems, Istanbul, Turkey

[1]abide.coskun@boun.edu.tr
[2]zuhal.tanrikulu@boun.edu.tr

Abstract
This study aims to investigate and improve factors affecting technological sustainability of m-learning. In addition to literature review, an investigation based on interviews was conducted with 11 heads and systems experts of distance education centers to obtain the technological sustainability factors of m-learning. In order to understand the significance of these factors on m-learning sustainability, another investigation based on survey research was conducted with 75 system staffs from the universities which have m-learning facilities. The data analyzed and evaluated for a technological sustainability model of m-learning. The study may provide guidelines to m-learning initiatives for a sustainable mobile learning.

Keywords: mobile learning, m-learning, sustainability, technology

INTRODUCTION

In the last ten years, many educational institutions have started to give mobile learning which is defined as "intersection of online learning and mobile computing" by William (2003). The mobile devices which are used in m-learning can be listed as mobile device, like cellular phones, Personal Digital Assistants (PDA), smartphones, tablet PC etc. (Andronico et al., 2003). These devices are used for many instructional activities such as downloading and sharing document, collaborating on projects, reviewing coursework, preparing for exams, showcasing their work, sharing project results, reading (listening to) audio books, recording information, presenting projects; conducting research, saving their work, submitting work to the instructor etc. (Corbeil & Valdes-Corbeil, 2007). Although there are more advantages of online learning environments for both students and institutions, high dropout rate is a problem in online education (Bowers & Kumar, 2015).

This study aims to investigate the technologic dimension of m-learning sustainability and seeks to answer such research questions: What are the factors that can affect the technological sustainability of mobile learning? What is the current situation of the technological sustainability of m-learning at universities in Turkey?

LITERATURE REVIEW

Technological perspective of mobile learning sustainability has been handled in few studies. According to Stansfield et al. (2009), appropriate infrastructure & standards (cost effectiveness, systems security, adoption of open-source technologies), support for staff & users/students (adoption of open-source technologies, effective training, maintenance agreements in place), embracing innovation (identifying new trends, integration with mainstream programs, pro-active management) and testing and evaluation (rapid application development, clear technology requirements) are key issues of sustainable e-learning.

Ktoridou and Eteokleous (2005) address the technological aspects on their study. According to them, when mobile devices are compared with PC or desktops, mobile devices have advantages in terms of portability, transfer, usability, battery life, time, familiarity and youth lifestyle but have disadvantages in terms of functionality, expansion and upgrade, connectivity and interoperability, connectivity costs and security. Pea and Maldonado (2006) handled seven device features contributing to the rise in handheld use within schools and beyond: (1) size and portability; (2) small screen size; (3) computing power and modular platform; (4) communication ability through wireless and infrared beaming networks; (5) wide range of available multipurpose applications; (6) ready ability to synchronize and back-up with other computers; and (7) stylus driven interface.

Standards and architecture, tools and technologies, and functionality and uses are important factors from the technological view of e-learning (Conole, 2004). Kukulska-Hulme (2007) pointed out that "m-learning activity continues to take place on devices which are not designed for educational use, and that therefore usability issues are frequently reported". He gave some usability issues related to physical attributes as small screen size, heavy weight, inadequate memory and short battery life, network speed and reliability, and physical environment.

 Copyright © International Science and Technology Conference (ISTEC)

Five broad categories of technology must be considered from technological viewpoint of m-learning; these are transport, platform, delivery, media technologies, and development languages (Attewell, 2005). Cobcroft (2006) handled mobile devices, wireless infrastructure, learning management systems (LMS) in his literature review into mobile learning in the university context. Sánchez and his colleagues (2013) investigated the factors that determine the acceptance of the WebCT learning system among students. The factors they investigated are technical support; computer self-efficacy; perceived ease of use; perceived usefulness; attitude; and system usage. The study revealed the importance of the technical support variable. Oinas-Kukkonen and Kurkela, V. (2003), stated that network accessibility is a main advantage of m-learning. So, it can be taken for inspection of its effect on sustainability.

From a technology viewpoint, restrictions that may impede m-learning sustainability as discussed by Maniar and Bennett (2007), include following eight aspects: small screen size and poor screen resolution, lack of data input capability, low storage, low bandwidth; limited processor speed, short battery life, software issues and interoperability, and lack of standardization. There are some technological challenges and limitation for mobile learning, lack of standards is one of them (Grohmann et al., 2005). Georgiev et al. (2006), also examine the technological challenges of transition from e-learning to m-learning in their study in terms of student, educators and developers. According to them, challenges are for developers:

- *less memory, less computing power, smaller screen size, absence (in most cases) of keyboard, etc.*
- *need to know very well all the abilities and downfalls of the particular mobile devices and communication technologies to successfully design and develop a mobile learning system.*

for educators:

- *need to know very well how to operate mobile devices,*
- *need to know what to require from the developers,*
- *need to know what the limits and abilities of such systems are,*
- *need to be also fluent with the modern communications devices used by their students.*

for students:

the different features of mobile devices compared to the personal computers

Mekuria (2009), studied on sustainability factors in mobile broadband technology and services. Some following questions are handled with the study: (1) Which technology is suitable for designing, activating and affordable delivery of relevant mobile broadband services? (2) Which technology provides easy to tools and protocols to create local mobile content and integrate it to the global web knowledge through mobile IP technologies? (3) Which technology has support to alternative energy usage and provides low power network topologies? (4) What is the contribution of such a technology deployment for the long term mobile-ICT development initiative and digital inclusion? (5) Which technology can give the needed spinoff and employment creation through mobile local content and service provision for social and economic development? (6) Which technology and/or combination of technologies, has the inherent capacity for long term industry support and sustainable service provision. (7) Which technology can provide the maximum spectral efficiency for a given licensed frequency area, by a network operator.

THEORETICAL FRAMEWORK AND HYPOTHESES

The sustainability items based on the factors in literature are combined with the items which are obtained from interviews and the factor analyses were applied to the sustainability items in order to group the items under some factors which will be the independent variables (Table 1).

Table 1 Literature-based and Interview-based M-Learning Sustainability Factors

availability of support for system use*	Technical Support for Staff, Instructor and Users
availability of support for connection problems*	
accessibility of support	
effectiveness of support	

*Interview-based sustainability items

After the factor analysis, a theoretical framework was developed to guide the study (Figure 1).

Figure 1 Theoretical Framework

The following hypotheses were established for this study:

H_1: Adequacy of infrastructure and standards will be associated with perceived general technological m-learning sustainability.

H_2: Evaluation and improvements of infrastructure and standards will be associated with perceived general technological m-learning sustainability.

H_3: Technical support for staff, instructors and users will be associated with perceived general technological m-learning sustainability.

H_4: Perceived general technological m-learning sustainability will be associated with perceived general m-learning sustainability.

METHODOLOGY

In this study, the literature was reviewed about current sustainability factors and an investigation was made in order to obtain additional sustainability factors from experts. A formal interview which consists of six predetermined and standardized questions, and comment area conducted with 11 heads or system staffs in distance education centers of universities.

Then, factor analysis was applied to group the items handled from both literature and interview. The items are collected under the titles: “Adequacy of Infrastructure & Standards”, “Evaluation and Improvements of I&S” and “Technical Support for Staff, Instructors and Users”.

In order to obtain data to understand the effects of these factors on technological m-learning sustainability, survey research conducted with system and support staff at distance education centers of universities. First part of the survey includes descriptive items like age and working year in m-learning environment. Another item is for understanding the accessibility to learning system from mobile devices. The second part of the form includes 15 Likert scale items for technological factors, 1 Likert scale item for general technological sustainability and 5 Likert scale items based on the definition of m-learning sustainability in recent study (Coskun-Setirek & Tanrikulu, 2015) for general m-learning sustainability. Totally 75 completed survey forms has been collected and analyzed for understanding the research questions.

RESULTS AND DISCUSSION

As a result of data collection process for technological sustainability issues, 75 valid responses have been collected. For the analyses of the data, descriptive analyses, reliability analyses, factor analyses, multiple regression analyses and linear regression analysis techniques were respectively used.

 Copyright © International Science and Technology Conference (ISTEC)

Descriptive Analysis

In descriptive analysis, age and working year of staffs in mobile learning are analyzed. As shown in Table 2, 52% of the respondents of the survey part about technological issues are 20-30 years old and percentages of respondents whose m-learning experience more than 3 years is 44.

Table 2 Demographic Profile of Respondents

Age		<20	20-30	30-40	40-50	50>	Total
	Frequency	2	39	19	9	6	75
	Percent	2.7	52	25.3	12	8	100
Experience		<1	1-3 year(s)	3-5 years	5>		Total
	Frequency	15	27	18	15		75
	Percent	20.0	36.0	24.0	20.0		100.0

When the mean values of the issues are examined, it can be seen that all of them higher than the average value 3 (shown in Table 3). Each issue has value more than 3.5 except the quality standards with 3.41 mean values. The issues quality standards, requirement specification, expansion and upgrade, and maintenance have low mean values so these issues should be solved to increase the technological sustainability of that aspect. The higher mean values belong to accessibility, interoperability, connectivity, and availability of system use support issues. On the other hand, the value of perceived technological m-learning sustainability, 3.69, is higher than the value of perceived general m-learning sustainability, 3.44. It can be said that technological sustainability is in better condition than other dimension of m-learning.

Table 3 Descriptive Statistics of Variables

Technological Issues	N	Mean
system security	75	3.68
connectivity	75	3.84
accessibility	75	4.19
interoperability	75	3.89
modularity	75	3.63
memory adequacy	75	3.80
quality standards	75	3.41
requirement specification	75	3.53
expansion and upgrade	75	3.55
maintenance	75	3.57
testing	75	3.64
availability of system use support	75	3.88
availability of support for connection problems	75	3.60
accessibility of supports	75	3.68
effectiveness of support	75	3.80
Perceived General Technological M-learning Sustainability	75	3.69
Perceived General M-learning Sustainability	75	3.44

Reliability Analysis

Cronbach's Alpha analysis was used for finding the reliability values of each variable. According to Cronbach's Alpha analysis, as shown by Table 4, the overall value of Cronbach's Alpha was found as .925. According to Kline (2013), the reliability of the scale is quite high since it is more than .9.

Table 4 Reliability Statistics

Cronbach's Alpha	N of Items
.925	21

Factor Analysis

In this section, Exploratory Factor Analysis is used to classify the 15 sustainability aspects into certain groups. The reliability of the scale is high with the .925 Cronbach's alpha value. On the other hand, the subjects-to-

 Copyright © International Science and Technology Conference (ISTEC)

variables ratio should be at least 5 and preferably 10 (Everitt, 1975). Corresponding ratio for this study is 6 and sample size is adequate for the analysis. When we took a rule of thumb into consideration, sample is found to be highly adequate for factor analysis with the .818 Kaiser-Meyer-Olkin Measure value (Table 5) because it is greater than .50 (a rule of thumb). In addition, the significance level of Barlett's Test (.000 as seen in Table 5) is below .001 therefore it is indicating sufficiently large correlations for principal component extraction and this test showed that the data is suitable for analysis.

Table 5 KMO and Bartlett's Test

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.818
Bartlett's Test of Sphericity	Approx. Chi-Square	558.546
	df	105
	Sig.	.000

The Total Variance Explained table (Table 6) shows that 62.157% of the total variance is explained by classifying these 15 aspects into 3 components. Below 50% is interpreted as unsatisfactory by many researchers and 60% or more is preferred as a rule of thumb.

Table 6 Total Variance Explained

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	6.306	42.041	42.041	6.306	42.041	42.041	3.473	23.153	23.153
2	1.633	10.884	52.924	1.633	10.884	52.924	2.995	19.966	43.119
3	1.385	9.233	62.157	1.385	9.233	62.157	2.856	19.039	62.157
4	1.072	7.144	69.302						
5	.837	5.578	74.880						
6	.677	4.512	79.392						
7	.582	3.882	83.274						
8	.526	3.505	86.778						
9	.384	2.559	89.338						
10	.358	2.384	91.721						
11	.350	2.334	94.055						
12	.289	1.925	95.980						
13	.262	1.748	97.728						
14	.189	1.260	98.989						
15	.152	1.011	100.000						

With the Rotated Component Matrix, it can be determined which variables load together under which factor. According to the Rotated Component Matrix (Table 7), 15 aspects were classified into 3 components as specified in theoretical framework of the study. The first group under component 2 was named as "Adequacy of Infrastructure & Standards". The second group under first component was named as "Evaluation and Improvements of Infrastructure & Standards". The last group under component 3 was named as "Technical Support for Staff, Instructors & Users".

Table 7 Rotated Component Matrix

Technological Items	Component		
	1	2	3

effectiveness of support	.199	.193	.735

As a result of the factor analysis, the items and the variables of the study are figured out in Figure 2.

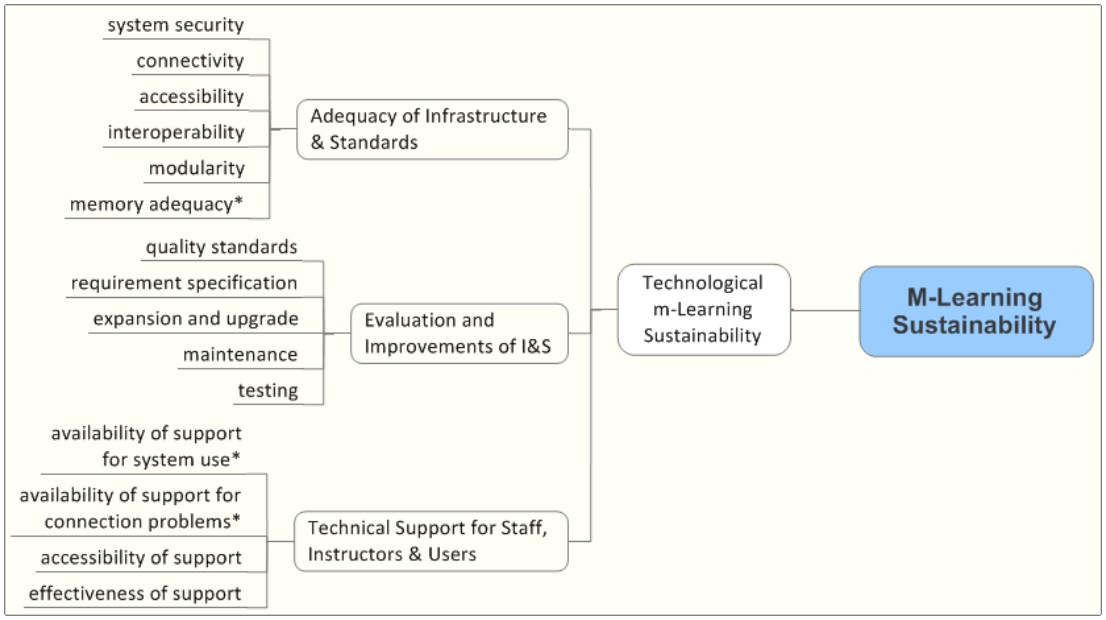

Figure 2 Technological Sustainability Items and Variables

Regression Analyses

For testing hypotheses 1, 2 and 3, a multiple regression analysis was constructed. The three influential variables "adequacy of infrastructure & standards", "evaluation and improvements of infrastructure and standards", and "technical support for staff, instructors and users" were used as independent variables, while perceived general technological m-learning sustainability was used as a dependent variable. The ANOVA table (Table 8) shows that F value of 30.116 having a significance level of 0.000 and the significance value is less than .05.

Table 8 ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	22.368	3	7.456	30.116	.000[a]
	Residual	17.578	71	.248		
	Total	39.947	74			

As seen in Table 9, the adjusted R^2 is .541 and .541 of the variance in the dependent variable is explained by the independent variables. Durbin-Watson value shows that there is 2.001 auto-correlation between the independent variables and it is between desired range of 1.5-2.5. So we can examine the hypotheses and coefficients.

Table 9 Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.748[a]	.560	.541	.498	2.011

a. Predictors: (Constant), adequacy of infrastructure & standards, evaluation and improvements of infrastructure and standards, and technical support for staff, instructors and users

b. Dependent Variable: perceived general technological m-learning sustainability

The results of regression analysis are presented in Coefficient table (Table 10). It shows that P-values of three independent variables are less than .05 and they are considered to have meaningful relationships with perceived general technological m-learning sustainability. Those factors are memory adequacy, investment, expansion and upgrade, and cost effectiveness. Therefore, all variables contribute significantly to the regression equation and hypotheses 1, 2 and 3 are supported by this test. The regression equation is specified as follows: PGTS = .651 + .364 X_1 + .256 X_2 + .272 X_3

Table 10 Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.651	.326		1.998	.050
	adequacy of infrastructure & standards (X_1)	.364	.090	.367	4.064	.000
	evaluation and improvements of infrastructure & standards (X_2)	.256	.088	.271	2.907	.005
	technical support for staff, instructors and users (X_3)	.272	.083	.305	3.261	.002

a. Dependent Variable: Perceived General Technological M-learning Sustainability (PGTS)

For testing hypotheses 4, a linear regression analysis was used. The perceived general technological m-learning sustainability was used as independent variable, while perceived general m-learning sustainability was used as a dependent variable. As shown in ANOVA table (Table 11), F value is 76.475 and it has a significance level of 0.000 which is less than .05.

Table 11 ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	25.827	1	25.827	76.475	.000[a]
	Residual	24.653	73	.338		
	Total	50.480	74			

a. Predictors: (Constant), Perceived General Technological M-learning Sustainability

b. Dependent Variable: Perceived General M-learning Sustainability

As seen in Table 12, R Square is .512 and the adjusted R^2 is .505 and independent variable explains .505 of the variance in the dependent variable. Durbin-Watson value shows that there is 1.769 auto-correlation between the independent variable and the dependent variable, and it is between desired range of 1.5-2.5. Therefore, the hypotheses and coefficients are can be examined.

Table 12 Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.715[a]	.512	.505	.5811326	1.769

a. Predictors: (Constant), Perceived General Technological M-learning Sustainability

b. Dependent Variable: Perceived General M-learning Sustainability

Coefficients table (Table 13) presents the results of regression analysis of the Hypothesis 4. It shows that the P-value is less than .05 and there is a meaningful relationship between the perceived general technological m-learning sustainability perceived and the general technological m-learning sustainability. Therefore hypothesis 4 was also supported by the linear regression test.

Table 13 Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	.470	.346		1.359	.178
	Perceived General Technological M-learning Sustainability	.804	.092	.715	8.745	.000

a. Dependent Variable: Perceived General M-learning Sustainability

The result of regression analyses were given in Table 16. All three issues which are adequacy of infrastructure & standards, evaluation and improvements of infrastructure & standards, and technical support for staff, instructors and users are considered to have meaningful relationships with the technological m-learning sustainability. In addition, there is a meaningful relationship between perceived general technological m-learning sustainability and perceived general technological m-learning sustainability.

Table 14 Result of Regression Analyses

Hypothesis	Factors	Coefficients			
		Beta	t	Sig.	Significant
	TECHNOLOGICAL M-LEARNING SUSTAINABILITY				
1	Adequacy of Infrastructure & Standards	.367	4.064	.000	Yes
2	Evaluation and Improvements of I&S	.271	2.907	.005	Yes
3	Technical Support for Staff, Instructors & Users	.305	3.261	.002	Yes
4	Perceived General Technological M-Learning Sustainability	.715	8.745	.000	Yes

*Significance at .1 levels.

The model for technological sustainability was developed after the analyses (as presented in Figure 3).

Figure 3 The Final Model for M-learning Sustainability

CONCLUSION

In this study, the aims are specifying the current situation of m-learning and identifying factors affect technological sustainability of m-learning.

The descriptive analysis inform about the current situation of the sustainability of m-learning at universities in Turkey. It is observed that quality standards, requirement specification, expansion and upgrade, and maintenance issues have minimum mean values so these issues should improve to increase the technological and general sustainability of that aspect. The maximum mean value belongs to accessibility, interoperability, connectivity, and availability of system use support issues. On the other hand, the value of perceived technological m-learning sustainability, 3.69, is higher than the value of perceived general m-learning sustainability, 3.44. Therefore, it can be said that technological sustainability is in better condition than other dimension of m-learning.

The result of regression analyses show that all three issues which are adequacy of infrastructure & standards, evaluation and improvements of infrastructure & standards, and technical support for staff, instructors and users are related with perceived general technological m-learning sustainability. Moreover, there is a meaningful relationship between perceived general technological m-learning sustainability and perceived general technological m-learning sustainability. Therefore all hypotheses 1, 2, 3, 4 were supported.

 Copyright © International Science and Technology Conference (ISTEC)

The limitation of this study is that the investigation is geographically limited to Turkey. As a recommendation for future research, other dimension of the m-learning sustainability such as pedagogical, managerial, economical, psychological sustainability, etc. can be studied.

TESTS TO INCREASE RETENTION IN FIR WOOD

Şeref KURT[1], Muhammed Nuri GÜNAY[1], Kadir KAYAHAN[2], Hüseyin YÖRÜR[1]

[1]Karabuk University, Faculty of Forestry, Forestry Industry Engineering, 78100, Karabuk/TURKEY

[2]Bartın University, Vocational High School, 74110, Bartın/TURKEY

Abstract: Wood material is a material which uses in almost every area of daily life of mankind, building materials, decoration, landscape studies until even from the cradle to the grave material. Exposed to especially outside weather conditions, despite the fact that in places that are naturally resistant to harmful biotic our species, according to impregnated in this un-impregnated materials the useful life is less than 70-80%. Especially in fast-growing trees that are commercial value, in large distribution area and outdoor use is inevitable application by impregnation. In impregnation power types like spruce and fir, to increase retention amount, -190 °C liquid nitrogen with treatment wood material and then applying pressure impregnation with impregnating increase significantly retention amount.

Keywords: Retention, fir wood, liquid nitrogen

Introduction

In the World and Turkey is rapidly declining forests and therefore become very important to using as efficient and durable of wood materials. One of the most important methods of use as the longevity of the wood is impregnated. Although natural resistance high tree species can survive over many areas of usage for many years, this period differ from in each environment and each tree species.

Impregnated wood materials are resistant to biotic and abiotic harmful, it is also an important building material for economic and aesthetic appearance. In the worldwide, Telecommunication poles, railway sleepers, cooling towers, supports poles, woodwork and exterior siding, roofing, fence posts, greenhouse equipment, sound barriers, highway guardrail, packaging containers, wood materials used in balconies and terraces, garage, city and garden the use of a water soluble preservative place of use such as editing has increased greatly in recent years. Impregnated wood materials with water-soluble wood preservatives are usually not a problem odor, after the impregnation process can be applied to surface treatments of wood materials and the use and handling are included in a more secure material (Kartal, 1998).

For the protection of the wood materials being tested various substances since 2000 years. In this regard, animal, vegetable and mineral oils are utilized. With the beginning of industrialization in Europe, the use of chemicals to protect the wood material has emerged. The results of the research, more than 250 were impregnated material for today. All wood preservatives must be the effect of reducing the surface tension of the wood, holder of the wood fibers feature and deeper penetrate (Bozkurt, 1993).

All tree species are not possible as equal to impregnate. Sometimes, the impregnates are able to penetrate deep in tree species, but it is difficult to penetrate some species (Bozkurt, 1993).

During the impregnation of the wood material occur two physical problems, how to get the air of jamming in the wood cells and how will flow in the cell fluids. In the Impregnations main flow way of Coniferous trees are the tracheids of tracheids and with the aid of bordered pits (Kurt, 2006). The bordered pits play a significant role in penetration into wood materials of impregnates in the coniferous trees (Wardrop, 1961).

Slahor et al., (1997) they conducted by poplar and maple extract on wood, ACQ-B impregnation with the impregnation process, effects on retention amount and penetration of impregnating agent temperature were investigated. According to result, it is determined that the penetration increase significant in statistical terms with rise from 80 °F to 180 °F of ACQ-B temperature.

 Copyright © International Science and Technology Conference (ISTEC)

The purpose of the study, to increase the retention preservatives of some tree species of our country grows and difficult impregnated; before impregnation, in the bordered pit areas expand openings with liquid nitrogen treatment and this method increase amount of the preservatives by more infecting in the wood material.

Materials and Methods
Materials

Fir (*Abies Nordmanniana*) wood was chosen randomly from timber suppliers of Karabuk, Turkey. A special emphasis was put on the selection of the wood material. Accordingly, non-deficient, whole, knotless, normally grown (without zone line, reaction wood, decay, insect or fungal infection) wood materials were selected. As impregnation material was used Tanalith-E.

Methods

Preparation of Experimental Samples

Fir (*Abies Nordmanniana*) wood impregnation was performed according to method full-cell (Bethell) and with ASTM D 1413-07 (2007) standards. 12 % moisture wood samples were put into the impregnation boiler and were pre-vacuum process for a period 60 minutes to 760 mm Hg levels. Liquid nitrogen was added into the boiler and was applied for 30 minutes. In result of this process, prepared impregnation solution was transferred to the boiler and was applied 5 to 6 bar pressure for 60 minutes. After pressure period given the end of the impregnation, it was withdrawn from the boiler to impregnation solution and final vacuum were applied.

The amount ratio of retention *(R,* %) was calculated as follows:

$$R(\%) = \frac{Mdi - Md}{Md} \cdot 100 \qquad (1)$$

R (%) is *Mdi* is the dry mass after impregnation (kg), *Md* is the dry mass before impregnation (kg).

Mechanical Properties

Perpendicular to the fibers bending resistance experiments were performed according to TS 2474 (1976). Bending modulus of elasticity was determined as the TS 2478 (1976). The test samples were prepared as 20x20x320 ± 1 mm.

Results and Discussion

According to the results of retention (Table 1), the highest amount ratio of retention was found in samples exposed to liquid nitrogen in 30 minutes prior to impregnation.

Table 1: The amount ratio of retention in the samples unapplied and applied liquid nitrogen.

Groups	% Retention
Control	2.55 (1.22)[a]
Liquid Nitrogen applied	7.4 (2.16)

[a]The values in parentheses are standard deviation.

To undergo aspiration of the stiffer bordered pit is required larger strength (Comstock, 1968). Due to wood material change in the anatomic structure (bordered pit and cell wall) by treating with liquid nitrogen -196 °C (Physically expands in the volume of the frozen liquids) prior to impregnation, it has significantly increased preservative penetration.

The results of bending strength and bending modulus of elasticity are given in Table 2.

 Copyright © International Science and Technology Conference (ISTEC)

Table 2: The results of bending strength and bending modulus of elasticity in the samples unapplied and applied liquid nitrogen.

Groups	Bending strength (N/mm^2)	Bending modulus of elasticity (N/mm^2)
Control	57.05 (3.44)[a]	4850 (848.53)
Liquid Nitrogen applied	55.44 (7.85)	4070 (1261.11)

[a]The values in parentheses are standard deviation.

According to the results of bending strength found 57.05 N/mm^2 for control samples and 55.44 N/mm^2 for Liquid Nitrogen applied samples and also, the results of bending modulus of elasticity found 4850 N/mm^2 for control samples and 4070 N/mm^2 for Liquid Nitrogen applied samples. It observed to not be statistically significant in samples exposed to liquid nitrogen in 30 minutes prior to impregnation.

Conclusion

In this study, the fir from difficult impregnated wood species was significantly increased in the amount of retention with liquid nitrogen treatment. With the less valuable wood species of difficult impregnated increase in the amount of preservative penetration, it may be used without reduction in mechanical properties against biotic factors in the areas at risk and also, physical life will be more than.

As a result,

1. The amount of retention increase 290 % liquid nitrogen applied samples compared to the control samples.

2. The bending strength and elasticity modulus of bending observe no statistical difference liquid nitrogen applied samples compared to the control samples.

3. The less valuable wood species of difficult impregnated will increase in the amount of retention and, sustainability and preservability of forests will be provided all over the world.

THE CHARACTERISATION OF BIMETAL DISKS USED FOR THERMOSTATIC CONTROL AND OVER-TEMPERATURE PROTECTION

Adem CALISKAN, Adem ONAT
Sakarya University, Vocational School of Sakarya, 54188 SAKARYA - TURKEY

ademc@sakarya.edu.tr, aonat@sakarya.edu.tr

Abstract: In this study, the two-layer bimetal disks used for thermostatic control and over-temperature protection were investigated for the effects of the shaping procedure and heat treatments on the instantaneous specific deflection of the temperature range.

A parametric study was carried out in which several mechanical disc shaping procedure and several heat treatments on differences in accuracy of switching temperatures were considered. As a result of this study, a simple thermo-mechanical shaping procedure was discovered for the accuracy of specific working temperature range. Also digital switching action was obtained for transducer used for thermostatic control and over-temperature protection.

Keywords: Bimetal, Thermostatic Bimetal, Thermostatic Control, Instantaneous Specific Deflection, Thermo-Mechanical Shaping.

Introduction

Thermostatic Bimetal is a composite material, made up of two or more metallic layers having different coefficients of expansion. When permanently bonded together, these layers cause the material to change its curvature when subjected to a change in temperature (Khadkikar 1993). This change of curvature, or bending, in response to temperature change, (flexivity), is a fundamental property of all Thermostatic Bimetals (Freyang 1996)

Thermostatic bimetal components both simple and complex are at the heart of numerous measuring instruments, regulation systems and safety devices. In heating and sanitary equipment, in electrical engineering systems and domestic appliances, in motor protectors, automobile fan controls, and as temperature compensators in television sets, and wherever a device must react to changes in temperature (Kantal 2008).

The uses of thermostatic bimetal components fall into four general classifications as follows (Howard 1942):

- Temperature Indication
- Temperature Control
- Control of function with temperature change over a range of temperature
- Control of function by auxiliary heating of the bimetal

The shapes of bimetallic elements vary depending on the application and include beams, disks, spiral helices, and U-shaped elements. Straight strips are the commonest form of bimetals, being the simplest and cheapest. When the available space is limited, a U shape can be employed. Spiral and helical bimetals convert temperature changes into a rotational movement or torque when the displacement is impeded. A spiral shape enables a large length of bimetal to be incorporated into a small volume, producing high sensitivity, limited only by strength considerations beyond a certain length. Bimetallic discs (shallow shells) reverse suddenly at a critical temperature which depends on the grade of bimetal employed and the geometry. They are used in numerous regulation devices and protection systems (Ziga 2013).

Thin and shallow bimetallic shells with suitable material and geometric properties have the characteristic of snapping-through into a new equilibrium position at a certain temperature. The result of such a fast snap-through of a bimetallic shell, acting as a switching element in a thermal switch, is the instantaneous shutdown of electric power and the machine (Henry 1972) The snap-through of the bimetallic shell is a dynamic occurrence that lasts a very short time and as such prevents the damaging sparking and melting of electric contacts and extends the life time of the thermal switch (Jakomin 2011)

A thermostatic bimetal shallow shells are constructed from a laminated composite of metals with different thermal expansion coefficients. They deform with changes in temperature (Kosel 2007). At least one bimetallic shallow shell is used in each device; however, there are some controls that use three of them. The bimetallic shallow shell

 Copyright © International Science and Technology Conference (ISTEC)

performs a snap action at defined temperatures and produces enough force to open or close electrical contacts. The temperature at which a bimetallic shallow shell "snaps through" on heating is called the "break temperature" and the temperature at which it "snaps back" on cooling is called "remake temperature".

Bimetallic shallow shells have been developed by purely empirical means. A great deal of experimentation has been carried out over the past decade to improve performance, and the improvements have been remarkable (Batista 2007).

It has been said that "Bimetallic shallow shells lend themselves poorly to calculation. They are designed empirically, based largely on experience. More than any other form of bimetal, they require starting materials whose physical and mechanical properties are precise and uniform, with small thickness variations, and excellent surface quality and flatness" (Trostel 1996).

At low temperatures, bimetallic shallow shells have a concave shape which then snaps to a convex shape at high great enough to activate a switch or make an electrical contact mechanically. As is common in discontinuous phase changes, shallow shells show considerable hysteresis behaviour (Figure 1). With adequate materials and correct shaping, the lower and upper snap temperatures, TLS and TUS, respectively, can be adjusted within a wide range.

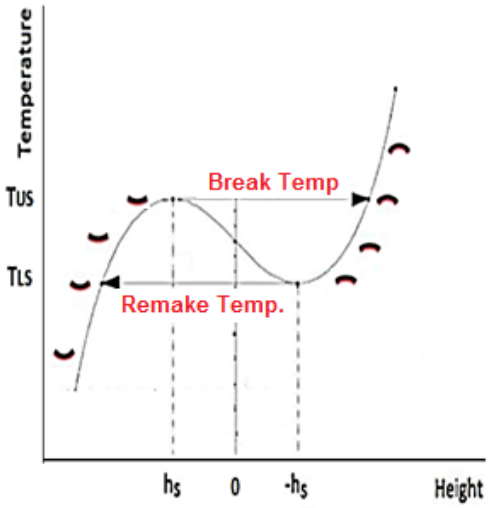

Figure 1. Qualitative characteristic of thermo-bimetal-snap disc.
The active steel layer is black and the passive invar layer is red (Ziga 2013)

The performance characteristics of the snap action disc are determined by a number of variables. These can be broadly classified into two groups: geometry and material variables. In order to optimise bimetallic shallow shell performance, it is necessary to define and understand these variables and identify the relative importance of each variable. Bimetallic shallow shell characteristics and variables are very specific, so the data about them cannot be easily found in literature. So, the effects of the shaping procedure and heat treatments of snap action disc on the instantaneous specific deflection of the temperature range will be investigated in this study.

Materials and Methods

In this study, manufacturing and calibration studies of the transducer using to control automotive engine temperature range to run on 86-94°C were performed. For this purpose, the test unit shown in Figure 2, was carried out design and production. The test unit is designed to simultaneously perform the control of 10 transducers and continuous stirring was applied to homogenize the oil temperature. At the same time the oil temperature is kept under control in the middle level of the oil in the tank by a precision thermometer.

 Copyright © International Science and Technology Conference (ISTEC)

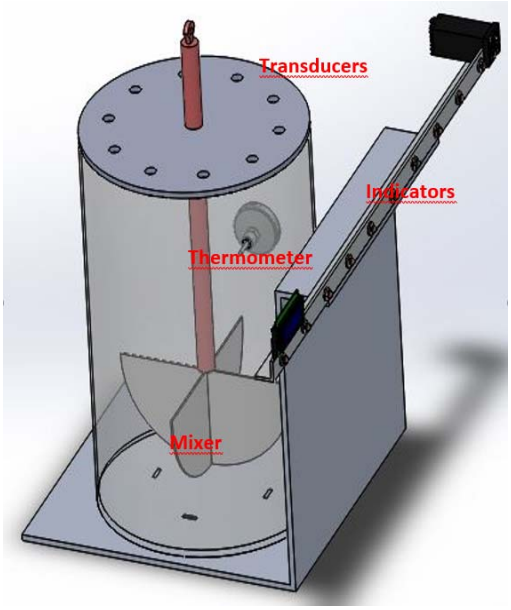

Figure 2. Test unit used in experimental studies.

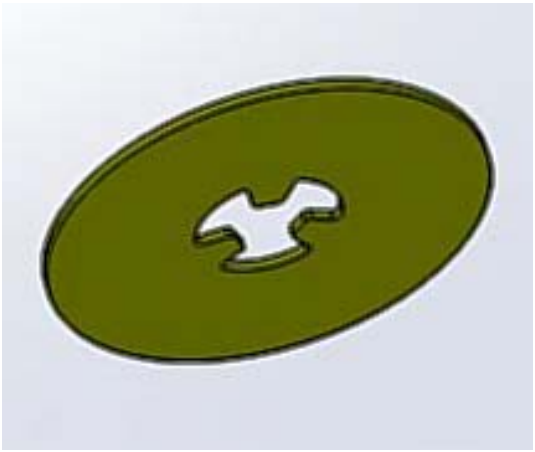
A commercial bimetal strip was used for the manufacture of transducers. General properties of bimetal strip were given Table 1. The strip of bimetal material has a 0.2 mm thick and 25 mm wide was die cutted primarily in the form of a disk has a diameter 12.7 mm. Then, a hole has a diameter of 2 mm was die cutted to make it suitable for installation in disk from the centre as shown in Figure 3.

Table 1. The general properties of bimetal strip, used for manufacturing transducers

ASTM Type	TM2
High Expansion Alloy	Alloy P (72%Mn, 18%Cu, 10% Ni)
Low Expansion Alloy	Alloy 10 (36%Ni, Balance Fe)
Thickness	0,20 mm
Density	7.61 g/cm^3
Useful Deflection Temperature Range	-70 - 260 °C
Recommended Max. Temperature	430 °C
Specific Curvature (10-93°C)	39.1 x10^{-6} (mm/mm)/°C (Tolerance ±4%)
Specific Deflection	20.6 x10^{-6} (mm/mm)/ºC



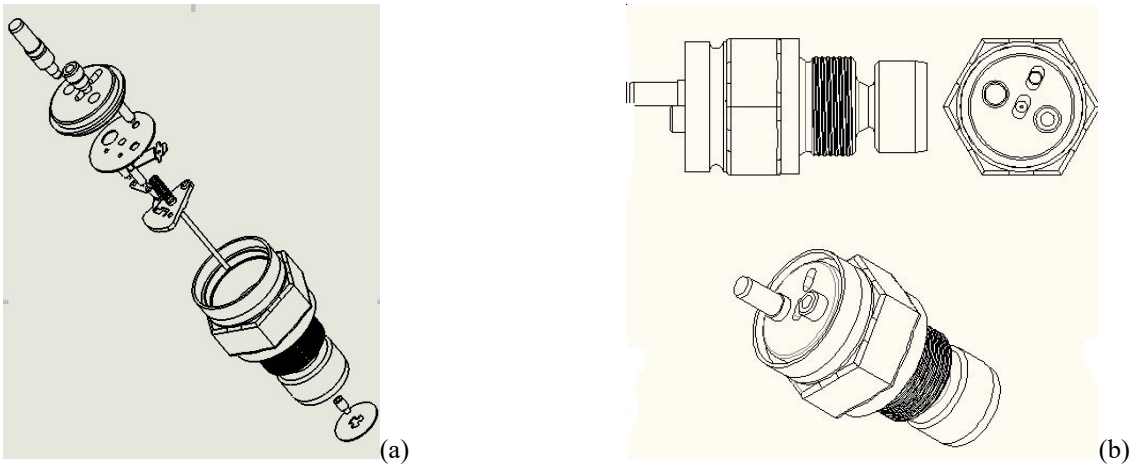


Figure 3. The schematic of the bimetal disc was die cutted for transducers

The parts of the engine temperature transducer (Figure 4a) and mounted transducers are shown in Figure 4b. The test unit was calibrated for the desired temperature range. The average values of every 10 measurements obtained from each transducer.

Results and Discussion

The performance of a particular bimetallic shallow shell can be summarized by the following process and material characteristics (Ziga 2013):

- Break temperature
- Remake temperature
- Force produced on snap through
- Shells life
- Temperature spread
- Specific thermal curvature of shell material

The break temperature (**The Upper Snap Temperature)** is the temperature at which a bimetallic shallow shell snaps from a concave to convex shape while being heated.

The remake temperature (**The Lower Snap Temperature)** is the temperature at which a bimetallic shallow shell snaps back from convex (broken shape) to concave shape while the blade is being cooled (Figure1). The difference between the break and the remake temperature is known as the "differential"

The test results of commercial bimetal strip used in transducers, the lower and upper snap temperatures, TLS and TUS, respectively, were given Table 2.

Table 2. Test results obtained from flat bimetal discs

Transducer	The Lower Snap Temperature (T_{LS}) (86±1ºC)	The Upper Snap Temperature (T_{US}) (94±1ºC)
S101	84.0	89.0
S102	83.0	88.9
S103	78.6	92.0
S104	84.0	90.0
S105	83.0	91.0
S106	87.0	98.5
S107	78.7	97.2
S108	92.8	95.4
S109	86.0	91.0
S110	86.0	98.0

Due to lack of the desired range of test results for the upper snap temperature and the most of the results are out of tolerance limit for the lower snap temperature, it was decided to form bimetal disc a shallow shell given in Figure 5. For this purpose, the bimetallic discs were loaded by a 3 MPa bending stress within 3 s to achieve desired shape has 0.50 mm height and 5º bending curvature.

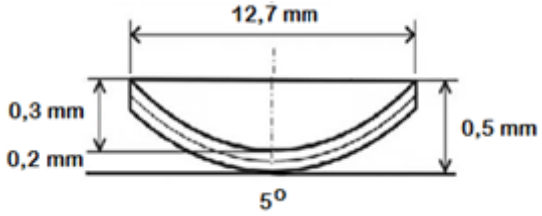

Figure 5. The schematic of the mechanically shaped bimetal shallow shell

After installation of transducers made of this shaped bimetal shallow shell were experimented in test unit. Obtained test result can be seen in Table 3.

Table 3. Test results obtained from pre-shaped bimetal shallow shell

Transducer	The Lower Snap Temperature (T_{LS}) (86±1°C)	The Upper Snap Temperature (T_{US}) (94±1°C)
S201	86.7	98.2
S202	87.6	91.5
S203	87.9	94.7
S204	87.5	91.0
S205	81.3	95.2
S206	82.0	95.4
S207	92.0	94.5
S208	89.5	89.6
S209	86.5	97.8
S210	85.6	93.5

Again because of the experimental results are not within the range to satisfy, it was decided to perform thermo-mechanical treatments to bimetal shallow shells. For this purpose, preformed discs heated to 350°C in a furnace then cooled in a stagnant air. After installation of transducers made of this shaped bimetal shallow shell were experimented in test unit. Obtained test result can be seen in Table 4.

Table 4. Test results obtained from preformed discs heated to 350°C in a furnace then cooled in a stagnant air.

Transducer	The Lower Snap Temperature (T_{LS}) (86±1°C)	The Upper Snap Temperature (T_{US}) (94±1°C)
S301	86.7	98.3
S302	88.0	92.0
S303	88.0	94.2
S304	87.3	91.5
S305	87.0	96.3
S306	82.4	96.3
S307	88.6	93.5
S308	86.7	90.0
S309	86.1	94.7
S310	86.2	94.9

Most of the experimental results are not within the tolerance limit, it was decided modify thermo-mechanical treatments. Firstly, preformed discs were heated to 350°C in a furnace then cooled immediately to -30°C. Then, discs were heated to 160°C in a furnace then cooled immediately to -30°C. This process was repeated 3 times. Obtained test result, after installation of transducers made of this shaped bimetal shallow shell were experimented in test unit, can be seen in Table 5.

S406	87.6	90.3
S407	86.7	89.8
S408	87.4	97.2
S409	85.6	95.0
S410	86.5	92.8

Again these experimental results are not within the range to satisfy, it was concluded that the angle of curvature on the bimetal disc is insufficient. To increase bending curvature and achieve the shape has 0.60 mm height, the bimetallic discs were loaded by a 3 MPa bending stress within 3 s (Figure 6).

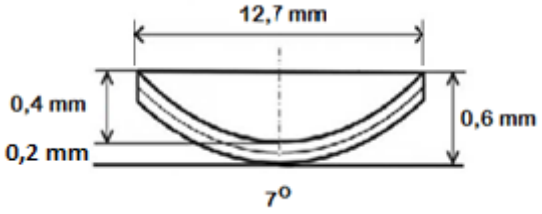

Figure 6. The schematic of the mechanically shaped bimetal shallow shell

After mechanical shaping, discs were heated to 350°C in a furnace then cooled immediately to -30°C. Then, discs were heated to 160°C in a furnace then cooled immediately to -30°C. This process was repeated 3 times. Obtained test result, after installation of transducers made of this shaped bimetal shallow shell were experimented in test unit, can be seen in Table 6.

Table 6. Test results obtained from the discs have 0.60 mm height and were heated to 350°C in a furnace then cooled immediately to -30°C. Then, discs were heated to 160°C in a furnace then cooled immediately to -30°C. (Repeated 3 times)

Transducer	The Lower Snap Temperature (T_{LS}) (86±1°C)		The Upper Snap Temperature (T_{US}) (94±1°C)	
	#10 repetitions	#50 repetitions	#10 repetitions	#50 repetitions
S501	86.0	85.1	94.0	93.5
S502	86.0	86.2	94.0	95.3
S503	86.0	86.7	94.0	94.0

S507	86.0	87.1	94.0	93.6
S508	86.0	86.3	94.0	94.0
S509	86.0	86.0	94.0	94.5
S510	86.0	86.1	94.0	94.8

All transducers work at unique snap temperature. But as repetitions increase deflections from snap temperature increase. The life time of bimetallic shallow shells depends on repeatability and fatigue failure. The repeatability of bimetallic shallow shell performance characteristics under cyclic condition are of vital importance. If some significant deviation of any of these characteristics occur then appliances may not operate safely. After a sufficient number of cycles, bimetallic shallow shells will eventually fail due to fatigue. Premature failure of a bimetallic shallow shell could result in an unsafe appliance. Functional tests on controls and appliances are carried out as a matter of course to ensure the bimetallic shallow shells have sufficient fatigue life. These tests are also required to obtain necessary safety approvals for both controls and appliances.

 Copyright © International Science and Technology Conference (ISTEC)

In order to accurate exact snap temperature action for 100 recapitulate without any fatigue deflection, we decided to perform mechanical shaping process is repeated twice then the details of heat treatment mentioned above was applied. Obtained test result can be seen in Table 7.

Table 7. Test results obtained from the sample discs shaped twice by mechanically shaping process and heat treated by above procedure

Transducer	The Lower Snap Temperature (T_{LS}) (86±1°C)		The Upper Snap Temperature (T_{US}) (94±1°C)	
	#10 repetitions	#100 repetitions	#10 repetitions	#100 repetitions
S601	86.0	86.0	94.0	94.0
S602	86.0	86.0	94.0	94.0
S603	86.0	86.0	94.0	94.0
S604	86.0	86.0	94.0	94.0
S605	86.0	86.0	94.0	94.0
S606	86.0	86.0	94.0	94.0
S607	86.0	86.0	94.0	94.0
S608	86.0	86.0	94.0	94.0
S609	86.0	86.0	94.0	94.0
S610	86.0	86.0	94.0	94.0

Even after 100 repetitions no fatigue deflection was observed at any transducers. So we assured the digital behaviour for exact snap temperature and for all transducers.

Conclusion

The unique property of flexivity that characterizes thermostatic bimetals allows these materials not only to sense the temperature but also to control it by making or breaking an electrical circuit. Although the design of a thermostatic bimetal primarily depends upon the expansion characteristics of the components, resistivity is also critical in some applications. In addition, the strength and fatigue properties, interface integrity, and residual stresses play a major role in determining the behaviour of thermostatic bimetal elements.

The characteristic properties of transducers using thermostatic bimetal materials depend of mechanical shaping and heat treatments as well as materials properties. In this study, the digital switching action behaviour for exact snap temperature were assured by way of residual stress control with the application of unique mechanical shaping process and thermal treatment to stabilize the mechanical properties.

Abstract: In this study, the color preferences of consumers were studied on the most applied three finishing types on the furniture surfaces. These are transparent finishing, staining, and opaque painting. In this direction, it was targeted to set forth the color preferences, which would be the basis for the user-oriented design applications. A personal interview survey was prepared for gathering data for this study. Some questions took place in the survey to determine color and finishing type preferences of consumers according to their different demographic and economic characteristics. It was contacted with a total of 479 consumers with the random sampling method. The consumers were potential furniture buyers and living in the central counties of Ankara, Turkey. The data collected by the survey were analyzed statistically and the results were interpreted. In conclusion, the color and finishing type preferences of the consumers on furniture surfaces show a variation according to demographic characteristics, such as age, gender, marital status, educational level and income level.

Keywords: Color preference, furniture design, consumer preferences, marketing, surface finishing

Introduction

Economic factors (income level, general economic situation, and financial structure), social factors (culture and sub-culture, social class, reference groups, roles and family), psychological factors (motivation, perception, attitudes, learning and personality) and personal factors (demographic and situational) are influential in the purchasing decisions of the consumers. Individuals expect a number of differences in product according to their characteristics, which stem from these variables. In connection with this, every product should be designed in a manner that would answer these expectations of the consumers. Product characteristics requiring differentiation related to furniture are functionality, reliability, durability and safety, led by being aesthetic. It is necessary to dwell upon the aesthetic characteristics, such as functionality, form, balance-proportion and texture, led by color, in order to be able to harmonize the characteristics of the product to the expectations of the consumers in the differentiation of products.

Selection, arrangement and application of color affect to the appearance of the furniture and add a meaning to the furniture, in general to the space where the furniture is used. There are meanings, such as vigor, warmth, coolness, mobility, tranquility, contentment, giving trust, peace, cleanliness, purity, etc. in the colors applied to space or furnishings, such as furniture. Furniture users are affected by this meaning, whether or not they are aware of it. Furthermore, there are differences in the color preferences according to the structural characteristics of the furniture users.

It is impossible to avoid the mutual influence of color and people, since every product and every space where these products would be placed would definitely be colored. For this reason, the colors of the spaces and furnishings should be suitable to the function of the space, the psychology of people and to the preferences of the people using these spaces. When the coloring of the furniture is viewed from this aspect, then whether or not the standard furniture should be "single-colored or multi-colored" and "which one of this color or colors would be used" confronts us as a very important problem that should be solved. Because according to the color preference of the consumers, different colors of the same model are sold in different quantities and an excessive production of a furniture with a color that is preferred less and offered on the market causes an increase in the levels of stock and consequently in costs.

Different finishing applications on the furniture surfaces, such as transparent finishing, staining, and opaque painting are also influential on the preferences of the consumers. The same consumer who likes a color in one type

 Copyright © International Science and Technology Conference (ISTEC)

of finishing may not like it on a different finishing type. For this reason, the determination of color preferences according to the technique of finishing is also very important, especially for the enterprises producing standard furniture. The differences in color preferences are encountered in every kind of product produced for people, not only for furniture or furnishings. For this reason, the expectations of the consumers from the aspect of color in different products and spaces are determined and studies are being made on color preferences.

A color preference test aimed at the importance of color in clothing related to the uniforms of nurses was applied with a specially designed color placard to 50 children in the 4-6 years of age group, who were being treated in a hospital and the color preferences of the children in this age group were studied (Lin, et. al., 1997). The characteristics of every product in international circulation should be adapted to the cultural structure of the country to which it is sent. In a study aimed at the place and influence of color in the movie sector, the necessity of the colors of the movies produced in the United States being in conformance with the color preferences of the country to which they were circulated was stressed. Otherwise, the movie may not reach the envisaged sales volume with a drop in ticket sales (Lee, 2001). According to a study made on 123 university students in Ankara on the color preferences of university students, colors having the maximum intensity and brightness were preferred more. The ground-color is unimportant and blue is the most preferred color (Camgoz, et. al., 2002). According to a study made on British and Chinese test subjects related to their color perceptions, such as the warmth or coldness, lightness or darkness, modernity or classicalness of colors, there is not a significant difference in the perception of colors between men and women. However, there is a difference among the perceptions on the basis of countries. Some color perceptions (for example, warm-cold), show cultural independence (Ou, et. al., 2004). Furthermore, four principles are influential in the color preferences based on folklore and tradition. These are forming contrast, the fact that the color is used somewhere else, common preference and availability (Hutchings, 2004). Regional preferences are of extreme importance in the color selection in production based on international trade. The globalization of color selections and color trends first of all facilitates the activities of the companies working on painting and textile manufacturers. However, in every situation, the ethnicity and regional cultures are influential on color preferences (Roberts, 2002). The preferences of university students were studied by putting upper colors having a different tone, intensity and brightness on six ground colors having a maximum intensity and maximum brightness value. Completely intense and bright upper colors on completely intense and bright ground colors are still preferred. Blue is the most preferred color when the ground colors are not taken into consideration (Camgoz and Yener, 2001). According to another study in which the characteristics of preference of the colors applied in different areas were studied, a color that could be defined as being beautiful, select or warm on a chip, does not have the beauty, selectness or warmth as on the chip when it is applied to a cup, t-shirt, sofa or car. In this situation, it is incorrect to apply a color, which is preferred on any product, to another product to create the same effect (Lee, 2001). The effects colors make on people at different light levels and different lighting methods could change. Any product on which any color is applied in a production environment could assume any tone of that color connected to the light in the environment when it is brought to the place of usage. Sometimes this can reach an effect, which does not please the user. For this reason, it is necessary to study the effect of any color in different lighting environments prior to its application on the product and to apply to the product the color tones, which are suitable to the preference of the user (Leta, et. al., 2002). The lighting system used in a space not only affects the visual comfort of those living in that space connected to the concentration of light, it also affects the physiology and psychology of those people. Furthermore, the lighting design of a space should always be treated together with the coloring of the walls, floors and ceilings of that space. Besides this, the colors of the other furnishings, led by furniture, are also important for reflecting the light and the effect set forth is influential on the psychology of people (So and Leung, 1998). The finishing processes applied on the furniture surfaces are in seventh place among the eighteen factors, which are influential on furniture preferences. According to this, color is an important factor in the decision to purchase furniture (Karki, 2000).

As can be seen from the studies mentioned above, the colors applied on the product surfaces are extremely influential on the consumer preferences and on the decisions for purchasing. Accordingly, in this study, the finishing type and color preferences according to demographic characteristics of the consumers have been studied on furniture colored with different finishing types.

Materials and Methods

This study was planned in order to obtain the color preferences of consumers which shall form a basis for the consumer focused design applications.

A survey was conducted with the objective of setting forth the color preferences of the users with different demographic characteristics. Differently finished furniture surfaces were used in the evaluation of these color preferences. The data for potential furniture consumers were gathered from data collection form.

 Copyright © International Science and Technology Conference (ISTEC)

The data collection form was composed of two parts: In the first part, questions aimed at determining some demographic characteristics of the furniture users, such as gender, marital status, age, educational level, profession, monthly family income and the number of individuals in the family. For the second part of the survey, the finishing applied on furniture with the objective of coloring was collected in three groups:

i. Transparent finishing: In this finishing technique, transparent finishes are used to protect the natural color and grain of wood. Finishes enhance the natural beauty of wood, protect it from excessive wear and abrasion, and make the surfaces easier to clean.
ii. Staining: Staining is extremely important to color harmony of furniture. Changing the kind and color of stain will make the same wood appear entirely different. For example, dark-red stain has been widely used in traditional mahogany furniture. Many people even today think of mahogany as a dark-colored wood. Actually, much contemporary mahogany furniture is light, honey-toned brown. Stains can also be used to make a less expensive wood look like a costly one. Gum, for example, is often stained to imitate mahogany (Feirer, 1970).
iii. Opaque (obscure) painting: In this kind of finishing, finishes totally obscures the wood grain with a coating and achieves a particular color decor.

Visual samples, on which these three finishing type have been applied, were prepared for participants to understand the questions of the survey more accurately. Those samples were shown to the participants at the moment of interviewing. The questions in the second group have been developed to determine the effect of the demographic characteristics on the finishing and color preferences of subjects.

As the area of sampling, 6 central counties (Altındağ, Çankaya, Keçiören, Mamak, Sincan, Yenimahalle) of Ankara Province in Turkey was selected due to the fact that it is the second largest province from the aspect of population density and due to the fact that it has people from all segments of the society because of migration. The set of participants were constituted from the potential furniture buyers visiting the furniture stores. Interviews were conducted on the first 5-person who came to a store in a street of the sampling and accepted to participate in the interview on Saturdays between the hours 10:00 and 18:00. After then, the interviewers passed through a new store by going ahead in clock wise direction on the street to interview with a new group of 5-person. It was interviewed with totally 479 potential furniture buyers selected from the samples environment. The data were obtained by 7 interviewers informed about the data collection forms. It was asked to the participants the question "Are the finishing type and color on furniture, important for you and if important, to choose their three favorite finishings and colors graded as the first, second and third." Numbers of participants according to the counties are given in Table 1.

Table 1. Number of participants according to the counties.

County	Number of Participants	County	Number of Subject
Altındağ	58	Sincan	42
Çankaya	128	Yenimahalle	90
Mamak	67	Keçiören	94
Total	***253***	***Total***	***226***
		Grand Total	***479***

The data were coded in Statistical Package for the Social Sciences (SPSS 17.0) for windows, and evaluated in frequencies, percentages and chi-square (X^2) analysis. Some of the demographic characteristics of the participants are given in Table 2.

Table 2. Some demographic characteristics of the participants.

Consumer Characteristics	N	%	Consumer Characteristics	N	%	Consumer Characteristics	N	%
Age			**Educational Level**			**Monthly Income (US$)**		
Less than 25 years of age	119	24.8	Primary School	55	11.5	Less than US$380	108	22.5
Between 25-35 years of age	183	38.2	High School	167	34.8	Between US$381-635	208	43.4
Between 36-45 years of age	97	20.3	Under Graduate	257	53.7	More than US$636	163	34.1

Results and Discussion

In this section, the finishing type and the color preferences of the participants were evaluated according to their demographic characteristics, and the findings were given in tables. The existences of statistical relationship between the participant's preferences and various demographic characteristics of the groups were analyzed by using the chi-square(X^2) analysis. The relations among the variables were statistically analyzed and the results were interpreted. The tables, showing there was no relation between the variables, were not included in the text.

The Type of Surface Finishings and the Color Preferences Related to These Types of Surface Finishings

When the color preferences according to the type of surface finishings of the consumers are analyzed without taking into consideration any consumer characteristics and order of preference, it was observed that the brown color group of wood on the furniture with transparent finishing was the most preferred group with a share of 29.7% and this was followed with the red color group with a share of 25.3% and with the black color group with a share of 22.1%. Brown and its tones are the most preferred color type with a share of 24.7% on the furniture applied staining. These color preferences are followed by red and its tones with a share of 17.1% and with yellow and its tones with a share of 13.9%. On the furniture surfaces coated with opaque paints, brown is the most preferred color with a share of 24.9% and this is followed by blue and its tones with a share of 20.4% and by red and its tones with a share of 18.7% (Table 3).

There does not appear to be a significant difference in the general color preference tendencies in case any of the consumer characteristics are not taken into consideration, but the color preferences according to the finishing type are taken into consideration. On the furniture surfaces coated with transparent finishes, the brown color group wood types were in the forefront in all of the preferences in first, second and third places with 35.3%, 29.0% and 24.8%, respectively. On the furniture applied staining, brown and its tones were the colors preferred the most at 51.4% and this was followed by red and its tones at 23.0% and blue and its tones at 19.8%. On the furniture with opaque painting, the same order of preference emerges with different percentages. In this type of furniture as well, brown and its tones are the colors preferred the most at 44.9%, red and its tones are in second place at 23.2% and blue and its tones are in third place at 25.9% (Table 3).

Table 3. Color preferences of the consumers on the furniture according to the type of surface finishing and according to the order of preferences

Colors According to the Type of Surface Finishing		Order of Preference							
		First		Second		Third		Total	
		N	%	N	%	N	%	N	%

Note: The percentages of the columns were taken.

The Effects of the Demographic Characteristics on Consumer Color Preferences
The Effect of Age on Color Preferences on the Furniture Applied Transparent Finishing

The brown color group woods are preferred the most in all of the age groups when the general color preference tendencies are considered on the furniture surfaces coated with transparent finishing applications of the age groups separated as those who are younger than 25 years of age, those who are between 25-35 years of age, those who are

 Copyright © International Science and Technology Conference (ISTEC)

between 36-45 years of age and those who are older than 45 years of age. The type preferred in second place from the aspect of color is the brown color group in those who are younger than 25 years of age and in those who are between 36-45 years of age and the red color group is preferred by those who are between 25-35 years of age and those who are older than 45 years of age. From the aspect of third preference, the yellow color group of wood type is preferred the most by those who are younger than 25 years of age, the brown color group of wood type is preferred the most by those who are between 25-35 years of age and the red color group wood type is preferred the most by those who are 36 years of age and older.

A significant difference was not found ($p>0.05$) among the color preferences according to age groups in the first and second preferences related to the furniture with transparent finishing and a significant difference was found ($p=0.028<0.05$) for the third preferences (Table 4). According to this, age was found to be ineffective in the first and second preferences on color preference on the furniture surfaces coated with transparent finishes and was found to be effective in the third preferences.

Table 4. The color (wood type) preferences according to age on the furniture applied transparent finishing

Age	Order of Pref.	White Color Group Wood		Yellow Color Group Wood		Brown Color Group Wood		Red Color Group Wood		Black Color Group Wood		Total	Results

The Effects of Age on Color Preferences on the Furniture Applied Staining

Brown and its tones are in the forefront as first preferences in all of the age groups at 48.7%, 53.6%, 50.5% and 51.3%, respectively, when the color preferences according to age on the furniture applied staining are analyzed. In the second preferences, red and its tones are in the forefront up to 45 years of age at 19.3%, 29.0% and 21.6%, respectively, and black and its tones are the second preferences of those older than 45 years of age. In the third preferences, white and red colors and their tones are preferred by those who are younger than 25 years of age at 18.5%, red and its tones are preferred by those between 25-35 years of age at 20.8% and blue and its tones are preferred by those between 36-45 years of age at 22.7% and by those older than 45 years of age at 25.0% (Table 5).

Table 5. Color preferences according to age on the furniture applied staining.

Age	Order of Pref.	White and its Tones		Yellow and its Tones		Black and its Tones		Red and its Tones		Blue and its Tones		Brown and its Tones		Green and its Tones		Two Compat-ible Colors		Total	Results

A significant difference was not found (p>0.05) among the color preferences according to age groups in the first and second preferences but a significant difference was found (p=0.007<0.05) in the third preferences (Table 5). In this situation, age was ineffective for the first and second preferences on the furniture applied staining and age was an effective factor for the third preferences.

The Effect of Age on the Color Preferences on the furniture Applied Opaque Painting

Brown and its tones were also the most preferred colors in all of the age groups on furniture surfaces on which opaque painting were applied at 42.9%, 45.4%, 45.3% and 46.3%, respectively. The distribution was not homogeneous in the second preferences. Those younger than 25 years of age and those older than 45 years of age preferred red and its tones in their second preferences, those between 25-35 years of age preferred blue and its tones and those between 35-45 years of age preferred yellow and its tones. As a third preference, those who are younger than 25 years of age preferred red and its tones at 22.7%, those older than 45 years of age preferred yellow and its tones at 22.5% and those in all of the other age groups preferred blue and its tones at 27.9%, 36.1% and 22.5%, respectively.

For all of the orders of preference on the furniture applied opaque painting, there was not a significant statistical difference (p>0.05) among the color preferences according to age groups. In this situation, it appears that age is not an effective factor on the color preferences on the furniture applied opaque painting.

The Effect of Gender on Color Preferences
The Effect of Gender on Color Preferences on the Furniture Applied Transparent Finishing

The brown color group wood was preferred by males at 36.3% and by females at 34.4% as their primary preferences when the color preferences of the consumers according to the gender are considered on furniture surfaces on which the transparent finishing was applied. As their second preferences, males preferred the red color group wood at 29.2% and females preferred the brown color group wood at 30.0%. As their third preferences, males preferred the red color group wood at 26.9% and females preferred the brown color group wood at 25.5% (Table 6).

In the statistical analysis made for determining whether or not gender was effective in color preferences on the furniture applied transparent finishing, it was determined that for all of the order of preferences, the differences between the color preferences of males and females were insignificant (p>0.05) (Table 6) and it was observed that gender is not a significant factor in color preferences.

Table 6. Color preferences according to gender on the furniture applied transparent finishing

Gender	Order of Pref.	White Color Group Wood		Yellow Color Group Wood		Brown Color Group Wood		Red Color Group Wood		Black Color Group Wood		Total	Results		
		N	%	N	%	N	%	N	%	N	%	N	x^2	SD	P
Male	1	13	6.1	17	8.1	**77**	**36.3**	56	26.4	49	23.1	212	8,691	4	0.069
Female		35	13.1	29	10.8	**92**	**34.5**	56	21.0	55	20.6	267

Female		23	8.6	40	15.0	**80**	**30.0**	73	27.3	51	19.1	267			
Male	3	23	10.8	31	14.6	51	24.1	**57**	**26.9**	50	23.6	212	3,494	4	0.479
Female		23	8.6	53	19.8	**68**	**25.5**	60	22.5	63	23.6	267			

1: First Preference, 2: Second Preference, 3: Third Preference. Note: The percentages of the rows were taken.

The Effect of Gender on Color Preferences on the Furniture Applied Staining

Brown and its tones were still the most preferred color at 46.3% in males and at 55.4% in females when the first preferences are taken into consideration. For the second preferences males and females preferred red and its tones at 23.6% and 22.5%, respectively. For the third preferences males and females preferred blue and its tones at 21.2% and 18.7%, respectively.

The differences among the color preferences according to gender in all the order of preferences are insignificant (p>0.05). According to this, gender is insignificant in the color preferences on the furniture applied staining.

 Copyright © International Science and Technology Conference (ISTEC)

The Effect of Gender on Color Preferences on the Furniture Applied Opaque Painting

The color preferences on the furniture applied opaque painting are given in Table 7. According to this, it appears that brown and its tones are the first preference for males and females at 37.7% and 50.6%, respectively. Blue and its tones are the second preference of males at 24.1% and red and its tones are the second preference of females at 24.3%. Blue and its tones are the third preference of males at 26.9% and of females at 25.1%.

According to the data obtained at the end of the statistical analysis, there is a significant difference among the color preferences according to gender in the first preferences ($p=0.023<0.05$) and the differences for the second and third preferences were found to be insignificant ($p>0.05$) (Table 7). According to this, gender is an effective factor on the color preferences on the furniture surfaces applied opaque painting.

Table 7. Color preferences according to gender on the furniture applied opaque painting

Gender	Order of Pref.	Black and its Tones		Green and its Tones		Red and its Tones		Blue and its Tones		Brown and its Tones		Yellow and its Tones		Total	Results		
		N	%	N	%	N	%	N	%	N	%	N	%	N	x^2	SD	p
Male	1	25	11.8	19	9.0	35	16.5	31	14.6	**80**	**37.7**	22	10.4	212	12,129	5	***0.033***
Female		26	9.7	24	9.0	30	11.2	39	14.6	**135**	**50.6**	13	4.9	267			
Male	2	25	11.8	27	12.7	46	21.7	**51**	**24.1**	38	17.9	25	11.8	212	7,064	5	0.216
Female		32	12.0	36	13.4	**65**	**24.3**	48	18.0	37	13.9	49	18.4	267			
Male	3	15	7.1	33	15.6	42	19.7	**57**	**26.9**	35	16.5	30	14.2	212	4,091	5	0.536
Female		25	9.4	40	15.0	51	19.1	**67**	**25.1**	33	12.3	51	19.1	267			

1: First Preference, 2: Second Preference, 3: Third Preference. Note: The percentages of the rows were taken.

The Effect of Marital Status on Color Preferences
The Effect of Marital Status on Color Preferences on the Furniture Applied Transparent Finishing

The brown color group wood is the first preference in married people at 37.1% and in single people at 32.4%. As second preferences, married people prefer the red color group wood at 28.5% and single people prefer the brown color group wood at 31.4%. As third preferences, married people prefer the brown color group wood at 25.8% and single people prefer the black color group wood at 25.0%.

According to the statistical analysis, the differences among the color preferences emerging according marital status are insignificant ($p>0.05$) in all orders of preferences. According to this, marital status is not an effective factor on the color preferences on the furniture surfaces coated with transparent finishes.

The Effect of Marital Status on the Color Preferences on the Furniture Applied Staining

Brown and its tones are the first preferences of married people at 55.7%, red and its tones are their second preferences at 25.1% and blue and its tones are their third preferences at 23.7%. Brown and its tones are the first preferences of single people at 44.7%, yellow and its tones are their second preferences at 22.8% and white and its tones are their third preferences at 18.1%.

Differences in color preferences according to marital status in all of the orders of preference are insignificant ($p>0.05$). According to this, it appears that marital status is not an effective factor on color preferences on the furniture surfaces coated with stains.

The Effect of Marital Status on Color Preferences on the Furniture Applied Opaque Painting

Brown and its tones were the first preferences of married people at 50.2%, red and its tones were the second preferences at 25.1% and blue and its tones were the third preferences at 28.6%. Brown and its tones were the first preferences of single people at 36.7%, red and its tones were the second preferences at 20.2% and blue and its tones were the third preferences at 21.8% (Table 8).

The differences among the color preferences, which emerge according to marital status for the first preferences, are significant ($p=0.031<0.05$) and the differences are insignificant ($p>0.05$) for the second and third preferences (Table 8). According to this, marital status is effective on the color preferences for the first preferences and is ineffective for the second and third preferences.

1: First Preference, 2: Second Preference, 3: Third Preference. Note: The percentages of the rows were taken.

The Effect of Educational Level on Color Preferences
The Effect of Educational Level on Color Preferences on the Furniture Applied Transparent Finishing

The first preferences of the primary school graduates were the brown color group wood at 50.9%, the second preferences were the black color group wood at 32.7% and the third preferences were the red color group wood at 30.9%. The first preferences of the high school graduates were the brown color group wood at 32.3%, the second preferences were the red color group wood at 32.9% and the third preferences were the brown color group wood at 26.8%. The first, second and third preferences of the university graduates were the brown color group wood at 33.8%, 30.4% and 24.5%, respectively. Among the university graduates, the black color group wood was also preferred at the same ratio as the brown, as their third preferences.

Differences among color preferences according to educational level in all orders of preferences are insignificant ($p>0.05$). According to this, educational level is not an effective factor on the color preferences on the furniture surfaces coated with transparent finishes.

The Effect of Educational Level on the Color Preferences on the Furniture Applied Staining

According to the color preferences connected to educational level given in Table 9, the first preferences of the primary school graduates were brown and its tones at 36.4%, their second preferences were red and its tones at 34.5% and their third preferences were blue and its tones at 34.5%. The first preferences of the high school graduates were brown and its tones at 53.8%, their second and third preferences were red and its tones at 21.5% and 19.8%, respectively. The first preferences of the university graduates were brown and its tones at 52.9%, their second and third preferences were red and its tones at 21.4% and 16.7%, respectively. However, in their third preferences, their red color preferences and their black and yellow color preferences were equal to each other at 16.7%.

Differences among the color preferences according to educational level for the first preferences on the furniture applied staining are significant ($p=0.012<0.05$), and the differences for the second and third preferences are insignificant ($p=0.05$) (Table 9). According to this, educational level is effective in the color preferences for the first preferences and it is ineffective for the second and third preferences.

Table 9. The effect of educational level on the color preferences on the furniture applied staining

The Effect of Educational Level on Color Preferences on the Furniture Applied Opaque Painting

The color preferences according to educational level on the furniture applied opaque paintings are given in Table 10. According to this, the first preferences of primary school graduates were brown and its tones at 38.2%, their second preferences were red and its tones at 21.8% and their third preferences were blue and its tones at 25.5%. The first preferences of high school graduates were brown and its tones at 44.8%, their second preferences were red and its tones at 28.1% and their third preferences were yellow and its tones at 24.0%. The first preferences of the university graduates were brown and its tones at 46.4% and their second and third preferences were blue and its tones at 24.9% and 28.0%, respectively.

Table 10. Color preferences according to educational level on the furniture applied opaque painting

Educational Level	Order of Pref.	Black and its Tones		Green and its Tones		Red and its Tones		Blue and its Tones		Brown and its Tones		Yellow and its Tones		Total	Results		
		N	%	N	%	N	%	N	%	N	%	N	%	N	x^2	SD	p
Primary	1	4	7.3	6	10.9	13	23.6	7	12.7	21	**38.2**	4	7.3	55	18,56	10	***0.046***

University		34	13.2	16	6.2	29	11.3	35	13.6	119	**46.4**	24	9.3	257			
Primary	2	11	20.0	7	12.7	12	**21.8**	11	20.0	9	16.4	5	9.1	55	17,54	10	0.063
High School		13	7.8	22	13.2	47	**28.1**	24	14.4	29	17.3	32	19.2	167			
University		33	12.8	34	13.2	52	20.3	64	**24.9**	37	14.4	37	14.4	257			
Primary	3	4	7.3	7	12.7	13	23.6	14	**25.5**	10	18.2	7	12.7	55	17,97	10	0.056
High School		17	10.2	18	10.7	36	21.6	38	22.8	18	10.7	40	**24.0**	167			
University		19	7.4	48	18.7	44	17.1	72	**28.0**	40	15.6	34	13.2	257			

1: First Preference, 2: Second Preference, 3: Third Preference. Note: The percentages of the rows were taken.

Differences among the color preferences according to educational level for the first preferences were significant (p=0.046<0.05) and the differences for the second and third preferences were insignificant (p=0.05) (Table 10). According to this, the educational level is effective on the color preferences for the first preferences and it is ineffective for the second and third preferences.

The Effect of Income Level on Color Preferences
The Effect of Income Level on Color Preferences on the Furniture Applied Transparent Finishing

The color preferences according to income level of the individuals, who were the subject of the survey, on the furniture surfaces coated with transparent finishes, are given in Table 11. According to this, the first preferences of the individuals who participated in the survey and who have an income of US$380 and less, were the brown color group wood at 44.4% and their second and third preferences were the red color group wood at 28.7% and 26.9%, respectively. The first preferences of those who have an income between US$381-635 were the brown color group wood at 38.5%, the second preferences were brown at 31.3% and the third preferences were the black color group wood at 24.0%. The first preferences of those who have an income of US$636 and above were the black color group wood at 28.8% and the second and third preferences were the brown color group wood at 31.3% and 29.4%, respectively.

Table 11. The wood type (color) preferences according to income level on the furniture applied transparent finishing

Monthly Income	Order of Pref.	White Color Group Wood		Yellow Color Group Wood		Brown Color Group Wood		Red Color Group Wood		Black Color Group Wood		Total	Results		
		N	%	N	%	N	%	N	%	N	%	N	x^2	SD	p
US$380 and less	1	15	13.9	10	9.3	48	**44.4**	24	22.2	11	10.2	108	22,64	8	***0.004***
Between US$381 - 635		20	9.6	18	8.6	80	**38.5**	44	21.2	46	22.1	208			
US$636 and above		13	8.0	18	11.0	41	25.2	44	27.0	47	**28.8**	163			
US$380 and less	2	5	4.6	22	20.4	23	21.3	31	**28.7**	27	25.0	108	9,52	8	0.300

According to the statistical analysis made, differences according to the different income groups in the first preferences among the color preferences were significant ($p=0.004<0.005$) and the differences in the second and third preferences were insignificant ($p>0.05$) (Table 11). According to this, the income level was effective on the color preferences in the first preferences and it was ineffective in the second and third preferences.

The Effect of Income Level on the Color Preferences on the Furniture Applied staining

The first preferences of the individuals who participated in the survey and who were in all of the income groups were brown and its tones at 43.5%, 50.0% and 58.3%, respectively. The second preferences in all of the income groups were red and its tones and at the same time, the preferences of the individuals who have an income level of US$636 and above were black and its tones. The third preferences of those having an income of US$380 and less, were blue and its tones at 23.1%, the third preferences of those having an income of US$381 - 635, were red and its tones at 21.2% and the third preferences of those having an income of US$636 and above, were blue and its tones and yellow and its tones at 19.0% each.

Differences according to the different income groups of the color preferences in all of the preferences were insignificant ($p>0.05$). According to this, the income level is ineffective on the color preferences on the furniture applied staining.

The Effect of Income Level on Color Preferences on the Furniture Applied Opaque Painting

The first preferences of those having an income of US$380 and less were brown and its tones at 40.7% and their second and third preferences were blue and its tones at 20.4% and 23.1%, respectively. The first preferences of those having an income between US$381 - 635 were brown and its tones at 47.1%, the second preferences were red and its tones at 25.0% and the third preferences were blue and its tones at 27.9%. The first preferences of those having an income of US$636 and above were brown and its tones at 44.8%, the second preferences were red and its tones at 24.5% and the third preferences were blue and its tones at 25.2%.

Differences according to the different income groups among the color preferences for all of the preferences on the furniture applied opaque painting were insignificant ($p>0.05$). In this situation, the income level of the individuals is not an effective factor on color preferences on the furniture coated with these type of surface finishes.

Conclusion

According to the findings, the type of surface finishings applied to the furniture surfaces and/or the color applied on these surfaces is important for the consumers. Furthermore, the opaque painting on the furniture surfaces is preferred less compared to the other finishing types. Accordingly, it can be deduced that the consumers seek a wood appearance on the furniture surfaces and that it is definitely necessary to take this wish into consideration in standard furniture production.

Brown and its tones are the most preferred colors in all kinds of surface finishings when the color preferences of the consumers are analyzed according to the type of surface finishing, without taking into consideration any consumer characteristics and orders of preference. This is followed by red, yellow, black and blue colors and their tones.

There is not much difference in color preferences and priorities given above, excluding extraordinary situations, when the general preferences emerging according to the general consumer characteristics, such as age, gender, education, marital status and income level are considered. Brown and red are still the first and second preference colors according to all of the consumer characteristics. Yellow, blue and black are in the forefront as the third preferences according to different consumer characteristics. Blue and its tones are the second preferences of males on the furniture applied opaque painting. Black and its tones are the second preferences of primary school graduates on the furniture surfaces coated with transparent finishes. Blue and its tones are the second preferences of university graduates on the surfaces coated with opaque painting. Black and blue colors and their tones are the first preferences for those who have an income of US$636 and above on furniture applied transparent finishing and staining and their preferring these is exceptional situations.

The fact that Beech and Pine are species of wood used a lot in Turkey, that furniture produced from these types of wood stems from the fact that beech in particular is suitable for finishing with every color and that they are put into the market as mahogany, walnut and hazelnut colors, could have been influential in the formation of a color culture in which brown and red are predominant. Furthermore, it is thought that the fact that the walls in housing

 Copyright © International Science and Technology Conference (ISTEC)

estate and in the housing built by contractors is generally finished with white or light colored paint could be influential in the selection of these colors on the furniture surfaces for contrast. In the same manner, the use of pine wood materials with a natural color in construction, interior design and furniture could be effective in preferring yellow the most. The use of black a lot in office furniture in the past and the fact that the Wenge wood is used a lot more in the building of furniture in recent years could be effective in the preferences for black.

According to the statistical analysis made to determine whether or not consumer characteristics are influential in the preference of color, it was found that age was effective on the third preferences in all of the surface finishing applications, that income level was effective on the first preferences in the transparent finishing applications, that gender was effective on the first preferences in the opaque painting applications, that marital status was effective on the first preferences in the opaque painting applications and that educational level was effective on the first preferences in the staining and opaque painting applications. According to this, a market segmentation should be made according to the findings above for the color preferences of the consumers according to income level in the transparent finishing applications, according to gender, marital status and educational level in the surface finishings with opaque paints, and according to educational level in the staining applications. Color and finishing preferences of the consumers connected to the customer characteristics specified should be taken into consideration in the user-oriented design applications and in the design activities, which keep consumer satisfaction in the forefront.

It was determined that age was ineffective on the color preferences of the consumers in all of the surface finishing applications, that gender and marital status were ineffective on the color preferences of the consumers in the surface applications made with transparent finishes and staining, that educational level was ineffective on the color preferences of the consumers in the transparent finishing applications and that income level was ineffective on the color preferences of the consumers in the staining and opaque painting. In this situation, there is no need for special color applications according to these variables. The most preferred colors satisfy all of the consumers.

THE COMPARISON OF ROBUST PARTIAL LEAST SQUARES REGRESSION METHODS (RSIMPLS, PRM) WITH ROBUST PRINCIPAL COMPONENT REGRESSION FOR PREDICTING TOURIST ARRIVALS TO TURKEY

Esra Polat

espolat@hacettepe.edu.tr

According to the World Travel & Tourism Council (WTTC), travel and tourism is the biggest industry in the world on virtually any economic measure, including gross output, value added, capital investment, employment and tax contributions. Tourism is a key ingredient in the economic development strategy of many developing countries such as Turkey. In regards to the total tourist arrivals to Turkey, it seems that the number of foreign visitors has accelerated rapidly in last decade. In 2004, Turkey attracted 17.5 million foreign tourists, which exceeded 41 million visitors in 2014. In existence of multicollinearity in the data set, the classical multiple linear regression analysis gives unreliable estimates for regression parameters and the variance of these parameters may be too large. Hence, in this case biased regression methods such as Principal Component Regression (PCR) and Partial Least Squares Regression (PLSR) are used. PCR and PLSR both fit a linear relationship between two sets of variables. They are the most popular regression techniques that they offer a good solution because they first reduce the dimensionality of the design matrix. SIMPLS algorithm is the leading PLSR algorithm because of its speed, efficiency and results are easier to interpret. However, both of the PCR and SIMPLS yield unreliable results when the data set contains outlying observations. Therefore, Hubert and Vanden Branden (2003) have been proposed the robust versions of these methods: robust PCR (RPCR) and a robust PLSR method called as RSIMPLS. Moreover, Serneels et al. (2005) have been proposed Partial Robust M-Regression (PRM) that it is a partial version of the robust M-regression. The aim of this study is to model the tourist arrivals (number of foreign tourists) to Turkey by using three popular biased robust RPCR, RSIMPLS and PRM methods in existence of both multicollinearity and outlier in the data set. Hence, the best model giving the best predictions of tourist arrivals is selected and the most important factors affecting the tourist arrivals to Turkey are determined.

THE COMPLEMENTARY ROLE OF BIOINFORMATICS IN ANALYZING THE FUNCTIONAL ASSOCIATION BETWEEN GTPASE ACTIVATING PROTEINS (GAPS) AND RAB GTPASES

Silviu Faitar
sfaitar@yahoo.com

Jeremiah Davie
daviej@dyc.edu

Proteins that contain the TBC (Tre2/Bub2/Cdc16) functional domain were shown to act as GTPase activating proteins (GAPs) for Rab G proteins involved in intracellular vesicular transport and fusion, membrane receptor recycling and cytokinesis. Of a special interest is the human Evi5 protein, a typical TBC domain-containing protein originally identified at the breakpoint of a constitutional chromosome translocation, in a patient with stage 4S neuroblastoma. Even though there are more than 50 human proteins predicted to have a TBC domain, and more than 70 already identified human Rab proteins, the specificity between Rab proteins and their respective TBC-containing GAPs is not well understood.

The present study combines biochemical and immunofluorescence microscopy techniques with bioinformatics protein sequence and conformation analysis, investigating the binding and functional specificity between the neuroblastoma Evi5 protein and Rab11, and between the highly homologous Evi5L protein and its potential activation target, Rab23.

Previous studies indicated that Evi5 is involved in the latest stages of cytokinesis, acting as a GAP for a subpopulation of centrosome-associated Rab G proteins. Immunoprecipitation studies determined that Evi5 physically interacts with Rab11, and immunochemistry experiments revealed that these proteins co-localize during cytokinesis at the midbody. Similar results also suggested a functional association between Evi5L and Rab23. Significantly, there was no physical interaction or co-localization between Evi5 and Rab23, or between Evi5L and Rab11. In an attempt to extrapolate these results on other putative pairs of TBC-containing GAPs and Rab proteins, the sequence and three-dimensional conformation of these four proteins is analyzed using bioinformatics resources.

ABSTRACT
This objectives of this research were to 1) surveillance of steroids in antiasthma drug sets dispensing for asthma relief and 2) test for steroids in antiasthma drug sets from drugstores on the Ratchathewi district. The researcher were collected drug sets from 111 drugstores in the Ratchathewi district, Bangkok during 1 January to 30 March 2015. Analysis for detection of contained with steroids in drug sets by steroid test kits (Immunochromatography technique). The results found that 27 drugstores at 24.3 percent are dispended 7 drug sets to customer and found 6 samples contaminated of steroids at 85.7 percent of drug set samples. The advertising media for side effect from drug sets usage and steroids to increase knowledge incorrect health behavior for improve of self medication of people.

Keywords: Steroids, Dispense, Drug Set, Asthma Relief

INTRODUCTION

Steroid is a controlled substance according to Notification of Public Health, Subject: Special Controlled Drug. This means steroid distribution is restricted under Drug Act. B.E. 2510, section 4 which states that steroid can only be prescribed by licensed medical practitioner, veterinarian, or a drugstore that has a licensed pharmacist on duty at all time. Thailand's legal principle pertaining to the dispensing of drug set under Drug Act. B.E. 2510 section 75 bi amended by Drug Act. B.E. 2530 prohibits any person from dispensing a mixing of medications as one prescription intending to cure, to treat or to prevent one particular condition. The prohibition does not apply to licensed pharmacist, medical profession or licensed dentist who prescribes only to their patients or veterinarian who dispenses only for their patients (Drug Act. B.E. 2510, 2010). However, the problem of using drug set still persists in both Bangkok and other provinces. In provincial area, drug set can be purchased from any drugstore, grocery or even coffee shop. Most of drug sets obtained from sampling were intended to cure flu, to relieve body ace and pain or to lower weight. Each of them made up of painkillers, linking to mental side effects, anti inflammatory drugs, vitamins and acid reducing medicines. And almost every drug set includes some form of steroid drug because drug sets believe that steroid is potent to treat a wide range of medical conditions (Charoenphol, 1996).

Asthma is a chronic inflammatory disease of the airways that requires daily use of controller medication in most case. A course of oral corticosteroids may be used in severe asthma, but long-term steroid use should be avoided if possible (Edmunds, and Mayhew, 2013, p.210). Asthma was thought to be a disease mainly of impaired autonomic control of the airway lumen diameter, but it is now recognized that many physiological mediators are involved in the pathogenesis of an asthma attack, including interleukins, histamine, leukotrienes, prostaglandins and other cytokines and nitric oxide, as well as autonomic neurotransmitters (Bryant and Knights, 2015, p.611) Corticosteroids used to relieved asthma and Chronic obstructive pulmonary disease medications for oral medication is prednisolone (Edmunds and Mayhew, M, 2013, p.204). The environmental is important to reduce exposure to dust mites and cockroaches, to which many patients with asthma are sensitive. To limit exposure to dust mites, especially in the bedroom where they are most common, one should enclose pillows and mattresses in airtight polyurethane covers or use fiberfill products instead of down or foam pillows, remove carpeting (hardwood or linoleum floor is better) and curtains, wash sheets and stuffed toys (for pediatric patients) in hot water every week, and clean bedrooms frequently with a vacuum that has a high-efficiency particulate air filter (Rakel, 2007, p.348).

Corticosteroids are commonly used in the treatment of asthma because of their anti-inflammatory effects. In addition, corticosteroids increase the effects of adrenergic bronchodilators to prevent or treat bronchoconstriction and bronchospasm. In acute asthma or status asthmaticus unrelieved by inhaled beta-adrenergic bronchodilators, high dose of systemic corticosteroids are given orally or intravenously with bronchodilators for approximately 5-10 day (Frandsen and Pennington, 2014, p.279-280). The effects of glucocorticoids in human can cause give risk to diabetes mellitus, immune reaction suppression, perforation of the ulcer occurs, reduce bone production and may develop cataract or glaucoma (Greenstein, 2004; Clayton, 2007; Karch, 2008). Treatment with prednisolone may cause of central nervous system stimulation with anxiety, mood swings, insomnia and headache.

 Copyright © International Science and Technology Conference (ISTEC)

Gastrointestinal complains include nausea, vomiting, increased appetite (Ascheenbrenner and Venable, 2012, p.1017)

Survey of drugstores' distribution of drug sets for body ace and pain dispensed in Ratchathewi district founded that 6 out of 95 samples contained steroid. Ratchathewi district is located in the heart of Bangkok, there should be no case of illegal distribution of steroid (Thongmuang and Sudjaroen, 2010). The similar survey was conducted in Study on Adulterantion of Steroids, Prednisolone and Dexamethasone in Traditional Thai Medicines on Hat-Yai, Songkhla. There were 200 samples were collected randomly from 54 stores during August to December 2008. Common adulterants, prednisolone and dexamethasone were examined in the samples by using thin layer chromatography (TLC) technique. The results showed that 4 samples were adulteranted with steroids as 2%, which high rick to find adulterant samples as 5.5% from all sources of Traditional Thai Medicines (Arandorn, Saclim, Vichayavoranan, Klaysatit and Dcj-adisai, 2010, p.20-30).

The another similar survey was conducted in Dusit district and founded 12 out of 38 drugstores illegally dispensed ace and pain drug sets containing steroid. These results are unexpected because both Ratchathewi and Dusit districts are located in the center of Bangkok where there should be no case of illegal steroid distribution left (Thongmuang and Sudjaroen, 2011). The survey of drugstores' distribution of drug sets in 7 districts, 18 sub-districts Pathum-thani province, Thailand on June to July 2010 from 24 drugstores and 25 grocery shops. There were 47 samples of drug sets found, 21 in drugstores, 26 in grocery shops. There were 14 samples of drug sets for common cold, 28 samples for muscle pain and 5 samples for pruritus. Steroid identification by the database for identification of oral corticosteroids and thin layer chromatography (TLC) showed that 28.6%, 46.2% and 80.0% of drug sets for common cold, muscle pain and pruritus contained steroids. The corticosteroids found in drug sets were dexamethasone and prednisolone (Maluangnon, Korsangruang, Chairop, Nopparsri and Jirasakpisan, 2014, p.1-14).

There are several methods to determined for the quantity of steroid (Dexamethasone and Prednisolone) such as; High Performance Liquid Chromatography or Thin Layer Chromatography (Thongyindee, 2004) in the form of Dexamethasone or Prednisolone tablet following pharmacopoeia (The United States Pharmacopoeia, 2009), or analyzing using Fourier transform infrared spectrophotometer and UV-visible spectrophotometer (Ruaysup, 2004) and this research was qualitative determined dexamethasone and prednisolone by immunochromatographic test kit from Bureau of Drug and Narcotic, Department of Medical Science, Ministry of Public Health, Thailand which was rapid and simply to perform with no prerequisite regarding laboratory equipments or laboratory skills (Matapatara and Likitthanaset, 2008) This objective of this research were to surveillance of steroids in asthma drug sets dispensed for asthma relief from drugstores in the Ratchathewi district, and evaluate situation of drug set with steroid drug usage.

MATERIALS AND METHODS

Sample collection: The drug sets were collected from 111 drugstores in the Ratchathewi district, Bangkok on January to March 2015. Name and location of 111 drug stores in the Ratchathewi district were provided from Food and Drug Administration, Ministry of Public Health**.**

The drug sets were brought and collected by students whom study in Department of Aesthetic Health Science, College of Allied Health Science, Suan Suandha Rajabhat University.

The conversation for drug sets dispended was asking for prescribed with asthma symptom such as obstructive pulmonary disease and cough with mucous plugs for a friend who belonging to student who's brought the drug set, each collected drug set were photo and labeled as individual data [Figure 1-6].

Sample preparation and determination: This research was qualitative determined dexamethasone and prednisolone by immunochromatographic test kit from Bureau of Drug and Narcotic, Department of Medical Science, Ministry of Public Health, Thailand [Figure 7]. Each tablets of drug set were gridded and filled until met the blue line of the test tube. Reagent was dropped into tube with sample contained until met the red line of the test tube [Figure 8].

Figure 7 Test kit

Figure 8 Test tube

The suspending were mixed at list 3 minutes by vortex mixer homogeneously and standing for precipitated. The supernatant was dropped (4 drops) into the test well of Immunochrographic test kit and read the result rapidly and not longer than 10 minutes. The positive result was presented as one band at "T" region (Figure.9) and negative result was presented as two bands at "T" and "C" region [Figure 10]. Dexamethasone and prednisolone were used as positive control.

Figure 9 Positive result

Figure 10 Negative result

RESULTS AND DISCUSSION

The sampling was conducted between 1 January to 30 March 2015 by roll playing, a research staff member acted as a customer who wanted to buy only five asthma drug sets without prescription, for a friend who had asthma symptoms; chest pressure, coughing up sputum, and wheezing waiting for her at the dormitory. Their friends reported that they previously experienced asthma drug set, from nearby drugstore, and it was fast and effective.
The findings were presented 61 drugstores (60.5%) denied to dispended drug sets. Therefore, 7 drug stores (6.9%) were dispensed drug sets to our volunteers without the prescription [Table 1] and the significant findings showed that 6 of 7 samples (85.7%), were contained with steroids (dexamethasone or prednisolone). Although don't have the prescription from doctor, sellers from drugstores dispensed illegally drug sets with steroid to customer.

Table 1: Situation of drug sets dispensed from drugstores

Dispensing of drug sets	**Number of drugstores**
Denied to dispensed drug sets	61
Dispensed drug sets	7
Not reject to dispensed drug sets but dispensed single tablets	6
Not reject to dispensed drug sets but dispensed blister pack	27
Out of Service	10
Total	111

The positive result was present as only one band. The colors of positive results are different in all of samples because there are have different tablets in each drug sets, but in every sample were contained steroid tablet (dexamethasone and prednisolone). The solution of positive result of sample one was showed in pink color [Figure

Twenty-seven drugstores do not reject to dispensed drug sets but dispensed blister packs. The blister packs were present at Meptin (procaterol 50 mg) , Asmasolon (theophylline 125 mg) , Theotrim 200 (theophylline 200 mg) , Franol (theophylline 120 mg , Ephedrine 11 mg , pherobarbitone 8 mg) , Nuelin-SR200 (theophylline 200 mg) , Terbutaline 2.5 mg , Procaterol 50 mg , Violin (salbutamol 2 mg) [Figure 17-23].

Figure 22 Terbutaline

Figure 23 Violin

Theophylline is the most commonly used methylxanthine for the treatment of asthma. Common side effects of theophylline include central nervous system (CNS) excitation, tachycardia, CNS vasoconstriction and peripheral vasodilation, and dieresis. Selecting theophylline as the primary long-term control medication may be considered for an individual who cannot or will not use inhaled medication or in those unable to afford long-acting beta$_2$

 Copyright © International Science and Technology Conference (ISTEC)

agonists (King and Brucker, 2011, p.591-592). Theophylline serum concentration need to be monitored closely owing to the drug's narrow toxic therapeutic range, individual differences in metabolism, and the effects of many factors on drug absorption and metabolism (Tierney, McPhee and Papadakis, 2006, p.231). In case of dispensing Nuelin-SR200 (theophylline 200 mg) from drugstore to use for relief asthma symptom may cause to this side effect.

Six drugstores do not reject to dispensed drug sets but dispensed single tablets. The single tablets was present at terbutaline 2.5 mg in white pill with 2.5 number in one side and with middle line in another side for all of drugstores [Figure 24].

Figure 24 Terbutaline 2.5 mg

Terbutaline is a relative selective beta$_2$ –adrenergic agonist that is a long-action bronchodilator. Dose of Terbutaline by oral are 2.5-5 mg every 6-8 hours, maximum dose are 15 mg per day (Abrams, Lammon and Pennington, 2009, p.716-717).

The important reason to denied for drug sets dispensing were presented 36 drugstores (59.0%) denied to dispensed drug sets as the reason for legal not allow to dispensed drug sets . Therefore, 9 drug stores (14.8%) denied to dispensed drug sets as the reason for they can dispensed if have the prescription from the doctor [Table 2] 8 drug stores (13.1%) denied to dispensed drug sets as the reason for drug sets usage is harmful to human system, 6 drug stores (9.8%) denied to dispensed drug sets as the reason for drug sets can be cause to adverse drug reaction and 2 drug stores (3.3%) denied to dispensed drug sets as the reason for out of medicine.

Table 2: Reason to denied for drug sets dispensing from drugstores

Reason to denied	**Number of drugstores**
Legal not allow to dispensed drug sets	36
Can be dispensed drug sets if have the prescription from doctor	9
Drug sets usage is harmful to human system	8
Drug sets can be cause to adverse drug reaction	6
Out of medicine	2
Total	61

The number of tablets for each set dispensed from drug stores in Ratchathewi district were various number [Table 3]. Three tablets per set were most dispensed as maximum number from 3 drugstores, Two of drugstores were dispensed 2 tablets per set and two drugstores were dispensed 4 tablets per set.

Table 3: Number of tablets per set dispensed from drugstores

Number of tablets per set	**Number of drugstores**
2	2
3	3
4	2
Total	**7**

CONCLUSION

The study found 6 drugstores in Ratchathewi district dispensed drug set contained with dexamethasone or prednisolone to customer on demand without asking for a prescription. However, 61 drugstores denied selling drug set as the reason for legal not allow to dispensed drug sets. Some pharmacists informed the staff about the danger of drug set which should not be used to relief asthma. They recommended using over the counter tablet or nasal spray instead. Some pharmacists even further informed the staff about steroid content and its side effect in drug set. This indicated that most of drugstores aware of an inappropriateness of drug set dispensing and concerned about the safety of public in drug consumption. In case of factors affecting to use drug sets of rural people in

 Copyright © International Science and Technology Conference (ISTEC)

Pasaknoi Village Choengdoi Sub-district, Doi saket District, Chiang Mai Province on 1995 collected data from 11 people by informal interviewing. The results showed that affecting usage of drug sets were the easiness and convenience of usage, including confidence and satisfication in the efficacy of drug sets. Also they had heard about the good qualities of drug sets more than the adverse effects from neighbours, relatives and their past experiences. Drug set was easy to buy from the stores in vollage and the price was cheap and appropriate to their income (Kamai, 1995, p.49-52).

This study showed that even though the drug stores were located in Bangkok which is the capital and the most civilized city of Thailand, there still exist a number of cases of asthma drug set dispensing as evidenced by drugstores in Ratchathewi as the central district in Bangkok. These results are related with research of drug sets dispended with steroids of Thongmuang and Sudjaroen in 2011 (Thongmuang and Sudjaroen, 2011), Therefore the situation occur again in 2015 at Ratchathewi district where there should be no case of illegal steroid distribution left. The focal point is the finding of the distribution of drug set containing steroid, a controlled substance, without prescription. It is an inappropriate usage of steroid drug; unnecessary use and for wrong purpose of treatment.

For this reason, the Department of Public Health should be more tightly enforcing the steroid regulation, especially, to prevent a case of drug set dispending from a drugstore operating without a pharmacist on duty and a case of steroid dispensing without prescription. To improve the safety of drug usage among public and also to increase the public awareness of risk and harm form steroid in drug set, the Department of Public Health should publish and advertise to educate public about the side effects of steroids. And also at university undergraduate level, a health related class should be required for graduation in order to strengthen the knowledge in this field for young people who are the future of our country.

ACKNOWLEDGEMENTS

The author sincerely thanks Research and Development Institute, Suan Sunandha Rajabhat University, Bangkok, Thailand for partially financial support. We thanks to students whom study in Department of Aesthetic Health Science and Department of Applied Thai Traditional Medicine, Faculty of Science and Technology, Suan Sunandha Rajabhat University for help us as good volunteers to collecting samples and useful data.

THE ECAT SOFTWARE PACKAGE TO ANALYZE EARTHQUAKE CATALOGUES

Tuba Eroğlu Azak

Akdeniz University, Department of Civil Engineering, Antalya Turkey

tubaeroglu@akdeniz.edu.tr

Abstract: Earthquakes are one of the most damaging natural disasters. Accordingly, earthquake phenomenon has been an important subject in seismology and earthquake engineering. In order to have insight on earthquakes, they have been compiled over the past years in databases called as earthquake catalogues. In seismic hazard studies, earthquake catalogues are of prime importance as they provide the most important features of earthquakes such as date, time, location, magnitude, depth etc. Accordingly, earthquake catalogues are often utilized to model seismicity. However, before such an implementation, earthquake catalogues need to be undergone several analyses such as seismic declustering, assessment of completeness periods and calculation of magnitude recurrence parameters. In order to perform these analyses, several software packages are available for users on different programming platforms. Vast majority of these software are only applicable to earthquake catalogues that are complete over the time period they extend. However, most of the earthquake catalogues are incomplete in terms of small and moderate size events particularly in the early years of instrumental period. This paper illustrates some of the useful features of the software package called as ECAT that is generated to compute completeness and magnitude recurrence parameters of earthquake catalogues whose completeness periods are unequal for different magnitudes.

Keywords: Earthquake Catalogue, Catalogue Completeness, Calculation of Magnitude Recurrence Parameters

Introduction

Turkey is located on a highly seismically active region where many devastating earthquakes take place. Only in the last 20 years, more than 10 earthquakes with $M_w \geq 6$ hit the country. Among them, in particular, Kocaeli and Düzce earthquakes served as a landmark for a better understanding of earthquake hazard and earthquake risk in Turkey. Accordingly, considerable effort has been given on assessment of seismic hazard on the basis of continually updated and improved seismic data. Considering seismic data, the contribution of earthquake catalogues in earthquake engineering is significant as the most important information on earthquakes such as location, time, magnitude and depth are compiled in these documents. Accordingly, seismic catalogues are often utilized to model and investigate seismic sources. To achieve this goal, however, further analysis steps such as seismic declustering, completeness analysis and magnitude-recurrence model analysis are essential. Considering these tasks, computer software is considerably necessary due to the utilized methods that either require back and forth computation or reapplication of the procedure several times for different sets of data and condition. Moreover earthquake catalogues are often lack of some small and moderate size events. This fact is mainly attributed to poor seismic networks in the early years of instrumental period. Accordingly, completeness periods of small, moderate or big size events in an earthquake catalogue may differ. Although there exist several methods to deal with the catalogues with unequal completeness periods, handy computer programs that incorporate such methods are either limited or not very well-known.

Recently, a national project supported by AFAD (Disaster and Emergency Management Authority of Turkey) has been completed with the collaboration of several universities and public institutions. As the final product, probabilistic seismic hazard maps for peak ground acceleration (PGA) and 5 % damped spectral acceleration (SA) at T= 0.2s and 1.0s were produced for 475- and 2475-year return periods considering the administrative borders of Turkey. These maps were generated by considering two different sets of seismicity models namely 1-area source model and 2-fault source + smoothed seismicity model that were developed under the light of the updated Turkish earthquake catalogue and active fault map of the region. In line with the demands encountered during the course of the project, a software package called as ECAT (**E**arthquake **C**atalogues **A**nalysis **T**ools) has been developed for assessing completeness periods of the Turkish earthquake catalogue and calculating magnitude recurrence parameters of earthquakes.

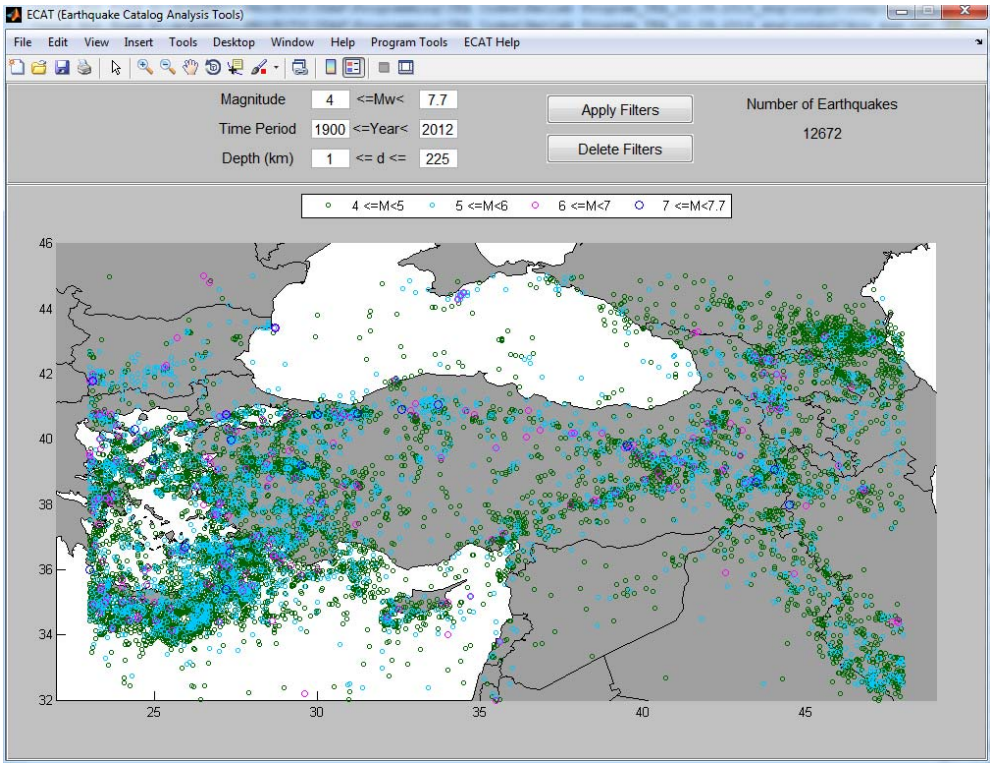
This study presents some of the useful features of the ECAT software that is applicable to earthquake catalogues

 Copyright © International Science and Technology Conference (ISTEC)

with unequal completeness periods. In the first part of the paper, capabilities of the software will be presented overall while the developed tools will be addressed in the subsequent sections.

General capabilities of the ECAT Software Package

The ECAT software is developed by making use of MATLAB® programming language and it provides a user-friendly environment for earthquake catalogue operations while letting users filter events in terms of date, location, magnitude and hypocentral depth. The main window of the software is based on a map in geospatial format that covers Turkish territory and its surroundings. The opening window of the software first asks for a catalogue file in the desired file format. Accordingly, all the events in the catalogue are plotted on the map in the main window of the program. Figure 1 illustrates the general view of the main window of the ECAT software.



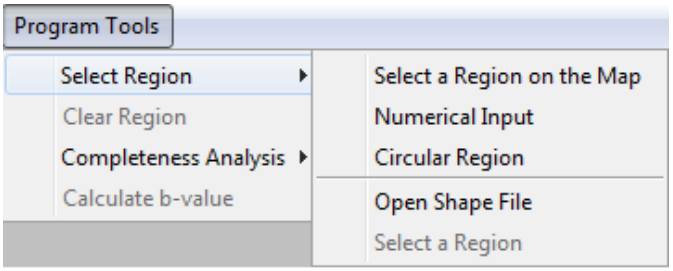


Figure 1. Main window of the ECAT software

As it can be seen in Figure 1, the earthquakes are plotted in terms of magnitude bins that are established with unit magnitude by default. On the upper panel, the extents of the selected catalogue are presented with upper and lower values in terms of magnitude, time and hypocentral depth. The user can limit and replot the earthquakes in terms these 3 constraints with the “Apply Filters” and “Delete Filters” buttons. Upon the each mouse click on “Apply Filter” and “Delete Filter” buttons, the earthquakes on the map are replotted. Similarly, the number of events that fulfil the selected criterion are automatically refreshed on the right hand side of the buttons.

The developed tools within the ECAT software are grouped under the “Program Tools” menu on the menu bar. Under the “Program Tools” menu, the tools for region selection, completeness analysis and magnitude recurrence analysis are available. The general view of the “Program Tools” menu and cascading view of the “Select Region” menu are given in Figure 2. The operations related with these tools will be presented in the following sections.

 Copyright © International Science and Technology Conference (ISTEC)

Figure 2. The submenus under "Program Tools" menu

Selection of a region

The ECAT software provides 4 different options for region selection. As the first option under the menu, users can define a region with an arbitrary shape by selecting the "Select a region on the map" command. By this command any shape with any number of points can be defined by clicking on the mouse buttons. A sample view of a user-defined region is presented in Figure 3.

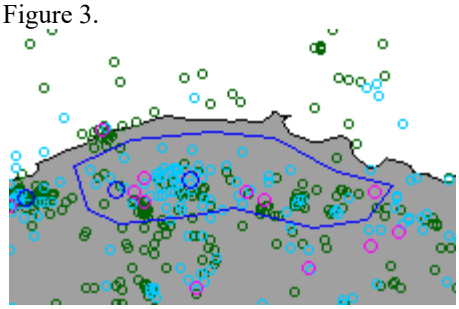

Figure 3. Region with an arbitrary shape

As the secondary option, users can define a rectangular region by selection the "Numerical input" command. Figure 4 illustrates the pop-up window where corner points of a rectangle can be entered.

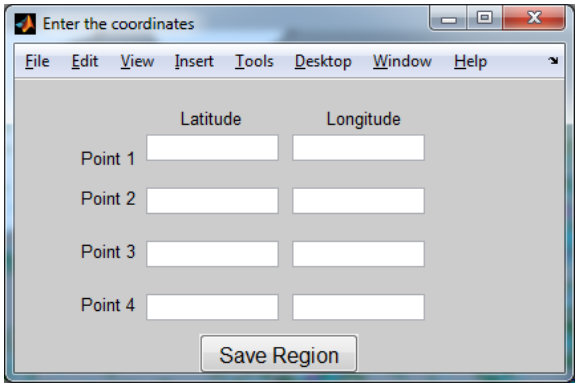

Figure 4. Rectangular region definition

The ECAT software also enables to define circular regions. By clicking on the "Circular region" option under the region selection menu, a pop-up window appears. On this window, users can define the central coordinates of a circle either by keyboard entry or mouse click on the main window. The radius of the circle is also defined on the circular region pop-up window.

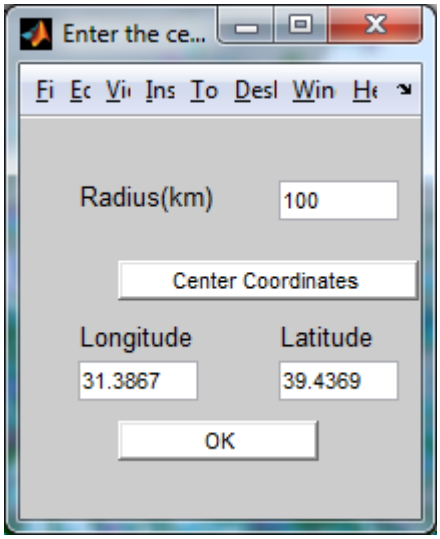

Figure 5. Pop-up menu for circular region selection

As the last option, region data can also be loaded from geospatial data files. Figure 6 illustrates a sample view of a loaded shape file that is plotted on top of the earthquake map. As it can be seen from the pop-up window appearing

 Copyright © International Science and Technology Conference (ISTEC)

in front of the main window, the program allows users to select a region out of several regions. Thus, a loaded shape file does not necessarily have to incorporate single region data.

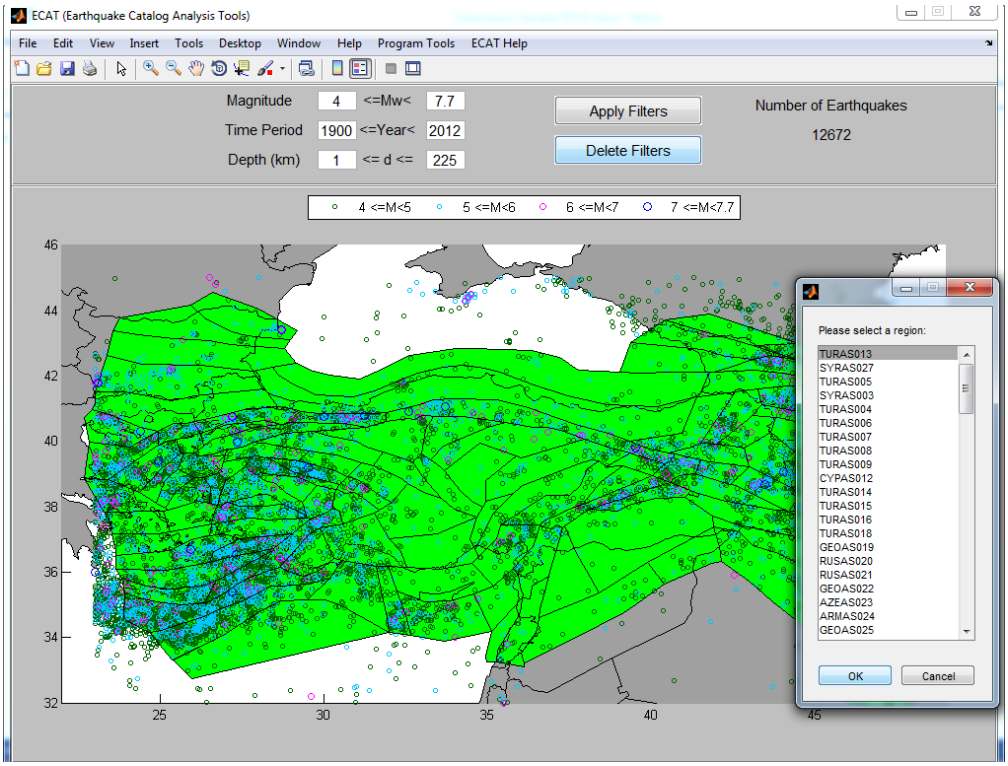

Figure 6. Selection of the region from a loaded shape file

After defining a region, users can proceed with the completeness analysis and magnitude recurrence relation tool.

Completeness Analysis Tool

As mentioned in the previous sections, earthquake catalogues are often lack of some events particularly in the early period of instrumental period. This fact complicates determination of completeness periods of catalogues as in this case one needs to investigate catalogue events in terms of subgroups of magnitude classes. Bearing on this idea, Stepp (1972) proposed a method to assess completeness periods of catalogues with unequal completeness periods. According to this method, the mean earthquake rate of each magnitude class is calculated for expanding time windows established from the last record backwards the first one. Then, scatter plots of standard deviation of the mean of the annual number of events are plotted against sample lengths for each magnitude class. Finally, completeness period of each magnitude class is assessed upon the stability of the estimates in the subintervals. The ECAT software enables users to decide on the duration of temporal window as well as magnitude interval to establish magnitude classes. The default values of these parameters are considered as 5 years and M_w 0.5 for time and magnitude increments respectively. The program also asks for lower, intermediate and upper magnitudes to be considered while constructing magnitude bins. Here, the intermediate magnitude is intended to separate moderate and big size events so that a single magnitude class can be established for big events regardless of the bin size. Figure 7 illustrates the main window of completeness analysis tool. On this window, users can zoom in and out on the plots and decide on the completeness periods of each magnitude class with the help of the auxiliary tools that can be utilized to draw/clear reference lines and trace on data.

The secondary method integrated into the ECAT software to assess completeness periods is based on the study by Mulargia et al. (1987). Similar to Stepp (1972) method, all selected earthquakes are grouped in terms of magnitude classes that are established according to the user's definitions. Then, cumulative number of events in each magnitude class is plotted against time starting from the first record towards the last one. Completeness period of each magnitude class is decided upon the stationarity of cumulative number of events. A sample plot of completeness analysis tool is illustrated in Figure 8 if the method by Mulargia et al. (1987) is selected.

 Copyright © International Science and Technology Conference (ISTEC)

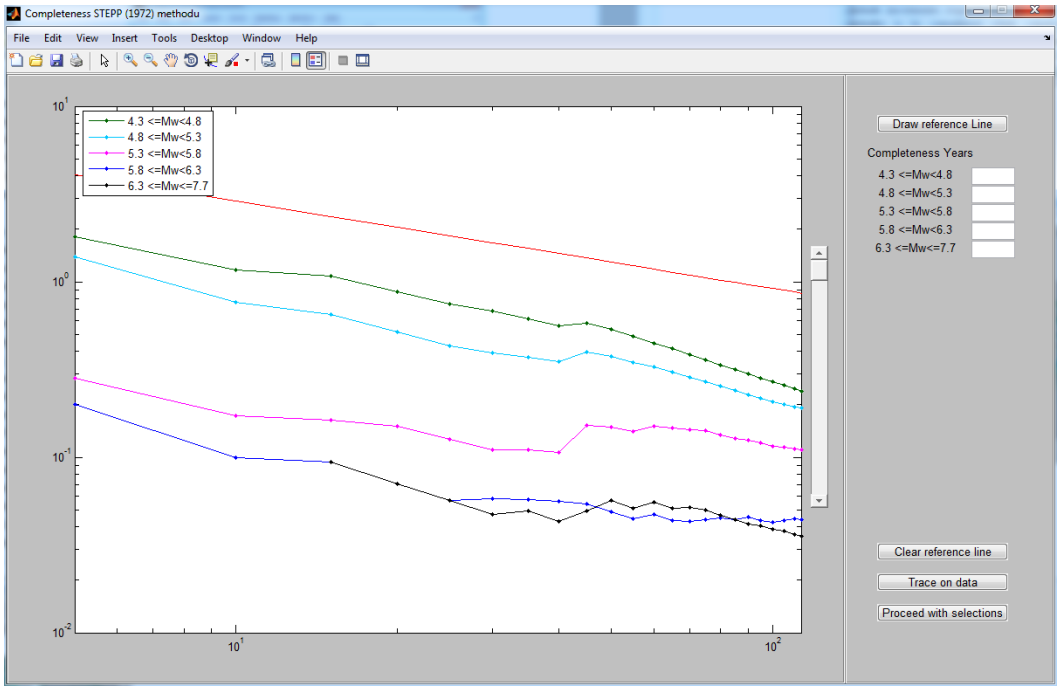

Figure 7. The main window of completeness tool for Stepp (1972) method

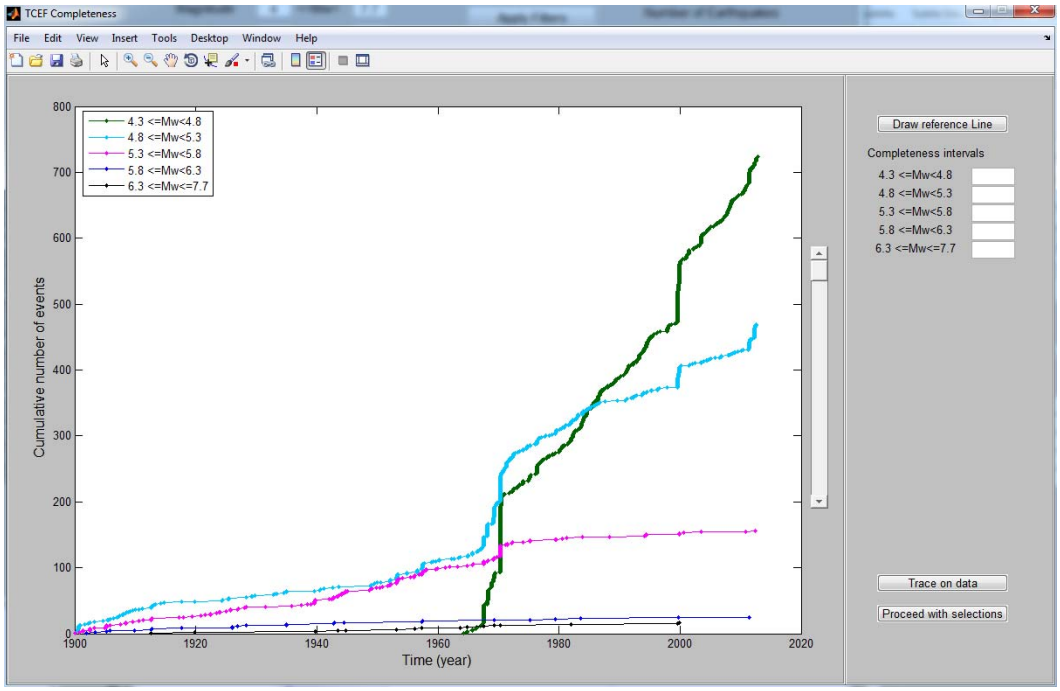

Figure 8. The main window of completeness tool for Mulargia et al. (1987) method

For both methods, completeness analysis is completed if "Proceed with selections" button is pressed. After this selection, the completeness analysis results are saved automatically as a text file under the main folder of the program. This file updates itself if the completeness analysis repeated. Once completeness analysis is completed, users can proceed with the magnitude recurrence tool.

Magnitude Recurrence Relation Tool

The ECAT software provides 3 methods for calculation of magnitude recurrence parameters. Among these methods, two of them can be applied to catalogues with unequal completeness periods. In the program, the magnitude recurrence tool can be accessed under the "Program Tools" menu. After choosing this tool, a pop-up window appears (Figure 9). On this window, the required inputs differ in accordance with the selected method.

 Copyright © International Science and Technology Conference (ISTEC)

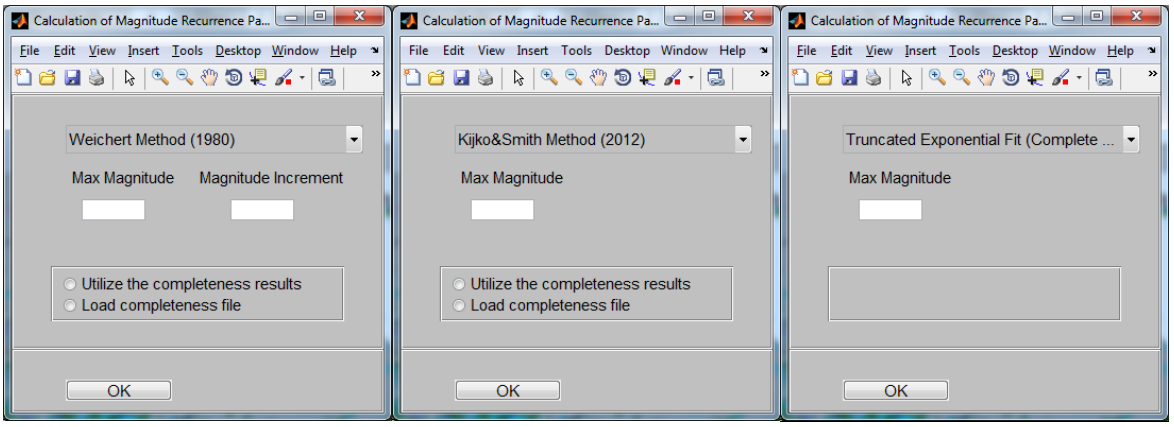

Figure 9. Appearance of the input window of magnitude recurrence tool in case (from left to right) Weichert (1980), Kijko and Smith (2012) and Truncated Exponential Fit method is selected.

According to Weichert (1980) method, maximum likelihood method is utilized to estimate magnitude recurrence parameters (ν and β) that are connected to the constants (a and b) of the Richter's (1958) equation (Eq. 1) for exponential distribution of earthquake magnitudes. Readers are referred to McGuire (1977) for the equivalent form of Eq.1 in case the equation is rearranged in terms of ν and β.

$$Log_{10}N(m) = a - bM \qquad \text{Eq.1}$$

As one can infer form Figure 9, for the case of Weichert (1980) method maximum magnitude and magnitude increment values are decided by the user. Here, the user can either utilize the completeness analysis results of the latest completeness analysis or load a previously saved completeness file. In this method, the magnitude increment that is utilized to construct successive magnitude bins is considerable important. According to Bender (1983), the magnitude increment must be kept small enough in order to not create bias in estimates. To this end, the value of magnitude increment is considered as 0.1 M as default. However, users can define values different than the default value. Another important parameter utilized in Weichert (1980) method is the maximum magnitude. It is well known that maximum magnitude has a great effect on magnitude recurrence parameters. In this sense, decision on maximum magnitude needs to be made under the light of state-of-art geological and seismological (McGuire, 1977). After deciding on magnitude related entries and selecting completeness file, maximum likelihood estimates of magnitude recurrence model is calculated. After that, the exponential fit is illustrated together with earthquake recurrence data on a new window as given in Figure 10.

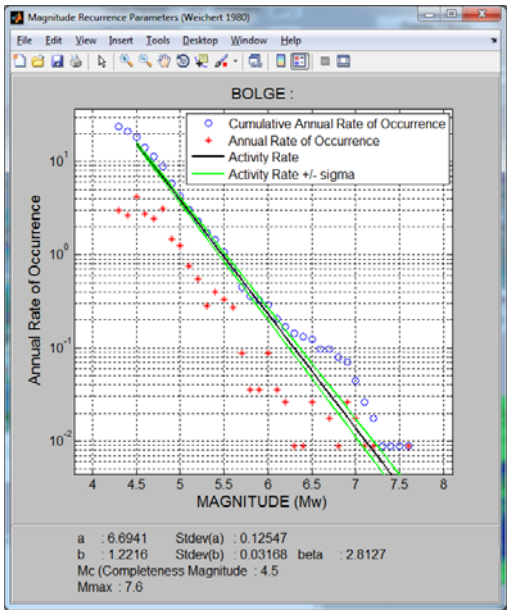

Figure 10. The fitted curve on earthquake recurrence data together with +/-1 σ

As the secondary method, users can utilize the method by Kijko and Smith (2012) to estimate magnitude recurrence parameters of the selected set of earthquakes. Similar to the pervious method, maximum magnitude is

 Copyright © International Science and Technology Conference (ISTEC)

decided by the user. However, this method does not require any other input other than completeness data file. According to this method, selected set of earthquakes are divided into sub-catalogues so that each sub-catalogue established according to the completeness periods. Then, each sub-catalogue is treated as a complete catalogue and maximum likelihood estimates of recurrence parameters of each sub-catalogue are calculated on the basis of Richter's (1958) equation. The recurrence parameters of each sub-catalogue are then combined by a joint function and magnitude recurrence parameters are derived for the entire set of earthquake. The ECAT program does not provide a plot for the results if Kijko and Smith (2012) is utilized. The results are displayed on the command window.

As the final method, users can also select to proceed with truncated exponential fit option where selected earthquakes are considered as complete in each magnitude bin. Accordingly, the maximum likelihood estimates of magnitude recurrence parameters are calculated on the basis of Richter's (1958) relationship. A sample view of the fitted function is displayed in Figure 11 where circles red dots correspond to annual rate of occurrence and blue circles designate cumulative annual rate of occurrence.

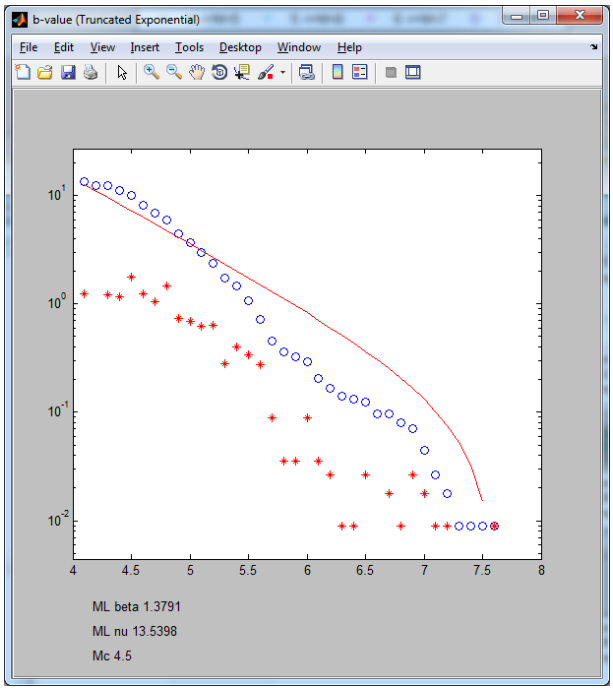

Figure 11. A sample view of fitted exponential curve in case truncated exponential fit option is selected

Concluding Remarks

This paper presents capabilities of the ECAT software that is developed to assess completeness of earthquake catalogues that have unequal completeness periods. In the recent version of the program, the completeness tool incorporates routines for Stepp (1972) and Mulargia et al. (1987) methods. The program also incorporates magnitude recurrence calculation tool that offers 3 methods to calculate maximum likelihood estimates of earthquake recurrence parameters. Among these methods, two of them are applicable to earthquake catalogues with unequal completeness periods. In the current version, the methods by Weichert (1980) and Kijko and Smith (2012) are integrated in the software. It is believed that the ECAT software will be a useful tool for researchers and engineers particularly for those who deal with earthquake catalogues that have unequal completeness periods.

[3]Faculty of Sciences and Arts, Department of Physics, Afyon Kocatepe University,Afyonkarahisar, Turkey

In this research, the effect of cold plasma on *Listeria monocytogenes* and *Staphylococcus aureus* inoculated on sliced pastirma was investigated. In the study, cold plasma which was produced using oxygen gas for 3 min (SP_1), oxygen gas for 5 min (SP_2), argon gas for 3 min (SP_3), argon gas for 5 min (SP_4), % 50-50 argon-oxygen gas for 3 min (SP_5), % 50-50 argon-oxygen gas for 5 min (SP_6), % 75-25 argon-oxygen gas for 3 min (SP_7) and % 75-25 argon-oxygen gas for 5 min (SP_8), was applied to pastirmas.

While moisture contents of samples which was applied cold plasma process were between 44,54-51,88 %, there were not any significant changes in pH values. Both moisture content and water activity values of pastirma samples decreased by the application of cold plasma process. The maximum decrease in a_w value was observed for SP_7 and SP_8 samples. SP_1 sample which was treated with pure oxygen had 0,99 malonaldehyde/kg and it was the highest TBA value after cold plasma treatment compared to the TBA values of other samples. There has been significant changes in color values L*a*b* of pastirma samples. While the lightness of pastirmas decreased, the redness and the yellowness of the samples increased. As a result of cold plasma process applied to pastirma samples inoculated with *Staphylococcus aureus* and *Listeria monocytogenes*, maximum 0,95 log cfu/cm^2 and 0,91 log cfu/cm^2 decreases were observed for *S. aureus* and *L. monocytogenes*, respectively. Moreover cold plasma process decreased TMAB numbers, yeast-mold numbers and psychrophile bacterium numbers in pastirma samples up to 1,41, 1,66 and 1,58 log cfu/cm^2, respectively. In this study, it was determined that cold plasma was effective on sensory properties. Color, appearance, flavor-aroma, texture and general discrimination points showed decrease compared to Control samples. This study showed that gas type and process period being used in cold plasma process was effective in inactivation of pathogens.

Abstract: In this study, it has been especially focused on geometrical damping with regard to the structure-foundation-soil interaction in order to examine the effect of the local soil conditions on the response of the structure subjected to seismic motion. The frequency dependent geometrical damping values corresponding to the lateral and rotational vibrations for the plane wave propagation problems were obtained in the case of clay soil with different plasticity and foundations embedment depth. The soil pattern and its geotechnical parameters were chosen from the Sakarya region. An analysis algorithm written by MATLAB code has been presented for the foundation-soil interaction problem based on impedance functions using in the substructure method. The importance of taking the soil-structure interaction into account in the computation process is emphasized to provide the earthquake safety of the engineering structures built on poor ground conditions in high seismic zones.

Key words: Substructure approach, impedance functions, geometrical damping, clay soil

YAPI-ZEMİN ETKİLEŞİM PROBLEMİNDE GEOMETRİK (RADYASYON) SÖNÜM ETKİSİ

Özet: Yerel zemin koşullarının deprem hareketine maruz yapının dinamik davranışı üzerindeki etkilerini yapı-zemin-temel etkileşimi açısından inceleyebilmek için bu çalışmada özellikle geometrik sönüme odaklanılmıştır. Düzlem dalga yayılım problemlerinde ötelenme ve dönme titreşim hareketine karşı gelen geometrik sönümün sismik kuvvetin titreşim frekansına bağlı değişimi temelin gömülme derinliğine ve farklı plastisite indisine sahip sert ve yumuşak olarak tanımlanan killi zeminler için elde edilmiştir. Zemin örnekleri ve geoteknik parametreleri Sakarya bölgesinden seçilmiştir. Temel-zemin etkileşim probleminin empedans fonksiyonlarına bağlı analizinde altsistem yaklaşımının kullanıldığı MATLAB kodunda yazılmış bir çözüm algoritması sunulmuştur. Depremselliği yüksek ve zayıf zemin koşullarında inşa edilecek önemli mühendislik yapılarının deprem güvenliğinin sağlanmasında yapı-zemin etkileşiminin hesap sürecine katılmasının önemi vurgulanmıştır.

Anahtar sözcükler: Altsistem yaklaşımı, empedans fonksiyonları, geometrik sönüm, kil zemin

Giriş

Depreme karşı davranışlarının önemli olduğu bilinen büyük ölçekli barajlar, nükleer güç santralleri, çok katlı rijit taşıyıcı sistemli konut binaları ve kule gibi ağır yapıların günümüzde aktif deprem bölgelerinde ve zayıf zemin koşullarunda kurulması zorunluluğu, üstyapı ile zemin arasındaki dinamik karşılıklı etki probleminin konusunu oluşturmaktadır. Zemin ortamının üstyapıya oranla çok rijit olduğu durumlar dışında, statik ve dinamik dış etkilere karşı üstyapı ve zemin her ikisi de şekil değiştirebilen sistemler olarak birlikte davranış gösterirler. Bu nedenle gerçek davranışın göz önüne alınabilmesi için zemin bölgesi de yapısal sistemin bir parçası olarak tanımlanmalı ve yapıyla beraber analiz edilmelidir. Sismik analizlerde yapı-zemin dinamik etkileşimi

 Copyright © International Science and Technology Conference (ISTEC)

probleminin çözüm sürecine katılarak yapıların deprem performansları daha ayrıntılı bir şekilde ele alınarak, depreme karşı tam güvenlik doğruluk düzeyi yüksek matematik modeller ve sayısal yöntemler kullanarak sağlanabilmektedir.

Yapı-zemin etkileşim probleminin çözümünde alt-sistem yaklaşımının kullanılmasında, temel ortamının yapısal davranış üzerindeki etkisi, yarı uzay veya ana kaya tabanlı yatay tabakalı zeminin teorik olarak elasto-dinamik çözümüne dayanan sismik yükün frekansına bağlı eşdeğer yay ve söndürücülerle temsil edilmektedir. Bu konuda geniş bir frekans aralığı üzerinde empedans fonksiyonlarının kullanımıyla ilgili yüzeysel ve gömülü temellerin titreşimleriyle ilgili birçok çalışma yapılmıştır (Apsel ve Luco,1987; Çelebi ve Gündüz, 2005; Mylonakis vd.;2006; Çelebi vd., 2006). Bu alanda gerçekleştirilen çalışmalar da elastik zemin davranışı varsayımı altında değerlendirilmiştir.

Yapı-zemin dinamik etkileşimini dikkate almak için "mevcut binaların sismik rehabilitasyonu" isimli ASCE-41 yönetmeliğinde (bir önceki versiyonu FEMA 356) dikdörtgen temeller için statik rijitlik formülleri kullanılarak zemin davranışını temsil edecek statik rijitlik katsayıları her bir titreşim modu için hesaplanabilmektedir. Bu katsayılar bina modeline statik yay sabitleri olarak tanımlanmaktadır. Artımsal itme analizi ile yapı-zemin dinamik etkileşiminin irdelendiği birçok ortak çalışma rapor sonuçlarında problemin çözümünün elastik zemin davranışı ile sınırlı kaldığı görülmektedir (NIST GC 12-917-21 Report, 2012).

Bu çalışmada iki boyutlu betonarme köprü ayağının, oturduğu zeminle etkileşim probleminin sayısal modelinin analizi için altsistem yöntemi esas alınmıştır (Şekil 1). Bu yaklaşımda rijit temelin oturduğu zemin ortamının şekil değiştirme özelliği ötelenme ve dönme empedans fonksiyonlarına bağlı ifade edilmektedir (Pais ve Kausel, 1988). Yerel zemin koşullarının deprem hareketine maruz yapının dinamik davranışı üzerindeki etkilerini yapı-zemin-temel etkileşimi açısından inceleyebilmek için bu çalışmada özellikle geometrik sönüme odaklanılmıştır. Düzlem dalga yayılım problemlerinde ötelenme ve dönme titreşim hareketine karşı gelen geometrik sönümün sismik kuvvetin titreşim frekansına bağlı değişimi temelin gömülme derinliğine ve farklı plastisite indisine sahip sert ve yumuşak olarak tanımlanan killi zeminler için elde edilmiştir. Zemin örnekleri ve geoteknik parametreleri Sakarya bölgesinden seçilmiştir.

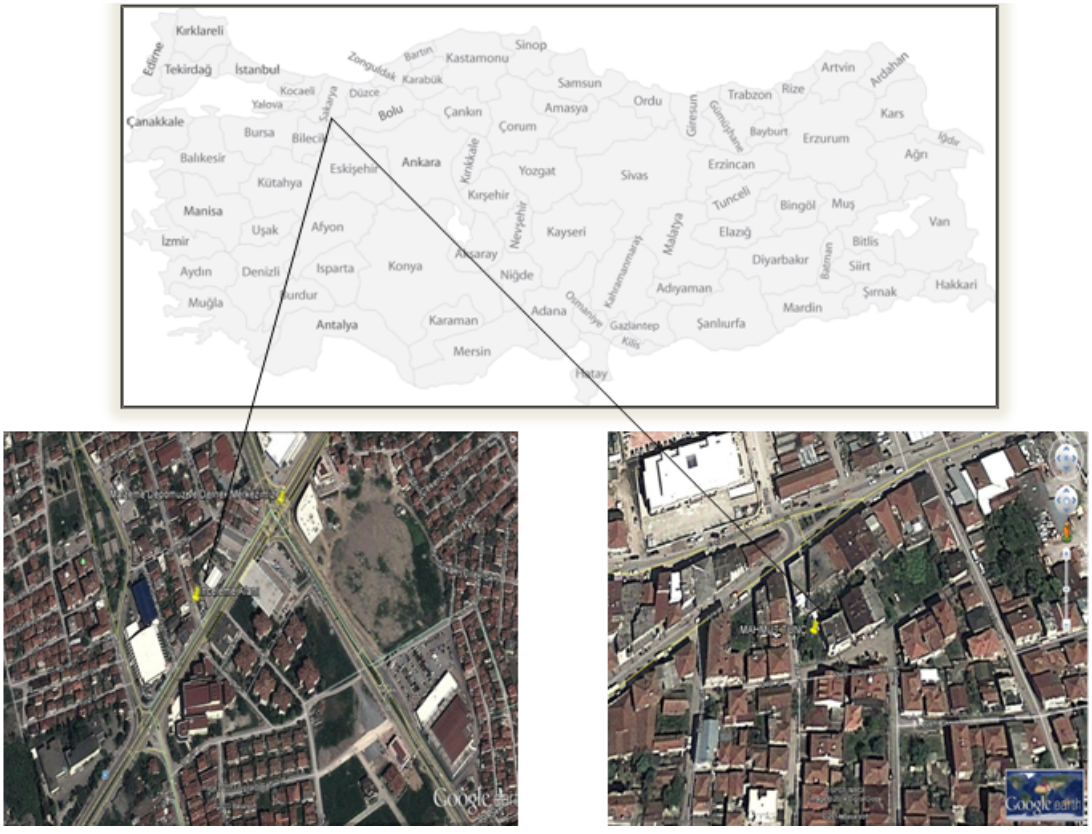
Şekil 2. Geometrik Sönümleri Hesaplayan Akış Şeması



Sayısal Uygulama ve Tartışma

Sayısal uygulamada betonarme köprü ayağının oturduğu temel ortamı farklı kıvamlardaki sert ve yumuşak kil olmak üzere iki durum için incelenmiştir. Bu çalışmada, zeminin birim şekil değiştirmesine karşı gelen, histerezis döngü ile tüketilen enerjiyi temsil eden malzeme sönümünün empedans fonksiyonlarına etkisi dikkate alınmamıştır. Yapı-zemin etkileşim probleminin sayısal modeli için altsistem yöntemi kullanılmıştır (Şekil 3).

Şekil 3. Yapı-Temel-Zemin Ortak Sisteminin Genel Yapısı

Sayısal analizlerde Sakarya ili Adapazarı ilçesindeki Yağcılar ve Pabuççular Mahallesine (Şekil 4) ait temel etüt raporundan alınan zemin mekanik özellikleri kullanılmıştır (Gündüz ve Kurnaz, 2013 ve 2014). İki farklı zemine ait bilgiler Tablo 2'de verilmiştir.

Şekil 4. Yer Bulduru Haritası

Tablo 2. Farklı Kıvamlardaki Killi Zemin Ortamının Özellikleri

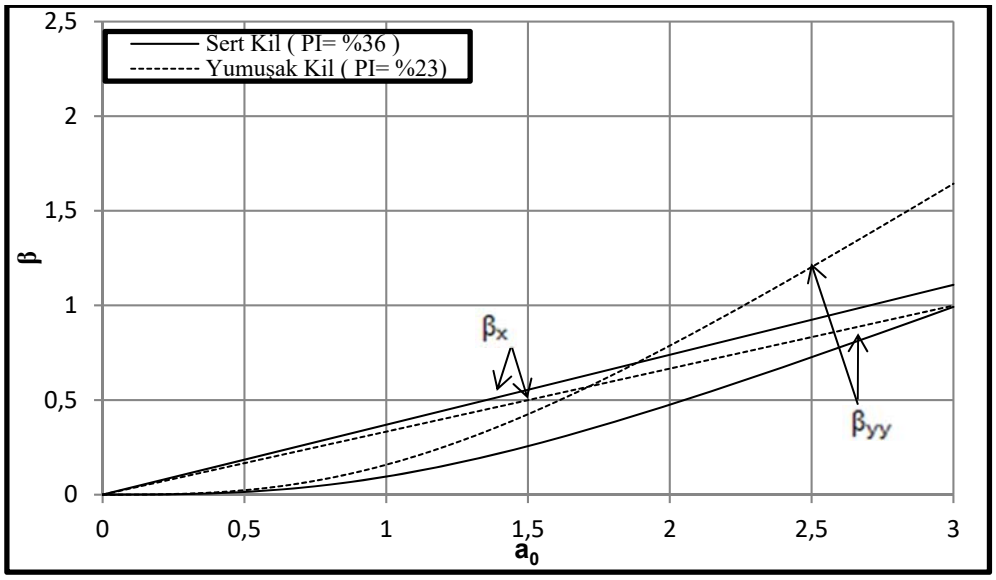
Parametre	Sembol	Birim	Sert Kil	Yumuşak Kil
Yoğunluk	ρ	ton/m^3	1.34	1.45
Kayma modülü	G	kN/m^2	46900	27800
Kayma dalgası	c_s	m/s	187	136
Poisson oranı	ν	-	0.30	0.468
Plastisite İndisi	PI	%	36	23
Elastisite Modülü	E	kN/m^2	122500	81500

Sayısal uygulamalarda kullanılan betonarme köprü ayağı modeline ait mekanik ve geometrik özellikler Tablo 3'de verilmiştir.

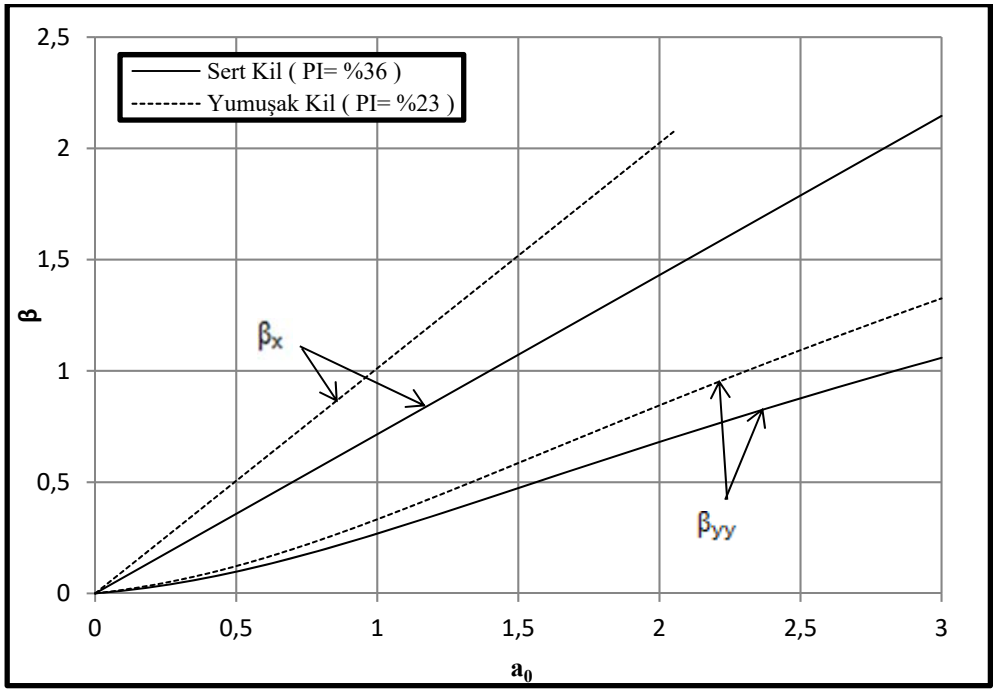
Tablo 3. Yapının Özellikleri

Parametre	Sembol	Birim	Büyüklük
Ağırlık	W	(kN)	500
Yanal ötelenme rijitliği	k	(kN/m)	100000
Yapının yüksekliği	H	(m)	10
Temel genişliğinin yarısı	B	(m)	4
Temel uzunluğunun yarısı	L	(m)	4
Zemine rijit bağlı sistemin periyodu	T	(s)	0.14
Açısal frekans	ω	(rad/s)	44.74

Şekil 5'de statik rijitlikten dinamik rijitliğe geçiş katsayısının boyutsuz frekans parametresine bağlı değişimi temel hareketinin ötelenme ve dönme bileşeni için gösterilmiştir. Ötelenme bileşeninin her iki farklı kıvamdaki kil için frekanstan bağımsız davranmaktadır. Dönme bileşenine ait geçiş katsayısı yüksek titreşim frekanslarında önemli derecede azalmaktadır. Kil zeminler için boyutsuz frekansın a_o=3 olması durumunda temelin dönme titreşimine karşı gelen dinamik rijitlik, statik rijitliğin nerdeyse yarı değerine kadar düştüğü elde edilen sayısal sonuçlardan görülmektedir.



Şekil 5. Dinamik Rijitliğe Geçiş Çarpanının α_x - α_{yy} Boyutsuz Frekans Parametresine Göre Değişimi



Temelin ötelenme ve dönme titreşim hareketine karşı gelen farklı kıvam endeksine sahip killerdeki geometrik sönümün titreşim frekansına bağlı değişimi yüzeysel (D/B=0) ve gömülü temeller (D/B=1) için ayrı ayrı elde

Yapı-temel-zemin etkileşiminin dikkate alındığı özel mühendislik problemlerinin analizinde empedans fonksiyonlarına bağlı altsistem yaklaşımı kullanıldığında statik rijitlikler yüksek frekans değerlerinde yetersiz kalabilmektedir. Titreşim frekansına bağlı dinamik rijitlik terimlerini kullanılması daha doğru sonuçlar verecektir. Dinamik etkileşim problemlerinde temel ortamının toplam sönümü geometrik sönümden önemli derecede temelin gömülme derinliğine ve zemin koşullarına bağlı olarak etkilenmektedir.

THE EFFECT OF HEAT TREATMENT ON MAGNETIC PROPERTIES OF RAPIDLY SOLIDIFIED MNAL ALLOY RIBBONS

Bedri BAKSAN
Eskisehir Osmangazi University, Faculty of Engineering and Architecture
Department of Metallurgical and Materials Engineering
Eskisehir, TURKEY
baksan@ogu.edu.tr

Abstract: The effect of heat treatment on magnetic properties of rapidly solidified $Mn_{54}Al_{46}$ alloy ribbons was studied. Melt spun $Mn_{54}Al_{46}$ alloy ribbons were heat treated at temperatures 500 ºC for 8, 10, and 12 hours, following a water quenching procedure. The heat treated and melt spun ribbons' magnetic properties were observed by vibrating sample magnetometer (VSM), the Curie temperatures were obtained from differential scanning calorimeter (DSC), and the microstructures were observed by optical microscope (OM). The better magnetic properties were obtained from the samples treated at 500 ºC, for 10 hours. The maximum energy product BHmax was obtained as 4.5 MGOe at 305 K, and the Curie temperature was found as 670 K. Increasing the heat treatment temperature deteriorates both the magnetic properties and Curie temperature. The magnetic properties were favored by τ phase which was detected by x-ray diffractometer. Increasing the heat treatment temperature affects the vicinity of τ phase by transforming into γ2 and β phases.

Keywords: Rapid Quenching, Magnetism, Phase Transformations, X-Ray Diffraction

Introduction

Magnetic materials have many important applications in energy production and utilization as well as numerous information science applications ranging from small, precise actuator motors to electronic storage media. The basic principles of magnetism can be explained by first explaining the different types of magnetism. The fundamental properties of magnetism arise from unpaired inner shell electrons which have an intrinsic spin. This spin gives rise to an individual magnetic moment attributed to each atom with these unpaired electrons.

Kono (Kōno, 1958), was discovered the metastable ferromagnetic τ phase, he studied about the composition of the MnAl alloy responsible for the presence, formation and the structure of ferromagnetic τ phase. He found that the ferromagnetic τ phase was in closed pack hexagonal (HCP) structure, this structure was a metastable phase. The ferromagnetic τ phase was obtained by quenching the ε-phase from high temperature by a martensitic transformation. The following studies were realized by Koch (Koch, Hokkeling, v. d. Steeg, & de Vos, 1960), and Zijlstra et al. (Zijlstra & Haanstra, 1966). Kenji (Kenji, Tadashi, & Yoshinori, 1970) added Boron in MnAl alloy to stabilize the metastable τ phase. More systematic approaches were done by Jakubovics (Jakubovics & Jolly, 1977) to explore the effect of the ferromagnetic phase and lattice defects to magnetic properties in detail.
Sakamoto (Sakamoto, Ibata, Kojima, & Ohtani, 1980) added C to MnAl alloy, and obtained the maximum energy product (BHmax) 4.1 MGOe.

There were numerous studies to stabilize the τ phase. In 1989 Sakka et al. (Sakka & Nakamura, 1989), was the first to produce Mn-Al-X (X = C, Ti, Ni, C, B melt-spun ribbons on single disk. He compared these ribbons with water quenched samples. The BHmax, and the magnetic susceptibility was found to be increased. The Ti, C, and B addition to ribbons increased the magnetic properties. The other studies were about the effect of grain size to magnetic properties Van Roy et al. (Van Roy, De Boeck, et al., 1995) conducted a detailed research on τ-MnAl structure and its magnetic properties, this study showed that the better magnetic properties could be obtained by 450 ºC, if the temperature raised up to 550 ºC, τ-MnAl structure transforms gradually to ε-MnAl. Van et al. (Van Roy, Bender, Bruynseraede, De Boeck, & Borghs, 1995) investigated the range of order of have a strong relationship with increase in magnetization of τ-MnAl ribbons.

Materials and Methods

In this study cast $Mn_{54}Al_{46}$ alloy and melt spun thin ribbons was produced and used, heat treatment was done at 500ºC for three duration time of 8, 10 and 12 hours. The effects of heat treatment on magnetic properties of this binary alloy were observed.

 Copyright © International Science and Technology Conference (ISTEC)

The Mn, and Al metals of high purity were obtained from Sigma-Aldrich. The melting of alloying elements were done in Leybold-Heraus vacuum induction furnace, melting atmosphere was cleaned and sweep at least three times with argon.

The cast $Mn_{54}Al_{46}$ alloy chuck was cut into small pieces for melt spin process. The alloy was melted, and spout out with argon. The circumferential speed of rotating copper disk adjusted to 20 m/s. The schematic view of the melt spin apparatus was shown in Figure 1(Wang & Mitra, 2014). The ribbons were 300 μm thick, and 3 mm wide.

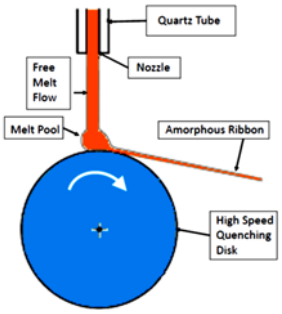

Figure 1. Schematic view of melt spin apparatus (Wang& Mitra, 2014)

Crystal structures were determined by X-ray diffraction (XRD; Philips PANalytical X'Pert-Pro) using Cu-Kα radiation.
Heat treatment procedures were performed on samples of the as-melt spun $Mn_{54}Al_{46}$ alloy sealed in quartz tubes following a vacuum assisted argon sweep procedure to protect against oxidation during heat treatment. The heat treatment sequence was 500ºC, for three duration times of 8, 10 and 12 hours. After each heat treatment interval, the magnetic properties of each of the vacuum-sealed sample were analyzed. Magnetic measurements were carried out using a superconducting quantum interference device magnetometer (SQUID; Quantum Design MPMS) at 305 K. The Curie temperature of the samples were obtained from Perkin-Elmer Diamond DSC with a scan rate of 5ºC/min.

The microstructures of both melt spun and cast samples were taken with Olympus PMG-3 metallurgical microscope. The microstructures were evaluated with Kameram software.

Results and Discussion

XRD results showed that the vicinity of τ phase occurs with increasing the heat treatment temperature, but further increase in temperature results with undesired transformation of τ phase into γ2 and β phases which deteriorates the magnetic properties. The XRD patterns of melt spun sample, heat treated at 500ºC for 10 hrs was given at Figure 2.

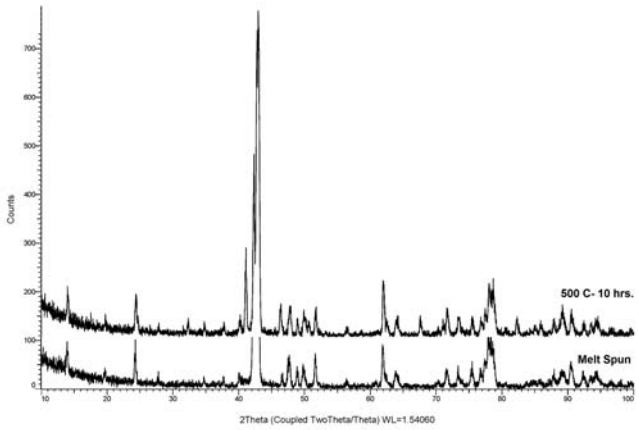

Figure 2. XRD of melt spun and heat treated at 500ºC for 10 hrs melt spun ribbons.

Magnetic measurements were determined from SQUID; Quantum Design MPMS, at 305 K. The hysteresis curves revealed that ribbons treated at 500ºC for 10 hrs have relatively high magnetic strength which gives maximum energy product of BH_{max} value of 4.5 MGOe at 305 K, a reasonable value for a permanent magnet. The hysteresis

 Copyright © International Science and Technology Conference (ISTEC)

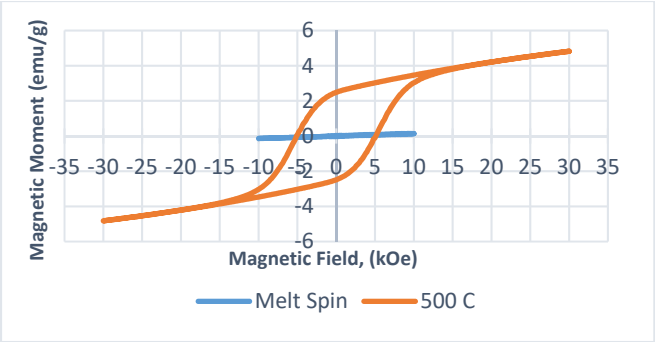

Figure 3. Magnetic hysteresis of Melt spin and heat treated at 500ºC for 10 hrs melt spun ribbons at 305 K

curves for both melt spin and heat treated at 500ºC for 10 hrs melt spun ribbons were given at Figure 3. The Curie temperature was obtained as 670 K from Perkin-Elmer Diamond DSC with a scan rate of 5ºC/min.

The microstructures of both heat treated at 500ºC for 10 hrs. cast alloy and melt spun ribbons were compared at Figure 4. Figure 4a shows as cast and heat treated at 500ºC sample, Figure 4b shows the heat treated at 500ºC melt spun ribbon's microstructure. The grain size of as cast and heat treated samples were pretty higher than the melt spun and heat treated samples. The quenching effect of melt spinning procedure highly obvious.

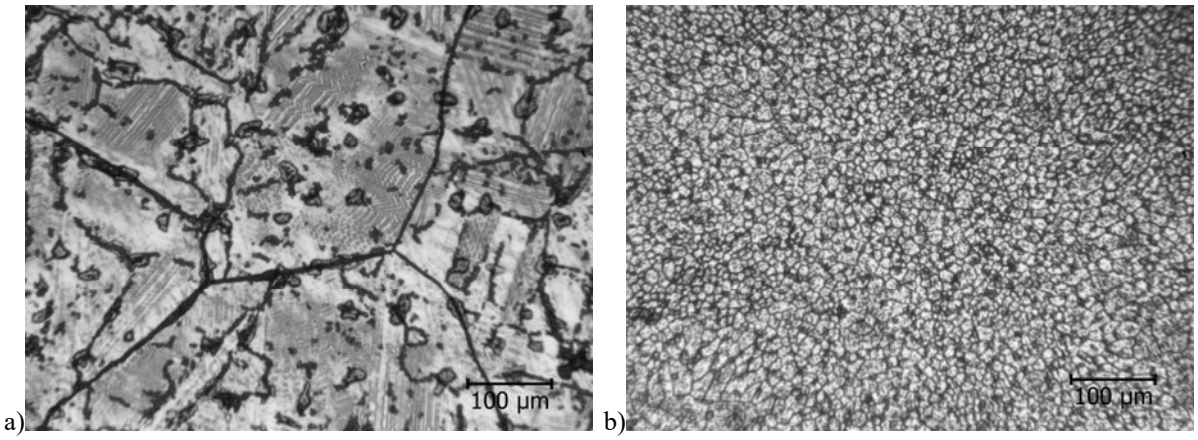

Figure 4. a) Cast and heat treated sample, b) melt spun and heat treated sample, both heat treated at 500ºC for 10 hrs

From XRD results it is seen that the heat treatment temperature increase worsening the magnetic properties due to transformation of τ phase into γ2 and β phases. The magnetic strength is highly related with τ phase, which is ordering the crystal structure together with the effect of rapid quenching the fine grain size is not sufficient therefore a heat treatment should be realized to start the formation of τ phase. The time for optimum magnetic properties limited with 10 hours, exceeding the 10 hours also promotes the formation of γ2 and β phases.

The magnetic properties as seen from Figure 3 shows a characteristic curve for a permanent magnet for melt spun and heat treated sample. The fine grain size have no effect on the magnetic properties therefore a heat treatment should follow melt spin procedure. The hysteresis curve shows that solely melt spun sample have no giant hysteresis, but after heat treatment the arrangement magnetic domains and also in our case the vicinity of τ phase, promotes the magnetic properties up to 4.5 MGOe maximum energy product achieved.

Conclusion

The production of binary magnetic $Mn_{54}Al_{46}$ alloy was successful. The production steps including casting, melt spinning, and heat treatment. The optimum magnetic properties was obtained from the melt spun ribbons heat treated at 500ºC for 10 hrs. However this alloy group had been an early studied alloy, by the discovery of modern production methods may have positive effect on production of hard to produce alloys.

THE EFFECT OF METAKAOLIN ADDITIVE ON FLY ASH – BASED GEOPOLYMER FOAM PROPERTIES

Gökhan GÖRHAN*, Gökhan KÜRKLÜ

Afyon Kocatepe University, Department of Civil Engineering, Afyonkarahisar - TÜRKİYE

ggorhan@aku.edu.tr, kurklu@aku.edu.tr

Abstract: In this study, the production of fly ash – based geopolymer foam was investigated. The fly ash obtained from Kütahya – Tunçbilek thermal power station and it was used as the raw material in the production of examples. Metakaolin was used as substitute material and it is added to the mixture obtained by calcining kaolin clay at 700 ºC in laboratory conditions. NaOH and sodium silicate solution were used as alkaline activator for made geopolymer foam medium. The aluminium powder added in order to increase the porosity of the material body in the prepared mixtures. The thermal curing processes were applied to the prepared mixtures for the geopolymerisation process. Then, the physical properties such as water absorption, density and porosity with compressive strength of the samples were determined. As a result, the effect of metakaolin additive on fly ash – based geopolymer foam properties were investigated.

Keywords: Geopolymer, Foam, Fly ash, Metakaolin.

Introduction

Geopolymer is one of the recent technologies developed with the aim of reducing the use of cement binder in concrete production. Leading the drive for seeking an alternative product to cement, this topic has gained popularity in the studies of researchers. Geopolymerization process carried out for the production of geopolymer involves reaction between aluminosilicate material and alkali solutions. When aluminosilicate materials used in the production of geopolymer are selected from industrial waste products, they cause much lower carbon dioxide emissions than cement does (Mo, 2016). In comparison to the use of cement, geopolymer products can lead to a reduction up to 64% in carbon dioxide emissions (McLellan, 2011).

Geopolymers was first developed in the early eighties by Joseph Davidovits. However, it is not possible to define geopolymerization process concisely in order to explain it. Geopolymerization is a complex process which has not been fully understood to this day (Davidovits, 1982). Therefore, taking into account each and every assertion defining this process, we can first state that geopolymers are incipient polymeric compounds. According to the monomer hypothesis, geopolymerization refers to a simple reaction mechanism involving condensation polymerization of ortho-sialiate ions. Geopolymers are three dimensional inorganic polymers comprising several semi crystalline phases and an amorphous series with Si-O-Al linkage. Si^{4+} and AI^{3+} cations with oxygen linkage in bridges in the structure of such polymer form tetra-hedral coordination. The negative charges on AlO^{4-} groups are balanced by alkali cation (generally sodium (Na+) or potassium (K+) ion) (Izquierdo, 2009; Cioffi, 2003).

Geopolymerization is a geosynthetic reaction of alumino-silicate minerals in a strong alkaline medium at low temperatures (Part, 2015). The three most widely used classes of materials in the geopolymerization process are calcined clay, coal slag and fly ash. In other words, the primary sources of geopolymer raw material are kaolin clay the geologic origin of which is in the form of rock and volcanic ash, while the secondary sources are industrial waste or sub-products such as fly ash and granulated blast furnace slag (Duxson, 2008). Although calcined clays, predominantly metakaolin, are widely used in the synthesis of geopolymer, they give rise to high water demand and high porosity in the production of concrete due to their plate-shaped particles and therefore they are not very suitable materials. Other types of the raw material are more suitable for the synthesis of two-part geopolymer (Hwang, 2015).

Recent studies on this subject indicate that although the use of flash metakaolin geopolymer as an effective binder in place of Portland cement in concrete causes the material to have a highly porous structure, the material has better mechanical properties than Portland cement concretes (Raphaelle, 2016). Another study (Duan, 2016) aims at expanding the use of waste iron ore tailings in geopolymers and reports that 20% replacement by fly ash is optimum. In another study, recyclable scrap-tyre rubber is added to geopolymer concrete with the aim of achieving low CO_2 emissions as well as recycling scrap-tyre rubber which is a serious environmental problem. In another study, fly ash is used as a binder and activated with sodium silicate and sodium hydroxide. The study shows that the replacement of fine aggregate by rubber in the samples up to 5% by volume is possible (Park, 2016). As can be

 Copyright © International Science and Technology Conference (ISTEC)

seen, studies carried out these days aim at producing resistant as well as light geopolymer materials and improving the physical properties of geopolymer concretes rather than improving their mechanical properties. The most effective method for this purpose is using foam concrete. Foam concrete refers to a type of a light concrete with high void ratio formed with or without the addition of a cement binder and a fine aggregate. Foam concrete was first patented by Aylsworth and Dyer in 1914 and then by Bayer and Erikkson in 1923. However, its use as a light construction material has become more popular in recent years (Ramamurthy, 2009; Zhang, 2014).

Some of the recent studies conducted on geopolymer foam concrete use oil palm shell as a lightweight coarse aggregate, palm oil fuel ash or low calcium fly ash as binders in concrete. The results of the oil palm shell foam geopolymer concrete morphology indicate that oven curing periods lead to the formation of a more dense and homogeneous geopolymer matrix, which results in higher compressive strength. The positive correlation of the foam volume with the water absorption and sorptivity points to a reduction in concrete strength. In addition, oil palm shell foam geopolymer concrete gains early strength of up to 87% of its 28-day compressive strength as a result of oven curing (Liu, 2016).

In another study, foamed geopolymer is synthesized with Class F fly ash, sodium hydroxide (NaOH) and the foaming agent, sodium hypochlorite (NaCIO), and then cured at 90 °C. The study investigates the formation of foamed geopolymer at the rates of NaCIO/fly ash whose NaOH/ fly ash effect has been predetermined. The rate of NaCIO/fly ash is kept constant at 0.50 composition while that of NaOH/ fly ash is changed in the range of 0.16 to 0.24. It is reported that the formulations in the study can be used to manufacture materials suitable for construction applications such as light and refractory insulation, interior wall or ceiling panels (Böke, 2015).

Geopolymer foam is used for concrete synthesis with partial replacement of slag by fly ash and mechanical mixing of pre-formed foam and Class F fly ash. Concretes with density of about 720 - 1600 kg /m3 and 28-day compressive strength of about 3–48 MPa are produced. The geopolymer foam concretes exhibit better thermal insulation properties (thermal conductivity in the range of 0.15 to 0.48 W/mK) than the Portland cement foam concretes which have the same density and strength. The compressive strength of the geopolymer foam concrete increases at room temperature with a partial replacement of slag by fly ash, however, leads to significant shrinkage and strength loss at high temperature (Zhang, 2015).

In this study, fly ash and metakaolin materials were activated with alkaline solution consisting of NaOH and sodium silicate solution in order to produce geopolymer material. Immediately afterwards, aluminium powder was added to the geopolymer matrix body at the beginning of the geopolymerization process to carry out foaming process and this way geopolymer foam samples were prepared.

Materials and Methods

Fly ash (FA) supplied from Tunçbilek Thermal Power Plant (Kütahya – TURKEY) was used as raw material in the production of the samples for geopolymer foam synthesis. Metakaolin clay supplied from a private company operating also in Kütahya – TURKEY was sintered at 700 ºC to obtain metakaolin (MK) material which was used as replacement material in this study. Table 1 presents the results of XRF analyses of the fly ash and the metakaolin (MK) materials.

Table 1. Chemical (XRF) composition of fly ash and metakaolin.

Oxide (%)	SiO_2	Al_2O_3	Fe_2O_3	MgO	Na_2O	K_2O	SO_3	CaO	K.K.	Toplam
Metakaolin	54.76	37.71	0.89	0.28	0.20	1.35	0.04	0.46	2.87	98.56

*SS: Sodium silicate solution.

Fly ash and metakaolin were dry-mixed for the preparation of the geopolymer foams and then alkaline solution consisting of a mixture of 15M NaOH and three-module sodium silicate solution was added to the dry mixture and

 Copyright © International Science and Technology Conference (ISTEC)

mixed for 1 more minute. Afterwards, aluminium powder was added to the geopolymer mixture and mixed for another 15-20 seconds. The mixtures were then cast into 50 x 50 x 50 mm metal molds. 10 minutes later, the samples were cured at 80 ºC for 1 hour in order to accelerate the geopolymerization mechanism. Table 2 demonstrates the materials used in the production of the geopolymer foam and Table 3 demonstrates the chemical properties of the materials.

Table 3. Properties of alkali activators.

Sodium silicate solution (SS)	Sodium hydroxide (NaOH)
Na_2O: 26.98 (%) SiO_2 : 8.77 (%) H_2O: 64.25 (%)	M: 40 g/mol NaOH ≥ 99,0 (%)

After curing, the samples were removed from the molds the day after and kept in the laboratory environment until the day of the experiment. Figure 1 displays the images of the samples.

Figure 1. Geopolymer foams cast into molds.

The Archimedes principle could not be fully implemented in determining the physical properties of the geopolymer foam samples due to low bulk density. Therefore, the apparent volumes of the geopolymer foam samples were calculated using a digital compass after the determination of the oven-dry weight and saturated dry-surface weight of the samples in order to identify their physical properties. The physical properties of the samples were determined using these values and in accordance with the equations given in TS EN 772-4 (2000) and TS EN 771-1 (2005) standards. Mechanical tests of the samples were carried out using a computer controlled automatic pressure testing machine in accordance with TS EN 196-1 (2002). Findings section presents the average values of three 7-day samples from each sample group.

Results and Discussion

The findings obtained from the geopolymer foam samples are shown in Figure 2 and Figure 4. The apparent porosity rates of the samples ranged from 32.60 % to 44.11 % and the porosity values decreased with an increase in the metakaolin (MK) replacement. It was determined that an increase in the MK replacement in the sample body led to a more smooth outer body surface and that the apparent porosity rates decreased as a result of a decrease in the rates of open pores (Figure 2a). Water absorption rate of the geopolymer material was quite high. Considering the fact that under normal circumstances, water absorption rate of fly ash is about 50 % and it can be dry-pressed, we can state that the water absorption rates of the samples significantly increased owing to the voids in the material. The water absorption rates of the geopolymer foam materials ranged from 69.83 % to 80.66 %. An increase in the MK replacement in the material body led to a reduction in the water absorption rates (Figure 2b).

With the addition of aluminium powder into the material body during geopolymer foam synthesis process, foaming in large volumes occurred in the mixtures with a large amount of FA material. However, in the aftermath of the foaming in large volumes, precipitation occurred in the material after a certain time. High rate of MK replacement was performed in order to prevent precipitation. An increase in the MK replacement led to a decrease in the samples' bulk density values which ranged from 466.9 kg/m^3 to 546.8 kg/m^3 (Figure 3a). As was the case for the bulk density values, the apparent density values of the material also decreased with an increase in the rate of

 Copyright © International Science and Technology Conference (ISTEC)

MK replacement. The apparent density values of the samples ranged from 692.8 kg/m^3 to 978.4 kg/m^3 (Figure 3b).

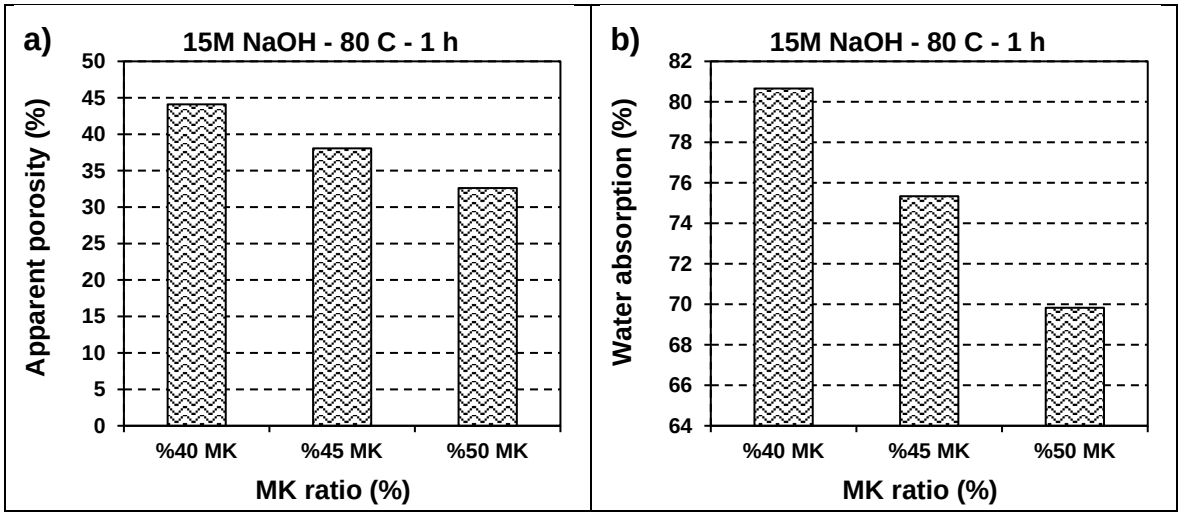

Figure 2. Apparent porosity and water absorption rates by weight of geopolymer foam samples.

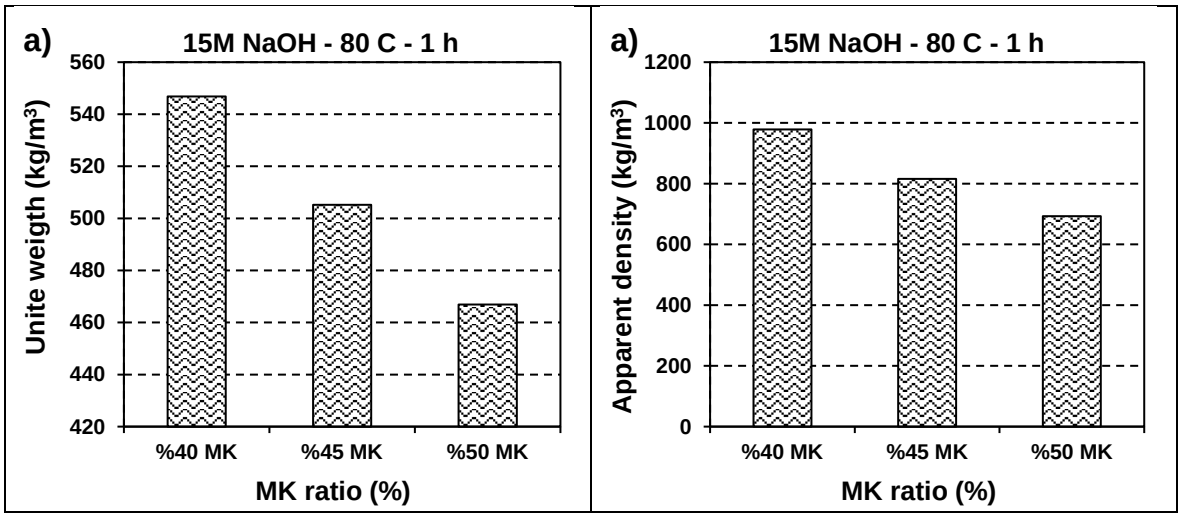

Figure 3. Bulk density and apparent density values of geopolymer foam samples.

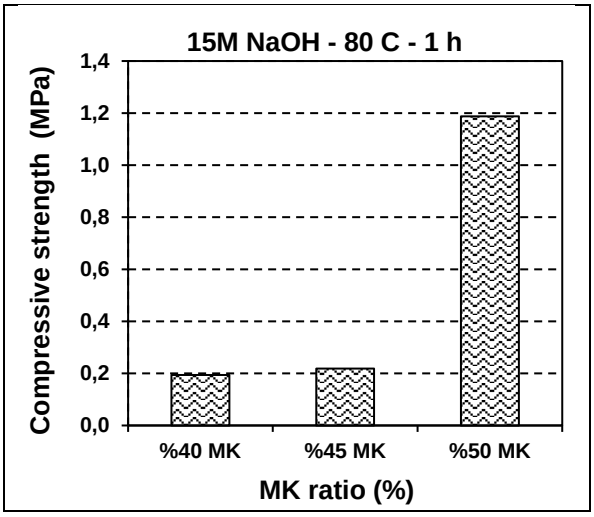

Figure 4. Compressive strength of geopolymer foam samples.

 Copyright © International Science and Technology Conference (ISTEC)

Figure 4 demonstrates the compressive strength values of the geopolymer foam samples. Evaluation of the data indicates that an increase in the rate of MK replacement led to an increase in the compressive strength values of the geopolymer foam samples. The highest compressive strength value (1.19 MPa) was obtained from the samples with the replacement of fly ash by MK by 50 %

Conclusion

The results obtained from this study investigating the production of fly ash -based geopolymer foam are as follows;

- In case of low levels of MK replacement rate in the synthesis of geopolymer foam, precipitation occurs in the geopolymer foam samples.
- It is observed that following foaming process, high rates of KM replacement prevent precipitation in the material and that no deformation occurs in the geopolymer foam with MK replacement by 40% or above.
- Geopolymer foams with high rates of fly ash develop a weak structure. Due to this weak structure, thermal curing process applied to geopolymer foams should be improved.
- This study which involved preliminary investigations of the production of geopolymer foam clearly shows that further optimization studies are needed. If compressive strength values of geopolymer foam materials with high porosity and low bulk density can be brought to a certain level through optimization studies, it will pave the way for the use of this material in the field of thermal insulation.

Abstract: Finite element analysis is an effective method for evaluating roller-compacted concrete (RCC) dams in the earthquake zone and investigating earthquake response of RCC dams. The primary aim of this research is to inspect the effect of various reservoir lengths on the earthquake response of a selected RCC dam under strong ground motion effect. This study presents two-dimensional earthquake response of Cine RCC dam considering geometrical and material non-linearity in time-history analyses. The Drucker-Prager material model is used in the materially non-linear analyses for concrete and also foundation rock. The reservoir length of RCC dam is modeled respectively as half, itself, two times, three times, five times and ten times of the dam height. The dam–reservoir-foundation interaction is modeled by the contact-target element couples. The hydrodynamic pressure of the reservoir water is modeled with two dimensional fluid finite elements based on the Lagrangian approach. 1999 Duzce Earthquake acceleration records are considered in all dynamic analysis. According to non-linear time history analyses, the horizontal displacements and principle stress components are compared and evaluated.

Keywords: Contact-target element, Hydrodynamic pressure, Lagrangian approach, Roller-compacted concrete dam.

Introduction

People have always tried to live around water resources from past to present Because water is very important to survive people and other lives. People have needed water for a lot of purpose until humanity. The settlers around water resources have used water for storing, drinking and irrigation in many eras. Furthermore, settlements away from water supplies have always many problems. They were not obtainable water every time and every place. Dams are the most important buildings for storing water, water protection and the buildings play very important role for obtaining of energy and continuing of people's daily lives. Dams can prevent uncontrolled water. Dams can reduce consumption of fossil fuels for electricity production. Roller compacted concrete (RCC) dams have been widely used by all world countries since the 1980s. DSI (state hydraulic works) which is responsible for realization of water resources development projects in Turkey is completed 204 large dams and 339 small dams until today. 111 large dams and 159 small dams are under construction in Turkey.

The investigators usually focused on the thermal analysis of RCC dams because thermal cracking may create a leakage path to the downstream face that is aesthetically undesirable. Noorzaei et al. (2006) performed thermal and structural analysis of Kinta RCC gravity dam, which is the first RCC dam in Malaysia, using the developed two-dimensional finite element code. Then the authors compared predicted temperatures obtained from the finite element code with actual temperatures measured in the field using thermocouples installed within the dam body and they found them to be in good agreement. Jaafar et al. (2007) developed a finite element based computer code to determine the temperatures within the dam body. According to performed thermal analysis of a RCC dam changing the placing schedule can optimize the locations of maximum temperature zones. Bayraktar et al. (2010) investigated the effect of reservoir length on seismic performance of gravity dams to near and far-fault ground motions. Abdulrazeg et al. (2010) performed three dimensional coupled thermal and structural analysis of roller compacted concrete dams. They assessed crack development within the dam body using the proposed crack index.

 Copyright © International Science and Technology Conference (ISTEC)

This method remarkably reduces the total number of elements and nodes when the dam height was increased. Zhang et al. (2011) simulate and analyze the temperature field and thermal stress of certain RCC gravity dams in cold regions using the material properties of roller-compacted concrete by three-dimensional finite element relocating mesh method. As a result, the authors indicated that superficial insulation prevented surface cracks from forming. Kartal et al. 2012 investigated three-dimensional earthquake analysis of roller-compacted concrete dams.

In this study, two-dimensional earthquake response of Cine RCC dam is investigated for six different cases. The reservoir length of RCC dam is modeled respectively as half, itself, two times, three times, five times and ten times of the dam height. The two dimensional fluid finite elements based on the Lagrangian approach is utilized to obtain the hydrodynamic pressure effect of the reservoir water. Contact-target elements are used in dam-foundation-reservoir interfaces. No separation friction case is considered between dam and foundation. Nonlinear time-history analyses are carried out to obtain earthquake response of the dam. Geometrically and materially nonlinear analysis were made for this purpose. Fixed boundary conditions are considered in the numerical solutions. Numerical solutions indicate that the horizontal displacements increased by increasing reservoir length and hydrodynamic pressure effect. In addition to this, principal tensile and compressive stresses increased by reservoir length. When reservoir length extended, greater displacements and stresses appeared in the upstream side of the dam.

Formulation of Dam-Foundation-Reservoir Interaction by the Lagrangian Approach

The formulation of the fluid system based on the Lagrangian approach is presented as following (Wilson and Khalvati, 1983; Calayır 1994). In this approach, fluid is assumed to be linearly compressible, inviscid and irrotational. For a general two-dimensional fluid, pressure-volumetric strain relationships can be written in matrix form as follows,

$$\begin{Bmatrix} P \\ P_z \end{Bmatrix} = \begin{bmatrix} C_{11} & 0 \\ 0 & C_{22} \end{bmatrix} \begin{Bmatrix} \varepsilon_v \\ w_z \end{Bmatrix} \tag{1}$$

Where P, C_{11}, and ε_v are the pressures which are equal to mean stresses, the bulk modulus and the volumetric strains of the fluid, respectively. Since irrotationality of the fluid is considered like penalty methods (Zienkiewicz and Taylor, 1989; Bathe, 1996), rotations and constraint parameters are included in the pressure-volumetric strain equation (Eq. (1)) of the fluid. In this equation P_z, is the rotational stress; C_{22} is the constraint parameter and w_z is the rotation about the cartesian axis y and z.

In this study, the equations of motion of the fluid system are obtained using energy principles. Using the finite element approximation, the total strain energy of the fluid system may be written as,

$$\Pi_e = \frac{1}{2}\mathbf{U}_f^T \mathbf{K}_f \mathbf{U}_f \tag{2}$$

where $\mathbf{U}_f$ and $\mathbf{K}_f$ are the nodal displacement vector and the stiffness matrix of the fluid system, respectively. K_f is obtained by the sum of the stiffness matrices of the fluid elements as follows,

$$\begin{aligned} \mathbf{K}_f &= \Sigma \mathbf{K}_f^e \\ \mathbf{K}_f^e &= \int_V \mathrm{B}_f^{eT} \mathrm{C}_f \mathrm{B}_f^e \mathrm{dV}^e \end{aligned} \tag{3}$$

where C_f is the elasticity matrix consisting of diagonal terms in Eq. (1). B_f is the strain-displacement matrix of the fluid element.

An important behavior of fluid systems is the ability to displace without a change in volume. For reservoir and storage tanks, this movement is known as sloshing waves in which the displacement is in the vertical direction. The increase in the potential energy of the system because of the free surface motion can be written as,

$$\Pi_s = \frac{1}{2}\mathbf{U}_{sf}^T \mathbf{S}_f \mathbf{U}_{sf} \tag{4}$$

where $\mathbf{U}_{sf}$ and $\mathbf{S}_f$ are the vertical nodal displacement vector and the stiffness matrix of the free surface of the fluid system, respectively. $\mathbf{S}_f$ is obtained by the sum of the stiffness matrices of the free surface fluid elements as follows,

$$\left.\begin{aligned} \mathbf{S}_f &= \Sigma \mathrm{S}_f^e \\ \mathbf{S}_f^e &= \rho_f g \int_A \mathrm{h}_s^T \mathrm{h}_s \mathrm{dA}^e \end{aligned}\right\} \tag{5}$$

 Copyright © International Science and Technology Conference (ISTEC)

where h_s is the vector consisting of interpolation functions of the free surface fluid element. ρ_f and g are the mass density of the fluid and the acceleration due to gravity, respectively. Besides, kinetic energy of the system can be written as,

$$T = \frac{1}{2}\dot{\mathbf{U}}_f^T \mathbf{M}_f \dot{\mathbf{U}}_f \tag{6}$$

Where $\dot{\mathbf{U}}_f$ and $\mathbf{M}_f$ are the nodal velocity vector and the mass matrix of the fluid system, respectively. $\mathbf{M}_f$ is also obtained by the sum of the mass matrices of the fluid elements as follows,

$$\left.\begin{aligned} \mathbf{M}_f &= \sum M_f^e \\ \mathbf{M}_f^e &= \rho_f \int_V H^T H dV^e \end{aligned}\right\} \tag{7}$$

where H is the matrix consisting of interpolation functions of the fluid element. If (Eq. (2), (4) and (6)) are combined using the Lagrange's equation (Clough and Penzien, 1993); the following set of equations is obtained,

$$\mathbf{M}_f \ddot{\mathbf{U}}_f + \mathbf{K}_f^* \mathbf{U}_f = \mathbf{R}_f \tag{8}$$

where, $\ddot{\mathbf{U}}_f$, $\mathbf{U}_f$ and $\mathbf{R}_f$ are the system stiffness matrix including the free surface stiffness, the nodal acceleration and displacement vectors and time-varying nodal force vector for the fluid system, respectively. In the formation of the fluid element matrices, reduced integration orders are used (Wilson and Khalvati, 1983).

The equations of motion of the fluid system, (Eq. (8)), have a similar form with those of the structure system. To obtain the coupled equations of the fluid-structure system, the determination of the interface condition is required. Since the fluid is assumed to be inviscid, only the displacement in the normal direction to the interface is continuous at the interface of the system. Assuming that the structure has the positive face and the fluid has the negative face, the boundary condition at the fluid-structure interface is,

$$U_n^- = U_n^+ \tag{9}$$

where U_n is the normal component of the interface displacement (Akkas et al., 1979). Using the interface condition, the equation of motion of the coupled system to ground motion including damping effects are given by,

$$\mathbf{M}_c \ddot{\mathbf{U}}_c + \mathbf{C}_c \dot{\mathbf{U}}_c + \mathbf{K}_c \mathbf{U}_c = \mathbf{R}_c \tag{10}$$

in which Mc, Cc, and Kc are the mass, damping and stiffness matrices for the coupled system, respectively. $\mathbf{U}_c, \dot{\mathbf{U}}_c, \ddot{\mathbf{U}}_c$ and $\mathbf{R}_c$ are the vectors of the displacements, velocities, accelerations and external loads of the coupled system, respectively.

NUMERICAL MODEL OF CINE RCC DAM

The Model of Cine RCC Dam

Cine dam, located approximately 16km southeast of Cine, Aydın, was constructed in 2010 by General Directorate of State Hydraulic Works (Fig. 1) (DSI, 2015). It was established on Cine River. This dam was projected as a roller compacted concrete dam. The reservoir is used for irrigation and energy purposes. The dam crest is 372.5m in length and 9m wide. The maximum height and base width of the dam are 136.5 m and 142.5 m, respectively. The maximum height of the reservoir water is considered as 98.77 m. The annual total power generation capacity is 118 GW.

Fig. 1. Cine Roller Compacted Concree Dam

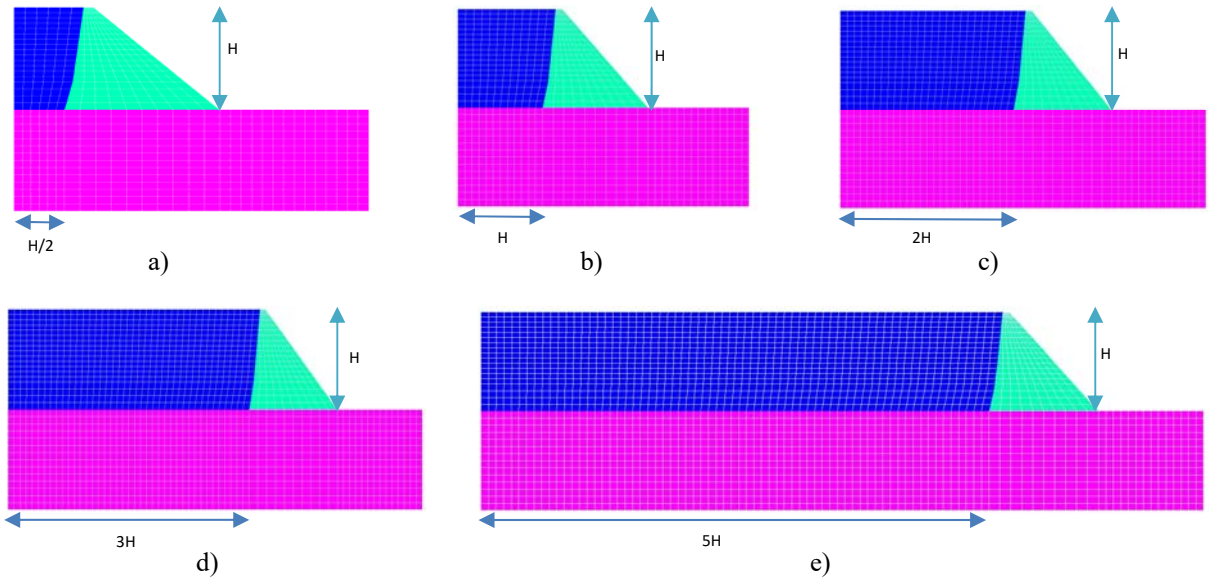
Material Properties of Cine Dam

The two-dimensional finite element model of Cine dam is modeled considering two layered foundation rock. One of this begins from crest level to base of the dam body. The other begins from the base of the dam body to bottom of the foundation. The material properties of Cine roller compacted concrete dam body and foundation are given in Table 1.

Table 1. Material Properties of Cine RCC dam

	Material Properties		
	Modulus of Elasticity (GPa)	Poisson's Ratio	Mass Density (kg/m³)
Concrete (Dam)	30	0.20	2530
Rock (Lower Foundation Soil)	25	0.18	2800



Finite Element Models of Cine Dam

This study considers two-dimensional finite element models of Cine RCC dam (Fig. 2). In this model, if the height of the dam is indicated as 'H', the foundation soil is extended as 'H' in the transverse river direction, downstream direction and gravity direction. Besides, reservoir water model is extended as following Table 2. Numerical analysis were performed for these six cases.

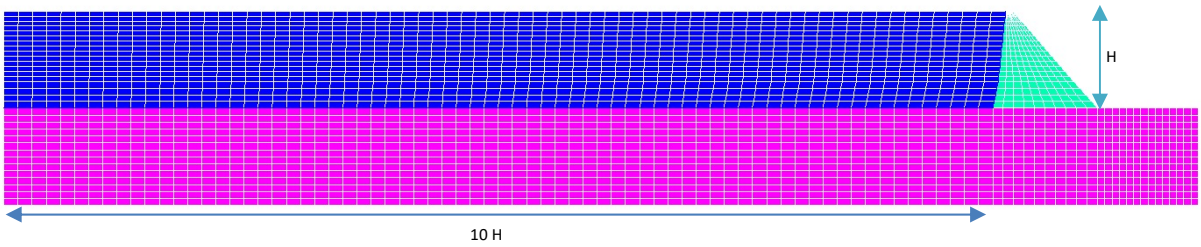


Table 2. Numerical analysis

Cases	*Reservoir length*
Case 1	H/2
Case 2	H
Case 3	2H
Case 4	3H
Case 5	5H
Case 6	10H

Fluid and solid element matrices are computed using the Gauss numerical integration technique (Wilson and Khalvati, 1983).

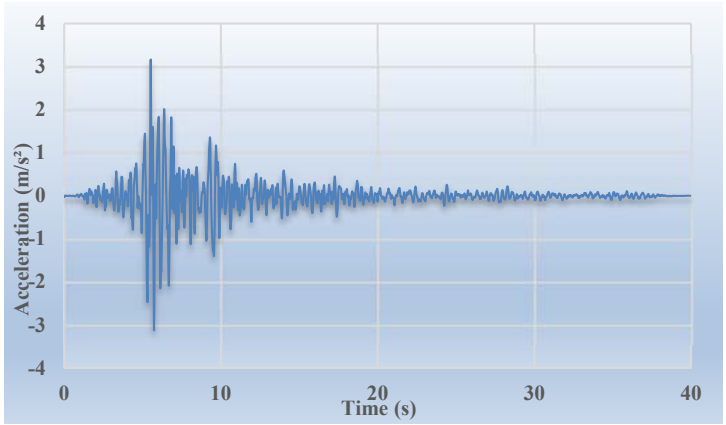

Fig. 2. Finite Element Models of Cine RCC dam

Strong Ground Motion Effects

This study investigates the earthquake response of Cine RCC Dam subjected to strong ground motion. Different reservoir length cases are taken into account in the numerical solutions. The north-south and vertical components of the 1989 Loma Prieta earthquake (Fig. 3) are utilized in analyses. Earthquake analyses are performed during 39.96 second. Nonlinear time-history analyses were performed using Ansys (2016). In the non-linear time history analyses, the time interval is used as 0.01 in different water level case. Rayleigh damping is used in time-history analysis. Therefore, first six vibration frequencies are considered to calculate Rayleigh damping constants using initial boundary conditions (Rayleigh and Lindsay, 1945; Chopra, 1996). Besides, Newmark algorithm was employed in numerical solutions.

Numerical Analysis and Results

This study presents earthquake behavior of Cine RCC dam considering north-south and vertical components of 1989 Loma Prieta earthquake. Earthquake analyses are performed during 39.96 second. Numerical analysis was investigated for six different cases. If dam body height supposes as H, reservoir length is modelled as the following (Table 2). Numerical analysis is performed for each cases.
Solutions are shown in Fig. 4-6. According to these solutions, the smallest displacement is approximately 4.7 cm at dam crest for Case 1. However, the maximum displacement is 7.4 cm at dam crest for Case 6 (Fig. 4). So this solution is clearly shown that when reservoir length extends, higher displacements are obtained.

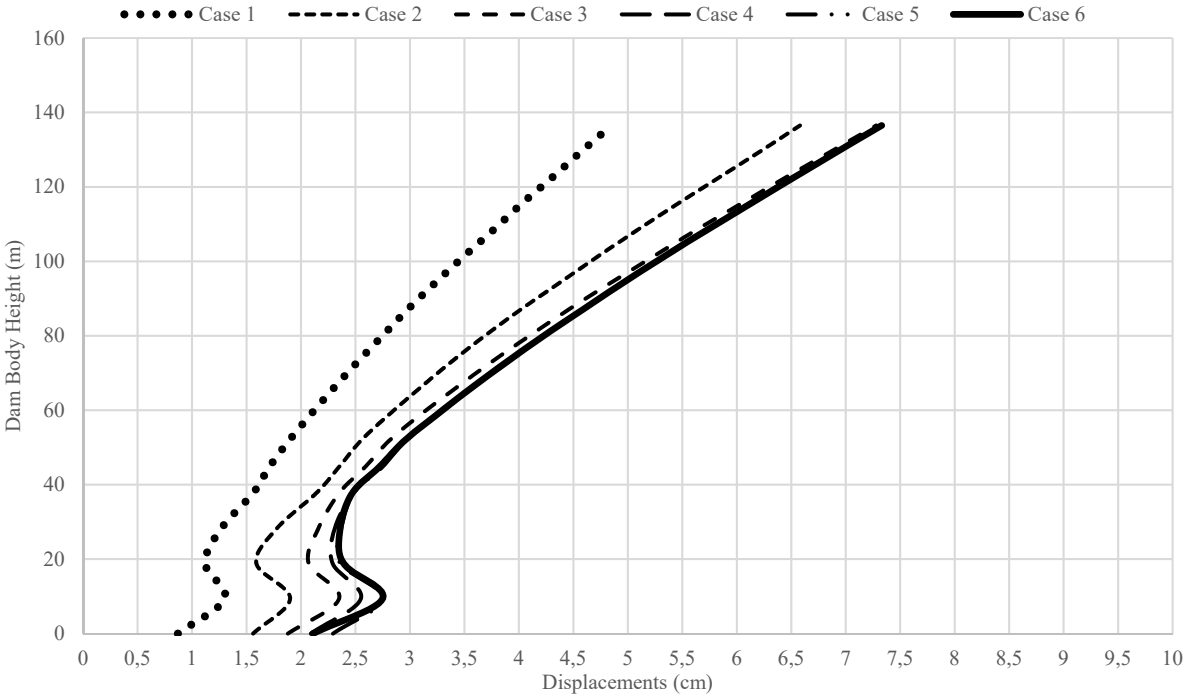

Fig. 4. Horizontal Displacements

The principal tensile and compression stresses are shown in Fig. 5-6. The maximum principal compression stress is approximately 9900 kN/m^2 at bottom of dam for Case 6. The minimum principal compression stress is 7350 kN/m^2 for Case 1 (Fig. 5.). The effect of reservoir length clearly appeared from these solutions.

 Copyright © International Science and Technology Conference (ISTEC)

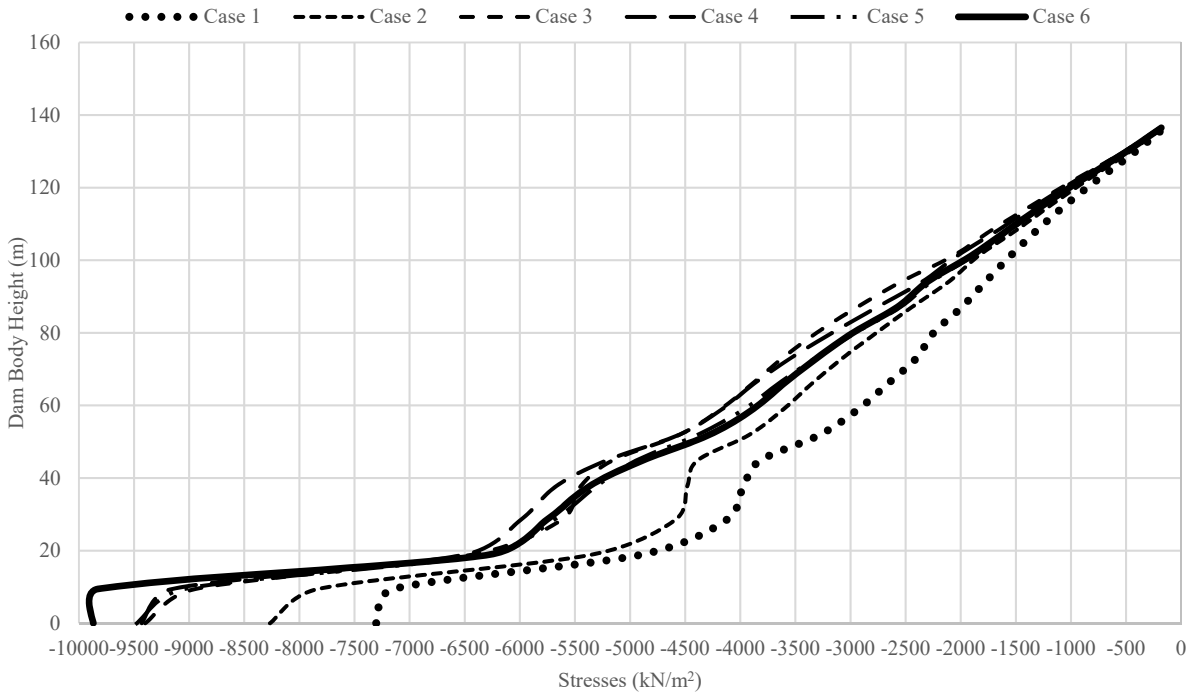

Fig. 5. Principal Compression Stresses

The maximum principal tensile stress is approximately 1950 kN/m^2 for Case 6 and the minimum principal compression stress is 7350 kN/m^2 for Case 1 at bottom of dam body (Fig. 6.). It clearly appears from Fig. 6 that if reservoir length extends, the principal tensile stresses increase by dam height.

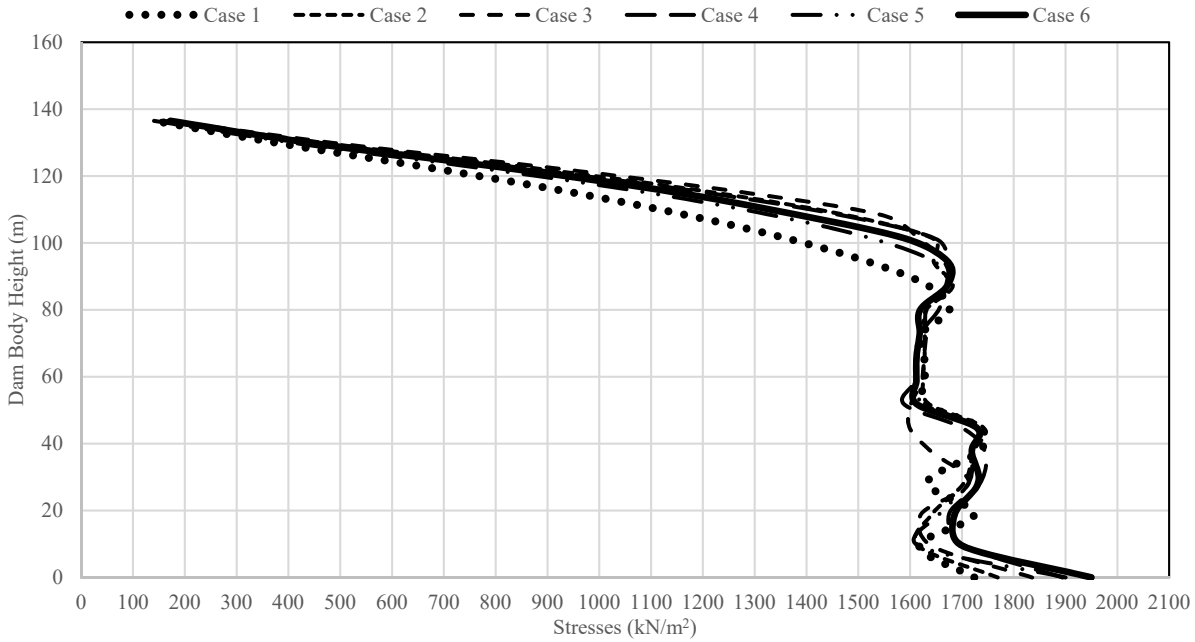

Fig. 6. Principal Tensile Stresses

Conclusion

Investigation of the effect of different reservoir length on the earthquake behavior of RCC dams is very important to observe the response of the dam. According to performed numerical solutions, if reservoir length extends, horizontal displacements increase. In additional this, nonlinear analyses clearly refer that the principle tensile and compressive stresses decrease the upper side of the dam body compared to bottom of the dam body.

 Copyright © International Science and Technology Conference (ISTEC)

When reservoir length extended, principal stresses and compression stresses increase. This solution shows that effect of reservoir length on behavior of dam.

Abstract: The goal of this study was to determine the effect of densification and heat treatment on thermal conductivity properties of fir (*Abies bornmulleriana* Mattf.) wood. Fir wood specimens were densified with compression ratios of 25% and 50%, and at 100 °C or 140 °C. Then, the heat treatment was applied to the fir specimens at 185 ºC and 212 ºC for 2 hours according to ThermoWood® method. The study results showed that, densification and thermal treatment applications was effected thermal conductivity of the fir specimens. The thermal conductivity increased based on compression ratios and temperatures in the densified specimens. The thermal conductivity in the compressed specimens at high ratio (50%) was found higher than other specimens. After densification, additionally, thermal conductivity increasing on the radial surface was higher compared to the tangential surface. After heat treatment, thermal conductivity of the all specimens decreased significantly depending on the increase in treatment temperature. Particularly, the heat-treated fir specimens at 212 °C may considerated where thermal insulation is important.

Keywords: Fir Wood, Densification, Heat Treatment, Thermal Conductivity

Introduction

The properties of wood depend on its chemical and structural characteristics. These can be changed using different and/or new wood modification techniques. Thus, wood can be made more resistant to destructive environmental factors (Bami and Mohebby, 2011). The mechanical properties of wood positively correlate with its density, and the mechanical strength can be improved by increasing the density. An increment of density is particularly important for low-density wood species (Laine et al., 2013; Sandberg et al., 2013). Wood can be densified by applying mechanical high-pressure compression with heat and/or steam. In addition, wood can be densified by saturating its pore volume with natural or synthetic resins (Kamke, 2006; Kutnar et al., 2008). A main disadvantage of mechanically densified wood is the recovery of its initial dimensions after exposure to water or heat (Seborg et al., 1956; Morsing, 2000; Blomberg et al., 2006; Pelit et al., 2014, 2016). One of the wood modification processes whose usage is increasing day to day and which are performed for extending their usage fields by enhancing some properties (stability, durability, etc.) of wood, is heat-thermal treatment.

The heat treatment process results in a modification in the molecular structure of the wood and thus improves its performance. The properties potentially improved by heat treatment are: biological resistance to fungi and insects, low equilibrium moisture content, increased dimensional stability with respect to the decrease in contraction and expansion, increased resistance to weathering, and increased thermal insulation capacity (Korkut and Kocaefe, 2009). On the other hand, the density and mechanical strength properties of heat-treated wood decrease due to mass loss and thermal degradation of the wood structure (Bekhta and Niemz 2003; Yıldız et al. 2006; Korkut et al., 2008; Pelit et al., 2015; Perçin et al., 2015). The decline in the strength properties of wood is the primary disadvantage of the heat treatment application. This situation restricts the sectors in which heat-treated wood may be used (Boonstra 2008).

As it is known, wood material that has a wide usage area as a natural raw material is a good insulator because of its structure (Aytin et al., 2016). Thermal conductivity of a material can be defined as the rate of heat transfer through a unit thickness of the material per unit area per unit temperature difference. The thermal conductivity of a material is a measure of how fast heat will flow in that material. A large value of a thermal conductivity indicates that the material is a good heat conductor, and a low value indicates that the material is a poor heat conductor or insulator (Şahin Kol and Sefil, 2011). The thermal properties of wood are affected by various factors. The more important influencing factors are species, density, moisture content, direction of heat flow (anisotropy), inclination of grain, and relation of volume or thickness of the sample to moisture content (Suleiman et al., 1999). In addition,

 Copyright © International Science and Technology Conference (ISTEC)

have an influence on thermal conductivity of wood material factors like kiln-drying operations, glueing of wood, preservation impregnation, hot pressing of wood based composites, and wood thermal degradation (Şahin Kol, 2009). In light of literature informations, the purpose of this study was to determine the thermal conductivity properties of the fir (*Abies bornmulleriana* Mattf.) wood specimens modified by densification and heat post-treatment applying.

Materials and Methods

Wood material

In this study, Uludağ fir (*Abies bornmulleriana* Mattf.) wood were used. The fir tree were supplied as logs from a lumber yard in Düzce, Turkey. The sapwood was cut from the logs with an automatically controlled band saw. Rough-scale planks were formed, the cuts being determined by considering the annual rings parallel to the surface (tangent section) and the sample dimensions. Attention was paid to ensure that no rot, knot, crack, color, or density differences were present in the specimens (TS 2470, 1976). The specimens were initially subjected to natural drying to approximately 12% moisture content, and then were cut to the dimensions of 420 × 95 mm (length-longitudinal direction × width-tangential direction) and two different thicknesses 26.7 and 40 mm (radial direction). Before the densification process, the specimens were held in a conditioning cabin (RH 65 ± 3% and 20 ± 2 °C) until they reached a stable weight (TS 2471, 1976).

Thermo-mechanical densification and heat treatment

The thermo-mechanical densification process was done with a hydraulic press at compression ratios of 25 and 50%, with temperatures of 100 and 140 °C for 10 min. After thermo-mechanical densification, heat post-treatment was carried out on the wood specimens to provide dimensional stability. The heat treatment was conducted under the protection of water vapor at the temperatures 185 and 212 °C for 2 h. The thermo-mechanical densification and heat post-treatment processes have been described in detail in a previous study by the authors (Pelit et al., 2016). After heat post-treatment, specimens remained in a conditioning cabin (RH 65 ± 3% and 20 ± 2 °C) until they reached a stable weight (TS 2471, 1976). The densified and heat treated specimens were then cut into smaller specimens in the dimensions of 100 × 20 × 20 mm^3 (longitudinal direction × tangential direction × radial direction). Test specimens were prepared in a number sufficient to accommodate 10 repetitions (n=10) for each variable.

Measurement of thermal conductivity

Thermal conductivity values of fir specimens was determined according to ASTM C 1113-99 (2004) by using hot-wire method. Measurements were made using QTM 500 (Quick Thermal Conductivity) device which is a product of Kyoto Electronics Manufacturing, Japan. PD-11 box probe sensor (constantan heater wire and chromel-alumel thermocouple) was used. After the completion of the device calibration, measurements performed on the surface of each sample for a period of one minute.

Statistical analyses

The MSTAT-C package program was used for statistical evaluations. Analysis of variance (ANOVA) was performed between factors, and differences between Duncan test results and mean values were compared when significant differences were detected within obtained data. Therefore, success ranking among the factors included into the experiment was determined by separating them into homogeneous groups according to Least Significant Difference (LSD) critical values.

Results and Discussion

Analysis of variance results of thermal conductivity values of fir wood specimens thermo-mechanically densified and heat treated are given in Table 1.

Table 1: Analysis of variance results for thermal conductivity values

*Significant at 95% confidence level

According to analysis of variance results; measuring surface, densification, and heat treatment factors on thermal conductivity values of fir wood specimens and their reciprocal interactions were found to be significant ($P \leq 0.05$). Mono comparison results of Duncan test, which was conducted by using LSD critical value at measuring surface, densification and heat treatment level, are shown in Table 2.

Table 2: Mono comparison results of Duncan test for thermal conductivity values at measuring surface, densification and heat treatment level

Measuring surface	Mean	HG	
Tangential section	0.1280	b	*LSD* ± 0.002273
Radial sections	0.1379	a*	
Densification	**Mean**	**HG**

185 ˚C	0.1365	b	
212 ˚C	0.1127	c	

HG: Homogeneous group; *: the highest value

According to the results of the comparisons in Table 3, thermal conductivity value of fir wood specimens was higher in radial sections (0.1379) than tangential section (0.1280). Regarding densification conditions, the highest thermal conductivity value (0.1448) was found in the specimens densified by compression 50% at 140 ºC and the lowest (0.1172) in the undensified specimens. As for the heat treatment level, the highest thermal conductivity value (0.1497) was seen in the untreated specimens, while the lowest (0.1127) was in the specimens subjected to heat treatment at 212 ºC. Multiple comparison results of the Duncan test conducted by using the LSD critical value at measuring surface-densification-heat treatment trio interaction level are given in Table 3.

				LSD: ± 0.008805			

SD: Standard deviation; HG: Homogeneous group; *: the highest value

According to results shown in Table 3, the highest thermal conductivity value (0.1669) was obtained in radial section of specimens without heat treatment that were densified by compression 50% at 140 ºC, and the lowest value (0.0937) was obtained in radial section of the specimens for which heat treatment was applied at 212 ºC and they were undensified. Thermal conductivity values of densified specimens increased depending on compression ratio and temperature. Thermal conductivity values was highest at each measured section of 50% compressed specimens. In terms of compression temperature, the highest thermal conductivity values was obtained from specimens compressed at 100 °C for the tangential section and specimens compressed at 140 °C for radial section. After compressing process, the thermal conducitivity values increased up to %11 on tangential section and up to %26 on the radial section compared with control specimens. The higher increase of thermal conducitivity on the radial section (surface) is related with compression of specimens at radial direction. In addition, the increase of thermal conductivity can be explained by decrease of void volume (porosity) and increase of density of fir specimens. In the denfication process, it was determinated in previous studies that the void volume of wood decreased and the amount of cell wall per unit volume increased according to compression ratio (Blomberg et al., 2005; Ünsal et al., 2011; Ülker et al., 2012; Arruda and Menezzi, 2013; Pelit et al., 2014). The thermal conductiviy of wood is closely related with the density and porosity. It was reported that thermal conductivity increases proportionally with density and increases in inverse proportion to the porosity (Suleiman et al.,1999; Rice and Shepard, 2004; Şahin Kol et al., 2008; Örs and Keskin, 2008).

Thermal conductivity decreased in all heat treated specimens. In addition, the increase in the temperature of the heat treatment significantly decreased thermal conductivity values. However, the thermal conducitivity values of densified (especially on the radial seciton) specimens influenced less by the application of heat treatment than control specimens. In the previous studies conducted in parallel to this study, it was determined that the values of equilibrium moisture content (Pelit et al., 2016) and air-dry density (Pelit et al.,submitted for publication) of heat-treated fir wood specimens decreased depending on the increase of heat. In addition, it was reported that the hygroscopicity, equilibruim moisture content (EMC) and density of heat-treated specimens decreased (Tjeerdsma and Militz, 2005; Esteveset al., 2007; Boonstra, 2008; Esteves and Pereira, 2009; Korkut and Kocaefe, 2009; Aydemir et al.,2011; Pelit et al., 2014; Aytin et al., 2015; Kocaefe et al., 2015). After heat treatment process, the significant decrease in the thermal conductivity values can be explained by the reduction in the EMC and density. The results are compatible with the literature (Şahin Kol and Sefil, 2011; Aytin et al., 2016). In literature stated that there is a very strong correlation between moisture content and thermal conductivity and the thermal conductivity increases with increasing moisture content. Because the thermal conductivity of water is much higher than wood (Gu and Hunt, 2007;Şahin Kol, 2009; Şahin Kol and Sefil, 2011).

Conclusion

After densification precess, thermal conductivity values of fir specimens increased depending on the compression ratio and temperature. The thermal conductivity values was higher in the specimens compressed at high ratio (50%). In terms of compression temperature, the highest thermal conductivity values was obtained from specimens compressed at 100 °C for the tangential section and specimens compressed at 140 °C for radial section. The thermal conductivity values of densified specimens increased up to 11% on tangential section and up to 26% on the radial section compared with control specimens. After heat treatment process, thermal conductivity values of all specimens decreased significantly depending on the increase of the process temperature. However, the thermal conducitivity values of densified specimens (particularly in the radial section) influenced less by the application of heat treatment compared with control specimens.

THE EFFECTS OF EDUCATIONAL DRAMA ON THEORY OF MIND SKILLS IN EDUCABLE INTELLECTUAL DISABILITY STUDENTS

Oktay Taymaz Sari
oktaytaymaz@gmail.com

The aim of this research was to investigate the effect of educational drama on theory of mind skills in 13 *educable intellectual disability*students aged 16-19 years from government high schools located in Istanbul, Turkey.The research was designed in experimental model which was based on pre-test and post-test. To evaluate the theory of mind skills in *educable intellectual disability*students by applying the Sally Ann (Wimmer & Perner, 1983; Leslie & Frith, 1988); "Smarties" test (Perner, Leekam, & Wimmer, 1987), Chocolate bar test (Flobbe, Verbrugge, Hendriks, & Krämer, 2008) and "Strange Stories Test" (Happé, 1994)that were translated and adapted to the Turkish language by Girli (2010). During the application of programme, all students had been applied drama activities related to selected words for 3 months. *The results of this study indicated*that *educable intellectual disability*students were promoted their theory of mind skills by using drama programme

THE EFFECTS OF SOCIAL MARKETING EFFORTS ON CONSUMERS: THE ICE BUCKET CHALLENGE

Selay ILGAZ SÜMER

Baskent University, Department of Management, Ankara- TURKEY

silgaz@baskent.edu.tr

Abstract: Marketers try to create behavioral changes by sending messages to the customers. Sometimes various institutions and governments also present some messages in order to raise awareness on social issues. These kind of marketing efforts are associated with social marketing. Social marketing campaigns involve messages such as giving up smoking, avoid using alcohol etc. In this study, it is aimed to determine the major effects of social marketing efforts on consumers' behaviors and thoughts. In order to find out these effects, the Ice Bucket Challenge campaign was employed. In this research content analysis was applied to evaluate the consumers' thoughts in Turkey. For that purpose, various dictionaries such as "Eksi Sozluk", "ITU Sozluk" and "Uludag Sozluk" were used. Frequency analyses were performed to analyze the consumers' thoughts about Ice Bucket Challenge. At the end of the study it was determined that Ice Bucket Challenge campaign influenced the consumers in different ways.

Keywords: Marketing, Social Marketing, Consumers

Introduction

Especially in recent years, firms and associations have started to focus on the long term benefits and the welfare of the society. These key points affect the marketing activities of the businesses. Social marketing gets more importance in the marketing programs of the firms. Social marketing campaigns enable to attract the attention of the customers to the topics related with social subjects such as giving up smoking, drawing attention to healthy nutrition, discouraging society from drinking alcohol and drugs, environmental protection etc. In other words, for the well-being of society, marketers have started to promote some ideas as well as goods and services. At this point, proper planning of social marketing campaigns, which can easily draw the attention of the consumers become more important. This study investigates how social marketing campaigns affect the consumers' thoughts, beliefs and attitudes in Turkey. To determine these effects well-known social marketing campaign, the Ice Bucket Challenge is used. The study reveals the influences of the Ice Bucket Challenge campaign on consumers. For this purpose, most famous dictionaries such as "Eksi Sozluk", "ITU Sozluk" and "Uludag Sozluk" were used to introduce the thoughts of the consumers. The remainder of the paper is organized as follows. First, social marketing is introduced. Next, it is highlighted how and for which purposes Ice Bucket Challenge campaign is publicized. Further, content analysis is used in order to state the consumers' thoughts and feelings about the campaign. Finally, the results and the impacts of the campaign are highlighted.

Social Marketing

Social marketing is the concept appeared in the early 1970s. In the emergence of this concept; Levy, Zaltman and Kotler have contributed a lot. They advocated that by the help of the social marketing programs, it is possible for consumers to adopt the social ideas that the businesses try to present. As a matter of fact, the major aim of the social marketing efforts is to influence the target consumers' behavior to increase the welfare of the society (Saunders, Barrington & Sridharan, 2015).

By the late 1960s and early 1970s, health sector have benefited from the social marketing efforts. In the 1980s, especially health promotion campaigns were frequently used to promote health. Furthermore, many campaigns were emerged such as anti-tobacco campaign, campaigns related with obesity etc. (Singaiah & Laskar, 2015)

In the literature it is possible to find several definitions on social marketing. According to Kotler and Zaltman (1971: 5) "social marketing is the design, implementation and control of programs calculated to influence the acceptability of social ideas and involving considerations of product planning, pricing, communication, distribution, and marketing research." Andreasen (1995: 7) defined that "social marketing is the application of commercial marketing technologies to the analysis, planning, execution and evaluation of programs designed to influence the voluntary behaviour of target audiences in order to improve their personal welfare and that of society." Lefebvre (2013: 4) stated that "social marketing is the application of the marketing discipline to social

 Copyright © International Science and Technology Conference (ISTEC)

issues and causes that provides a framework for developing innovative solutions to social problems that have long perplexed and frustrated us."

The keys of creating successful social marketing programs require focusing on the major benchmarks, including the following:

- Behavior change
- Consumer research
- Segmentation and targeting
- Exchange
- Competition
- Marketing mix

Behavior change is one of the aims of social marketing efforts. The major goal of the social marketing effort is to create behavioral changes after the campaign was presented to the target consumers. Besides, formative research must be made to understand the values of the consumers. Focus groups, interviews are some of the data collection methods in consumer research. This research enables to pretest the intervention elements with the target group. Segmentation and targeting are the important parts of the social marketing efforts since target group is selected according to the various segmentation variables like age, income etc. An exchange criterion is also important to reveal the motivating factors. It is known that the motivating factors can be either tangible or intangible. In other words, after participating to a social marketing campaign consumer can gain rewards or only personal satisfaction can be provided after the attendance. Competition is the benchmark related with analyzing the internal and external forces that creates the behavioral changes. The last criteria, marketing mix, is related with the application of marketing mix elements such as product, price, place and promotion (Stead, Gordon, Angus & McDermott, 2007; Luca & Suggs, 2010).

It is understood that social marketing activities are more different from business marketing activities. The reason is that in business marketing, artificial preferences are the main subject of the marketing activities whereas in social marketing society's welfare and beliefs get more importance in the marketing activities of the businesses. In other words, social marketing is the efficient and striking way of creating society's concern to the social issues and also can be regarded as a good option in performing the social objectives (Kotler & Zaltman, 1971).

The Ice Bucket Challenge

Ice Bucket Challenge is an important campaign started on July 2014 to create awareness on amyotrophic lateral sclerosis (ALS) disease. ALS is the motor neuron disease which causes the muscles to be damaged. In ALS, sensory nerves work well whereas the patients cannot be able to command voluntary muscles (Handa & Ebisawa, 2008).

The aim of the Ice Bucket Challenge campaign was either donating money to ALS Association or uploading a video on social media. To promote awareness of this disease, plenty of people have dumped a bucket of ice and water on their heads.

Figure 1. The Ice Bucket Challenge Campaign.

Ice Bucket Challenge Campaign is the interesting way to draw people's attention to ALS disease. The campaign has attracted many people's attention and more than 17 million people share their videos in social media. Hereby, 440 million people watched these videos a total of 10 billion times. Especially the celebrities have important contributions in attracting interest to the campaign all over the world. Owing to this campaign, ALS Association has received $ 115 million in 2014 (http://www.alsa.org/about-als/, 27.06.2016).

 Copyright © International Science and Technology Conference (ISTEC)

Results and Discussions

A content analysis was used in order to investigate the consumers' thoughts about Ice Bucket Challenge. To determine these thoughts online dictionaries such as "Eksi Sozluk", "Uludag Sozluk" and "ITU Sozluk" were used. Content analysis is a research methodology that is used to codify the existing texts according to fewer content categories (Stemler, 2001).

The population of the study is Turkish online dictionaries whereas the sample of the study includes three most popular Turkish dictionaries called "Eksi Sozluk", "Uludag Sozluk" and "ITU Sozluk". These dictionaries were searched according to the keyword "Ice Bucket Challenge". Entries between July 2014 and October 2014 were taken into consideration just because these dates are the most popular times of the campaign. It was determined that 585 entries were made between this period of time (Table 1).

Table 1: Number of the Ice Bucket Challenge entries in online dictionaries between July 2014 and October 2014.

Dictionary	**Number of the Entries**
Eksi Sozluk	298
Uludag Sozluk	127
ITU Sozluk	160
Total Entries	**585**

In the study three basic questions were examined. These questions can be listed as follows:

- What are the feelings of the consumers about the Ice Bucket Challenge Campaign?
- How the consumers' feelings about the Ice Bucket Challenge Campaign change within the considered time interval?
- Which phrases are frequently encountered in entries related with the Ice Bucket Challenge Campaign?

The descriptive statistics about the first question is given in Table 2. Entries for each dictionary were grouped as "positive feelings", "neutral feelings" and "negative feelings". It is found that the majority of the dictionary authors have negative opinions about the campaign. Among the dictionaries analyzed, "Uludag Sozluk" entries are found to have the highest number of negative entries while "Eksi Sozluk" contains the lowest number of negative entries. On the other hand, "Eksi Sozluk" has the highest number of positive feelings among all. Besides, it is shown that the minority of the dictionary authors have neutral feelings about the Ice Bucket Challenge Campaign.

Table 2: Feelings of the consumers about Ice Bucket Challenge.

Dictionary	**Positive Feelings**		**Neutral Feelings**		**Negative Feelings**	
	n	**%**	**n**	**%**	**n**	**%**
Eksi Sozluk	98	32,9	52	17,4	148	49,7
Uludag Sozluk	16	12,6	19	15	92	72,4
ITU Sozluk	40	25	38	23,8	82	51,2

The dictionary entries were also analyzed in terms of cumulative counts. The following figures (Figure 2, Figure 3, and Figure 4) illustrate the line plots of cumulative counts related to positive, neutral and negative feelings. In these figures, horizontal axes refer to the sequence of dictionary entries in chronological order while the vertical axes indicate the cumulative counts. It is observed that positive feelings are shown to be dominant nearly in all dictionaries in former entries. However, in latter entries, negative feelings tend to surpass the others. This can be explained that the campaign was found to be creative and attractive by society in the beginning. However, as time passes, the campaign was criticized due to some negative aspects such as waste of time, waste of water and regarding this campaign as a show especially after the attendance of celebrities.

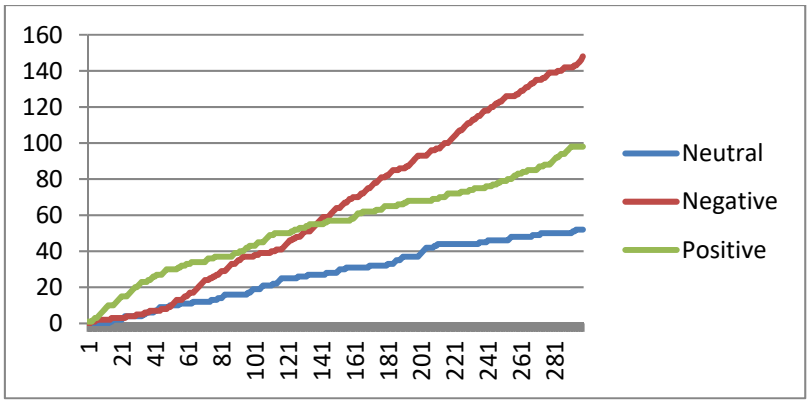

Figure 2. Cumulative count of the feelings for "Eksi Sozluk".

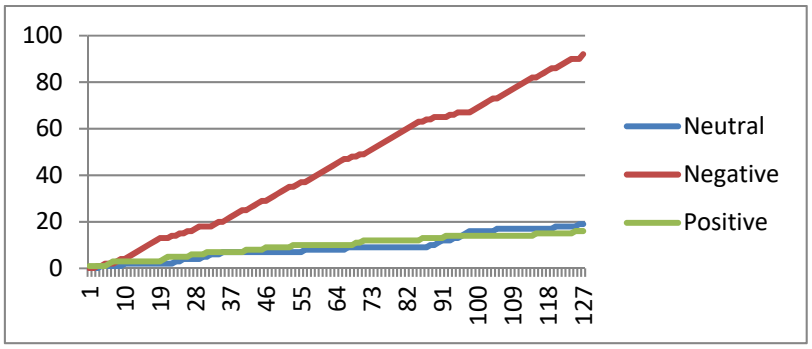

Figure 3. Cumulative count of the feelings for "Uludag Sozluk".

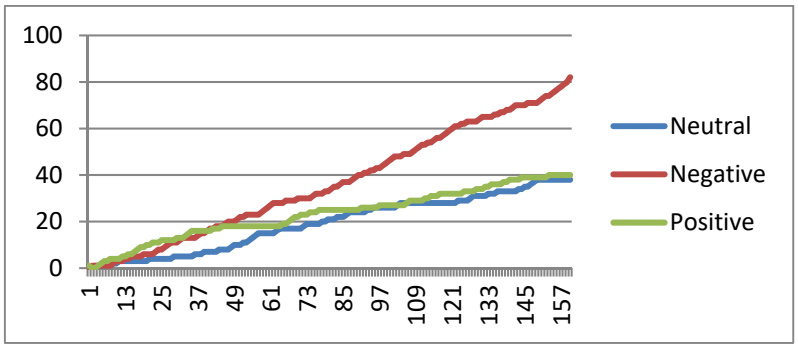

Figure 4. Cumulative count of the feelings for "ITU Sozluk".

The frequently used phrases were analyzed to answer the last research question. The phrases were determined after a preliminary work and chosen as distinguishing as possible. The list of phrases and their frequencies for each online dictionary are shown in Table 3. "Raise awareness" is the most encountered phrase among the entries of three dictionaries. On the other hand, "social responsibility project" is the rarely encountered phrase. The phrases such as "raise awareness", "fun" and "charity" can be observed as the most frequently encountered phrases taking place in positive feelings. Similarly, "show", "advertisement" and "waste of water" are the prominent phrases contained within negative feelings.

Waste of Water	11	5	0	**16**
Bad	10	1	0	**11**
Unnecessary	2	2	5	**9**
Efficient	4	2	0	**6**
Social Responsibility Project	0	3	0	**3**

Conclusion

Social marketing has an important role to attract the awareness of the society to the social problems and issues. In this study, Ice Bucket Challenge was examined to state the society's feelings about the campaign. For this purpose, three famous online dictionaries called "Eksi Sozluk", "ITU Sozluk" and "Uludag Sozluk" were analyzed. It was found that 26% of the entries have positive opinions about the campaign while 55% and 19% of the entries have negative and neutral opinions, respectively. It is revealed that the general opinion converges to negative feelings about the campaign. The negative feelings reflected by the dictionary authors are mainly based on excessive water usage, turning out to be a show instead of a campaign etc. On the other hand, it is appeared that the campaign has several positive aspects such as drawing attention to a disease, collecting donations etc. As a future work, involving the large variety of dictionaries (national and international) might be useful to enrich the present study and following similar studies.

THE EFFECTS OF THE CONSTITUENTS ON THE MECHANICAL PROPERTIES OF THE POLYESTER MATRIX COMPOSITES REINFORCED WITH CALCITE PARTICULATES

İbrahim ÇELİKYÜREK

Eskişehir Osmangazi University, Department of Metallurgical and Materials Engineering, Eskişehir- TURKEY

cibrahim@ogu.edu.tr

Abstract: The Polyester based polymer matrix composites (PMC) were produced using calcite particulates in size of 100□m. The effects of the amount of the curing agent (hardener) and catalyst (fastener) on the mechanical properties of the polyester and composites produced with these polyesters were investigated. The mechanical properties were determined by three point bending tests and the hardness measurements. Additionally, the effects of the particulate ratio used as reinforcing were revealed. The results showed that the flexural stress and strain of the composites are reduced with increase in reinforcing amount. The amounts of the curing agent and catalyst used for polymerization affected the mechanical properties. The strength of the polyester matrix and composites were degreased with increasing curing agent and catalyst amount whereas the flexural strains were increased.

Keywords: Polymer matrix composites, Artificial marble, Strength, Hardness

Introduction

The polymer matrix composites have been used widely in the all areas of the technology. The polymeric materials can be categorized in three main group; thermoplastics, thermosettigs and elastomers. In that three group thermosettins are in liquid phase before polymerization whereas thermoplastic are in solid phase at the ambient temperatures. Thus, the thermoplastics need to be melting in forming processes whereas thermosettings do not. All kind of polymers can be used as matrix and generally particles and fibers are used as reinforcement in micro and nano-scale. The thermosetting polymers, beside other advantages, can be infiltrated into the reinforcement materials easily, formed in a simple mould and polymerized at the room temperature. These properties make them more advantageous for composite production.

One of the most important difficulties on the composite production is to provide a good bonding between the matrix and reinforcement at the interface. The matrix material should be infiltrated in the reinforcement and could have good wetting properties. Most of the thermosetting polymers can provide both requirements with the lot of reinforcement materials at the same time.

As a thermosetting polymer, unsaturated polyester can be polymerized at the room temperature using curing agents and catalysts. The natural and synthetic fibers, particles, fabrics and also wasted fabrics can be used as reinforcement thus, increases the mechanical properties of the polymer. The reinforcement type and shape, the distribution of the reinforcements, amount of the reinforcement, homogeneity and orientation of the reinforcement all affect the mechanical and physical properties of the composites.

The artificial marble is a polymer matrix composite reinforced (or filled) with marble powder, and widely used in construction and architecture industry. In this study, ERCO E-6 cast type unsaturated polyester was used as matrix material including Cobalt 6% as curing agent (hardener) and MEK-P as catalyst (fastener) in different ratios. The reinforcement material was calcite powder in size of <100 □m. The effects of the both matrix constituent amounts and reinforcement amount on the mechanical properties of the composites were determined.

Materials and Methods

Polyester matrix composites were produced using calcite particulates. As a matrix ERCO E-6 cast type unsaturated polyester was used. The reinforcing material (or filling material) was calcite powder in size of <100 □m. Polyester is a thermosetting polymer. Before casting unsaturated polyester was poured in a cup. Then Cobalt 6% was added (wt.% 1, 2 and 3) and then the mixture was blended. Standard Cobalt 6% is an abbreviation for the compounds cobalt napthenate and cobalt octoate, usually supplied as a 6% solution. These compounds are promoters used in the curing of polyester and vinyl ester resins with methyl ethyl ketone peroxide (MEK-P) type catalysts. The purpose of cobalt-based promoters is to speed up the curing reaction of polyester and vinyl ester resins and allow them to cure at room temperature. The cobalt-based promoter helps the catalyst to start the chemical reaction between the resin and styrene monomer and form a cured solid. The exact amount of promoter added to the resin

 Copyright © International Science and Technology Conference (ISTEC)

will depend on the resin used, the temperature in the workshop and the gel time desired. Usually 0.1 to 1% (based on the mass of resin) of cobalt 6% type promoter is added. (poliya, 2016). Eventually, MEK-P was added (wt.% 2 and 4) and the mixture was blended in a short duration and casted in a mold which was produced using RTV silicon in dimensions of 20X20X200mm^3. MEK-P is a catalyst used in the composites industry for polyester and vinyl ester resins. It reacts with the resin to turn it from a liquid to a solid (cure it). MEK-P is organic peroxide. Since these compounds are unstable in their pure form, they are mixed with inert compounds to form the catalysts used in the industry. Whilst various types of catalysts are available to cure polyester and vinyl ester resins for room temperature cure. (poliya, 2016). The castings were cured at the room temperature for 25 minutes.

While producing composites first of all unsaturated polyester and calcite powder (wt.% 33, 50, and 67) were blended homogeneously. Then Cobalt was added and blended again, eventually MEK-P was added and blended in a short time. Mixture was casted immediately and cured at the room temperature for 25 minutes.

The microstructures of the composites were characterized using optical light microscopy. The mechanical properties of the polyester matrix and the composites were determined by three point bending tests. The flexural strengths and strains were determined. The effects of the Cobalt, MEK-P, and calcite amounts on the mechanical properties were revealed. Three tests were carried out for all samples and the arithmetic average was calculated.

Results and Discussion

Some of the optical microstructures of the composites are shown in figure 1. As seen in figures the calcite particulates were distributed in the polyester matrix homogeneously. The homogeneous distribution of the particles is very important for composites reinforced with particles. Also it is seen on the micrographs that the amount of the pores in the both polyester matrix and composites is negligible.

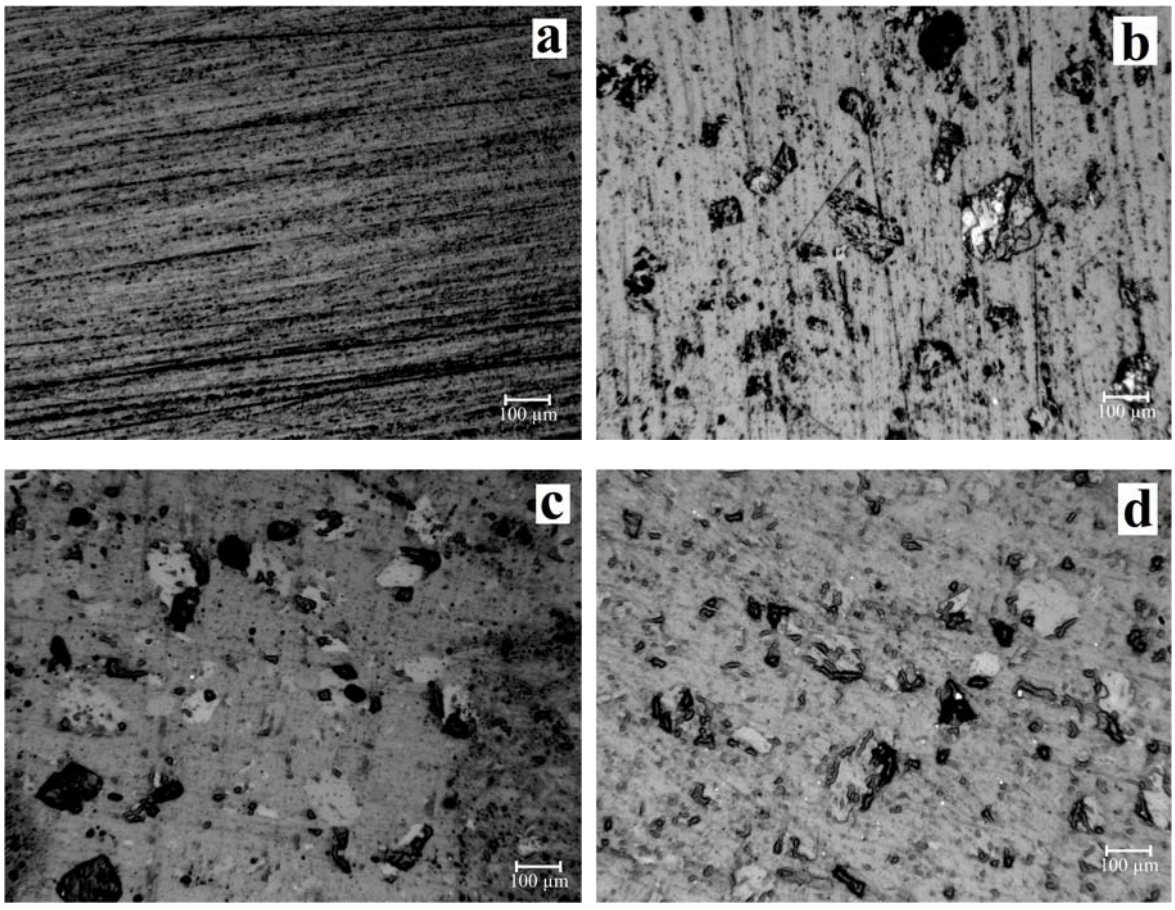

Figure 1. The optical micrographs of the polyester matrix and composites. a) polyester matrix including 2% Cobalt and 4% MEK-P, b) composite reinforced with 33%calcite, including 2% Cobalt and 4% MEK-P, c) composite reinforced with 50%calcite, including 1% Cobalt and 2% MEK-P, d) composite reinforced with 66%calcite, including 3% Cobalt and 2% MEK-P.

Figure 2 shows the effects of the constituents on the flexural strengths of the polyester matrix and composites. The flexural strengths were determined using max. bending forces. Both the polyester matrix and its all composites

 Copyright © International Science and Technology Conference (ISTEC)

exhibited brittle fracture. The polyester matrix exhibits higher flexural strength than all the composites. The addition of the particles to the polyester was resulted in a reduction in strength. The flexural strength of the composites was reduced with increase in particle ratio. The increase in the amount of the Cobalt resulted a reduction on the flexural strength for both polyester matrix and all the composites also. Minimum flexural strength was obtained with the 2% MEK-P ratio.

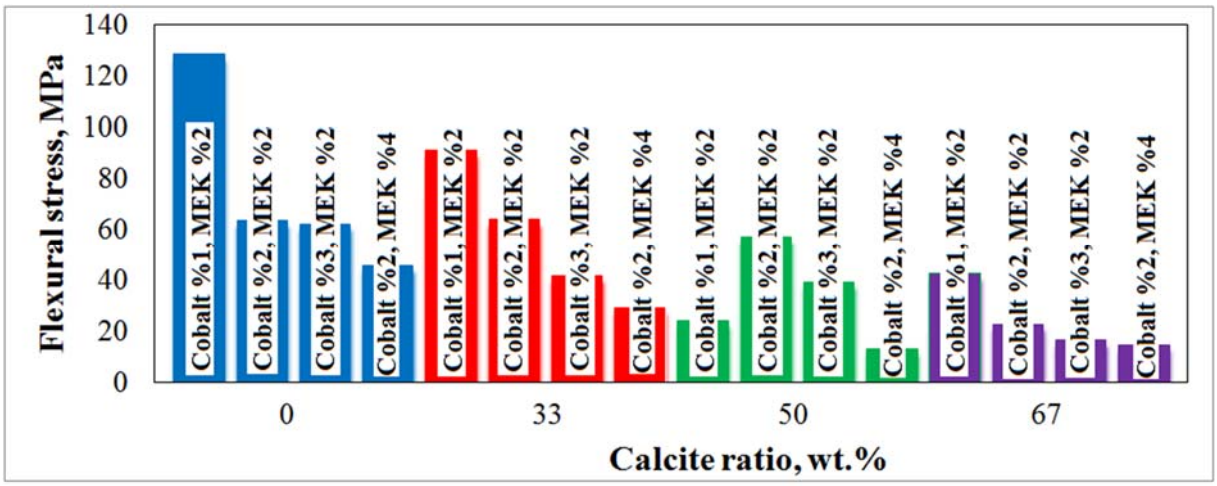

Figure 2. The effects of the constituents on the flexural strengths of the polyester matrix and its composites reinforced with calcite particulates in various ratios.

The flexural strains (deflections) of the polyamide matrix and composites were given in figure 3. The tested samples were approximately in dimensions of 20X20x200 mm^3. The diameters of the supporting pins and loading pin were 30 mm and 10 mm respectively. The support span (distance from centre of the supporting pins) was 100 mm. The deflection amount express the deform ability of a brittle material before fracture. As seen from the figure that all the composites exhibit higher deflection than the polyester matrix. Especially the composites including more than 50 % reinforcement have a high deflection. The reinforcement amount of the composites is very affective on the deflection. The Cobalt amount is also affective but, not increases the deflection, contrary has decreasing affect.

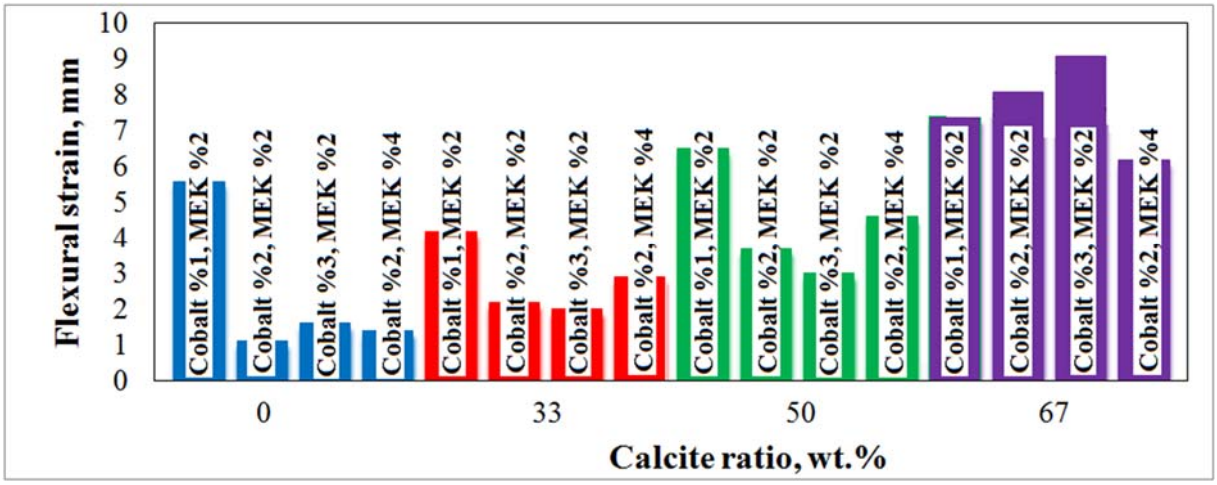

Figure 3. The effects of the constituents on the flexural strains of the polyester matrix and its composites reinforced with calcite particulates in various ratios.

Conclusion

 Copyright © International Science and Technology Conference (ISTEC)

The artificial marbles are produced using the polyester and the calcite powder. The calcite powder is a filling material and is used to reduce the price, supply a favorable hardness and enough chemical resistance. The mechanical properties of the artificial marbles are important and should be determined. The particle size, amount and distribution can affect the mechanical properties for composites reinforced with particles. According to the results of this work, the calcite which was added to the polyester matrix reduces the strength of the matrix instead of increase. This founding shows that the particles do not contribute to the strength, because there was not a strong bonding between the polyester matrix and calcite particles at the interface. The increase of the particle amount results a reduction for the strength because of reduction on the matrix area at the section. Contrary, the deflection amounts of the composites are higher than the matrix, and deflection is increased with increasing particle amount.

THE EFFECTS OF WORKPLACE FRIENDSHIP ON JOB INVOLVEMENT

Can BİÇER[1], Ozan BÜYÜKYILMAZ[2]

1.Karabuk University, School of Foreign Languages, Karabük- TURKEY, canbicer@karabuk.edu.tr
2.Karabuk University, Faculty of Business, Karabük- TURKEY, ozanbuyukyilmaz@karabuk.edu.tr

Abstract: This study aims to investigate the assumed direct relationships between workplace friendship and job involvement. Data for the sample was collected from 63 employees working in Karabuk University School of Foreign Languages via survey method. Hierarchical regression analyses was conducted to test the hypotheses. The results show that friendship opportunity and friendship prevalence were positively related to job involvement and friendship prevalence has a bigger effect on job involvement than friendship opportunity. Theoretical and applied implications are discussed.

Keywords: Friendship Opportunity, Friendship Prevalence, Job Involvement

Introduction

This article discusses the effects of the workplace friendships on job involvement. What is more, we argue that workplace friendships have a significant role on the employees' job involvement through friendship opportunity and friendship prevalence.

Work and workplace provide opportunities to human beings to productively channelize energy and create something useful and meaningful and fulfill many of their needs. In this sense then both work and workplace are critical factors in creating purpose and focus in human life (Singh et al., 2012).

It's very common that working people spend much more time at their workplace than their homes. Working hours may vary but people usually work from 9:00 in the morning till 6:00 in the evening. Thus, working people meet other employees more than anyone else even their close friends, family members or neighbors in a week or month. So the relationships between employees at work become very important for the employers and for the company itself for reaching the organizational goals. As a result, close or distant friendships among employees can be a real advantage or disadvantage for the organizations.

Human beings have a social nature. They always try to be in contact with other people and to make relationships. Friendships develop in all kinds of settings. This happens all the time and in all parts of life, including work (Kiesel, 2011). If you've worked with the same company for several years, you've probably built many friendships. Some of your coworkers might be close friends, while others are individuals with whom you might share a weekend story on Monday morning. A friendship at work can become a powerful networking tool or a toxic relationship (Swales, 2015). Effective employment relations are vital to the workplace, whether at the time of recruitment, during an employees' tenure or at the time of separation. Employers, managers, employees and their representatives are all key players in this relationship. Where the employment relationship breaks down, conflict can occur (Wanrooy et al., 2011). To sum up, workplace friendships are often viewed as a positive aspect of organizational culture, but they can also be the cause of discomfort for employees and inefficiency in the organization (Morrison and Nolan, 2007).

THEORETICAL FRAMEWORK

Workplace Friendship

Many work settings are also social environments. Workers interact with their supervisors and co-workers about job-related matters, such as the job tasks that need to be done and the best way to accomplish these tasks. In addition, workers interact frequently about nonrelated job tasks, such as the weather, current events, and leisure pursuits. Because the workplace can often be a social environment, it has the potential to promote the formations of friendships (Chadsey and Rusch, 1988).

The workplace has become a uniquely important site for the building of cooperative and constructive social ties across lines of group identity and social division. Workplace cooperation, sociability, and solidarity all play a role in promoting these ties, and all of those emerge out of basic features of human psychology and basic

 Copyright © International Science and Technology Conference (ISTEC)

imperatives of human labor in a modern economy (Estlund, 2003). Relationships are important, as they are the mechanism through which we work. Organizations are built on people with skills and resources, and relationships are the links between those people. Good relationships are an investment, and a valuable tool which we use to help attain our work goals. In contrast, bad relationships are a liability. They can be emotionally draining and divert mental energy from work. Dealing with bad relationships can take up valuable time and lead to stress which in turn undermines work performance (Clydesdale, 2013).

Workplace friends share superordinate goals (to fulfil their interdependent work tasks), and workplace contacts have broad institutional support (the backing of managers, owners and the law). Moreover, given the time spent at workplaces, contacts are frequently personal and intimate. Functional and cognitive interdependencies and interpersonal contacts coincide in the prediction that diverse workplaces will generate diverse friendship networks (Kokkonen et al., 2015). In addition, friends at work also form a strong social support network for each other, both personally and professionally. Whether rooting for each other on promotions, consoling each other about mistakes, giving advice, or providing support for personal situations, comradeship at work can boost an employee's spirit and provide needed assistance (Rioardan, 2013). On the other hand, traditionalists argue that pals have no place at the office for a number of reasons. Friendship between colleagues can blur decision making, they say, making difficult decisions more complicated and leading to distractions or inappropriate behavior (Clark, 2013).

Workplace friendship is related not only to employee perception of people, but probably to perception of jobs, and thus affects employees' work motivation (Mao et al., 2012). In fact, it is sometimes hard to overcome the challenges of managing workplace friendships. Workplace friendships represent potential threats to the self-concept of friends if they obtain differential organizational outcomes; they involve the exchange of resources which are incompatible; and they represent contrasting norms of reciprocity. The emotional bond between colleagues may not overwhelm the competition they face over who will get promoted. Indeed, business challenges may be exacerbated by the friendship with rival or debtor. Workplace friendships bring benefits but may also intensify some relational costs (Ingram and Zhou, 2008).

Friendship opportunity, friendship prevalence are the two main subtitles of workplace friendship. Workplaces are the habitat for making friends. When people get a new job they normally meet new people and begin to know each other as they are together nearly more than 6 hours a day. Although workplace friendship depends on voluntary actions, workplaces offer lots of opportunities to socialize and to make friends. Since friendship is a close, mutual and voluntary dyadic relationship workplace is naturally related to opportunities for friendships in the workplace (Bornstein and Lamb, 2011). Song (2006) concluded that friendship opportunity and quality of friendship have a positive impact on work attitudes and not only do workplace friendships create alternatives to the negative effects often seen in working relationships, but workplace friendships can contribute to the positive aspects of a working relationship.

In organizations, patterns of friendship may vary by status, shared experiences, and interests (Kiopa, 2013). The prevalence of friendship(s) is expected to increase when the co-workers trust each other and spend time as much as after work. However, workplace friendships can lead to an increase in job satisfaction, job involvement, positive organizational commitment, longevity on the job, social support, communication and coordination, can enable shared values, and experiences and for the organization, workplace friendship increases institutional participation, motivates employees to better serve the organizational purpose, establishes supportive and innovative climates, and increases organizational productivity (Song, 2006).

After all, workplace friendship involves more than people merely acting in friendly ways or being mutual acquaintances: There must be trust, liking, and shared interests or values, too. Workplace friendships are sometimes limited to certain spheres of work or work-related leisure (such as having a "lunch" friend). Workplace friends usually are able to articulate what they like about another person or what they enjoy doing together ("What I like most about [working with] you is that …"), even though the relationship includes instrumental considerations as well ("I like you, and I need you, too") (Berman et al., 2002).

Job Involvement

Workplace friendships directly impact both job satisfaction and job involvement and friendship opportunities are associated with increases in job satisfaction, job involvement, and organizational commitment (Riordan and Griffeth, 1995). Job involvement plays a significant role basically on role segmentation and time and attention devoted to the job role at workplaces. There is an important link between the workplace friendships and job involvement at workplaces -the better the quality of workplace friendships, the better the job involvement and performance will be at the organizational level.

 Copyright © International Science and Technology Conference (ISTEC)

According to the Business Dictionary the definition of the job involvement is "The degree to which an employee is engaged in and enthusiastic about performing their work. Business managers are typically well aware that efforts to promote job involvement among staff tend to pay off substantially since employees will be more likely to assist in furthering their company's objectives" (Business Dictionary: 2015). Job involvement is the degree to which a person is identified psychologically with his work, or the importance of work in his total self-image (Lodahl and Kejner, 1965). Liao and Lee (2009) defined job involvement, "the extent to which a person's self-esteem depends on his or her work efficiency" (p.24).

The job involvement concerns the degree to which employees identify themselves with their job. It may be influenced by the level of satisfaction of one's needs- intrinsic or extrinsic (Gilkar and Darzi, 2013). Disengaged employees are an unfortunate reality in the workplace, and poor leadership is often to blame (Kim and Mauborgne, 2014). On the other hand, affectively job involved employees tend to do their jobs more eagerly and they generate behaviors that facilitate good human relationships for their organization (Ueda, 2012).

As noted by Jayawardanaa et al., (2013), job involvement represents a key factor influencing employees' levels of perceived organizational support and job satisfaction. Job involvement represents a cognitive and emotional identification by individual employees with their job. For highly involved employees, their jobs are connected with their identities, interests and life goals. Highly job-involved employees are more likely to be prepared to reciprocate the organizational benefits and supports provided to them, to exert extra efforts to ensure that organizational goals are achieved. They may also experience high levels of task identity, task significance and job autonomy. On the other hand, low job-involved employees are more likely to leave the organization, withhold work effort or 'engage in various undesirable on-the-job activities'.

Involved employees can use their insights to improve their jobs directly and jobs with a high degree of employee involvement might increase satisfaction. In conclusion, satisfied workers are more likely to increase participation in high-involvement practices and establishments with satisfied workers may be more likely to adopt new programs (Mohr and Zoghi, 2008).

The Effects of Workplace Friendship on Job Involvement

The importance of the link between workplace friendship and job involvement has been recognized recently in previous studies. The feelings of friendship affect the performance of the workplace. The personal relations in the workplace are associated with the higher level of job involvement. Workplace friendship increases institutional participation, motivates employees to better serve the organizational purpose, establishes supportive and innovative climates, and increases organizational productivity, job satisfaction and job involvement (Song, 2006). Workplace friends give each other more real job information/viewpoints and accept each other's information/viewpoints more than workplace acquaintances do, i.e., others with only a work relationship and workplace friendship has a positive relationship with perceived job significance and job involvement (Mao et al., 2012).

A friendly atmosphere within an organization, making the entire workforce enthusiastically work together in order to achieve individual employees' as well as organizational goals and it directly affects the level of the job involvement of the employees positively. Thus, employees with high job involvement are more focused towards their jobs, likely to have less turnover and leaving intensions and are more motivated to stay with the organization. They grow in expertise and thus become even more valuable to their employer and the organization. Employees with high levels of job involvement make the job a central part of their personal character and focus most of their attention on their jobs (Mohsan et. al., 2011). More involved persons also feel more competent and successful at work, believe that their personal and organizational goals are compatible, and tend to attribute positive work outcomes to their internal and personally controllable factors (Liao and Lee, 2009).

We expect that workplace friendship has effects on the job involvement and we examine the friendship opportunity and friendship prevalence greater detail in the following sections.

H1: Workplace friendship will be positively related to job involvement.
H1a: Friendship opportunity will be positively related to job involvement.
H1b: Friendship prevalence will be positively related to job involvement.

MATERIALS AND METHOD

Sample and Procedure

Data were collected from the employees' working in Karabuk University School of Foreign Languages via face to face survey. Surveys were distributed to 78 employees and all employees were invited to participate. From 78 employees 63 participants choose to participate and completed the questionnaire. Participants represented staff roles like teaching staff, manager and administrative staff. The questionnaire assessed demographic variables, dimensions of workplace friendship and job involvement. Participants were %51 male and %49 female. %73 working as teaching staff, %6 working as manager and %21 working as administrative staff. %9.5 high school or vocational school graduate, %65 college or university graduate and %25.5 master or doctorate graduate. %5 working in the university 1 year or less, %31.5 working in the university between 2 to 3 years and %63.5 working in the university more than 3 years.

Measures

Questionnaire was prepared in Turkish. Participants responded to all items using 5-point Likert scales (1 = strongly disagree to 5 = strongly agree) with items coded such that a higher score indicated a greater amount of the focal construct.

Items to measure *Workplace Friendship* were derived from Nielsen et al.'s (2000) study. Workplace friendship was measured along two dimensions: friendship opportunity and friendship prevalence. Six items were used to measure friendship opportunity and six items were used to measure friendship prevalence. A sample item for friendship opportunity is 'I have the opportunity to get to know my coworkers' and a sample item for friendship prevalence is 'I have formed strong friendships at work'. The Cronbach's alpha obtained for friendship opportunity was 0.94 and for friendship prevalence was 0.95. A Cronbach's alpha obtained for the workplace friendship scale was 0.93.

Job Involvement was measured by Kanungo's (1982) ten-item scale. A sample item for this scale is 'Most of my interests are centered around my job'. The Cronbach's alpha obtained for this measure was 0.93.

RESULTS

Prior to testing the hypotheses, separate confirmatory factor analyses were performed to examine the construct validity of the studied constructs (Tabachnick and Fidell, 2007). Several fit indices were used to assess model adequacy (Hair et al, 1998; Brown, 2006; Byrne, 2010; Kline, 2011), namely chi-square ($\chi 2$), the Root-Mean-Square Error of Approximation (RMSEA), the Goodness of Fit Index (GFI), the Normed Fit Index (NFI), the Tucker-Lewis index (TLI) and the Comparative Fit Index (CFI). RMSEA scores below 0.08 and GFI, NFI, TLI and CFI values above 0.90 represent a good fitting model.

In the analysis concerning workplace friendship, results suggest that the two-factor model had an acceptable fit with the observed data, $\chi 2(51)= 56.713$, RMSEA= 0.04, GFI= 0.88, NFI= 0.93, TLI= 0.99, CFI= 0.99. In the analysis involving job involvement, the model fit statistics were acceptable, $\chi 2(26)= 31.483$, RMSEA= 0.05, GFI= .91, NFI= 0.92, TLI= 0.98, CFI= .99.

Additionally, the convergent and discriminant validity was assessed of the scales by the method outlined in Fornell and Larcker (1981). For convergent validity, the composite reliability (CR) and the average variance extracted (AVE) were calculated in order to determine whether the measurement variable was representative of the related construct. All AVEs in Table 1 were 0.61 or higher, and exceeded the cutoff value of 0.50 (Fornell and Larcker, 1981; Hair et al., 1998), and all CRs were 0.93 or higher and exceeded the cutoff value of 0.70 (Fornell and Larcker, 1981; Hair et al., 1998). These results provided evidence for convergent validity of each of the constructs involved in the research model of this study.

The evidence of discriminant validity can be demonstrated when measures of conceptually different constructs are not strongly correlated among themselves as compared to similar constructs. In order to evaluate the discriminant validity, the square root of the AVE in each construct is compared with the correlation coefficients between two constructs (Fornell and Larcker, 1981; Hair et al., 1998). The square root AVE in each construct that appear on the diagonal in parentheses in Table 1 was larger than any correlation between the associated construct and any other construct. These results provided evidence for discriminant validity.

The means, standard deviations, zero-order correlations, and reliability estimates (α) for the measures used in the study are reported also in Table 1. As seen in this table, zero-order correlations were all in the expected direction and the internal consistency for each measure was above the 0.70 as recommended by Nunnally and Bernstein

 Copyright © International Science and Technology Conference (ISTEC)

(1994). In addition to this, correlations between measures never exceeded 0.85, suggesting that no bivariate multicollinearity exists between scales (Kline, 2011).

Table 1. Descriptive Statistics

	Mean	SD	α	CR	AVE	Correlations						
						1	2	3	4	5	6	7
1.Gender	1.50	0.50	-	-	-	-						
2.Staff Role	1.47	0.82	-	-	-	0.03	-					
3.Education	3.12	0.65	-	-	-	0.19	-0.41**	-				
4.Tenure	2.58	0.58	-	-	-	0.39**	-0.05	0.18	-			
5.Friendship Opportunity	3.62	0.84	0.94	0,94	0,72	-0.01	-0.11	0.25*	0.24	**(0.86)**		
6.Friendship Prevalence	3.38	1.03	0.95	0,94	0,73	0.01	-0.27*	0.29*	0.04	0.50**	**(0.85)**	
7.Job Involvement	3.38	0.89	0.93	0,93	0,61	0.05	-0.16	0.17	0.08	0.53**	0.71**	**(0.78)**

*p<0.05; **p<0.01; N=63, The square root of the constructs' AVE appear on the diagonal in parentheses

Hierarchical regression analyses were conducted to test the hypotheses (Table 2). Because they may affect the variables and relationships of interest, gender, staff role, education and tenure were included as control variables.

Table 2. Hierarchical regression analysis examining the effects of workplace friendship on job involvement

	Job Involvement	
	Step 1	Step 2
	β	β
Control Variables		
Gender	0,02	0,08
Staff Role	-0,12	-0,01
Education	0,11	-0,09
Tenure	0,05	-0,02
Independent Variables		
Friendship Opportunity		**0,25***
Friendship Prevalence		**0,61****
F Value	0.67	11.65**
R^2	0.04	0.55
Adjusted R^2	-0.02	0.50
ΔR^2		0.51**

*p<0.05; **p<0.01; N=63

Hypotheses 1a predicted that friendship opportunity would be related to job involvement. As shown in Table 2, friendship opportunity was significantly and positively associated with job involvement (β=0.25, p<0.05). Thus, Hypotheses 1a was supported.

Hypotheses 1b predicted that friendship prevalence would be related to job involvement. As shown in Table 2, friendship prevalence was significantly and positively associated with job involvement (β=0.61, p<0.01). Thus, Hypotheses 1b was supported.

DISCUSSION

This study was conducted to determine the relationship between workplace friendship and job involvement. For this purpose, data for the sample was collected from 63 employees working in Karabuk University School of Foreign Languages via survey method and the hypotheses were tested by hierarchical regression analyses.

The results of this study confirm and extend prior findings that workplace friendships influence individual and organizational outcomes (Nielsen et al., 2000; Kiesel, 2011; Mao et al., 2012; Asgharian et al., 2013). First, prediction relating to the direct effect of friendship opportunity on job involvement was confirmed. These findings suggests that when a job allows employees to talk with one another on the job and to establish informal relationships with other employees at work, employees are more likely to be committed to their organization identify themselves with their jobs. Second, study findings confirm the direct effect of friendship prevalence on job involvement. That is, when co-workers trust each other and spend time as much as after work, they are more likely to be committed to their organization identify themselves with their jobs. These results were similar to that of prior studies (Riordan and Griffeth, 1995; Nielsen et al., 2000; Morrison, 2004).

The findings of this study also showed that the effect of friendship prevalence on job involvement is greater than the effect of friendship opportunity. This finding shows that while the friendship opportunity is an important predictor of job involvement, spending more time and building trust between employees play a greater role for employees to identify themselves with their job.

This study was conducted on full-time employees labored in a university setting. Thus, the present findings have important implications for university organizations. Universities should be aware that by improving the friendship in working environment, employees will be more committed to their jobs and their organization. Friendship within the work environment may be severely underrated and underutilized as a condition for individual and organizational effectiveness (Riordan and Griffeth, 1995). But, as mentioned by Song (2006), workplace friendship motivates employees to better serve the organizational purpose and increases organizational productivity, job satisfaction and job involvement.

There were a number of limitations to the current study. First, the sample used for the analysis consists of just 63 people. So it limits the generalizability of the findings. Second, data were collected at a single point in time. Thus, the use of cross-sectional research design limits the ability to make causal relationships among the study variables. Future research can rely on experimental or longitudinal designs and provide more convincing evidence on causation.

THE EVALUATION OF ENVIRONMENTAL ENGINEERING EDUCATION PROGRAMME -A CASE STUDY OF BURSA ULUDAG UNIVERSITY FROM TURKEY

Berrak EROL NALBUR[1*], Arzu TEKSOY[1], Seval Kutlu AKAL SOLMAZ[1]
[1]Uludag University, Faculty of Engineering, Department of Environmental Engineering, Görukle,Bursa,Turkey
e-mail: bnalbur@uludag.edu.tr, arzu@uludag.edu.tr, akal@uludag.edu.tr

ABSTRACT
Environmental Engineering Education Programme (EEEP) has grown and expanded over the past 30 years across universities in Turkey. After being established the first Environmental Engineering Department (EED) in 1978, today there are 36 universities which offer environmental engineering undergraduate study country-wide. There is a growing demand in Turkey for qualified environmental engineers and the available EED's in Turkey have become capable of meeting this demand of the country. EEEP in Turkey, at the both undergraduate and graduate level, has been a visible and widely available study option in the past three decades. The knowledge and interest in these programmes may vary across universities but the basic components remain the same. All curricula offer units from the basic subjects, general environmental subjects, water-related subjects, other environmental subjects, global environmental subjects, etc. A bachelor's degree in environmental engineering typically takes four years to complete. The EED was established at Uludag University (UU) as a graduate program in 1991. This programme was began offering undergraduate programs in 1992. The department today has 21 academic staffs and about 400 students. UU undergraduate programme received accreditation by Association for Evaluation and Accreditation of Engineering Programs (MÜDEK (in Turkish)) in 2011. Numerous courses both on Environmental Sciences and on Environmental Technology are offered at the graduate and undergraduate level. All curricula offer units from the basic subjects, general environmental subjects, water-related subjects, other environmental subjects, global environmental subjects, etc. This paper summarizes the EEEP of the EED at UU and its location among the other 36 departments in Turkey. Hence, the education programmes of existing departments have been compared and the evaluation of the results and related suggestions are given in this study.

Introduction

The Environmental Engineering Department which is one of the 8 departments in the Faculty of Engineering of Uludag University, was established in 1991-1992 academic year. The department today has 21 faculty members and about 421 students at the undergraduate level. Each year about 70 new students are enrolled in the Environmental Engineering Department. These students are selected based on their results of a general University entrance examination. Environmental Sciences and Environmental Technology are the two main sub-departments of the Environmental Engineering Department. Numerous courses both on Environmental Sciences and on Environmental Technology are offered at the graduate and undergraduate level.
This paper summarizes the curriculum development and missions of the Environmental Engineering Department at Uludag University. Also, the basic characteristics of the undergraduate and graduate program are reviewed from the point of view of sustainable production.

Environmental Engineering Program

A bachelor's degree in engineering is required for all entry-level engineering jobs. It is important to select a program that is accredited in Environmental Engineering. Accredited environmental engineering programs usually provide broad studies in the physical, chemical, and biological sciences in Turkey. Some graduate level programs are also available in Environmental Engineering.

Admission Requirements

Admissions requirements for undergraduate environmental engineering departments include a solid background in mathematics (algebra, geometry, trigonometry, and calculus) and science (biology, chemistry, and physics), and courses in English, social studies, Atatürk's Principles and The History of Turkish Renovation I-II and

 Copyright © International Science and Technology Conference (ISTEC)

computer and information technology. Bachelor's degree programs in environmental engineering typically are designed to last 4 year. In a typical 4-year college curriculum, the first 2 years are spent studying mathematics, basic sciences, introductory engineering, Atatürk's Principles and The History of Turkish Renovation I-II and social sciences. In the last 2 years, most courses are in engineering, usually with a concentration in one branch. For example, the last two years of an environmental program might include courses in solid waste management, treatment plant design, hydraulic design, and hazardous waste management.

Courses of Study

Environmental Engineering Departments have an interdisciplinary character which requires knowledge in many fields of science, including physics, chemistry, hydrology, geology, and biology. Undergraduate students of Environmental Engineering Department of Uludağ University take courses that cover these fields including microbiology, organic chemistry, hydrology, engineering geology and others.

The concept of total quality control (TQC) is applicable to academics. To test the end product of academics is not as easy as to test the end product of an industry. Tardy studies are required to test ''graduates'' who are the end products of an educational institute. Uludağ University Environmental Engineering Department has started a study to have an accreditation in 2011. An accreditation study and an evaluation procedure have been requested from Association for Evaluation and Accreditation of Engineering Programs (MÜDEK). MÜDEK is recognized by the Higher Education Council of Turkey as the National Quality Assurence Agency in accrediting engineering programs. MÜDEK is a full member of European Network for Accreditation of Engineering Education. With 25 years of experience in undergraduate education, the Environmental Engineering Department today has fulfilled the MÜDEK (2011) accreditation criteria and has been accredited by MÜDEK since 2011.

Curriculum of the Program

The curriculum of the Department is planned to provide students with a solid professional education. The basic mission statement of the Uludağ University Environmental Engineering Department is "Environmnetal Engineering Department undertake to make original researches in the environmental area, to provide training in continuous improvement approach, to train engineers armed with the information to understand and solve problems in the field, based on ethical values , with self- refreshing approach and able to work as a team, who can lead in the area and to serve the community in environmental issues". In order to fulfill these missions and to reach its goals the following basic teaching program in the undergraduate and graduate education is applied.

The curriculum in Uludağ University Environmental Engineering Department topics has wide provisions. There are some courses on engineering science such as statics, fluid mechanics and thermodynamics. There are several compulsory courses as well as technical elective courses expose students to problem-solving in the technical context and to more global issues and societal context. The students are also required to take ten credits of social elective courses that provide a much broader perspective on the role of engineers in society. Courses in the junior and supper division courses focus on environmental engineering applications and problem-solving exercises.

There are some compulsory laboratory courses (CEV 2030 Environmental Microbiology, CEV 2025 Environmental Chemistry, etc.) in the curriculum. Students have chance to obtain hands-on laboratory techniques, data collection and analysis. In some courses the experiments have been designed for the students to work in a team or individually. The team is encouraged to do the experiment, interpret the data and write a technical report on the findings independently.

Apart from CEV4006 Graduation Project that students take during their senior year, there are also two design courses which they take during junior and senior years (CEV 3074 Environmental Engineerıng Project I and CEV 4101 Environmental Engineerıng Project II). Due to the importance of the design in engineering education and the Graduation Project has been extended to two semesters from 2016-2017 academic year. During the course CEV 4101 Environmental Engineerıng Project II students have to work in teams and design a multidiciplinary Project. This course is usually a very challenging course for students because it makes the student to create multidisiplinary projects and work in teams. At the end of the courses, the teams write a final report on the projects and prepare an oral presentation to a jury. The jury consists of 3 faculty members from the Department.

After the course is over, students would have gained the knowledge of solving a design problem, improving communication skills, and an understanding of the professional and ethical responsibility of an engineer. The students also learn the importance of life-long learning aspect during this design process.

The curriculum of Environmental Engineering Department has been given in Appendix 1. In this program the total number of credits for the following groups of courses and their percentages are given as follows.

Math and Basic Sci.	**60 ECTS ***	**25% of total**
Atatük's principals and history of revolutions I-II, Soc. Sci.	31 ECTS	13% of total
Departmental Courses	149 ECTS	62% of total
Total	240 ECTS	

*European Credit Transfer System - ECTS

Employment

Environmental Engineers work in a wide variety of industries, including chemical, pharmaceutical, water/wastewater treatment, mining, and manufacturing, and can be involved in hazardous waste remediation, air pollution control, facilities planning, and environmental consulting.
As the trend of regulation changes from pollution cleanup to prevention, environmental engineers will have to shift their focus to public health, an area of growing concern. But trends in environmental protection and regulation constantly change, so environmental engineers must keep abreast of a range of environmental issues to ensure steady employment.

Conclusions

Environmental engineering education has grown, expanded and evolved into a unique area of engineering over the past decade.
Environmental engineering is different from any classical engineering discipline because it is multidisciplinary in nature, covering a broad range of topics from engineering and science, to economics and humanities, etc. It is not enough to take an existing programme and add on environmental units, and then call it environmental engineering. This method may appear to be the quickest and most economical way of developing a new programme but, according to the authors, it has resulted in many problems and failures.
The basic characteristics of the undergraduate program of the Environmental Engineering Department at Uludag University has been reviewed. The Environmental Engineering Department today has fulfilled the MÜDEK accreditation criteria and accredited by MÜDEK.
Some of the most important points emphasized in the courses are problem-solving in the technical and societal context, working in a multidisciplinary team and life-long learning.
An understanding of sustainable development is delivered to the students during several courses taken from the Department.

Abstract: At present, Taiwan is short of indigenous energy, over 98% of energy supply depends on import (Tsai, 2005). As Taiwan's national income increases gradually, the traffic network is improved increasingly, and the demand of the automobile and motorcycles for the imported energy increases continuously, the important issue for the moment is to establish the automobile and motorcycle fuel saving accomplishment development indexes. The purpose of this study is to know the automobile and motorcycle fuel saving accomplishment and to evaluate its importance. This method uses related references and Fuzzy Delphi Method of expert questionnaire to discuss the automobile and motorcycle fuel saving accomplishment. As confirmed by the experts, the major factor aspects pushing the automobile and motorcycle fuel saving accomplishment include "fuel saving cognition", "fuel saving affection" and "fuel saving skill". There are 17 indexes and 56 items. The mean value of importance is 0.7166, the important indexes and consensus value are fuel saving skill (0.72789), fuel saving cognition (0.71098) and fuel saving affection (0.71092). It is obvious that the automobile and motorcycle fuel saving shall start with the fuel saving skill aspect. The factors of automobile and motorcycle fuel saving accomplishment can provide reference for the automobile and motorcycle users and competent authorities to develop automobile and motorcycle fuel saving accomplishment training and learning.

Keywords: fuel saving accomplishment, Fuzzy Delphi, fuel saving cognition, fuel saving affection, fuel saving skill

I. Introduction

With the aggravating extreme climate over the world, the trend of global warming and climate change has been scientifically verified as the result of human activities (Intergovernmental Panel on Climate Change [IPCC], 2007), especially the high CO_2 emission from burning fossil fuels. Therefore, multiple experts indicate that the promotion of energy education depends on building an effective communication mechanism, so as to enhance the citizens' environmental awareness, changing the attitude toward living and exercising specific environmentally friendly actions (Chedid, 2005; Dias, Mattos, & Balestieri, 2004; Zografakis, Menegaki, & Tsagarakis, 2008).

1. Research Background and Motives

At present, the traditional oil reserves are being exhausted over the world, the international oil situation fluctuates, the oil price risk increases and the alternative energy has not yet be found, Taiwan's energy development is confronted with rigorous challenges. The power source of the present automobile and motorcycles is derived from burning fossil fuels (e.g. diesel oil, gasoline, liquefied petroleum gas), so it is inevitable to produce a great deal of CO_2. With the rising environmental considerations and the greenhouse gas reduction specification in the "Kyoto Protocol" adopted at the "Framework Convention on Climate Change", Japan Kyoto, 1997, various countries restricted the use of petroleum to some extent, and made related laws to control the consumption of fossil fuels, so as to reduce the production of greenhouse gases including CO_2. In

 Copyright © International Science and Technology Conference (ISTEC)

addition, various countries concentrate on pushing fuel saving and carbon emission reduction, increasing the energy efficiency for automobile and motorcycle fuel saving and carbon emission reduction has become a global consensus. The automobile and motorcycle fuel saving management policies and encouragement measures are used as important strategies for greenhouse gas reduction.

The fuel saving education is obviously important for enhancing our people's attitude and behavior of automobile and motorcycle fuel saving. The traditional delphi requires more than three times of scale survey and revision, taking much time, and the larger the number of surveys is, the higher is the cost (Wu, 2005). If the Fuzzy Delphi is used, and the expert opinions are integrated by triangular fuzzy number, only one survey is required, not only reducing the cost, but also expressing the fuzziness and uncertainty of human thinking, the objectivity of scale is enhanced. Convenient use, even automatic presentation of the cognition, affection and skill about energy saving and carbon reduction in daily life will contribute to enhancing the energy saving accomplishment.

Therefore, the automobile and motorcycle fuel saving accomplishment development index is the important subject at present in the view of this study. The analysis is based on literature review and Fuzzy Delphi Method, hoping to find out the strategy for pushing the automobile and motorcycle fuel saving and carbon emission reduction, so as to provide reference for developing the decision on fuel saving and carbon emission reduction, guiding the automobile and motorcycle drivers to the new accomplishment of fuel saving and carbon emission reduction, so as to implement the promise of carbon emission reduction to the world and to build a sustainable Taiwan.

2. Research Questions

The research questions include:

1. What aspects does the automobile and motorcycle fuel saving accomplishment scale have? What is the weight of each aspect? Which aspect has the highest weight?
2. What indexes does the automobile and motorcycle fuel saving accomplishment scale have? What is the weight of each index?
3. Which index has the highest weight among all the indexes? Which indexes have the highest weight in each aspect?

3. Research Purposes

According to the research background and motives, the purpose of this study is to use Fuzzy Delphi Method to develop an automobile and motorcycle fuel saving accomplishment scale for the middle school and college student owners who have just obtained a driver's license. The fuel saving knowledge will be popularized in the middle school and university education from the angle of effective automobile and motorcycle fuel saving, so as to implement the fuel saving and carbon emission reduction policy to enhance our people's accomplishments of fuel saving and environmental protection, responding to the global environment where the oil reserves are exhausted increasingly and the climate changes rapidly.

II. Research Method

The fuzzy Delphi selects the importance of items of the automobile and motorcycle fuel saving accomplishment questionnaire scale, the experts fill in it and express their opinions. The revision is made according to the expert advice, the experts' consistent view is obtained. The advantages include fully expressing individual opinion, the expert opinions have the same value, being free from personal power and position. This study uses triangular fuzzy number to integrate multiple experts' opinions, free of repeated surveys. This integration method uses the preference relation of each participant to build the personal fuzzy preference relation, so as to obtain the overall preference relation. The technology is used to design the scale for a subject, the expert group expresses opinions. Afterwards, the expert opinions are collected and organized to obtain the group members' consistent view (Wang and Wang, 2006).

1. Research Subjects

This study invited 16 industrial and academic experts to evaluate this scale. The experts are professionals of automobile and motorcycle field. The expert background is shown in Table 2. Most of the experts have automobile or motorcycle repair and maintenance Grade B certificate or above, and have enough automobile and motorcycle teaching seniority and experience. The experts to fill in the scale have further understanding of automobile and motorcycle fuel saving and carbon emission reduction, the interference in the scale reliability and validity is reduced.

2. Research Tools

This study uses Fuzzy Delphi Method to evaluate the evaluation factors in automobile and motorcycle fuel saving and carbon emission reduction. The expert questionnaire is used for research, so as to integrate expert opinions reasonably and objectively. The Fuzzy Delphi Method is an expert forecasting method, as well as one of group decision methods, it can extract the advantages of questionnaire survey and meeting. The purpose of questionnaire is to evaluate the importance order rank in the evaluation sheet, there are 0~10 ranks, higher score represents higher importance. The double triangular fuzzy numbers of Fuzzy Delphi Method are used for gray zone test, the expert group's opinions are analyzed. After the "automobile and motorcycle fuel saving accomplishment" questionnaire filled by the experts is analyzed by Fuzzy Delphi Method, the threshold is screened, so as to select the appropriate evaluation factors.

Table 2

Major factor aspects of automobile and motorcycle fuel saving accomplishment and reference source

Research classification		Research variables	References
Fuel saving cognition	Memory	1.1.1Description of oil consumption of vehicles using the same fuel, small c.c. vehicles perform better than large c.c. vehicles in fuel saving and carbon emission reduction.	Bureau of Energy (2014).
		1.1.2Opening the door windows before startup in the strong sunlight to reduce the temperature inside the vehicle rapidly before the air conditioning is turned on can reduce the fuel consumption and the carbon emission.	Teng, M.E.(2011.03). Tsai, W.P.(2012.09). Bureau of Energy (2011).

 Copyright © International Science and Technology Conference (ISTEC)

	Comprehension	1.2.1Evading strong sunlight during fueling and not to spill the fuel and fastening the tank cap after fueling can reduce the fuel evaporation and waste, the fuel consumption and carbon emission may be reduced.	Bureau of Energy (2014).
		1.2.2When the vehicle weight load is reduced (non-original vehicle's fittings, e.g. top holder and top cargo box), the engine load can be reduced and the vehicle fuel efficiency can be increased, the fuel consumption and carbon emission may be reduced.	Teng, M.E.(2011.03). Tai, C.H. (2011.07). Tsai, W.P.(2012.09). Bureau of Energy (2011). Bureau of Energy (2014).
		1.2.3When the vehicle is running at a high speed, keeping the windows closed when the speed per hour is higher than about 60km/hr can reduce the wind resistance coefficient, the fuel consumption and carbon emission may be reduced.	Teng, M.E.(2011.03). Bureau of Energy (2011).
	Application	1.3.1The automobile and motorcycle with a jet engine can depart without idle warming, the normal working temperature of engine is reached by slow running and slow speed, the fuel consumption and carbon emission can be reduced.	Teng, M.E.(2011.03). Tai, C.H. (2011.07). Bureau of Energy (2011). Bureau of Energy (2014).
		1.3.2The vehicle runs at constant speed as possible, running at a steady speed of 40-50km/hr downtown, running at a high steady speed of 80-90km/hr, driving at an economic speed can reduce the fuel consumption and carbon emission.	Teng, M.E.(2011.03). Tai, C.H. (2011.07). Bureau of Energy (2011). Bureau of Energy (2014).
		1.3.3The depth above standard tire tread depth 1.6mm can reduce the fuel consumption and carbon emission.	Lai,T.L.(2014.01).
		1.3.4The vehicle tire pressure within the computing range recommended by the original manufacturer's standard can reduce the friction resistance, unnecessary tire wear is reduced, the fuel consumption and carbon emission can be reduced.	Teng, M.E.(2011.03). Tai, C.H. (2011.07). Tsai, W.P.(2012.09). Bureau of Energy (2011). Bureau of Energy (2014).
	Analysis	1.4.1Selecting appropriate gasoline for the automobile and motorcycle can reduce the fuel consumption and carbon emission. Inappropriate fuel is likely to cause engine carbon knock and fuel waste.	Bureau of Energy (2014).
		1.4.2Additional ethyl fluid (gasoline additive) for the automobile and motorcycle can clean the oil nozzle carbon deposit and increase the oil injection efficiency, the fuel consumption and carbon emission can be reduced.	
		1.4.3The addition of engine oil treatment (oil additives) to the automobile and motorcycle can reduce the internal wear of engine and enhance the lubricating effect, the fuel consumption and carbon emission can be reduced.	Bureau of Energy (2014).
	Integration	1.5.1In terms of the automobile designs of the same model, the hydrogen fuel cell vehicle performs better than general gasoline vehicle in fuel saving and carbon emission reduction.	
		1.5.2In terms of the automobile designs of the same model, the electric vehicle performs better than general gasoline vehicle in fuel saving and carbon emission reduction.	Fang,J.Y.(2012.05). Margaret. A. Walls (1996).
		1.5.3In terms of the automobile designs of the same model, the hybrid vehicle (e.g. fuel-electric vehicle) performs better than general gasoline vehicle in fuel saving and carbon emission reduction.	Liu,T.C.(2013). Bureau of Energy (2014).
	Appraisal	1.6.1In terms of the vehicles of the same model and displacement, the GDI engine performs better than general injection engine in fuel consumption and carbon emission.	Liu, T.C.(2013).
		1.6.2In terms of the vehicles of the same model and displacement, the diesel car performs better than general gasoline car in fuel saving and carbon emission reduction.	Bureau of Energy (2014).
		1.6.3In terms of the vehicles of the same model and displacement, the car performs better than recreational vehicle in fuel saving and carbon emission reduction.	
		1.6.4In terms of the vehicles of the same model and displacement, the car performs better than sports car in fuel saving and carbon emission reduction.	
		1.6.5In terms of the vehicles of the same model and displacement, the jet engine performs better than carburetor engine in fuel saving and carbon emission reduction.	Lin,Y.C.(2004). Badih A. Jawad¸ Thomas V. Kuzak¸ (2000).
		1.6.6In terms of the vehicles of the same model and displacement, the lightweight vehicle performs better than nonlightweight vehicle in fuel saving and carbon emission reduction.	Liu,T.C.(2013). Li, P.T.(2009).
Fuel saving affection	Acceptance	2.1.1Maintaining and overhauling vehicle regularly as required can reduce the fuel consumption and carbon emission.	Fan, S.F.(2012.01). Teng, M.E.(2011.03). Tai, C.H. (2011.07). Bureau of Energy (2011).

 Copyright © International Science and Technology Conference (ISTEC)

		2.1.2Listening in the road condition from traffic broadcast station at any time during driving to know the real-time traffic condition, so as to take necessary measures and choose smooth roads, the fuel consumption and carbon emission can be reduced.	Bureau of Energy (2014).
		2.1.3The light-colored vehicle has lower air conditioning load than deep-colored vehicle, the fuel consumption and carbon emission can be reduced. (In the strong sun, maximum surface temperature difference between car bodies in different colors is 20℃)	Bureau of Energy (2014).
	Response	2.2.1Not mounting additional electrical equipments which increase the generator load on the vehicle is helpful to fuel saving and carbon emission reduction.	Teng, M.E.(2011.03). Tsai, W.P.(2012.09).
		2.2.2Thermostatical control and appropriate temperature setting of automobile air-conditioning system can reduce the fuel consumption and carbon emission.	Bureau of Energy (2011).
	Evaluation	2.3.1If a relatively long parking is required during driving, the engine shall be shut down to avoid idle motion, the fuel consumption and carbon emission can be reduced.	Bureau of Energy (2014).
		2.3.2Planning the optimum route before departure, evading rush hour and congested sections to avoid wasting time, the fuel consumption and carbon emission can be reduced.	Teng, M.E.(2011.03). Tsai, W.P.(2012.09). Bureau of Energy (2011). Bureau of Energy (2014).
	Organization value	2.4.1Arranging "fuel saving driving" training for drivers can reduce the fuel consumption and carbon emission.	Tsai, T.H.(2008).
		2.4.2Safe driving and protecting the passengers can reduce the fuel consumption and carbon emission.	Huang,H.H.(2011.11). Teng, M.E.(2011.03). Tai, C.H. (2011.07). Chang, M. F.& Horowitz, A. J. (1980). Bureau of Energy (2011).
		2.4.3Using the original manufacturer's automobile and motorcycle tires and not mounting tires with low flatness ratio (aspect ratio) are helpful to fuel saving and carbon emission reduction.	Tai, C.H. (2011.07).
	Setting	2.5.1In terms of the vehicles of the same model and displacement, the front-wheel drive transmission system has the best performance in fuel saving and carbon emission reduction. (front-wheel drive > four-wheel drive > rear wheel drive)	Liu,T.C.(2013).
		2.5.2In terms of the vehicles of the same model and displacement, the CVT performs best in fuel saving and carbon emission reduction. (CVT > MT > AT)	Liu,T.C.(2013).
		2.5.3New vehicle appreciation can refer to the oil consumption test data sheet in the "Fuel Economy Guide" published periodically by Bureau of Energy, Ministry of Economic Affairs, choosing the vehicle with better fuel efficiency performs best in fuel saving and carbon emission reduction.	Bureau of Energy (2014).
Fuel saving skill	Perception	3.1.1Treading on the brake pedal lightly during deceleration to keep a safe distance to the vehicle ahead can reduce the fuel consumption and carbon emission.	Tsai, W.P.(2012.09). Teng, M.E.(2011.03). Tai, C.H. (2011.07). Evans, L. (1979).
		3.1.2In terms of the spark plugs of different materials, the spark plug made of iridium alloy has higher sparking voltage than that of general materials, the fuel consumption and carbon emission can be reduced.	
		3.1.3Using the original manufacturer's automobile aero kit during high speed running can reduce the fuel consumption and carbon emission. (e.g. tractor trailer nose air deflector and automobile chassis air deflector can reduce wind resistance during running)	Tai, C.H. (2011.07). Bureau of Energy (2011). Bureau of Energy (2014).
		3.1.4Using automobile sheathing paper can reduce interior temperature, the fuel consumption and carbon emission can be reduced.	Yao, M.(2011).
	Response trend	3.2.1The vehicle with variable valve mechanism functional unit can reduce the fuel consumption and carbon emission.	Liu,T.C.(2013).
		3.2.2The vehicle with functional unit of electric steering engine can reduce the fuel consumption and carbon emission.	Liu,T.C.(2013).
		3.2.3The vehicle with functional unit of off-cylinder can reduce the fuel consumption and carbon emission.	Liu,T.C.(2013).
		3.2.4The automobile and motorcycle with functional unit of idling stop can reduce the fuel consumption and carbon emission.	Lai, T.L.(2012.03). Liu,T.C.(2013).
		3.2.5The diesel common rail injection (CDI) engine reduces the fuel consumption and carbon emission compared with general gasoline engine.	Liu,T.C.(2013).
		3.2.6The vehicle with functional unit of lean combustion can reduce the fuel consumption and carbon emission.	Liu,T.C.(2013).

 Copyright © International Science and Technology Conference (ISTEC)

Following response	3.3.1Not placing any sundries on the vehicle following the automobile design lightweighting principle can reduce the fuel consumption and carbon emission.	Liu,T.C.(2013).
	3.3.2The automobile and motorcycle driving can follow the vehicle energy saving manual and video fuel saving driving pattern made by Bureau of Energy, Ministry of Economic Affairs, the fuel consumption and carbon emission can be reduced.	Bureau of Energy (2011). Bureau of Energy (2014).
Skill	3.4.1Stepping on the gas lightly during acceleration, smooth start and acceleration, to avoid frequent shift and sudden acceleration, sudden deceleration and arbitrary lane change, the fuel consumption and carbon emission can be reduced.	Tsai, W.P.(2012.09). Teng, M.E.(2011.03). Tai, C.H. (2011.07). Bureau of Energy (2011).
	3.4.2Changing gear appropriately with running speed and load, not overloading the engine, keeping the engine speed slow (1500~2000 rpm), and driving at a high gear can reduce the fuel consumption and carbon emission.	Tsai, W.P.(2012.09). Tai,C.H.(2011.07). Hooker, J. N. (1988). Bureau of Energy (2011). Bureau of Energy (2014).
	3.4.3Be aware of the traffic flow condition ahead, mild and smooth turning, operating the engine brake instead of general brake as possible during deceleration, the fuel consumption and carbon emission can be reduced.	Bureau of Energy (2011). Bureau of Energy (2014).
	3.4.4Making sure the hand brake is released before driving can reduce the fuel consumption and carbon emission.	Bureau of Energy (2014).
	3.4.5The fine tire tread performs better than massive tire tread on general black top in fuel saving and carbon emission reduction.	Teng, M.E.(2011.03). Tai, C.H. (2011.07).
Complex response	3.5.1The brake system is repaired, adjusted, changed and cleaned according to the original manufacturer's warranty specifications, the brake pad wear can be reduced, and the running resistance is reduced, the fuel consumption and carbon emission can be reduced.	Bureau of Energy (2014).
	3.5.2The four wheels are aligned as per the original manufacturer's specification, the fuel consumption and carbon emission can be reduced.	
	3.5.3Preventing the exhaust pipe from being choked by oil sludge that reduces the horsepower, the fuel consumption and carbon emission can be reduced.	Bureau of Energy (2014).
Creation	3.6.1LED energy-saving bulb for the automobile and motorcycle can reduce the fuel consumption and carbon emission.	Lin, C.H.(2011).
	3.6.2Streamlined automobile and motorcycle shape with low wind resistance coefficient can reduce the fuel consumption and carbon emission.

3. Data Analysis

The data of the recovered scales are processed. This study sent out 16 scales, and recovered 16, the recovery ratio is 100%. The experts select the importance level of each item in the scale, the defuzzification value of each initial index is worked out. The Fuzzy Delphi consistency test "Fuzzy Delphi scale" has 56 items, including fuel saving cognition, fuel saving affection and fuel saving skill aspects. The evaluation index (defuzzification value) is screened by threshold greater than 0.6, the item greater than 0.6 is reserved; that smaller than 0.6 is deleted.

4. Research Process

First, the research subject is determined as automobile and motorcycle fuel saving accomplishment. Afterwards, related references are discussed. The scale is prepared according to the references, reviewed by the research members to guarantee the suitability and readability of item, the face validity test is completed. When the Fuzzy Delphi expert members are determined, the expert members exchange and correct opinions on the scale, so as to guarantee the specialty and correctness of items, the expert validity is completed. It is reviewed by the instructor after correction, then the Fuzzy Delphi scale survey is implemented. The experts evaluate the importance level of each item. Afterwards, the defuzzification values of aspects and items are calculated, and the consistency is tested. The scale is corrected according to the test result.

III. Research Results

According to the data of questionnaire survey scale, the "fuel saving cognition", "fuel saving affection" and "fuel saving skill" are analyzed by Fuzzy Delphi Method of expert questionnaire. This questionnaire is graded by experts and scholars, who fill in the most straightforward observation value, based on this observation value, the threshold (S) is determined according to the research purpose, so as to decide whether or not to delete the factors. If the geometric mean of a factor is greater than or equal to the threshold ($M \geqq S$), this factor is accepted as evaluation factor, otherwise ($M<S$), this factor is deleted. This study refers to the geometric mean (0.6) of

 Copyright © International Science and Technology Conference (ISTEC)

consensus importance of all potential influence factors, and considers the criteria validity after screening and the operability of the future handling problem, so the screening threshold (S) is defined as 0.6. Finally, the experts eliminate the potential influence factors with consensus importance value smaller than 0.6, the index screening result is 1) 6 indexes in fuel saving cognition (0.711) aspect, i.e. memory (0.709), comprehension (0.620), application (0.699), analysis (0.673), integration (0.802), evaluation (0.763); 2) 5 indexes in fuel saving affection (0.711) aspect, i.e. acceptance (0.701), response (0.755), evaluation (0.769), organization value (0.655), setting (0.675); 3) 6 indexes in fuel saving skill (0.728) aspect, i.e. perception (0.731), response trend (0.751), following response (0.717), dexterity (0.779), complex response (0.699), creation (0.689), all the 17 indexes conform to the threshold. It is found that the item defuzzification values in the indexes of various aspects mismatch the threshold. The screening result is "1.2.1 evading strong sunlight during fueling and not to spill the fuel and fastening the tank cap after fueling can reduce the fuel evaporation and waste, the fuel consumption and carbon emission may be reduced " total value (0.555), "1.3.3 the depth above standard tire tread depth 1.6mm can reduce the fuel consumption and carbon emission." total value (0.437), "1.4.3 the addition of engine oil treatment (oil additives) to the automobile and motorcycle can reduce the internal wear of engine and enhance the lubricating effect, the fuel consumption and carbon emission can be reduced" total value (0.582), "2.4.2 safe driving and protecting the passengers can reduce the fuel consumption and carbon emission" total value (0.450), all of them are smaller than 0.6. The four items have not reached the threshold, they are deleted. The defuzzification values of the other items are greater than 0.6, so reserved.

IV. Conclusion and Suggestions

This study combines fuzzy theory with Fuzzy Delphi Method to develop an automobile and motorcycle fuel saving accomplishment scale. According to the experts' visual consensus importance value sequencing, the experts' evaluation on automobile and motorcycle fuel saving is that the "fuel saving skill" is the most important among the aspects, the "integration" automobile design is the most important among indexes; "in terms of the vehicles of the same model and displacement, the lightweight vehicle performs better than nonlightweight vehicle in fuel saving and carbon emission reduction" is the most important among the items, so as to provide reference for the automobile and motorcycle users and related competent authorities to develop the automobile and motorcycle fuel saving accomplishment training and learning.

THE IMPORTANCE OF ONTOLOGY IN SOFTWARE ENGINEERING EDUCATION PROGRAMS

Zeynep Altan

Beykent University, Engineering-Architecture Faculty Software Engineering Department, Istanbul

zeynepaltan@beykent.edu.tr

Abstract: Since late 1970s (Yordon Structured Design, DeMarco Structured Analysis) and early 1980s (Structured System Analysis and Design Method -SSADM) to early 1990s (Booch Method), software developing methodologies have planned to model system building. As the real world problems became more complex and software industry became more complicated, software engineering education has been a necessity as a separate discipline. The Guide to the Software Engineering Body of Knowledge (SWEBOK) was published in 2004 after the description of a sequence of software engineering standards. These standards began to be specified in 1976 by IEEE Computer Society. On the other hand, the radical changes on the context of software problems arose object technology. The revolution of object technology took many years. As the consequence of different practices, a new software development approach Model-Driven Engineering (MDE) developed by Object Management Group (OMG) focused on models as the primary artifacts for development process. The processes have been implemented with transformations mapping information from one model to another. The integration of knowledge in different models depends on the existence of explicit declarative semantic models. Therefore, increasing diversity and complexity of information gave rise to increasing interests on ontologies. These formal domain models have been linked to each other on the Web. The linked ontologies provide shared terminologies for different applications. In 2013, the Knowledge Areas (KAs) in SWEBOK 3.0 have also been rearranged according to these complications of the real world problems. Formal and informal solution techniques, latest development methods and new technologies have been included to guide the software engineering education programs.

Keywords: Ontology, Semantic Web, Model Driven Engineering SWEBOK, Knowledge Area

Introduction

In 2009, Tim Berners Lee at TED conference explained the importance of Linked Data as follows[1]: "At the present day, the huge amount of data, in other words open data, must be combined each other as a different system or technology. It is required to give meaning to everything to obtain the required solution. This is the semantic web movement and Wikipedia is the first project of that movement". Knowledge based applications on MDE uses ontologies to share the information (Gruber, 1993; Uschold &Gruninger,1996; Parreiras& Gröner& Walter et.al. ,2013). Although the primary applications on ontology have been accepted as the research area of the artificial intelligence experts, it came into a part of industrial software engineering applications on the solution today's software problems. One of the knowledge areas of the Software Engineering education program on SWEBOK taxonomy (Bourgue & Fairley, 2014) is Mathematical Foundations KA and it supplies well understood solutions to the real world problems with an unambiguous logic. The search of the formal systems related with the completeness, in other words preciseness is the basis of discrete mathematics. Since the software problems for different applications requires distinct abstraction, Mathematical Foundations is a separate KA of the software engineering undergraduate programs. Software Engineering Models and Methods as another KA of the SWEBOK taxonomy defines the modelling as an abstraction of any software component, and this component has more than one abstractions. The aggregation of these abstractions compose the software model. When the developed model has been reused, coherence with the new context will be verified by the inferences constituted from simplifications (abstractions).

Ontology is a conceptualization corresponding to any domain as machine readable entities, attributes, and well understood rules, in other words axioms (Gruber, 2008; Tobias, 2011; Aßmann &Andreas&Christian, 2010). Various ontologies that have aimed at modelling the concepts support to reuse and to extend these independently

[1] https://www.ted.com/talks/tim_berners_lee_on_the_next_web?language=en

 Copyright © International Science and Technology Conference (ISTEC)

developed ontologies. Information modelling as one of the modelling types of Software Engineering Models and Methods KA is an abstraction as semantical, in other words conceptual knowledge model and it includes the senses, properties and constraints that formalize the real world outlook of knowledge. Finally, standard knowledge representation for semantic web can be determined by intelligent access to the heterogeneous and distributed information with better interaction of human-computer on the web. It is not possible to implement this using UML diagram that is one of the structural modelling types of the same KA (Software Engineering Models and Methods).

Logic based knowledge representation used widely for ontology languages is represented by Description Logic (DL). (Sowa, 2008; Krötzsch&Simancík&Horrocks, 2014), and it belongs to the same KA of SWEBOK taxonomy. First order predicate logic supplies the modeling of all relationships among the objects as set elements. For example, World Wide Web Consortium (W3C) has been defined by DL syntax with the class/concept constructors of OWL2 (Web Ontology Language)[2]. Disambiguation of the ontological studies can also be obtained by semantic definitions which the complexity has been reduced. This is possible with theoretically well-defined reasoning algorithms and well explained formal properties. eScience, geographical investigations, engineering, medicine, biology, defense industry projects are some of the application domains that the ontologies have extensively been used. Software engineering education programs must be a separate discipline since the concepts summarized above. In this study, the reasons of teaching ontology in undergraduate software engineering programs due to the need to huge data for present day software products have briefly been explained.

Software Engineering Undergraduate Programs

The number of software engineering department in Turkey has been 16 in the 2015-2016 academic year. Three of them with the inclusion of Technology Faculty Departments are at Karadeniz Technical, Fırat and Celal Bayar Universities. Three of the foundation universities are held in North Cyprus (Doğu Akdeniz, Lefke and Yakın Doğu Universities), one is in Ankara (Atılım University), two are in Izmir (Izmir Ekonomi and Yaşar Universities) and one is in Mersin (Toros University). In Istanbul there are six Software Engineering Departments at the Universities Bahçeşehir, Beykent, Maltepe, Aydın, Işık and Sabahattin Zaim. Since the number of software engineering departments have rapidly increased in the last 10 years, it is important to prepare and to update the education programs of software engineering departments. The first study about the organization of software engineering undergraduate programs began in 1987 with the conference "The Conference on Software Engineering Education and Training - CSEET". These conferences devised by SEI (Software Engineering Institute) repeated with different periods, until they were completely complemented. Another important study to prepare the education programs is the project SWEBOK started in 1998. This project aims to the software engineering standards supported by IEEE (Altan, 2010). SWEBOK Guide released in 2004 was composed of 10 KAs. This guide has been expanded in parallel with the raise of problem sizes to appraise the software engineering on the world measurement. Table 1 shows all KAs with the reorganized 5 KAs. The undergraduate programs at software engineering departments must be updated in accordance with the new requirements since the comprehensive complexity of the software problems (Altan, 2015). Moreover, to distinguish software engineering undergraduate programs from computer engineering undergraduate programs, it is important to realize the KAs in SWEBOK guide.

Since a special emphasis is put on the information sector both in our country and in European countries in accordance with Europe 2020 Targets, software engineers will increasingly be demanded persons. Moreover

[2] http://www.w3.org/TR/owl2-profiles

 Copyright © International Science and Technology Conference (ISTEC)

researches show that the software sector gets possession the most labor force when compared with other sectors. We also know that information and telecommunication technologies contributes the maximal productivity on all over the world. In this context, young graduates can employ at all domains from social media, business, and economics to education and production sectors to apply present-day technologies; besides they can develop new software products and new application domains. On the other hand, it is a fact that well-qualified labor supply is insufficient in Information Technology (IT) industry in Turkey. Although the sector employs 160,000 persons, more than half of them are the labor force with poor quality (Türkiye Bilişim Derneği, 2016). Furthermore, digital data will get around to 40 billion terabyte since the considerably growing data annually obtained from device, sensor, geographic applications, web and social media. Big data as a new concept arose from this huge increment beside the usual data sources, and the IT sector made an investment to the new technological developments to obtain consequences semantically. The fundamental reason of this research comes from the management of big data.

The Challenges on Software Engineering

The main problem of the software engineers is to produce working software artifacts according to the customer needs, in time and within the budget. This is the fundamental software quality criteria on the evolution of software engineering discipline. Software crisis gradually have been increasing since the first software products developed. In 1995, the Standish Group[3], a small IT Research Company, published "The CHAOS Report" about over 8,000 software projects. Each project was accepted to be successful if it met all the software product quality criteria. While only 16.2% of the projects were successful and 31.1% of projects were cancelled. 52.7% of them were challenged. Any project has usually been confirmed as canceled before delivered anything; in other words, before completion or never implemented. The challenged projects were either completed or operational with over-budget, over-schedule and/or estimate fewer featured. Standish Group 2015 CHAOS Report gives us 29%, 19%, 52% results for successful, cancelled and challenged projects sequentially. More than 50,000 projects around the world ranged all project sizes including re-engineering implementations give the similar results with the first CHAOS Report. During the 21 years software developing methodologies have changed to cope with the complex real world problems. Cancelled and challenged IT Projects are higher in Standish Group Reports than in other reports since the detailed evaluation criteria reflects the critical quality problems with software.

At the present time, the customers demand the products with more functionality delivering in shorter time. Moreover traditional software development processes starting with waterfall projects and the evolution of waterfall by time as prototyping, incremental, spiral and unified processes became a challenging issue for software engineering discipline. Too many requirements and scope changes, lack of management skills, much development costs than planned, lack of technical skills, unessential system anymore are other causes of unsuccessful software projects. By time three measurements on time, on budget, on satisfaction to succeed a project increased to six adding the measurements on target, on goal and on value. This is the success criteria of the Project Management Institute (PMI) that most of the project management processes have been doing from the PMBOK Guide (4. Edition)[4] since 2012. Team working and skill level of the team members are important issues for a software project. However, most organizations don't emphasize enough in increasing the skills of their people. The collection of basic behaviors about how people work together is another success factor nowadays software projects. On the other hand, the users must be involved in the project starting from the requirements elicitation at the all developing phases of the product[5]. Optimization and organization of the projects reduce project overhead and business capability increases[6].

Software development is the process of generating software through successive phases. This process includes not only the actual writing of code, but also the preparation of requirements, the design of what is to be coded, and the confirmation of what is developed to meet the objectives (Presman, 2014; Sommerville, 2011). Before system development methods came into being, the development of a new system or any product was often carried out by using the experiences and intuitions of the management and technical personnel. As the complexity of software products long ago made the need clear for some kind of development process, the waterfall model recorded in 1970 as the first public life cycle model. Since then, waterfall model describing linear and sequential development method has been a popular version of the software development life cycle for software engineering. Figure 1 shows the distinct goals of the waterfall for each development phases. Agile solutions have emerged as a perfect approach for the software development. These projects have firmly been

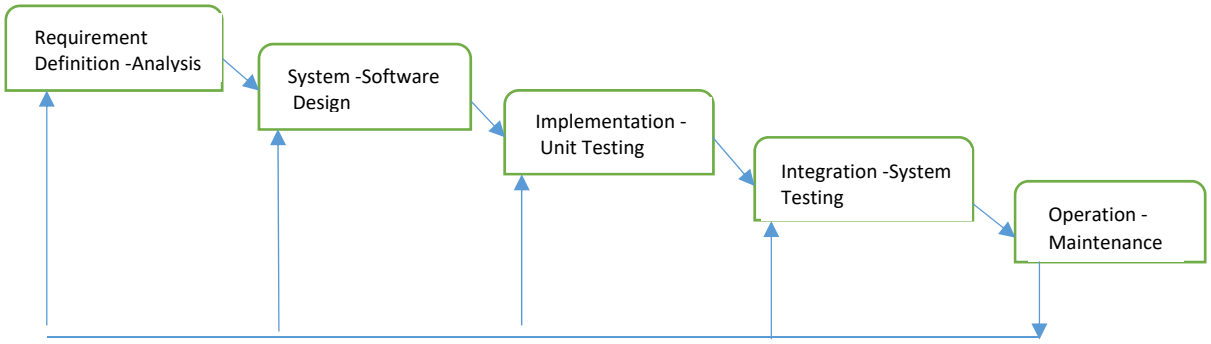
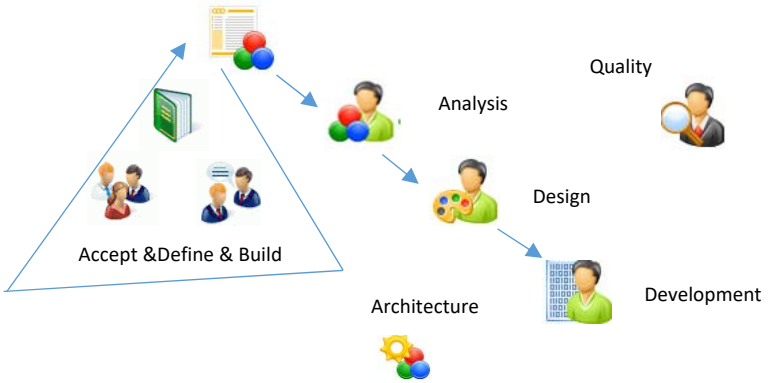
shared with users and delivered continuously (Braude &Bernstein, 2010). Furthermore, the solutions of some software problems can be achieved by model based engineering frameworks, and the usage of frameworks supply the abstractions in a lower level than others.

The basics of the software development processes must be given as individual courses in the software engineering undergraduate programs. The lectures can be carried out both in department electives and in core courses of the curriculum structure. This property distinguishes the computer engineering undergraduate program from software engineering education programs.





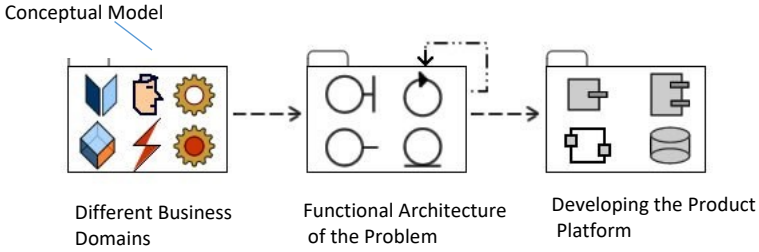


Figure 1: General overview of waterfall model

Model-Driven Software Development as a Software Engineering Paradigm

Model-Driven Software Development is a branch of software development approach based on the idea of developing software from domain-specific models (Perisic, 2014; Küster,2011). The primary aim of this development technique is to increase the productivity and maintainability of software. These can be achieved by raising the abstraction levels of physical system represented in a general purpose language. Such development processes are called as domain-specific models written in high level. Therefore developers can concentrate on application logic rather than the complexity of low-level implementation details. This is contrast to traditional software development practices where modelling is commonly used for documentation. Moreover, communication purposes and the final product broadly differs from the models representing the problem. We can not only distinguish the differences between procedural and declarative software engineering processes, we can also see the abstraction levels and the platforms to be integrated in Figure 2. The abstract syntax has been used at each abstraction level in Figure 2-b. The developers describe the problem and its solution at different abstraction levels using model based engineering.

a) General Overview to Agile and Phase Software Development Models

 Copyright © International Science and Technology Conference (ISTEC)

b) Model Driven Engineering Processes as Bottom-Up with work-units defined by their role on targeted artifact

Figure 2: Phase Based Modern Software Models and Model Driven Software Engineering

Model Driven Engineering (MDE) describes tasks directly from development flows. Therefore, a declarative and bottom-up approach is implied contrary to the activity based top down development processes. The effects are built-in and derived processes instead of textual and graphical developing phases of the activity based models. In Figure 3, we can clearly see the transition from conventional development processes to more effective processes. Domain-specific models constitute requirements-driven and architecture centric development approach (Figure 2-b) instead of document-based and code-centric problem solutions (Figure 2-a)

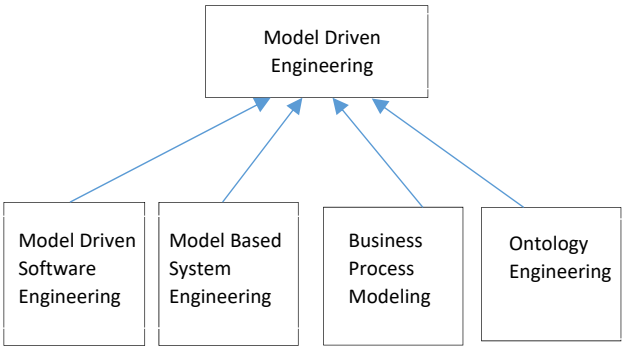

Figure 3: Models Relationships of Model Based Engineering

Model Driven Architecture (MDA)[7] developed by Object Management Group (OMG) is the special case of Model Based Software Engineering, and it is divided into three models as Computation Independent Model (CIM), Platform Independent Model (PIM), and Platform Specific Model (PSM) (Figure 4). CIM has to be used to clarify the problem domain focusing on the environment and the specific requirements of the system. Briefly, the structural details of the product are hidden at this layer. Fine grained artifacts of this layer can be descripted as events and communications, objects and features, processes and activities and objects and agents. These are defined independently and followed as PIM. PIM is input to model the problem. At this phase, the developers define functional architecture of the system by specific technologies. All the information needed is symbolized with boundaries, controls, entities and services to describe the behavior of the system in a platform independent way by different platforms. The solution results as PSM. To constitute specific components of the developing system, PSM is applied to the convenient technologies. PSM combines the specifications in the PIM with the details that specify how the system uses a particular type of platform. Fine-grained artifacts of this layer is middleware, clients, servers, databases as specific platform characteristics. To get the well-defined software product, it is important not to confuse these three layers (Stahl & Völter, 2006).

Figure 4: Architectural Layers of MDA with respect to abstractions

INCOSE (International Council on Systems Engineering) defined its 2020 vision as Model Based Systems Engineering, thereby announcing systems engineering as an independent discipline which works in conjunction with software engineering. This view approves the existence of formal description languages in domain-specific conceptual modelling in software engineering. Any description language as a text-based language, which acquires from discrete mathematics and first order propositional calculus, constitutes the conceptual modelling

[7] http://www.omg.org/mda/presentations.htm

 Copyright © International Science and Technology Conference (ISTEC)

as an intermediate phase prior moving from the visual solution towards programming language solution (Altan, 2015).

Semantic Extraction of Ontologies

In his PhD theses Parreiras (2011) predicts that the software engineering domain will depend on the dependency between MDE and ontology technologies. In fact, real-world elements form the structure of models and language semantics comprise metamodels as a step of MDE. The second step is transformations between languages. UML (Unified Modelling Language) and OWL are two examples of the transformation languages. Ontology as an explicit, formal and declarative semantic model gives the integration of knowledge and services (Bunge, 1977). While UML has extendibility and modularity properties, these attributes has not been presented in most OWL languages. Ontology is also an urgency to develop contemporary software systems since the inclusion of huge knowledge. Basic introduction to knowledge and ontology is given in Sowa's book (2000). Logical languages, frame based languages and graph based languages are three different representation style of knowledge (Baclawski& Kokar& Kogut et.al, 2002). The first language expresses knowledge in terms of logical statements. An example of such knowledge representation is Knowledge Interchange Format (KIF). The second classification is similar to object oriented database languages. The last one includes semantic networks and conceptual graphs. Sowa as one of the pioneers of conceptual graph theory proposed to create a logical system to represent natural language semantics, and defined it being a graph representation for logic based semantic networks. It is also a compromise between a formal language and a graphical language. First order logic semantics has been used to translate the graphs. The modern frame-based systems denote the implementation of knowledge base (KB) systems and DL that can be applied in several areas cover the theoretical aspects (Baader et.al., 2003). We can integrate model driven development and semantic web using OWL ontologies, for example Protage[8]. Therefore, the resulted object design patterns will reduce the complexity and will increase the productivity. The templates which are the form of knowledge base also supply the reliability. A standard DL knowledge base consists of ABox and TBox components. The ABox contains extensional knowledge about the domain of interest. In other words, it is possible to assert the individuals with ABox axioms. TBox is a concept definition, that is, the definition of a new concept in terms of other previously defined concepts. In other words it is possible to determine the relationships between objects with TBox axioms. The following example describes a simple domain ontology about online library records in terms of DL[9].

Lecturer ⊑ ∃isMemberOf.University ∏ ∃writes.Article ∏ ∃teaches.Course	[TBox Axiom]
Course⊑ ∃ isArrangedby.Department	[TBox Axiom]
University ⊑ ∃isLocatedIn.City	[TBox Axiom]
University(Beykent,KavramVacationSchool,Sakarya),Department (computerEngineering)	[ABox axiom]
Article(computer science)	[ABox axiom]
Lecturer (Zeynep Altan), University (Beykent), City (Istanbul)	[ABox axiom]
isLocatedIn (Beykent,Istanbul), teaches(ZeynepAltan, computerEngineering)	[ABox axiom]
isMemberof (ZeynepAltan, Beykent)	[ABox axiom]
writes(ZeynepAltan, computerScience), Lecturer(Ali A.)	[ABox axiom]
isLocatedIn (Ali A., ¬Kavram), isLocatedin(Ali A., ¬Sakarya)	[ABox axiom]

Based on the KB above, any user may search all lecturers at Beykent University with the following DL query:

∃isMemberOf.{Beykent}

The answer of this request is *Zeynep Altan* in case of short KB. The conclusion also includes the lecturer *Ali A.* for the complete KB. We have to close the domain of a class with an example. We accepted that the class

[8] http://protegewiki.stanford.edu/wiki/Protege_Ontology_Library#OWL_ontologies

[9] It has been accepted the class hierarchy of the ontology has previously been constituted.

 Copyright © International Science and Technology Conference (ISTEC)

University is equivalent to the set of other defined individuals. Moreover, we can assert that university of the article is the same as university of the lecturer as the following:

course(?x) ∧university(?y)∧article(?z)∧ isMemberOf(?x,?y) →isArrangedby(?x,?z) →isLocatedin(?y,?z)

It is possible to reuse and extend these templates. When we define the super class, for example University class, it includes all universities in all cities of the studied countries. In other words, it includes a list of existing individuals of this type. This superclass and its rule is*MemberOf* is usable for other types of university domain. For example, for student relationships, Erasmus programs etc. Finally, the templates can be reused in other ontologies

Conclusion

Complex software systems play an important role in business and everyday life. Since the technologies and practices in the informatics area are increasingly developing, the education programs on software engineering need to include both technical and non-technical abilities with details for the industrial software engineering. Therefore an essential task in teaching software engineering is the incremental improvement and enhancement of courses. The complexity and evolution of software engineering education is an indisputable reality; therefore more transparent and traceable problem solving methods are valuable than traditional ones. MDE is one of the contemporary approximation to develop software products unlike traditional development techniques which tend to be code-centric. As a present day example, the usage of models at all levels of the software development life-cycle can be emphasized by MDA standard. This change in software engineering has impacted both the construction way of the software products and the teaching way the software engineering education. Moreover software engineering standards have a significant emphasis on body of knowledge that should be integrated in a software engineering curriculum. Besides, KAs in SWEBOK plays the most important role in updating education programs. In this paper, the impact of the MDE approach has been explained on software education. As a constituent of MDE, semantic web techniques enable new software engineering capabilities. It is possible to identify various ontologies based on all phases of software life cycle and their application scope. Because of the attractively of OMG's MDA software development approach, new KAs in SWEBOK must definitely be added to the software engineering undergraduate programs without delaying.

THE IMPORTANT COMPONENT OF VOCATIONAL AND TECHNICAL EDUCATION: VOCATIONAL SCHOOLS

Tümay Atakan
tmyatakan@yahoo.com

Ozdemir Ay
ozdemiray@trakya.edu.tr

Abstract: Nowadays, the constant improvement of science and accordingly, the technology's renewing itself have been affecting the education process of the countries. Therefore, educational institutions and the curricula carried out at these institutions have to be suitable to the conditions of the time. The needs of the society and employment areas of the country should be considered, especially in the improvement of the vocational and technical education programs, and qualified intermediate staff should be trained and introduced to the industry. Vocational schools, which operate to train the intermediate staff needed by the industry, take on an important task in this field. In order for the vocational and technical education system in Turkey to be in the conjuncture of the developing world, and with the adequacy and quality to meet the requirements of the labor market, university-industry collaborations should become prevalent, the participation of the enterprises to vocational education should be ensured, and the quality of education in vocational schools must be improved by exchanging information with the countries where vocational education systems are implemented.

ABSTRACT：Alzheimer's disease is one of the common problems for the elders. Some mild symptoms of the Alzheimer's might be misinterpreted as normal circumstances because of aging, leading to the procrastination of treatment process. Affected people would have a hard time managing activities of daily living and forget roads back home, which may jeopardize their live safety. Because the patients barely leave their homes, it may place significant burdens for patients themselves and caregivers.

This interactive game of this projects focuses on Flash, with the help of Kinect motion sensor of Microsoft, making a combination of software and hardware. The skeletal tracking feature of Kinect enables users to control the mouse and other objects through human body, which allows the elders to play some simple games at home. The researcher also used easy questions to observe whether the elders have problems of Alzheimer's, and further to facilitate their brain functions.

The interactive memory learning game for the elders – with the application of Kinect, was developed in this research. The motion sensor camera of Kinect makes human body become a game controller, which provides interactions for the memory match game. With the availability of Kinect, television, and computers, seniors with mild Alzheimer's can facilitate their hand control and limb movements through simple commands. The memory game could enhance brain stimulation for seniors with mild Alzheimer's and decelerate aging process, bringing about effects of sport and entertainment.

Chapter 1

1.1 Research Background

Alzheimer's disease is one of the most common types of dementia and the typical beginning symptom is dysmnesia. The patient will forget events which happened just now (short-term memory is poor), and early memory (long-term memory) is relatively not affected in the early period of the disease. When a relatively mild dementia occurs, the recent memory often forgets daily things, when it becomes severer, he forgets a friend's name, phone number, direction, etc., and often forgets to return to do the outstanding work due to other distractions.

Microsoft's Kinect can rely on the change of human's body skeleton to judge the extent of human motion and detect gestures according to the finger's posture so as to achieve more subtle judgment, the corresponding response is made in accordance with the judgment of the change of the depth value, the provided virtual images are like personal experience, and what is used is the inseparable relationship between human's body movement and hands, for example, touch, pressing buttons and induction are all technologies of the development of hand movements.

1.2 Research Motives

With the coming of aging society, the problem of life caring for dementia patients constantly appears in communities and families. In the early period of dementia, it is difficult for family members to distinguish whether the forgetfulness of parents is normal aging or disease, and they may fail to know the disease even it becomes moderate degree, as the appearance of the patients are the same as ordinary persons. The elderly with dementia often forget how to go home, leading to family members often looking for them everywhere, many families are afraid of the elderly with dementia going out alone once again, because of which the elderly with dementia often sit for a whole day in the home. As family members are busy with housework, the elderly with dementia have no object to speak to, which causes the memory of dementia patients to decline gradually.

With the popularization of TV video game system, almost every family member can play TV video game system in today's society, the age of the game also rises gradually along with the popularization of TV video game system, and the game types also gradually increase; so animation game is combined with Kinect to produce the game of "Memory Test in Interactive Learning among Dementia Patients", matched with Kinect device of TV video game system, and the game is operated with the body without the need to carry on any manipulation, which can not only use the brain to think about the topics in the game, but make the body move around.

1.3 Research Purposes

This research uses Flash animation to produce interactive learning game of "Memory Game of Dementia Patient", the purpose is to produce the interaction with memory game with Kinect dynamic camera released by Microsoft with the concept of body controller to use simple Kinect operation to make the elderly patients with mild dementia:

 Copyright © International Science and Technology Conference (ISTEC)

1. Use body to control to promote physical movement
2. Use memory games to improve brain agitation
3. Help the elderly with mild dementia to slow down the speed of decline in memory
4. Achieve movement in body and achieve the effect of entertainment.

Chapter 2 Literature Review

2.1 What is Dementia?

Dementia is not a single disease, but a combination of a group of symptoms (Syndrome), mild symptoms not only include the loss of memory, but affect other cognitive functions, including language ability, space perception, computing power, judgment ability, abstract thinking ability, concentration and other various aspects of functional degradation, and meanwhile interference behavior, personality change, delusion or hallucination and other symptoms may appear, the severe degree of which is enough to affect the interpersonal relationship and the ability to work and so on. Usually, the first symptom found in patients is the frequent forgetting what has happened recently, and then they have difficulty dealing with daily life, work and rest, and the work they are familiar with in the past. The patients themselves may have personality change, behavior change, loss of judgment, finding no proper words to express themselves, thinking obstacle or inability to follow some instructions.

The main symptom of dementia is the loss of memory, we are often forgetful, but the forgetfulness of dementia is different from that of ordinary people; their memory loss is continuous and progressive but not occurs once in a while. These can affect the function of their work or family, sometimes they can not find the way home, and what is more severe is that they will forget how to wear clothes, eat or take a bath and other human's basic life ability.

2.2 Introduction in Relation to Kinect

2.2.1 Hardware

Kinect has three lens, and the lens in the middle is RGB color camera, which is used for recording color images. The lens on the left side and the right side are 3D structure optical depth sensor composed of infrared transmitter and infrared CMOS camera, which is used to extract in-depth data (the distance between the object in the scene and the camera). The highest resolution of color camera is 1280*960, and the highest resolution of infrared camera is 640*480. Kinect is also matched with focus tracking technology, the motor in the base will rotate as the focused object moves, and the maximum elevation upwards and downwards is positive and negative 27 degrees. Microphone Array is built in Kinect, which collects sound simultaneously through four microphones, the noise is eliminated after comparing, and the sound collection, speech recognition and sound source localization are made through it.

 Copyright © International Science and Technology Conference (ISTEC)

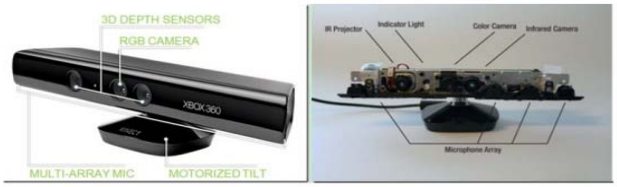

Figure 1, Kinect Sensor

2.2.2 Software

Kinect for SDK v1.7

Kinect integrates the continuous field depth snapshot of Windows sensor from Kinect to establish complete 3D model. SDK 1.7 also includes new Kinect interactive functions, including natural man-machine interface control for the support of pushing and pressing (push to the button) (clip pan) and grasping and transferring, multiple people interaction and reorganization of gesture folding and unfolding: turn on and turn off hand recognition.

2.3 Interactive Learning

The application of Kinect is very extensive, which can be used in the operation and interaction of computer games, through body movement learning and game type learning, the operation of general carriers also have demand for interaction in order to avoid the touch of control system, housewives avoid using their hands with food residue to turn over electronic recipes while cooking, and simulation training, cognitive ability detection inspection, remote diagnosis and treatment, etc. in medical treatment.

In the learning application, such simple interesting physical interaction activities and games can be used and such method can also be used to achieve actual practice for dynamic learning topics such as dance, martial arts, sports and physical coordination, etc., and movement information relating to the learners can be collected as analytical skills and the data analysis on the coordination and fitness ability, thus further providing advanced personal body interaction learning tutoring.

Chapter 3 Research Method

3.1 Research Process

3.2 Software and Hardware Demand and Development Environment Establishment

 Copyright © International Science and Technology Conference (ISTEC)

The demand for software and hardware in the development of Kinect application program is as follows, the operating system must use Microsoft Windows 7 operating system due to the need of software operating environment, and both 32 bit and 64 bit are available; hardware part needs CPU of dual core 2.66GHz and over 2GB RAM, supports display card of DirectX 9.0c or above and at least one Kinect sensor; software part uses Visual Studio 2010 or Visual C# 2010 Express to write program code, NET Framwork 4.0 environment and install Kinect SDK for Windows. It is suggested to install Microsoft DirectX9 as the skeleton detection part may be used.

3.2.1 Installation of Kinect for Windows SDK v1.7

For the installation of Kinect for Windows SDK, please do not connect Kinect with computer, and meanwhile Visual Studio 2010 is closed up to avoid the failure of installation. Load according to 32 or 64 operating system and install the corresponding Kinect SDK. Restart once again after the completion of installation so as to correctly identify environment variables needed by Kinect SDK.

3.2.2 Installation and Testing of Kinect Sensor Drive Program

Before the installation of Kinect sensor drive program, network connection shall be confirmed to be normal. After connecting Kinect sensor with external power supply, then connect it with USB plug of the computer, and the system will automatically download and install necessary drive program after the steps mentioned above are completed.

3.3 Adjustment of Motor Elevation

Use instruction
Right hand: move, change the position of mouse
Left hand: rise high, press down left button

Figure 3. Use and Instruction Interface of Mouse Control

 Copyright © International Science and Technology Conference (ISTEC)

3.4 System Structure

System mainly contains Kinect, Kinect for windows v1.7, Flash and C#; Kinect is responsible for sensing surrounding environment information and sending it to the computer, Kinect for windows v1.7 receives the environment information sensed by Kinect and executes actual mouse operation indication, computer integrates all the data to make decision on Flash game operation, and the whole system structure is shown in Figure.

3.5.2 Design Idea

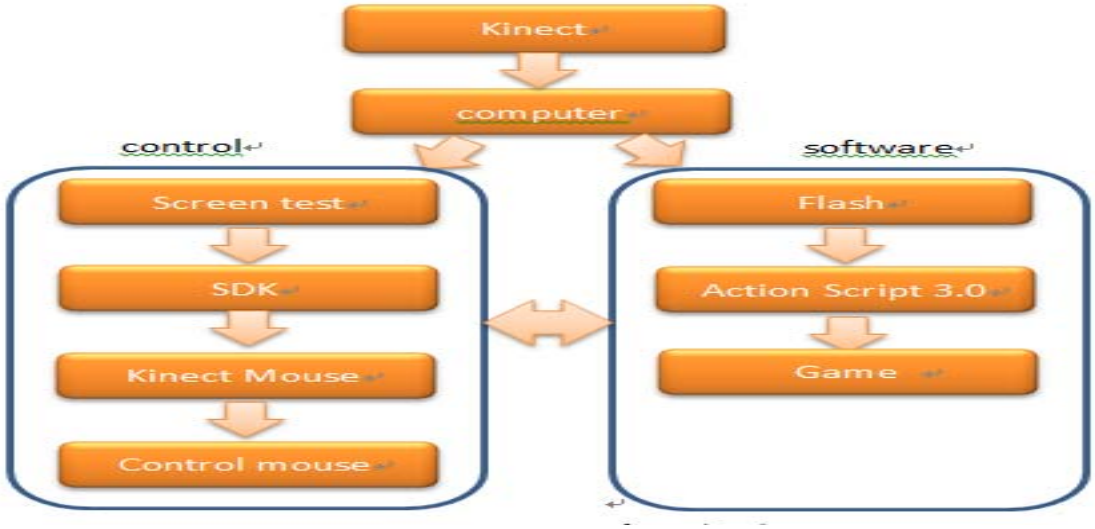

Figure 4 System Structure

Alzheimer's disease is the problem concerned by the whole world at present and its early symptoms occur mostly in people of more than 65 ages, but people of about 20-30 may have such symptoms due to the current way of life and pressure. The symptoms of Alzheimer's disease include irritability, aggressiveness, emotional ups and downs and loss of long-term memory, and our concept is mainly to use the mode of interactive games to help dementia patients train brain to strengthen the memory.

3.5.3 Improvement of Life

As the cases of dementia of elderly people increase year by year in our society, which causes troubles for a lot of families, besides, dementia leads to the memory of patients decline gradually, interactive learning game of "Dementia Kinect Interaction Game" is designed for patients with mild dementia, as the family members dare not make patients with dementia go out alone, they can only stay at home for a long time, or they must wait for their family members to accompany them to go out when they have spare time; while we produce interaction learning games to make patients with mild dementia think about the topics in the game and move bodies to operate TV video game to realize the activation of brain cells of patients and the movement of patient's body to slow down the decline of memory, this can make family members not afraid that patients have no speech objects at home when they are busy.

3.6 Internal Program

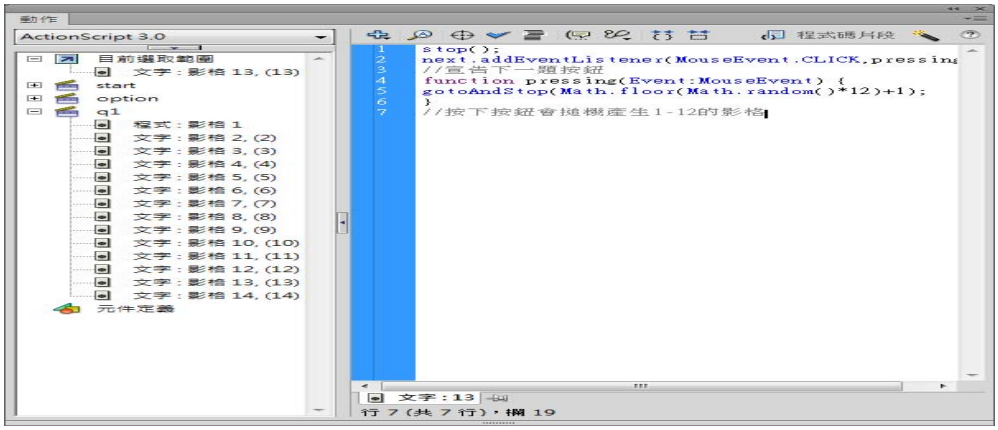

Figure 5. Adobe flash Program

3.7 Game Operation

Currently we make a measurement on the distance between Kinect device and operators, device angle and height so as to realize the best effect when operators are controlling mouse, but not make the mouse flap, nobody should stand behind the operators, Kinect mouse control is to capture hand movements of persons, so in case of two or more persons, the hand movements of the other person will also be caught, which will cause disorder of mouse.

Kinect layout height: about 64cm

Kinect elevation angle: 7 degrees

Distance between Kinect and operator: about 3.27 meter

Figure 6. Game Menu

Chapter 4 Conclusion and Future Studies

Kinect device is to combine computer to develop interactive learning system, this research uses flash software as the interactive operation mode of main game Kinect for the game. The main programming language of Kinect is C# program, Kinect is used to control the mouse and operate flash game, Kinect is connected to flash through continuous attempts, lastly the mouse control program is first started in the computer, the Kinect is used to operate flash game, the interaction learning in this plan which makes dementia patients test animation games in combination with Kinect has achieved initial effect, this research plans to present the game in future with 3D form, 3d max modeling software and Unity game engine platform are used to produce and develop works to make the pictures presented more delicate, this program has successfully completed interaction game learning system, which has preliminary growth space for the health of dementia patients.

THE INTERPRETATION OF THE SKILLS OF THE STUDENTS IN MATH DEPARTMENT FOR USING MATH IN REAL LIFE: A CROSS – AGE STUDY

Hayal Yavuz Mumcu
hayalym52@gmail.com

Meral Cansiz Aktaş
cansizmeral@hotmail.com

Today, math is not perceived as a collection of the abstract concepts and skills necessary to be learned just like in the past; but as "the information that occurs with the process of problem solving and interpretation that is based on the modeling of the reality and again, the skills that develops within this process" as defined by De Corte (2004, s.279). In accordance with this understanding, the purpose of teaching math has become to provide mathematical aptitude and form the skill of being able to use math in necessary conditions conveniently (Altun and Memnun, 2008).

When the results of PISA and TIMSS being the studies with the widest scopes regarding the use of math are examined, it is seen that the real-life usage levels of the children and youngsters having their education in our country specially are too low when compared to other countries. The number of the studies regarding the concept of using math at higher education level is very little. Starting from this; in the current study, it has been tried to observe how the students of the department of math in the faculty of science and literature use the pure math they learn in the real life conditions by studying together with them. In addition; within the scope of the study, the assessment of the skills in using math has been provided by considering them together with the variables of class level, gender and academic achievement.

The method of case study has been used in the study; and it is also called as the cross-age study because the consideration and comparison of the math-using skills of the students taking place in different class levels are conducted. The study has been carried out with a total of 24 students selected with the method of random sampling and consisting of 6 ones each from every class level of Ordu University Science and Literature Faculty Math Department. 8 ea. open-ended real life problems (MKDBP) have been formed for the purpose of observing the math-usage skills of the students taking place in the study. In the analysis of the data; four different DPAs (Graded Scoring Scale for Reasoning Skills (MBDPA), Graded Scoring Scale for Problem Solving Skills (PÇDPA), Graded Scoring Scale for Regression Skills (İBDPA) and Graded Scoring Scale for Modeling Skills (MoBDPA)) under the name of Graded Scoring Scale for Math-Usage Skills having been developed by the researchers have been used. The expert comments and reliability analyses have been taken into consideration in the validity and reliability of the mentioned assessment tools and the reliability coefficients for the mentioned graded scoring scales have been calculated as respectively P1= %81, P2= %79, P3= %79 and P4= %82.

As a result of the study; it has been seen that while the students are able to use the problem solving and regression skills under the problem conditions that are not complex so much, they are not able to use the reasoning and modeling skills successfully in general of the study. When the successes of the students are considered according to the level of the classroom, it has been observed that the math usage skills of the senior students are higher than other students; but the mentioned difference is meaningful only for the problem solving and modeling skills. According to the attained data; it could be cited that the 4^{th} grade students are able to use the problem solving skills more successfully when compared to the 3^{rd} grade students and they are able to use the modeling skills more successfully when compared to the 2^{nd} and 3^{rd} grade students. It has been observed that there are not meaningful differences among the math usage skills of the students according to the variable of academic success; and the math usage skills of the male students are at higher level when compared to those of the female students according to the variable of gender.

 Copyright © International Science and Technology Conference (ISTEC)

Within the direction of the results attained from the study; it is suggested that different courses that shall be planned regarding the usage of the math as an obligation or as an elective course at both undergraduate and graduate levels in the educational programs of the mentioned faculties be added within the scope of the fact that the students studying in the science and literature faculty should have the skills, knowledge and idea about the useful side of math.

THE LABORATORY IMPLICATIONS BASED ON ARGUMENTATION OF PRE-SERVICE SCIENCE TEACHERS

Assoc. Prof. Dr. Bülent AYDOĞDU

Afyon Kocatepe University, Department of Elementary Education, Afyonkarahisar-TURKEY

baydogdu1976@yahoo.com

Assoc. Prof. Dr. Nil DUBAN

Afyon Kocatepe University, Department of Elementary Education, Afyonkarahisar -TURKEY

nily@aku.edu.tr

Abstract: The purpose of current study is to determine the effect of laboratory implications based on argumentation on the pre-service science teachers' logical thinking abilities and critical thinking tendencies. The sample group of the study consists of a total of 64 pre-service teachers (32 for the experimental group, 32 for the control group) who are in their fourth year in the Science Education Program at a state university. The pre-test/ post-test control group experimental design model was used that current research. In the experimental group, the experiments were conducted using worksheets based on argumentation, whereas in the control group the experiments were conducted in the form of a close-ended experiment. In this quasi-experimental designed research, the "Logical Thinking Abilities Test" and "The California Critical Thinking Disposition Inventory" were used as data collection tools. As a result of this study, it was found that the logical thinking ability and critical thinking tendency levels of the experimental group were higher than those of the control group. Accordingly, it can be argued that laboratory activities conducted with argumentation-based worksheets are more effective than laboratory activities conducted with the use of close-ended experiment in terms of developing logical thinking abilities and critical thinking tendencies on the part of pre-service science teachers.

Keywords: Pre-service science teachers, argumentation, science laboratory implications

Introduction

As is known, it is vital to design a learning environment based on research-inquiry in order to provide students with permanent learning. In a leaning environment based on research and inquiry, students ask questions, formulate arguments and structure information by supporting their arguments with proofs (Günel, Kıngır and Geban, 2012). The teacher helps students to develop their high level cognitive skills such as analysis, synthesis and evaluation by providing a suitable environment in which students can make scientific debates (Duschl and Osborne, 2002). In the study they carried out to support the use of argumentation teaching by teachers in a scientific context, Simon, Erduran and Osborne (2006) stated that motivating students for the process and occupational development of the teachers might have an impact on the quality of argumentation. Specifically, scientific debates have recently become a notable practice (Driver, Newton and Osborne, 2000). One of the reasons for this is that students can carry out studies which are similar to those of scientists and have the opportunity to structure information in the way scientists do in the teaching environments in which scientific debate strategies are used (Brown, Collins and Duguid, 1989). In addition, the fact that students think about the link between the argument that is formulated during scientific debates and the proof put forward to support this argument will improve their abilities of critical thinking (Erduran, Ardaç and Güzel, 2006). As a result, the students will have the opportunity not only to learn scientific concepts but also to appreciate the nature of science (Driver et al., 2000). With this in mind, Keys, Hand, Prain and Collins (1999) devised the approach of learning science based on argumentation as a learning and teaching approach based on written and oral argumentation which allows students to experience the processes that scientists go through while solving real-life problems they face and which provides the students with the opportunity to structure information during this process in science classes. There are various definitions as to what an argument means. Toulmin (1958) defines argument as an assertion and demonstrating its validity. Driver et al. (2000), on the other hand, defines argument as an individual or a group activity, a social activity done through thought or writing. While argument defines as claims, data, grounds and the backings contributing to an idea, argumentation signifies compiling these constituents (Simon, Osborne and Erduran, 2003). It is striking that Toulmin model is frequently used in the

 Copyright © International Science and Technology Conference (ISTEC)

studies conducted in recent years. Toulmin model is comprised of six elements. While data, claims and grounds are the main elements of an argument, backing, qualifiers and rebuttals are auxiliary elements. In Toulmin's model, grounds verify the course from the data to the result, whereas the backings are assumptions that demonstrate the validity of grounds (Jimenez-Aleixandre and Pereiro-Munoz, 2002). The main structure of this model has been formulated as because (data) is…… in terms of ……. (grounds), then ……. (backing); therefore, ……. (result). Zohar and Nemet (2002) expressed that argumentation plays an important part in science education in that it encourages scientific thinking and development of a qualified conceptual understanding in students. Teaching argumentation skills in science classes as a way of developing reasoning skills has been a focal point of studies on science education that adopt argumentation (Acar, 2008).

Numerous studies conducted in the field of science education conclude that integration of argumentation into the education and training environments may benefit students in many respects (Berland & Reiser, 2011; Sampson & Clark, 2011). In the study carried out by Çetin, Kutluca and Kaya (2013), it was concluded that, at the end of the process, there is an increase in the quality of the argumentation performed by the students involved in the process of argumentation as compared with the beginning of the process. Also, the researchers stated that students can formulate more quality arguments and can learn science concepts more effectively thanks to the science classes based on argumentation. Especially, the presentation of argumentation in combination with laboratory is invaluable with regard to science education. In this way, students will both have the opportunity to put theoretical knowledge into practice in laboratory environment and find the chance to debate their arguments with their friends in their groups. Laboratory practices based on argumentation are a strategy devised by Sampson, Grooms and Walker (2011). In this practice, students try to explain a problem, a phenomenon or an observation by working in small groups. While doing this, they design their own experiment settings, share their results with other groups in a certain format and get feedback from their peers. Groups reassess their views and try to explain different views in the light of feedbacks they get. The students are asked to write any hypothesis/claim in small groups in a laboratory environment and to design an experiment with regard to this and also they are asked to discuss their own designs with other groups (Osborne, Erduran and Simon, 2004). In addition, the groups are expected to prepare reports while sharing their results. Moreover, the students get the chance to be evaluated by their teachers/instructors or their peers by being observed during the process. During evaluation, how students form arguments such as claim, data, backing (qualifier), grounds (proofs), limiters, rebuttals (exceptions) is of importance. In such practices, there are also some reasoning activities in which students express especially how the proofs and the explanation are connected. When the body of literature is examined, we come across studies with regard to argumentation based laboratory practices (Demircioğlu, 2008). Demircioğlu (2011) carried out a study to examine the effect of laboratory education based on the approach of "Argument Based Inquiry" during "General Physics Laboratory III" classes on the academic success of pre-service science and technology teachers, their tendencies towards discussion, scientific process skills and their level of argumentation. The study concluded that laboratory education based on the approach of "Argument Based Inquiry" increases the academic success and scientific process skills of pre-service science and technology teachers as compared to traditional classes, but it doesn't provide any change as to their tendency towards discussion. During the implementation of the study, the quality of argumentation was seen to increase in the reports of the students in the experimental group, while the quality of argumentation does not change in the reports of the students in the control group.

When the body of literature especially in our country (in Turkey) is examined, we see that the positive effects of argumentation based practices on high level mental skills (such as scientific process skills, critical thinking skills, logical thinking skills etc.) are mentioned and the studies scrutinizing these skills (Aydın and Kaptan, 2014; Çınar, 2013; Demiral, 2014; Gültepe, 2011, Koçak, 2014; Şahin, 2016; Tonus, 2012; Tümay, 2008) stand out. However, a study that deals with the development of critical thinking disposition and logical thinking skills which lead to the development of the skills in students mentioned above through argumentation based learning practices does not exist. With this in mind, we aim to study the effects of argumentation based laboratory practices on the logical thinking skills and critical thinking disposition of pre-service science teachers. To this end, we have formulated two hypotheses and tested these hypotheses. These hypotheses are as such:

1. There is a significant difference between the logical thinking skills of the pre-service teachers in the experimental group to whom argumentation based laboratory practices were applied and that of the pre-service teachers in the control group to whom close-ended experiments were applied and the difference is in favour of the experimental group.
2. There is a significant difference between the critical thinking disposition of the pre-service teachers in the experimental group to whom argumentation based laboratory practices were applied and that of the pre-service teachers in the control group to whom close-ended experiments were applied and the difference is in favour of the experimental group.

 Copyright © International Science and Technology Conference (ISTEC)

Method

In this study, a quasi-experimental design with a pre-test post-test control group was used. The experimental design classified as test model is a quantitative research model "which is directly controlled by the researchers and in which the desired data are produced with the aim of identifying cause-effect relationships" (Karasar, 2011).

In experimental studies, terms such as participants or study group are preferred instead of population and sample because the aim of experimental studies is to demonstrate the circumstances that are studied rather than generalize (Sönmez, 2005). Within this context, the term of study group was preferred in this study rather than population-sample. The study group of this study is comprised of the students who are attending the Department of Science Teaching for Elementary Schools in the Faculty of Education in Afyon Kocatepe University during the spring semester of the 2015-2016 academic year. The study group is made up of 64 pre-service teachers in their senior year (4^{th} year) who are either in experimental group or in control group.

Data Collection Tools:

"Logical Thinking Ability Test (LTAT)" and "California Critical Thinking Disposition Inventory (CCTDI)" have been used in this study as data collection tools.

"Logical Thinking Ability Test (LTAT)" was devised by Tobin and Capie (1981) and was adapted to Turkish by Geban, Aşkar and Özkan (1992). The test consists of 10 questions, 8 of which are multiple-choice questions, which measure the abilities of defining and controlling variables, calculating probability, developing relations and using ratio. The first 8 multiple-choice questions each have one correct answer and an explanation that leads to this correct answer. In order for the answer to be rendered correct, both the answer and the explanation must be correct. The last two questions which are not multiple-choice ones certain probabilities must be stated in full. The highest point one can get on this test is 10. The reliability of the test is 0.81. In this study, it has been found out that the KR-20 coefficient obtained in the pre-test results of LTAT is 0.61.

"California Critical Thinking Disposition Inventory (CCTDI)" was originally formulated by Facione, Facione and Giancarlo in 1998 as a Likert-type scale comprised of 75 items. The validity and reliability studies of the scale in its translated form into Turkish were conducted by Kökdemir (2003). It was noted that the structure of factors that constitute CCTDI which was reduced to 51 items are not very different from its original form, that some items were moved between factors and that two factors were combined into one. The scale is comprised of 51 items and 6 sub-scales in total (Truth-seeking, Open-mindedness, Analyticity, Systematicity, Self-confidence, Inquisitiveness). "Analyticity" of these sub-scales expresses watching out for situations which tend to be problematic, logical thinking in tough problems and using objective evidence. "Open-mindedness" signifies an individual's being tolerant of different approaches, his/her taking others' views and ideas into consideration while making decision and be mindful of his/her own mistakes. "Inquisitiveness" means an individual's disposition to obtain information and to learn new things without expecting any gain from this. "Self-confidence" refers to the confidence a person has in his/her own logical thinking processes. "Truth-seeking" measures the disposition to evaluate different ideas. "Systematicity" refers to the disposition to use a decision-making strategy based on information and that follows a specific method; in other words disposition to making research in an organised, planned and careful manner. This new form of CCTDI has an internal consistency reliability of 0.88 and the total variance that the scale explains is 36,13. The internal consistency coefficient of CCTDI used in this study has been found to be 0.85.

The Implementation Process

The participants in the study group are made up of two groups, one experimental group (n=32) and one control group (n=32). Before the implementation process, "Logical Thinking Ability Test (LTAT)" and "California Critical Thinking Disposition Inventory (CCTDI)" were applied to both groups as a pre-test. During the implementation process, worksheets based on argumentation were used in the laboratory activities of the experimental group, while close-ended experiment techniques were used in the laboratory activities of the control group. While preparing the worksheets based on argumentation, experiments that would attract students' attention were especially chosen. 8 activities were made during the implementation process. When the process was completed, "Logical Thinking Ability Test (LTAT)" and "California Critical Thinking Disposition Inventory (CCTDI)" were applied this time as a post-test.

Analysis of the Data

The data obtained was analysed with the help of statistics packet program in order to compare the results of the pre-test and the post-test. Independent sample t-test was used to determine the differences between the post-test

 Copyright © International Science and Technology Conference (ISTEC)

scores of the pre-service teachers which was aimed at identifying the logical thinking abilities of the pre-service teachers in the experimental group and the control group. Similarly, independent sample t-test was used to determine the differences between the post-test scores with regard to the critical thinking disposition of the pre-service teachers in the experimental group and the control group.

Findings

In this section, we have examined whether there are significant differences in the logical thinking ability and critical thinking disposition between the experimental group in which open-end argumentation based laboratory applications were used and the control group in which close-ended experiment technique was used and the results have demonstrated in tables in detail. It has been found out that the data obtained from LTAT and CCTDI scales has a normal distribution. Therefore, unrelated samples t-test and related samples t-test were used in the analysis of the data.

Table 1 shows the independent samples t-test results regarding the pre-test scores that the students in the experimental group and the control group got on LTAT.

Table 1. Independent samples t-test results of the pre-test scores that the students in the experimental group and the control group got on LTAT.

Test	Groups	N	Mean	SD	t	P
LTAT	Experimental (Pre-test)	32	6.59	1.68	-0.483	0.631
	Control (Pre-test)	32	6.84	2.39		

When we examine Table 1, we can note that there isn't a statistically significant difference between the LTAT pre-test scores of the students in the experimental group and the control group.

Table 2 shows the independent samples t-test results regarding the pre-test scores that the students in the experimental group and the control group got on CCTDI.

Table 2. Independent samples t-test results of the pre-test scores that the students in the experimental group and the control group got on CCTDI.

CCTDI sub-scales	Groups	N	Mean	SD	t	P
Analyticity	Experimental (Pre-test)	32	57.84	6.37		
	Control (Pre-test)	32	59.56	6.65	-1.06	0.295
Open-Mindedness	Experimental (Pre-test)	32	46.78	8.55		
	Control (Pre-test)	32	47.71	6.85	-0484	0.630

When we examine Table 8, there aren't any statistically significant differences between the post-test scores that the students in the experimental group and the control group obtained in the sub-scales of CCTDI and on the overall scale.

Conclusion

This study aims to identify the effects of argumentation based laboratory practices on the logical thinking ability and the critical thinking disposition of pre-service science teachers. In parallel with this aim, implementation process was conducted on the 64 pre-service teachers who are attending the Department of Science Teaching in this study in which quasi-experimental design with a pre-test and post-test control group was used. Before the implementation process, "Logical Thinking Ability Test (LTAT)" and "California Critical Thinking Disposition Inventory (CCTDI)" were applied to both groups as a pre-test. As a result of the analyses conducted, it was found out that there wasn't a statistically significant difference in the pre-test scores that the students in the experimental group and the control group obtained on LTAT. Similarly, it was observed that there aren't any statistically significant differences between the pre-test scores that the students in the experimental group and the control group obtained on the sub-scales of CCTDI and the overall scale. In the study which was carried out with 32 pre-service teachers in each of the experimental group and the control group, close endedf experimental techniques were used in the laboratory activities of the control group, while argumentation based worksheets were used in the laboratory activities of the experimental group. At the end of the 8-week long implementation process, measuring tools were used as post-test. It was found out that there isn't a statistically significant difference in the pre-test and pot-test scores that the students in the control group obtained on LTAT, the sub-scales of CCTDI and overall CCTDI. Likewise, it was seen that there isn't a statistically significant difference in the pre-test and the post-test scores that the students in the experimental group obtained on LTAT. On the other hand, it was observed that there are statistically significant differences between the pre-test and post-test scores that the students in the experimental group obtained on the "Inquisitiveness and "Self-Confidence" sub-scales of CCDTI and the overall scale and the differences are in favour of the post-tests. When the post-test scores that the students in the experimental group and the control group obtained on LTAT and the sub-scales of CCDTI and overall CCDTI were compared, it was also observed that there aren't any statistically significant differences between the scores.

A significant difference in logical thinking ability of the students in the experimental group and the control group did not emerge as a result of the argumentation based laboratory activities. It can be assumed that this outcome arose because the 8-week implementation process was not enough. This is because argumentation based laboratory practices are not what students are accustomed to. When we take the fact that close-ended experiments or open-end experiments without argumentation are conducted in laboratory classes into consideration, it is true that it will take pre-service teachers to get used to this new practice. When the body of literature is studied, we can see that logical thinking skills are dealt with rather than logical thinking ability in the studies carried out with regard to argumentation. For instance, the study conducted by Aydın and Kaptan (2010) concludes that while the logical thinking skills of the pre-service teachers aren't significantly affected in classes in which the argumentation is readily presented, the logical thinking skills of the pre-service teachers are significantly affected in the group that had an argumentation based class.

We have concluded that there isn't a statistically significant difference between the post-test scores that the students in the experimental group and the control group obtained on the sub-scales of CCTDI and the overall scale. This conclusion we have made corresponds to the conclusion that there isn't a statistically significant difference in the critical thinking disposition between the post-test scores of the students in the experimental group and the control group which was drawn in a study titled the effects of argumentation based science learning on the success of the pre-service teachers in the subject of solutions and their critical thinking disposition conducted by Koçak (2014). Similarly, the study carried out by Qing, Jing, Yazhuan, Ting and Junping, (2010) demonstrates that a statistically significant difference between the average scores that the experimental and the control group students obtained with regard to their critical thinking disposition does not exist. We can see that, among the studies that deal with the argumentation based learning approach, there are also studies that examine the effects on critical thinking skills apart from critical thinking disposition. One such study is the experimental study that Çınar (2013) carried out argumentation based science teaching for 5th graders. This study also concluded that there isn't s significant difference between the experimental group and the control group students with regard to the development of their critical thinking skills.

Although there isn't a significant difference between the experimental group and the control group in this study, a significant difference in the critical thinking disposition of the students in the experimental group emerged at the end of the process of argumentation based laboratory activities. Especially, the strikingly significant difference in the Inquisitiveness and Self-confidence makes us think that argumentation based laboratory

 Copyright © International Science and Technology Conference (ISTEC)

practices attract the attention of the pre-service teachers and that it helps them gain self-confidence over time. When we study the body of literature, we see that the studies dealing with argumentation practices focus on critical thinking skills rather than critical thinking disposition. Within this context, we can cite the study conducted by Eirexas and Jiménez Aleixandre (2007) as an example to this in that it deals with skills rather than disposition. In the study mentioned above, students were encouraged to put forward their arguments in written and oral debates and its was observed that the critical thinking skills of students improved thanks to these debates at the end of the implementation process. In parallel with this, Tümay (2008) conducted the study in "Chemistry Teaching with a Focus on Argumentation" classes which aimed to examine the growing understanding of argumentation in science and science education that pre-service chemistry teachers have. At the end of the implementation process, it was concluded that teaching with a focus on argumentation is an effective way of improving the thinking skills of pre-service teachers. In a study conducted by Gültepe (2011), it emerged that the teaching approach based on scientific discussion is more effective than traditional teaching approach in improving critical thinking skills of students. Tonus (2012) found out that there is a significant difference between the pre-test and the post-test measuring critical thinking skills of the students after the argumentation process. In the study in which Şahin (2016) examined the effects of Argumentation Based Science Learning approach (ABSL) on the academic success, metacognition and critical thinking skills of gifted students, it was found out that there is a statistically significant difference in favour of the experimental group when the results of critical thinking skills tests were compared. The results obtained from these studies have parallels with each other.

In this study, logical thinking ability test and critical thinking disposition inventory were used with a view to identifying the effects of the argumentation based laboratory activities of pre-service teachers on high level thinking. In other studies to be carried out in the future, logical thinking skills and critical thinking skills tests directly aimed at skills rather than ability or disposition could be used. This study was carried out for a period of 8 weeks. In order to better identify the effects of argumentation based laboratory practices, longer-termed studies spanning a whole academic year could be conducted. Quantitative research method was used in this study. Mixed method studies could be designed in future studies to be conducted by integrating qualitative aspects.

THE LENGTH-WEIGHT RELATIONSHIP AND CONDITION FACTOR OF ANGORA LOACH, OXYNOEMACHEILUS ANGORAE (STEINDACHNER, 1897) INHABITING KILIÇÖZÜ STREAM IN KIZILIRMAK RIVER BASIN (CENTRAL ANATOLIA-TURKEY)

Okan Yazicioğlu
oknyzcoglu@gmail.com
Ramazan Yazıcı
rmznyzci@gmail.com

Abstract: In this study, length-weight relationship (LWR) and condition factor (K) of Angora loach, *Oxynoemacheilus angorae* (Steindachner, 1897) was determined. The 103 specimens were sampled from Kılıçözü stream in 2014. The length and weight of specimens varied between 3.5 and 9.8 cm and 0.38 and 6.58 g, respectively. Length-weight relationships for female, male and all samples were found as $W= 0.01056.TL^{2.896}$ ($r^2= 0.923$), $W= 0.00963.TL^{2.940}$ ($r^2= 0.978$) and $W= 0.00987.TL^{2.929}$($r^2= 0.963$), respectively. LWRs indicated isometric growth in female, male and all samples. The values of Fulton's condition factor (K) ranged from 0.699 to 1.246 for females and from 0.654 to 1.072 for males.

Abstract: Because of neutrons are uncharged particles, they are powerful in terms of penetration into the material. Recently shielding is an important issue because of neutrons which have many applications today do not harm living tissue. Different compounds, alloys and composites are usually preferred against neutrons as shielding material. The aim of this project is to determine minerals(Veatchite($Sr_2B_{11}O_{16}(OH)_5*(H_2O)$, Sussexite($Mn^{+2}BO_2(OH)$ and Vimsite($CaB_2O_2(OH)_4$),based new shielding materials against neutron particles using by Fluka Monte Carlo method and then to obtain neutron total macroscopic cross sections and several shielding parameters by experimentally.

Key words: Neutrons, Macroscopic Cross Section , Fluka Monte Carlo

1 .Introduction

Ordinary time, the neutron shielding effects of materials were examined for nuclear reactor shielding design and many shielding experiments and calculations were performed to obtain the removal cross sections of the materials. The neutron attenuations of materials were evaluated with the cross sections. After that, benchmark or mock-up experiments on the multi-layer problem to confirm the shielding characteristics or to evaluate analysis accuracy were reported recently, the need to transport spent nuclear fuels is increasing due to the current limited storage capacity. Considering that the existing storage facilities will be full by 2016, a national policy for spent fuel urgently needs to be established Nowadays, the application field of neutron particles has increased and new scientific studies about discovering materials with higher performance that the material which are already used and can be used as a shield against neutrons has been prepared. A fast neutron loses their energy basically by the elastic crashes with atomic nucleus. In recent years, there has been rapid growth of electron accelerator based neutron sources for medical and industrial applications because of their compactness (Patil B.J.,Chavan ,S.T,Pethe S.N.,Krishnan R.,Dhole S.D.,2010) .In this study, neutron shielding for mineral appearance is seen in Figure-1(a,b,c) http:\\www.mindat.org; http:\\webmineral.com\data).

A neutron can come to the thermal balance with the centre periphery of the atom by reaching 0.04 eV energy at ambient temperature after a lot of crashes. In these contributions, it is always valid as a simple and clear way to

 Copyright © International Science and Technology Conference (ISTEC)

use Fluka Monte Carlo simulation techniques. It is possible to work intuitively on a neutron ray reaching the thermal balance.

2. Methodology of the Monte Carlo FLUKA

Monte Carlo codes are extensively used for probabilistic simulation of various physical systems .These code are widely used in calculations of neutron radiation shielding and gamma ray transport in materials (Wielopolski L.,Song,Z.,Orion,I,Hanson A.L.,Hendrey,G.,2005).Monte Carlo methods are very different from deterministic transport methods. Deterministic methods, the most common of which is the discrete ordinates method, solve the trans port equation for the average particle behavior The other hand, Monte Carlo does not solve an explicit equation, but rather obtains answers by simulating individual particles and recording some aspects of their average behavior .Monte Carlo is well suited to solving complicated 3-D time-dependent problems (Bremister,J.1993,). FLUKA code is a sub-program of the Monte Carlo code .It is a general purpose tool for calculations of particle transport and interactions with matter, covering an extended range of applications (Korkut,T. ,Karabulut, A.,Budak ,G. et al..,2012).Fluka is a multipurpose transport Monte Carlo Code ,for calculations of particle transport and interactions with matter from electron and proton accelerator shielding to target design, calorimetry ,activation, dosimetry ,detector design ,ADS systems ,neutrino physics ,radiotherapy ,shielding design etc. Therefore , Fluka is a tool that is constantly employed in the majority of CERN applications where energy deposition has to be calculated through beam-matter interactions ,as well as for radiation protection and shielding simulations . Fluka program works with Fortran Software written with machine code. The developments of Fluka program started with being used for Monte Carlo application for protons with high energy by J. Ranft and H. Geibel in 1962..Monte Carlo technique is randomly number selection technique from one or more probabilistic distribution in a special trial or simulation study(Hançerlioğulları ,A. 2006).The Mcnp code was used for reactor designs and calculations. the Monte Carlo simulation code Geant developed at CERN , allows the simulation of the particle shower generation and propagation inside a medium with a complicated geometry or composition. To follow hadrons inside matter, Geant is interfaced to Fluka ,Gheisha and Micap codes. In particular ,MICAP allows the simulation of neutron propagation and interaction within an energy region from 20 MeV down to 10^{-5} eV The flux calculation has been completely carried out in the framework of the FLUKA Monte Carlo code(Battistoni ,G., Ferrari A.,Montraruli T.,Sala P.R.,2003; Battistoni, G., Francesco, B. ,Markus, B., Mauro C. ,et al..,2011). The Fluka

 Copyright © International Science and Technology Conference (ISTEC)

collaboration ensures the constant update of the code with the most advanced physics and features .Fluka is based, as far as possible, on original and well tested microscopic models. Due to microscopic approach to hadronic interaction modeling. FLUKA features a combinatorial geometry which is constantly enhanced in order to cope with new demands for more complex detector descriptions .The FLUKA simulations are carried out for a detailed description of an ideal calibration set up, exposing the detector only to direct collimated and monochromatic neutron beams avoiding any diffused radiation contribution(Borio di tigliole,A.,Cesana ,A.,Dolfini R.et al.,2001).

3.Shielding Applications and Material

The development of medical technology and medical equipment using radiation has played a key role in the diagnosis and treatments of many diseases .In particular, the utilization of radiation for invasive procedures, such as angiography ,has been expanded so that the exposure of patients and medical staff to radiation also tends to increase, making individual radiation protection a very important issue(Seon-Chil ,K.,Kyung-Rae ,D.,Woon-Kwan,C.,2012). Shielding must be provided around a reactor to protect both personnel and material. Shielding that is adequate for neutrons and gamma rays will also stop alfa and beta particles. The weight of shielding to be used is almost independent of the shielding material itself. This study aims to evaluate the neutron shielding effects of tree materials, Veatchite , Sussexite and Vimsite by using a neutron source. Properties of minerals are shown table- 1. The attenuation effects through shielding materials were investigated for various thicknesses of the materials. Neutrons are uncharged particles are powerful in terms of penetration into the material. Neutrons, which has many applications today .In shielding design it is often useful to perform a first assessment of the required shielding thickness by using a simplified approach based ,for example ,on a point nsource line of sight model, to be verified at a more advanced stage of the project with a Monte Carlo simulation ia a more realistic geometry of the facility(Agosteo S.,Magistris M.,Mereghetti, 2007).Neutron sources are more important in neutron shield measurements. The neutrons originate from spontaneous fission and from some (a,n) reactions in the source materials. The spontaneous fission and (a,n) neutron source terms are dependent on the kind of isotope and the decay time .For the prevent harm living tissue, shielding is anImportant issue.There are different compounds, alloys or composites are preferred against neutron particles using like shield.The purpose of this study was to shield against neutron radiation can be used as a material in three different mineral containing boron and hydrogen, and the evaluate of interaction these minerals with 4.5 MeV energy neutron using Monte Carlo simulation method. Neutron shielding is most effective is the nucleus of the shield material has about the same mass as the neutron. This makes hydrogen rich materials excellent neutron shits. It needs also to be something to absorb the neutrons, boron being the poison of choice .Conversely gamma shielding requires neutrons with very high mass. Were it not for the presence of the neutrons, depleted or native uranium would be the best choice (in fact depleted uranium is commonly used as shielding material for X-ray machines and radiography sources), but since neutrons and uranium shielding would be counterproductive, lead is used instead. This nuclear code enables the use of possibility for particles from thermal energy neutrons to all other particles having energy and extensive radiation ranges.

4 .General Equation for calculating shielding

In simplest form shielding involves interposing distance and materials between the source and recipient of radiation. Design considerations and the calculation of resultant dose complicate the problem. To gain some insight into shielding into shielding calculations we shall consider an oversimplified situation which involves a point source of radiation (National Council on Radiation Protection and Measurements,1977).
According to the inverse-squre law, the ,the intensity of radiation on the surface of a sphere of radius R will be where P is the source strength(number of particle

$$I=P/4\Pi R^2 \qquad (1)$$

 Copyright © International Science and Technology Conference (ISTEC)

If we place enough distance between ourselves and the source, the intensity of radiation will be reduced to safe levels .However ,if we place material between ourselves and the source, we can take advantage of a collimated beam of gammas. The intensity of radiation follows an exponential curve

$$I=I_0\, e^{-\mu x} \qquad (2)$$

where μ is linear absorption coefficient and has dimensions of reciprocal centimeters. A mass absorption coefficient may be defined by $\mu_m = \mu/\rho$, Equation -2 then becomes where D is the absorber thickness.

$$I=I_0\, e^{-\mu_m D} \qquad (3)$$

For a sphere of radius R ,If put X=R, equation-2 will became

$$I=I_0\, e^{-\mu R} \qquad (4)$$

applies strictly to a collimated beam and only when scattered radiation is removed from the beam .In a thick shield such as that equation -4 would give a low result because some of the radiation is backscattered into the path. When primary neutrons dominate the shielding situation, the shielding transmission ratio for neutrons,

B_n, can be derived from the neutron fluence rate,$Ø_0$ The various types of interactions of neutrons with matter are combined into a total macroscopic cross sections value (Korkut,T.,Karabulut, A.,Budak ,G. et al.., 2012;. Korkut,T ,Korkut,H., Karabulut, A ,Budak ,G.2011).

$$\sum_{TOTAL} = \sum_{fission} + \sum_{capture} + \sum_{scatter} + \ldots\ldots\ldots \qquad (5)$$

The fundamental purpose of radiation shielding is to reduce the dose-equivalent index from all sources of radiation that converge on a particular reference point, so that the dose-equivalent index rate at the reference point does not exceed the applicable H_m or dose-limit value mathematically, this can be stated as follows:

$$\dot{H}_{Ld} \leq \dot{H}_m \qquad (6)$$

Where, $\dot{H}_{Ld}$ is the sum of dose-equivalent index rates at the reference point, $\dot{H}_m$ is the applicable H_m or dose-limit rate and Fj is the maximum absorbed dose rate or particle fluence rate from the j th, ,Bj is the shielding transmission ratio for the radiation from the jth source,T is the occupancy factor of the area represented by the reference point ,Kj is dimension-converting constant pertaining to radiation from the jth source.Dj is the distance between the jth radiation source and the reference point .

$$\dot{H}_{Ld} = \sum_{ji} \frac{Fj\ Bj\ T}{Kj Dj^2} \qquad (7)$$

Monte Carlo methods can calculate directly the self-shielding factor taking into account the multiple scattering. The resonance self-shielding factor ,T r_{es}(R),in wires of radius R, is defined as the ratio between the reaction rates per atom in the real sample and in a similar and infinitely diluted sample,.

$$T_{res}(R) = \frac{\int_{c1}^{c2} \phi(C)\sigma(C)dE}{\int_{c1}^{c2} \phi 0(C)\sigma(C)dE} \qquad (8)$$

 Copyright © International Science and Technology Conference (ISTEC)

where $\phi 0(C) \propto \frac{1}{C}$ is the original no-perturbed, epitermal neutron flux per unit energy interval inside the infinitely diluted sample, $\phi(C)$,represents the perturbed epithermal neutron flux inside the real sample, $\sigma(C)$,denotes the (n,γ)cross-section ,and C_1 and C_2 are ,respectively ,the lower and the upper limits around the resonance energy C_{res} (Gonçalves,I.F., Martinho,E.,Salgado J.,2001; Gonçalves,I.F.,Martinho,E.,Salgado J.,2001).

4. Calculations

In this study the effects of cross section for high performance materials such as Veatchite, Sussexite and Vimsite were calculated, and also the parameters of the neutron armor of these materials were measured .There are many advantage using materials having hydrogen and boron in terms of neutron shielding technology because the neutron shielding capability depends heavily on the hydrogen concentration .As a shield material against neutron the interactivities with neutron particles with 4.5 MeV by the Fluka simulation method of three different minerals containing boron and hydrogen. A Comparison of double differential fluency predicted by FLUKA at various at a neutron energy. The Isotope production are shown in Fig 2-4 . The effectiveness of different types of neutron shielding for the ATLAS forward region has been studied by means of Monte Carlo simulations and compared with the results of an experiment performed at the CERN PS (Ṡtekl ,I.,Pospısil S.,Kovalenko, V.K et al.,2000.)

5 .Results and Conclusions

In our working, we have investigated fast neutron shielding properties of Vimsite , Sussexite and Veatchite samples simulation process. The results of this investigation have provided new information about the total macroscopic cross sections ,secondary radiation , neutron flow absorbed doses and deposited energies by low energy neutron interaction of fast neutrons through materials including different amounts of boron and hydrogen atoms per unit volume. Absorbed dose per primary particle(in GeV/g) by samples calculated over Fluka. Simulation results are shown Fig-5. According to these results, the highest performance among the minerals is vimsit for the neutron shielding .Interaction of three different boron-containing mineral particles and 4.5 MeV energy neutron were simulated by Monte Carlo techniques .As a result of simulation studies minerals isotope production rates for the neutron radiation, flows and secondary curves were obtained. As a result of interactions has not found radioactive isotopes. It also was not detected in the secondary radiation with high stream. Evaluation of the total macroscopic cross sections for neutron shielding minerals (μ) and the stored energy values were determined. For frequently used in studies of neutron shielding concrete were calculated of the same values.Al three minerals has been identified as a better neutron shield material than concrete.

THE RECENT INCREASE IN THE USE OF MORNING-AFTER PILL AND THE DECREASE IN THE AGE OF THE FEMALE CONSUMERS IN IRAN

Nicole Jafari, Ed. D. California State University at Fullerton, U.S.A
Saghar Janamian, B.A. Baha'i Institute for Higher Education, Iran
Naghmeh Taghavi, M.S. Baha'i Institute for Higher Education, Iran

Abstract - Morning–After Pill has been the subject of many of the recent scrutiny in the scientific world. This magic pill, which acts as an 'emergency contraception' (Del Bo, 2012), is gaining worldwide popularity due to its convenience and highly effective result orientation, but it is also raising questions regarding its functionality and social moral standing. The proponent researchers defend it claiming that it is not the same as abortion for the simple reason that it prevents implantation of the Zygote to the uterine lining thus acting prior to the actual pregnancy. The opponent scientists on the other hand, argue its gray area of ambiguity compromising sound ethical and medical traditions. Furthermore, the quick, easy, no accountability, and the effective nature of this pill overshadows the side effect, consumer education, as it does not sever as sound traditional practices ignoring such needs as awareness before consumption practices (Del Bo, 2012).

Plan B has been dubbed as a safer, more convenient, and even, at times, a better moral choice compared to abortion. This conclusion stems from the fact that medically; pregnancy does not occur until the zygote (the fertilized egg) has implanted itself to the uterine wall. Maximum efficiency and productivity of this pill dictates that the first pill of Plan B must be taken immediately right after unprotected intercourse and the second pill to be consumed within twelve hours of such sexual encounter (Abell, 2009). Therefore, if no pregnancy has occurred, the use of the Morning-After Pill does not constitute an abortion. This claim or philosophy may be ethically or morally acceptable; however, consumer's inaccessibility to information about this drug jeopardizes their health and mental wellbeing.

A structured one on one interview survey research method based on the adaptation from the Grounded Theory (Smith & Biley,1997) will be used for the purpose of data collection on the increased usage of the Morning-After Pill and female consumers' decrease in age. The demographic locations for data collection will be legal and licensed pharmacies in two major metropolitan cities in Iran, where pharmacists disperse the pills based on physician's prescription.

The alarming increase in the usage of the 'Morning-After Pill' and decrease in the age of female consumers in Iran creates an atmosphere of ethical, moral, and health crisis. The absence of organizations such as the Food & Drug Administration (FDA) or any other pharmaceutical regulatory agencies in countries like Iran makes consumers much more vulnerable to ignorance and lack of knowledge thus leading to uninformed decision making. This paper aims to reflect the concerns discussed above; however, it does not aim to take sides on whether the Morning-After Pill should be banned.
Keywords: Morning after pill**,** plan B, contraceptive, abortion

The purpose of this study was to investigate the recent increase in the consumption of Morning After Pill (Also known as Plan B) and the decrease in the age of the female consumers in two major cities in Iran. Plan B or "The Morning-after Pill" is an emergency contraceptive used by females as a secondary option to prevent pregnancy. The process is that after a woman has had unprotected sex or if the primary birth control has failed, plan B is to be administered. "The Morning-after Pill" is not intended to be used as birth control, as it is emphasized by its literature it is to be consumed as an emergency or back up plan only. Plan B (One-Step type) is available over-the-counter without a prescription (mayoclinic.org). Morning–After Pill (Plan B) has been the subject of some recent scrutiny in the scientific world. This magic pill, which acts as an 'Emergency Contraception' is gaining worldwide popularity due to its convenience and highly effective result orientation, but it is also raising

 Copyright © International Science and Technology Conference (ISTEC)

questions regarding its functionality and social-moral standing. The proponent researchers defend it claiming that it is not the same as abortion for the simple reason that it prevents implantation of the zygote to the uterine lining thus acting prior to the actual pregnancy (Abel, 2009). The opponent scientists on the other hand, argue its gray area of ambiguity compromising sound ethical and medical traditions. Furthermore, the quick, easy, no accountability, and the effective nature of this pill overshadows the side effects and consumer education. This does not sound as traditional as some scientists would like it to be, where consumers' need to know is compromised (Del Bo, 2012).

Plan B is also marked as a safer, more convenient, and even, at times, a better moral choice compared to abortion. This conclusion stems from the fact that medically; pregnancy does not occur until the zygote (the fertilized egg) has implanted itself to the uterine wall. Maximum efficiency and productivity of this pill dictates that the first pill of Plan B must be taken immediately right after unprotected intercourse and the second pill to be consumed within twelve hours of such sexual encounter (Abell, 2009). Therefore, if no pregnancy has occurred, the use of the Morning-After Pill does not constitute an abortion. This claim or philosophy may be ethically or morally acceptable to some scientists; however, consumer's inaccessibility to information about this drug jeopardizes their health and mental wellbeing.

RESEARCH METHODOLOGY

Methodology **–** This particular research was conducted based on a qualitative type of study. For the purpose of collecting data on the increased usage of the "Morning-After Pill" in young female consumers in Iran, the methodology used was "Grounded Theory" (Smith & Biley,1997). In that fashion, theoretical constructs were induced from data sources gathered in two metropolitan cities in Iran: Tehran and Shiraz as they symbolize the modern living and social modernity. The demographic locations for data collection were legal and licensed neighborhood pharmacies, where pharmacists disperse the pills without physicians' prescription or any enforced regulations. The pre-study interview and the self-report questionnaire were designed for the purpose of extracting information in the areas of consumer's age, gender, repetition, consultation, and other pertinent data to help with the research findings. Further details on the data collection may be found in the data collection section of this paper.

Sample Population **–** The researchers sample population were licensed pharmacist in mid to high socioeconomic neighborhoods located in urban metropolitan areas, where traffic for such activities of birth control purchase or morning after pill could be expected. These pharmacists were first scouted, had a pre-test interview for potentiality of being a good sample, and had a confidentiality/consent form signed to be part of this study. Among these pharmacists in such neighborhood, 25 pharmacies were chosen based on the fact that per preliminary interviews they had accepted to participate in this research studies. Out of 25 pharmacists, who participated in this study 10 were chosen in Shiraz and 15 from Tehran, the capital city of Iran. Several of the pharmacists had requested to be paid a consultation fee for their time spent, and as part of the research grant they were compensated.

Data Collection **–** Data collection was based on combining a one-on-one interview with a questionnaire style information gathering method. In total, there were 14 questions, which nine were designed based on Likert scale, four formatted on open ended structure, and one requiring a Yes/No response. The type of questions asked were designed to extract information regarding the following subjects:

- Increase in sales of the pills
- Sale and the method of purchase
- Age of consumer
- Gender of consumer
- Trend of consumption in the past three decades
- Whether a prescription is necessary or not
- The presence of consultation before and after the purchase

 Copyright © International Science and Technology Conference (ISTEC)

After questionnaires and one-on-one interviews were conducted, the researchers carefully examined the data for possible errors or other types of mistakes. All but one pharmacist had answered the questionnaires impeccably and with great detail.

LITERATURE REVIEW

The type of hormones used in the Morning-After Pill, particularly Plan B is levonorgestrel, which is progestin and does not contain estrogen. Other morning-after pill may contain both progestin and estrogen (Duramed Corp. @ www.go2planb.com). These type of hormones have been found in birth control pills for a long time and are not necessarily harmful if taken as instructed. The mechanism in which Plan B works is that the pill interferes with the natural processes of a female's ovulation by either delaying or preventing it; therefore, it does not appear to cause abortion (Abel, 2009). Although, there are side effects connected to morning-after pill that include nausea, headache, abdominal pain, vomiting, and dizziness that could last up to 24 hours.

According to Plan B website, there are approximately 2.7 million unplanned pregnancies each year in the United States, which 54 percent of them end in abortion ("When things don't,"2008). Plan B and pills of the same nature claim to help prevent an abortion; although, the main goal is not to get pregnant at all whether by avoiding sexual encounters, using a bright control, or resorting to emergency pills by preventing the conception to take place (as "Plan-B" claims) to accomplish this task.

The above argument stems from the fact that Plan-B pill if taken no later than 72 hours after an intercourse, acts as a barrier to conception, which means it will prevent the zygote (fertilized egg) from implanting to the uterus, thus no abortion has occurred. Scientifically speaking, the pill acts before the embryonic stage occurs, which absolves the responsibility of being an abortion facilitator. On the other hand, the conscientious and philosophical argument begs to differ on the debate that life starts at conception, so does the pill interfere with the natural process of a Zygote on its way to implantation? This viewpoint dubs the process of intercepting the zygote as unethical and immoral.

These questions and many more are raised by moral watch dogs that Plan-B is intervention in the post-fertilization process, thus offering this pill over the counter and as an easy way out may be immoral and unconsciousness. In that case, what is the moral responsibility of the pharmacist and does he or she have a right to conscientiously object to selling it? In that case, a more moral and conscious scientist would act on a zero probability that Plan-B is harmful to both the female and the natural process of fertilization (Del Bo, 2012).

RESULTS and FINDINGS

The result of the study reflected that consumption as reported by Pharmacies on the number of pills per year are as follows:

- 3 Pharmacies Reported Above 3000 Pills Per Year
- 11 Pharmacies Reported 2000-3000 Pills Per Year
- 10 Pharmacies Reported Under 2000 Pills Per Year
- 1 Pharmacy Reported Under 1000 Pills Per Year

The data above shows that approximately 50% of the pharmacies participating in the study report a consumption of over 2000 pills a year. It only takes one pill for "Plan B" to work, which leads to the conclusion that there are either repeat costumers or each customer uses more than one pill per year. In addition, 12 pharmacies reported the consumers are repeat and only 2 pharmacist reported consultation is offered, which means 48% of customers are repetitive. Furthermore, 76% of pharmacies reported an increase in the consumption from last decade, but all agreed there was a trend in the use and consumption of the younger age consumer. Interestingly, several of the pharmacist reported there are as many male customers as females.

Specific Results – The reported data above, certainly reflects that there has been a clear increase in the demand for the emergency pill as the age of the consumer has decreased. This certainly reiterates the hypothesis that there is a correlation between the increased use of Morning-After Pill and the decrease in the age of the female consumers in Iran. The study results in endorsing the hypothesis and reinstating the fact that demand for emergency pill has gone up as the consumer age has declined.

 Copyright © International Science and Technology Conference (ISTEC)

Unanticipated Results – The surprising element in the data collection was the fact that there has been an increase in the number of males, who purchase the pill. There may be reasons to why a male consumer would purchase the pill instead of the female pertaining to cultural taboos, embarrassment, shyness, or other reasons not disclosed. This area would be an interesting topic to further investigate for the fact that perhaps the female consumer has some moral or philosophical issues with being seen purchasing the emergency pill. If this is indeed true, then Del Bo (2012) may very well have a valid argument regarding the morality and philosophy of such consumption and the role of the pharmacist in this dilemma.

Significant Findings – All pharmacists except for one unanimously agreed that there has been an increase in the usage of the pill in the past several decade and this escalation has been steady. Two pharmacists did not answer this question; however, in their previous questions related to the consumption they had indicated an increase in the trend. The unanimous agreement makes a strong point in the increase in consumption. In responding to the open ended questions, in general the pharmacist agreed that it would be useful for consumers to receive an education on the use of Morning-After Pill.

DISCUSSION AND RECOMMENDATIONS

The alarming increase in the usage of the 'Morning-After Pill' and the decrease in the age of female consumers in Iran creates an atmosphere of ethical, moral, and health crisis.
The absence of organizations such as the Food & Drug Administration (FDA) or any other pharmaceutical regulatory agencies in countries like Iran makes consumers much more vulnerable to ignorance and lack of knowledge thus leading to uninformed decision making. This research reflects some of the concerns discussed above; however, it does not aim to take sides on whether the "Morning-After Pill" should be banned in such countries. Objectively, the research study aims to bring awareness to the lack of regulations, consumers' opportunity for education, lack of access to proper literature, and governmental proper policies in such countries as Iran. Although, it is noteworthy to mention this is not unique to Iran, as previous literature has shown that this type of problems is prevalent in other parts of the world as well.

The other prominent problem found through this research study is the fact that pharmacist do not offer consultation to consumers neither before nor after purchase. Furthermore, consumers do not ask for literature, consultation, advisement, or any other type of informational guidance. As cited in many of the websites, where the morning after pill is sold, the side effects may include bleeding, uterine complications, hormonal difficulties, and irregular menstrual period. At any rate, any of these side effect could have a life long impact on the female consumer's health, well being, and future re-productive attempts. These serious side effects combined with rapid decrease in the age of consumer makes for an undesirable and lethal combination. The researchers of this study certainly would like to urge for more studies on the consumer behavior and lack of education offered by the medical field particularly in less advanced societies. The final conclusion is that there is a dire need for global and worldwide education on drug uses, consumerism, regulations, and drug safety.

THE REFLECTION OF URBAN POVERTY ON CHILD POVERTY

Tahir Emre GENCER,

Research Assistant at Department of Social Work,Hacettepe,Ankara,Turkey,

tahiremregencer@gmail.com

Abstract: The most active and vulnerable subjects of the problems and challenges in urban areas are children. Urban areas impact child development negatively. In various studies conducted, it has been proven that child development and behaviour formation are determined by the spaces interacted with rather than the intelligence and character. Therefore, the environment with which the child interacts plays a crucial role in child development and growing to be healthy individuals. This study aims to identify the negative impacts of shortcomings in the planning of spaces and the lack of psycho-social support in this processes as well as the negative impacts of urban poverty on children based on the interaction between children and urban areas in order to ensure high benefit of children. This study has been prepared within the scope of literature review. As the result of literature review conducted, it has been identified that the risk of facing poverty and being affected by poverty is higher among children compared to adults. Furthermore, it is stated that poverty experienced during childhood could often be the indicator of poverty to be experienced during adulthood, as well.

Keywords: Urban Poverty, Child Poverty, Urbanization, Child Welfare

Introduction

The phenomenon of urbanization which emerged after industrialization depending on migration from rural to urban, has led to reveal urban poverty as a multidimensional concept. globalization that came in view with urbanization, has extended the sphere of influence of poverty. The globalization, the neoliberal policies and privatization emerged with urbanization has extended the syphere of influences. It, also has spread and increased urban poverty.

Problems such as social and economic inequalities, structural problems, inadequate urban policies, lack of sanitation, low education levels, unemployment, deficiencies of housing and social integration are among the most important causes of urban poverty. Urban poverty is also the source of many social problems as inability to adapt to the urban areas in terms of social, cultural, economic and psychological aspects, squatting, dysfunction of urban transformation and urban design process, the growth of the informal sector, the increase in crime rates, increase in domestic and communal violence, the inability to prevent the street working children and child labor. The children.are the most active and the most defenseless subject of urban space difficulties and problems. The aim of this study is reveal the negative effects of urban poverty on children. This study was prepared within the literature research. As a result of the literature research, it is reported that the risk of encountering poverty and its negative effects is higher for children than adults.. Moreover, it is stated that the poverty in the period of childhood, may be a heraldist of poverty in adulthood.

Urban poverty-stricken children become improvished in terms of biopsychosocial aspects. Poverty and impossibleness, which caused by urbanization process, can prevent access to the most basic services such as education, nutrition, health. A lot of problems, which resulted from reflections of urban poverty on child poverty, such as opportunities of inequality, social exclusion, social injustice, security-deprived neighborhoods, the differences between living conditions, can cause deprivation, developmental disorders and permanent damage in children's inner world in many aspects. According to result of child welfare researchs, all of this problems have led to serious violation of right because of countries that accepted convention on the rights of the child and have the child protection system.

Literature Review

1. Poverty

 Copyright © International Science and Technology Conference (ISTEC)

Poverty is an old but recently discovered social problem description of which changes depending on the period. Zastrow (1991) identifies two approaches to describe poverty.

The first one is *absolute poverty (in a narrow or traditional sense)* which is described as failure to meet vital needs (such as eating, drinking, clothing and sheltering that will prevent death and enable survival) required to live and to support yourself and your family due to lack of money. The UN Criteria describe absolute poverty threshold as Access to Food, Sheltering, Clean Drinking Water, Hygiene, Health, Education, Information and Services ensuring the continuation of human life while the World Bank describes it as daily intake of minimum 2400 calories.

The second suggested concept is *relative (in a broader sense) poverty*. This concept, in addition to the basic needs stated above, refers to the state of failure to reach to the traditional living standards of the society and lagging behind. This situation reflects the failure to reach the lowest living standard. It only appears when individuals compare their living standards with another's.

Brody (1970), on the other hand, divided poor people into three categories including upper class, middle class and lower class.
In this classification, *upper class* represents poor individuals who do not necessarily have low level of income and whose current income amount equals to the special needs; *middle class* represents poor individuals who have low level of income and who are below the minimum living standard (generally large families); and *lower class* represents poor/ (Poor Poor) individuals who survive with social assistance payments.

Two important concepts related to poverty are income poverty and human poverty. Income poverty is described as the state of failure to achieve sufficient income level in terms of meeting required basic needs of the individual or household in order to survive or meet the minimum living standard. Human poverty, on the other hand, is handled as a concept including absolute and relative poverty descriptions and having a more comprehensive meaning. This concept, accepted by the United Nations, emphasizes the requirement of having financial, political, social and cultural opportunities to meet basic needs in addition to the monetary opportunities with the aim of ensuring human development and living a humane life. As a result of this approach, poverty appears to be a multi-dimensional concept. Human poverty is defined as the situation with lack of education opportunities, malnutrition, short lifespan, lack of employment opportunities, insufficient mother and child health, fear of future, catching preventable diseases, lack of freedom and lack of basic human competencies such as power (Kaya, 2011:37-38).

Amartya Sen, who provides one of the most important conceptualizations regarding poverty, explains that it is possible to handle poverty with both absolute and relative poverty approaches. While economic development defines and measures development through national income increase per capita based on the level of income and consumption, *"human development approach"*, which does not deem an income-oriented development understanding appropriate, places people in the centre of development emphasizing the expansion of all economic, cultural, political and social preferences and options of individuals. In this approach, while increase in the income levels of individuals is accepted as an important factor and a prerequisite for development, it is stated that improvement in the income level is insufficient solely to measure actual welfare, and increase in the health services, education and social safety, etc. directly contributes to the life quality and increasing this quality (Sen, 2004: 202). *Capacity approach* creates a multi-dimensional perspective for human welfare. Rather than concentrating on people's income levels and expenditures, this approach concerns about the question "what is equality" included in political philosophy by focusing on "what people can" and "what they can be" in an effective way. (Nussbaum, 2005; Robeyns, 2005).

Poverty concept is directly related to the unmet needs of individuals or children. Each unfulfilled need constitutes a poverty component. According to Barker, poverty represents the elements desired to be obtained in terms of physical, spiritual and social aspects in order for individuals to continue their lives, maintain their good positions and fulfil their tasks (2003: 56). Deficiencies regarding physical, psychological, economic, cultural and social elements required by individuals to maintain their lives and good positions and to function properly constitute their problems. Therefore, problems are defined by needs.

Poverty problem is faced especially by the elderly, disabled, women and children both in developed and developing countries.

Another important issue is the way of measuring poverty. There is not a standard approach to identify and describe

 Copyright © International Science and Technology Conference (ISTEC)

poverty. Discussions on poverty are generally conducted through the measurement of national and international comparisons by benefiting from the reasons of poverty. When poverty are measured in terms of monetary aspect, income increasing policies are considered as solutions. International organizations, on the other hand, handle poverty in a multi-dimensional way especially based on the United Nations human rights (Vandemootele, 2000).

2. Urban Poverty

Urban areas, beyond a physical concept, are the places ensuring shelter, psycho-social interaction and development (such as socialization, playing, gaining self-confidence and feeling safe) while contributing to social interaction and development.

Urbanization phenomenon emerging depending on the migration from rural to urban areas after industrialization caused the appearance of urban poverty which is a multi-dimensional concept.

According to the World Bank, Urban Poverty is described as "limited access to employment opportunities and income, insufficient and unsafe sheltering and services, violence, unhealthy environment, limited or lack of social protection mechanisms and limited access to education and health services". (Zülfikar, 2010:11).

Eight different factors impacting urban poverty are defined as follows (Dinçoflaz, 2009:34-35):

- Insufficient income,
- Insufficient and unstable resource availability,
- Insufficient sheltering,
- Insufficiency of public infrastructure services,
- Deprivation of social safety,
- Failure to sufficiently protect poor people in the functioning of legal system,
- Ineffectiveness and weaknesses of poor people in decision-making processes,
- Silence of poor people.

Alternate poverty (poverty-alternately) is another poverty concept closely related to urban poverty. Alternate poverty (poverty-alternately) represents the increase in wealth and welfare levels of certain groups over others as a result of citizenship and unequal power relations among poor people living in urban areas (Kocatepe, 2011:28). In alternate poverty, poverty is handled within a process on the basis of social relations. According to this concept, poor individuals using right sources and channels transfer their poverty to other poor newcomers. In this approach, poor individuals living in the urban areas rent out or sell the lands they occupied to the poor people recently migrating to the urban areas and therefore, they get rid of poverty and transfer their poverty to the newcomers in time (Işık and Pınarcıoğlu, 2009: 79).

Urban poverty may cause many problems such as irregular urbanization, unplanned growth, triggering socio-economic impossibilities, failure to achieve healthy living conditions, deprivation of public services, exposure to urban safety problems and to the risks in the urban breakdown areas (such as negligence-abuse-drug addiction-violence-being forced to commit crime) and many other impossibilities.

3. Needs of Children and Child Poverty in Urban Sense

It is possible to define children, whose physiological, psychological, cognitive, social and cultural needs cannot be met, who cannot obtain rights defined within the scope of the UN Convention on the Rights of the Child (such as living, participation, protection and development) and fall behind the welfare system, as *Poor Children (child poverty).* Poverty is experienced both in developed and developing countries. Therefore, international organizations such as the World Bank and the United Nations carried out various researches on this issue. When poverty is analysed in more detail, it is observed that it manifests the biggest and the most important impacts on children. Child development is prevented by poverty. Those who experience poverty during childhood are under a higher risk of facing poverty in the future, as well. Due to the vicious cycle emerging at this point, poverty is transferred to the upcoming generations (Durgun, 2011).

Poverty and deprivation concepts in the children's lives cause failure to meet needs of the child. While reviewing the literature, Maslow's (1954) hierarchy of needs model regarding human needs, Max-Neff's (1991) human scale

 Copyright © International Science and Technology Conference (ISTEC)

development, Peet and Bossel's (2000) ethics-based system model regarding basic needs as well as models for gender needs appear prominent in the proper identification of children's needs. Being aware of children's needs is important in terms of designing and identifying the features of an urban space in line with the development processes of children. In accordance with the United Nations Convention on the Rights of the Child, each child has 4 basic needs and rights, namely "living, participation, protection and development". Each child needs feeding, sleeping, moving and to be protected in order to develop as of the moment they were born. In addition, children have basic spiritual needs such as loving, to be loved, to be looked after, feeling successful and sufficient and gaining freedom like other individuals (Uçar, 2013, p. 15). Researchers such as Piaget, Montessori and Werner emphasize in their studies that interaction of children with the environment constitutes the basis of development, and the environment includes measurable physical components on cognitive-perceptual development. Considering that children use observation, exploration, trial and error methods while learning, it is a widely accepted truth that they need a physical environment with various resources (Kirazoğlu, 2012, p. 16).

4. Relation between the Child and City/Space

Spaces hosting daily life, especially the housing areas, do not serve only as shelters but also as natural stages where social interactions and relations are experienced. Differences between the living spaces identify the life quality in terms of accessibility or inaccessibility to public services. Repetition of opportunities and lack of opportunities in the spaces and their results bear important consequences for children living there (Erder,2002:26-30; Ümit,2007:103) Impacts of the spaces on the structure and functioning of society and on children cannot be underestimated. Experiences, emotions, hopes and concerns of children are shaped through spaces (Philo, 2000). As we cannot think children apart from their social relations, it is also not possible to think them apart from the spaces where these relations are shaped (Sibley, 1995). Therefore, the relation of children with the spaces refers to their socialization area beyond a physical space where they establish social relationships and gain social experiences (Moss and Petrie, 2002).

Physical environment and urban spaces (particularly open areas) that children interact with play an important role in child development and growing to be healthy individuals (Zomervrucht, 2005). Physical environment of children includes various active open areas and spaces such as the sheltering area and its surroundings, school and playgrounds in parallel to their physical, perceptive, emotional and social development. These spaces mainly shape children's both social and private lives. However, urban spaces pose dangers for children as a result of decrease in open areas and increase in traffic density and safety problems due to disordered housing caused by rapid and unplanned urbanization. Due to these dangers, children are deprived of open areas and streets where they freely move and develop. This spatial deprivation negatively impacts the development process, personality formation, behaviours, attitudes and reactions of children. Improving life quality of children, whose social, cultural and perceptive development is negatively affected by the reflection of problems caused by urbanization to the spaces, is of crucial importance for the future of the society (Al-Khalaileh, 2004; Tandoğan, 2014: 19-20).

Needs of an adult have an hierarchical structure. Human needs are ranked in the order of importance as biological needs, safety, sense of belonging, bonding, prestige, self-actualization (improving skills) and intellectual, emotional and aesthetic needs (Maslow, 1968). Apart from adult needs, one of the basic vital needs of children is playing. Playing contributes to children's physical development, socialization, perception of life, personality formation and transfer of the culture to the next generations (Çukur, 2009).

For children feeling the challenges of living in urban spaces the most, it is quite important to build child-oriented structures and conduct policies, implementations and designs in urban planning in line with children's needs. Therefore, child-friendly city concept is frequently emphasized and relevant activities are conducted with the aim of making urban spaces more habitable for children. *Child-friendly city* refers to a space with qualities contributing to the physical, psychological and social development of children so that they would become self-valuing individuals in the future. In physical terms, urban spaces should arouse positive feelings among children, provide opportunities for game activities, make them feel safe and an equal part of the society along with other individuals through the behaviours of adults (Churchman, 2003). Furthermore, child-friendly city aims to ensure that "children citizens" are active in the decision-making processes regarding the urban areas they live in; are able to express their desires and thoughts about the urban area; participate in family, society and social life; meet their basic needs such as health, education and sheltering; benefit from healthy water and health services at the maximum level; are protected against abuse, exploitation and violence; walk on the streets safely; meet and play with their friends; have green areas with animals and plants; live in a clean environment; participate in cultural and social activities; and have access to all services regardless of their race, religion, income, gender and disabilities (Unicef, 2004: 1)).

 Copyright © International Science and Technology Conference (ISTEC)

Conclusion and Discussion

The most active and vulnerable subjects of the problems and challenges in urban areas are children. Urban breakdown areas in the centres or periphery of urban areas, which do not have healthy living conditions and public services and where urban safety problems and poverty reach dangerous levels, may cause developmental disorders and damages in the inner worlds of children in many aspects. These problems caused by urban insufficiency can also be reflected in children's lives by transforming into serious problems such as negligence, abuse, violence, being forced to commit crime, exclusion, othering and impossibilities, and these can cause irreversible severe traumas. As a result of these, children may create insecure bonds with the environment and society; feel hatred, grudge and anger; and many other behavioural disorders such as aggression, stress, loneliness and introversion may arise, and their tendency to fight/conflict may increase. Furthermore, they may be forced to be engaged in illegal affairs and commit crime in order to eliminate social and spatial inequalities they experience in their own way, to fight poverty and to survive.

Realizing required arrangements and practices to make children's living environment more *"child-friendly";* in other words " informative, guiding and advocate " is important in terms of creating spaces that can answer the needs and desires of children. The social and spatial arrangements should be made to get the most basic rights, social integration and healthy development to children. Moreover, while studies about the urban policies and child welfare including the all children are ongoing, safe environment should be provided on every child , based on 'participation, protection, development and survival rights', focusing on the 'social justice and equal opportunities' as stated by United Nations Convention on the Rights of the Child (UNCRC).

Urban areas should provide physical spaces supporting social interaction, equal opportunities, accessibility, self-esteem and cultural identity where children can meet their basic needs such as social justice, equality, sheltering, education, health and playing in accordance with the UN Convention on the Rights of the Child. Besides, children's needs, expectations and desires should be met, and they should be provided with safe environments in the developmental periods. Institutions and civil society organizations responsible for urban safety, urban policies and welfare of children have to carry out comprehensive legislation, policy and planning activities based on social justice, equality, participation of children, children's rights and human rights. Furthermore, it is required to include scientists, academicians, local governments, trade associations, employers and social politicians in these activities to carry out inter-disciplinary professional team works handling children along with their needs using an integrated approach.

tahiremregencer@gmail.com

Damla KARAGÖZ,

Research Assistant at Department of City and Regional Planning,Metu,Ankara,Turkey,

damlakrgz@gmail.com

Abstract: The main concern of this study is urban areas open to risks despite the child's need for a safe and healthy environment in the childhood, lack of urban safety in the streets which are the socialization area and playground of the child and failure to develop child-friendly urban policies that can solve this safety problem. The aim of the study, on the other hand, is to identify the lack of safety for children using urban areas full of dangers during their developmental period, their needs of protection, failure of urban areas to provide safe environment for children and the shortcomings of child welfare system in this regard. This study handles current academic publications, current news and data from the international non-governmental organizations through children's rights and child-friendly perspective within the scope of literature review.

Anahtar Kelimeler: Child-Friendly Cities, Urban Safety, Child Welfare,

Introduction

In the scope of the Convention on the Rights of the Child and the Child Protection Law, it is an obligation to protect each child within the borders of Turkey against all risks, support their developmental processes, ensure child welfare under the modern childhood paradigm beyond the basic needs and provide safe living environment on the basis of rights-based approach and social justice approach. Despite these obligations in the legal legislation, policy processes and on paper, it is known that the situation is not quite like this in practice and on the contrary, the majority of children are facing serious problems such as poverty, abuse, drug addiction and violence, and that urban areas trigger these problems.

Literature Review

1. About Childhood

1.1. Childhood Concept and Modern Childhood Paradigm

In accordance with Article 1 of the Convention on the Rights of the Child, a child is described as; "For the purposes of the present Convention, a child means every human being below the age of eighteen years unless under the law applicable to the child, majority is attained earlier." Although the age of majority varies depending on the country, each person under the age of 18 is generally considered a child. Children are individuals; they have equal status with adults as a part of humankind. They are not the property of parents and the government. Healthy development and active participation of children are quite important for the future of all cities or communities. Children start the life as fully dependent individuals; however, they grow and develop with the assistance of adults to gain independence. They do not have only physical needs but also cognitive, emotional, social, psychological and physiological needs. Their dependence and developmental situations make them more sensitive, and therefore;

 Copyright © International Science and Technology Conference (ISTEC)

they are affected more by the environmental conditions, poverty, insufficient sheltering, environmental pollution and other negative conditions compared to adults (UNICEF Innocenti Research Centre, 2004, p. 5).

According to Uçar (2013), prevailing child paradigm of the 20th century is based on three basic assumptions:

a. Children are different from adults; or children constitute a special biological category.
b. Children need to be prepared -raised- for adulthood or adulthood is an acquisition.
c. Child raising responsibility belongs to adults or the government (Uçar, 2013,p. 36).

1.2. Children's Rights

Turkey put the UN Convention on the Rights of the Child (CRC), which grants rights to "each child" without distinction of any kind, such as race, colour, sex, language, political, national, ethnic or social origin, property, disability, birth or other status, into effect in 1994. Protection of children against discrimination, ensuring their participation and looking after high benefit of children are under the responsibility of the Government. There as 4 fundamental rights including "*living, participation, protection and development*" that should be granted to children.

The UN Convention on the Rights of the Child ensured quite significant developments such as

- setting the ground for the preparation of Child Protection Law,
- meeting the needs of children, supporting their socialization, ensuring the improvement of their skills, recognizing and valuing their rights, preventing violation of their rights, strengthening their capacities, protecting children against dangers/risks and supporting their bio-psycho-social development.

1.3. Children's Needs

Being aware of children's rights is important in terms of designing and identifying the features of a child-friendly urban space.

Each child needs feeding, sleeping, moving and to be protected in order to develop as of the moment they were born. In addition, children have basic spiritual needs such as loving, to be loved, to be looked after, feeling successful and sufficient and gaining freedom like other individuals (Uçar, 2013, p.15). During their development, children have certain needs such as dependency, socialization and obtaining information regarding their environment (1st Istanbul Child Congress, Istanbul Child Report, 2000, p. 65).

Researchers such as Piaget, Montessori and Werner emphasize in their studies that interaction of children with the environment constitutes the basis of development, and the environment includes measurable physical components on cognitive-perceptual development. Considering that children use observation, exploration, trial and error methods while learning, it is a widely accepted truth that they need a physical environment with various resources (Kirazoğlu, 2012, p. 16).

Furthermore, while reviewing the literature to analyse the needs of children, it is observed that Maslow's (1954) hierarchy of needs model, Max-Neff's (1991) human scale development, Peet and Bossel's (2000) ethics-based system model regarding basic needs as well as conceptualizations for gender needs are of crucial importance.

2. Child-Friendly Urban Design

2.1. Relation between the Child and Space

Child-friendly environment concept does not only refer to the natural environment or constructed environment but also to the physical, psychological, economic, political and cultural environment. These environmental criteria determine the outline of children's lives based on physical, psychosocial, cultural, economic and even political existence. On the other hand, they are based on human rights and democracy to a certain extent (Horelli, 2007, quoted by Tandoğan, 2011).

Spaces hosting daily life and particularly housing areas do not only serve as shelters but they also determine the life quality in terms of differences between spaces people live in and accessibility or inaccessibility to public services.

 Copyright © International Science and Technology Conference (ISTEC)

Repetition of opportunities and lack of opportunities in the spaces and their results bear important consequences for children living there (Erder, 2002:26-30; Ümit,2007:103). Physical environment and urban spaces (particularly open areas) that children interact with play an important role in child development and growing to be healthy individuals (Zomervrucht, 2005). Experiences, emotions, hopes and concerns of children are shaped through spaces (Philo, 2000). Relation of children with the spaces refers to their socialization area beyond a physical space where they establish social relationships and gain social experiences (Moss and Petrie,2002).

2.2. Child-Friendly City

All people, social interactions, economic, political and social structures determining the wellbeing of children are experienced in certain spaces. Well-being of children is limited with the spaces they are interacting with. Children's living areas and neighbourhoods represent a space where they establish social relationship networks and experience cultural interaction beyond just a physical environment they reside in. Therefore, physical and social features of the residence have a determining role in the wellbeing of children (Semerci et al., 2012).

Children need areas where they can gain and reflect their unique experiences in the urban spaces. Existence of children in urban spaces is an inevitable element in creating healthy, lively and happy urban spaces as well as it is a requirement for their physical and mental development (Aitken, 2001). In other words, child-friendly urban area is a space supporting physical and social development of children so that they would become adults looking after their urban spaces in the future. In physical terms; children should like and feel safe in the urban spaces and in symbolic terms; urban design, planning and behaviours of adults should convey the message that children are an equal part of the society along with other individuals (Churchman, 2003, quoted by Kirazoğlu, 2012, p. 59).

Kytta (2003) developed a model with two fundamental criteria to identify whether a space is child-friendly. These criteria are free movement of children and meeting their desires, needs and expectations. Nordström (2010) identified that children rather conceptualize child-friendly city concept in these 3 aspects: “safety and security”, “urban and environmental qualities” and “basic services such as health and education”. (quoted by Severcan, 2015, p. 146,149).

Haikkola and Horelli (2002) determined 10 aspects of child-friendly urban spaces in their study through the eyes of children:

1) Housing and sheltering
2) Basic services such as health, education and transportation
3) Participation
4) Safety and security
5) Family, relative, friend and neighbour circle
6) Urban and environmental qualities
7) Existence and distribution of resources
8) Ecology
9) Sense of belonging and continuity
10) Good governance (quoted by Severcan, 2015, p. 145-146

Child friendly city foresees a good administrative system looking after children's rights and is obliged to realize organizations and activities required to ensure active participation of children in the city management and decision-making mechanism through all service units in the province, to evaluate all relevant decisions through the perspective of children's rights and to grant the right of equal access to all basic services (Çocuk Dostu Şehir Projesi Uygulama Yönergesi, 2006:2). Child-friendly city refers to a city where voices, needs, priorities and rights of children become an indispensable part of public policies and implementations. Actually, it is possible to consider such a city also as a human-friendly city. (Korkmaz, 2006, quoted by Topsümer, 2009, p. 9).

Furthermore, the most important issue in the relation between child and city is games. Urban outdoor areas such as playgrounds play a crucial role in the physical, perceptive and mental development of children. When there are even common parking lots of buildings, there should certainly be common playgrounds and recreation areas allocated for children. Children's desires should be listened and their opinions should be taken into consideration while making decisions affecting them. If children would not be aware of the results and impacts of their opinions, then their participation in urban design would not be realistic and meaningful.

However, urban spaces pose dangers for children as a result of decrease in open areas and increase in traffic

 Copyright © International Science and Technology Conference (ISTEC)

density and safety problems due to disordered housing caused by rapid and unplanned urbanization. Due to these dangers, children are deprived of open areas and streets where they freely move and develop. This spatial deprivation negatively impacts the development process, personality formation, behaviours, attitudes and reactions of children.

2.3. Child-Friendly Street

Child-friendly cities should include child-friendly streets. Streets are one of the public spaces used by children the most. Therefore, child-friendly streets should be organized to be able to think about a child-friendly city. Streets are the social centres of towns and cities, meeting points for protests, stages of oppression and places where children acquire their very first knowledge about the world and neighbours meet each other (Appleyard, 1981, p. 1). Streets are common living spaces. Social behaviours are formed in outdoor spaces more than indoor spaces. In outdoor spaces, individuals have the opportunity to feel that they belong to a certain community; streets, squares and arranged spaces serve also as communication areas (Bal, 2005, p. 3).

3. Child, Safety and Urban Safety

"Safety" criterion formed using (Kiss 2.0) is handled in two parts as social safety and traffic safety. *Social Safety:* Social safety can be ensured with the existence of people on the streets or with the direct view of streets from houses. In this way, children would feel safe. Jacobs (1993) underlined the relation between the number of people using streets and social safety as follows: A properly used street is a safe street. An empty street is generally unsafe." (Jacobs, 1993, p. 54).

Regarding “urban safety”, there are two different aspects to be taken into consideration. First of all, urban safety concept recalls safety need arisen during the urbanization process and the relevant strategies developed. Looking through this perspective, urban safety, first of all, includes an urban safety perception different from the rural one and relevant services (Kosiak 2003: 7). "Safe city" concept has always been considered as an indicator of civilization, and "urban rights" were born with the improvement of human rights in modern times. Safe cities can be seen as spaces where crimes are actively fought, offenders cannot take shelter, opportunities for committing crime are not provided, unplanned housing does not exist, people show determination and will to reach to the level of contemporary civilizations and feel happy, meet their needs and have high living standards (Derdiman, 2014: 273).

Regarding these points, safety engineering should focus on the issues related to ensuring the highest possible protection of each space, either open or closed, against crimes, implementing procedures and measures to minimize the possibility of committing crime in line with safe architectural designs and then, warranting a structure or habitation approval/license (Derdiman, 2013: 47, 48). On the condition that it is safe, allowing children to go to the grocery store or spend time on the streets increases their self-esteem and sense of belonging while ensuring socialization with their peers and inhabitants of the neighbourhood.

In addition, trust rather than safety concept should be placed in the centre in cities, and trust-building policies should be aimed rather than safety policies.

Conclusion and Discussion

As a result of the literature review conducted, it was identified that safety level of urban areas is insufficient, they pose many risks and children suffer from urban safety deprivation the most in the society.

For children feeling the challenges of living in urban spaces the most, it is quite important to build child-oriented structures and conduct policies, implementations and designs in urban planning in line with children's needs. Therefore, child-friendly city concept is frequently emphasized and relevant activities are conducted with the aim of making urban spaces more habitable for children. Realizing required arrangements and practices to make children's living environment more "*child-friendly*"; in other words " *informative, guiding and advocate* " is important in terms of creating spaces that can answer the needs and desires of children.

A child-friendly city refers to an urban area or local government system endeavouring to reflect children's rights in urban daily life. Urban areas where children's voices, needs, priorities and rights become an

 Copyright © International Science and Technology Conference (ISTEC)

indispensable part of public policies and implementations are child-friendly. Therefore, such an urban area is also a human-friendly space.

It also refers to a space with qualities contributing to the physical, psychological and social development of children so that they would become self-valuing individuals in the future. In physical terms, urban spaces should arouse positive feelings among children, provide opportunities for game activities, make them feel safe and an equal part of the society along with other individuals through the behaviours of adults (Churchman, 2003). Their aim is to ensure that children participate in family, society and social life; meet their basic needs such as health and sheltering; benefit from healthy water and health services at the maximum level; are protected against abuse, exploitation and violence; walk on the streets safely; meet and play with their friends; have green areas with animals and plants; live in a clean environment; participate in cultural and social activities; and have access to all services regardless of their race, religion, income, gender and disabilities. (Unicef, 2004, p. 1; Sivri Gökmen, 2013, p. 822).

Urban areas should provide spaces supporting social interaction, equal opportunities, accessibility, self-esteem and cultural identity where children can meet their basic needs such as social justice, equality, sheltering, education, health and playing in accordance with the UN Convention on the Rights of the Child; and they should ensure that safe environments meeting the needs, expectations and desires of children are available.

Sue-Jeong Shin
bewisebebrave@gmail.com

Hee-Kyung Lee
heelee@yonsei.ac.kr

Myunghwan Hwang
hwangmh031@naver.com

This study aims to see how Korean high school students use English learning strategies and to unveil the relationship among L2 proficiency, language learning strategies and other learning variables such as student's curriculum tracks. the self-assessment of English proficiency, the length of English learning, the length of attending private English education and the interest in English. Based on Strategy Inventory for Language Learning(SILL), a kind of self-report questionnaire developed by Oxford(1990), a total of 121 surveys were collected from male Korean high school students, and their responses were statistically analyzed using Pearson's product moment correlation, Multivariate analysis of variance(MANOVA), and Binominal logistic regression. The results indicated that the correlation between language learning strategies and learning variables was low and that there was no statistically significant difference in L2 proficiency among groups divided by the frequency of students' language learning strategy use. In addition, only the social strategy showed statistically significant difference among student's curriculum tracks and the degree of language learning strategy use did not adequately explain students' interest in English learning. Further pedagogical implications and future research suggestions are provided.

THE RELATIONSHIP BETWEEN WATER QUALITY AND SOCIO-ECONOMIC DEVELOPMENT

Ekrem Mutlu
ekrem-mutlu@hotmail.com

Telat Yanik
telatyanik@hotmail.com

Although ¾ of our world is covered with water, the amount of water suitable for human use is very limited. The amount of fresh water is 2.5% of the total water stocks on earth. 0.3% of this amount consists of the fresh water sources suitable for human use and ecosystem. Water is one of the fundamental components of blood and body fluids of human. Water, which is required for vital activities, should be provided in the form containing no unhealthy materials or chemical content that is harmful for human. For meeting the fundamental needs of human and ecosystem, the water quality is as important as the amount of water. In water source management, besides the amount of water, also the importance paid to the quality of water should be immediately increased. Low-quality water causes many economic, social, environmental and health problems. The fact that the water stocks will be scarcer in upcoming years will lead the water-related problems and costs to increase. Socio-economic development depends on the quality of water. Non-good water quality poses risk for human and ecosystem health. Thus, worsening water quality threatens the socioeconomic development. The ecosystem health has traditionally been the subject of rich/developed countries and the environmental movements there. But, the increasing awareness about the importance and dimensions of the benefits and services of ecosystem allows it to be considered as a component of socioeconomic development and discussed also in poor countries as an important topic.

THE RELATIONSHIP OF PERCEPTION OF PREGNANCY RISK, ANXIETY, AND SPOUSAL SUPPORT IN PRIMIGRAVIDAS

Mi Hye, Kim [1] So Yeong, Choe [2]

[1] Cheongam College Jeonnam, Korea, mixedbetty@nate.com
[2] Gyeongsang National University, College of Nursing, Korea, css4214@gnu.ac.kr

Abstract: This study aims to identify the relationship between perception of pregnancy risk, anxiety, and spouse support in primigravidas. A sample of 160 primigravidas was recruited from two obstetrics and gynecology hospitals in Korea. The data were analyzed using descriptive statistics, t-test, ANOVA, and correlation analysis. There were statistically significant differences in perception of pregnancy risk according to age in general and obstetric characteristics ($t = 2.03$, $p = .043$). There were also statistically significant differences in spouse support scores according to age ($t = 3.82$, $p = .001$), job ($t = 2.57$, $p = .011$), and prenatal education ($t = -2.72$, $p = .007$). Perception of pregnancy risk and spouse support were correlated with anxiety ($r = .416$, $p < .001$; $r = -.176$, $p = .026$). Primigravidas over 35 years old need enhanced perception of pregnancy risk. There is need for education about Knowledge of High Risk Pregnancy.

Keywords: PERCEPTION, PREGNANCY RISK, ANXIETY, SUPPORT

Introduction

Perception of pregnancy risk refers to a pregnant woman's awareness of danger to the health of the fetus or herself due to a pregnancy-specific disorder (Richter, Parkes, & Chaw-Kant, 2007) and is a personal and subjective assessment of pregnancy risk as general risk is perceived differently by different people (Shim, 2009). Perception of pregnancy risk is affected by personal belief, attitude, judgment, and emotion as well as psychological aspects and socio-cultural factors involved in the perception of risk in a certain situation (Heaman & Gupton, 2004; Bayrampour, Heaman, Duncan, & Tough, 2013). A previous study showed that pregnant women with a higher perception of pregnancy risk were more likely to use a healthcare management facility, be motivated to seek prenatal health management, and give consideration on childbirth locations and more eagerly followed decisions, recommendations, and procedures prescribed by doctors for medical intervention (Bayrampour et al., 2013).

Recently, age at first childbirth has been increasing not only in Korea but also in many other countries (Carolan, 2013). The incidence rates of pregnancy complication, congenital disorder, and genetic defect are reported to have increased with the increase in age at first childbirth (Korean Association of Obstetricians and Gynecologists, The, 2010; Hwang, Kim, Yoon, & Lee 2011; Carolan, & Nelson, 2007), and, thus, special attention should be paid to pregnancy at an older age. The International Federation of Obstetrics and Gynecology (FIGO) defines pregnancy at the age of 35 or older as high-risk pregnancy and recommends that high-risk pregnancy be dealt with seriously because of a high likelihood of unfavorable pregnancy outcome (Park, Lim, & Han, 2009; Hwang, 2013; Nordeng, Ystrom, & Einarson, 2010). In Korea, too, healthcare costs for pregnant women of 35 or older have been increasing every year, accounting for 31.7% of the total use of national health insurance service in 2008 (Hwang, Kim,Yoon, Lee, 2011). Accordingly, attention at the societal level needs to be paid to pregnancy at an older age. Recently, to address the low birth rate in Korea, the government started to provide financial support for external fertilization, which has caused an increase in the rates of multiple pregnancies, preterm labor, and low weight birth (Korea National Statistical Office, 2012; Health Insurance Review & Assessment Service, 2015). Low-weight newborn babies are reported to have a much higher rate of premature death and have a much higher likelihood of disability or illness in life (Kim, Lee, Park, Whang, & Kim, 2009; Park, 2006). Accordingly, an investigation of the perception of pregnancy risk in pregnant women at an older age can provide important basic data for prenatal care. Moreover, research has never been conducted to examine the level of perception of pregnancy risk during the prenatal period or to identify associated factors; hence, research is needed to provide basic data (Atkinson, S.J. & Farias, M.F, 1995)

Of factors associated with perception of pregnancy risk, state anxiety is fear of pregnancy itself, and such anxiety works in combination with several other factors such as the pregnant woman's past experience, interpersonal relationships, and current status (Sung, Ju, & Ju, 2003; Chung, Kim, Ryu, & Na, 2002). Accordingly, anxiety level in a pregnant woman can be an important indicator for perception of pregnancy risk (Heaman & Gupton, 2004; Bayrampour et al., 2013; Gupton, Heaman & Cheung, 2001).

In addition, the level of spousal support may be correlated with perception of pregnancy risk. Spousal support is the most familiar and effective support system for a pregnant woman (Park, 2007; Chun, 2014; Koblic, 2010), and, therefore, it should be recognized as an important aspect before prenatal care is provided to a pregnant woman

 Copyright © International Science and Technology Conference (ISTEC)

(Bryanton, Gagnon, Johnston, & Hatem, 2008).
Accordingly, in the present study, we aimed to examine the perception of pregnancy risk of primigravidas in the childbirth environment, which is a change from their normal environment, to identify associated factors, and ultimately, to provide basic data for pre- and postnatal care programs to predict potential pregnancy risk and manage problems that may occur during pregnancy.

1. Study objectives

The purposes of the study were to examine the levels of perception of pregnancy risk, anxiety, and spousal support and to investigate the relationships among them. The specific objectives were as follows: first, to examine study participants' general and obstetric characteristics; second, to examine participants' perception of pregnancy, anxiety, and spousal support; third, to analyze participants' perception of pregnancy, anxiety, and spousal support according to their general and obstetric characteristics; and fourth, to investigate correlational relationships of perception of pregnancy risk, anxiety, and spousal support.

Methods

1. Study design

The present study was a descriptive correlational study conducted to examine the perception of pregnancy risk, anxiety, and spousal support in primigravidas and to investigate the relationships of the factors.

2. Study participants and the sampling method

Data were collected between March and May of 2016 after the study was approved by the G University Institutional Review Board (GIRB-A16-Y-0001). To recruit study participants, we first contacted the chiefs and the nursing departments of hospitals and obstetrics and gynecology offices located in J city of G province and explained the study objectives. After they signed a written consent form, we recruited participants from primigravidas who visited the outpatient clinic of the hospitals or the obstetrics and gynecology offices for a check-up. The study was conducted with the contacted primigravidas who understood the study objectives and volunteered to participate in the study. All participants were told about study ethics, their rights to withdraw from the study at any time, confidentiality, and anonymity. The questionnaire took approximately 15 minutes to fill out, and a completed questionnaire placed in a sealed envelope was collected by the researcher.
The sample size required for correlational analysis was 134 with the assumptions of an α level of 0.05, power of 0.95, and a medium effect size of 0.3, as estimated by using the G*power 3.1 program (Faul, Erdfelder, Buchner & Lang, 2009). Considering a dropout rate of 20%, a total of 160 primigravidas were recruited.

3. Research instruments

1) The Perception of Pregnancy Risk Questionnaire (PPRQ)

Perception of pregnancy risk refers to a pregnant woman's subjective feeling, intensity, attitude, and opinion in regard to pregnancy. The concept includes risk perception in both general and specific areas of pregnancy and the assessment of risk regarding both herself and the baby.
To measure perception of pregnancy risk, we used the PPRQ where 9 items were in the form of a visual analogue scale. Each item was scored on a scale ranging from 1 point (“never”) to 10 points (“very likely”); total scores ranged from 9 to 90 points, and a higher score indicated a higher perception of pregnancy risk (Heaman, Gupton, & Gregory, 2009). When the PPRQ was developed, the value of a reliability measure, Cronbach's α, was .87. The instrument was translated into Korean and then back-translated into English and permitted for use by the authors.

2) Anxiety

Anxiety is differentiated into two types, trait and state anxiety. Of those, state anxiety refers to a feeling of anxiety arising from self-assessment of how one feels in a specific time (Hahn, Lee & Chon, 1998). In the present study, state anxiety was defined as the assessment of how concern, tension, nervousness, and worry are felt “here and now” and was measured using the STAI-YZ, a 20-item scale for state anxiety developed by Hahn, Lee, Chon, and Spielberger (2000). Each item was measured on a 4-point Likert scale where 1 meant “never” and 4 meant “very much,” and total scores ranged from 20 to 80. A higher score meant a higher level of perceived anxiety. The value of Cronbach's α was .92 at the time of the development of the instrument.

3) Spousal support

In the present study, spousal support was defined as an aspect of social support established in a spousal relationship

 Copyright © International Science and Technology Conference (ISTEC)

and was measured with a 22-item instrument tested for reliability and validity. The instrument was originally developed by Park (1985) and was revised by Kim (2008). Each item was measured on a 6-point Likert scale where 1 meant ″never″ and 6 meant “always,” and total scores ranged from 22 to 132. The higher the score, the stronger the spousal support. The value of Cronbach′s α was .94 and .96 when it was revised (Kim, 2008).

4. Data analysis

Data were statistically analyzed with SPSS Windows version 21.0 in the following manner.
First, frequencies and percentages were computed for participants' general and obstetric characteristics. Second, the means and standard deviations were computed for the levels of perception of pregnancy risk, anxiety, and spousal support. Third, t-test and ANOVA were performed to analyze the levels of perception of pregnancy risk, anxiety, and spousal support according to participants' general and obstetric characteristics. Fourth and finally, Pearson correlation coefficients were computed to investigate the correlational relationships of pregnancy risk, anxiety, and spousal support.

Results

1. Participants' general and obstetric characteristics

Of the total sample of 160 primigravidas, 124 (77.5%) were under 35 while 36 (22.5%) were over 35, and all were married (100%). Regarding educational level, 108 (67.5%) had received education at the college level or higher. Regarding occupation, 82 (51.2%) did not have a job while 78 (48.8%) did. Regarding income, 74 (46.3%) had an income over 3 million won while 57 (35.6%) had an income between 2 and 2.99 million won. Regarding marital satisfaction, 154 (96.3%) were satisfied with their marriage. With regard to obstetric characteristics, 125 (78.1%) had no experience of miscarriage while 35 (21.9%) had had one or more miscarriages, and a large number of participants had not received prenatal education (n = 105, 65.6%). As many as 151 out of 160 (94.4%) had not received infertility treatment for the current pregnancy. No disease had occurred during the current pregnancy in 142 (88.7%), and 147 (91.9%) did not have any disease before the current pregnancy. With regard to gestational age, in descending order, 97 (60.6%) were 28–42 weeks along, 37 (23.1%) were 15–27 weeks along, and 26 (16.3%) were 1–14 weeks along (Table 1).

2. PPRQ, anxiety, and spousal support in primigravidas

The mean score for perception of pregnancy risk was 24.96 ± 12.28 (possible range: 9–90) with a minimum score of 9 and a maximum score of 66. The mean score for anxiety was 38.45 ± 9.45 (possible range: 20–80) with a minimum score of 20 and a maximum score of 76. Finally, the mean score for spousal support was 97.95 ± 13.32 (possible range: 6–132) with a minimum score of 55 and a maximum score of 119 (Table 2).

Table 2: The Degree of Anxiety, Spouse Support, PPRQ (N = 160)

Variable	Range	Minimum	Maximum	M±SD
PPRQ	9- 90	9	66	24.96±12.28
Anxiety	20-80	20.00	76.00	38.45±9.45
Spouse's Support	6-132	55.00	119.00	97.95±13.32

3. PPRQ, anxiety, and spousal support according to general and obstetric characteristics of primigravidas

The analyses conducted on the PPRQ, anxiety, and spousal support according to the participants' general and

 Copyright © International Science and Technology Conference (ISTEC)

obstetric characteristics showed the following results. The level of perception of pregnancy risk significantly differed by age (t = 2.03, p = .043); the mean score for the PPRQ was 26.02 ± 13.03 in those under 35 and 21.33 ± 8.41 in those over 35, showing that primigravidas under 35 had a higher perception of pregnancy risk. Anxiety level did not show a statistically significant difference across any general or obstetric characteristics. Level of spousal support differed significantly depending on age; the mean score was 100.03 ± 12.05 in those under 35 and 90.77 ± 15.09 in those over 35 (t = 3.82 p = .001), showing a higher level of spousal support in younger primigravidas. Additionally, level of spousal support was higher in the primigravidas with a job than in those without (100.67 ± 12.25 and 95.35 ± 13.84, respectively; t = −2.57, p = .011) and, additionally, in the primigravidas who received prenatal education than in those who did not (101.83 ± 10.41 and 95.91 ± 14.24, respectively; t = −2.72, p = .007).

Table 3: The Degree of PPRQ, Anxiety, and Spouse Support According to General and Obstetric Characteristics (N = 160)

4. Correlations between PPRQ, anxiety, and spousal support

The correlational analyses showed that the higher the PPRQ score was, the higher the level of anxiety was ($r = .416$, $p < .001$), and the higher the level of spousal support was, the lower the level of anxiety was ($r = -.176$, $p < .026$; Table 4).

Table 4: Correlation between PPRQ, Anxiety, and Spouse Support Variable (N = 160)

Variable	PPRQ r(*p*)	Anxiety r(*p*)	Spouse's Support r(*p*)
PPRQ	-	-	-
Anxiety	.416(.000)	-	-
Spouse's Support	-.013(.867)	-.176(.026)	-

Discussion

The study was conducted to examine the levels of perception of pregnancy risk, anxiety, and spousal support in primigravidas and investigated the relationships among them. The results showed that the level of perception of pregnancy risk was, on average, 24.96 points (possible range: 9–90) and differed significantly by age ($t = 2.03$, $p = .043$). The primigravidas under 35 showed higher levels of perception of pregnancy risk and spousal support compared to those over 35. In addition, the level of spousal support was significantly higher in the primigravidas with a job and in those who received prenatal education.

The primigravidas over 35 had a significantly lower perception of pregnancy risk compared to those under 35, which suggested that, in Korea, primigravidas over 35 may not have an appropriate perception of pregnancy risk. Because the perception of pregnancy risk among primigravidas has never been measured or studied in the literature, making a direct comparison is difficult. However, according to Je and Choi (2014), who measured the knowledge of high risk pregnancy in unmarried women over the age of 30, the level of knowledge was low with an average score of 55.5% for correctly answering questions about high-risk pregnancy, which would influence their perception of pregnancy risk. Additionally, a study with primigravidas and multigravida has shown that pregnant women over 35 had a lower perception of pregnancy risk compared to nurses or other medical staff and argued that approaches to raise perception of pregnancy risk had been insufficiently studied (Heaman et al., 2012a). Based on these studies, we believe that there is a need for educational or promotional programs for pregnant women over 35 to develop an appropriate perception of pregnancy risk (Je & Choi, 2014). Pregnant women who appropriately perceive pregnancy risk are more likely to follow medical intervention, recommendation, and treatment and to use a healthcare management facility, all of which lead their health behavior in a positive direction. Accordingly the concept of perception of pregnancy risk has recently been recognized as critical (Bayrampour et al., 2013). Therefore, for pregnant women at an older age to predict potential health problems during pregnancy and handle various complications well, a variety of educational methods should be explored to give them an appropriate perception of pregnancy risk (Wang, 2014), and interventional methods should also be developed. Moreover, the health of a pregnant woman determines the lifetime health of the fetus. Accordingly, a national policy is needed with regard to educational support for and promotion toward pregnant women at an older age.

In the present study, the mean score for anxiety in the primigravidas was 38.45 (possible range: 20–80). Kim and Choi (2014) conducted their study using the same instrument as in the present study to measure anxiety levels in pregnant women under and over 35 and reported that the mean anxiety score was 40.90 in those under 35 and 41.79 in those over 35, a finding similar to ours. In the present study, we also observed that, the higher the level of anxiety, the higher the perception of pregnancy risk ($r = .416$, $p < .001$). The finding was similar to that of another study in which the same instrument was used for primigravidas and multigravida, showing that, the higher the level of pregnancy-related anxiety, the higher the perception of pregnancy risk ($r = .46$, $p < .001$; Bayrampour et al., 2013). These findings suggest that anxiety is a critical factor influencing perception of pregnancy risk.

As described above, anxiety was positively correlated with perception of pregnancy risk, but it was negatively correlated with spousal support ($r = -.176$, $p = .026$). Additionally, the level of spousal support was significantly higher in the primigravidas under 35 ($t = 3.82$, $p = .001$), with a job ($t = -2.57$, $p = .011$), and with prenatal education ($t = -2.72$, $p = .007$). In the total sample, the mean score for spousal support was 97.95. A notable finding is that the primigravidas under 35 had a higher score than those over 35, and, accordingly, a variety of interventional programs to improve spousal support for elderly primigravidas should be developed (Chang, 2001). No previous study has measured spousal support separately in primigravidas under and over 35, nor have any reported a correlation between perception of pregnancy risk and spousal support, which makes precise comparison difficult. However, a study with marriage-based female immigrants reported a finding similar to that of the current

 Copyright © International Science and Technology Conference (ISTEC)

study: the higher the level of spousal support, the lower the level of state anxiety (Kim, Lim & Jeong, 2013). Considering that pregnancy and childbirth are a process a couple goes through together, not an event for the pregnant woman alone, spousal support is a very important factor in perception of pregnancy risk.

In summary, the number of primigravidas over 35 is increasing, and because they are classified as women with high-risk pregnancy in obstetrics, the number of high-risk pregnancies is also increasing (Whang et al., 2011). However, the level of perception of pregnancy risk was lower in the primigravidas over 35 compared to those under 35. In order for pregnant women over 35 to handle various pregnancy complications that may occur after pregnancy and prepare for healthy pregnancy and childbirth, they should be able to appropriately assess pregnancy risk, and there should be greater opportunities for them to receive information regarding perception of pregnancy risk and relevant education. Additionally, effective nursing interventional programs are needed to achieve these outcomes. Moreover, given that anxiety increased in the primigravidas with a higher perception of pregnancy risk and decreased in those with stronger spousal support, various interventional programs should be developed to raise spousal support for pregnant women over 35. In addition, considering that the health of a pregnant woman at an older age determines the lifetime health of the newborn baby, multi-faceted promotions and policies supporting them should be developed at the government level.

A limitation of the study is that we studied only a few factors affecting perception of pregnancy risk, and it is suggested that future research should investigate various factors affecting perception of pregnancy risk by including many other potentially influential variables and by examining the perception of pregnancy risk in elderly primigravidas as well as pregnant women with pregnancy complications.

Conclusion

This study was conducted to examine the levels of perception of pregnancy risk, anxiety, and spousal support in primigravidas over 35 and the relationships between the factors as the number of pregnant women over 35 is increasing in society. The study results showed that perception of pregnancy risk was lower in the primigravidas over 35 compared to those under 35, suggesting that there should be greater opportunities for pregnant women at an older age to receive information regarding perception of pregnancy risk and relevant education to help them appropriately assess their perception of pregnancy risk. To do so, effective nursing interventional programs should be developed, and multi-faceted promotional efforts should be made at the government level. Additionally, it was observed that perception of pregnancy risk was significantly higher in the primigravidas whose anxiety levels were higher whereas anxiety decreased in those with stronger spousal support. Accordingly, various interventional programs should be developed to raise spousal support in pregnant women over 35.

THE USE OF WEB 2.0 PLATFORM AS A COURSE SCHEDULE: THE EXAMPLE OF YOUTUBE

Selma BÜYÜKGÖZE, Selen YAMAN, Nadir SUBAŞI

Kırklareli University, Technical Sciences Vocational School – TURKEY
selma.bulut@klu.edu.tr , selen.yaman@klu.edu.tr , nadir.subasi@klu.edu.tr

Abstract: YouTube is a social platform which has monthly more than 1 billion users today, and which is used for several different purposes such as acquiring information, learning new things and spending good time. This sharing platform is used for students to interact with other users, and for uploading assignments of Computer Programming students on YouTube who receive day time and evening education at the Kırklareli University Vocational School of Technical Sciences. With the questionnaire which has been conducted as a result of total 70 students using this method, the outcome of the implementation has been attempted to be determined.

Keywords: Social Network, YouTube, Educational Technologies on Vocational Education, Genuine Methods and Techniques of Education

INTRODUCTION

Increasing number of individuals who prefer communication, information or for joy, time which spend on Internet increases each day. According to statistics of Statista internet sites (2016), increasing number of social media users, spend on social network sites most of this time. According to digital report the share of We Are Social web sites (2016) number of social media users in Turkey are 42 million people and the users spend time of average 4 hours and 14 minutes on Internet via pc or tablet in a day. The average time spent on social media users in Turkey are determined 2 hours and 32 minutes per day. (2016)

According to Aslanyürek and his colleagues (2015), use of smart phones widely and service providers of GSM spread Internet services, hence persons access to the Internet with mobile phones has made it possible. In parallel with this development, a social media developer provides applications for Smartphone, with people's mobile phones have provided access to social media. According to We Are Social Digital (2016); the number of people actively using social media via mobile devices increases 13 percent than last year in Turkey. This situation provides that people can easier, faster and seamless way to access to social networking sites.

Social Networks provides for users that introducing themselves in social platform, building a social network environment, to communicate with other users and move on (Ellison, Steinfield & Lampe, 2007), sharing the content they creating (photograph, video, blog etc.), creating a profile to contain their personal information, photographs, and videos, the way to communicate with foreigners and finally exploring new friendship (Wang and ark., 2010). Social Networks is important tools for sharing daily events and news, according to Gülbahar and her colleagues. (Gülbahar, Kalelioğlu & Madran, 2010).

Concept of web 2.0 is used synonym as concept of social media. (Lenhart, Purcell, Smith, & Zickuhr, 2010). O' Reilly said that web 2.0 is not packaged software, web 2.0 is a data source of enriched with more and more the use of the people and web 2.0 is the trusted environment as developers to users in the platform. Nowadays, Web 2.0 technologies which are often used in studies conducted in the field of education are blog, wiki, podcast, sites of sharing videos and networks. (Davies& Merchant, 2007; Griffiths& Wall, 2011; Kuzu, 2007; Meyer, 2010; Usluel&Mazman, 2009). The difference web 2.0 technologies relates with the amenities they offering their users. (Baran, 2013). A video sharing site that uses this technology is Internet site which named YouTube.

YOUTUBE

YouTube where is users uploading their own videos, watching other people 's videos , interpreting them, they sharing personal and / or subscribing to the official video channel, and major social networking sites on YouTube is a video sharing site that allows viewing of the current video. It's established by Chad Hurley, Steve Chen, and Jawed Karim three old employee of PayPal at 14 February at 2005. According to web site named Alexa, YouTube is the second most used websites in Turkey and The World. Moving from this property purposed of education was thought using for reinforcing elements for learning lessons. Video sharing sites of TeacherTube and SchoolTube inspired after its development.

TeacherTube: a video sharing site where teachers share videos about education (Thiyagu, 2010). American teachers James Smith is co-founder of the TeacherTube. This site allows teacher - student communication and

 Copyright © International Science and Technology Conference (ISTEC)

vocational training of teachers of the same subject any place in the world. TeacherTube can be defined as a site that contains only educational videos. This site is a good example for concept of distance learning. It includes videos of primary, secondary, high school, and college level from; physics, literature, geography, English, history, math and many areas. (Erbasan, 2016)

SchoolTube is a video sharing site to educational area based on students. It is a platform located of education contents of prepared from teachers or students, classroom activities, extracurricular activities, etc., it is an important social network which services to education areas.

PLACE THE SOCIAL NETWORKING AND YOUTUBE APP IN EDUCATION

Hazar (2011) put forth that especially Social Networks is extensively used by students' level of secondary and high school, most of these students think, social Networks are important source of various topics and socializing circles. Bilen and his colleagues (2014) point out that generally students use social Networks purpose of keep on social relationship , utilization rates in order to support their academic work (about lectures) is really low.

It has not been seen in Turkey that a study done by supporting learning from social networks YouTube in type of field research studies. It can support the training of nurses was seen in study named"NursingEducation2.0: YouTube'' using the YouTube video sharing platform (Skiba, 2007).

Thiyagu said that in his study, it can be used as a training tool use of web 2.0 tools such as Google Earth, Google Maps, iGoogle, Skype, TeacherTube, SchoolTube, Boolify, Picasa, Flickr.

Vijayakumar (2011) has said that useful results will come to use of YouTube or TeacherTube videos by the level of the students who to put into action by writing a second language in order to create a brainstorming.

Son (2011) use applications of YouTube, SchoolTube and TeacherTube, inside of references sharing tools, when he determine for online references of learning language.

Mulen and his colleagues (2008) in their study talk about that; students in middle school in the art class use of YouTube app and the results. Mulen and his colleagues say it may be beneficial use of TeacherTube and YouTube because of these reasons YouTube can be accessed without a user count and necessary of restrict the search results for students and then in order to display more relevant results.

Burke and his colleagues say it may be use as an effective learning method that students create online video as a group Project.

RESEARCH AND METHOD

In this study it is requested to do applications via use of one of the sharing video sites YouTube followed subjects in the lessons of governance system from students. In this way, it is provided to apply the topics which learned in the class within maximum period of a week, and were asked upload on the video sharing website YouTube. While students doing these applications at the same time they create videos that consist of voice narration through a program that records video screen. In this site every students create a channel themselves. They have opened their own channels; they upload their audio video they have prepared. Every week during the class, videos uploaded to video sharing sites YouTube are watched via the channels they opened in their name. Constructive criticism is done to themselves about their videos via lecturer and friends following up courses. Thanks to this experiment, they can help the other users via their channels. Before that, they had to use other channels for learning.

Survey is done to students who being educated vocational school of technical science department of computer programming. 70 students enrolled in the course, volunteers have answered the questionnaire as 90%. . The survey questions prepared by researchers established literature compiled. In this survey, questions directed about social-demographic level and use of YouTube, the question style is test and type of Likert. Our survey, two demographic variables, the 9-point Likert scale and including 12 consists of 23 questions based on the YouTube experience. The data analyze via SPSS 21 statistic program Frequency analysis, Mann Whitney U and Kruskall Wallis test. The confidence intervals used in this study is 95 percent

 Copyright © International Science and Technology Conference (ISTEC)

RESULTS

The findings obtained as a result of frequency analysis performed is as follows.

58.7% of the students who participated in our study were men, 98.4% for the first time taken the course,% 85.7 of the previously watched video on YouTube to learn something new, and previously 69.8% not adding video to open the YouTube channel, it has been identified.

The students who participated in our study, 88.9% of YouTube video by adding homework grade given can the idea of mind has never come, and 95.2% this application has learned YouTube on how a canal, using the% to 65.1 Bandyca program to capture video their choice was determined.

The students who participated in our study, found that exciting of 54.0% of the video capture, the video captured the 95.2% he knows homework will be assessed as grade, 73.0% lecturers of, he thinks monitored until the end of the captured videos, 92.1% is effective in learning the lessons of the captured video, and 58.7% wants another lesson to be treated the same technique course, have been identified.

The students who participated in our study; 88.9% of the video captured to be useful for other people and did not think to remove this video of the recent 87.3%, were identified. 'To upload videos to YouTube, it gave me time' statement on the participation of 33,3%, and 'to upload videos to YouTube, gave me enthusiasm' expressed in that hesitant 41.3%, has emerged.

Students who participated in our study, 'To upload videos to YouTube, offers a more objective evaluation of the possibility of the lecturers' statement on the participation of 55.6%, 'to upload videos to YouTube, DVD-flash memory as hardware rescued from carry with me' expression of 44.4% fully participated,

'To upload videos to YouTube, my interest in the course consistently high kept' statement to attended of 46.0%, and 'videos to upload to YouTube, course helped me become more successful' statement on attended of 52.4%, were identified.

The students who participated in this study; 'To upload videos to YouTube, my courage broke' the statement certainly not participating of 31.7%, 'to upload videos to YouTube, has caused excitement and stress' statement to not attended of 36.5%, and 'videos to upload to YouTube, was hampered to show my skills related' statement to not attended of 39.7% was determined.

Is there any effects of sex?

Students have different gender affects the success of the course, causes excitement and stress during loading YouTube homework.

YouTube and who do not add videos by creating an account?

If students open an account on YouTube and upload homework videos before that test, they are more successful their lessons, if not, students specify that breaking their courage.

Is there any difference between from who think to get homework degree on YouTube and who do not think to get homework degree on YouTube?

It was determined, students rid of to carry equipment such as video- flash driver and some of students are more successful in their lessons.

Is there any effects to learn opening a channel on YouTube?

Students learn how to create an account on YouTube and students rid of to carry equipment such as video- flash driver.

Is there any effects to make voiced presentations on YouTube?

The results of the study, it gave time to students to upload homework videos to YouTube, it kept students interest high and continuous to lesson, and lecturer can evaluate objectively.

According to Kruskal Wallis Test; The results of the study, it gave time to students to upload homework videos to YouTube, it kept students interest high and continuous to lesson, and lecturer can evaluate objectively.

Is there any effects the videos of on YouTube is watched by lecturer till the end?

It is understood, lecturer watch the videos uploaded on YouTube till the end, and Students aware of that. It was determined, it gave time to students to upload homework videos to YouTube, it kept students interest high and continuous to lesson.

Is there any effects to process the lesson with same method for another lesson too?

It was determined it gave time to students to upload homework videos to YouTube, it kept students interest high and continuous to lesson.

Is there any effects of benefit for other people of students' videos?

The results of the study, it gave time to students to upload homework videos to YouTube, it kept students interest high and continuous to lesson, and lecturer can evaluate objectively at the same time students more successful of their courses

Is there any effects to remove videos from YouTube?

It gave time to students to upload homework videos to YouTube, it kept students interest high and continuous to lesson, and lecturer can evaluate objectively at the same time students more successful of their courses.

DISCUSSION

Technology is integral part in our life with the increase in smart phones and their developed applications. Our interest increase with that rate. Social network are used by students of middle and high age.

Students of Kırklareli Vocational School of Technical Science use video sharing site YouTube of web 2.0 tools for purposed strengthen in lesson of content management system. , the survey is done to students end of the term, data of survey are analyzed by SPPS 21 statically program.

Use for syllabus platform of Web 2.0: questions of Likert scale in example of YouTube;

- it does not affect the results how many times taken lessons
- there is not a significant difference from students of watch the videos purposed to learn new things or not watching
- there is no effect difference of program to taping video on YouTube
- it is awared by students, the videos of taping on YouTube is examined as homework notes
- Videos of taping on YouTube are efficient to learning lessons aware of all students.

When the results is examined

- the difference of sex effects the success of lesson
- students who not open an account or not type video on YouTube, feel stress and excitement during the uploading their homework's
- uploading the homework's provides more successful
- students rid of to carry their DVD- flash driver
- When they upload their homework's, it kept students interest high and continuous to lesson, and lecturer can evaluate objectively at the same time students more successful of their courses.
- lecturer watch the videos uploaded on YouTube till the end, and Students aware of that
- Videos on YouTube are beneficial for other users.

CONCLUSION

It was determined at the end of the study, supporting to teaching process cause of, students of Kırklareli University of Technical Sciences Vocational School learn efficient and successful, students are more active, to facilitate the learning process, students think that piece of the teaching process via YouTube.

The results of the study, Social Networks can be integrated into the education system and social Networks can be increased the effectiveness, cause of the students have such a thought. For this purpose, YouTube can be supported as a supportive tool learning lessons for practice-based courses such as Web Project Management, Application Development, Introduction the Programming, and in this way, the success of the course can be increased. In this topic, lack of study is expected to necessary to increase the study.

THEORETICAL AND EXPERIMENTAL VIBRATION ANALYSES OF BRIDGE WINGS ON LARGE SHIPS

Adil Yücel
adil.yucel@itu.edu.tr

Alaeddin Arpaci
arpacial@itu.edu.tr

In this paper, the ship bridge extensions called “Bridge Wing” which are one of the most critical areas of importance to ship vibration are studied. The natural frequencies and mode shapes of these extensions which are modelled with different angles, are determined with finite element analysis. Furthermore, these bridge wing models are prepared on computer and the results obtained by finite element analysis are verified by experimental modal analysis. Besides, the results obtained from different bridge wing designs are compared and effects of design properties on the results are emphasized.

eergun@martur.com.tr, sevda@uludag.edu.tr

Özet: Bu çalışmada bir ticari araç sürücü koltuğunun dinamik konfor analizinin bilgisayar ortamında yapılabilmesi için uygun bir sonlu eleman modelinin hazırlanması ve bu modelin doğrulanması ele alınmıştır. Çalışmada dinamik konfora etki eden koltuk elemanları öncelikle tek tek daha sonra da gruplar halinde analiz edilerek elemanlar üzerinde yapılan fiziksel testlerden elde edilen sonuçlar karşılaştırılmıştır. Hazırlanan model, koltuk üzerinde yapılacak konfor testlerini fiziksel olarak laboratuvar ortamında gerçekleştirmeye gerek kalmadan sonlu elemanlar yöntemine dayalı bir yazılım kullanarak oldukça iyi bir yaklaşıklıkla analiz etmeye imkan vermektedir.

Anahtar kelimeler: Ticari araç sürücü koltuğu, dinamik konfor, sonlu elemanlar yöntemi

CREATION OF A FINITE ELEMENT MODEL FOR DYNAMIC COMFORT ANALYSIS OF COMMERCIAL VEHICLE DRIVER'S SEAT

Abstract: In this study, creation of a suitable finite element model to dynamic comfort analysis of a commercial vehicle driver's seat in computer and verification of this model were discussed. Seat elements that affect the dynamic comfort first one by one, then in groups were analyzed and compared the results obtained from physical tests. Prepared model gives the possibility to analyze tests performed on seat comfort by using a software based on finite element method without the need to perform physically in the laboratory.

Keywords: Commercial vehicle driver's seat, dynamic comfort, finite element method

Giriş

Sürücü koltuklarında dinamik konfor, kullanıcının sürüş esnasındaki konforuna ait bir tanımlamadır. Dinamik konfora etki eden en önemli etkenler arasında ses, titreşim ve sertlik parametreleri sayılabilir. Dinamik konfor değerlendirmesinde sürüş esnasında yoldan gelen titreşimlerin ne kadar azaltılarak yolcuya aktarıldığına bakılır ve burada önem arz eden unsurlar; koltuğun maruz kaldığı titreşim, bunun sürücüye etkisi ve koltukta bulunan sönümleyici elemanların özellikleridir.

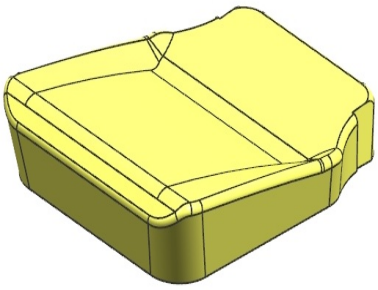
Yeni bir koltuk üretiminde konfora ait değerlendirme yapmak için genellikle iki yol izlenir. Bunlardan birincisi koltuğu prototip olarak üretip testler yardımıyla değerlendirme yaparak çıkan sonuca göre prototipte değişiklikler yapıp testleri tekrar etmek, ikincisi ise koltuğa ait bir sonlu eleman modeli hazırlayarak bu model üzerinde yapılan analizlerle fiziksel bir ürün ortaya çıkarmadan koltuğun konfor değerlendirmesini yapmaktır (Ergün, 2016).

Bu yöntemlerden ikincisi hem daha hızlı hem de daha az maliyetli olan çözümdür. Koltuk için doğru bir sonlu elemanlar modeli oluşturmak için koltukta bulunan tüm parçaların detaylı olarak incelenmesi ve mekanik özelliklerinin bilinmesi gerekmektedir.

Literatürde koltuk konforuna dair yapılan çalışmalara bakıldığında, bunların önemli bir bölümünün üretilmiş koltuklar üzerinde yapılan testlere dayalı olduğu görülmektedir. Niekerk ve ark. (2002), koltuğun dinamik konforunu ölçmek için farklı koltuklar üzerinde objektif ve sübjektif ölçümler yapmışlar, toplam 16 farklı koltuk modeli kullanılan çalışmada sübjektif değerlendirme için 6 farklı denek kullanmışlardır. Kyung ve ark. (2007),

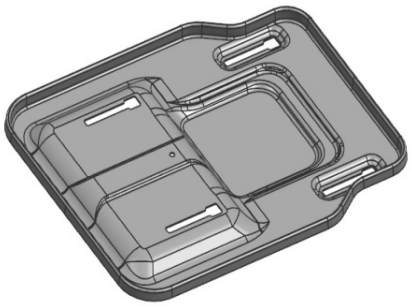
 Copyright © International Science and Technology Conference (ISTEC)

taşıt koltuklarında sürücünün sürüş esnasındaki konfor ve konforsuzluğunu değerlendirmek için 27 denek üzerinde, 2 farklı araç ve her bir araç için 2 farklı koltuğu test etmişlerdir. Bouazara ve ark. (2009) ise pasif ve aktif süspansiyona sahip iki farklı sürücü koltuğunun titreşim analizlerini yaparak, bu koltuklara ait dinamik modelleri oluşturmuşlardır. Konfor analizine ilişkin çalışmalarda üretilmiş koltuk üzerinden alınan verilerle yapılan değerlendirmelerin yan ısıra koltuğa ait sonlu eleman modeli oluşturarak sayısal verilerin bu model üzerinden elde edildiği çalışmalar da bulunmaktadır. Siefert ve ark. (2008), bir otomobil koltuğunun statik ve dinamik konforunu incelemek için sonlu elemanlar modeli kurmuşlar, bu modelin doğruluğunu sağlayarak, bilgisayar ortamında koltuk konforu için optimizasyon çalışmaları yapmışlardır. Verver ve ark. (2004) ise, yine bir otomobil koltuğunun konfor analizini yaparken kullanılacak sonlu elemanlar modelinin hazırlanma aşamalarını açıklamışlar, bu çalışmayla koltuğun tasarım aşamasındayken konfor parametrelerinin incelenebilmesini amaçlamışlardır. Çalışma sonunda elden edilen sonlu elemanlar modelinin koltuğun tasarım aşamasında konfor analizlerinin yapılmasına olanak sağlayacağı ve bu sayede koltuk üretilmeden olası konfor problemlerinin önlenebileceği vurgulanmıştır.



Yapılan bu çalışmada ise; tasarlanmış bir sürücü koltuğu üzerinde konforu etkileyecek bileşenler belirlenerek öncelikle fiziksel testler yardımıyla bu bileşenlerin mekanik özellikleri belirlenmiştir. Elde edilen mekanik özellikler bileşenlerin ayrı ayrı sonlu elemanlar modelinin kurulmasında kullanılmıştır. Komple koltuk sonlu elemanlar modeli hazırlanana kadar sünger ve çelikler gibi hammadde testleri, amortisör ve körük gibi satın alınan ürün testleri ve bu bileşenlerin birlikte kullanıldığı yarı komple testleri yapılıp bu testlerden elde edilen tüm veriler sonlu elemanlar analizleriyle doğrulanmıştır. Fiziksel testler ve sanal analizlerden elde edilen değerler karşılaştırılarak; sonlu elemanlar yöntemiyle kurulan modelin doğruluğu kanıtlanmıştır.

Koltuk Bileşenleri

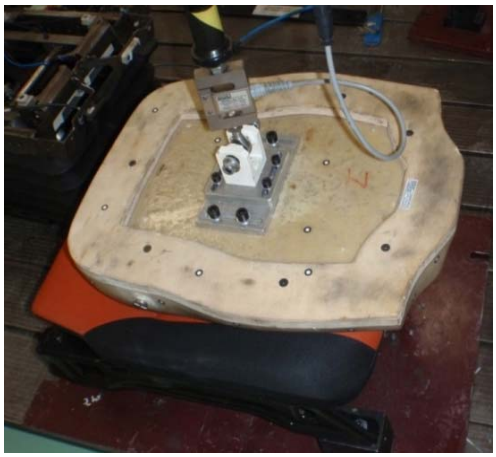


Çalışmada öncelikle tasarlanan koltuk üzerinde konfora etkisi olabilecek elemanların bağımsız olarak mekanik özellikleri irdelenmiştir. Mekanik özellikler fiziksel testler yardımıyla elde edilmiştir. Yapılan fiziksel testlerle aynı sınır şartları altında sonlu elemanlar modelleri kurularak analizler yapılmıştır. Bu analizlerle bağımsız parametrelerin doğru bir şekilde sonlu elemanlar modelinde tanımlandığı ispatlanmıştır. Birinci aşamada mekanik özellikleri belirlenen bağımsız parametreler; çelik iskelet yapısı, amortisör, hava körüğü ve süngerdir. Koltuk bileşenlerinin bağımsız olarak incelenmesinden sonra yarı komple koltuk modelleri analizlerine geçilmiştir. Bu aşamada komple koltuk modeli iki ayrı gruba bölünerek, birinci aşamada elde edilen verilerin ortak olarak kullanıldığında da beklenen sonucu verip vermediği incelenmiştir. Konfora etkisi olan parametreler dikkate alınarak komple koltuk iki ana yarı kompleye ayrılmıştır. Bu yarı komplelerden ilki oturak süngeri, kumaşı ve oturak taban sacından oluşan “oturak süngeri yarı komplesi”, diğeri ise koltuk iskeleti ve iskelet üzerinde bulunan süspansiyon ve hava yaylarını içeren “oturak iskeleti yarı komplesi”dir.

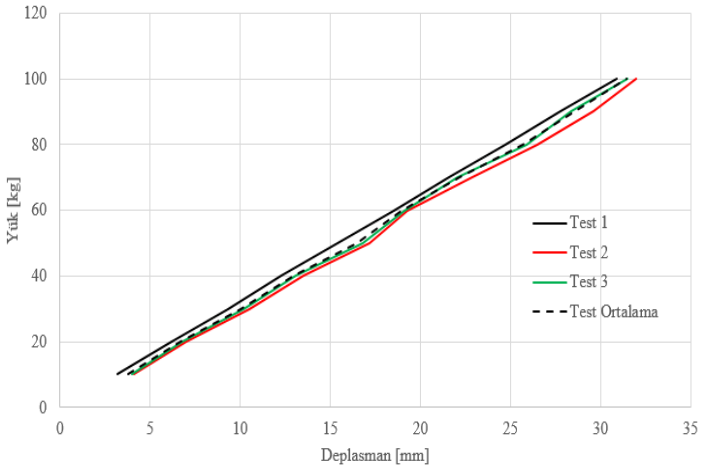
Oturak Süngeri Yarı Komplesi

Oturak süngeri yarı komplesi için koltuğun süngeri, kumaşı ve bunların bağlandığı oturak sacını içeren yapı kullanılmıştır. Tasarlanan oturak süngeri Şekil 1’deki geometriye sahiptir ve 45 gr/lt yoğunluktaki malzemeden üretilmiştir. Şekil 2’de geometrisi gösterilen oturak sacı ise 1.2 mm kalınlığında DC04 derin çekme sacından üretilmiştir. Seçilen yarı komple grubu sabit bir zemine oturtularak üzerinden dikey yönde bir aparat vasıtasıyla basma testi yapılmıştır. Kullanılan aparat Şekil 3’de gösterildiği gibi bir insanın kalça formunu simgeleyen standart bir geometriye sahiptir.

Şekil 1. Oturak süngeri modeli



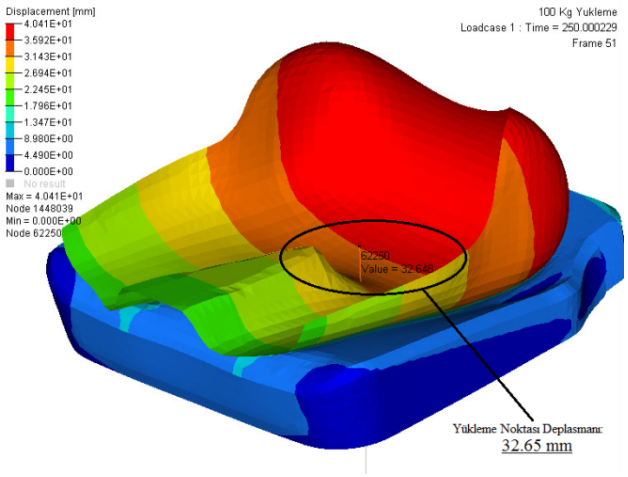
Şekil 2. Oturak sacı modeli



Şekil 3. Kalça formu

Test sabit bir hızda, yaklaşık 100 kg yüke ulaşana kadar yapılmış ve 3 kez tekrar edilmiştir. Şekil 4’de kalça formunun uygulanma şekli gösterilmiştir. Testler sonucunda elde edilen kuvvet – deplasman eğrileri Şekil 5’de gösterilmiştir. Grafikten de görüleceği üzere 100 kg yük altında oturak süngeri yarı komplesinde ortalama 31.5 mm deplasman oluşmaktadır.

 Copyright © International Science and Technology Conference (ISTEC)



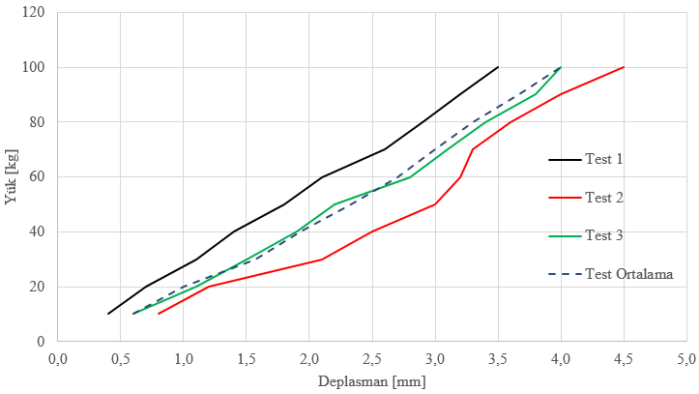
Şekil 4. Kalça formu basma testi

Şekil 5. Oturak süngeri yarı komplesi basma testi sonuçları

Oturak süngeri yarı komplesi için gerçekleştirilen bu fiziksel test için aynı sınır şartlarında sonlu elemanlar modeli kurulmuş ve aynı fiziksel testte olduğu gibi 100 kg'lık bir yükleme uygulanmıştır. Yapılan analiz sonucunda sonlu elemanlar modelinde oluşan deplasman değeri Şekil 6'da gösterilmiştir.

Şekil 6. Oturak süngeri yarı komplesi basma testi sonlu elemanlar analizi sonucu

100 kg yük uygulanan sonlu elemanlar analizi sonucunda oturak süngeri yarı komplesinde yükleme noktasında 32.65 mm deplasman oluşmuştur. Fiziksel testlerden elde edilen ortalama deplasman değeri ise 31.5 mm idi. Bu sınır şartlarında ortaya çıkan sonuçlar incelendiğinde sanal ve fiziksel testler arasında 1.15 mm'lik bir fark olduğu ortaya çıkmaktadır. Bu değer sonlu elemanlar modelinin, bu sınır şartlarında % 96.3' lük bir doğruluk oranına sahip olduğunu göstermektedir.

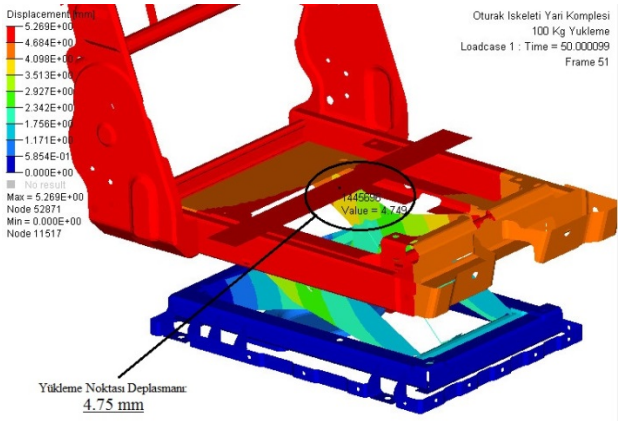


Oturak İskeleti Yarı Komplesi

Koltuk oturak iskeleti; amortisör, hava körüğü, makaslı yükseltme iskeleti ve diğer bağlantı elemanlarından oluşan yarı kompledir. Bu aşamada montajlanan koltuk iskeleti ile testler ve analizler yapılmıştır. Bu yarı komple; koltuk süngeri ve oturak süngeri çıkarılmış komple koltuğu temsil etmektedir. Yarı komple üzerinde yapılan fiziksel testlerde koltuk rijit bir platform üzerine konularak, belirli bir bölgeden 5 x 50 cm ölçülerinde bir plaka yardımıyla basıya zorlanmıştır. Şekil 7'de oturak iskeleti yarı komplesi ve test aparatları görülmektedir. Yükseklik ayarı en üst konumda iken sabit bir hızda yaklaşık 100 kg civarında yüke ulaşılana kadar basma yükü uygulanmıştır. Testler üç kez tekrar edilmiş ve sonucunda Şekil 8'de gösterilen kuvvet – yer değiştirme eğrilerine ulaşılmıştır. Şekilden de görüldüğü gibi 100 kg yük altında oturak iskeleti yarı komplesi ortalama olarak 4 mm yer değiştirmiştir.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 7. Basma testi düzeneği

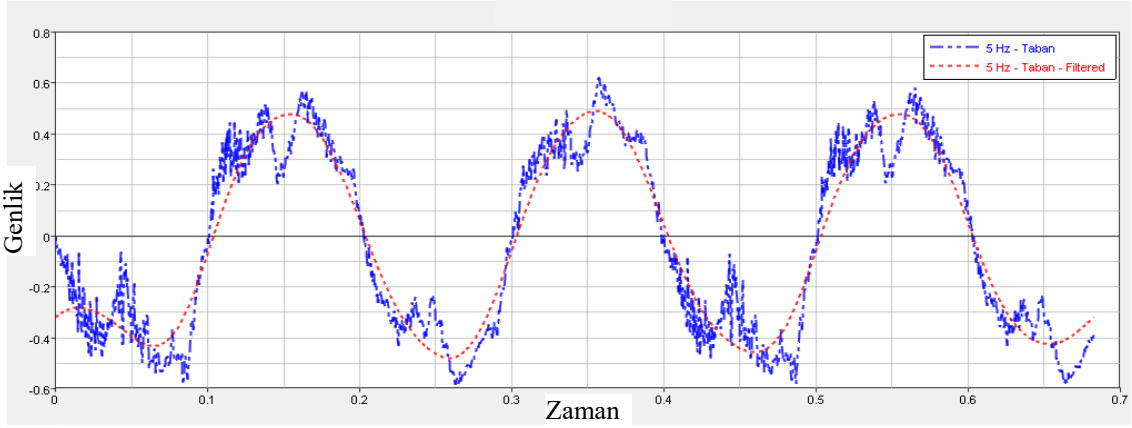


Şekil 8. Basma testi sonuçları

Oturak iskeleti yarı komplesinin sonlu elemanlar modeliyle doğrulanması, içerisinde fazla bağımsız parametre olduğu için önemlidir. Özellikle hava körüğü ve amortisör aynı anda etkileşim halindedirler. Yarı komple için hazırlanan sonlu elemanlar modeli Şekil 9'da gösterilmiştir.

Şekil 9. Sonlu elemanlar modeli

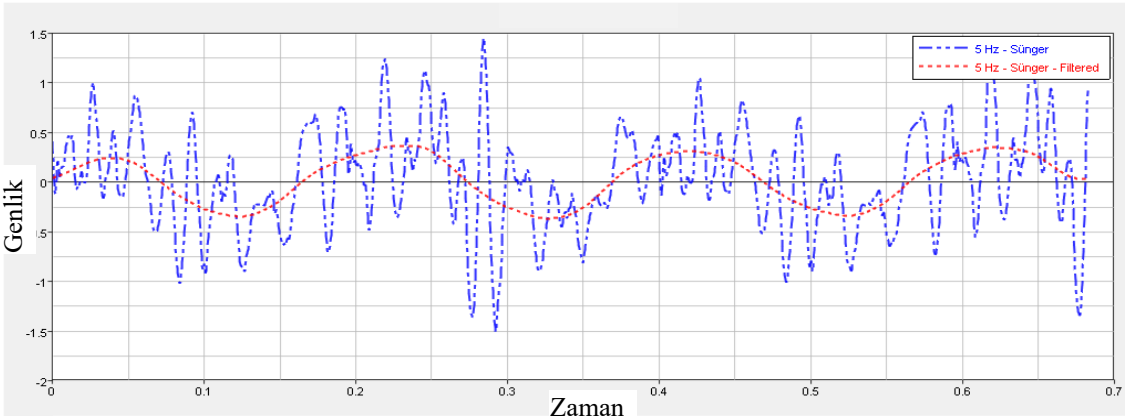
Şekil 10. Basma testi sonlu elemanlar analizi sonucu



Oluşturulan sonlu elemanlar modeline fiziksel testtekine benzer bir aparat yardımıyla 100 kg yük uygulanmıştır. Şekil 10'da sonlu elamanlar analiz sonucu gösterilmiştir. 100 kg yük uygulanan sonlu elemanlar analizi sonucunda oturak iskeleti yarı komplesinde yükleme noktasında 4.75 mm deplasman oluşmuştur. Fiziksel testlerden elde edilen ortalama deplasman değeri ise 4 mm idi. Bu sınır şartlarında ortaya çıkan sonuçlar incelendiğinde sanal ve fiziksel testler arasında 0.75 mm'lik bir fark olduğu ortaya çıkmaktadır. Bu değer sonlu elemanlar modelinin, bu sınır şartlarında % 82'lik bir doğruluk oranına sahip olduğunu göstermektedir.

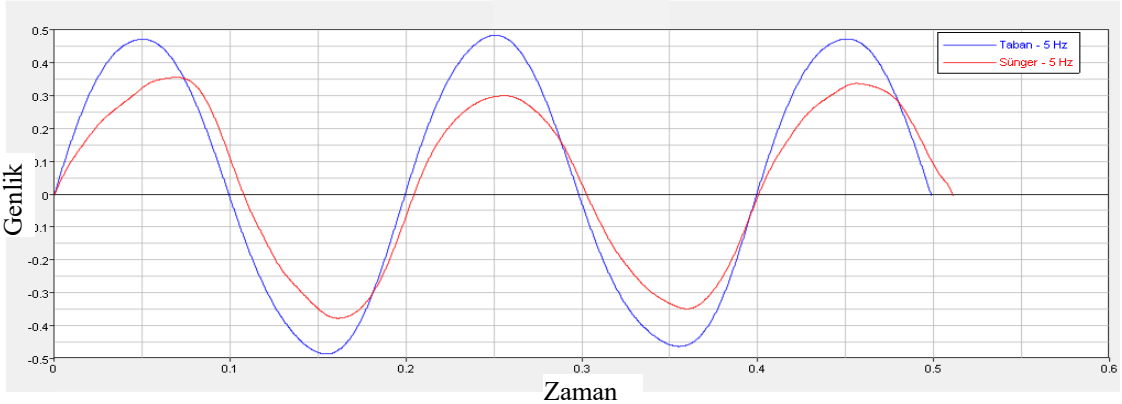
Komple Koltuk Çalışmaları

Bu aşamada prototip olarak hazırlanan komple koltuk ile testler yapılmış ve koltuğun dinamik konforuna ait veriler ortaya konmuştur. Ayrıca bu testler sonlu elemanlar yöntemiyle yapılan analizlerle tekrar edilerek koltuğa ait komple koltuk sonlu eleman modelinin elde edilmesine olanak sağlamıştır. Koltuğun dinamik konfor analizleri için; prototip olarak üretilen koltuk üzerinde, bozuk bir yol girişini temsil eden sabit genlikli giriş sinyali etkisi altında sürücü konforunun ölçülmesi ve yorumlanması gerekmektedir. Sürüş esnasında yoldan gelen titreşimlerin sürücüye etkisini incelemek için koltuğa dikey titreşim testi uygulanmıştır. Sürücü konforu açısından 5-20 Hz arasındaki frekanslara sahip titreşimler daha önemlidir. Bu nedenle, konfor değerlendirmesi için 5, 10 ve 15 Hz'lik sabit frekanslı ve genlikli periyodik girişlerle testler yapılmıştır.



Koltuk ilk olarak 5 Hz frekansta sinüzoidal bir giriş sinyaline maruz bırakılmıştır. Koltuk tabanına koyulan ivmeölçer yardımıyla giriş genliğinin zamana bağlı değişimi Şekil 11'de gösterilmiştir. Grafikte kırmızı renkteki eğri giriş sinyalinin filtrelenmiş halini göstermektedir. Koltuk tabanından alınan değerler aynı zamanda sarsıcı cihaza girilen değer ile aynıdır.

 Copyright © International Science and Technology Conference (ISTEC)

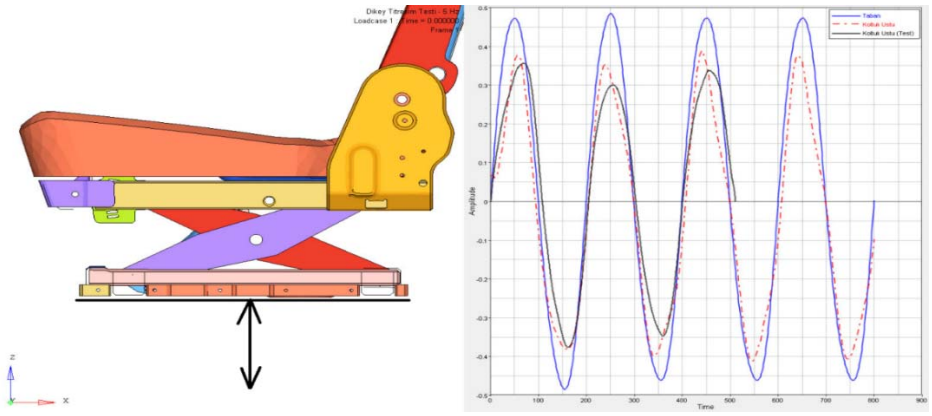


Şekil 11. Koltuk tabanına uygulanan 5 Hz'lik ivme girdisi

Aynı frekans bandında sünger üzerinden de ölçüm yapılmıştır. Bu ölçümün amacı tabandan gelen titreşimin büyüklüğünün sürücüye gelene kadar ne kadar azaldığını gözlemlemektir. 5 Hz bandında yapılan titreşim testi sonucunda sünger üzerinde ölçülen titreşim genliğinin zamana bağlı değişimi Şekil 12'de gösterilmiştir.

Şekil 12. Koltuk süngeri üzerinden ölçülen 5 Hz'lik ivme çıktısı

Yapılan ölçümler 5 Hz frekansında sabit genlikli periyodik bir girişe maruz kalan koltuğun sürücüye ne kadar titreşim aktardığını ortaya koymaktadır. Taban ve sünger üzerinde ölçüm yapılırken farklı zamanlardan örnekleme metoduyla değerler alındığından elde edilen eğrilerin tepe noktaları farklı zamanlarda görülmektedir. Eğrileri karşılaştırmak için genliğin sıfır olduğu noktalar referans alınarak filtrelenmiş eğriler tekrar düzenlenerek Şekil 13'de gösterilmiştir.



Şekil 13. 5 Hz'lik giriş sonucunda taban ve sünger üzerindeki ivme karşılaştırılması

Yukarıdaki grafikten görüldüğü gibi 5 Hz frekansındaki periyodik bir girişte taban ve sünger üzerinden okunan değerler farklıdır. Bu fark koltuğun sönümleme kabiliyetini ortaya çıkarmaktadır. Eğrilerin genlik pik değerlerini karşılaştırdığımızda girişteki genliğin 0.486 çıkıştaki genliğin ise 0.302 birim olduğu görülmektedir. Bu değerlere göre koltuğa gelen titreşimin etkisi %37.9 oranında azaltılarak sürücüye aktarılmıştır.

 Copyright © International Science and Technology Conference (ISTEC)

Aynı testler 10 Hz ve 15 Hz frekans bandında tekrar edilmiş, taban ve sünger üzerinden okunan pik değerleri karşılaştırıldığında koltuğa gelen titreşim etkisinin sırasıyla %35.6 ve %25.5 oranında azaltılarak sürücüye aktarıldığı görülmüştür. Farklı frekanslarda yapılan bu testler sonucunda koltuğun sönümleme kabiliyetinin %25-38 arasında olduğu belirlenmiştir.

Komple koltuğa yapılan dikey titreşim testleri koltuk için hazırlanan sonlu eleman modeli üzerinde de tanımlanmıştır. Yapılan sonlu elemanlar analizi sonucunda 5 Hz frekansındaki periyodik bir giriş sinyali için sünger üzerinden okunan değerler sarsıcı testinden elde edilen değerlere yakın çıkmıştır. Taban ve süngerden alınan verilerin genlik pik değerleri-karşılaştırıldığında girişteki genliğin 0.486 çıkıştaki genliğin ise 0.320 birim olduğu görülmüştür. Bu değerlere göre koltuğa gelen titreşimin etkisi bu frekans değeri için %34.1 oranında azaltılarak sürücüye aktarılmıştır.

Şekil 14. 5 Hz'lik dikey yönlü titreşim analizi sonuçları

Şekil 14'de sünger üzerinden okunan ivme değeri için hem analiz hem de test sonucu aynı grafik üzerinde gösterilmiştir. Grafikte mavi renkli eğri tabandan ölçülen giriş sinyalini, kırmızı renkli eğri analiz sonucunda elde edilen koltuk üstüne ait ivme değerlerini ve nihayet siyah renkli eğri ise sarsıcı testinden elde edilen yine koltuk üstüne ait ivme değerlerini göstermektedir. Grafikten de görüldüğü üzere, hazırlanan sonlu eleman modeli dinamik şartlar için fiziksel testlere oldukça yakın değerler vermektedir.

Sonuçlar ve Değerlendirme

Bu çalışmada koltuğa ait doğru bir sonlu elemanlar modeli kurmak için nasıl bir yol izlenmesi gerektiği açıklanmıştır. Elde edilen bu model hem koltukta kullanılabilecek yeni hammadde ve ürünlerin etkisini görebilmek için kullanılabilecek hem de yasal gereklilikler ve üretici firma kültüründe mevcut farklı test beklentilerinin analiz edilmesinde kullanılabilecektir.

Bu çalışmada, imidazol ve 1,3,4-tiyadiazol halkalarını birlikte içeren imidazo[2,1-b][1,3,4]tiyadiazol türevlerini sentezlemek, çeşitli spektroskopik yöntemlerle karakterize etmek ve bu bileşiklerin antifungal aktivitelerini teorik ve deneysel olarak araştırmak amaçlandı. Bu amaç için ilk olarak tiyofen-2-asetonitril'in tiyosemikarbazit ile olan reaksiyonundan yüksek verimle 5-(tiyofen-2-ilmetil)-1,3,4-tiyadiazol-2-amin sentezlendi. Daha sonra hedef bileşikler olan imidazo[2,1-b][1,3,4]tiyadiazol türevleri (4-12), 5-(tiyofen-2-ilmetil)-1,3,4-tiyadiazol-2-amin'in fenasil bromür türevleriyle (3a-i) olan reaksiyonlarından orta-iyi verimlerle (52-69%) sentezlendi. Sentezlenen tüm bileşiklerin yapıları IR, ^{1}H NMR, ^{13}C NMR, elementel analiz, kütle spektrosokpisi ve X-ray analiz (7, 8, 10 nolu bileşikler) teknikleri kullanılarak aydınlatıldı.

Imidazo[2,1-b][1,3,4]tiyadiazol türevlerinin (4-12) antifungal aktiviteleri, molecular docking ile, 3u7b *F. oxysporum f. sp. lycopersici* protein yapısını kullanılarak teorik olarak incelendi.

Son olarak da sentezlenen tüm bileşiklere *in vitro* koşullarda antifungal aktivite testleri uygulandı. İnhibisyon çapları, inhibisyon yüzdeleri ve LD_{50} dozları belirlendi. Elde edilen teorik ve deneysel aktivite sonuçlarına göre sentezlenen tüm bileşiklerin orta-iyi derecede antifungal aktivite gösterdikleri belirlendi.

Keywords: 2-Amino-1,3,4-tiyadiazol; İmidazo[2,1-b][1,3,4]tiyadiazol; fenasil bromür; Antifungal aktivite; Moleküler docking.

Abstract: One can easily find in the city centre of Tokat and nearby towns the fine examples of Anatolian Turkish architecture belonging to the period of Seljuk such as mosques, shrines, baths, fountains, khans and caravansarays which served distinctive functions. Many pieces of art have been regenerated through proper methods of restoration with the contributions of well-informed local authorities and with the awareness of preservation of historic and cultural heritage and desire to transfer them to the future. After the Battle of Manzikert (1071) the Seljukians of Turkey ruled over some parts of Anatolia who attached importance to trade infrastructures building caravansarays, bridges and sebils (wells and fountains) on trade roads and turned Anotolia into Turkish-Islamic nation.

The construction of Seljukian caravansarays, which were the foundation of Anatolian Economy, started during the ruling of Sultan Kılıç Arslan II (1155-1192) and devoloped in a very short time spreading caravansarays all accoss the trade roads of Anatolia. Caravansarays played improrttant role on development and continuity of transit trade in the Anatolian geography as described in the resources of Seljukian period such as inscriptions, literary works and travel books. Carvansarays, magnificient structures with their specific architecture and decoration, were considerably modern stopover destionations according to the conditions of the period. Considering the historical caravansarays as cultural entities to be preserved, it is vital to document and preserve them as well as transfer them to next generations preserving their material, technical and architectural features by means of proper methods of restoration. In this study, a detailed structural survey of the Caravansaray of Mahperi Hatun has been made and projects of restoration and restitution have been prepared. Following this, scientific evaluation and reporting studies were carried out as well as reconstruction and reinforcement processes were selected in the context of intervention types applicable to cultural premises which need to be preserved. In the light of prepared projects and scientific data obtained thereafter, the unusable materials have been selected to be removed from the structure and inventory of the materials has been recorded. However, the usable materials have been enumarated and stockpiled in order to be reused. The study remains faithful to the building survey. In accordance with the inventory of unusable materials, most characteristacly similar natural stones to be used in the materials have been brought from Tokat quarry so as to be applied.

Keywords: Building Survey, Restoration, Caravansaray, Seljuk, the Caravansaray of Mahperi Hatun

Introduction

In the 11th and 12th century the Seljuks, who conquered Anatolia, founded here the Anatolian Seljuk Empire and to strengthen their sovereignty and economy on their newly won land they started to develop commercial activities (Önge, 2007). In this context, they didn't just built orderly roads, walkways and bridges to safely connect the towns, markets and trade routes of their big country, but they also founded certain mansions (ranges), public houses and caravanserais to ensure the absolute safety of their trade journeys (Akok, 1974). The Seljuks, who built various caravanserais and madrasahs in many parts of the country also put great importance on the expansion of the trade routes in Anatolia. This way Anatolia became the haunt of crowded trade caravans and one of the most important centers of world trade.

This prepared study is based on the Tokat-Pazar Mahperi Hatun Caravanserai, which is one of the Seljukian caravanserais that reached our time. The first part contains definitions about the caravanserais that were

 Copyright © International Science and Technology Conference (ISTEC)

established because of the interest in trade of the Anatolian Seljuks. In short, concepts such as operating systems and basic planning elements have been analyzed. The second part tries to explain the used methods for the restoration of the Tokat - Pazar Mahperi Hatun Caravanserai. The third part describes the work steps that have been carried out while working on the Tokat - Pazar Mahperi Hatun Caravanserai. The last part however shows today's status of the Tokat - Pazar Mahperi Hatun Caravanserai by using the information of part two and three.

CARAVANSERAI

The word caravanserai derives from the Farsi word kârban (caravan) and saray (palace). Caravanserais are non-profit institutions that have been built on the main roads between cities for accommodation of caravans and passengers. Although it is not quite possible to say where the first caravanserais have been established, some sources say that caravanserais are based on ribats (Akıl,2006). Two caravanserais in Asia that have been built by the Turks and are called ribat belong to the Ghaznavid and Kara-Khanid Khanate dynasty. Their architecture and plans became later examples for the caravanserais built by the Seljuks (Günel,2010).

Operating System and Plan Samples of the Caravanserais in Anatolia:

The caravanserais that received their essence from solidarity and humanity survived until today thanks to the foundation system and are commercial buildings for the public benefit established on roads. Caravanserais were generally built 8-10 hours (35-40 kilometers) by foot away. The stay up to three days in caravanserais was completely free. Expenses were paid by the Sultans, Lords and their foundations.

Kilij Arslan II started a program that transformed the Anatolian Seljukian caravanserais into cornerstones of the economic policy in order to establish trade in Anatolia, create a connection to the Asian trade routes and to lead them to the Mediterranean and Black Sea ports. The building of caravanserais also continued in the Ottoman Empire after the Seljuks. Caravanserais built during the Ottoman period show to main plan types:

1) Closed caravanserais without courts: A square or rectangle building with only one door forms the basis of the plan. The windows are small and high. The raised benches on either side of the entrance axis serve for accommodation of the guests. The middle part is for animals or cargo.

2) Open caravanserais with courts: This type divides the stables and service departments around the yard and the inside accommodations for the passengers at night. Usually there is a water fountain in the middle of the court (Akıl,2006).

Caravanserais are ostentatious structures with thick and tall walls. Along the boundary walls and at the corners there are strut towers. The main door is called crown door and it is possible to find examples of the beautiful Seljukian stone dressing on these doors (Korkmaz,2009). The stone dressing can usually be found on the frame. The crown door, niches, windows, arches and wall edges are architectural pieces that are used for stone adornments. The crown doors, which catches one's eye between the plain walls, give the feeling as if they are inviting the visitors inside. Limestone is used for most of the structures, sometimes at various colors and tones, sometimes only one color and sometimes a few of them together. Marble was rarely used. Inscriptions and plates with the names of the architects are also placed on the crown doors and the structures walls. The virtuosos also left unique signs and marks on the walls of the structure. TOKAT-PAZAR MAHPERİ HATUN CARAVANSERAI

Established on the Amasya-Tokat road, 1 km east from the district Pazar, near the Yeşilırmak River; according to two inscriptions the "public house" has been built by Sultan Melike Mahperi Hatun and was finished in the year 636/ 1238-39. (Picture-1). Hall 19.50x28 m (10 stone pedestals), the court is 33x34 m big (Özerkin,1965). Figure 2 shows the site plan of the caravanserai.

Picture -1. Tokat / Pazar Mahperi Hatun Caravanserai

Figure 2: Pazar / Tokat Mahperi Hatun Caravanserai Site Plan

The caravanserai consists of two different sections, one summer and one winter section. The summer section consists of a cloister that is surrounding the court and the parts behind it. The winter section however is divided into three parts by two rows of pillars, the pendentive is covered and completely closed to the outside. The caravanserai consists of cut stones and is rectangular planned. The
entrance door is very pompous, has a rectangular shape and stands inside a pointed arched niche. There is a construction inscription above the entrance door. The door inside the niche stands inside a round arch and consists of alternatively different colored stones. It resembles the portals of Anatolian Seljukian madrasahs and caravanserais. The roof of the caravanserai is completely destroyed but the portal and outer walls survived in a good condition until today (www.e-tatih.org,2015).

RESTORATION DECISIONS AND APPLICATION

A scientific restoration begins with an analytical study. This study is carried out from three angles:

a. The historical angle,
b. The aesthetical angle,
c. The technical angle (in terms of structure and construction.)

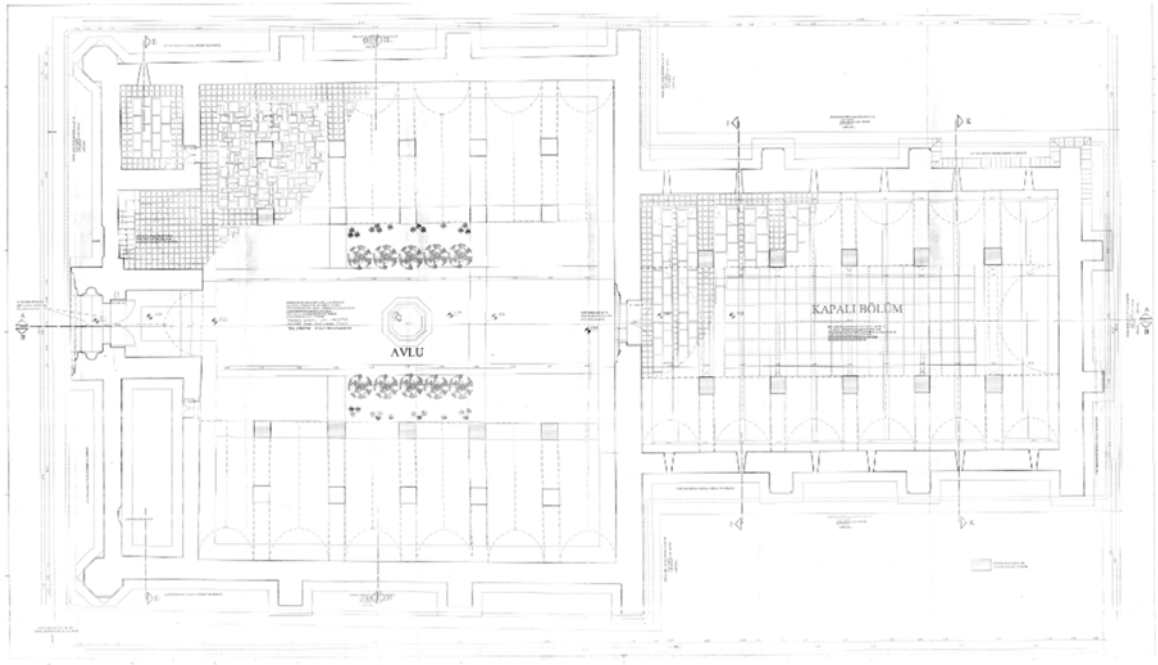
All three studies are handled at three levels:

a. Interaction of the building with the environment;
b. Totality of the structure;
c. Details of the structure (Kuban,2003).

These repairs on ancient structures are named restoration and are carried out according to type and degree of intervention in order to protect them and extent their life. While restoration means to bring back the original state of the structure to a certain extent and make it stronger in order to ensure that it will last longer, the process also contains the repair, the maintaining of the old or the giving of a new function. Giving the structure its old function back or creating a new one for it ensures the use of the structure which is an important part of the conservation culture. It is very rare that the structure is transformed completely back to its original state (reconstruction), this is why mostly the protection of the present is intended. Because of these reasons the scope of the repair/completion

 Copyright © International Science and Technology Conference (ISTEC)

works is closely linked to the damage ratio of the structure and to the desired restoration level (Yılmaz,2012). This caravanserai on the Tokat-Turhal-Amasya caravan route in the district Pazar of the province Tokat was built by the wife of Sultan Kayqubad I, Mahperi Hatun in the years 1238-1239. The structure was built completely out of fine cut stones. Figure 3 given below shows the building survey of the structure.



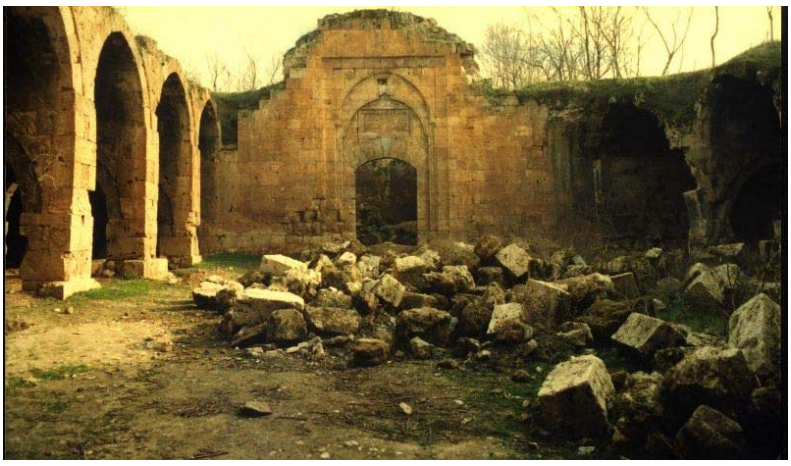


Figure- 3; Tokat - Pazar Mahperi Hatun Caravanserai Building Survey

Like seen in the building survey of the Mahperi Hatun Caravanserai, the bearing stands of the pendentive arches on the right and left of the court have become extremely damaged over the years (Picture 6).

Picture-6; Tokat - Pazar Mahperi Hatun Caravanserai Open Inner Court (Foundations General Directorate-Tokat District Directorate)

Walls and Struts

Bearing walls in historic building are generally made out of cut stone, rough stone, rubble stone, bricks or alternating materials (stone+bricks) and loads from the structure are conducting a continuous basis. The cross-sectional dimensions of the walls together with the oblique loads on it are determined by considering the earthquake loads. The thickness of the walls in historic masonry structures are chosen very big when compared to the self-weight of plane walls. In order to compare the vertical and horizontal loads of the wall they need to act as a whole.

The bearing walls of the Mahperi Hatun Caravanserai was built with cut stones. The bearing walls, which make up a big part of the outer periphery of the structure was preserved in its original form and was only cleaned up.

 Copyright © International Science and Technology Conference (ISTEC)

Walls with missing or insufficient parts were restored according to the building survey. Appropriate stones that fit the texture of the structure were supplied by the quarry in the center of Tokat and by manufacturing them properly the loads provided by the structure were transmitted to the basis (Picture-7). To ensure integrity of the wall, stones were connected with mortar, seam and wood/wrought iron beams on different levels. Some parts of the wall were strengthened with struts so they would withstand the loads from the oblique roof.

Picture-7; Tokat - Pazar Mahperi Hatun Caravanserai Open Outer Walls (Foundations General Directorate-Tokat District Directorate)

Pendentives

Pendentives are architectural elements that connect a series of arches in a row, which then forms a corridor. This way it is possible to create a sturdy but light foundation to carry the upper structure. In historic structures they were used to create a closed volume in rectangular areas.

In the Mahperi Hatun Caravanserai part of the pendentives in the open court and all of the pendentives in the closed area were damaged or collapsed. The pendentives were manufactured by creating supporting molds and they were strengthened with adhesive mortar and wrought iron beams (Picture-8, Picture-9).

Picture- 8; Tokat - Pazar Mahperi Hatun Caravanserai Closed Court Pendentive Manufacture

Picture-9; Tokat - General View of the Pazar Mahperi Hatun Caravanserai Open Inner Court Pendentives

Arches

Arches are architectural elements that are connected to a semicircle or arc-shaped center lock stone, rise up on two feet on which they bear the weight of the upper wall and create an opening with the desired space. The arches here are used as junction points between the pendentive feet and the outer walls of the structure and are located above the main entrance of the structure, the entrance of the open court and the door between the open and closed court (Picture-10/Picture-11). Because they were generally in a better shape than the pendentives, simple refuting and stones in bad shape were switched out and the transfer of the dome load to the main wall, which is their main task, was made safer.

 Copyright © International Science and Technology Conference (ISTEC)

Picture-10; Tokat - General View of the Pazar Mahperi Hatun Caravanserai Main Entrance Door

Picture-11; Tokat - General View of the Pazar Mahperi Hatun Caravanserai Pendentive Arches

MAHPERİ HATUN CARAVANSERAI APPLICATION REPORT

A restitution project was prepared according to the presented sources of the said structure, old photographs, information given by the Foundations Tokat District Directorate, new photographs and studies performed on site. Regarding the closed court, pendentive ruins and the exterior wall facades surrounding the structure were used to determine the laying tracks of the pendentive feet (Figure-4).

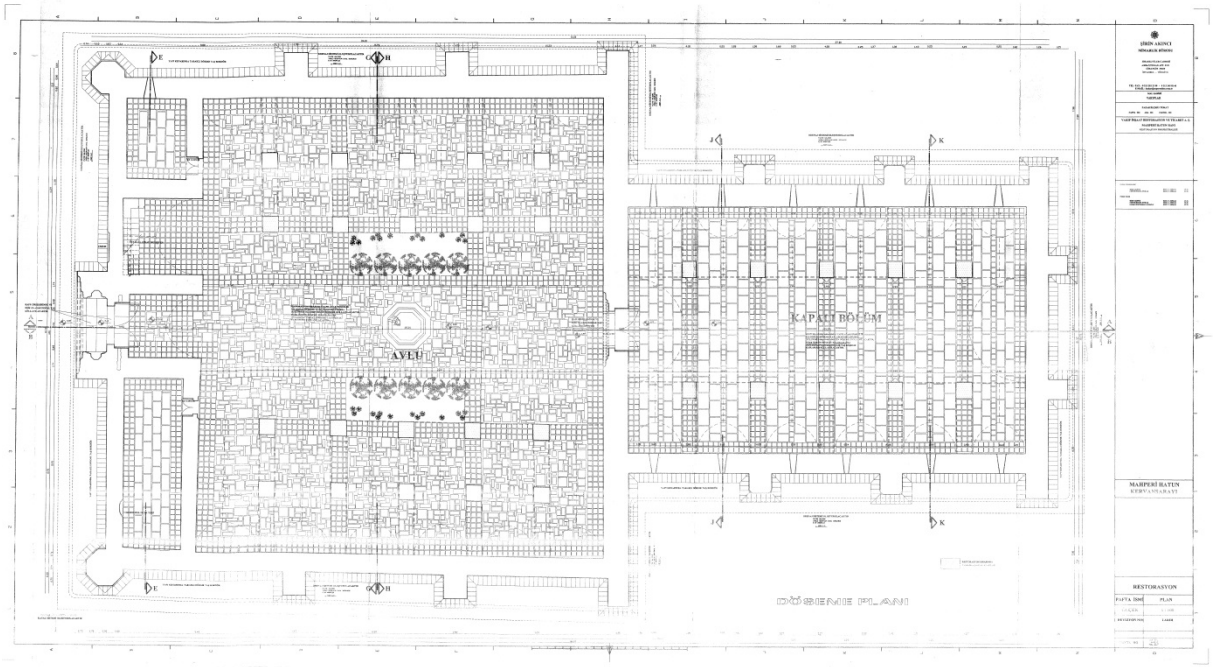

Figure- 4; Tokat - Pazar Mahperi Hatun Caravanserai Restitution Project

By using part of the surviving wall of the closed court, the location and height of the present windows could be calculated (Picture – 12). Because of the height difference of the closed and open court, a concrete floor and stairs were created(Picture – 13).

 Copyright © International Science and Technology Conference (ISTEC)

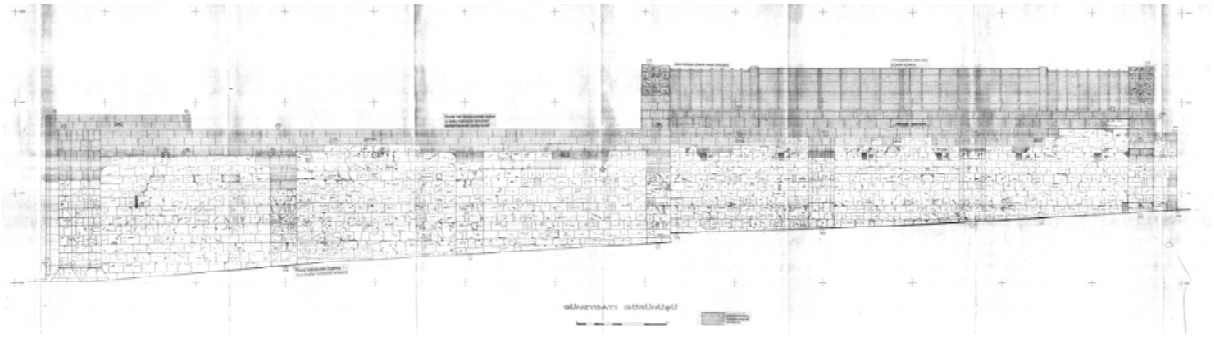

Figure-5; Tokat - Pazar Mahperi Hatun Caravanserai South-West Facade

Picture-12; Tokat - Pazar Mahperi Hatun Caravanserai Height Difference of the Open and Closed Court

The closed court was built in correspondence with the restitution project, which was prepared according to old traces, photographs and bibliographies, with stones from the quarry in the center of Tokat. During the building of the pendentives and the formation of the arches, mortar was used between the stones and iron blades were used as support and connections.
e the inner court of the structure was in better shape than the closed court, application decisions were taken more easily in line with the restitution project. Surviving pendentive ruins were saved and completed with appropriate stone material. Completely destroyed pendentives however were rebuilt in line with the restitution project. The structure system and ruins revealed, that the pavement is made out of stones. Thus the height differences of the structure were evened out with concrete and covered with stones (Picture-13).

Picture-13; Tokat - Pazar Mahperi Hatun Caravanserai Inner Pavement Application

 Copyright © International Science and Technology Conference (ISTEC)

3.3. USED METHODS

By evaluating the ruins of the Mahperi Hatun Caravanserai and the obtained documents, a restoration project was prepared in line with the prepared restitution project. The stone basis of the building was present and by cleaning up the ruins it was strengthened with appropriate brickdust mortar and cut stones with the same properties of the original material. Present walls of the caravanserai however were numbered, removed and put aside about to be masoned again. Usable stones were separated and insufficient material was substituted with appropriate material by the quarry in the center of Tokat in order to mason the walls (Picture-14). Missing pieces were replaced by new material with the same properties. Since some gutters were in good shape they were used again. Because no wood material was left, new elements were manufactured according to the project.

Picture-14; Tokat - General View of the Pazar Mahperi Hatun Caravanserai

After placing stone blocks for regional repairs of regional/local cracks, the gaps were filled with an appropriate mortar injection. For the repair of fine cracks and cracks and gaps in thick walls the best method is to use a mortar injection with similar properties of the wall. Instead of the renewal of some elements, present elements were repaired and stainless steel was placed in the junction points.

Different from the original structure both parts (Inner court and closed court), the floor and the roof were isolated and protected against water. First the top of the pendentives were filled with light material and the whole structure was covered with stone pavement. The top of the closed court however was covered with polycarbonate material, so it doesn't lie heavy on the structure, and the arched iwan part was covered with lead material. Considering snow and rain falling on the structure, the stone pavement was created beveled and with gutters the water drain was ensured. The Roof Surface of the Mahperi Hatun Caravanserai (Picture-15).

Picture-15; Tokat - General View of the Pazar Mahperi Hatun Caravanserai Roof

4. CONCLUSION AND EVALUATION

The Seljukian caravanserais are formed with art, culture, aesthetics, need, material and construction techniques, are located on historical trade routes and are part of our cultural heritage that needs to be kept alive. Seljukian masterpieces that survived until our days are about to lose their battle against time because of destruction and

 Copyright © International Science and Technology Conference (ISTEC)

degradation. Considering the condition of the structure, great importance has been placed on the protection of authenticity, traditional material and application of the technical and constructional system.
By determining that the bearing systems of the Mahperi Hatun Caravanserai consist of cut stone, which was found out via traces identified during the project phase and information of eyewitnesses, the structure was returned to its original sate.

TORNALAMADA MEYDANA GELEN TIRLAMA TİTREŞİMLERİN YÜZEY PÜRÜZLÜLÜĞÜNE ETKİSİNİN İNCELENMESİ

Selim BACAK[1], Serkan AYDIN[2]

[1] Süleyman Demirel Üniversitesi, Teknik Bilimler Meslek Yüksekokulu, Makine ve Metal Teknolojileri Bölümü, Isparta.

[2] Süleyman Demirel Üniversitesi, Teknik Bilimler Meslek Yüksekokulu, Elektrik ve Enerji Bölümü, Isparta.

Özet: Bu çalışmada, AISI 4140 çeliği herhangi bir ısıl işleme maruz bırakılmadan tornalama işlemi gerçekleştirilmiştir. Kesici takım olarak, sermet kalitesindeki iki farklı talaş kırıcı form a sahip kesici uçlar ve ona uygun takım tutucular kullanılmıştır. Kesme parametreleri üretici firma kataloğundan seçilmiştir. CNC torna tezgahında AISI 4140 ıslah çeliğinin kuru tornalanması sonucunda meydana gelen tırlama titreşimleri, kesici takım tutucu üzerine bağlanan MPU6050 6 eksen ivme ve gyro sensörünün, Arduino Mega mikrodenetleyicisi aracılığıyla anlık verileri kaydedilip grafiksel analizi yapıldıktan sonra, sonuçlar yüzey pürüzlülüğü ölçüm cihazında çıkan Ra değerleri ile bağlantıları kurulup karşılaştırılmaları yapılmıştır. Oluşturulan bu sistemde grafiksel analizi yapılan değerler yüzey pürüzlülüğü ölçüm cihazından alınan Ra değerleri ile örtüştüğü ve talaş kırıcı formların tırlama titreşimi ile Ra değerine etki ettiği gözlemlenmiştir.

Anahtar Kelimeler: Yüzey pürüzlülüğü, Titreşim, Mikrodenetleyici, Arduino, İvme ve gyro

Abstract: In this study, steel AISI 4140 has been turned without any heating process. As cutting tools it has been used cermet quality which have two different chipbreaker forms and tool holders are fitted. Cutting parameter have been chosen from producer's catalogue. Chatter vibrations which have been occured by dry turning on lathework bench MPU6050 6 axis acceleration and gyro sensor which are tied cutting tool holder, after data is recorded and analysed grapically via Arduino Mego microcontroller, results have been connected and compared to Ra values which are taken from surface roughness machine. In this system, scores that have been analysed graphically match up with Ra values taken from surface roughness machine and chipbreaker forms affect chatter vibration and Ra values.

Key Words: Surface roughness, Vibration, microcontroller, Arduino, Acceleration and gyro

1. Giriş

Talaşlı imalat, imalat sektöründe vazgeçilemez üretim metotlarından birisidir. İmalat yöntemleri ile elde edilen ürünün ölçü ve geometrik tamlığının yanında yüzey pürüzlüğü kalitesinin de istenilen değerlerde olması önem oluşturmaktadır. Yüzey pürüzlülüğü yapısı, iş parçası, kesici takım özellikleri, işleme parametreleri ve işleme yapılan tezgah ile doğrudan alakalıdır. İmal edilen parçanın mekanik ömrü, kullanıldığı yerdeki etkenlere karşı dayanımı yüzey pürüzlülüğü ile de alakalıdır. Yüzey pürüzlülüğünün tahmininde iş parçası ile kesici takım arasındaki titreşimi kullanmak da mümkündür.

Bir cismin denge konumun da periyodik olarak yaptığı harekete mekanik titreşim denir. Titreşim takım tezgahlarında, istenmeyen gereksiz bir enerjidir. Titreşimin imalat sırasında ortaya çıkan çeşitleri mevcuttur. Bunlar genel olarak serbest titreşimler, zorlanmıs titreşimler, kendi kendini uyaran titreşimler, yenilenebilen titreşimler, termomekanik titreşimler ve mod çiftlemesi olarak adlandırılır.

Takım ve iş parçası arasındaki bağıl hareket, doğal frekanslı bir sistemdir, takım tezgahlarında ki işleme sırasında yüzeye ve kesici takıma zarar verebilir. Bu hareket kabul edilen limitlerin üzerinde olursa buna tırlama denir ve ortaya çıkan tırlama kötü yüzey sonuçlarına, düşük ölçü tamlığına, takım aşınmalarının artmasına, takım kırılmasına ve dolaylı olarak tezgâh ömrünün kısalmasına yol açar.

 Copyright © International Science and Technology Conference (ISTEC)

Tırlama araştırmaları kesme işlemleri esnasında kararlılığı etkileyen en kritik faktörün talaş kalınlığı olduğunu göstermiştir (Kayhan ve Budak (2004)).

Hahn (1953) yaptığı çalışmada metal kesme işleminde meydana gelen zorlanmış titreşimlerde periyodik dalgalanmaların frekansının iş mili hızıyla orantılı olduğunu, fakat kendiliğinden-doğan titreşimlerde periyodik dalgalanmaların iş mili hızından bağımsız ve tabii frekansla orantılı olduğunu açıklamıştır.

Tlusty ve Polacek (1963), yaptıkları çalışmada, minimum ağırlıkta tezgâhın yüksek kararlılığına sahip olması için kendiliğinden-doğan titreşimin, tezgâhın karakteristiklerine etkisini incelemişler. Sunulan teoride, tezgâhtaki değişmelerin titreşim üzerindeki değişmelere nasıl etki ettiği belirlemişlerdir.

Wu ve Liu (1985), metal kesme dinamiğinin analitik modellenmesi üzerine yaptıkları çalışmada kesme işlemi esnasında oluşan kesme kuvvetlerinin belirlenmesi için bir analitik yaklaşımla, kendiliğinden-doğan titreşimin matematik modeli geliştirmişlerdir.

Lee ve arkadaşları (2001), yüksek hızla frezeleme sırasında oluşan kesme kuvvetleri ve bu esnada oluşan titreşimleri incelemişler. Normal kesme hızlarında yapılan işleme şartlarında oluşan kuvvetlerin ve işleme parametrelerinin tespit edilmesinin kesme parametrelerinin incelenmesinde yeterli olacağını belirtmişlerdir. Ancak, yüksek hızla işlemede yeterli olmadığını bildirmişlerdir. Yüksek hızla işleme şartlarında işlenen parçaların geometrik tamlığı ve yüzey kalitesi kesme sırasında oluşan titreşimlerin etkisinin büyük olduğu ve bu şartlarda yapılan işlemenin gerçek anlamda incelenip irdelenerek benzetim edilebilmesi için titreşimlerinde dikkate alınmasının gerekli olduğu vurgulamışlardır.

Ghani ve Choudhury (2002) tarafından yapılan çalışmalarda, kesme parametrelerinin ve takım üzerindeki titreşimin, yüzey pürüzlülüğüne ve serbest yüzey aşınması üzerine etkisi deneysel olarak incelenmiştir. Kesme hızı, ilerleme hızı ve talaş derinliğinin artırılmasıyla serbest yüzey aşınması hızlandığını ortaya koymuşlardır.

Neşeli ve Yaldız (2007), tornada takım geometrisine bağlı olarak meydana gelen tırlama titreşimlerinin yüzey pürüzlülüğüne etkisini incelemişler. Bunun için üniversal torna tezgahında, değişik yaklaşma açıları (60°, 75°, 90°) ve talaş açıları (-3°,-6°,-9°) kullanılarak, kuru kesme şartlarında AISI 1040 çeliği üzerinden 0.5 mm derinliğinde talaş kaldırmışlardır. Deneysel çalışmada, yaklaşma açısının artması ve negatif talaş açısının azalması tırlama titreşiminin artışına sebep olmuş, yüzey pürüzlülük değerinin de tırlama titreşimine bağlı olarak arttığı gözlemlemişlerdir.

Altınkaya ve Güllü (2008), AISI 316 paslanmaz çeliğin takma uçlu parmak freze ile işlenirken, kullanılan kesici uç üzerindeki talaş kırıcı formun kesici kenar üzerindeki aşınmaya ve yüzey pürüzlülüğüne etkisi incelenmişlerdir.

Bu çalışmanın amacı aynı kalite ve firmaya ait, farklı talaş kırıcı formlardaki kesici uçların sabit kesme parametreleri altında, tornalama işlemi tabi tutularak meydana gelen tırlama titreşiminin, ivme ve gyro sensörü kullanarak, Arduino Mega mikrodenetleyicisi sayesinde verilerin grafiksel analizinin yapılması ve yüzey pürüzlüğü değerleri ile karşılaştırılmasıdır.

2. Deneysel Çalışma

Deneyler de AISI 4140 ıslah çeliğine farklı talaş kırıcı formlara sahip aynı özellikte iki kesici takım kullanılarak, L300 CNC Torna tezgahında talaş kaldırmak suretiyle gerçekleştirilmiştir. Malzeme boyutları Ø22x150 mm olarak belirlenmiştir. AISI 4140 ıslah çeliği herhangi bir ısıl işleme maruz bırakılmadan tornalama işlemi gerçekleşmiştir. Numunelerin kimyasal özellikleri, Çizelge 2.1 de verilmiştir.

Çizelge 2.1 AISIS 4140 ıslah çeliğinin kimyasal kompozisyonu

C	Si	Mn	Pmax	Smax	Cr	Mo	V

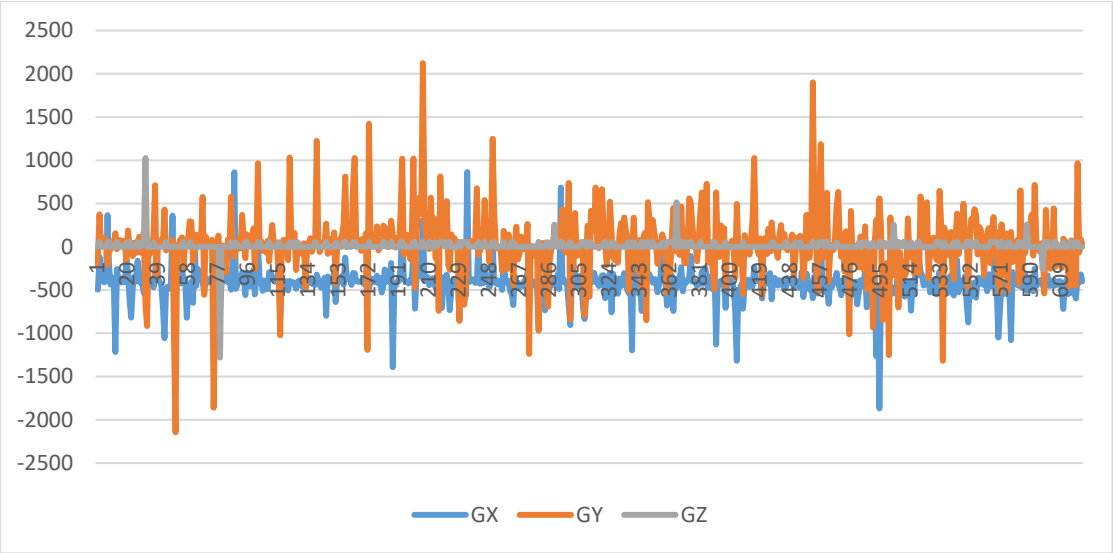
Şekil 2.1 DCMT-HMP kodlu kesici uç

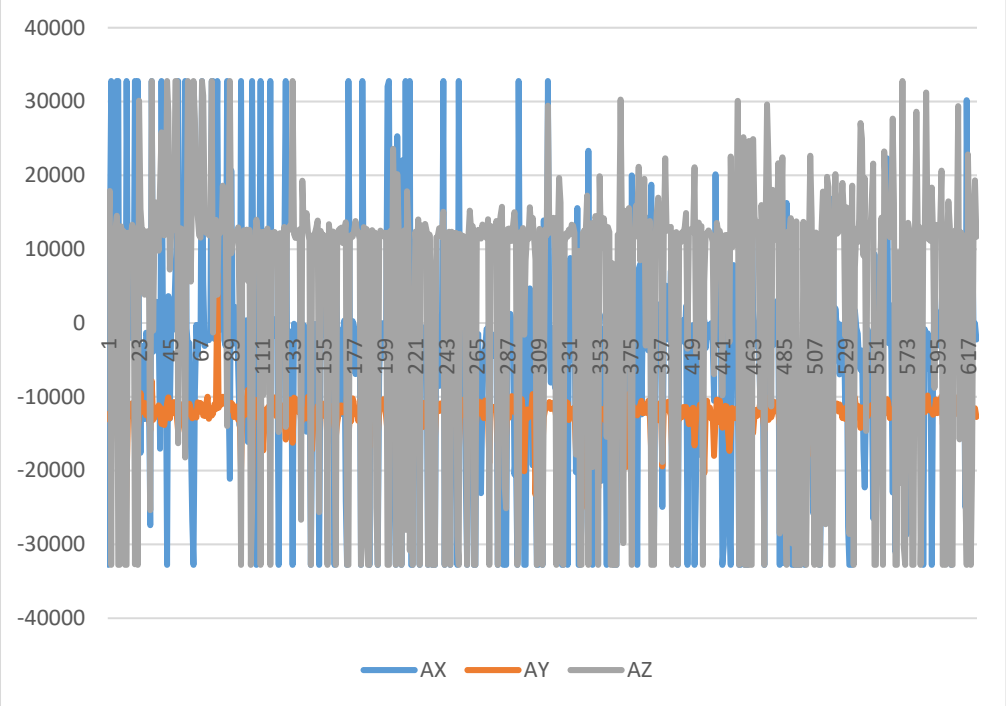
Şekil 2.2 DCMT-C25 kodlu kesici uç

Deneyler sırasında soğutma sıvısı kullanılmamıştır. Kesici uçlar bir sefer kullanılarak iki punta arasına bağlanan her bir numunenin puntaya yakın tarafından 50 mm' lik boyuna tornalama işlemi yapılmıştır. Kesme işleminin parametreleri firma kataloğundan belirlenip her iki uç tipi için geçerli olan değerlerler seçilerek sabit tutulmuştur. Talaş derinliği 1mm, kesme hızı 210 m/dak, ilerleme değeri ise 0,3 mm/dev. değerleri kullanılmıştır.



Şekil 2.3. Uygulamanın Blok Şeması

İşleme sırasında meydana gelen tırlama titreşim sinyalleri, kesici takım üzerine bağlanan MPU6050 6 eksen ivme ve gyro sensörünün, Arduino Mega mikrodenetleyicisi aracılığıyla verileri Gobetwino programı sayesinde anlık olarak PC 'ye aktarılmış yaklaşık 5 dakikalık işleme süresince kaydedilmiştir. İvme ölçer sensör, takım tutucu üzerine kataloğunda belirtilen toleranslar dahilinde özel yapıştırıcı kullanılarak sabitlenmiştir. Böylece sensörden alınabilecek en hassas veriler alınmaya çalışılmıştır. MPU6050 ivme ve gyro sensörü insansız hava araçlarında da kullanılan hassas bir sensör olup üç boyutlu hareketleri Arduino Mega mikrodenetleyicisi sayesinde °/s ile m/s cinsinden işlenmesine olanak sağlamaktadır. Alınan verilerin grafiksel analizi yapılarak parçanın işlem sonrası pürüzlük ölçüm cihazından alınan verilerle kıyaslanması sağlanmıştır. İşlenen numunelerin yüzey pürüzlülük değerlerini ölçmek için Hommel Testter T500 pürüzlülük ölçüm cihazı kullanılmıştır.



3. Deneysel Bulgular

Bu çalışmada farklı talaş kırıcı forma sahip aynı kalitedeki iki kesici ucun, talaşlı imalat sonucu meydana gelen tırlama titreşiminin, yüzey pürüzlülüğünü nasıl etkilediği, ivme ve gyro sensörü ile Arduino Mega mikrodenetleyici sayesinde araştırılması yapılmıştır. C25 kodlu talaş kırıcı forma sahip kesici uç ile yapılan talaşlı imalat sonucu alınan verilerin grafiksel analizi yapıldığında ham gyro değerleri şekil 3.1 de, ivme değerleri de şekil 3.2 de gösterilmiştir. Hommel Testter T500 pürüzlülük ölçüm cihazı ile yapılan ölçümlerde ise Ra değeri 1.1 µm, Rz değeri 8.2 µm , Rmax değeri de 12.2 µm çıkmıştır.

4. Sonuçlar

- MPU6050 6 eksen ivme ve gyro sensörünün, Arduino Mega mikrodenetleyicisi kullanılarak anlık verilerinin PC üzerine kaydedilmesi ile yapılan grafiksel analiz, tornalama sırasında ortaya çıkan tırlama titreşimleri hakkında bilgi vermiştir
- İş parçası üzerinde oluşan yüzey pürüzlülüğü (Ra) değerinin ölçülmesi sonucunda, pürüzlülüğün işleme sırasında meydana gelen tırlama titreşimi oranı ile orantılı ve ölçümlerin başarılı olduğu sonucuna varılmıştır.
- Aynı özellikteki farklı talaş kırıcı formlara sahip kesici uçlar ile yapılan talaşlı imalattan elde edilen sonuçlara bakıldığında, talaş kırıcı formların numunelerde farklı tırlama titreşimleri meydana getirdiği, bununda farklı yüzey pürüzlülük değerlerine neden olduğu ortaya çıkmıştır.

TORQUE AND FLUX RIPPLE MINIMIZATION OF DTC CONTROLLED IM BY USING FUZZY LOGIC DUTY-RATIO ESTIMATOR AND HYBRID FLUX OBSERVER

Yavuz USER

Akdeniz University Electric Electronics Engineering Department Antalya, Turkey.
yuser@akdeniz.edu.tr

Abstract: Direct Torque Control (DTC) drive allows direct and independent control of flux linkage and electromagnetic torque by the selection of optimum inverter switching tables. There is no need for any complex transformation of current or voltage. However in the conventional DTC induction motor drive there are torque and flux ripples, since none of the inverter switching vectors is able to generate the exact stator voltage required to produce the desired chances in the electromagnetic torque and stator flux linkage. In this study, we propose a method to reduce torque and flux ripples. Two steps were carry out for this purpose. The first step is to use duty-ratio. A selected inverter switching vector not for the entire switching period as in conventional DTC, but only for a part of the switching period which is defined as the duty ratio, δ and by using zero switching vector for the rest of period. The duty ratio determines the average input voltage to the induction motor during the application of each switching vector as δVdc. The duty ratio of each switching state is a non-linear function of the electromagnetic torque error, stator flux-linkage error and a function of the position of the stator flux-linkage space vector. In that case fuzzy-logic based duty-ratio control can be used because of it is difficult to model its non-linear structure. The second step is to use hybrid flux observers. The hybrid flux observer uses two model for high and low speeds. Accurate stator flux estimation is obtained by using the stator voltage equation at high speeds, but low speeds accurate stator flux estimation is obtained by the rotor voltage equation. The proposed method is simulated via using MATLAB Simulink and compared to conventional DTC results. Comparing results suggest that the proposed method reduced the ripples in electromagnetic torque, stator flux linkage, stator currents and speed. Motor parameters, reference flux and torque values of motor and load torque value of conventional and proposed methods are arranged to be same for the comparison.

Keywords: Induction Motor, Direct Torque Control, Duty-Ratio Control, Hybrid Flux Observer, Torque and Flux ripple.

Introduction

Direct torque control method (DTC) is a vector control system because it allows calculating motor's flux and torque with the help of measurable magnitudes by motor parameters. The method is based on applying a switching series, which shall directly eliminate errors, which shall occur in torque, through the reference given as value and the calculated flux, to the power switching elements in the inverter (Vasudevan, 2004).

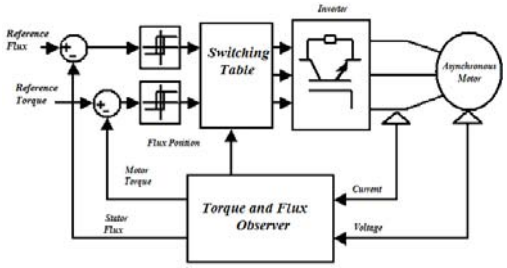

Fig. 1. DTC method block diagram

$$v_{s\beta} = R_s i_{s\beta} + \frac{d\psi_{s\beta}}{dt}, \quad v_{s\alpha} = R_s i_{s\alpha} + \frac{d\psi_{s\alpha}}{dt} \tag{1}$$

$$\psi_{s\alpha} = \int (v_{s\alpha} - R_s i_{s\alpha})dt, \quad \psi_{s\beta} = \int (v_{s\beta} - R_s i_{s\beta})dt \tag{2}$$

$$M_e = p\left(i_{s\alpha} i_{s\beta} - i_{s\beta} i_{s\alpha}\right), \quad \left|\vec{\psi}_s\right| = \sqrt{\left(\psi_{s\alpha}^2 + \psi_{s\beta}^2\right)} \tag{3}$$

This may be realized by using motor model on the α-β axis set. Stator flux, torque and stator flux sector zone may be calculated with the help of currents and voltages measured in the motor's stator as mentioned above equations (Depenbrock, 1988).
To accomplish switching process, one of the 8 different voltage vectors consisting of 8 different switching is selected as seen in Figure 2. Vi (Sa, Sb, Sc) (i=0,1,2…7) Besides 6 switching levels, there are V0(0,0,0) and V7(1,1,1) levels not producing a voltage at the output when they are applied. Table 1 may be useful to determine that the flux in which zone.

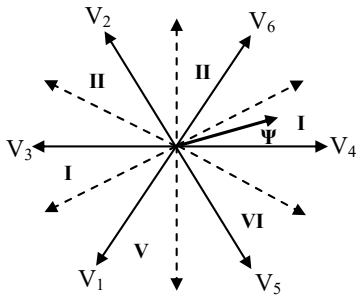

Fig.2 Switching Positions of DTC

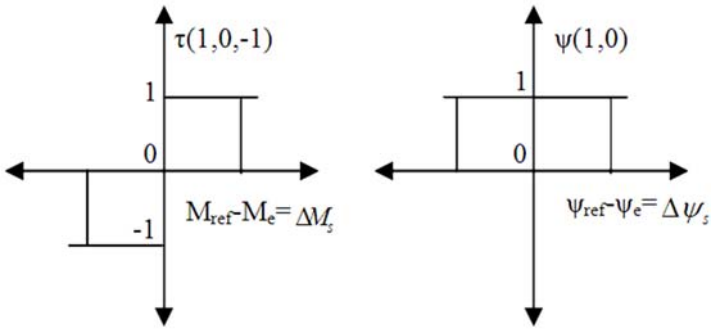

Fig.3 Hysteresis blocks which are Flux and torque error

Figure 3 is hysteresis block schema on which flux and torque errors are applied. Flux and torque errors are applied on hysteresis blocks and the signs produced by these blocks are used in addressing switching board. Hysteresis band widths are symbolized with and for flux and torque respectively. Table 1, which is seen below, shows switching logics when the motor is desired to rotate clockwise and counter-clockwise (Sarioglu, 2003).

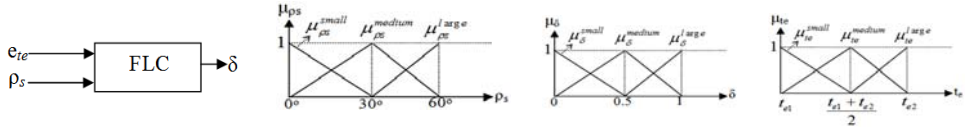

Table 1: Optimal Switching Logics For Motor Rotating

		θ(1)	θ(2)	θ(3)	θ(4)	θ(5)	θ(6)
ψ =0	τ =1	V_5	V_1	V_3	V_2	V_6	V_4
	τ =0	V_7	V_0	V_7	V_0	V_7	V_0
	τ=-1	V_6	V_4	V_5	V_1	V_3	V_2
ψ =1	τ =1	V_1	V_3	V_2	V_6	V_4	V_5
	τ =0	V_0	V_7	V_0	V_7	V_0	V_7
	τ=-1	V_2	V_6	V_4	V_5	V_1	V_3

Material and Methods

In the conventional DTC induction motor drive a voltage vector is applied for the entire switching period and this causes the stator current and electromagnetic torque to increase over the whole switching period. Thus for small errors, the electromagnetic torque exceeds its reference value early during the cycle, and continues to increase, causing a high torque ripple. A solution can be obtained where the ripples in the torque and flux can be reduced by employing a selected inverter switching vector not for the entire switching period, as in the conventional DTC induction motor drive, but only for a part of the switching period (which is defined as the duty ratio, δ) and by using the zero switching vector for the rest of the period. The duty ratio is selected to give a voltage vector whose average over the switching cycle gives the desired torque change, thus resulting in reduced torque ripples(Vas, 1989).

The duty ratio of each switching state is a non-linear function of the electromagnetic torque error and stator flux-linkage error, and it is also a function of the position of the stator flux-linkage space vector. Thus it is difficult to model this non-linear function. However, by using a fuzzy logic based DTC system, it is possible to perform fuzzy logic based duty-ratio control, where the duty ratio is determined during every switching cycle. In such a fuzzy-logic system, there are two inputs, the electromagnetic torque error ete=teref - te and the stator flux linkage position ρs . The output of the fuzzy-logic controller is the duty ratio(δ). The fuzzy-logic duty-ratio estimator is shown in Fig.4. The fuzzy logic controller is a Mamdani-type of controller and contains a rule base. As shown Table II There are 18 simple rules and there are only a minimal number (three) fuzzy sets used for two input variables and also for the three output variables; these are small, medium and large.

 Copyright © International Science and Technology Conference (ISTEC)

Fig. 4. Fuzzy-logic duty-ratio estimator, and membership functions

The hybrid flux estimator uses two models; a stator-voltage-equation-based model and also a rotor-voltage-equation-based model. Such an estimator utilizes the fact that at high speeds, accurate stator flux estimation can be obtained by using the stator voltage equation, but at low speeds accurate stator flux estimation can be obtained by using the rotor voltage equation. it is also possible to improve the estimation of the stator flux linkages with this method (Vas, 1989).

Designing Of The Simulink Model And Simulation Results

Both of control systems are realized in Matlab/Simulink. Fuzzy Logic Duty-Ratio Estimator and Hybrid Flux Observer based direct torque control Simulink schema of induction machine in Matlab/Simulink is shown in the Figure 5. Figure 6 and Figure 7 show us comparing torque, flux loop, and current respectively.

Fig.6 Conventional DTC a)Torque b)Current c)Flux Loop

a) b) c)

Fig.7 Proposed DTC a)Torque b)Current c)Flux Loop

Conclusion

Fuzzy Logic Duty-Ratio Estimator and Hybrid Flux Observer based direct torque control method is compared to conventional direct torque control. The DTC and the Fuzzy Logic Duty-Ratio Estimator and Hybrid Flux Observer based DTC method are simulated and the comparison of their performances is presented. The ripples in electromagnetic torque, stator flux and stator currents reduced by the duty-ratio-controlled DTC.

Abstract: In this study, the torsional stresses of circular hollow shafts manufactured from composite materials were examined at different orientation angles. For circular hollow composite shafts; glass fiber were used as the fiber materials, while epoxy resin was used as the matrix material. 80mm, 200mm and 250mm-long-composite shafts of different inner diameters were used. The hollow composite shafts were manufactured at θ=45°, 60°, 75°, 80°, 88° orientation angles through the filament winding method. The mechanical torsion tests of circular hollow composite shafts were separately repeated for each sample. The obtained results were evaluated among themselves in terms of the length of the shaft, the diameter of the shaft and the orientation angle, after which they were transferred to the graphics.

Keywords: Composite shafts, Filament winding, Orientation angle, Torsion test

Introduction

Apart from the fact that shafts, which are used in every field of technology, are among the most important power transfer elements, they are exposed to tensile, compression, bending and torsional stresses due to their operational characteristics. Since shafts transmit power from one machine element to the other, they become exposed to torsional stress, which is the most hazardous one of all. Since shafts are exposed to bending due to the elements found on the top of them as well as being exposed to torsion due to rotating, the calculations are generally made according to combined stresses, and accordingly, their constructions and designs are performed. However, hollow shafts are usually preferred in the cases in which lightness (weightlessness) is required, which, then, causes weakness in strength/endurance by almost 6%; yet, 25% of lightness is achieved. For this reason, hollow shafts are quite frequently used, particularly in automotive industry and in aviation and space industries. The following studies were found when a topic-related literature review was made. Bert and Kim carried out an analytical solution to compute torsional buckling of composite drive shafts. They calculated the torsional buckling load of composite drive shafts with various lay-ups with good accuracy by considering the effect of off-axis stiffness and flexural moment. Their theory can predict the torsional buckling of composite drive shafts under pure torsion and combined torsion ad bending [1]. Chen and Peng performed numerical simulation using a finite element method to study the stability of composite shafts under combined loading conditions. The predicted the critical axial load of a thin-walled composite drive shaft under rotation [2]. Kim et al. manufactured hybrid shaft which had stainless steel surface and composite core. Carbon/epoxy layers were laid in to the steel tubing. They found that hybrid shaft had less tilting angle and higher natural frequency compared to that of non-hybrid steel shaft [3]. Kim and Lee studied the performance of hexagonal, elliptical lap and adhesively bonded circular joints. Adherents were carbon fiber epoxy and steel shafts. Among three joints investigated, hexagonal joint was the best fo torque transmission. The double lap joint performed better than single lap joint. Hexagonal single lap joint and circular double lap joint performed almost the same [4]. Kim et al. conducted both experimental and numerical study to predict behaviour of the adhesive-bonded composite shaft. Carbon and glass composite tubes are joined together using adhasive bonding. Various length of bonding has been investigated. It was reported that the bonding length of 16 mm and larger was enough for 3500 Nm toque capacity. The yoke thickness, diameter of shaft, and adhesive thickness were 4,8 mm, 90 mm and 0,2 mm, respectively [5]. Hahn and Erikson, used pin and glue together to transfer load between thin-walled torsion test specimen. Studies regarding torsional behaviour of composite tubes are very limited. They studies usually report the result of few isolated torsional test. However meaningful conclusions can only be drawn by conducting adequate number of tests. Hence easy gripping methods needed for the torsion tests of composite tubes [6]. Soden et al. performed a number of experiments to determine the failure and strength of

www.iste-c.net Copyright © International Science and Technology Conference (ISTEC)

E-glass/epoxy tubes with various winding angles of the fibres. They obtain theoretical failure envelopes by using lamination theory and netting analysis, and predicted the initial and ultimate failure loads satisfactorily [7]. Mistry et al. investigated the effect of the winding angle on the strength of GRP pipes using finite element analysis, and predicted first ply failure loads and an optimal angle close to 80°, instead of 55°, as reported by netting analysis elsewhere for internal pressure loading [8,9]. Caroll et al. presented the rate-dependent behaviour of ±55 filament wound glass/epoxy tubes under biaxial loading [10]. Swanson et al. studied the failure of hand layed uo quasi-isotropic carbon/epoxy laminates subjected to biaxial stress. They suggested a maximum fiber strain failure criterion, a progressive failure model that incorporates ply stiffness changes and a nonlinear model for the matrix shear response. Failure tests, involving torsional shear combined with axial tension or compression of unidirectional hoop wound cylinders, were also carried out to examine matrix failure under multiaxial stress conditions [11, 12]. Fujii et al. investigated the strength and nonlinear stress/strain response of plain woven glass fiber laminates, fabricated using the wet winding technique, under biaxial loading, and also estimated the strength using the Tsai-Wu and Tsai-Hill criterion and 2nd Piola-Kirchhoff stress [13, 14]. Ferry et al. studied the fatigue damage of both bending and torsion loading on unidirectional glass-fibre/epoxy composite bars, observing that damage processes occurred throuhgh the fibre failure, delamination and matrix cracking. These authors concluded that damaging occurred by several complex processes, depending on both the ratio between bending and torsion stresses and the ratio between minimum and maximum stresses [15].

Materials and Methods

Within the scope of this study, glass (600 gr/m2) was used as the fiber material, whereas epoxy was used as the matrix material. Dimensionally; composite shafts of 80mm, 200mm and 250mm in size, with Do=17mm-outer diameter and Di=12mm and 13mm-inner diameters were used.

I.Manufacturing method

In this study, the method referred to as the filament winding method in the literature, which is the most commonly-used one, was applied as the manufacturing method (Fig. 1). The glass fibers were wound over the rollers in the form of three layers at the orientation angles, θ=45°, 60°, 75°, 80°, and 88°. The manufactured circular hollow composite shafts were designed in given lengths according to ASTM standards and were made available for torsion tests, again, in accordance with ASTM standards (Fig. 2).

Figure1: Filament winding machine

Figure2: A test specimens of glass/epoxy

Experimental Studies

The circular hollow circular composite shafts manufactured from 80mm, 200mm and 250mm-long glass/epoxy material with Di =12mm and Di =13mm inner diameters, which consisted of three layers, were subjected to torsion tests separately. The torsion tests were performed at room temperature through the location-type Shimadzu AG-X universal device with 250 kN load cell

Results and discussions

A. Effects of orientation angles on torsion stress

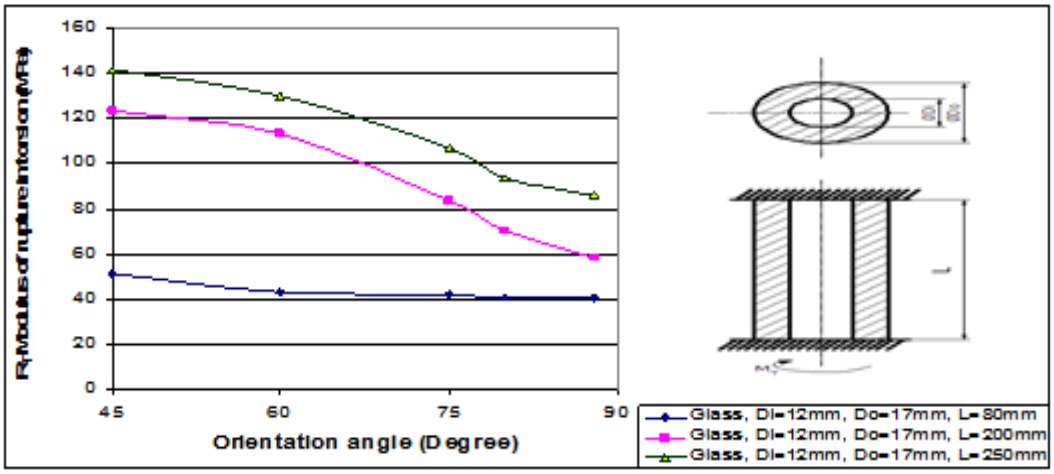

Figure 3: Torsion stress- orientation angle and length curve of glass for torsion stress

The values of modulus of rupture in torsion of hollow circular glass/epoxy composite shafts were analyzed according to the orientation angle. Accordingly;

As will be seen in the graphics; it was observed that as the orientation angle of the fiber increased, the values of the modulus of rupture in torsion of glass/epoxy composite shafts decreased (Fig. 3).

It was seen that the modulus of rupture in torsion had reached the maximum value when it was at 45° orientation angle (Fig. 3). Separately, since the number of translocations among the fibers will increase once the orientation angle is extended, the values of modulus of rupture in torsion diminishes, as well

B. Effects of wall-thickness on torsion stress

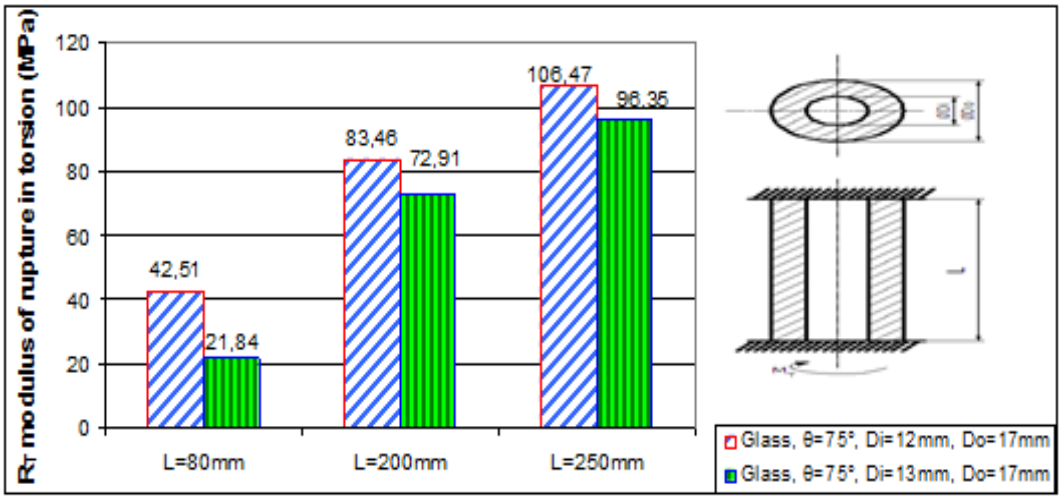

Figure 4: Effects of wall-thickness for glass on torsion stress

The values of modulus of rupture in torsion of hollow circular glass/epoxy composite shafts were analyzed according to the wall-thickness. Accordingly;

www.iste-c.net Copyright © International Science and Technology Conference (ISTEC)

It was seen that the values of modulus of rupture in torsion of the circular hollow glass/epoxy composite shafts with the inner diameter Di=12mm, and at θ=75° orientation angle, which were in different lengths, were higher than the values of modulus of rupture in torsion pertaining to those with the inner diameter Di=13mm (Fig. 4).

It was ascertained that the values of modulus of rupture in torsion of the hollow circular composite shafts had also increased as the wall thickness increased (Fig. 4). The reason for this is that the endurance/resistance values drop down because the rate between the outer and inner diameters declines, in other words, because the wall thickness diminishes.

Therefore, it can also be seen in the graphics that the wall thickness in the hollow circular composite shafts, as it diminishes, will pose a risk in terms of all the stresses. The shear stresses in all the loaded (non-hollow) circular composite shafts increase in a linear way, from the center of the shafts towards their surface. In other words, the shear stresses take 'zero' value at the center of the shafts but reach the maximum value while they move towards the outer surface. However, the minimum shear stress in the circular hollow composite shafts reaches the maximum value, starting from the inner diameter value towards the outer diameter.

C. Effects of lengths of reinforcement material on torsion stress

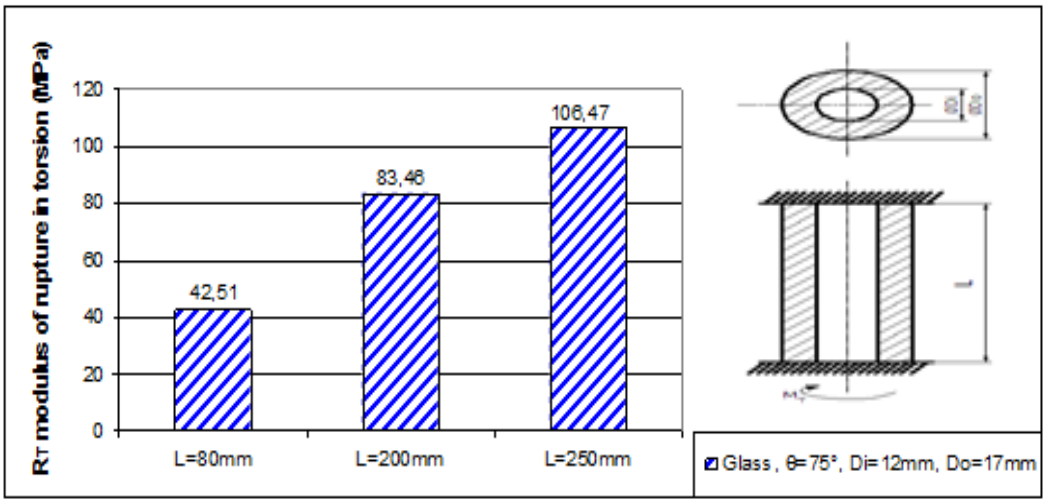

Figure 5: Effects of length of specimens for glass on torsion stress

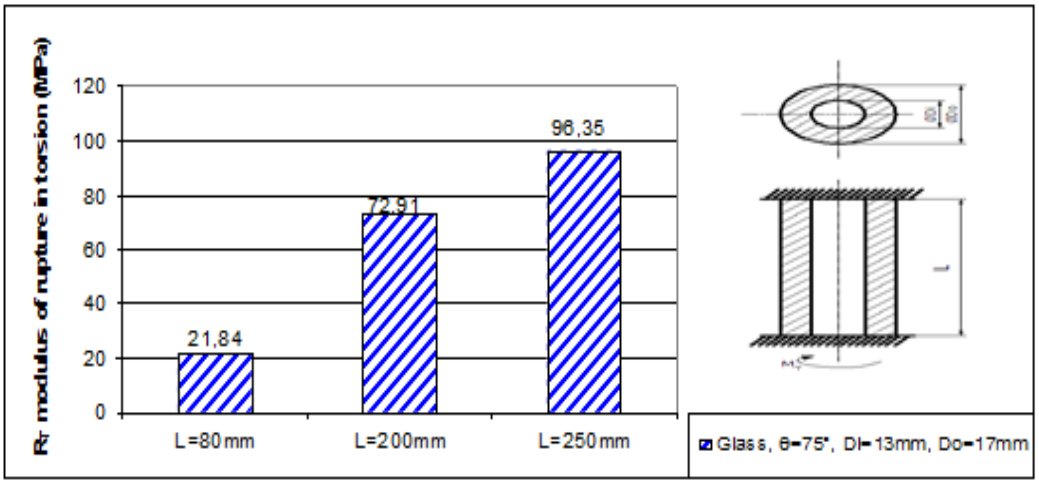

Figure 6: Effects of length of specimens for glass on torsion stress

The values of modulus of rupture in torsion of hollow circular glass/epoxy composite shafts were analyzed according to the lengths of the reinforcement materials. Accordingly;

www.iste-c.net Copyright © International Science and Technology Conference (ISTEC) 1371

It was seen that as the lengths of glass/epoxy hollow circular composite shafts increased, the values of modulus of rupture in torsion also increased (Fig. 5, 6). As the lengths of the hollow circular composite shafts increase, the degree of the rotational angle increases, as well. Hence, the endurance/resistance values increase as the shaft length increases.

It was observed that the glass/epoxy composite shaft of L=250mm-length, at θ=75° orientation angle, and with Di=12mm-inner diameter had reached the highest values of modulus of rupture in torsion (Fig. 5).

when the lengths of the hollow circular composite shafts were increased the values of modulus of rupture in torsion also increased. The reason for this is the fact that the torsion angle is in direct proportion to length.

Conclusions

In this study, the torsional stresses of hollow circular shafts manufactured from glass/epoxy composite materials were examined at different orientation angles. Composite shafts of different lengths and different inner diameters were used. The hollow composite shafts were manufactured by being wound on the rollers at θ=45°, 60°, 75°, 80°, 88° orientation angles through the use of the filament winding method. Each hollow circular composite shaft that was manufactured was subjected to torsion tests. The significant results were obtained from the torsion tests that mentioned below.

The torsional stress values drop down due to the fact that the number of translocations among the fibers will increase as the orientation angle extends. It was seen that the modulus of rupture in torsion of the glass/epoxy composite shafts has reached the maximum value at 45° orientation angle.

It was determined that as the orientation angle of the fiber extended, the modulus of rupture in torsion of glass/epoxy composite shafts declined.

when the lengths of the hollow circular glass/epoxy composite shafts were increased the values of modulus of rupture in torsion also increased. The reason for this is the fact that the torsion angle is in direct proportion to length.

It was determined that the modulus of rupture in torsion of the glass/epoxy hollow circular composite shafts had increased as the wall thickness increased.

The shear stresses in hollow circular glass/epoxy composite shafts increase in a linear way, starting from the inner diameter of the shafts towards the outer surface of the shaft; in other words, the shear stresses take ‘zero’ value at the center of the shafts but reach the maximum value as they move towards the outer surface.

Özet: Bu çalışmada, toz metalürjisi ve sıcak ekstrüzyon prosesleri kullanılarak üretilen T/^ısıl işlemli AA7075-SiC metal matrisli kompozitlerin, aşınma ve korozyon dayanımı incelendi. Bu amaçla; AA7075 alüminyum alaşım tozlarına farklı boyut ve oranlarda SiC partikül (SiC$_p$) ilave edilerek elde edilen toz karışımları Ø35x30 mm boyutlarında preslendi. Preslenmiş kompaktlar 480 °C'de, 12 mm çaplı çubuklar halinde ekstrüze edildi. T73 yaşlandırma prosesi, çözeltiye alınıp ardından su verilen numunelere iki kademeli aşırı yaşlandırma işlemi şeklinde uygulandı. Kompozitlerin mekanik özellikleri sertlik ve adhesif aşınma testleri ile belirlenirken, korozyon dayanımları farklı sürelerde uygulanan EXCO korozyon testleri ile tespit edildi. Deneysel sonuçlar, SiC$_p$ içeriğinin artmasına bağlı olarak kompozitin sertlik ve aşınma direncinin de arttığını gösterdi. SiC partikül ilavesi AA7075 alaşımının korozyon dayanımını arttırırken, artan partikül boyutu ile birlikte kompozitin korozyon dayanımı düşmüştür.
Anahtar Kelimeler: AA7075; Kompozit; Ekstrüzyon; Aşınma; Korozyon

EFFECT OF T73 HEAT TREATMENT ON WEAR AND CORROSION RESISTANCE OF AA7075-SiC$_p$ COMPOSITES PRODUCED BY HOT EXTRUSION AND POWDER METALLURGY PROCESSES

Abstract: In this study, wear and corrosıon resistance of T73 heat treated AA7075-SiC$_p$ composıtes produced by hot extrusıon and powder metallurgy processes were investigated. For this purpose, various size (8, 32 and 82 µm) and ratio (wt.%10 and %15) of SiC particle were added into AA7075 aluminum alloy powders, then Ø34x30 cylindrical blocks are produced by pressing. The pressed compacts were extruded at 480 °C as 12 mm dia round bars. Then, T73 overaging treatment was performed in two stages. Mechanical properties of AA7075 alloy and composites samples were determined by microhardness and adhesive wear tests. Corrosion resistance of samples were determined by EXCO corrosion test in different periods. Resuts show that that the hardness and wear resistance of composites increased with SiC$_p$ addition. EXCO corrosion tests show that corrosion resistance of AA7075 alloy increased with SiC$_p$ addition and, corrosion resistance of composites decreased with increasing SiC particle size.
Keywords: AA7075; Composite; Extrusion; Wear; Corrosion

Giriş

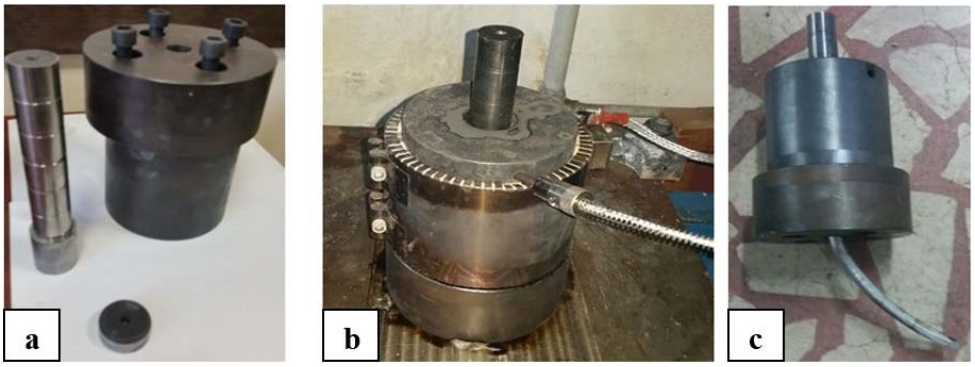
Alüminyum alaşımlarından 7xxx serisi, genellikle düşük yoğunluk, yüksek dayanım, süneklik, tokluk ve yorulmaya karşı direncinden dolayı yapısal uygulamalarda, uzay ve havacılık sanayinde yaygın olarak kullanılan malzemedir (Güleryüz, 2011). 7075 alüminyum alaşımları Al-Zn-Mg-Cu ihtiva etmesi sebebiyle farklı ısıl işlemlere maruz bırakılarak mekanik özellikleri iyileştirilerek ticari olarak kullanıma sunulmuştur. Bu ısıl işlemlerin başında T6 ısıl işlemi gelmektedir. 7XXX serisi aluminyum alaşımları, yüksek sertlik ve mukavemet sağlayan T6 temper durumunda korozyona karşı oldukça duyarlı olduğundan, geçmiş yıllarda bu alaşımların korozyon direncini iyileştirmek amacıyla, T73 olarak bilinen aşırı yaşlandırma işlemi geliştirilmiştir (Baydoğan, 2004).

Sahip oldukları yüksek tokluk ve dayanımları nedeniyle son yıllarda alüminyum esaslı kompozitlere olan ilgi oldukça artmıştır (Sun et al., 2013). Al-Zn-Mg-Cu alaşımları sahip oldukları yüksek sertlik ve kırılma tokluğu (Jin et al., 2013), düşük yoğunluk (Ronki et al, 2011, Yang et al, 2013), iyi işlenebilirlik, kaynaklanabilirlik ve stress korozyon çatlak direnci (Ronki et al., 2011) gibi özelliklerin süper kombinasyonuna sahip olup havacılık ve otomotiv endüstrisinde tercih edilen malzemelerdir (MacAskill et al, 2009, Taleghani et al, 2014, Rendigs et al, 1997, Williams et al, 2003). Alüminyum esaslı kompozitler toz metalürjisi prosesleri ile üretilebilmekte ve sıcak

 Copyright © International Science and Technology Conference (ISTEC)

ekstrüzyonla şekillendirilebilmektedir. Toz metalurjisi farklı özelliklere sahip malzemelerin çeşitli oranlarda karıştırılmasını ve malzeme özelliklerini kontrol etmeyi nispeten daha kolay hale getirmiştir (Sun et al., 2013).

Bu çalışmada, SiC partikül takviyeli AA7075 metal matrisli kompozitlerin aşınma özelliklerine partikül boyut ve miktarının etkisi incelendi. Bu amaçla, AA7075 alüminyum alaşım tozlarına farklı boyut ve oranlarda SiCp ilave edilerek elde edilen toz karışımları silindirik bloklar halinde preslendi. Preslenen toz kompaktlar sıcak ekstrüze edildi. T73 ısıl işlemi uygulanan çubuklara sertlik ve aşınma testleri uygulanarak sertlik, aşınma ve korozyon dayanımları karşılaştırıldı.



Deneysel Çalışma

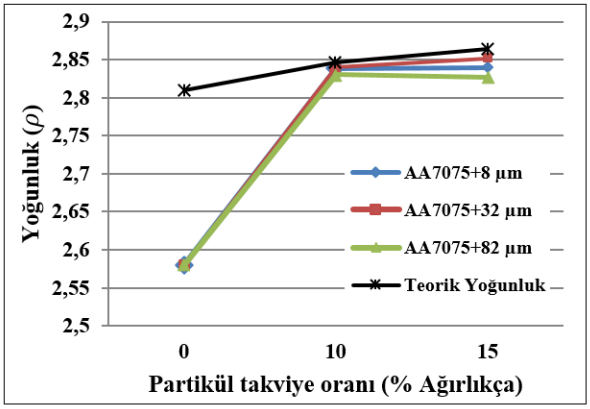
Kompozit üretiminde matris malzemesi olarak 200 mesh altı (<74 µm) partikül boyutuna sahip ve kimyasal kompozisyonu Tablo 1'de verilen AA7075 alaşım tozları kullanıldı. Takviye elemanı olarak ortalama partikül boyutu 8, 32 ve 82 µm olan SiCp kullanıldı. Kompozit numuneleri elde etmek amacıyla AA7075 alaşım tozlarına ağırlıkça %10 ve %15 SiCp ilave edildi. Homojen bir karışım elde etmek amacıyla tozlar üç eksenli karıştırıcıda (Turbula T2F) 45 dakika süreyle karıştırıldı.

Tablo 1. AA7075 alaşımının kimyasal bileşimi

Elementler	Al	Zn	Mg	Si	Cu	Cr	Mn	Fe	Zr	Na	P	S	Cl	K
% Ağırlık	Kalan	4,78	1,84	0,24	1,45	0,25	0,26	0,23	0,023	0,32	0,03	0,04	0,28	0,05

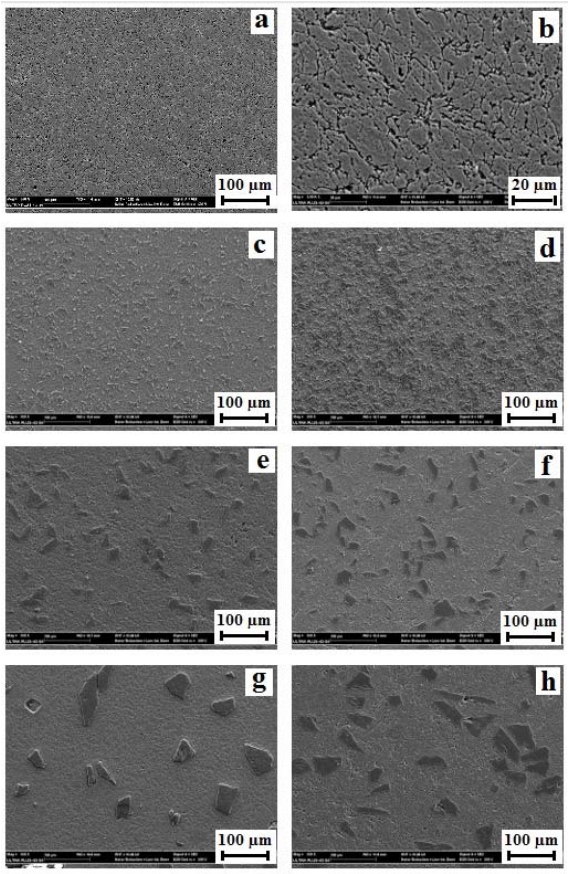
AA7075 alaşım ve SiC_p takviyeli tozların 350 MPa basınç altında tek eksenli olarak preslenmesi ile toz metal kompaktlar elde edildi. 35 mm çapında ve yaklaşık 30 mm yüksekliğindeki soğuk preslenmiş kompaktlar kalıp içerisinden çıkarılmadan Şekil 1'de görülen ekstrüzyon kalıp düzeneği ile 480°C'ye ısıtılıp 1 saat bekletildikten sonra 12 mm çaplı çubuklar halinde ekstrüze edildi (Şekil 1-c). Ekstrüzyon işleminde malzemenin akışını kolaylaştırmak ve daha iyi yüzey kalitesi elde etmek amacıyla kalıp yüzeyleri yüksek sıcaklık dayanımlı kalıp ayırıcı gres yağı ile yağlandı. Ekstrüzyon işleminden sonra AA7075 alaşım ve kompozit çubuklar kesilerek aşınma ve korozyon testleri için numuneler elde edildi.

Şekil 1. Ekstrüzyon kalıbı a) Kalıp parçaları b) Kalıba ısıtıcının bağlanması c) Ekstrüzyon



AA7075 alaşım ve kompozit malzemelerin mekanik özelliklerinin yanı sıra korozyon dayanımlarını iyileştirmek amacıyla standart T73 ısıl işlemi uygulandı. T73 ısıl işlemi, 480 °C'de 2 saat bekletilerek çözeltiye alınan numunelere su verme ve ardından önce 110 °C'de 8 saat ardından 175 °C'de 8 saat olmak üzere iki aşamada gerçekleştirildi.

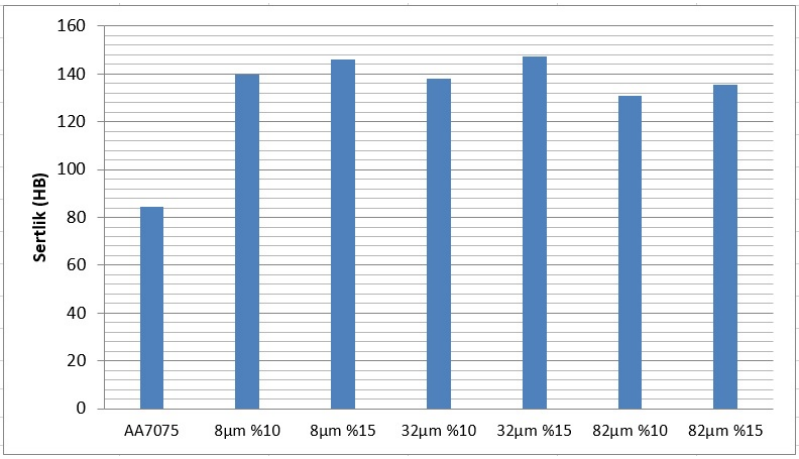
AA7075 alaşım ve kompozit numunelerin yoğunlukları Redwag AS 220 R2 marka model hassas terazi ve yoğunluk kiti kullanılarak arşimed prensibine göre ölçüldü. Sertlik değerleri Brinell sertlik olarak HBW 2.5x31,25 standardında ve QNESS Q250M makro sertlik ölçüm cihazı kullanılarak tespit edildi. Aşınma deneyleri standart pin-on-disk tipi aşınma cihazı kullanılarak 40 N yük altında, 1000 metre mesafede ve 1 m/s'lik kayma hızında gerçekleştirildi. Aşınma testinde, AISI 52100 çeliğinden imal edilmiş 58-60 HRc sertliğine sahip aşındırıcı disk kullanıldı. Numunelerin aşınma miktarları deney öncesi ve deney sonrası 10^{-4} g hassasiyetinde yapılan ağırlık ölçümleri ile tespit edildi. Mikro yapı ve aşınma yüzeyleri Carl Zeiss Ultra Plus Gemini Fesem tarama elektron mikroskobu (SEM) kullanılarak incelendi. Numunelerin korozyon dayanımını belirlemek amacıyla AA7075 alaşımları için ASTM G34-79 standardında kimyasal bileşimi verilen (234 g/l Sodyum klorür, 50 g/l Potasyum nitrat ve 6,3 ml/l Nitrik asit) EXCO çözeltisine 4, 8 ve 16 saatlik periyotlarda daldırılan numunelerde meydana gelen ağırlık kayıpları ile malzemelerin korozyon dayanımları belirlendi.



Sonuçlar ve Tartışma

 Copyright © International Science and Technology Conference (ISTEC)

Ekstrüze edilen AA7075 alaşım ve kompozit numunelerin yoğunluk değerleri Şekil 2'de verilmiştir. Teorik yoğunluk olarak ifade edilen tam yoğunluk değer grafiği ile karşılaştırıldığında AA7075 alaşım numunelerin yoğunluk değerleri oldukça düşükken (≈ 2,6 g/cm^3), %10'luk partikül ilavesi ile birlikte tam yoğunluk değerlerine yakın sonuçlar elde edilmiştir. Partikül takviye oranı %15 olduğunda yoğunluk değerlerinde azda olsa bir düşüş meydana gelmiştir. Elde edilen sonuçlar alaşım numunelerin gözenek oranının kompozit numunelere göre daha yüksek değerlerde elde olduğunu ortaya koymaktadır. Şekil 3'te verilen mikroyapı görüntüleri de bu sonucu doğrulayacak niteliktedir. AA7075 alaşım numunelerin SEM görüntülerinde (Şekil 3-a,b) küçük ve büyük boyutlu gözenekler belirgin bir şekilde görülürken, kompozit numunelerde gözeneklerde belirgin bir azalma gözlenmiştir. Ayrıca kompozit numunelerde partiküller homojen bir dağılım göstermiştir.



Şekil 2. AA7075 alaşım ve kompozit numunelerin yoğunlukları

Şekil 3. AA7075 alaşım ve kompozit numunelerin mikroyapısı
a-b) AA7075 alaşımı, c-d) 8µm %10-15, e-f) 32µm %10-15, g-h) 82 µm %10-15

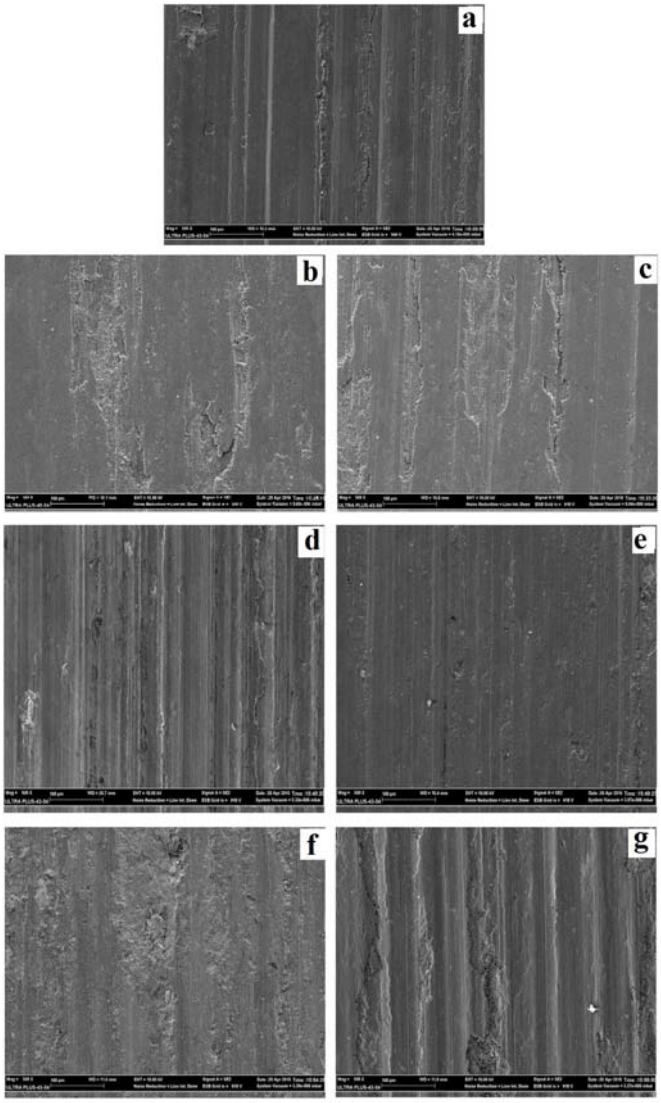
Şekil 4'te alaşım ve kompozit numunelerin sertlik değerleri grafik olarak verilmiştir. Alaşım ve kompozit numunelerin sertlik değerleri karşılaştırıldığında SiC_p miktarının artışına bağlı olarak kompozitlerin sertliğinde de artış meydana gelmiştir. Bu durumu Kang et al. karışımlar kanunu ile açıklamaktadır [12]. Kanuna göre matris yapıya göre daha sert olan partiküllerin miktarı arttıkça kompozitinde sertliği artmaktadır. Ayrıca Şekil 4'de göre 8 ve 32 µm boyutlu partikül takviyeli kompozitlerde sertlik değerleri birbirine yakın değerlerdeyken, 82 µm partikül takviyeli kompozitlerde sertlikte bir miktar azalma meydana gelmiştir. Bu durumu El-Kady et al. iki şekilde açıklamaktadır. Birincisi sertliğin yumuşak ve sert ara yüzey arasındaki daha büyük ara yüzey alanına bağlı olduğu. İkincisi ise, iri taneli sert parçacıklar ile matris ara yüzeyindeki kusurlar yük altında kolaylıkla kırıldığından sertlik değerlerinde azalma meydana gelmektedir [11]. AA7075 alaşım numunelerde ise sertliğin oldukça düşük değerlerde elde edilmesinde gözenekli yapının da etkisi vardır.

Şekil 4. T73 ısıl işlemli AA7075 alaşım ve kompozit numunelerin sertliği

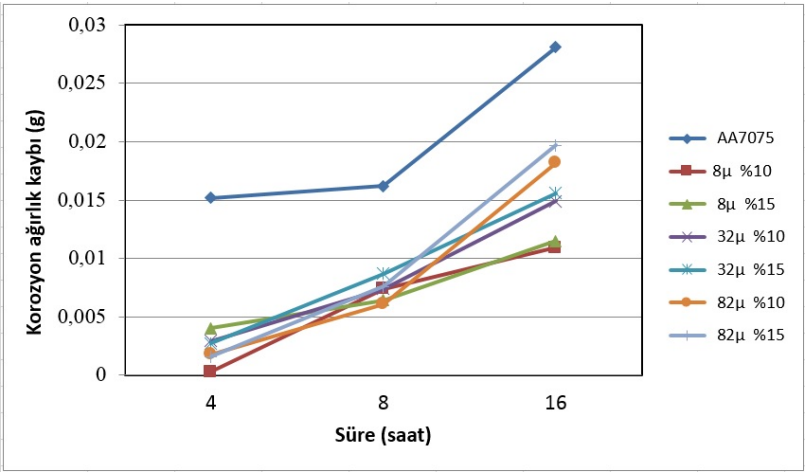
Aşınma testleri sonucu meydana gelen ortalama aşınma miktarları Şekil 5'te verilmiştir.



Şekil 5. T73 ısıl işlemli AA7075 alaşım ve kompozit numunelerde aşınmaya bağlı ağırlık kaybı grafiği

Grafik incelendiğinde en yüksek aşınma kaybı AA7075 alaşım numunelerde meydana gelirken, partikül boyut ve oranlarının artışına bağlı olarak aşınma kayıplarında kayda değer azalma meydana gelmiştir. Aşınma sonuçları yapıya eklenen partiküllerin aşınma direncini arttırdığını göstermektedir. Matris yapıya ilave edilen partiküllerin neden olduğu sertlik artışı, kompozitin aşınma direncinde de artışa neden olmaktadır. Aşınma numunelerindeki ağırlık kaybı, SiC_p miktar ve boyut artışına bağlı olarak azalma göstermektedir. Seramik partiküllerle matris yapı arasındaki zayıf kimyasal bağın yanı sıra partikül boyutunun küçülmesine bağlı olarak azalan temas yüzey alanı, matrisle partikül arasındaki mekanik bağ kuvvetini de zayıflatmaktadır. Azalan mekanik bağ kuvveti, partiküllerin matris yapıdan kolayca ayrılarak aşınma miktarının artmasına neden olmaktadır. Aşınma yüzeylerine ait SEM görüntüleri Şekil 6'da verilmiştir. Aşınma yüzeyleri incelendiğinde AA7075 alaşım numunelerde daha düzgün ve

 Copyright © International Science and Technology Conference (ISTEC)



oluk şeklinde aşınma yüzeyi gözlenirken, MMK numunelerde adhesif aşınmanın yanı sıra yapıya ilave edilen partiküllerin neden olduğu abrasif aşınma mekanizmalarının da meydana geldiği görülmektedir.

Şekil 6. AA7075 alaşım ve kompozit numunelerin aşınma yüzeyleri
a) AA7075 alaşımı, b-c) 8µm %10-15, d-e) 32µm %10-15, f-g) 82 µm %10-15

EXCO çözeltisi ile 4, 8 ve 16 saatlik periyotlarda yapılan korozyon testleri sonrası alaşım ve kompozit numunelerde meydana gelen ağırlık kayıpları Şekil 7'de görülmektedir. Genel olarak korozyon sonucu meydana gelen malzeme kaybı korozyon test süresinin artışına bağlı olarak artarken, en yüksek korozyon kaybı alaşım numunelerde meydana gelmiştir. Kompozit numunelerle karşılaştırıldığında alaşım numunelerdeki korozyon kaybındaki artış numunelerin sahip olduğu gözenekli yapı ile açıklanabilir. Gözenekli yapı korozyona uğrayan yüzey alanını arttırmanın yanı sıra korozyon çözeltisinin malzemeye daha kolay nüfuz etmesini sağlamaktadır. Kompozit numunelerdeki korozyon kayıpları değerlendirildiğinde, 16 saatlik korozyon testi sonrası en düşük korozyon kaybı 8 mikron partikül takviyeli numunelerde meydana gelirken en yüksek korozyon kaybı 82 mikron partikül takviyeli numunelerde meydana gelmiştir. Alaşım numunelerde olduğu gibi kompozit numunelerdeki korozyon kaybındaki artış komzpozitteki gözenek miktarının artışı ile açıklanabilir. Kompozit numunelerdeki gözenek miktarı artan partikül boyutu ve miktarı ile artmaktadır. Gözenek miktarındaki bu artış korozyon miktarında da bir artış meydana getirmektedir. Kompozit numunelerde korozyon kayıplarındaki azalmanın bir diğer nedeni ise yapıya eklenen partiküllerin korozyona uğrayan AA7075 alaşımı ile korozyon çözeltisinin temas yüzey alanını azaltmasıdır. Artan yüzey alanı korozyona maruz kalan yüzey alanını arttıracak dolayısıyla da korozyon sonucu meydana gelen ağırlık kaybı da artacaktır.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 7. T73 ısıl işlemli AA7075 alaşım ve kompozit numunelerde korozyon kaybı

Sonuçlar

AA7075 alaşım tozlarına farklı boyut ve oranlarda SiC_p ilavesi ile elde edilen toz karışımlarının soğuk preslenmesi ve sıcak ekstrüzyonu ile AA7075-SiC_p kompozitler başarı ile üretilmiştir. AA7075 alaşım numunelerde yaklaşık 2,6 g/cm^3 yoğunluğa ulaşılırken, partikül takviyeli kompozitlerde yoğunluk oranı 2.8 g/cm^3'ün üzerine çıkmaktadır. Matris yapıya ilave edilen SiC_p ilavesinin artışına bağlı olarak kompozitin sertlik ve aşınma direncinde artış meydana gelmiştir. SiC partikül ilavesi AA7075 alaşımının korozyon dayanımını arttırırken, artan partikül boyutu ile birlikte kompozitin korozyon dayanımı düşmektedir.

TREATABILITY OF FOOD INDUSTRY WASTEWATER BY $O_3/UV/H_2O_2$ ADVANCED OXIDATION PROCESSES

Eylem Topkaya, Ayla Arslan, Bilge Özbay, İsmail Özbay, Sevil Veli

Department of Environmental Engineering, Kocaeli University, 41380, Kocaeli, Turkey.

Abstract

In this study, treatability of wastewater from manufacturing of potato chips was examined by $O_3/UV/H_2O_2$ process which is among advanced oxidation processes. Chemical oxygen demand (COD) and absorbance parameters were evaluated to determine the efficiency of the process. All experiments were performed at a constant room temperature (20 ± 2 ° C) with 1 L sample of wastewater. As UV light source, 2 x 2.2 W low-pressure mercury lamps were used. The effects of O_3 concentration (0-20 ppm), pH (3-11), H_2O_2 concentration (0 to 45 mM) and time (10-90 min) were investigated in ozone oxidation studies. In the experimental study, the highest COD removal efficiency was 92%, at the experimental conditions of pH 5, 15 ppm O_3 concentration, 11.25 mM H_2O_2 concentration and 70 minutes. The highest removal efficiency of absorbance was found as 91% at the experimental conditions of pH 9, 5 ppm O_3 concentration, 11.25 mM H_2O_2 concentration and 70 minutes. In the experimental conditions of pH 5, O_3 concentration at 5 ppm, H_2O_2 concentration at 11.25 mM and 70 minutes reaction time, removals of COD and absorbance were achieved as 79% and 90% respectively. Also removal of color and odor has been clearly observed at the end of the experiments conducted by $O_3/UV/H_2O_2$ process.

1. Introduction

Among other agricultural products, potato is a widely used raw material for food industry. There are a lot of types of processed potatoes like potato chips, frozen french fries, dehydrated diced potatoes, dehydrated mashed potatoes, potato flakes, potato starch, potato flour, tinned white potatoes and pre-peeled potatoes (Hung et al., 2006; Ersahin et al., 2011). The stages of potato chips processes are; receiving raw materials, storage of the raw materials, extracting the stone, bark peeling, selecting and cutting, slicing, washing, frying, salting, extracting defect, coating and packaging (Dalzell, 1994). During manufacturing of potato chips, slices and shredded potatoes especially major processing steps are washing, peeling and blanching operations uses big volumes of water (Malladi and Ingham, 1993).

Potato chips process wastewater is considered as having high pollution load due to its content like high concentrations of carbohydrates, starches and proteins which are responsible for high suspended solids, chemical oxygen demand and biochemical oxygen demand (Malladi and Ingham, 1993; Hadjivassilis et al., 1997; El-Gohary et al., 1999). Therefore, this wastewater might be only discharged into the municipal sewage system after reducing its pollutant amounts to discharge limit (Kobya et al., 2006). Potato chips process wastewater has significant ratio of readily biodegradable organic matter content and thus biological treatment processes are applicable for this wastewater (Dalzell, 1994).

Several types of biological treatment, electrocoagulation and biogas processes have been investigated for treatment of potato chips process wastewater. These include the use of two stage biological treatment (Özturk et al., 2003), anaerobic and aerobic treatment (Zoutberg and Eker, 1999; Senturk et al., 2010; Austermann-Haun and Seyfried, 1992), electrocoagulation (Kobya et al., 2006), biogas production (Barampouti et al., 2005), products recovery (Catarino et al., 2007), optimization of a biological process (Mishra et al., 2004) and biogas and energy recovery (Musluoglu, 2010).

In recent years, new process methods have been explored for efficient treatment of various industrial wastewaters with low operating costs. Advanced Oxidation Processes (AOPs) are among these new methods. AOPs including ozone-based homogeneous processes, for instance O_3, O_3/UV and $O_3/UV/H_2O_2$ are used as effective alternatives. The ozone has recently occurred as a treatment technology for the removal of contaminants in water degradation by hydroxyl radical (OH•) that is used as an oxidant in the AOPs (Hoigné

 Copyright © International Science and Technology Conference (ISTEC)

1998; Andreozzi et al., 1999). Ozone, which is having high selectivity and reactivity for organic compounds, is a strong oxidizer (Litter, 2005). Among AOPs, ozonation and ozonation in combination have been shown to be effective in the treatment of wastewater such as the olive mill wastewaters (Benitez et al., 1999), the winery wastewater (Lucas et al., 2010), the cork manufacturing industry (Benitez et al., 2003; Lan et al., 2008), pretreatment of hospital wastewater (Arslan et al.,2014), effluent organic matter (Audenaert et al., 2013), pharmaceutical (Im et al., 2012; Vogna et al., 2004), surfactant (Rivera-Utrilla et al., 2006), linear alkyl benzene (LAB) industrial wastewater (Zangeneh et al., 2014).

In this work, the effectiveness of $O_3/UV/H_2O_2$ process was investigated for the treatment of potato chips process wastewater. The effects of initial pH, hydrogen peroxide amount, ozone concentration and reaction time were examined. The effect of process on the reduction of chemical oxygen demand (COD) and absorbance were evaluated.

2. Materials and methods

2.1. Materials

The wastewater used for this study was supplied from a wastewater treatment plant of potato chips process facility. Wastewater samples were taken from the outlet of the anaerobic treatment. COD, pH, conductivity, temperature, color, absorbance, total suspended solids (TSS), nitrite, nitrate, ammonia, sulphate and chloride parameters were analyzed for wastewater characterization studies as shown in Table 1. All analyses were performed according to the Standard Methods (APHA, 2005).

2.2. Ozonation System

The experimental set-up for ozone treatment system consisted of ozone generator, ozone monitor and reaction tank in Figure 1 (Arslan et al., 2014). The reaction tank had UV lamps in it and UV light source 2 x 2.2 W low-pressure mercury lamps were used. The ozonation experiments were conducted in a batch reactor (made of Pyrex

 Copyright © International Science and Technology Conference (ISTEC)

glass) with a volume of 2L. The ozone, which is required for the reaction, is produced by ozone generator using oxygen in the air. Ozone is fed into the reactor by means of a diffuser which is located in the reactor bottom. At the beginning of the reaction, 1L potato chips process wastewater was added into the reactor and then $O_3/UV/H_2O_2$ experiments were performed with the addition of H_2O_2 prior to ozonation. Hydrogen peroxide (Merck, 30% w/w) was used as an oxidant. Liquid samples were periodically taken from the reactor to determine the absorbance and COD removal efficiency of the wastewater.

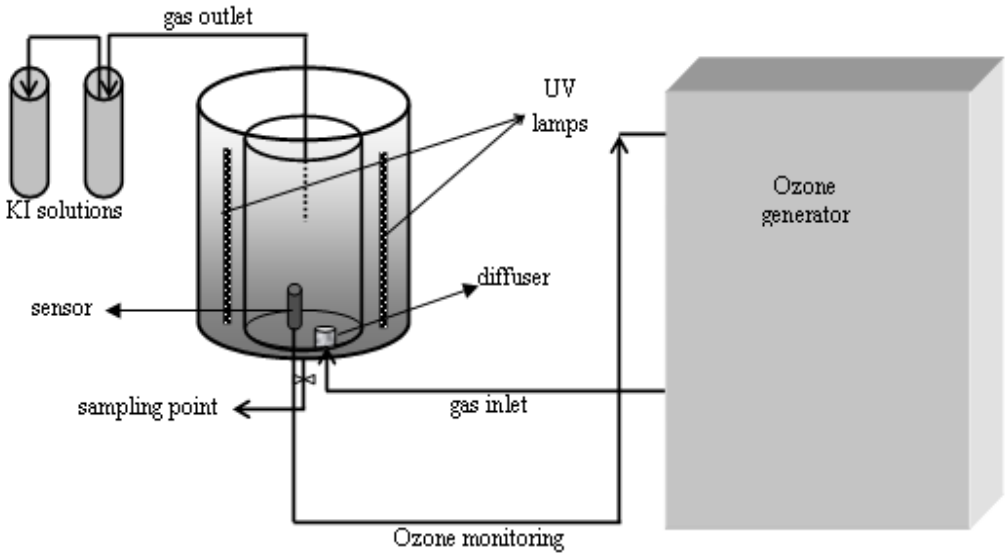

Figure 1. Experimental set up of ozonation system

2.3. Principal of $O_3/UV/H_2O_2$ process

Photooxidation and mineralization of organic pollutants occur by hydroxyl radicals in $O_3/UV/H_2O_2$ processes. H_2O_2 initiates decomposition of the ozone with electron transfer under the UV irradiation and OH• radicals are produced at the end of this reaction (Huang et al.,1993; Zayas et al., 2007). The following reactions are performed in this process (Domenech et al., 2001):

$$O_3 + H_2O_2 \rightarrow \cdot OH + O_2 + HO_2\cdot \quad \text{(very slowly)} \qquad (1)$$

$$H_2O_2 \rightarrow HO_2^- + H^+ \qquad (2)$$

$$HO_2\cdot \rightarrow \cdot O_2^- + H^+ \qquad (3)$$

$$HO_2^- + O_3 \rightarrow O_3^- + HO_2\cdot \qquad (4)$$

$$\cdot O_2^- + O_3 \rightarrow O_3^- + O_2 \qquad (5)$$

$$O_3^- + H^+ \rightarrow HO_3 \qquad (6)$$

$$HO_3 \rightarrow \cdot OH + O_2 \qquad (7)$$

$$O_3 + \cdot OH \rightarrow O_2 + HO_2\cdot \qquad (8)$$

$$O_3 + HO_2\cdot \rightarrow 2O_2 + \cdot OH \qquad (9)$$

The reactions of organic contaminants occurring by ozone, increase the rate of oxidative cleavage together with the effect of OH• radicals formed by the addition of hydrogen peroxide. $O_3/UV/H_2O_2$ process accelerates the formation as photochemical of OH• radicals. This process is used in the treatment of industrial wastewater (Legrini et al., 1993).

2.4. Analysis

Concentration of COD was measured by using the chemical oxygen demand analysis, according to the standard methods for the examination of water and wastewater (APHA 2005). In the experimental study, a spectrophotometer (HACH-LANGE Dr 5000) was used to determine the absorbance and a digital pH-meter (HACH, HQd) was also used for pH measurement. 6N H_2SO_4 and 6N NaOH were used to adjust the pH.

3. Results and discussion

3.1. Effect of pH

All experiments were performed with 1L potato chips process wastewater sample. Experimental studies were performed intervals at pH 3, 5, 7, 9, 11. The effects of pH on the change in UV absorbance and removal of COD are shown in Figure 2 and 3.

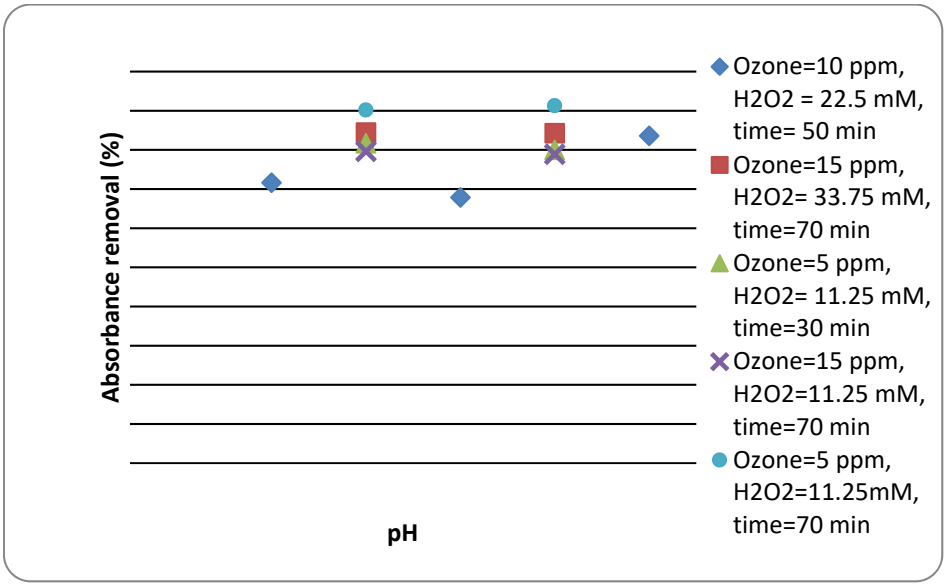

Figure 2. Absorbance removal efficiency versus pH values

Fig. 2 shows that at pH 5 and 9, the highest ratios of percentage change in UV absorbances were 90 % and 91 %, respectively. The lowest ratio was found at pH 7. The low pH reactions efficiencies depend on ozone concentration, H_2O_2 amounts and reaction time. According to previous studies, ozone decomposition rate is preferred by the formation of hydroxyl radicals at higher pH values (Zangeneh et al., 2014).

 Copyright © International Science and Technology Conference (ISTEC)

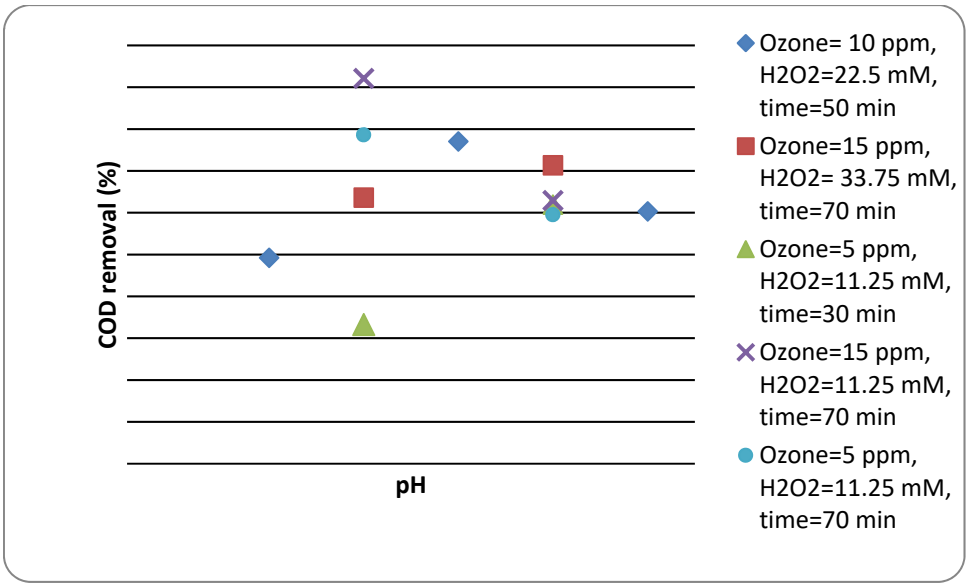

Figure 3. COD removal efficiency versus pH values

As shown in Fig. 3; at pH 5 and pH 7, COD removal efficiencies were 92% and 77%, respectively. COD removal efficiency of 92 % occured under the experimental conditions of pH 5, 15 ppm ozone concantration, 11.25 mM H_2O_2 amount and 70 min reaction time.

3.2. Effect of reaction time

Experimental studies were performed at intervals of 10, 30, 50, 70, 90 minute reaction times. The effects of reaction time for absorbance and COD removal efficiencies are shown in Figure 4 and 5.

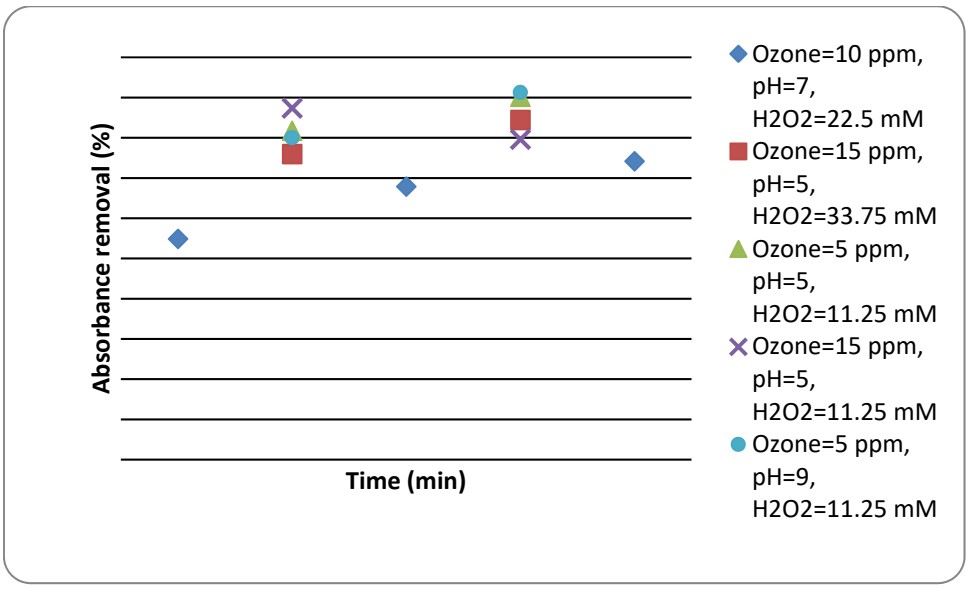

Figure 4. Absorbance removal efficiency versus reaction time

Fig. 4 shows that 30 and 70 min reaction times efficiencies of the ratio of percentage change in UV absorbance were highest 87 % and 91 %, respectively.

 Copyright © International Science and Technology Conference (ISTEC)

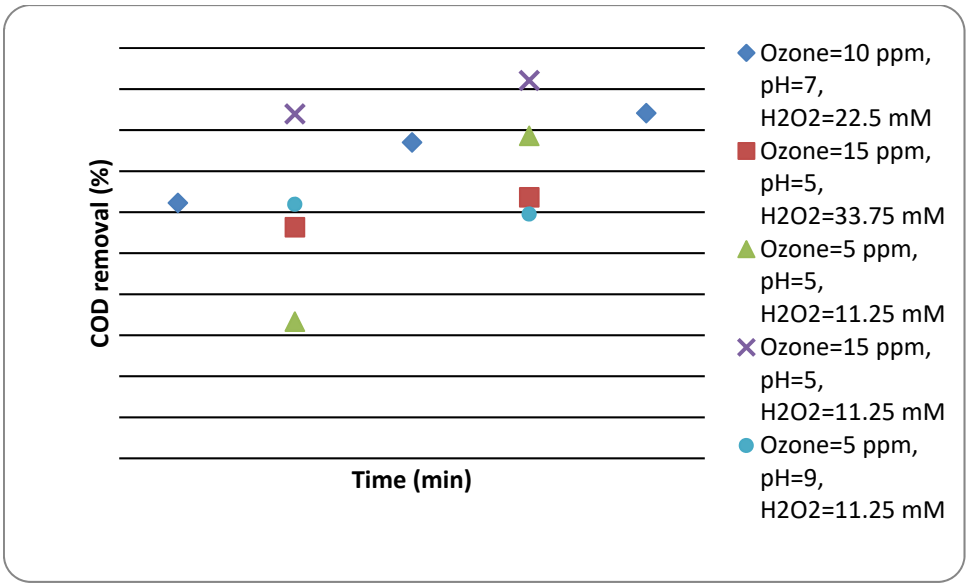

Figure 5. COD removal efficiency versus reaction time

Fig. 5 shows that at 30, 70 and 90 min reaction times efficiencies of the COD removal were highest 84%, 92 % and 84 %, respectively. When reaction time increased, absorbance removal efficency increased first and then decreased.

3.3. Effect of H_2O_2 amount

Experimental studies were performed various amounts of H_2O_2 (0, 11.25, 22.5, 33.75, 45mM). The effects of H_2O_2 amounts for removals of absorbance and COD are shown in Figure 6 and 7.

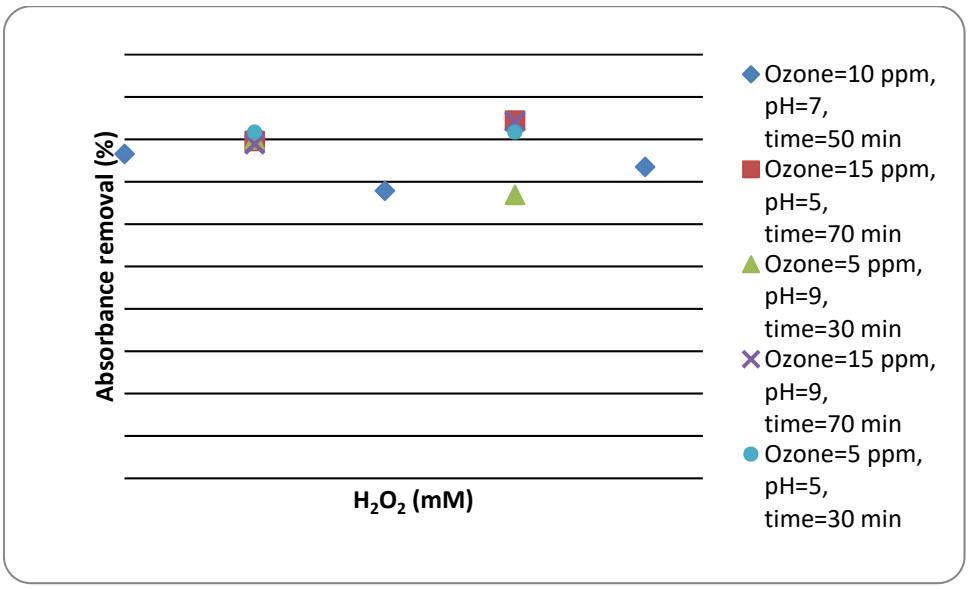

Figure 6. Absorbance removal efficiency versus H_2O_2 amounts

Fig. 6 depicts the performance of hydrogen peroxide treating the industrial wastewater at different dosages. For 11.25 mM and 33.75 mM H_2O_2 amounts,the ratios of percentage change in UV absorbances are at highest as 82% and 84 %, respectively. Removal efficiencies were found close to each other. It can be said that the excess amounts of H_2O_2 was caused scavenger effect on the producing of OH• radicals.

 Copyright © International Science and Technology Conference (ISTEC)

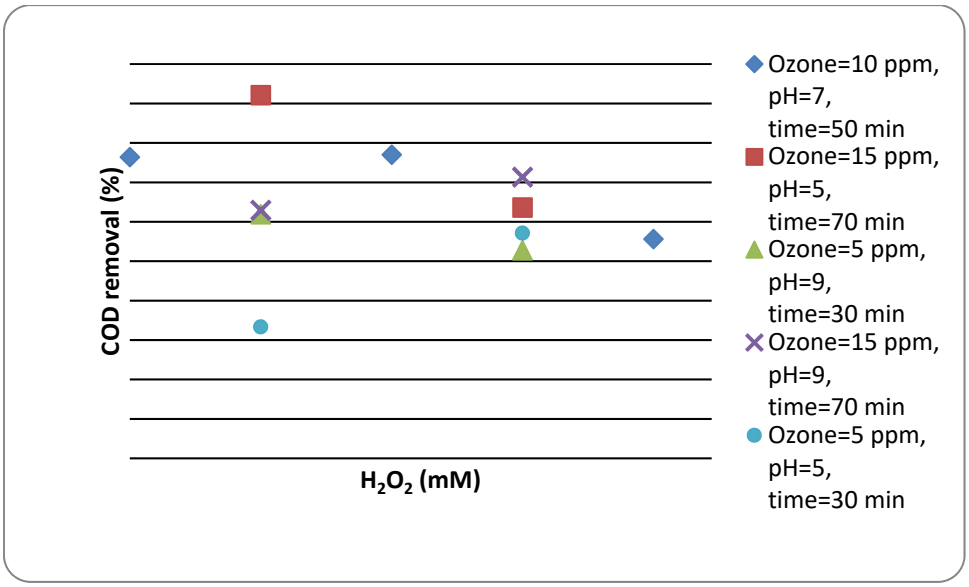

Figure 7. COD removal efficiency versus H_2O_2 amounts

Fig. 7 shows that 11.25mM and 22.5 mM H_2O_2 amounts efficiencies of the COD removal were highest 92 % and 77%, respectively. When H_2O_2 amount increased, COD removal efficency increased but some conditions were observed in decrease depending on ozone concentration and reaction time.

3.4. Effect of Ozone concentration

Experimental studies were performed with different ozone concentrations (0, 5, 10, 15, 20 ppm). The effects of UV absorbance change and COD removal efficiency on the ozone concentrations are shown in Figure 8 and 9.

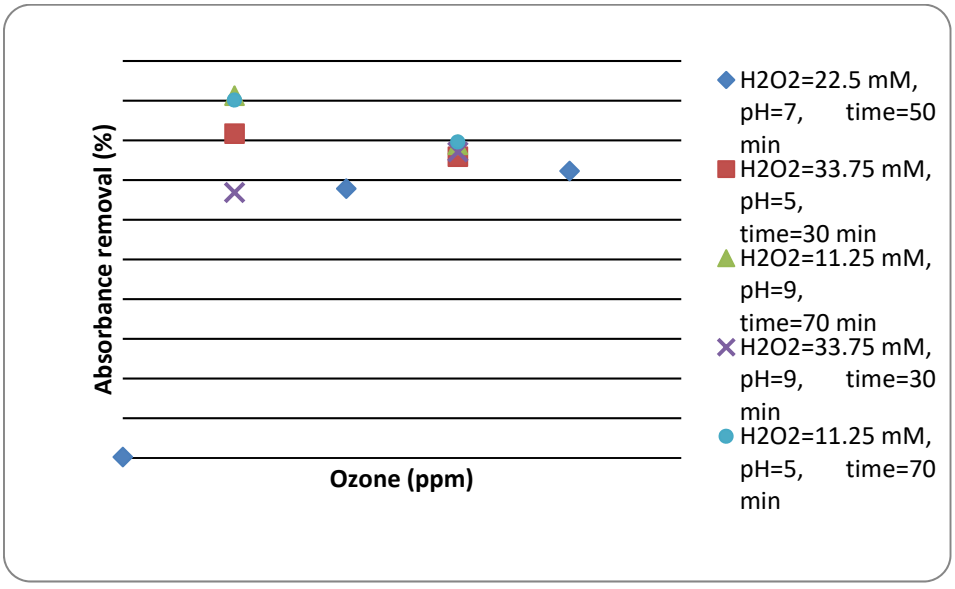

Figure 8. Absorbance removal efficiency versus ozone concentration

Fig. 8 shows that 5 ppm and 15 ppm ozone dosage concentration ratios of the percentage change in UV absorbances were at highest as 91% and 80 %, respectively. Increasing the applied ozone dose had a negative effect on UV absorbance change and was observed the more ozone concentration caused slight turbidity in the water.

 Copyright © International Science and Technology Conference (ISTEC)

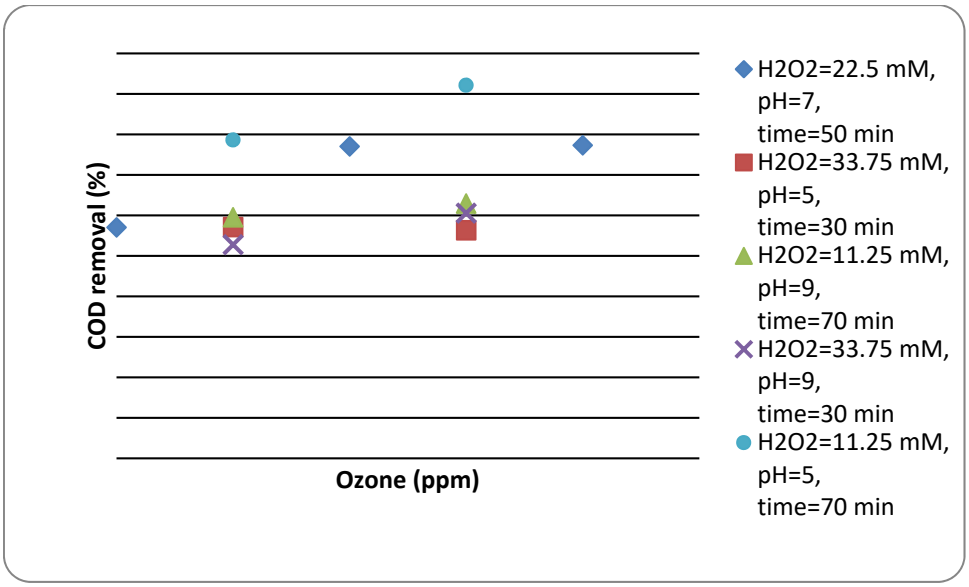

Figure 9. COD removal efficiency versus ozone concentration

Fig. 9 shows that 5 ppm and 15 ppm ozone dosage concentration efficiencies of the COD removal were highest 79 % and 92%, respectively. When the reaction had more than 15 ppm ozone dosage, the absorbance and COD efficiencies were decreased. It was observed that in the ozonation process, the best COD removal efficiency 92% was obtained at asidic pH (5) and high reaction time (70 min).

4. Conclusions

In this study, the treatment which is based on ozonation was applied to the potato chips process wastewater for the removal of COD and the change in UV absorbance. The highest COD removal was observed as 92% under the following conditions; pH 5, 15 ppm O_3 concentration, 11.25 mM H_2O_2 concentration and 70 minutes reaction time. The highest ratio of percentage change in UV absorbance was 91% at the experimental conditions of pH 9, 5 ppm O_3 concentration, 11.25 mM H_2O_2 concentration and 70 minutes.

Also it has been observed that, removal of color and odor clearly at the end of the experiments conducted by $O_3/UV/H_2O_2$ process. Sludge formation of encountered in the classical treatment processes, caused by the sludge disposal problems and additional costs don't occur in this process. This result is an important advantage of the treatability of food industry wastewater using of advanced oxidation processes method.

As a result, the $O_3/UV/H_2O_2$ process is an effective alternative in color removal and also COD removal for potato chips process wastewater.

Abstract: Last three decades, early cancer detection and researches on early detection solutions play vital role for human health. Computed tomography images (CT) are widely used in radiotherapy planning because they provide electronic densities of tissues of interest which are mandatory to a correct dose computation. Furthermore, the good spatial resolution and soft/hard tissues contrast allow precise target delineation. Also, CT techniques are preferred compared to X-Ray and MRI images. Image processing techniques have started to become popular in use of CT images. In this study, image pre-processing, image erosion, median filtering, thresholding and feature extraction of image processing techniques are applied on CT images in detail. The aim of this study is to develop an image processing algorithm for lung cancer detection on CT Images.

Keywords: CT Lung Cancer Images, Thresholding, Feature Extraction

Introduction

As WHO reported (WHO 2012), all around the world 8.2 million people died because of cancer. According to American Cancer Society (ACS 2012) researches showed that lung cancer mortality rates in men has dropped nearly 30 percent whereas, this rate in women has started to regress in last 10 years.

According to ACS (ACS 2012), the second most common cancer in both men and women is lung cancer, where prostate cancer is more common for men and breast cancer is for women. Lung cancer has very low survival rate after late diagnosis, where it is directly proportional with its growth at its detection time. However, if it can be detected at early stages, people have a higher possibility of survival.

Carcinoma, another name given to lung cancer, is growing of abnormal cells. Lung cancers are broadly classified into two types: small cell lung cancers and non-small cell lung cancers which are abbreviated as SCLC and NSCLC respectively (Rath 2001). As for the stages, there are four stages of carcinoma; I, II, III and IV, where staging is relying on tumor size, tumor and lymph node location (Rath 2001).

In today's world there are different techniques such as Chest Radiography (x-ray), Computed Tomography (CT), Magnetic Resonance Imaging (MRI) scan and Sputum Cytology, for diagnosing lung cancer (Al-Tarawneh 2012), (Chaudhary and Singh 2012). As stated earlier, early diagnoses are important for interfering the cancer, so that new technologies are greatly needed. Researches showed that, with early detection, survival rate of lung cancer patients has been increased from 14% to 49% within last five years (Chaudhary and Singh 2012). Image processing techniques are widely used in different medical fields to guide medical staff for detection of cancer in earlier stages (Al-Tarawneh 2012).

Nowadays multi-disciplinary actions are carried out for effective and efficient solutions for human health and survival. One of the most popular multi-disciplinary work is on image processing techniques that have been used in various medical fields (Ada and Kaur 2013), (Dimililer 2012), (Dimililer 2013). The aim of this paper is to perform image processing techniques and their interrelated methods to Health care, especially to the carcinoma patients. Ultimate research relay on quantitative information for instance, the shape, size and the ratio of the

 Copyright © International Science and Technology Conference (ISTEC)

affected cells (Pathan and Sptalkar 2012).

Proposed Lung Tumor Detection System

In this section, detection of tumors within the lung using Image processing techniques will be proposed. The suggested system will be explained in detail.

Image Acquisition

Computed tomography (CT) scan images are preferred to be used in this research, due to low noise and better clarity compared to X-Ray and MRI images. The lung image database has been chosen from NIH/NCI Lung Image Database Consortium (LIDC) which is an on-line CT image dataset available for the researchers in the field of digital image processing. The images used within this research are in .raw format. Figure 1 shows samples of original CT images.

Figure 1. Original CT lung images.

Image Enhancement on Lung Tumor Detection

Following image acquisition, all the images have gone a few image processing steps; grayscale conversion, thresholding, erosion, median filtering and noise removal, and image subtraction.

Gray Scale Conversion

This step involves conversion of original DICOM images which are in RGB format to grey color. It converts RGB images to grayscale by removing the tint and saturation information while maintaining the luminance.

Normalization

The size of the images has been reduced from `512 x 512` to `256 x 256` pixel values, in order to provide sufficient information while the processing time is low.

Image Thresholding

Threshold value is a specific value that turns a grayscale image into a binary image due to thresholding method. The main idea of this method is when multiple levels are selected, determine the threshold value or values (Dimililer, Kirsal-Ever and Ugur 2016). The easiest method for image segmentation is thresholding method, and it is the most common method used in CT images. The images in the proposed system are divided into five, namely `low brightness, LB (T1)`, `medium-low brightness, MLB (T2)`, `medium brightness, MB (T3)`, `high-medium brightness, HMB (T4)`, and `high brightness, HB (T5)` where ranges are defined as 0-51, 52-103, 104-155, 156-207, 208-255 respectively. These defined threshold values for brightness are classified according to field of applications, as stated in (Khashman and Dimililer 2005).

Figure 2 shows a median filter applied image, whereas figure 2b represents threshold segmentation is applied. This is the area with the consistency values higher than the defined threshold. High consistency areas mostly involve of cancerous tissue. Through the threshold segmentation, the location of cancerous tissue is determined.

 Copyright © International Science and Technology Conference (ISTEC)

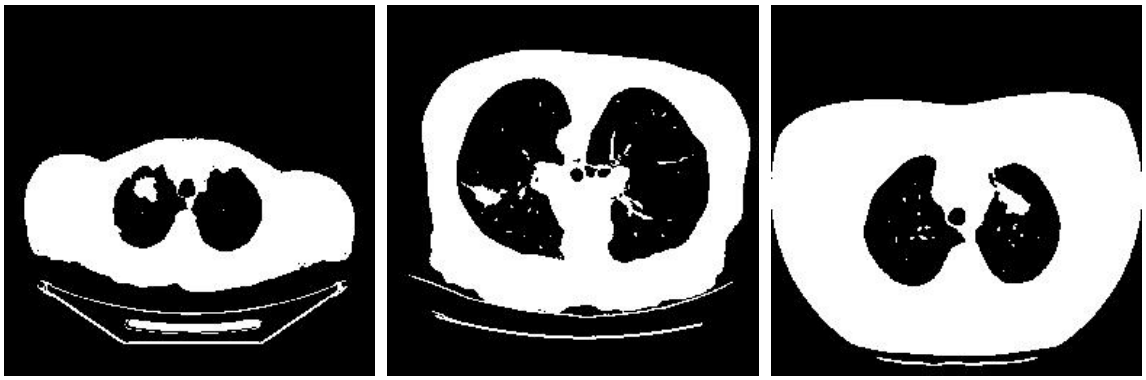

Figure 2. Threshold applied to Median filtered image.

Noise Removal

For removing the noise, erosion and 5 x 5 median filter (Dimililer, Kirsal-Ever and Ugur 2016) are applied to the system respectively. Erosion is one of the basic operators in the morphological image processing. The main effect of the operator on a binary image is to erode away the confines of sites of foreground pixels such as white pixels. Median filtering is applied to reduce the noise within CT images preserving the details and smooth non-impulsive noise. If the aim is to simultaneously minimize noise and conserve edges, a median filter is more impressive (Badrul Alam Miah and Abu Yousuf 2015). Figure 3 represents original CT lung image that erosion applied, where figure 4 shows median filter applied to eroded image.

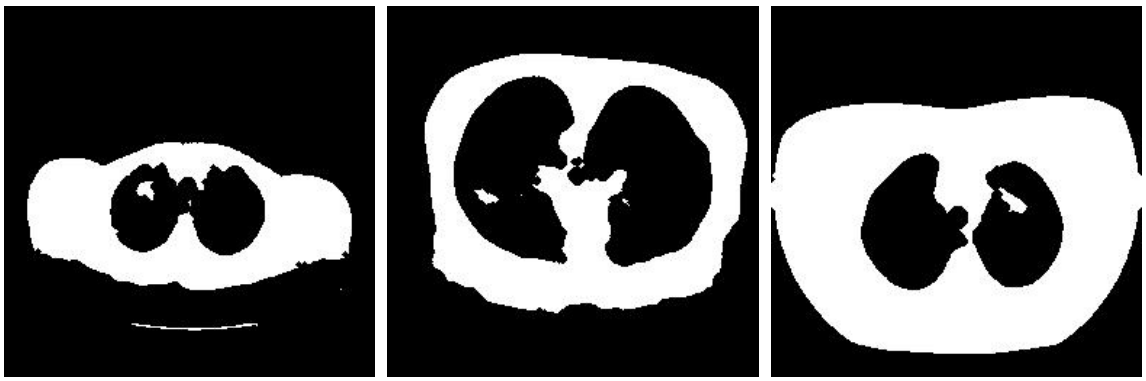

Figure 3. Original CT image with Erosion.

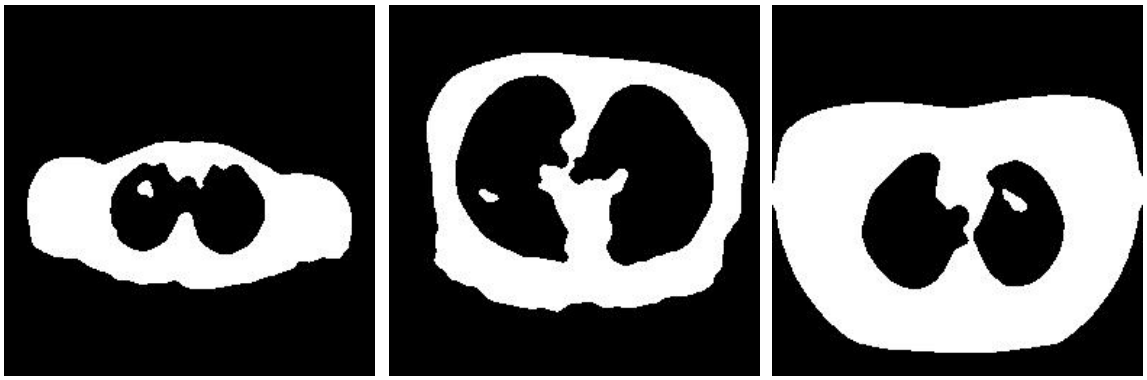

Figure 4. Median filtered applied to eroded image.

 Copyright © International Science and Technology Conference (ISTEC)

Feature Extraction

Image feature extraction stage plays an important role in this project. Image processing techniques are applied to localize and eliminate various desired portions or shapes (features) of an image.

The objects within the lung images having a total pixel numbers less than 1000, has been considered as 0 (black). The number of pixels has been decided upon several experiments for this type of tumors on lung images.

This whole process has been known as segmentation and after performing segmentation on lung images, the features can be achieved and the diagnosis rule can be designed to detect the cancer nodules in the lungs (Sharma and Jindal 2011). Figure 5 represent this information.

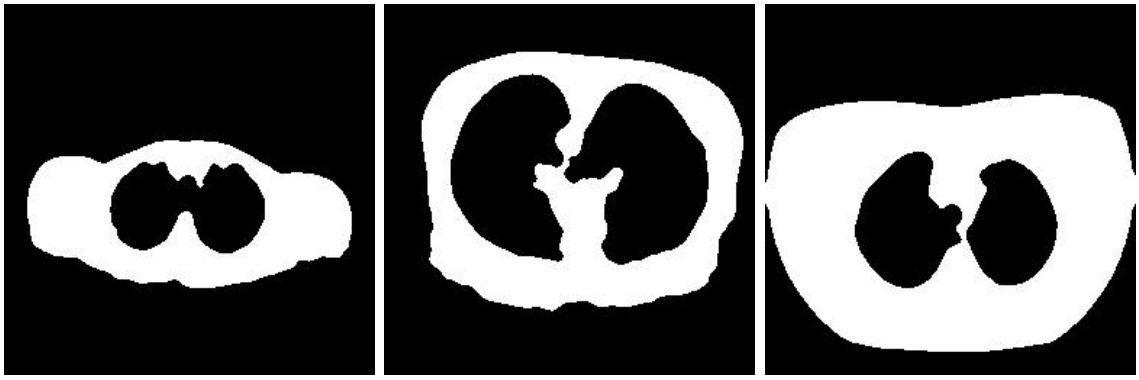

Figure 5. Feature Extraction.

Image Subtraction

In this step, images that have tumor cells are clarified by using filtering and elimination of small objects. Then tumor cells are removed from images. For removing tumor cells from images, objects are eliminated under specific pixel values.

In last step, in order to create tumor cells alone, difference between filtered image and small objects removed from the images are taken into account.

These two approaches are combined and applied successfully. Figure 6 shows the original image with the subtracted image.

Conclusion

In this paper, a tumor detection system using image enhancement is presented. In order to reduce the amount of data with computational and time costs, image processing techniques are used for providing meaningful representations of lung patterns. Relationship between input and output patterns has been created in order to detect the tumors within the images. Input images are obtained in 256x256 raw format, which thresholding are applied in order to clear black and white pixels. Afterwards, erosion and median filtering are used to remove noise. Afterwards, small objects within the image are removed. Last but not the least, small objects removed image is subtracted from median filtered image in order to find the location of the tumor.

Future work will include the modification of the system to recognize images that have scattered tumor on the lung cells.

TURIZM ÖN LISANS PROGRAMLARINDA MESLEK AMAÇLI İNGILIZCENIN (EOP) KARŞILAŞTIRMALI İHTIYAÇ DEĞERLENDIRMESI

Akif Gökçe
agokce@bartin.edu.tr

Orhan Batman
obatman@sakarya.edu.tr

Günden güne büyüyen turizm endüstrisi, dengenin arz tarafında sadece doğal kaynaklar, kaliteli ürün, alt yapı ile değil hizmet derecesi ve turistik deneyim memnuniyeti ile sürdürülebilirliğini gerekli kılmaktadır. Hizmet ve ülkeden memnun ayrılan turistler ise onlarla iyi ilişkiler kuran turizm *sahipleri* ve çalışanları sayesinde mümkün olmaktadır. Farklı uyruktan biriyle kurulacak etkili iletişimde mesleğin gereklerini karşılayan yabancı dil öğretimi önemli bir yer teşkil etmektedir. Turizm mesleğine yönelik İngilizce öğretimin öğrenci ve öğretici-uzman görüşlerine dayalı değerlendirilmesi amacıyla yapılan bu çalışma, 498 öğrenci örneklemine uygulanan ihtiyaç analizi anketi vasıtasıyla mevcut dil öğretim durumunu ortaya koymak; 20 öğretici-uzman grubuna uygulanan değerleme anketi vasıtasıyla etkililiğini değerlendirmek üzere tasarlanmıştır. Bu çalışma, turizm eğitiminde yabancı dil öğretiminin önemini ve etkinliğinin araştırdığı için önemli görülmektedir. Bu kapsamda alan yazında konuya ilişkin geçmiş çalışmalar incelenmiş, eğitim, mesleki eğitim, turizm eğitimi gibi kavramsal ifadeler açıklanmış, araştırmanın metodolojisi hakkında bilgi verilmiş, işlenen ve Ki-Kare, tek örneklem K-S, Friedman ve Kendall W gibi parametrik olmayan testlerle analiz edilen verilerin ışığında bulgular ve bulgulara dair tartışmalar ortaya konmuş ve sonuçlara dair önerilerle çalışmaya son verilmiştir. Araştırma sonucunda mevcut öğretim programı, yöntem ve tekniklerinin öğrenci ihtiyaçlarını karşılamakta yetersiz olduğu; turizm mesleğine yönelik dil beceri ve yeteneklerinin iletişime dayalı olmasının umulduğu gibi sonuçlara ulaşılmıştır.

Özet: Turizm sektörü ülke ekonomisinde oldukça önemli bir yere sahiptir. Turizmin ülkelerin kalkınmasında önemli bir araç olarak görülmesi ile birlikte ülkeler ve turizm işletmeleri arasındaki rekabet daha da artmıştır. Yoğun rekabet işletmeleri, sundukları hizmetleri farklılaştırmaya yönlendirmiştir. Turizm hizmetlerinin farklılaştırılmasında özellikle bilgi teknolojisinde yaşanan gelişmelerin katkısı büyüktür. Bilgi teknolojileri turizm pazarlamasını önemli ölçüde etkilemiş, müşteri memnuniyetini arttırmıştır. Bu çalışmada, insanların el hareketlerini tanıyan ve yorumlayan görüntü işleme tabanlı bir sistem geliştirilmiştir. Bu sistem ile tüketicilerin otel odasında yer alan televizyon, stor perde, ışık, klima gibi bazı çevre birimlerini kontrol edebilmesi planlanmıştır. Geliştirilen bu sistemin tüketicilerin konaklama işletmesi tercihleri üzerinde etkili olacağına, düşük maliyetli bir yapıya sahip olması sayesinde de işletme yöneticilerinin sistemden yararlanma taleplerini arttıracağına inanılmaktadır.

Anahtar Kelimeler: Turizm Pazarlaması, Konaklama İşletmesi, Bilgi Teknolojisi, İnsan-Bilgisayar Etkileşimi

Giriş

Turizm, ülkelerin kalkınmasında oldukça önemli bir yere sahip olan sektörlerin başında gelmektedir. Özellikle, bir ülkenin ekonomik açıdan gelişmesinde ayrıcalıklı bir yere sahip olan turizm sektörünün; ulusal ve uluslararası çapta meydana gelen gelişmeleri yakından takip etmesi, turizm işletmelerinin de tüketici isteklerini ve ihtiyaçlarını en iyi şekilde tatmin edebilecek hizmetler sunarak mevcut turist potansiyelini arttırmaları gerekir. Bunu sağlamanın yollarından biri teknolojik gelişmeleri yakından takip etmektir. Yoğun rekabet ortamında rakip işletmeler ile mücadele edebilmenin, değişen tüketici beklentilerine cevap verebilmenin yolu budur. Son yıllarda turizm endüstrisinde de teknolojiden yoğun bir biçimde yararlanıldığı görülmektedir. Merkezi rezervasyon sistemleri, global dağıtım sistemleri, çevrimiçi seyahat portalı vb. turizmde kullanılan bilgi teknolojilerine örnek olarak gösterilebilir. Bu çalışmada, tüketicilerin konaklama işletmesi tercihlerinde etkili olacağı düşünülen, diğer yandan turizm işletmelerinin elde edecekleri gelire olumlu katkılar sağlayacağına inanılan; el hareketlerini tanıma ve yorumlama özelliğine sahip görüntü işleme tabanlı bir sistem geliştirilmiştir. Konaklama işletmelerinde kullanılacak bu sistem sayesinde tüketiciler çeşitli çevre birimlerini kontrol edebilecek ve otel odasında oturdukları yerden birtakım isteklerini yerine getirebileceklerdir. Bu nedenle geliştirilmiş olan sistemin, hem tüketicilere hem de işletmelere olumlu katkılar sağlayacağına inanılmaktadır. Bu kapsamda, çalışmada öncelikle turizm pazarlamasının tanımı ve özellikleri üzerinde durulacaktır. Takip eden kısımda turizm endüstrisi ve teknoloji konusuna kısaca değinilecektir. Üçüncü bölümde ise geliştirilen sistem ve özelliklerinden bahsedilecektir. Çalışmanın son kısmında da sonuçlara yer verilecektir.

Turizm Pazarlamasının Tanımı ve Özellikleri

Turizm sektöründe ulusal ve uluslararası pazarlardan müşteri çekebilmenin yolu etkin bir pazarlama programı hazırlamaktan geçer. Bu kapsamda, turizm pazarlamasında yer alan faaliyetlerin turizm işletmeleri tarafından

 Copyright © International Science and Technology Conference (ISTEC)

itinalı bir biçimde hazırlanması gerekir. Literatürde turizm pazarlaması kavramına ilişkin çok sayıda tanım yer almaktadır. Turizm pazarlaması kavramı, Kozak ve diğerleri (2002: 281) tarafından "bir turistik destinasyonun ya da turizm işletmesinin en yüksek kazanç elde etme hedefine uygun olarak, turizm ürününün pazarda iyi bir yer almasını sağlamak amacı ile turizm talebinin özelliklerini de dikkate alarak turistik ürün ile ilgili araştırma, tahmin ve seçim yapmayı hedefleyen ve bu konularda alınacak kararlarla ilgili bir yönetim felsefesidir." olarak tanımlanmıştır. Literatürde yer alan bir başka tanımda da turizm pazarlaması, "tanımlanabilir tüketici gruplarının ihtiyaçlarını en iyi biçimde karşılayabilmek amacıyla yöresel, bölgesel, ulusal ya da uluslararası düzeyde özel ya da kamusal turizm elemanlarının yönetilmesi politikalarını sistematik ve eşgüdümlü olarak yürüten en uygun kazancı sağlayan faaliyetlerin tümü." olarak ifade edilmektedir (Hayta, 2008: 33).

Turizm pazarlaması mal pazarlaması ile karşılaştırıldığında bazı farklı niteliklere sahip olduğu görülmektedir. Bu farklılıkların ortaya çıkmasının en temel nedeni hizmetlerin sahip oldukları kendilerine has özellikleridir. Turizm pazarlamasını mal pazarlamasından farklılaştıran başlıca özellikler aşağıdaki gibi sıralanabilmektedir (Kozak, 2006; Hayta, 2008) :

- Turizm pazarlamasının konusunu hem mal hem de hizmetler oluşturmaktadır.
- Turizm pazarlamasında dağıtım kanalı terstir. Bir başka ifade ile, turizm hizmetlerinden yararlanmak isteyen tüketicinin turizm işletmesinin bulunduğu yere gitmesi gerekir.
- Turizm ürünlerine olan talep hem işletmeler hem de ülkeler tarafından yürütülmekte olan tutundurma çabalarından etkilenmektedir.
- Turizm pazarlamasında süreç yönetimi önem taşımaktadır.
- Turizm pazarlamasına yönelik faaliyetlerin temelinde insan unsuru yer almaktadır. Bu durum, turizmin emek yoğun bir sektör olmasından kaynaklanmaktadır.
- Turizm pazarlamasında üretim ve tüketim eş zamanlı olarak gerçekleşmektedir.
- Turizm pazarlamasında alt yapı ve doğal güzellikler hizmet cazibesini arttırmada önemli bir role sahiptir.

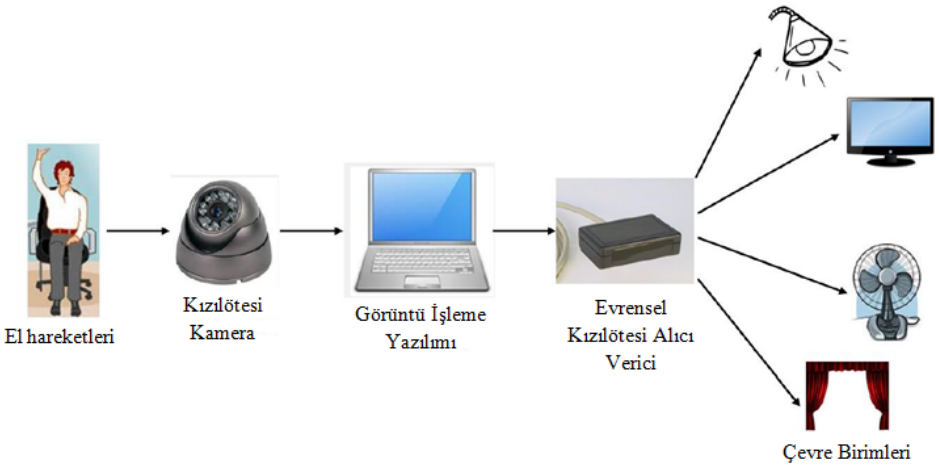
Turizm pazarlamasının kendine has özelliklerinden dolayı, mal pazarlamasında dikkate alınan 4P bir başka ifade ile; ürün (product), fiyat (price), tutundurma (promotion) ve dağıtım (place) hizmet pazarlamasında yeterli olmamaktadır. Hizmet pazarlamasına yönelik karma elemanları arasında; fiziksel ortam (physical environment), katılımcılar (participants) ve süreç yönetimi (process management) gibi 4P'nin yanı sıra 3P daha yer almaktadır (Karahan, 2000; Ilgaz Sümer & Eser, 2006).

Hizmet pazarlamasında önemli bir karma elemanı olan fiziksel ortam kapsamında; işletme içinde kullanılan ekipman, mobilya-teçhizat, teknolojik araç-gereç vb. yer almaktadır. Özellikle son yıllarda teknolojide meydana gelen gelişmeler ile birlikte, turizm işletmeleri müşterilerine sundukları pek çok hizmetin merkezine teknolojiyi yerleştirmişlerdir. Turizm işletmeleri tarafından teknoloji, rekabetçi üstünlük elde etmede önemli bir araç olarak yoğun bir biçimde ve farklı şekillerde kullanılmaya başlanmıştır.

Turizm Endüstrisi ve Teknoloji

Günümüzde rakip işletmeler karşısında üstünlük elde edebilmenin ve farklılaşabilmenin yollarından biri teknolojiden yararlanmaktan geçer. Dinamik bir yapıya sahip olan turizm sektörü açısından teknolojiden faydalanmak, bir yandan işletmelerin ve tüketicilerin bilgiye en hızlı biçimde ulaşmalarını sağlar diğer yandan da sunulacak turizm hizmetlerinin kalitesini arttırır.

Turizm endüstrisinde kullanılmakta olan başlıca bilgi teknolojileri aşağıdaki gibi sıralanabilmektedir (Ahipaşaoğlu & Kaya, 2005; Kurgun, Kurgun & Güripek, 2007):



- Merkezi Rezervasyon Sistemleri
- Global Dağıtım Sistemleri
- Online Seyahat Portalları
- Destinasyon Yönetim Sistemleri
- Coğrafi Bilgi Sistemleri

Turizm endüstrisinde sıklıkla kullanılmakta olan bilgi teknolojilerinin yanı sıra tüketici istek, ihtiyaç ve beklentilerindeki farklılaşmalar çerçevesinde turizm işletmelerinin mevcut durumlarını sürekli gözden geçirmeleri gerekmektedir. Hızla değişen tüketici taleplerine yanıt verebilmenin yolu, turizm hizmetlerini farklılaştırmaktan ve sunulan farklı hizmetlerle hedef pazarı şaşırtmaktan geçer. Bu çalışma kapsamında geliştirilmiş olan akıllı otel odası otomasyon sistemi de, tüketicileri otel odasında sunulacak olan kolaylıklar ile şaşırtmak, turizm hizmetlerinden daha rahat bir biçimde yararlanmalarına yardımcı olmak ve işletmelerin çeşitli açılardan tasarruf elde edebilmelerini sağlamak üzere tasarlanmıştır.

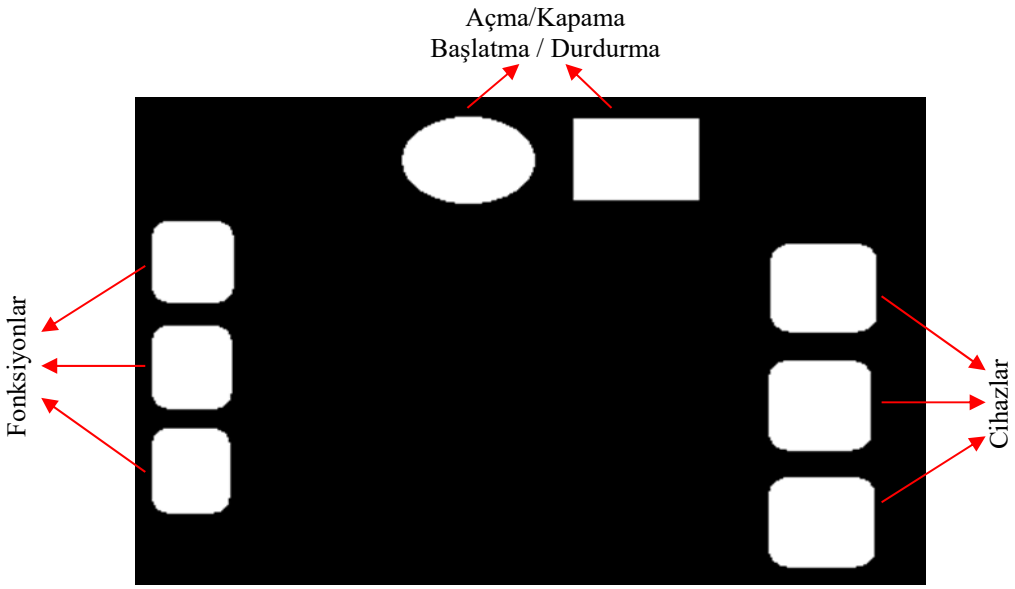
 Copyright © International Science and Technology Conference (ISTEC)

Akıllı Otel Odası Otomasyon Sistemi

Vücut hareketlerinin bilgisayar tarafından tanınması ile doğal ve yenilikçi bir sözsüz iletişim yolu ortaya çıkmıştır. Bu sayede insan bilgisayar etkileşimi (Human-Computer Interaction - HCI) ve işaret dilleri gibi alanlarda birçok uygulama alanı doğmuştur. Bu çalışma kapsamında, otel odasında konaklayan müşterilerin el hareketlerini tanıyan ve yorumlayan görüntü işleme tabanlı bir sistem geliştirilmiştir. Bu sistem ile kişinin bulunduğu ortamda yer alan bazı çevre birimlerini (televizyon, stor perde, ışık, klima) kumanda edebilmesi olanaklı hale gelmektedir. Sistemin genel yapısı Şekil 1'de verilmiştir.

Şekil 1.Önerilen sistemin genel yapısı.

Buna göre; geliştirilen sistemde kızılötesi bir kamera kullanılarak oturma pozisyonundaki kişinin tek elinin konum bilgisi, görüntü işleme algoritmaları ile tespit edilmektedir. Alınan konum bilgisi, ortamda bulunan farklı cihazların belirli kumanda fonksiyonları (cihaz açma-kapama, ses açma-kapama, ışık düzeyi açma-kapama vb.) ile ilişkilendirilmektedir. Bu ilişkilendirme sonucu ortaya çıkacak kumanda komutları Evrensel Kızılötesi Alıcı Verici (Universal Infrared Receiver Transmitter – UIRT) ara birimi ile çeşitli cihazlara iletilerek kumanda işlevi gerçekleştirilmektedir (USB-UIRT, 2016). Bu işlevin gerçekleştirilebilmesi için ilgili cihazların kumanda sinyallerinin UIRT ara birimine daha önceden öğretilmiş olması gerekmektedir.



Kameradan alınan Kırmızı-Yeşil-Mavi formatındaki renkli görüntü gri-seviyeli görüntüye çevrildikten sonra histogram eşitleme (histogram equalization), zıtlık esnetme (contrast stretching) gibi görüntü iyileştirme fonksiyonları uygulanır. Daha sonra, eşik değeri belirleme ve morfolojik görüntü iyileştirme algoritmaları ile kişinin el bölgesi tespit edilir. Örnek bir el görüntüsüne ait tespit adımları Şekil 2'de sunulmaktadır. Gonzalez & Woods (2008)'da uygulanan yöntemlerin detayları ve teknik alt yapılarına yer verilmektedir.

Şekil 2. El bölgesinin tespitine yönelik işlem adımları.

 Copyright © International Science and Technology Conference (ISTEC)

Tespit edilen el bölgesinin işlevsel hale gelebilmesi için bir kullanıcı paneli geliştirilmiştir. Bu panel; veri analizi, görüntü işleme ve karmaşık matematiksel işlemler için kullanılabilecek en uygun programlama ortamlarından biri olarak bilinen Matlab programlama dili ile gerçekleştirilmiştir (Mathworks, 2016). Kumanda edilecek cihazlara ve ilgili fonksiyonlarına erişim sağlanabilmesi için panel üzerinde çeşitli butonların yerleşimi yapılmıştır (Şekil 3). Buna göre; üst sırada yer alan butonlar cihazlar için açma/kapama ve başlatma/durdurma işlevlerini yerine getirmektedir. Sol ve sağ sütunlarda yer alan butonlar ise sırası ile fonksiyonlar ve cihazların erişimi için tasarlanmıştır. Örnek bir ekran çıktısına Şekil 4'de yer verilmektedir. Burada kullanıcı, el hareketleri ile televizyon için ses arttırma fonksiyonunu seçmiştir.

Şekil 3. Cihaz kumanda paneli üzerinde yer alan butonların yerleşimi.

Şekil 4. Televizyonda ses arttırma fonksiyonu için örnek bir ekran çıktısı.

Diğer örneklere Şekil 5'de yer verilmektedir. Buna göre; Şekil 5(a)'da televizyonun çalışmasının durdurulması, Şekil 5(b)'de televizyonun cihazlar panelinden seçimi, Şekil 5(c)'de televizyon kapatma fonksiyonunun gerçekleştirimi ve Şekil 5(d)'de de sistemin başlatılmasına yönelik örnek ekran çıktıları görülmektedir.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 5. Sistemin çalışmasını örnekleyen ekran çıktıları.

Sonuç

Bu çalışmada el hareketlerini algılayarak tanıyan görüntü işleme tabanlı bir akıllı otel odası otomasyon sistemi geliştirilmiştir. Böylece otelde konaklayan tüketicilerin oturdukları yerden bulundukları ortamda yer alan bazı çevre birimlerini kontrol edebilmeleri olanaklı hale gelmektedir. Geliştirilen sistemi kullanacak olan konaklama işletmelerinin; maliyet tasarrufları, rekabetçi üstünlük vb. açılardan avantaj elde edebilecekleri düşünülmektedir. Ayrıca, akıllı otel odası otomasyon sisteminin sunmakta olduğu kolaylıkların tüketicilerin otel tercih kararları üzerinde de etkili olacağına inanılmaktadır.

TURİZM SEKTÖRÜ İÇİNDE AŞÇILIK MESLEĞİNİN KADIN İSTİHDAMINDAKİ ROLÜ

Mutlu DOĞAN

Anadolu Üniversitesi, Eskişehir Meslek Yüksekokulu, Türkiye

mdonmez@anadolu.edu.tr

Özet: Turizm sektörü; dinamik bir sektör olarak ülke ekonomilerine milli gelir açısından önemli bir pay oluşturmaktan, istihdam yaratmaya kadar pek çok katkı yapmaktadır. Turizm sektörü, bu konumu nedeniyle, işsizlik sorunu yaşanan Türkiye gibi gelişmekte olan ülkeler açısından önemli bir sektör haline gelmiştir. Turizm sektöründe üretilen hizmetten memnuniyet ise, bu sektörün başarısının sürdürülebilir hale gelmesinde en önemli şartlardan biridir. Özellikle bu sektörün içinde yer alan konaklama işletmelerinin yiyecek içecek departmanı hem misafir memnuniyeti hem konaklama işletmesine sağlamış olduğu ekonomik katkı açısından kritik bir öneme sahiptir. Yiyecek-içecek departmanının başarısı konaklama işletmesinin başarısını doğrudan etkilemektedir. Bu bölümdeki uzun çalışma süreleri, hafta sonu yoğun çalışma şartları, fiziki bakımdan güç gerektiren işlerin yapılması gibi nedenlerle sektörde erkek istihdamı daha fazla olmuştur. Aynı zamanda bayanlarda evlilik durumu da bu işgücüne katılımı olumsuz yönde etkileyen önemli bir unsurdur. Konaklama işletmelerinde misafir memnuniyetinin oluşmasında, yiyecek-içecek hizmetlerinin ciddi bir etkisinin olduğu göz önüne alındığında, bu alandaki eğitimli personelin önemi bir kat daha artmaktadır. Son yıllarda Üniversitelerin Aşçılık ve Gastronomi bölümlerinin artması ile buralardan mezun olan eğitimli bayan öğrenciler yiyecek içecek departmanlarında görev alarak daha kaliteli hizmet sunumunda katkıda bulunurlar.

Anahtar Kelimeler: Turizm, Yiyecek içecek, Mutfak, Konaklama işletmesi, ,Kadın istihdamı

Abstract: Tourism sector makes many contributions to country economies from creating an important share with regard to national income to providing employment opportunities as a dynamic sector. Thanks to this position, tourism sector has become an important sector for developing countries such as Turkey where unemployment problems are experienced. Satisfaction from the service provided in the tourism sector is among the most important conditions for the sustainability of the success of this sector. The food and beverage departments of the accommodation establishments which are part of this sector have a critical importance for both customer satisfaction as well as the economic contributions provided to the accommodation facility. The success of the food and beverage department has direct effects on the success of the accommodation establishment. Male employment has been more dominant in this sector due to the long working hours, intensive weekend schedules as well as tasks that require physical strength. Marriage is also an important factor that has negative impact on the participation of women in this sector. When it is taken into account that the food and beverage services play an important role in customer satisfaction related with accommodation establishments, the importance of trained personnel in this field becomes even more important. Recently, female students who graduated from the Culinary Arts and Gastronomy departments of universities that have started to increase in number started to take place in the food and beverage departments thus contributing to the presentation of a more quality service.

Keywords: Tourism, Food and beverage, Accommodation establishment, Female employment

GİRİŞ

Günümüzde her yıl milyonlarca insan, sürekli yaşadıkları yerlerden geçici sürelerle ayrılarak başka ülkelere veya bölgelere gitmekte ve buralarda gezip görme, dinlenme, eğlenme ve öğrenme gibi psikolojik sosyal ve kültürel gereksinimlerini karşılamaktadırlar. Ekonomik ve sosyal anlamda geniş etkiler doğuran ve turizm olarak isimlendirilen bu olay, günümüz uygarlığının temel bir özelliğini oluşturmaktadır.

Çağımızda teknolojinin baş döndürücü bir hızla gelişme göstermesi, turizmi de etkilemesi kaçınılmazdır. Teknolojik gelişmelerin sonucu, dünyada oldukça hızlı büyüyen ve gelişen turizm sektörü, Türkiye'de de

 Copyright © International Science and Technology Conference (ISTEC)

büyümeyi ve gelişmeyi sürdürmekte ve aynı zamanda diğer sektörlerin gelişmesine de katkıda bulunmaktadır. Turizm hareketlerinin tarihsel gelişimine bakıldığında, 1950"li yıllarda uluslararası seyahatlere katılan toplam kişi sayısı yaklaşık olarak 25 milyon kişi iken, 2013 yılında bu rakamın yaklaşık 1.08 milyar kişiye ulaştığı görülmektedir. Bunun yanında dünya genelinde 2020 yılında, uluslararası turizm hareketlerine katılan kişi sayısının 1,6 milyara ulaşması ve uluslararası turizm gelirlerinin de 2 trilyon dolara yükseleceği öngörülmektedir. Küreselleşme olgusu turizm sektörünün ekonomik anlamda dünyanın en hızlı büyüyen sektörlerinden birisi olmasını sağlamıştır.

Ülkemizde ise turizm sektörü, özellikle 2000'li yıllardan itibaren hızlı bir değişim ve gelişim göstermiş ve uluslararası rekabet gücünün en yüksek olduğu sektörlerden biri haline gelmiştir. Türkiye'ye (Türkiye İstatistik Kurumu) [TUİK] verilerine göre 2014 yılı itibariyle gelen turist sayısı, 41 milyon 415 bin 70 kişi, turizm geliri ise 34 milyar 305 milyon 904 bin dolar olarak gerçekleşmiştir. Turizm, ülkelerin ekonomik sıkıntılar yasadığı dönemlerde büyük bir döviz girdisi sağlayarak, dış ticaret açıklarının ve işsizliğin azaltılmasında kilit rol oynamaktadır. Aynı zamanda emek-yoğun özelliği, istihdamı artırıcı bir rol oynayarak, işsizliğin önlenmesinde kurtarıcı durumundadır. Turizm sektörüne giren tüm gelir, turizm sektöründe istihdamı doğrudan, diğer sektörlerdeki istihdamı ise dolaylı olarak etkilemektedir. İnsanların turizm alanında istihdam edilmesi ve bunun için gerekli bilgi ve becerilere sahip olmaları, ülke turizminin gelişimi açısından oldukça önemlidir. Turizm sektörü ve özellikle konaklama işletmeleri ülkemizde ciddi bir istihdam kapasitesine sahiptir. Bu sektörün en belirgin yapısal özelliği hizmet sektörü olması ve çalışanların emeklerinin birincil olduğu işlerin var olmasıdır.

Konaklama işletmeleri; turistlerin geçici konaklama, yeme ve içme, kısmen eğlence ve diğer bazı sosyal ihtiyaçlarını karşılayan işletmelerdir. Başka bir anlatımla; konaklama işletmeleri, turistlerin değişik mekanlarda geceleme ihtiyaçlarını karşılayan tesislerdir. Turistlerin seyahat nedenleri; seyahatten beklentileri, gelir düzeyleri, yaş grupları ve zevklerinin birbirinden farklı olması konaklama işletmelerinin de farklı olmasını gerektirmektedir. Türkiye'de konaklama işletmeleri, otel, motel, tatil köyü, pansiyonlar, sağlık tesisleri gibi değişik kriterlere göre sınıflandırılmaktadır. Konaklama işletmelerinin ekonomik katkısı düşünüldüğünde; bu işletmelerde sunulan yiyecek-içecek hizmetlerinin önemi de kendiliğinden ortaya çıkmaktadır. Çünkü konaklama işletmesinde odalar bölümünden sonra en fazla geliri yiyecek- içecek bölümü sağlamaktadır. işletmeler bu geliri elde edebilmek için yiyecek ve içeceklere önemli tutarlarda harcamalar yapmaktadırlar. Konaklama işletmelerinde yeme içme hizmetlerinin sunulduğu yiyecek içecek bölümünde yemek üretiminin yapıldığı departman olan mutfaklar da büyük bir öneme sahiptir. Bu departman önemli bir istihdam alanı oluşturmaktadır. Burada çalışan personelin profiline bakıldığında erkeklere göre kadın çalışan sayısının az olduğunu, kadınlara biçilen temel alanlardan biri mutfak olmasına rağmen bu durumun sektörde karşılık bulamadığı görülmektedir.

TURİZMDE İSTİHDAM DURUMU

İstihdam kavramını farklı şekillerde tanımlamak mümkündür. Genel anlamıyla istihdam, "çalışmak ve gelir sağlamak istek ve iradesinde olan kişilerin, mal veya hizmet üretiminde çalıştırılmaları" olarak tanımlanabilir.
Turizm sektöründe gösterilen faaliyetlerin büyük bir kısmının hizmet ağırlıklı faaliyetler olması nedeniyle genellikle emek -yoğun bir sektör olması, talep edilen işgücünün de ya kalifiye veya vasıfsız olması, bu tür işgücünün de gelişmekte olan ülkelerin veya ekonomisi bozulmakta olan bölgelerin çoğunda bol miktarda bulunması, turizmin istihdam yaratmada ki katkısını arttırmaktadır. Turizm sektöründen doğrudan etkilenen konaklama, ulaşım, eğlence, seyahat acenteleri, yönetim, finansman ve sağlık gibi pek çok sektör bulunmaktadır. Ayrıca tarım ve imalat gibi diğer sektörleri de dolaylı olarak etkilemektedir. Bu nedenledir ki turizm sektörünün istihdam üzerindeki etkisini net bir şekilde belirlemek oldukça zordur. Turizmin gelişimine paralel olarak artan istihdam etkisi, genel olarak doğrudan, dolaylı ve uyarılmış olarak üç farklı istihdam meydana getirir. Bunlar.

- Doğrudan İstihdam; konaklama, yeme-içme, ulaştırma işletmeleri, seyahat acenteleri ve tur operatörleri gibi turizm işletmeleri doğrudan istihdamı kapsar.
- Dolaylı İstihdam; turizm sektörünün ihtiyaç duyduğu ürünleri ve hizmetleri sağlayan sektörlerdeki ve turistlerin harcamalarından yararlanan faaliyetlerdeki işler dolaylı istihdamın kapsamındadır. Tarım balıkçılık, inşaat, el sanatları, bankalar ve imalat sektörleri gibi sektörler turizmin gelişmesi ile birlikte yeni istihdam olanakları sağlanan sektörlerdir.
- Uyarılmış İstihdam; doğrudan ve dolaylı istihdamla sağlanan gelirlerin harcanmasıyla ekonomide yaratılan ek istihdamı kapsayan istihdamdır.

Turizm sektörünün bu şekilde ortaya çıkarmış olduğu istihdam olanakları, özellikle Türkiye gibi işsizlik problemiyle karşı karşıya olan ülkeler açısından oldukça önemlidir.
Ayrıca, turizm sektöründe makineleşme ve otomasyon imkanlarının sınırlı olması, sektörün meydana getirdiği istihdam yoğunluğunu diğer sektörlere nazaran yükseltmektedir. Sektörde emek-yoğun faaliyetlerin fazla olması

 Copyright © International Science and Technology Conference (ISTEC)

nedeniyle turistik tüketim harcamaları yüksek oranda doğrudan istihdam etkisi oluşturmaktadır. Bunun yanında turizm sektörüne mal ve hizmet sunan yan sektörlere de yeni iş imkânları sağlayarak dolaylı istihdam etkisi meydana getirmektedir. Turizm sektöründe yapılan yatırım ve harcamaların, diğer sektörlere göre yüksek oranda istihdam sağladığı kabul edilmektedir. İçöz ve Kozak'a göre (1998:225) turizmde istihdam edilen kişilerin sayısını artıran faktörler şunlardır:

- Emek yoğunluğu
- Çok sayıda düsük ücretli iş alanı bulunması
- Çok sayıda yarı zamanlı ve geçici is alanının bulunması
- Sezon yoğunluğu ve dönemsellik olarak belirlenmiştir.

Turizm sektörü elbette tek başına bir ülkenin kalkınmasını sağlayamaz ancak kalkınmanın sağlanmasında olumlu katkılar sağlayacağı da yadsınamaz bir gerçektir. Turizm sektörünün Türkiye ekonomisi içinde yarattığı istihdam ile ilgili olarak tek bir veri bulunmamakla beraber, çeşitli kaynaklardan derlenen bilgilerden bu alanda çalışan toplam kişi sayısının 1 milyonun biraz üzerinde olduğu görülmektedir.

Tablo 1:Konaklama Tesislerinde İstihdam (2000-2010)

Yıllar	Otel+Lokanta (Bin Kişi)	Otel, Eğlence Yerleri (Bin Kişi)
2000	776	211.4
2001	796	243.5
2002	826	255.6
2003	847	280.1
2004	872	297.6
2005	949	309.2
2006	1.001	318.4
2007	1.067	328.7
2008	1.058	341.5
2009	1.131	342.4
2010	1.066	351.4

Kaynak:http://www.tuyed.org.tr (18.05.2011)

Yukarıda verilen tablo incelendiğinde, otel, lokanta ve eğlence yerlerinin istihdam rakamlarının sürekli arttığı, sadece 2008 ve 2010 yıllarında otel lokanta istihdamında bir gerileme olduğu görülmektedir.
Turizm sektöründe kadın-erkek çalışanların durumuna bakıldığında;
Kadınların insani duygulara daha iyi hitap edebilmeleri, sosyal ve aile içerisindeki konumları ve kişisel özellikleri, konaklama işletmelerinde istihdam edilmeleri için bir tercih sebebi olarak ön plana çıkmaktadır. Bu durum, turizm sektöründe her geçen gün kadın çalışanların sayısının artmasından anlaşılmaktadır. EUROSTAT'ın verilerine göre 2013 yılında ülkemizde turizmde istihdam edilen erkeklerin oranı % 70 iken kadınların oranı %30 civarındadır. Ancak turizmde istihdam edilenlerin içerisinde erkeklerin oranı 2006'da %74.3 iken 2013' de %70.1'e düşmüş, kadınların oranı ise %25.7'den %29.9'a yükselmiştir. Bu sektörde kadın çalışanların meslek ve pozisyon durumuna bakıldığında turizm endüstrisinde belirgin yatay ve dikey toplumsal cinsiyet ayrımcılıkları vardır.

- Yatay olarak kadınlar ve erkekler farklı mesleklere yerleştirilirler. Kadınlar garson, temizlikçi, seyahat acentası satış temsilcisi olarak istihdam edilirken; erkekler barmen, bahçıvan, yapı çalışanları, sürücü, teknik personel olarak istihdam edilmektedir.
- Dikey olarak tipik "toplumsal cinsiyet" piramidi turizm sektöründe de yaygındır. Daha düşük pozisyonlar ve kariyer gelişim olanağı çok az olan meslekler kadınlar tarafından doldurulmaktadır. Buna karşın önemli yönetimsel pozisyonlar erkekler tarafından doldurulmaktadır.

Bu durumda, dünya nüfusunun yarısını oluşturan kadınların ekonomik yaşama katılma, ekonomik değer üretme ve dolayısıyla da kalkınmayı sağlamada önemli etkileri olmasına rağmen, ekonomik kalkınmadan yararlanma payları erkeklerin aldıkları payın gerisinde kalmaktadır. Kadınların bu şekilde ekonomik ve toplumsal anlamda ikinci planda kalmalarına neden olan ana etken, kaynağını erkek egemen kültürden alan cinsiyet ayrımcılığıdır. Bu zihniyet, kadının rollerini ev içi alanla sınırlamakta ve ev dışında herhangi bir uğraşı olsa bile bunun kadının ikinci görevi olduğunu söylemektedir. Küreselleşmenin beraberinde getirdiği esnek ve ucuz emek arayışı ile birlikte kadın istihdamı artsa da, dünya genelinde kadın emeği hala büyük oranda, ücretsiz aile işçisi başta olmak üzere, düzenli geliri olmayan işlerde yoğunlaşmış durumdadır.

AŞÇILIK MESLEĞİNDE KADIN İSTİHDAMI

 Copyright © International Science and Technology Conference (ISTEC)

Türkiye'de kadın, gerçek anlamda 1950'lerden sonra kırdan kente yönelik göçün beraberinde getirdiği kentleşme sonucunda işgücü piyasası içinde yer almaya başlamıştır. Zaman içinde kadınların işgücü piyasasındaki konumları ve çalışma biçimleri de değişime uğramıştır. Bu değişimin sektörel açıdan nasıl olduğu önemli bir konudur. Çünkü bir ülkedeki istihdamın sektörel dağılımı o ülkenin kalkınmışlık düzeyinin önemli bir göstergesidir. Kalkınma ile birlikte istihdam, tarım sektöründe azalırken tarım dışı sektörlerde artmaktadır. Bu durum kadın istihdamı için de aynen geçerli olmaktadır. Gelişmekte olan ülke ve bölgelerde kadın işgücü tarım sektöründe yoğunlaşırken, gelişmiş ülkelerde kadınların yoğun olarak çalıştığı sektör hizmet sektörü olmaktadır. 2000 yılında hizmetler sektöründe çalışan kadın oranı % 27,3 iken, 2005 yılında % 33,3 olmuştur. Hizmet sektörü içerisinde yer alan turizm sektöründe her geçen gün kadın çalışanların sayısı giderek artış göstermektedir. Öte yandan, turizm sektöründe konaklama işletmelerinde işgören devir hızının oldukça yüksek olması bilinen bir sorundur. İşgören devir hızının yüksek olduğu bölümlerin başında, çok sayıda çalışanıyla mutfak departmanı gelmektedir. İşgören devir hızının yüksek lmasına neden olan unsurlardan birinin, çalışma koşulları olduğunu söylemek mümkündür. Çünkü, mutfaklardaki fiziksel çevreye ait unsurlar, işgörenlerin motivasyonunda ve verimli çalışmasında büyük bir etkiye sahiptir. Mutfakta buhar, koku duman olmadan yemek pişirilmesi mümkün değildir ve mutfakta oluşan hava kirliliğinin sağlığı ciddi şekilde olumsuz etkilediği de görülmüştür. Ayrıca, çalışma ortamında uygun olmayan termal stresin rahatsızlığa ve sağlık sorunlarına neden olduğu ve iş performansını olumsuz etkilediği belirlenmiştir. Bununla birlikte mutfaklarda ; kayma, düşme, yaralanma gibi kazalara da çok sık rastlanmaktadır. Dolayısıyla, fiziksel çevrenin çalışanlara hitap edecek şekilde düzenlenmesi gerekmektedir. Sektör itibariyle sıklıkla mevsimlik çalışma, part-time çalışma, uzun çalışma saatleri, kayıt dışı istihdam ve düşük ücret olumsuzlukları ile karşı karşıya kalınmaktadır. Bunun yanısıra çalışanlar genellikle kapalı alan, yüksek sıcaklık, yetersiz ekipman ve teçhizat gibi fiziki çalışma koşullarının olumsuzlukları ile de baş etmeye çalışmaktadırlar. Bu nedenlerden dolayıdır ki mutfaklarda özveri ile çalışan personele ihtiyaç vardır. Bu personelin önemli bir bölümünü aşçılık mesleğini yapanlar oluşturmaktadır. Mesleki Yeterlilik Kurumu (2010) tarafından hazırlanan ulusal meslek standartlarında aşçı; "*işletme ve bölüm istekleri doğrultusunda, standart reçete ve mönü hazırlama, yerel, ulusal ve dünya mutfaklarına ait çorba ve konsomeleri, sıcak ve soğuk sosları, hamur işi yemeklerini, et ve su ürünleri yemeklerini, sebze ve kuru baklagillerden yapılan yemekleri, zeytinyağlıları, pilav ve makarnaları, sıcak-soğuk mezeleri, salataları, garnitürleri ve tatlıları reçete/mönülere ve hijyen kurallarına uygun olarak hazırlama ve servis için sunuma hazır hale getirme bilgi ve becerisine sahip kişi*" olarak tanımlanmaktadır. Aşçılık, üst düzeyde beceri ve planlı çalışmayı gerektiren bir meslektir.

Genelde mutfak departmanın da aşçı olarak çalışan kadın sayısı oldukça azdır. Sektörde daha az eğitim gerektiren işlerde kadınlar çalıştırılmakta ve buna dayalı olarak finansal olarak da az kazanmaktadırlar Toplum içinde kadınlara biçilen temel alanlardan biri mutfak olmasına rağmen bu durumun sektörde karşılık bulmadığını görmekteyiz. Bunun yanı sıra çalışanlar arasında da kadın ve erkek işi ayrımı yapılmaktadır. Burrell vd. (1997) Fransa, İspanya, İtalya ve İngiltere'de konaklama sektöründe çalışan kadınlar üzerinde yapılan bir çalışmada mutfakta kadın ve erkek dağılımında çok fark olmamasına rağmen yapılan iş bakımından farklılıklar tespit edilmiştir. Mutfakta erkekler daha çok yemek yaparken kadınlar temizlik ve bulaşık yıkama işlerinde yer almaktadır. Mok ve Finley(1986), Hong- Kong'da otel yiyecek-hizmet işgörenlerinin iş tatmin düzeylerini demografik değişkenlere göre incelemiş ve iş tatmini ve işgören devri arasındaki ilişkiyi araştırmıştır. Çalışmanın sonuçlarına göre; kadın işgörenlerin erkek işgörenlere, genç işgörenlerin yaşlılara oranla tatmin düzeylerinin daha düşük olduğu sonuçlarına varmışlardır.

Kadınların üzerindeki sorumlulukların yaptıkları işlerin performansını etkileyeceği düşünülmektedir. Özelllikle kesintisiz hizmet esasına dayanan turizm işletmelerinin mesai saatlerinin standart değil de karmaşık olabilmesi ve her an işe çağrılabilme olasılığı, bir düzensizlik olarak ortaya çıkmakta ve bu durum sektördeki özellikle evli kadınlar açısından önemli bir sorun teşkil etmektedir. Hizmetlerin çoğunlukla insan emeğine dayandığı mutfak departmanında iş yüklerinin fazla olması durumu, kadınların fiziki özelliklerinden kaynaklanan bu iş yüküne dayanamama eğilimleri ayrı bir sorun olarak karşımıza çıkmaktadır. Çalışma saatlerinin uzunluğundan dolayı yeterince dinlenememe, çalışanların fiziksel dayanıklılıklarını ve dolayısıyla direnç, güç ve dikkat gibi hususları olumsuz etkileyeceğinden, mutfaklarda kazaların oluşmasına neden olabilmektedir. Ergonomik olarak düzenlenmeyen mutfak donanımı çalışanlarda kas ve iskelet sistemi ile ilgili meslek hastalıklarına neden olmaktadır. Bu mutfaklarda kullanılan ekipmanların ağır ve büyük olması burada çalışan kadınlar için zorluklar yaratmaktadır. Çünkü bu kazanları kaldırmak, büyük tencerelerde büyük kepçelerle çok miktarda hazırlanan yemekleri karıştırmak, belki bin kişi için patatesi tek başına soymak ya da on kiloluk mayonezi taşımak gibi hepsi büyük bir emek ve güç gerektiren işlerdir. Bu işlerden dolayı bel kayması, sırt kaslarının zedelenmesi ve boyun tutulması gibi rahatsızlıklara sık rastlanmaktadır. Bu nedenlerden dolayı turizm işletmeleri mutfaklarında kadın personelin uzun süre istihdam edilmesi zorlaşmaktadır. Ancak Son yıllarda her alanda olduğu gibi mutfak cihazları da teknolojik olarak modern hale gelmiştir. Yeni teknoloji ile donatılmış bu aletler, farklı biçimleri, renkleri, kontrol elemanları, dijital göstergeleri, programlanabilir olmaları nedeniyle mutfakta

 Copyright © International Science and Technology Conference (ISTEC)

çalışanların işini kolaylaştırmıştır. Günümüz modern mutfakları sayesinde kadınlarda, geçmişte imkansız denilebilecek işleri artık başarabilmektedirler. Böylece teknoloji kadınları tamamen destekliyerek turizm sektöründeki mutfaklarda erkeklerle eşit bir şekilde çalışabilme ortamını sağlamıştır. Teknolojinin bu olumlu etkisiyle birlikte mutfaklarda teknolojik yeniliklere uyum sağlıyacak nitelikli işgücüne ihtiyaç vardır. Bunun için sektörde erkek çalışanların yanı sıra kadın işgücünün eğitim seviyesini yükseltecek örgün ve yaygın eğitim imkânları kullanılarak istihdam edilebilirlik artırılmalıdır. Son yıllarda aşçılık mesleğine olan ilginin arttığı söylenebilir. Bununla birlikte birçok üniversite de önlisans düzeyinde aşçılık programları ile lisans düzeyinde Gastronomi bölümleri açılmıştır. 2011 yılında aşçılık programı sayısı 43 olup , 2014 yılında bu sayı 91' e yükselmiştir. Böylece giderek artış gösteren nitelikli kadın aşçı ihtiyacı bu bölümlerden mezun olan öğrencilerin yiyecek içecek sektörü mutfaklarında istihdam edilmesiyle karşılanacaktır. Bu konuda işletmeler de, mezun öğrencilerin meslekleri konusunda ilerlemelerini sağlamalıdır. Ayrıca, mesleğe karşı olumlu izlenimler sağlayarak, aşçılık eğitimi almış öğrencilerin kendilerini geliştirme de çeşitli fırsatlar sunmalıdırlar.

SONUÇ

Turizm sektörü; dinamik bir sektör olarak ülke ekonomilerine milli gelir açısından önemli bir pay oluşturmaktan, istihdam yaratmaya kadar pek çok katkı yapmaktadır. Turizm sektörü, bu konumu nedeniyle, işsizlik sorunu yaşanan Türkiye gibi gelişmekte olan ülkeler açısından önemli bir sektör haline gelmiştir.

Turizm sektörünün içerisinde yer alan yiyecek- içecek sektörü de aynı hızla gelişmektedir. Ancak istihdam durumuna bakıldığında Turizm sektörünün genelinde kadın çalışan oranının diğer sektörlere göre daha fazla olmakla birlikte yiyecek içecek üretimi yapan işletme mutfaklarında yeterli çoğunluğa ulaşılamadığı görülmektedir. Mutfaklardaki İş yükü ve çalışma sürelerinin fazlalığı özellikle hem erkek hem de bayan çalışanların sorunları arasında büyük bir yer tutmakla birlikte, bu konuyla ilgili olarak iş- görev dağılımı bayanların fiziksel özellikleri ve ailesel boyuttaki sorumlulukları düşünülmelidir. İşletmeler genelde nitelikli işgören istihdam etmeyi sadece gider olarak değerlendirmekte; kaliteli, nitelikli çalışanların sağlayacağı yararlar göz ardı edilmektedir. Bu bakımdan, sektör genelinde mesleki eğitim alan kişilerin istihdam oranı da çok düşük seviyelerdedir. Oysa işletme kalitesinin ve tercih edilme sebeplerinin başında hizmet kalitesinin geldiği yadsınamaz bir gerçektir. Hizmet kalitesi konusunda eğitimli, müşteri ile birebir iletişimde uzman ve başarılı çalışanlar sayesinde başarılabilir. Bu nedenle Turizm işletmeleri, yeni personel politikaları belirlemelidir. İşletmelerin düzenleyecekleri bu politikalar içerisinde işe alım sürecinde eşit değerlendirme, eşit ücret imkanı, sosyal haklar anlamında eşitlik, çalışma saatlerinde eşitlik, kariyer imkanları anlamında ortak imkanlar sağlanması, kariyer değerlendirme sırasında ise önyargılardan uzak eşit şartlarda değerlendirme, yeterli eğitime ve meslek becerisine sahip personel istihdamı gibi konularda düzenlemelere gidilmelidir. Bu düzenlemeler sayesinde yiyecek içecek işletme mutfaklarında aşçılık mesleğini yapmak isteyen kadın istihdamında da önemli bir artış sağlanabilir.

ÖZET: Bilgi teknolojilerindeki hızlı gelişmeler bireyleri yaşamın her alanında etkilemektedir. Bireyler akıllı telefonlarla çektikleri resimleri, tablette kullanılan metin dosyalarını ve dizüstü bilgisayarlarda izledikleri filmleri birbiriyle bağlantılı olarak bulundukları her yerden ulaşma ve paylaşma imkânına bulut teknolojisiyle kavuşmuşlardır. Bu teknoloji, internet bağlantısı olan tüm cihazlardan sanal ortamdaki kişisel veri depolama alanına ulaşıp kayıtlı öğeleri kullanma imkânı sağlamaktadır. Ancak teknolojinin kullanımında tüketiciler açısından en başta güvenlik endişeleri olmak üzere çeşitli riskler bulunmaktadır. Bu ortamda teknoloji kabulü teknolojinin başarı sağlamasında kritik rol oynayan faktörlerden biridir. Bu çalışmada genç tüketicilerin teknoloji kullanım ve kabulleri UTAUT (Birleşik teknoloji kabul ve kullanım modeli (Unified Theory of Acceptance and Use of Technology) modeli yardımıyla incelenmiştir. Çalışma üniversite öğrenci örneklemi üzerinde gerçekleştirilmiş olup, araştırma sonucunda UTAUT modelini oluşturan faktörler arasındaki ilişkiler ortaya konmuştur.

Anahtar Kelimeler: Teknolojik Yeniliklerin Benimsenmesi, Bulut Teknolojisi, UTAUT Modeli, Teknoloji Kabulü, Teknoloji Kullanımı

CONSUMERS' TECHNOLOGICAL INNOVATIONS ADOPTION: INVESTIGATION OF THE CLOUD TECHNOLOGY ADOPTION USING THE UTAUT MODEL

ABSTRACT: The rapid developments in information technology affect individuals in all areas of life. Today, individuals have the opportunity to use and share the photos taken with smartphones and text files used in tablets and the movies they watch in laptops, which are connected with each other from anywhere with the cloud technology. This technology provides the opportunity to reach a personal data storage of the registered items in a virtual environment from any device with an internet connection. However, there are various risks of the use of technology, including safety concerns for consumers in the first place. In this environment, ensuring the success of the technology acceptance technology is one of the factors that play a critical role. In this study, the use of technology and acceptance of young consumers was analyzed by UTAUT (Unified Theory of Acceptance and Use of Technology) model. The study has been carried out on the sample of undergraduate students and the research results demonstrate the relationships between the factors composing the UTAUT model.

Keywords: Adoption of Technological Innovations, Cloud Technology, UTAUT Model, Technology Acceptance, Use of Technology

1. Giriş

Kablosuz internet teknolojisindeki gelişmeler, dev boyutlardaki verilerin saklanıp paylaşılabilmesi ve mobil cihazların artan popülaritesi bulut teknolojisine olan ilginin artmasını sağlamıştır (Cao vd., 2013). Teknoloji kabul modelleri arasında en sık kullanılanı Davis vd. (1989) tarafından ortaya konan Teknoloji Kabul Modelidir (Technology Acceptance Model - TAM). Modele yıllar içerisinde yapılan ilave ve değişikliklerle Venkatesh ve arkadaşları (2003) tarafından *Birleşik Teknoloji Kabul ve Kullanım Modeli* (the Unified Theory of Acceptance and Use of Technology - UTAUT) modeli geliştirilmiştir (Wang vd., 2006). Model literatürde geçmişte kullanılan ölçüm araçlarından çok daha iyi bir oranla kullanıcıların teknolojiyi kabul ve kullanımını açıklamayı başarmıştır (El-Gayar ve Moran, 2006).

Bu çalışmanın amacı, UTAUT modeli çerçevesinde genç tüketicilerin bulut teknolojisini kabul ve kullanımlarını etkileyen faktörler arasındaki ilişkileri araştırmaktır. Çalışmanın devamında ilk olarak bulut teknolojisi ve UTAUT modeli çerçevesinde tüketicilerin teknoloji kabulüne yönelik literatür taraması gerçekleştirilmiştir. Sonrasında araştırma modeli ve modele ilişkin hipotezler ortaya konmuştur. Daha sonra ise araştırma metodolojisi ve araştırmada elde edilen sonuçlar analiz edilerek araştırma sonuçları değerlendirilmiştir.

2. Literatür Taraması

2.1.Bulut Teknolojisi

Bulut teknolojisi, internet üzerinden hizmet olarak sunulan uygulamalar ve veri merkezlerinde bu hizmetleri sağlamak amacıyla bulunan donanım ve sistemsel yazılımlardır. Veri merkezlerinin söz konusu donanım ve yazılımları 'Bulut' olarak isimlendirilmektedir (Armbrust vd., 2009). ABD Ulusal Standartlar ve Teknoloji Enstitüsü (National Institution of Standards and Technology - NIST) bulut teknolojisini "*Düşük çaba veya servis sağlayıcısı etkileşimiyle hızlı alınıp iletilebilen, ayarlanabilir bilişim kaynaklarının paylaşıma açık havuzuna istendiğinde uygun bir şekilde ağ erişimi sağlayan model*" olarak tanımlamaktadır (Mell ve Grance, 2011: 3).
Bulut teknolojisi, kullanıcıların hesaplarına ve depolama alanlarına internet üzerinden farklı cihaz ve bölgelerden ulaşabilmelerine olanak sağlamaktadır (Seyrek, 2011). Bulut bilişim teknolojisinin hizmet modelleri temelde *altyapı hizmeti, yazılım hizmeti ve platform hizmetleri* olmak üzere üç grupta toplanmaktadır. Altyapı hizmeti, kullanıcıların çeşitli yazılım ve uygulamaları kurulup çalıştırılabildiği, depolama, işleme ve ağ gibi birçok bilgisayar hizmetini kullanabildiği bir altyapı hizmetinden oluşmaktadır. Kullanıcılar, altyapıyı bizzat kendileri yönetemeseler de depolama alanları, işletim sistemleri ve yüklenen programlar üzerinde kontrol sahibi olabilirler. Yazılım hizmeti, bulut altyapısı üzerinde bulunan uygulamaların kullanıcıların hizmetine sunulmasını içermektedir. Platform hizmetleri ise uygulama geliştirenlerin bulut hizmetinin sağlayıcısı tarafından desteklenen araç, hizmet ve programlama dillerini kullanarak çeşitli uygulamaları oluşturabilmesine yönelik hizmetlerdir (Mell ve Grance, 2011).

Bulut teknolojisi özellikle Dropbox, Apple iCloud ve Google Drive gibi popüler uygulamalar öncülüğünde son yıllarda hızla gelişmektedir (Moryson ve Moeser, 2016). Bulut teknolojisi, farklı cihazlardan kişinin bulunduğu yer ve zaman fark etmeksizin internet bağlantısı olan her yerden tüm dosyalarına ulaşma imkânı verdiği için tüketicilere birçok fonksiyonel fayda sağlamaktadır. Aynı zamanda tüketiciler fiziki depolama aygıtları taşıma zahmetinden de kurtulmaktadırlar. Dolayısıyla tüketiciler arasında bulut hizmetlerinin daha çok depolama amaçlı kullanımı ön plana çıkmaktadır.

2.1 Teknoloji Kabulü ve UTAUT Modeli

Bulut teknolojisinin kabulü hakkında yapılan literatür taraması sonucunda, bu yeni teknolojinin kabulünün önündeki en büyük engellerin güvenlik ve gizliliğe yönelik endişeler olduğu görülmektedir. Seyrek (2011) çalışmasında, firmalar açısından değerli verilerin kaybolması veya çalınmasının kritik zararlara sebebiyet vereceğini belirtmiştir. Moryson ve Moeser (2016) de çalışmalarında UTAUT modelinin değişkenlerine ek olarak algılanan güvenlik riski faktörünü de modele dâhil etmiştir.
UTAUT modeli öncesinde literatürde teknoloji kabulünde kullanılan modeller incelendiğinde en yaygın olarak Davis vd. (1989) tarafından geliştirilen TAM modelinin kullanıldığı görülmektedir. Bu model, bireyin yeni teknoloji kabulünü; bireylerin kullanma niyeti ve davranışları arasındaki ilişkilerle açıklamayı amaçlamaktadır. Model, algılanan kullanışlılık, algılanan kullanım kolaylığı ve bireyin davranışa dönük niyeti olarak belirlenen temel unsurlara dayanmaktadır. Venkatesh ve arkadaşları (2003) çalışmalarında sekiz farklı bilgi teknolojileri kabül modelini incelemişlerdir. Farklı çalışmalarda incelenen bu modeller; nedenli eylem teorisi (the theory of reasoned action - TRA) (Ajzen and Fishbein, 1980); teknoloji kabul modeli (Technology Acceptance Model) (Davis vd. 1989); motivasyonel model (motivational model) (Davis vd., 1992); planlı davranış teorisi (the theory

 Copyright © International Science and Technology Conference (ISTEC)

of planned behavior) (Ajzen, 1991); birleştirilmiş teknoloji kabul modeli ve planlı davranış modeli (a model combining the technology acceptance model and the theory of planned behavior) (Taylor ve Todd, 1995); PC kullanımı modeli (the model of PC utilization) (Thompson vd., 1991); yenilik yayılma teorisi (the innovation diffusion theory) (Rogers, 1995) ve sosyal biliş teorisi (the social cognitive theory) (Compeau vd., 1995) olarak ele alınmaktadır.

Teknoloji kabul ve kullanımına ilişkin literatür incelendiğinde UTAUT modelinin birçok farklı alanda kullanıldığı görülmektedir. Örneğin Wang vd. (2006) ile Alawadhi ve Morris (2008) e-devlet hizmetleri, Carlsson vd. (2006) mobil cihaz ve hizmetleri, El-Gayar ve Moran (2006) üniversite öğrencilerinin tablet bilgisayar kullanımları, Cheng vd. (2008) ile Foon ve Fah (2011) internet bankacılığı, Yu (2012) ile Zhou vd. (2010) mobil bankacılık, Zhou (2011) mobil internet kullanımı, Oktal (2013) bilgi sistemlerinin kullanımı konularını içeren çalışmalarında UTAUT modelini kullanmışlardır.

Venkatesh ve arkadaşları (2003) çalışmalarında teknoloji kabul ve kullanım davranışının doğrudan belirleyicisi olan *performans beklentisi, çaba miktarı, sosyal etki ve altyapı durumu* olmak üzere dört temel faktörü ele almışlardır.

Performans beklentisi faktörü, bireyin teknoloji kullanımı sonucunda iş performansında sağlayacağı gelişim ve faydalar olarak tanımlanmaktadır. Zhou ve arkadaşları (2010) çalışmalarında performans beklentisinin, kullanıcının teknoloji kullanımı sonucunda elde edeceği performans gelişim beklentisini yansıttığını belirtmiştir. Wang ve arkadaşları (2006) ise çalışmalarında, performans beklentisi faktörünün kullanıcıların mobil cihaz ve hizmetleri kullanma niyetini pozitif olarak etkilediği sonucuna ulaşmışlardır. Cao ve arkadaşları (2013) da çalışmalarında performans beklentisi faktörünün bulut teknolojisinin kabulünde pozitif etkiye sahip olduğunu bulmuşlardır. Carlsson ve arkadaşları (2006) ise çalışmalarında, performans beklentisi faktörünün kullanıcıların mobil cihaz ve hizmetleri kullanıma niyeti üzerinde doğrudan etkileye sahip olduğu sonucuna ulaşmışlardır.

Çaba beklentisi faktörü, teknolojiyi kullanmanın ne kadar çaba gerektirdiğini ve kullanım kolaylığının ne kadar olduğunu ifade etmektedir. Bu faktör, teknolojiyi kullanmanın bireyler açısından ne kadar zor olduğuyla ilişkilendirilmektedir (Zhou vd., 2010). Cheng ve arkadaşları (2008) çaba beklentisi faktörünü, teknolojinin kullanımına ilişkin kolaylık derecesi olarak tanımlamıştır. Bulut teknolojisi geçmişte kullanılan geleneksel depolama yöntemlerinden farklılık gösterdiğinden ve bireylerin kullanımı için internet kullanımı konusunda bilgi sahibi olunmasını gerektirdiğinden özellikle bilişime uzak kişilerin öğrenmek için daha fazla çaba göstermesi gerektirmektedir.

Sosyal etki faktörü, birey için önemli olan kişilerin söz konusu yeni teknolojinin kullanımını ne kadar önemli gördüğünü ifade etmektedir (Cheng vd., 2008). Sosyal medya ve dijital ortamın hızlı gelişimi, bireylerde özellikle medya dosyalarına tüm araçlardan ve her yerden ulaşma isteğini doğurmuştur.

Modelin bir başka faktörü olan altyapı koşulları faktörü ise, organizasyonel ve teknik altyapının bireyin teknolojiyi kabul ve kullanımını destekleme derecesi olarak tanımlanmaktadır (Venkatesh vd., 2003). Bireysel açıdan bakıldığında bu faktör, kullanıcının teknoloji kabulünü hızlandırıp, engelleri ortadan kaldıracak kolaylaştırıcı koşullar olarak görülmektedir. Belirtilen bu etkiler kullanıcıda teknoloji kullanımına yönelik bir niyet oluşturmakta ve bu niyet zaman içerisinde kullanma davranışına dönüşebilmektedir.

3. Araştırma Modeli ve Hipotezler

Cao ve arkadaşları (2013) bulut teknolojilerinin kabulünü UTAUT modeli aracılığıyla inceledikleri çalışmalarında, orijinal UTAUT modeline ek olarak bulut teknolojisinin karakteristiğinden kaynaklanan üç farklı dış faktörü de araştırma modellerinde kullanmışlardır. Bunlar algılanan risk, algılanan maliyet ve bireysel yenilikçilik faktörleridir. Kullanıcıların bulut teknolojisinin kullanımında algılanan riskler; gizliliğin korunması, veri güvenliği ve hizmete ulaşabilme başlıkları altında ele alınmıştır. Bulutta saklanan veriler çoğunlukla fotoğraf, çalışma verileri ve/veya iletişim bilgileri gibi kişisel verileri içerdiğinden tüketicilerin hizmetin güvenlik ve güvenirlilik gibi yönlerine olan talepleri yoğun biçimde ortaya çıkmaktadır. Ayrıca bulut hizmeti tamamen internete bağımlı bir yapı olduğundan, internet ağına bağlanamayan kullanıcılar hizmeti kullanamamakta ve sonuçta verilerine ulaşamamaktadırlar. Algılanan maliyet, bireylerin hizmet kullanımı için katlanacakları algılan maliyet düzeyi olarak ifade edilebilir. Son olarak verilerin bulutta saklama teknolojisi geleneksel saklama metotlarından farklı olduğundan bireyin yenilikçi yapısı da bireylerin teknoloji kabul sürecine etkide bulunacaktır (Cao vd., 2013).

Bu çalışmada bulut teknolojisinin kabulüne etki eden UTAUT modeli faktörleri ve bu faktörlerin birbirlerini nasıl etkilediği incelenmiştir. Bu kapsamda ilgili literatürden yararlanılarak oluşturulan teknoloji kabul ve

 Copyright © International Science and Technology Conference (ISTEC)

kullanımına pozitif ve/veya negatif etkide bulunması beklenen faktörlere ait hipotezler aşağıdaki tablo 1'de belirtilmiştir.

Tablo 1. Araştırmanın hipotezleri

H1	Kolaylaştırıcı koşullar, performans beklentisi üzerinde olumlu etkiye sahiptir.
H2	Performans beklentisi, özgüven üzerinde olumlu etkiye sahiptir.
H3	Özgüven, sosyal etki üzerinde olumlu etkiye sahiptir.
H4	Kolaylaştırıcı koşullar, çaba beklentisi üzerinde olumlu etkiye sahiptir.
H5	Kolaylaştırıcı koşullar, kaygı üzerinde olumsuz etkiye sahiptir.
H6	Sosyal etki, kaygı üzerinde olumsuz etkiye sahiptir.
H7	Performans beklentisi, niyet üzerinde olumlu etkiye sahiptir.
H8	Kolaylaştırıcı koşullar, niyet üzerinde olumlu etkiye sahiptir.

Çalışmanın sonraki aşamalarında yukarıda tablo 1'de belirtilen hipotezlerin test edilmesi amacıyla gerçekleştirilen araştırma metodolojisi, verilerin analizi, bulgular ve sonuç başlıkları yer almaktadır.

4. Metodoloji

Bu çalışmanın amacı, UTAUT modeli çerçevesinde genç tüketiciler olarak öğrencilerin bulut teknolojisini kabul ve kullanımlarını etkileyen faktörler arasındaki ilişkileri araştırmaktır. Özellikle genç tüketicilerin teknolojiye olan yatkınlığı ve ilgisi, bulut teknolojisi gibi yeni teknolojilerin kabul ve kullanımına etki eden faktörlerin ve bu faktörler arasındaki ilişkilerin belirlenmesini gerektirmektedir. Bu bağlamda bu çalışmadan elde edilecek sonuçlar, teknoloji şirketlerinin pazarlama stratejilerinin belirlenmesine yarar sağlayacaktır

Araştırmanın örneklemi Uludağ Üniversitesi İşletme bölümü lisans öğrencilerinden oluşturmaktadır. Araştırmada pratik ve maliyetsiz olmasından dolayı kolayda örnekleme yöntemi kullanılmıştır. Oldukça yaygın olarak kullanılan bu teknik, en ucuz ve kolay bir şekilde örnek kütleye ulaşıldığı için (Coşkun vd., 2015; Gürsakal, 2009) tercih edilmiştir. Araştırma 1-20 Haziran 2016 tarihleri arasında uygulanmıştır. Anket verileri yüz yüze görüşme yöntemiyle elde edilmiştir.

Anket formu iki bölümden oluşmaktadır. İlk bölümde araştırmanın ana konusunu içeren beşli Likert ölçeğine ait 27 soru, devamında ise anket katılımcılarının demografik verilerini içeren kategorik sorular bulunmaktadır. Likert ölçeğindeki soru ifadeleri Venkatesh tarafından 2003 yılında geliştirilen UTAUT modeline ait ifadelerdir. Ölçek sosyal etki, özgüven, performans beklentisi, niyet, kolaylaştırıcı etkiler, çaba beklentisi ve kaygı olmak üzere 7 faktörden oluşmaktadır. Anket formları lisans öğrencilerine yöneltilmiş ve araştırma sonunda analizde kullanılabilir 150 adet ankete ulaşılmıştır.

5. Analiz ve Bulgular

Araştırmanın analizi IBM SPSS ve AMOS programlarının yardımıyla gerçekleştirilmiştir. Araştırmaya katılan cevaplayıcıların yaş ve cinsiyet gibi demografik verileri incelendiğinde; katılımcıların % 52,7'sinin (79 kişi) bayan, %47,3'ünün (71 kişi) erkeklerden oluştuğu görülmektedir. Araştırma öğrenci örneklemi üzerinde uygulandığından, katılımcıların %95'inin 19-24 yaş aralığında, geri kalan kısmının ise 25-32 yaş aralığında olduğu görülmüştür. Katılımcıların gelir seviyeleri incelendiğinde ise, %36'sının (54 kişi) 500 TL ve daha az, %27,3'ünün (41 kişi) 501-1000 TL, %20'sinin (30 kişi) 1001-1500 TL, %7,3'ünün (11 kişi) 1501-2000 TL, geri kalan %9,3'ünün ise 2001 TL ve üzeri gelire sahip olduğu bulunmuştur.

Araştırma verileri üzerinde yapılan analizler neticesinde verilerin güvenilirlik değeri (cronbach alpha: ,727) uygun değer aralığında gerçekleşmiştir. Ayrıca verilerin basıklık ve çarpıklık değerleri literatürde kabul edilen sınırlar içerisinde bulunmuş olup, elde edilen KMO ve Bartlett Testi Sonuçları aşağıdaki tablo 2'de gösterilmiştir.

Tablo 2. KMO ve Bartlett Testi Sonuçları

Kaiser-Meyer-Olkin Measure of Sampling Adequacy		,742
Bartlett's Test of Sphericity	Yaklaşık ki-kare değeri	1148,020
	Serbestlik Derecesi	190
	Anlamlılık	,000

Her bir maddenin kendi içerisinde doğru değişkene ait olduğunun saptanması için faktör analizi gerçekleştirilmiş ve kendi grubu içerisinde toplanmayan 5 madde analizden çıkarılmış, tekrarlanan analiz sonuçları geri kalan 20 maddelerin kendi aralarında doğru faktörlerde (7 faktör) toplandığını ortaya koymuştur. Sonraki aşamada AMOS programı yardımıyla kurulan modelde faktörlerin birbirlerini etkileme düzeyleri incelenmiştir. Aşağıdaki tablo 3'de de görüleceği üzere ortaya konan modelin uygunluk değerleri, literatürde kabul gören değer aralıkları içerisinde gerçekleşmiştir.

Tablo 3. Modelin Uygunluk Değerleri

Değer	**Gerçekleşen Değer**	**İyi Derece Uygunluk**	**Literatürde Kabul Gören Değer Aralıkları**
p (olasılık değeri)	,229	$.05 < p \leq 1.00$	$.01 \leq p \leq .05$
CFI	,987	$.97 \leq CFI \leq 1.00$	$.95 \leq CFI < .97$
AGFI	,865	$.90 \leq AGFI \leq 1.00$	$.85 \leq AGFI < .90$
RMSEA	,023	$0 \leq RMSEA \leq .05$	$.05 < RMSEA \leq .08$
$\chi 2$/s.d.	1,081	$0 \leq \chi 2/$ s.d. ≤ 2	$2 < \chi 2/$ s.d. ≤ 3
CFI: Comparative Fit Index – Karşılaştırmalı Uyum Endeksi, AGFI: Adjusted Goodness of Fit Index – Ayarlanmış Uyum İyiliği Endeksi, RMSEA: Root mean square extracted approximation – Ortalama hata karekök yaklaşımı, $\chi 2$: ki kare, s.d. : Serbestlik Derecesi			
Kaynak: Schermelleh-Engel, K., Moosbrugger, H., and MULLER, H. (2003), "Evaluating the Fit of Structural Equation Models: Tests of Significance and Descriptive Goodness-of-Fit Measures", Methods of Psychological Research Online, Vol. 8, No. 2, p. 52.			

Araştırmada faktörlerin birbirlerini etkileme düzeyleri hakkında önerilen hipotezlere ilişkin sonuçlar aşağıdaki tablo 4'te gösterilmiştir.

Tablo 4. Hipotez Testi Sonuçları

	Etkiler	**Gerçekleşen Değer**	**Hipotez Testi Sonucu**
H1	Kolaylaştırıcı Koşullar → Performans Beklentisi (+)	,415	KABUL
H2	Performans Beklentisi → Özgüven (+)	,410	KABUL
H3	Özgüven → Sosyal Etki (+)	,188	KABUL
H4	Kolaylaştırıcı Koşullar →Çaba Beklentisi (+)	,595	KABUL
H5	Kolaylaştırıcı Koşullar → Kaygı (-)	-,387	KABUL
H6	Sosyal Etki → Kaygı (+)	,352	KABUL
H7	Performans Beklentisi → Niyet (+)	,356	KABUL
H8	Kolaylaştırıcı Koşullar → Niyet (+)	,318	KABUL

Yukarıdaki tablo 4 incelendiğinde, bulut teknolojisine ilişkin olarak kolaylaştırıcı koşulların performans beklentisi, çaba beklentisi ve niyet üzerinde olumlu etkisinin, buna karşın kaygı üzerinde negatif etkisinin bulunduğu görülmektedir. Performans beklentisi faktörünün özgüven ve niyet üzerinde pozitif etkisi olduğu, sosyal etkinin de kaygı üzerinde pozitif etkiye sahip olduğu görülmektedir. Ayrıca özgüven faktörünün sosyal etki üzerindeki pozitif etkisinin bulunduğu da araştırmanın önemli sonuçları arasındadır.

Elde edilen sonuçlar değerlendirildiğinde işletmeler bulut teknolojisine ilişkin olarak gerçekleştirecekleri kolaylaştırıcı koşullar aracılığıyla bulut teknolojisinin tüketicileri olan kullanıcıların performans beklentilerini arttırabilirler, kullanıcıların kendilerine özgüven duymalarını sağlayabilir, yeni teknolojiye uyum sağlamak için kabul ettikleri çaba miktarını da olumlu yönde etkileyebilirler. Ayrıca tüketicilerin yeni teknolojiyi benimseme ve kullanmaya yönelik niyetlerini de yönlendirebilirler. Bu anlamda bulut teknolojisinin kabul ve kullanımındaki en önemli faktörlerden birisi olarak kolaylaştırıcı koşullar faktörü ön plana çıkmaktadır.

6. Sonuç

İnternet kullanımı, kablosuz internet teknolojisinin yaygınlaşmasıyla birlikte hızla artmaya devam etmektedir. Günümüzde bireyler yaşamlarının her alanında internet teknolojisinden faydalanmaktadır. Kişisel verilere her an ve her yerden erişime duyulan ihtiyaç, günümüzde fiziki veri depolama ve taşıma aygıtlarının zaman içerisinde yerini tamamen bulut teknolojisine bırakmasına neden olacaktır. Araştırmacıların özellikle güvenlik ve gizlilik endişeleri göz önüne alındığında hangi faktörlerin bireylerin bulut teknolojisi kullanımlarına etkide bulunacağı önem taşımaktadır.

Bu araştırmadan elde edilen sonuçlar değerlendirildiğinde işletmeler bulut teknolojisine ilişkin olarak gerçekleştirecekleri kolaylaştırıcı koşullar aracılığıyla bulut teknolojisinin tüketicileri olan kullanıcıların performans beklentilerini arttırabilirler, kullanıcıların kendilerine özgüven duymalarını sağlayabilir, yeni teknolojiye uyum sağlamak için kabul ettikleri çaba miktarını da olumlu yönde etkileyebilirler. Ayrıca tüketicilerin yeni teknolojiyi benimseme ve kullanmaya yönelik niyetlerini de yönlendirebilirler. Bu anlamda bulut teknolojisinin kabul ve kullanımındaki en önemli faktörlerden birisi olarak kolaylaştırıcı koşullar faktörü ön plana çıkmaktadır.

Her çalışmada olduğu gibi bu araştırmanın da çeşitli sınırlamaları bulunmaktadır. Zaman, maliyet ve çaba gereksiniminden dolayı araştırmada örnekleme yöntemi olarak kolayda örnekleme yöntemi seçilmiş ve araştırma öğrenci örneklemi üzerinde gerçekleştirilmiştir. Bu sınırlama araştırmanın sonuçlarının genelleştirilmesini kısıtlamaktadır. Gelecekte yapılacak çalışmalarda araştırma örnekleminin farklı gelir seviyesine sahip bireylerin olduğu daha geniş bir örneklem üzerinde gerçekleştirilmesi, araştırma sonuçlarının genelleştirilmesine imkân sağlayacaktır.

ÖZET: Bireylerin tüketim davranışları yalnızca ürünlerin fonksiyonel faydalarından değil, sembolik anlamlarından da etkilenmektedir. Tüketicilerin yaptıkları tüketim seçimlerine çeşitli anlamlar yükledikleri bu yapıda kuşkusuz yerli ve yabancı ürünlere yönelik tutumları önemli rol oynamaktadır. Günümüz dünyası mesafelerin giderek kısaldığı bir yapıdadır ve kültürlerin birbirlerini aktif biçimde etkilemeleri kaçınılmaz olmuştur. Çalışmada bu etkileşim düşüncesinden hareketle *Kozmopolit Tüketici Tutumu* incelenmiştir. Kozmopolit tüketici tutumu, bireylerin yerel tüketim kalıplarından sıyrıldıkları, farklı kültürlere ait ürünlerin varlığından ve bu ürünleri tüketmekten hoşnut oldukları açık fikirli bir yapıyı ifade etmektedir. Lisansüstü eğitim görmüş bireyler üzerinde gerçekleştirilen araştırma sonuçları, kozmopolit bireylerin bu tutumlarını tüketim davranışlarına da yansıttığını ve yüksek eğitim düzeyindeki bireylerin etnosentrik bir tutumdan ziyade farklılaşmak amacıyla yabancı ürün tüketimini destekleyen kozmopolit bir tutum sergilediklerini ortaya koymaktadır. Ayrıca araştırma sonucunda yerli ürün tüketimini destekleyen etnosentrik tutum ile kozmopolit tüketici tutumunun birbirleriyle negatif ilişkide olan yapılar olduğu bulunmuştur.

Anahtar Sözcükler: Kozmopolitanizm, Menşe Ülke Etkisi, Yabancı Ürün Tercihi, Tüketici Kozmopolitanizmi, Etnosentrizm

CONSUMER ATTITUDES TOWARDS DOMESTIC AND FOREIGN PRODUCTS: INVESTIGATION OF COSMOPOLITAN CONSUMER ATTITUDE ON POST-GRADUATE INDIVIDUALS

ABSTRACT: Consumers consumption behavior influenced by not only functional beliefs but also symbolic meanings of products. The structure which consumers install various meanings to their consumption choices is undoubtedly affected by attitudes towards domestic and foreign products. Today, cultures actively affecting each other because of closing distances. Driven from this interaction idea this study examines *Cosmopolitan Consumer Behavior*. Cosmopolitan consumer behavior refers to an open-minded nature which individuals stripped of their local consumption patterns and grateful of the presence of the products of different cultures and satisfied from consuming these products. Research was conducted on post-graduate individuals reveals that they exhibit a cosmopolitan attitude rather than an ethnocentric attitudes that supports the foreign product consumption in order to differentiate from others. Moreover, it was found that cosmopolitan consumer attitudes and ethnocentric attitudes that support domestic consumption the product is made have negative correlation with each other.

Keywords: Cosmopolitanism, Country of Origin Effect, Foreign Product Choice, Consumer Cosmopolitanism, Ethnocentrism

* Bu çalışma, Prof. Dr. Murat Hakan ALTINTAŞ'ın danışmanlığında yürütülen Can Efecan AKHAN'ın "Tüketicilerin Yerli ve Yabancı Ürünlere Yönelik Tutumları: Kozmopolit Bakış Açısına Yönelik Bir Araştırma" başlıklı yüksek lisans bitirme tezinden geliştirilmiştir.

1. GİRİŞ

Uluslararası pazarlarda başarı sağlamak isteyen firmalar açısından faaliyette bulundukları ülkelerdeki tüketici tercihlerini anlamak ve bu tercihleri etkileyen faktörleri doğru analiz edebilmek, yabancı pazar seçimi ve pazar stratejilerinin oluşturulmasında hayati bir rol oynamaktadır (Shankarmahesh, 2006). Bu noktada tüketicilerin yabancı ürünleri yerli muadillerine veya yerli ürünleri yabancı muadillerine neden tercih ettikleri çok önemli bir soru halini almıştır. Özellikle küreselleşme ve liberalizm dönemi bağlamında, ekonomik düşünce sistemlerinde yaşanan değişimlerin değer, inanç ve yaşam tarzlarında yarattığı etkinin farklı tüketim davranışları ortaya çıkarttığı belirtilmektedir. Böylesi bir değişim tüketicilerin ithal ürünleri yerli alternatiflerine tercih etmelerine neden olacak faktörlerin ve tüketicilerin tipik davranışlarının anlaşılması gerekliliğinden ötürü daha özellikli stratejileri gerekli kılmaktadır (Ma, Wang & Hao, 2012).

Artan göç oranları, milletlerarası etkileşimin artması ve dünyadaki bilgi teknolojilerindeki hızlı gelişmeler neticesinde çoğu ülkede yeni bir kültür ortaya çıkmıştır. Söz konusu bu kültür paylaşılan dünya ve insanlığın refahı gibi kavramları ortaya çıkarmış, bireyler farklı toplumlara empati ve anlayış hisleri göstermeye başlamış, bu durum uluslararası ticaret bağlamında tüketici dünya görüşlülüğü olarak tanımlanmıştır (Sunardi, 2009). Seyahat ve uluslar arası sosyal medya aracılığı ile küresel trendlerle doğrudan etkileşim içerisinde olmak, bireyde dünya görüşlü bir tutumun oluşmasını tetikleyebilmektedir. Bu etkileşim farklı kültürlerden alışkanlıklar, adetler ve ürünlere olan alışkanlığı arttırmakta ve tüketicilerde en azından deneme hissi uyandırmaktadır (Nijssen&Douglas, 2008).

2. KOZMOPOLİT TÜKETİCİ TUTUMU

Artan göç oranları, farklı ülkelerden evlat edinmeler, milletlerarası evlilikler ve dünyadaki bilgi ve iletişim teknolojilerindeki hızlı gelişmeler neticesinde çoğu ülkede yeni bir kültür ortaya çıkmıştır. Bu melez kültür paylaşılan dünya ve insanlığın refahı gibi kavramları ortaya çıkarmış, bireyler farklı toplumlara empati ve anlayış hisleri göstermeye başlamış, bu durum uluslararası ticaret bağlamında tüketici dünya görüşlülüğü olarak tanımlanmıştır (Sunardi, 2009). Seyahat ve uluslararası sosyal medya aracılığı ile küresel trendlerle doğrudan etkileşim içerisinde olmak, bireyde dünya görüşlü bir tutumun oluşmasını tetiklemekte, bu etkileşim farklı kültürlerden alışkanlıklar, adetler ve ürünlere olan alışkanlığı arttırmakta ve tüketicilerde en azından deneme hissi uyandırmaktadır (Nijssen & Douglas, 2008).

Kozmopolitanizm, -Yunanca kosmopolitês- kelime olarak dünya vatandaşı anlamına gelmekte olup, antropoloji ve sosyal psikoloji alanlarından pazarlama alanına çekilmiş bir kavramdır. Yönetim ve pazarlama alanlarında daha fazla kullanım alanı bulan kavram, yönetim ve pazarlama alanlarında her geçen gün daha yoğun kullanım alanı bulmuştur. (Cleveland et al., 2011). Söz konusu dünya vatandaşı fikrinin, günümüzün teknoloji ve iletişim olanaklarıyla daha önce olmadığı ölçüde olanaklı olduğu söylenebilir (Skrbis, Kendall & Woodward, 2004). Kozmopolit bakış açısı, her biri kendine özgü özellikleri içeren farklı kültürlerin oluşturduğu ortak bir yapıyla ilişkileri zorunlu kılmakta; çeşitliliğin kendisine, bireysel tecrübelerde kültürlerin bir arada var olabileceğine yönelik bir duruş içerir. Daha derin bir anlamda kozmopolitanizm her şeyden önce 'diğer' ile iletişime geçmeye yönelik isteklilik ve eğilimdir; farklı kültürel deneyimlere açıklığa yönelik estetik ve entelektüel bir duruş, teklikten ziyade zıtlıkları arama yönelimidir (Hannerz, 1990). Kozmopolitanlar keşfetmekten ve yeni tecrübeler edinmekten keyif alırlar. Bu durum onların 'farklı' olana yönelik hoşgörüsünün bir sonucudur (Rössel&Schroeder, 2015). Bu bağlamda, Kozmopolitanlar kendilerini ait oldukları kültürün önyargılarından sıyırmış kişilerdir (Cannon, 2001).

Kozmopolit tüketici olgusu, tüketicilerin dış gruplara yönelik pozitif yönelimlerin bir sonucudur (Parts, 2011). Kozmopolitanizm bireylerin kendi gruplarından başka bir grup hakkında öğrenme ve farklılıkları tüketme isteğini içeren bir yapı olduğundan, kozmopolit tüketiciler farklı ülke ve kültürlerden ürünler tüketmeye yönelmektedirler. İşte bu noktada menşe ülke bilgisinin ürünün kalitesini belirten bilişsel bir ipucu olmasının yanında, aynı zamanda duygular, kimlik ve geçmiş tecrübe/hislerle olan bağlantısı etkide bulunmaktadır (Gec & Perviz, 2012). Ülkelerin tüketicilerde yarattığı çağrışımlar geçmiş tatillerde yabancılarla gerçekleşen iletişim sonucunda doğrudan oluşabileceği gibi, eğitim hayatı ve kitle iletişim araçları aracılığıyla gerçekleşen,

 Copyright © International Science and Technology Conference (ISTEC)

tüketicilerin ürün veya markalar hakkındaki seçimlerini etkileyen dolaylı çağrışımları da vardır (Verlegh&Steenkamp, 1999).

Kozmopolit tüketici tutumu bireylerin farklı kültür, düşünce ve ürünlere yönelik hoşgörüsünün bir sonucu olarak açık fikirli bir düşünce yapısıyla tüketim davranışlarında kendi kültürlerinin sınırlarının ötesine geçtiği bir yapıyı ifade eder. Bireyin farklı kültürlerle etkileşimi ve farklılıkları tecrübe etmesi, kozmopolit tüketici yapısının gerekliliklerinden olduğundan, bu durum yabancı ürün tüketimini zorunlu kılmaktadır. İşletmeler, geçmişte sadece ulusal pazardaki rakipleriyle rekabet halindeyken günümüzde küreselleşmenin etkisiyle uluslararası pazarlara giren işletmelerle de rekabet halindedirler (Cannon & Yaprak, 2002).

Yukarıdaki açıklamalar ışığında, kozmopolitan tüketicilerin üç özelliğinin olduğu belirtilebilir (Riefler, Diamantopoulos & Siguaw, 2012). Bunlar; farklı ülke ve kültürlere karşı açık fikirli bir bakış açısına sahip olmaları, farklı ulusal ve kültürel ürünlerin çeşitliliğine önem vermeleri ve ithal ürünleri tüketme konusunda istekli olmalarıdır. Açık fikirlilik "Diğer ülke ve kültürlerin özgün öğelerini tecrübe etmeye olan ilgiyi ifade eden önyargılardan uzak bir eğilim'' olarak tanımlanmaktadır. Çeşitlilik arayışı ve çeşitliliği yaşama hissi kozmopolit tüketicilerin genel duruşlarının bir açıklayıcısıdır. Bu duruş, tektipliliğin tercih konusu olduğu bir dünyanın aksine farklılık ve çeşitlilikleri arama istekliliği gündeme getirir (Riefler & Diamantopoulos, 2009) Riefler vd. (2012) kozmopolitan tüketicinin sınırları aşan tüketim boyutunu ''Farklı ülkelerden ürün ve hizmet tüketmeye yönelik bir pozitif eğilim'' olarak tanımlamışlardır. Kozmopolit tüketicileri kültürel sembollere ve etkinliklere olan yakınlıkları, bu kültürlere anlayış gösterme ve bu kapsamda tüketim eğilimlerine sahip olmaları, doğal olarak sanat, müzik ve moda alanlarına yönlenmelerine olanak verir (Cleveland & Papadopoulos, 2009).

Riefler ve Diamantopoulos (2009) yurtdışı seyahatler, kültürlerarası eğitim ve sosyal statü arayışının kozmopolit tüketim eğiliminin öncüllerinden olabileceğini belirtmiştir. Bu durum, kozmopolit tutum bireylerin taşralılıktan kurtulmalarının bir sürükleyicisi olarak algılanabilmektedir. Ülkelerin küresel tüketim sahasına girmeleriyle birlikte rekabet baskısı daha fazla hissedilmekte, hayatta kalabilmek adına daha verimli faaliyetlere ihtiyaç duyulmaktadır. Tüm sektörlerde daha verimli olma sürecinde bir yandan tüketiciler de verimliliğe olan ihtiyaçtaki artışın farkına varmakta, bu ihtiyaç tüketicileri kendilerine avantaj sağlayacak farklı kültürlerden yeni ve daha iyi fikirlere açık hale getirmektedir. Diğer taraftan her geçen yıl iletişim teknolojilerinin günlük yaşama olan etkisi artmasıyla birlikte uluslararası televizyon ağları, uydu bağlantıları, internet ve mobil teknolojiler vasıtasıyla teknolojinin çok hızlı bir biçimde yayılması yabancı ve farklı fikirlerin geçmişe oranla çok daha görünürde ve ulaşılabilir olmasını sağlamıştır.

3. METODOLOJİ

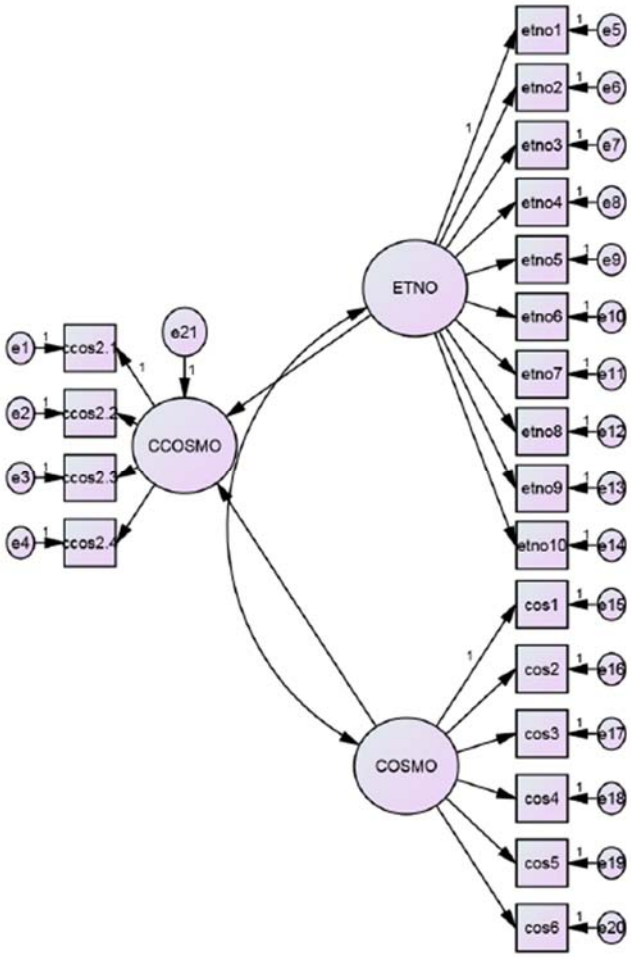
Araştırmanın amacı kozmopolit tüketici kavramının, etnosentrizm ve genel kozmopolitanizm ile olan ilişkisini belirlemektir. Günümüzde milliyetçi hislerin, menşe ülke etkisiyle bağlantılı tüketim tercihlerinin ve ülkelere yönelik tutumların pazarlama alanında giderek daha etkili olduğu göz önüne alındığında, söz konusu kavramlar arasındaki ilişkinin belirlenmesi, tüketici tercihlerinin daha iyi anlaşılabilmesi adına önem taşımaktadır. Bu bağlamda araştırma tüketicilerin kozmopolit bakış açılarının incelenmesi adına; tüketici kozmopolitanizmi, tüketici etnosentrizmi ve genel kozmopolitanizm yapılarını ve bu yapılara ilişkin tutumları kapsamaktadır. Araştırma süresince veriler bu tutumlara ilişkin toplanmıştır.

Araştırmanın soru formunu üç temel yapı oluşturmaktadır. Birinci yapı veya ölçek Shimp ve Sharma (1987) tarafından geliştirilmiş olan 'CETSCALE' adlı tüketici etnosentrizmi ölçeğinin kısa formatıdır. Orijinal hali 17 maddeden oluşan CETSCALE ölçeği, pazarlama yazınında daha önce birçok araştırmada kullanıldığı şekilde 10 maddelik kısa formatında araştırmaya dahil edilmiştir. İkinci yapı veya ölçek Riefler, Diamantopoulos ve Siguaw (2012) tarafından oluşturulmuş olan tüketici kozmopolitanizminin üç boyutlu kavramsallaştırılmasını inceleyen 12 maddelik C-COSMO ölçeğidir. Ölçeğin üç boyutu arasından, tüketimle ilişkisinin daha yüksek olduğundan hareketle 2. boyutu olan 4 maddelik 'Çeşitlilikten hoşnut olma' boyutu araştırmada kullanılmıştır. Son yapı ise Riefler, Laroche ve Papadopoulos'un (2009) çalışmalarında tüketicilerin kozmopolitan eğilimlerinin belirlenmesi amacıyla kullandıkları 6 maddelik genel kozmopolit tutum ölçeğidir. Yapı kozmopolit bireylerin, bu yönelimlerini tüketim davranışlarına da yansıtacağı öngörüsüyle araştırmaya dahil edilmiştir. Anket formunun cevaplanmasında 5 aralıklı likert ölçeğinden faydalanılmıştır. Cevaplayıcılardan '1: Kesinlikle

 Copyright © International Science and Technology Conference (ISTEC)

katılmıyorum, 2: katılmıyorum, 3: kararsızım, 4: katılıyorum ve 5: kesinlikle katılıyorum' seçeneklerinden kendilerine en yakın geleni cevaplamaları istenmiştir.

4. ARAŞTIRMA MODELİ VE HİPOTEZLER



Önceki bölümde belirtildiği gibi çalışmanın amacı kozmopolit tüketici tutumunun, tüketici etnosentrizmi ve kozmopolitanizm yapılarıyla olan ilişkisinin belirlenmesidir. Buradan hareketle araştırmada aşağıdaki hipotezler incelenmiştir.

Hipotez 1: Tüketici etnosentrizmi, Tüketici kozmopolitanizmi üzerinde negatif etkiye sahiptir.

Hipotez 2: Genel kozmopolitanizm, tüketici kozmopolitanizmi üzerinde pozitif etkiye sahiptir.

Hipotez 3: Kozmopolitanizm ve tüketici etnosentrizmi birbirleriyle negatif ilişki içerisinde olan yapılardır.

Hipotezlerin incelendiği model IBM SPSS programının AMOS eklentisi yardımıyla aşağıdaki şekilde oluşturulmuştur.

5. ARAŞTIRMA SONUÇLARI VE BULGULAR

Araştırmanın örneklemi Bursa ilinde öğrenim görmüş ve halen görmekte olan lisansüstü öğrencileri kapsamaktadır. Araştırma, verilerin daha hızlı elde edilmesi ve katılımcıları motive etmesi bakımından web tabanlı anket yardımıyla gerçekleştirilmiştir. Bir aylık süreçte 182 geçerli anket formuna ulaşılmıştır.

 Copyright © International Science and Technology Conference (ISTEC)

Araştırmada oluşturulan modelin hipotezleri yapısal eşitlik modellemesi ile test edilmeden önce verilerin analizi yapılmıştır. Öncelikle verilerin basıklık ve çarpıklık değerlerinin normalleştirilmesi amacıyla aykırı ve uç veriler tespit edilmiş, normal dağılım etrafında gözlemlenmeyen 50 cevap formu çalışmadan çıkarılmıştır. Geri kalan 132 veri üzerinde devam ettirilen analizlerde yapıların içsel tutarlılıkları ile KMO ve Bartlett testi sonuçları yazında kabul gören değerler çerçevesinde gerçekleşmiştir.

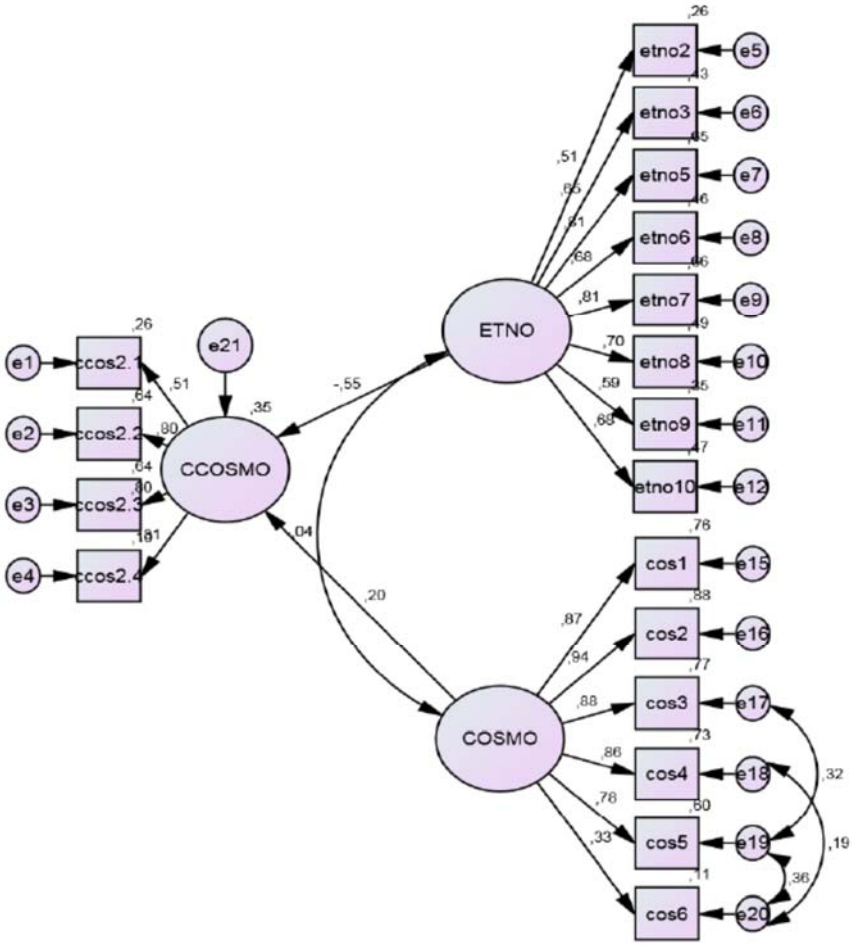
Tablo 1.KMO Testi Sonuçları

KMO (Kaiser-Meyer-Olkin) Değeri		0,831
Bartlett Dağılım Testi	**Yaklaşık x2 değeri**	1463,653
	Serbestlik Derecesi	190
	Anlamsızlık	,000

Sonrasında açıklayıcı faktör analizi kapsamında her bir maddenin kendi yapısı içerisinde yer alıp almadığı incelenmiştir. Sonuç olarak maddelerin kendi faktörleri içinde toplandıkları gözlemlenmiştir. Sonraki aşamada gerçekleştirilen doğrulayıcı faktör analizinde tüketici etnosentrizmini ifade eden ETNO yapısına ait 10 maddeden 2 maddenin analizden çıkartılmasına karar verilmiştir. Gerekli modifikasyonların yapılmasının ardından üç modelin ayrı ayrı ve genel modelin analiz sonuçları aşağıdaki tabloda gösterilmiştir.

Tablo 2. Genel Model Verileri

	Madde	**Ort.**	**Cr. α**	**RMSEA**	**χ^2 / s.d.**	**CFI**	**GFI**
CCOSMO	4	3,46	0,645	0,129	1,04	0,96	0,978
COSMO	6	4,23	0,882	0,018	3,16	1,00	0,985
ETNO	8	2,85	0,881	0,039	1,20	0,99	0,955
Genel Model (Üç yapı)	18	3,52	0,751	0,03		0,984	0,895
Cr. α : Cronbach Alpha, RMSEA: Root mean square extracted approximation – Ortalama hata karekök yaklaşımı, CFI: Comparative Fit Index – Karşılaştırmalı Uyum Endeksi, GFI: Goodness-of-Fit Index – Uyum İyiliği Endeksi, s.d. : Serbestlik Derecesi							



18 madde üzerinde gerçekleştirilen araştırmada ortaya konulan üç hipotez test edilmiştir. Oluşturulan modelde test edilen hipotez sonuçları aşağıda belirtilmiştir.

Tablo3. Çalışmada Önerilen Hipotez Sonuçları

	İfade	**İlişki Gösterimi**	**Beta (β) Katsayı Değerleri**	**Sonuç**
Hipotez 1	Etnosentrizm tüketici kozmopolitanizmini negatif etkiler	CCOSMO <--- ETNO	-,546	Onaylandı
Hipotez 2	Kozmopolitanizm tüketici kozmopolitanizmini pozitif etkiler	CCOSMO <--- COSMO	,204	Onaylandı
Hipotez 3	Kozmopolitanizm ve etnosentrizm arasında negatif bir ilişki vardır	COSMO <--- > ETNO	-,043	Onaylandı

 Copyright © International Science and Technology Conference (ISTEC)

Hipotez sonuçlarının detaylı incelebileceği genel model analizin ardından aşağıdaki gibi şekillenmiştir.

5. SONUÇ

Pazarlama yazınında tüketici kozmopolitanizmi hakkında gerçekleştirilmiş daha önceki çalışmalar, yapının farklılıkları önyargısız ve açık bir şekilde karşılayan ve buradan hareketle çeşitli ülkelerden gelen yabancı ürünlerin tüketimini olumlu yönde etkilediğini ifade etmektedir. Araştırma sonuçları birincil öncülü yerli ürün tüketimi olan etnosentrizm yapısının, tüketici kozmopolitanizmini güçlü biçimde negatif etkilediğini, kozmopolit tüketici tutumunun öncelikli gerekliliklerinden birinin yabancı ürünleri tecrübe etme ve tüketme olduğunu bir kez daha ortaya koymuştur. Buradan hareketle dış pazarlarda başarı sağlamayı veya yabancı ürünlü tüketicilere de hitap etmeyi amaçlayan işletmelerin bu eylemlerinde söz konusu tüketicilerin milliyetçi yönelimlerinin seviyesini ölçümlemeleri söz konusu faaliyetlerindeki verimliliği arttıracaktır.

Pazarlama çabalarının merkezini oluşturan tüketicilerin tutumlarını doğru analiz etmek işletmeler açısından hayati rol oynamaktadır. Kuşkusuz tüketicilerin tüm satın alma davranışları, ürün milliyeti temelli gerçekleşmemektedir. Ancak unutulmamalıdır ki her geçen gün daha küçük bir köy haline gelen gezegenimizde çok uluslu şirketler ve yerli alternatifleri arasındaki rekabet giderek kızışmakta, bu süreçte tüketicilerin yerli ve yabancı ürünlere yönelik geliştirecekleri tutumlar işletmelerin pazarlarda sağlayacakları başarı noktasında kritik bir noktada bulunmaktadır. Çalışma bu bağlamda tüketicilerin yerli ve yabancı ürünlere yönelik tutumlarını incelemek isteyecek işletmelere giriş niteliğinde bilgi sağlamakta, kozmopolit tüketicileri analiz etmelerinde

 Copyright © International Science and Technology Conference (ISTEC)

kolaylık sağlamaktadır. Ayrıca çalışma, tüketici kozmopolitanizmi yapısı üzerine gerçekleştirilecek sonraki çalışmalarada yol açması açısından önem taşımaktadır.

TÜRK SİVİL HAVACILIK ALANINDA EĞİTİM VEREN YÜKSEKÖĞRETİM KURUMLARININ MEVCUT DURUM ANALİZİ

Savaş S. ATEŞ, Hasan LİK

Anadolu Üniversitesi, Eskişehir-Türkiye

ssates@anadolu.edu.tr
hlik@anadolu.edu.tr

Özet: Türk havacılık sektörünün son yıllardaki büyümesi Dünya genelindeki büyümeye oranla daha hızlı gerçekleşmiştir. Havacılık sektöründeki nitelikli insan kaynağı ihtiyacı da büyümeye paralel olarak gerçekleşmektedir. Bu araştırmanın amacı Türk havacılık alanında eğitim veren yükseköğretim kurumlarının nitelik ve nicelik açısından incelenmesidir. Araştırmanın birinci bölümünde Avrupa Birliği üye ülkelerinin ortaya koymuş olduğu havacılık eğitim standartları literatür taraması ile verilmiştir. Araştırmanın ikinci bölümünde Türkiye de yer alan havacılık alanındaki Yükseköğretim kurumları sayıları, bölüm çeşitliliği ve öğrenci sayıları verilmiştir. Yapılan anket çalışması ile eğitim kurumlarında verilen eğitimin içeriği, yabancı dil seviyesi, toplam ECTS kredisi içerisindeki havacılık derslerinin yeri, öğretim üyesi/elemanı sayısı ortaya konmuştur. Araştırmanın sonucunda Türk sivil havacılık sektörüne insan kaynağı yetiştiren Yükseköğretim kurumlarının mevcut durumu ortaya konarak geleceğe dönük önerilerde bulunulmuştur.
Anahtar Kelimeler: Havacılık, Eğitim, Yükseköğretim Alanında Eğitim

Giriş

Türkiye'de 2003'te başlatılan bölgesel havacılık politikası kapsamında 2013 yılına kadar ticari uçuş sayısı %160, koltuk kapasitesi %176, kargo kapasitesi %346 artmıştır (SHGM, 2015). Gelişen havacılık sektörü Türk sivil havacılık sektörünün dünya sıralamasındaki yerini üst sıralara taşımıştır. AB Avrupa Hava Seyrüsefer Güvenliği Örgütü (EUROCONTROL) verilerine göre Türkiye'nin 2015 yılı itibariyle Avrupa hava ulaşım sektöründe yolcu sıralaması bakımından yeri 3'üncü, dünya havayolu yolcu sıralaması bakımından 9'uncu, RPK (ücretli yolcu kilometre) bakımından ise 10'uncu sıradadır (SHGM, 2016). Türkiye'de 13 havayolu ve hava kargo işletmesindeki toplam uçak sayısı 2015 yılı sonu itibariyle 489'dur (SHGM, 2016). Hava taksi işletme sayısı 50, genel havacılık işletme sayısı 60, balon işletmesi sayısı 25, zirai ilaçlama işletme sayısı ise 39'dur.

Havacılıkta büyümeye paralel olarak insan kaynağı ihtiyacı da artmaktadır. Türkiye'de 2003 yılında havacılık sektöründe istihdam edilen personel sayısı 65.000 kişi iken 2013 yılında bu sayı 180.570 kişiye ulaşmıştır. 10 yıl içerisinde istihdam edilen personel sayısı %200 artarak yıllık ortalama %20 civarında bir artış göstermiştir (DHMİ, 2015).

Türk sivil havacılık sektöründeki insan kaynağı ihtiyacının giderilmesinde 4 farklı yöntem kullanılmaktadır.

- Yükseköğretim kurumlarının havacılık bölümlerinden mezun olanlar,
- Milli Eğitim Bakanlığına bağlı lise dengi okul mezunları,
- Askeri havacılık okullarından mezun olup sivil havacılık sektörüne geçenler,
- Havacılık alanı dışında eğitim alıp hizmet içi eğitimler ile havacılıkta çalışan personel.

Havaaracı Bakım Eğitimi standartları Avrupa Birliği Havacılık Ajansı (European Aviation Safety Agency (EASA)) tarafından belirlenen EASA Part 66/147'de belirtilen standartlara göre verilir (EASA, 2012). Türkiye'de havacılık otoritesi Sivil Havacılık Genel Müdürlüğü (SHGM) tarafından EASA'ya benzer dokümanları içeren SHY66/147'de yayınlanmıştır (SHGM, 2013). Bu standartlara uygun eğitim veren kurumlar Sivil Havacılık otoritesi SHGM tarafından yetkilendirilir. Yetkilendirilen eğitim kurumlarının ders süreleri, içerikleri, derslerin içeriklerinin hangi seviyede anlatılacağı, sınavlarda kaç soru sorulacağı ve devamsızlık bilgileri standardize edilmiştir. Bu çerçevede eğitim alan öğrencilerin havaaracı bakım lisansını alabilmesi için gereklilikler belirlenmiştir.
Havaaracı bakım lisansı için her bir kategori veya alt kategori sorumluluklarını gösteren tablo aşağıda verilmiştir. Bu tabloda söz konusu kategoriler için geçerli konular "X" işareti ile gösterilmiştir (EASA, 2012).

İlgili kategorilere göre temel eğitim kurs süresi ve verilmesi gerekli olan temel eğitim oranları belirlenmiştir. Bu eğitimleri alanların girmesi gereken modül sınavları soru sayıları ve süreleri standarttır.

Tablo 2: İlgili Kategorilere Göre Temel Eğitim Kurs Süresi Ve Verilmesi Gerekli Olan Temel Eğitim Oranları

Temel Dersler	Süre (Saat)	Teorik eğitim oranları (%)
Al	800	30 to 35
A2	650	30 to 35
A3	800	30 to 35
A4	800	30 to 35
Bl.l	2400	50 to 60
B1.2	2000	50 to 60
B1.3	2400	50 to 60
B1.4	2400	50 to 60
B2	2400	50 to 60
B3	1 000	50 to 60

Kaynak: (EASA, 2012)

Havaalanı yer hizmetleri alanında çalışmak için gerekli eğitimler IATA (International Air Transport Association, Uluslararası Hava Taşımacılığı Birliği) tarafından belirlenmektedir (IATA, 2016). Bu eğitimler tavsiye niteliğinde olup ulusal havacılık otoritesi tarafından bazıları zorunlu tutulabilmektedir.

 Copyright © International Science and Technology Conference (ISTEC)

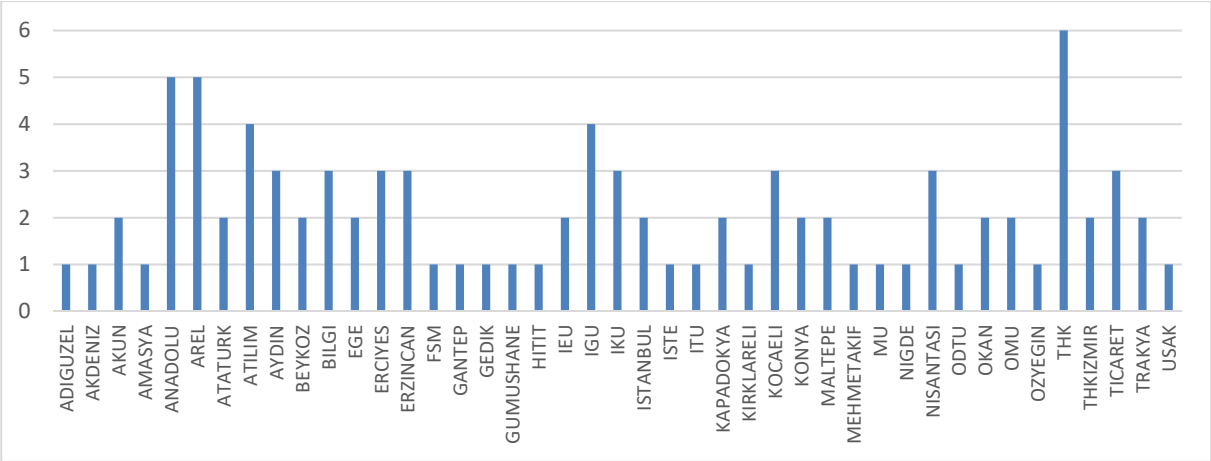
Havayolu işletmelerinde uçuş harekât uzmanı olarak çalışılabilmek için ise ICAO Doc.7192-D3 el kitabına göre aşağıdaki eğitimlerin alınması ve ulusal otorite tarafından yapılacak sınavların başarı ile tamamlanması gerekmektedir (ICAO, 1998):

- Sivil hava hukuku ve kuralları
- Havacılık prensipleri
- Havaaracı yük ve performansı
- Seyrüsefer
- Hava trafik yönetimi
- Meteoroloji
- Yük ve denge kontrolü
- Tehlikeli maddelerin hava aracı ile taşınması
- Uçuş planlama
- Uçuş izleme
- Radyo iletişimi
- İnsan faktörleri
- Güvenlik (Acil ve anormal durumlar)

Türkiye'de ise uçuş harekât uzmanı olarak çalışabilmek için Uçuş Harekât Uzmanı Lisans Yönetmeliğine göre eğitim almak ve sınavdan başarı ile geçmek gerekir (SHGM, 2016).

Araştırma yükseköğretim kurumlarının havacılık bölümleri kapsamında gerçekleştirilmiştir. Türk sivil havacılık sektörüne insan kaynağı yetiştiren Yükseköğretim kurumlarının mevcut durumunun ortaya konulması amacıyla 100'den fazla bölümde anket yöntemiyle veri toplanarak analiz edilmiştir.

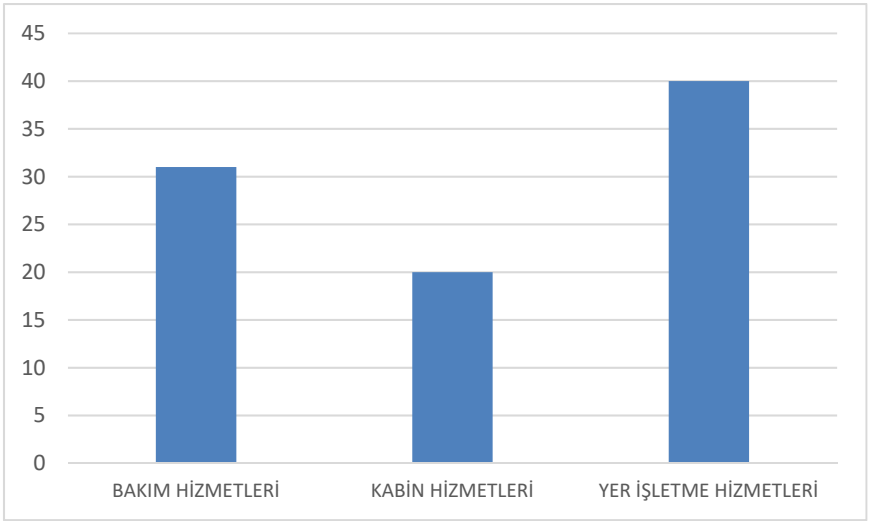
Amaç ve Yöntem



Araştırma havacılık eğitimi veren yükseköğretim kurumlarında eğitim veren öğretim elemanları ile yapılmıştır. Araştırmada anket yöntemi ile veriler toplanmıştır. Verilerin toplanmasında Sivil Havacılık Genel Müdürlüğü (SHGM) ve Yükseköğretim Kurumu (YÖK) komisyonu tarafından staj atamalarında kullanılan Havacılık Staj Yazılımı kullanılmıştır. Anket çalışması 43 yükseköğretim kurumunda 91 bölümde gerçekleştirilmiştir. 80 bölüm tarafından anket cevaplanmıştır.

Bulgular ve Analiz

Yükseköğretim kurum sayıları ve bölüm türleri



Yapılan anket çalışması sonucunda Türkiye'de 43 yükseköğretim kurumunun 17'sinde 1 bölüm/program, 13'ünde 2 bölüm/program, 8'inde 3 bölüm/program, 2'sinde 4 bölüm/program, 2'sinde 5 bölüm/program, 1'inde ise 6 bölüm/program bulunmaktadır. Anket sonuçlarından üniversitelerde farklı bölüm ve program adlarında 91 bölümde havacılık eğitimi veren mevcut yükseköğretim kurumlarının 19 farklı bölüm/program adı altında eğitim verdiği anket sonuçlarından ortaya çıkmaktadır. Bölüm/program isimleri farklı olmasına rağmen Türkiye'de havacılık eğitimi genel olarak 6 branşta yapılmaktadır. Bu branşlar teknik bölümler (Uçak veya Havacılık Elektrik Elektroniği, Uçak Gövde Motor Bakım, Uçak Teknolojisi), Pilotaj, Hava Trafik Kontrol, Kabin Hizmetleri, Havacılık İşletmeciliği (Sivil Hava Ulaştırma İşletmeciliği veya Havacılık Yönetimi) olarak genellemek mümkündür. Sonuçlar yükseköğretim kurumlarının büyük çoğunluğunun tüm branşlarda eğitim vermediğini ortaya koymaktadır.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 1. Havacılık Alanında Eğitim Veren Yükseköğretim Kurumları

Bu anketlerde Bakım Hizmetleri alanında 31, Kabin Hizmetleri alanında 20 ve Yer İşletme Hizmetleri alanında 40 bölüm/program bulunmaktadır. İlave olarak ankette olmayan 2'si devlet, 1'i vakıf, 2'si özel toplam 5 yükseköğretim kurumunda pilotaj bölümü ve sadece 1 yükseköğretim kurumunda Hava Trafik Kontrol bölümü de bulunmaktadır.

Şekil 2. Havacılık Alanında Eğitim Veren Yükseköğretim Kurumları Bölüm/Programları

Bölüm/Programların kuruluş yılları

Yükseköğretim düzeyinde eğitim veren bölümler 1986 yılında kurulmaya başlanmış olup, ankete cevap veren 69 bölüm değerlendirildiğinde 2012 yılından sonra açılan bölüm sayılarında hızlı bir artış olduğu görülmektedir. Bu artışın ana nedeni 2002 yılından sonra havacılık sektöründeki büyüme sonucu kalifiye personel ihtiyacının artmasıdır. 2002 yılı sonrası Türkiye'de havacılık sektöründe büyüme oranı yaklaşık olarak her yıl ortalama %15 civarında ve bundan sonraki büyüme öngörüleri de %10-15 oranında olması beklenirken, yükseköğretim kurumlarının sayısı 2012 ve sonrası için her yıl yaklaşık %100-200 arasında bir artış göstermiştir.

Lisans/Önlisans dağılımı

Bölüm türleri bakımından değerlendirildiğinde anketi dolduranların 22'si lisans ve 58'i önlisans seviyesinde eğitim vermektedir. Bölümlerin eğitim süreleri bölüm türlerine göre değerlendirildiğinde kabin hizmetleri öğrencilerinin tamamının önlisans düzeyinde eğitim aldığı görülmektedir.

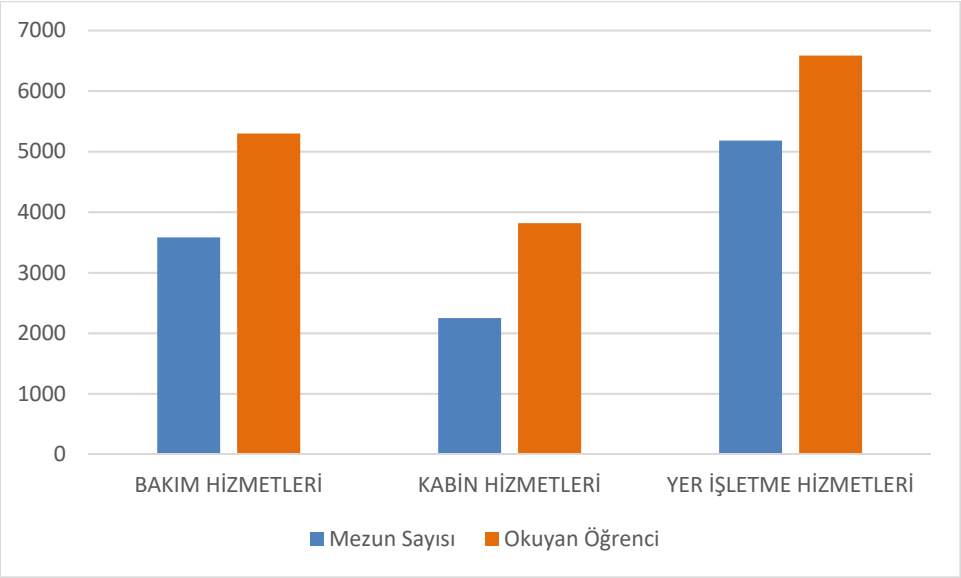
 Copyright © International Science and Technology Conference (ISTEC)

Tablo 4: Bölüm Türlerine Göre Eğitim Süreleri

	Eğitim Süresi		
Bölüm Türü	**Lisans**	**Önlisans**	**Toplam**
Bakım hizmetleri	12	15	27
Kabin hizmetleri	0	19	19
Yer işletme hizmetleri	10	24	34
Toplam	**22**	**58**	**80**

Havacılık alanında yükseköğretim düzeyinde eğitim gören öğrenci sayıları

Anketi cevaplayan 80 yükseköğretim bölüm/programında eğitim alan toplam öğrenci sayısı 15.700'dür. Öğrencilerden 5.393'ü lisans ve 10.307'si ise önlisans bölüm/programında eğitim almaktadır. Ankete cevap vermeyen yükseköğretim kurumlarının da hesaba katılması halinde 16.000'in üzerinde öğrenci olduğu tahmin edilmektedir.



Şekil 3. Öğrenci Sayılarının Eğitim Alanlarına Göre Dağılımı

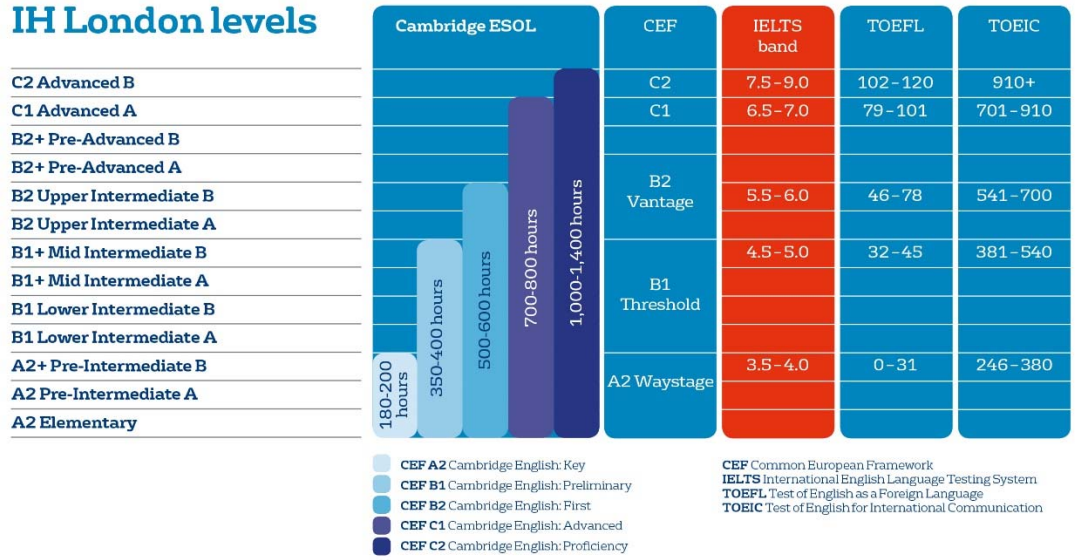
Yükseköğretim kurumlarında havacılık alanında eğitim gören toplam 15.700 öğrencinin 8.262'si 2015-2016 öğretim yılında bölümlere giriş yapmıştır. Son birkaç yıldır yükseköğretim kurumlarındaki öğrenci kontenjanlarındaki artışın sektörün büyümesi sonucu ihtiyaç duyulan nitelikli eleman ihtiyacının çok üstünde olduğu görülmektedir.

Anketi cevaplayan yükseköğretim kurumlarından 1986'dan bu güne kadar havacılık alanından toplam mezun sayısı 11.017 kişi iken bu kurumlarda okuyan öğrenci sayısı ise 15.700'dür. Mevcut yükseköğretim kurumlarından önümüzdeki 4 yıl içerisinde mezun olacak öğrenci sayısının geçmiş 30 yıllık dönemde mezun öğrenci sayısından fazla olduğu görülmektedir. Bu durum yükseköğretim kontenjanlarındaki artışın sektörün büyüme hedeflerinin çok üstünde olduğunu göstermektedir.

 Copyright © International Science and Technology Conference (ISTEC)

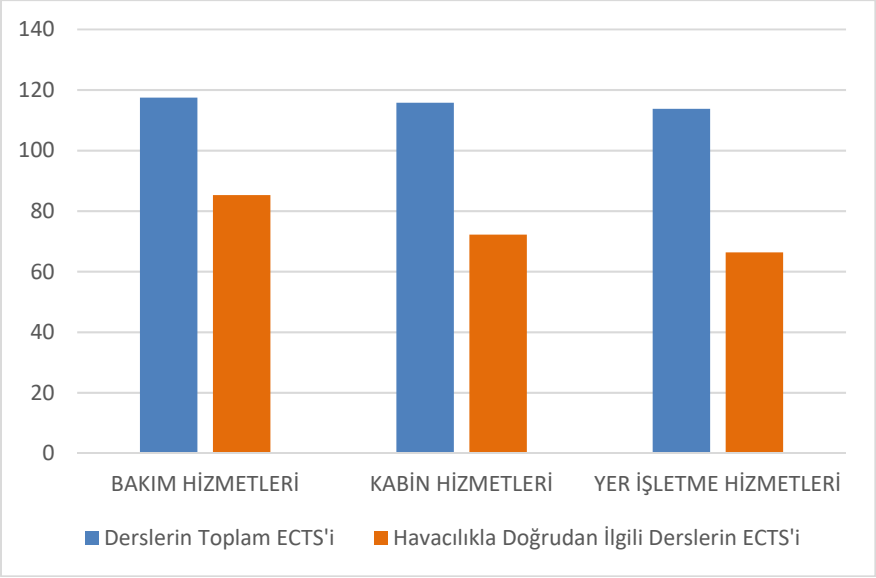
Şekil 4. Mezun Öğrenci Sayısının Okuyan Öğrenci Sayısına Oranı

Eğitim içerikleri



Anketi cevaplayan havacılık eğitimi veren yükseköğretim kurumlarından 50'sinde hazırlık eğitimi verilmektedir. Havacılık eğitiminde İngilizcenin önemi günden güne arttığı halde ve literatürün neredeyse tamamının İngilizce olmasına rağmen yabancı dil hazırlık eğitiminin olmaması veya eğitimin belli bir yüzdesinin İngilizce yapılmaması mezun öğrencilerin kalitesinde göreceli olarak bir düşüşe ve istihdamında sıkıntılara yol açmaktadır. İngilizce hazırlık eğitimi haricinde öğrencilerin toplam aldıkları İngilizce eğitim saati sorulmuştur. Elde edilen yanıtlar gruplandığında yer işletme, kabin ve bakım hizmetlerinden en fazla 0-100 saat aralığında ders alan öğrenci sayısı çıkmıştır. İngilizce eğitim veren kurumların uluslararası dil yeterliliği için gerekli olan eğitim sürelerinin çok altında olduğu anket sonuçlarından ortaya çıkmaktadır. Bu durum mezunların istihdam için gerekli olan dil puanını almalarında zorlanmalarına sebep olmaktadır.

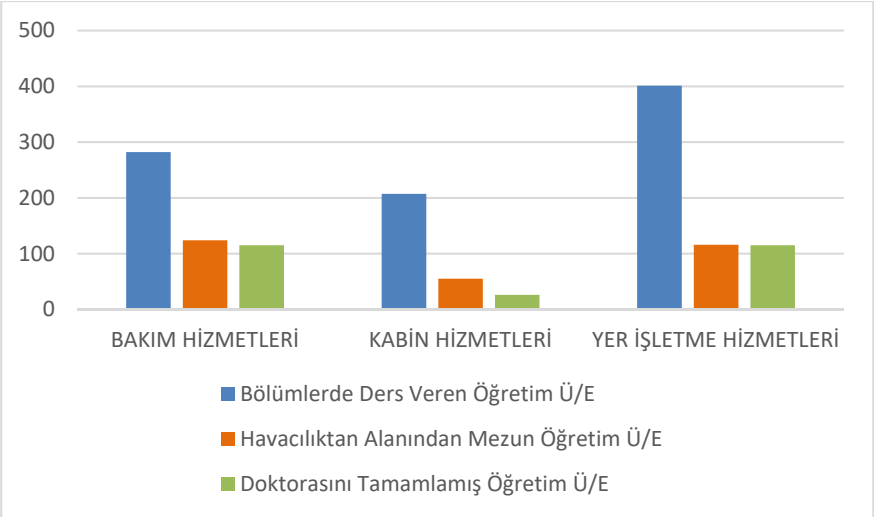
Şekil 5. Hazırlık Hariç İngilizce Ders Saati



Tavsiye edilen İngilizce öğretim saatleri ile karşılaştırıldığında 0-100 saat aralığındaki İngilizce eğitimi A2 elementary seviyesinin altında yer almaktadır.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 6. Uluslararası İngilizce Seviyeleri İçin Tavsiye Edilen Saat Aralığı
Kaynak: (International House London, 2016)



Yükseköğretim kurumlarına öğrencinin mezun olması için gerekli ECTS sayısı ve bu ECTS'in ne kadarının havacılıkla doğrudan ilgili olduğu sorulmuştur. Bu soruya verilen cevaplardan ECTS kredi sayısının doğrudan mesleki eğitim ile ilgili olması bakım eğitimi konusundaki Avrupa Havacılık Emniyet Ajansının (Eurepean Aviation Safety Agency) eğitim standart ve sürelerinden kaynaklanmaktadır.

Şekil 7. Önlisans Düzeyinde Eğitim Veren Bölümlerde Havacılıkla Doğrudan İlgili Derslerin Genel Derslere Oranı

Yükseköğretim kurumlarında ders veren toplam öğretim üyesi/elemanı sayısı, havacılık alanından mezun öğretim üyesi/elemanı sayısı ve doktorasını tamamlamış öğretim üyesi/elemanı sayısı sorulmuştur. Elde edilen veriler ile Şekil 8 hazırlanmıştır. Öğretim üyeleri/elemanları birden fazla ders verdiğinden şeklin oransal olarak değerlendirilmesi daha doğru olacaktır.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 8. Öğretim Elemanı Sayısı

Sonuç ve Öneriler

Türkiye'de 2003-2013 yılları arasında havacılık sektöründeki büyüme rakamları dünya ortalamasının çok üzerinde olduğu görülmektedir. Bu büyüme eğiliminin çok üstünde bir büyüme ise havacılık sektörüne insan kaynağı yetiştiren yükseköğretim kurumlarında olmuştur. Son 30 yılda havacılık sektörüne insan kaynağı yetiştiren kurumların verdiği mezun sayısından daha fazlası 2015-2016 öğretim yılında yükseköğretim kurumlarında öğrenimine devam etmektedir. Havacılık sektörünün asıl ihtiyacı olan standartlara uygun yetiştirilen insan kaynağı sayısı toplam mezun sayısına oranlandığında hızlı bir azalmanın olduğu görülmektedir. Mezun sayısında nicelik olarak bir artış olduğu ama nitelik olarak azalma olduğu çıkarımında bulunulabilir.

Türkiye'de Sivil Havacılık Genel Müdürlüğü tarafından belirlenen standartlarda eğitim vermenin (yetki almanın) öğretim kurumlarına ve eğitmenlerine getireceği sınıftaki öğrenci sayısı kısıtlaması, eğitmen özelliklerinden kaynaklı kısıtlamalar, ders içerik kısıtlamaları gibi dezavantajları vardır. Bu nedenle eğitim kurumları yetki almaktan kaçınmaktadır. Fakat mezuniyet sonrası temel eğitim yetkisi olmayan ve standartlara uygun eğitim verilemeyen yükseköğretim kurumlarından mezun olan öğrencilerin havacılık sektöründe istihdam edilmesinin önünde engeller vardır. Örneğin teknisyen olarak çalışmak isteyen ve yetkisi olmayan bir mezun 3 yıl deneyim elde ettikten sonra uçakta yetkili olarak çalışabilmektedir. Bu durum işletmelerin istenen standartta insan kaynağı ihtiyacının karşılanmasını geciktirmektedir.

Mevcut durumun üstesinden gelebilmek için sektörün büyümesi ile orantılı olarak gelecek 10 yılın projeksiyonu çıkartılabilir. Bu doğrultuda öğrenci almış ve eğitimlerine devam eden yükseköğretim kurumları standartlara uygun eğitim verebilmeleri için teşvik edilmelidir. Yeterlilikleri sağlayamayan eğitim kurumlarının Yükseköğretim Kurumu tarafından öğrenci almaları kısıtlanabilir. Buna rağmen verilen mezun sayısı ihtiyaçtan fazla ise öğrenci kontenjanları düşürülebilir. Gelecekte oluşabilecek talep artışlarında ise eğitim yetkisi olan kurumların kapasitelerinde bir artışa gidilerek öğrenci kontenjanları da arttırılabilir. Yükseköğretim Kurulu kendisine bağlı tüm yükseköğretim kurumlarının havacılık ile ilgili bir bölüm açılma talebini Sivil Havacılık Genel Müdürlüğünün izni veya tavsiyesi ile açılması sağlanabilir. Sivil Havacılık Genel Müdürlüğü Türkiye'de havacılık sektöründe hangi bölümlerde nitelikli personel ihtiyacı olduğunu sektör araştırmaları ile tespit edebilmesi önemli bir gerekliliktir. Yükseköğretim kurumlarının uçak üzerinde bakım yapan insan kaynağı eğitmek yerine daha kısa sürede, daha az emek ve maliyetle havacılık sektörünün ihtiyaç duyduğu diğer alanlarda nitelikli insan kaynağı yetiştirilmesi konusunda çalışmalar yapılmalıdır.

SHGM'den alınan rakamlara göre 2016 yaz döneminde sadece uçak bakım alanında toplamda zorunlu staj yapması gereken yaklaşık 1950 öğrenciden 850 öğrenciye staj yapma imkânı bulmuştur. Havacılık sektörü yükseköğretim kurumlarındaki uçak bakım alanında eğitim görenlerin %50'sine staj yeri sağlamıştır. Havacılık sektöründe öğrenci sayısının bu şekilde artmaya devam etmesi durumunda gelecekte mezun öğrencilerin istihdamının sorun haline dönüşeceği tespit edilmiştir. SHGM ve YÖK işbirliği ile havacılık alanında eğitim gören insan kaynağının nitelik ve nicelik olarak havacılık sektörünün ihtiyaçlarını karşılayacak şekilde olması sağlanabilir.

Özet: Bu çalışmada, 2013-2015 yılları arasında Türkiye'nin Marmara bölgesindeki kadın sığınma evlerinde çeşitli sebeplerden dolayı 30 günden fazla yaşamak zorunda kalan kadınların durumları araştırılmıştır. Veriler incelendiğinde, bu kadınlardan meslek eğitimi desteği ve sertifikası alarak kendi ayakları üzerinde durabilecek konuma gelmiş olanların kendi hayatlarını kurma aşamasında başarılı oldukları görülmüştür. Bu çalışma ile meslek eğitimi desteği alan kadınlar ile kadın sığınma evlerinden ayrılma sebepleri arasında anlamlı bir ilişki bulunduğu tespit edilmiştir.

Anahtar Kelimeler: Kadın, Sığınma Evleri, Meslek Eğitimi Sertifikası

Abstract: In this study, women who are forced to temporarily live in women's shelters for more than 30 days for various reasons between the years of 2013-2015 in Marmara region of Turkey were investigated. When the data were analyzed, it was found that the women who gained various vocational training certificates became economically self- sufficient or independent. It was also seen that, these certificates supported them on their journey of getting their life back together. With this study, we observed a meaningful relationship between the training certificates and reasons for leaving the women's shelters.

Keywords: Women, Women's Shelters, Training Certificates

Giriş

Türkiye'de Resmi Gazete'de yayınlanan Kabul Tarihi: 8/3/2012 olan 6284 sayılı "aileninkorunması ve kadına karşı şiddetin önlenmesine dair kanun"nun birinci bölüm'ün deki amaç, kapsam ve temel ilkelere göre;

MADDE 1 – (1) Bu Kanunun amacı; şiddete uğrayan veya şiddete uğrama tehlikesi bulunan kadınların, çocukların, aile bireylerinin ve tek taraflı ısrarlı takip mağduru olan kişilerin korunması ve bu kişilere yönelik şiddetin önlenmesi amacıyla alınacak tedbirlere ilişkin usul ve esasları düzenlemektir.
(2) Bu Kanunun uygulanmasında ve gereken hizmetlerin sunulmasında aşağıdaki temel ilkelere uyulur:
a) Türkiye Cumhuriyeti Anayasası ile Türkiye'nin taraf olduğu uluslararası sözleşmeler, özellikle Kadınlara Yönelik Şiddet ve Aile İçi Şiddetin Önlenmesi ve Bunlarla Mücadeleye İlişkin Avrupa Konseyi Sözleşmesi ve yürürlükteki diğer kanuni düzenlemeler esas alınır.
b) Şiddet mağdurlarına verilecek destek ve hizmetlerin sunulmasında temel insan haklarına dayalı, kadın erkek eşitliğine duyarlı, sosyal devlet ilkesine uygun, adil, etkili ve süratli bir usul izlenir.
c) Şiddet mağduru ve şiddet uygulayan için alınan tedbir kararları insan onuruna yaraşır bir şekilde yerine getirilir.

 Copyright © International Science and Technology Conference (ISTEC)

ç) Bu kanun kapsamında kadınlara yönelik cinsiyete dayalı şiddeti önleyen ve kadınları cinsiyete dayalı şiddetten koruyan özel tedbirler ayrımcılık olarak yorumlanamaz. Hükümleri yeralmaktadır (Resmi Gazete, 2012).

Yasal Çerçevede Sığınma Evlerinin Kuruluşu

1948'de Birleşmiş Milletler Genel Kurulunda kabul edilen İnsan Hakları Evrensel Bildirgesi, herkesin hiçbir ayrıma uğramadan insan haklarından yararlanacağını belirterek, "Yaşam, özgürlük ve kişi güvenliği her insanın hakkıdır" ve "Hiçkimseye işkence ve zulüm uygulanamaz, insanlıkdışı yada onurkırıcı biçimde davranılamaz, ceza verilemez" denilmektedir.

30 yıl sonra, 1979'da kabul edilen ve Türkiye'nin de taraf olduğu Birleşmiş Milletler Kadınlara Karşı Her Türlü Ayrımcılığın Önlenmesi Sözleşmesi (CEDAW- Kadın Hakları Sözleşmesi), taraf devletlerin kadınlarla erkekler arasında eşitliği sağlama ve kadınlara yönelik ayrımcılığı yasaklama konusundaki yükümlülüklerini ayrıntıyla ortaya koymuştur.

Türkiye CEDAW sözleşmesi uyarınca ilk kez 1990 yılında SHÇEK'e bağlı kadın konukevini açarken aynı zamanda Avrupa Konseyi ülkelerince Mayıs 2011'de imzaya açılan İstanbul Sözleşmesi'ni de imzalayan ilk ülke olmuştur. Kasım 2011'de TBMM'de sözleşme onaylanmıştır.

Aile İçi Şiddetin Önlenmesi ve Bunlarla Mücadeleye İlişkin Avrupa Konseyi Sözleşmesi (İstanbul Sözleşmesi)'ne göre; Kadına Yönelik Şiddet ve Aile İçi Şiddetin Önlenmesi ve Bunlarla Mücadeleye İlişkin Avrupa Konseyi Sözleşmesi, kadına yönelik şiddet, özellikle de ev içi şiddet konusunda, uluslararası alanda bölgesel olarak hazırlanmış ilk Avrupa Konseyi Sözleşmesidir. Kadına yönelik ev içi şiddetle ilgili yaptırım gücü olan ilk uluslararası sözleşme olan bu belge, Mayıs 2011'de Türkiye tarafından İstanbul'da imzalandığı için kısaca İstanbul Sözleşmesi olarak anılmaktadır. İstanbul Sözleşmesi, imzalayıp onaylayan ülkelere, fiziksel, cinsel, ekonomik ve duygusal şiddet türlerini önlemek için gerekli yasal önlemleri alma yükümlülüğü getirmiştir (www.ankara.bel.tr).

İstanbul Sözleşmesi'ndeki Tanımlara Göre

Şiddete uğrayan ya da uğrama riski bulunanlara, özellikle de kadınlara ve çocuklarına ilişkin koruyucu ve önleyici, oldukça kapsamlı 80 madde içeren Sözleşmede yer alan tanımlar şöyle: "Kadınlara yönelik şiddet" bir insan hakları ihlali ve kadınlara yönelik ayrımcılığın bir biçimi olarak anlaşılmaktadır ve ister kamusal ister özel alanda meydana gelsin, kadınlara fiziksel, cinsel, psikolojik ve ekonomik zarar veya ıstırap veren veya verebilecek olan toplumsal cinsiyete dayalı her türlü eylem veya bu eylemlerle tehdit etme, zorlama veya keyfi olarak özgürlükten yoksun bırakma anlamına gelir (http://www.kadinininsanhaklari.org)

"Kadın" sözcüğü 18 yaşın altındaki kız çocuklarını da kapsar.

Sözleşme hazırlanırken aşağıdaki dört temel ilke dikkate alınmıştır:

Önleme (şiddeti önleme),
Koruma (şiddet mağdurunu koruma),
Kovuşturma (şiddet uygulayanı soruşturma),
Politikalar (kadına karşı şiddetin sonlandırılmasına yönelik politikalar).

Sözleşmeye Taraf Devletlerin Yükümlülükleri

İstanbul Sözleşmesi'nin en önemli düzenlemelerin biri, belgeyi imzalayan ve onaylayan devletlere, kadına yönelik şiddetin temelinde yer alan özel dinamikleri saptayıp ortadan kaldırması için belli sorumluluklar yüklemesidir. Mesela Sözleşmeye göre taraf devletlerin, kadınların aşağı bir cins olduğuna ve kadınlarla erkekler için alışılagelmiş rollerin bulunduğu düşüncesine dayanan önyargı, örf ve adet, gelenek ve her türlü farklı uygulamayı ortadan kaldırmak için gerekli önlemleri alma yükümlülükleri vardır. Devletler ayrıca, kadın ve erkeklere ilişkin sosyal ve kültürel davranış modellerinin değişmesini sağlamak için politikalar üretir. Sözleşme özellikle de kültür, örf ve adet, gelenek, din veya sözde "namus" gibi kavramların, şiddet uygulamak için bir mazeret olarak kullanılmasını engeller (http://www.kadinininsanhaklari.org). Ülkemizde 2012 yılında yürürlüğe giren 6284 sayılı Ailenin Korunması ve Kadına Karşı Şiddetin Önlenmesine Dair Kanun ve İstanbul Sözleşmesine bağlı olarak, kadına yönelik şiddetle mücadele edilmektedir. Ayrıca Bakanlığa bağlı sığınma evlerinin dışında belediyelerce ve STK'larca sığınma evleri hizmeti verilmektedir. İstanbul Sözleşmesi'nde yer alan Devlet yükümlülükleri ve gereken özeni gösterme sorumluluğu maddesinde; Taraflar, kadınlara yönelik şiddet eylemlerinde bulunmaktan kaçınır ve devlet adına faaliyet gösteren devlet yetkilileri, görevliler, kurum, kuruluş ve diğer aktörlerin bu yükümlülüğe uygun davranmalarını sağlar. Taraflar devlet dışı aktörlerce işlenen ve işbu Sözleşme kapsamında yer alan şiddet eylemlerinin gereken özeni göstererek önlenmesini,

 Copyright © International Science and Technology Conference (ISTEC)

soruşturulmasını, cezalandırılmasını ve tazmin edilmesini sağlamak üzere gerekli hukuki veya diğer tedbirleri alır.

Belediye Kanunu

Belediyeler, 5393 sayılı Belediye Kanunundaki koruma evleri maddesi uyarınca bu hizmeti vermektedir. Belediyenin, görev, yetki ve sorumluluklarını düzenleyen bu kanunun 14. Maddesinin a) bendinde "Büyükşehir belediyesi ile nüfusu 50.000'i geçen belediyeler, kadınlar ve çocuklar için koruma evleri açar" ifadesi yer almaktadır (www.ankara.bel.tr).

Kadın Konukevlerinin Amacı

Eşlerden birinin çocuklar ve aynı çatı altında yaşayan diğer aile bireylerinden birine yönelik uyguladığı fiziki, duygusal veya cinsel kötü muameleye aile içi şiddet denir. Sağlıklı bir toplumsal yapının oluşması kadın ve çocukların güçlenmesinden geçmektedir. Çağdaş, demokratik, ileri bir toplum için, kadınların güçlendirilmeleri, etkinlik alanlarının genişletilmesi, eğitim, istihdam, sağlık, siyaset, hukuk ve benzeri alanlarda eşit fırsat ve olanaklardan yararlanmalarının sağlanması büyük önem taşımaktadır. Tüm dünyada olduğu gibi ülkemizde de ciddi bir sorun olan kadına yönelik şiddet; kadının bireysel ve toplumsal işlevlerini, özel yaşamını, işini ve diğer sorumluluklarını yerine getirebilmesinde, kadının güçlenmesi ve ilerlemesinde engel teşkil etmektedir. Bu nedenle şiddet uğrayan kadın ve çocuklar için sığınma evlerinde çok yönlü destek sağlanmaktadır ve sağlanmaya devam edilmektedir. Bu destekler sosyal, ekonomik ve hukuksal sorunların giderilmesine yönelik çalışmalardır(www.ankara.bel.tr).

Dünyada Sığınma Evleri

İlk kadın sığınak/sığınma evleri bazı yazarlara göre 16. yüzyıl İtalya'sında ortaya çıkmıştır. Kocalarından kötü muamele gören ve sokağa atılan ve durumları "mutsuz" olarak tarif edilen kadınlar bu evlere sığınmaktaydı. İtalya Bolonya'daki La Casa del Soccorsodi San Paolobu evlerden biridir (Ferrante, 1990). Günümüz kadın sığınma evinin ilk örneği 1972'de İngiltere'de Erin Pizzey tarafından açılan Batı Londra'daki Chiswick Kadın Sığınağı'dır (Logar, 2008). Kadın sığınma evlerinin şiddetle mücadelede önemli bir yerinin olduğunun anlaşılması ile birlikte kısa bir sürede Avrupa'da, Amerika Birleşik Devletleri ve Kanada'da çok sayıda kadın sığınma evi açılmıştır. 1973'te Amerika Birleşik Devletleri'nde Boston Massachusetts, ve St. Paul Minnesota'da (www.ibiblio.org, 2012), aynı yıl Interval House ve Nellie's isimli sığınma evleri de Kanada'da açılmıştır (http://www.criaw-icref.ca/millenium, 2012.). Almanya'daki ilk modern sığınma evi 1976'da Berlin'de, 1978'de Avusturya Viyana'da, 1979'da İsveç'te, 1989'da İtalya'da kurulmuştur (Logar, 2008).

Viyana'da 1993'te toplanan Dünya İnsan Hakları Konferansı sonuç bildirgesi, toplumsal cinsiyete dayanan şiddeti tanımlamış ve alınacak yasal önlemlerle ve ülkeler arası işbirliği ile toplumsal cinsiyete dayanan şiddetin mutlaka ortadan kaldırılması gerektiğini ortaya koymuştur. Konferansta geliştirilen Kadınlara Yönelik Şiddetin Önlenmesi Bildirgesi Aralık 1993'te Birleşmiş Milletler Genel Kurulu'nda özel olarak kadına karşı şiddeti ele alan ilk insan hakları belgesi olarak kabul edilmiştir. Viyana Konferansında bu gelişmelere ek olarak Avrupa'da kadına yönelik şiddetle mücadele eden kadın örgütleri bir araya gelerek Avrupa Kadına Yönelik Şiddet Ağının (WAVE; WomenAgainstViolence Europe) kurulmasının ilk adımını atmışlardır (Logar, 2008).

WAVE, günümüzde Avrupa bölgesindeki 46 ülkede örgütlenmiştir ve Avrupa'da kadınlara sığınma ve danışmanlık, kadın yardım hattı gibi olanakları sağlayan 4000'den fazla kurumun bilgisini veritabanında bulundurmaktadır (www.wave-network.org). Kadın sığınma evleri günümüzde ülkelerin kadına yönelik şiddete yönelik önlemlerinin önemli bir parçasıdır. Avrupa Konseyi üye ülkelerin kadın sığınma evleri ile ilgili standartlarını belirlemiştir. Bu standarda göre sığınma evlerinin kapasitesinin her 7500-10.000 nüfusa karşılık bir kalacak yer olması gerekmektedir. "Kalacak yer" bir yetişkinin ve ortalama sayıdaki çocuğun kalabileceği yer olarak tarif edilmektedir (Combatingviolenceagainstwomen, 2007).

WAVE verilerine göre Haziran 2011 itibarıyla Avrupa'daki 44 ülkede, sığınma evlerinde her 10 bin kişiye 0,34 kalacak yer sağlanabilmiştir. Avrupa'da kadın sığınma evlerinin kapasitesinin toplam 80.144 kadına hizmet verecek düzeyde olması gerekmekteyken, sağlanan kapasite 27.036'da kalmıştır. WAVE istatistiklerine göre Haziran 2011 itibarıyla Avrupa bölgesinde 44 ülkeden Avrupa Konseyi tarafından tanımlanan kriterleri sağlayan ülkeler İngiltere, İspanya, Hollanda, Norveç, Malta ve Slovenya'dır (Paksoy Erbaydar, 2012).

Türkiye'de Sığınma Evleri

Türkiye'de mağdur kadınlar için açılan ilk sığınma evinin tarihi 18. yüzyıla kadar dayanmaktadır. Osmanlı Devleti'nde ise sığınma evlerinin açılış tarihi ise 300 yıl öncesine dayanmaktadır. İstanbul'daki "Hatuniye Dergâhı" bu evlere örnek bir yapıdır. Burada, şiddet gören ve zor durumda olan kadınlara zanaat öğretilip

 Copyright © International Science and Technology Conference (ISTEC)

onların kendi ayakları üzerinde durmaları sağlanmış, psikolojik rahatsızlıkları olanlarsa tedavi edilmiştir. Eyüp'teki Hatuniye Dergâhı, Osmanlı Devleti'nde 100 yıla yakın bir süre zor duruma düşmüş, şiddet görmüş kadınlara ev sahipliği yapmıştır. Çeşitli kaynaklara göre kadınlar bu Dergah'a sığınmışlar ve zanaat öğrenmişler, psikolojik rahatsızlıkları olanlarsa tedavi edilip hayata kazandırılmış, yaşlı kadınlar için ise burası bir huzurevi görevi görmüştür. Kapasitesi yüz kişilik olup sadece 18-80 yaşları arasındaki kadınlar kalabilmişlerdir (www.haber7.com).

Dünya'da ilk modern kadın sığınma evi örneklerinin 1970'li yıllarda ortaya çıkmış olmasına karşın, Türkiye'de, ilk sığınma evi 1993 yılında Ankara'da Kadın Dayanışma Vakfı tarafından açılmıştır (www.wave-network.org, www.kadindayanismavakfi.org.tr). İstanbul'un ilk kadın sığınma evi ise 1995 yılında Mor Çatı Kadın Sığınağı Vakfı tarafından kurulmuştur (Altınay, 2008).

Sosyal Hizmetler Çocuk Esirgeme Kurumu'nun 1990 yılında açmaya başladığı Kadın Misafirhanesi/Kadın Konukevi adındaki sığınma evleri ve Bakırköy ve Şişli Belediyeleri'nin aynı yıl açtığı kadın sığınma evleri kamu kurumlarınca açılan ilk sığınma evi örnekleridir (www.morcati.org.tr). Türkiye'de 5393 Sayılı Belediyeler Kanunu nüfusu 50 bini aşan belediyelere kadın sığınma evi açma görevini vermiştir. Bu yasa dışında Aile ve Sosyal Politikalar Bakanlığı Kadının Statüsü Genel Müdürlüğü (KSGM) sığınma evi açabilmektedir. KSGM verilerine göre Mart 2012 itibarıyla Türkiye'de toplam 1859 kalacak yer kapasiteli 83 kadın sığınma evi vardır. Bu sığınma evlerinin 55'i KSGM, 25'i yerel yönetimler 3'ü ise kadın örgütlerince işletilmektedir (Karataş, Şener, Otaran, 2008). İçişleri Bakanlığı Mahalli İdareler Genel Müdürlüğü, Avrupa Birliği'nin mali, Birleşmiş Milletler Nüfus Fonu'nun da teknik desteği ile 2008-2010 döneminde Ankara, Antalya, Bursa, Eskişehir, Gaziantep, İstanbul, İzmir ve Samsun'da sığınma evleri yaptırmış, burada çalışacak kişilerin eğitimi ve kamuoyu duyarlılığının artırılmasına yönelik çalışmalar yürütmüştü (KSGM, 02.03.2012).

Türkiye'de Sığınma Evlerinde Sunulan Hizmetler

- ✓ Şiddete uğrayan kadınların barınma sorununun çözülmesi,
- ✓ Şiddete uğrayan kadınlarda şiddet sonucu ortaya çıkan umutsuzluk, değersizlik, suçluluk, utanç ve korku gibi duyguların aşılması,
- ✓ Özgüven ve özsaygının yeniden yapılanması,
- ✓ Yasal yardımlardan yararlandırılması,
- ✓ Yeni yaşam seçeneklerini sağlıklı bir biçimde belirleyebilmeleri yönünde psikolojik destek, danışmanlık, hukuksal rehberlik sunulması,
- ✓ Kendilerine yeterli olabilecekleri bir iş ve meslek kursuna yönlendirme,
- ✓ Aile veya eşle bir araya gelmeyi tercih etmeleri durumunda ailenin şiddet içermeyen bir ortam haline gelmesi ve çocukların şiddetten uzak, sağlıklı bir ortamda yetişmesi için aile ilişkilerinin sağlıklı sürdürülmesinin sağlanması,
- ✓ İzleme faaliyetlerinin sürdürülmesidir (https://www.ankara.bel.tr)

Bulgular ve Tartışma

Marmara bölgesinde 2013-2015 yılları arasında çeşitli nedenlerle kadın sığınma evlerinde kalan 142 kadın arasında yapılan çalışmaya göre; verileri oluşturan tablo üzerinde yaptığımız "ifcondition" testleri neticesinde kadınların kadın sığınma evlerinde 30-100≥ günün üzerinde kaldığı müddetçe kuaförlük, evde yaşlı ve hasta bakımı, çocuk bakımı, takı tasarımı, okuma yazma gibi eğitimler alaraksertifika veya sertifikalarına sahip olmuşlardır.

Sığınma evinde kalan kadınlardan çocuğu olanların birçoğu iş başvurusu yaparak işe yerleşmiş ve/veya kendi istekleri ile kurumdan ayrılmışlardır.

Bu süre içinde kadın sığınma evine başvuran 142 kadından %12'i (17 kadın) işe yerleşmiştir. İşe yerleşen kadınlardan%65'i (13 kadın) İŞKUR başvurusu yaparak, %52'si (9 kadın) eğitim sertifikalarından en az birine sahip olarak işe yerleşmiştir.

Sığınma evlerinde bu süre içinde kalan 142 kadından %53'ü (76 kadın) 3 ve 4 çocuk sahibidir. Çocuğu olan kadınlardan %10'u (8 kadın) işe yerleştirilmiştir.

 Copyright © International Science and Technology Conference (ISTEC)

Geri kalan kadınlardan hiç çocuğu olmayan ve en fazla iki çocuğu olanların istihdama katılmalarını sağlayacak en az bir sertifikaya sahibi olmalarına rağmen işe yerleşmedikleri görülmüştür.

Sığınma evinde bulunan kadınlardan, çocukları bakıma muhtaç olmayanlar çalışma hayatına daha rahat başlamaktadırlar. Çocuğu bakıma muhtaç olanlar ise alacakları ücret bakıcı ücretini karşılayamayacağı için mecburen çalışmamayı ve çocuklarına bakmayı tercih etmişlerdir.

Sonuç

Sığınma evlerinde kalma süresi altı ayla kısıtlanmıştır. Altı ay içinde kadının toplumsal hayata katılabilecek kadar kendini toparlayabileceği, iş bulup, düzenini kurabileceği düşünülmüştür. Öngörülen süre, bazı koşullarda bir altı ay daha uzatılabilmektedir.

Sığınma evleri kadının kalacağı altı aylık dönemden sonrasını da düşünmelidir. Altı ay şiddetten uzak kalan kadın, tekrar şiddet gördüğü yere geri dönmemelidir. Bu sebeple sığınma evleri, kadına iş bulmalı, bir kaç kadını bir araya getirip, onlara ödeyebilecekleri düzeyde bir ev kiralayıp döşeyebilmelidir. Devlet, yerel yönetimler ve gönüllü kuruluşlar bir arada çalışmalıdır. Devlet, kamu veya özel sektör kuruluşları, belli sayıda hükümlü ve özürlü çalıştırma zorunluluğunda olduğu gibi, kadın sığınma evinde yaşayan kadının belli oranda istihdamı ile de sorumlu olabilirler (Alpago, Ceyda, YLT, 2006).
Kadın sığınma evlerinde kalan kadınlara her ne sebeple gelmiş olursa olsun öncelikle psikolog kontrolünde psikolojik destek verilerek özgüvenlerini kazanmaları sağlanmalı, kaldıkları süre içerisinde sivil toplum kuruluşları, üniversiteler, belediyeler, çeşitli özel kuruluşlar aracılığı ile meslek eğitimleri verilerek tümevarımcı yöntemle daha fazla istihdama katılmaları sağlanarak topluma kazandırılmaları ve kendi ayakları üzerinde durmalarını sağlayacak eğitim çalışmalarına ağırlık verilmesi gerektiği neticesine ulaşılmıştır.

Kadın sığınma evleri bünyesinde çalışmak isteyen ancak küçük çocuğu olan kadınlar için çocuk bakım birimi oluşturularak istihdama kazandırılabilecek kadın sayısının artacağı ön görülmektedir. Kurum içinde oluşturulan çocuk bakım evlerinde çalışabilecek kadınlar, kurumda kalan ve kurum içinde çalışmak isteyen ve ayrıca çocuk bakımı eğitimi alıp bu sertifikaya sahip olan kadınlardan oluşabilecektir. Ayrıca bu evlerde de eğitim ve staj imkânı tanınarak çalışma hayatına adım atmaları desteklenmelidir. Böylece kadın istihdamına destek sağlamak kurum içinden de sağlanabilecektir.

Kadınların sosyal ve ekonomik konumlarını iyileştirmek için sorumluluğu bulunan tüm taraflarca çalışmalar yapılması ve olumsuz göstergelerin işaret ettiği alanlarda iyileştirilmelerin yapılması gerekliliği bir gerçektir.

TÜRKİYE'DEKİ ADLİ HİZMETLERİN DİJİTALLEŞMESİNDE KARŞILAŞILAN SORUNLAR VE ÇÖZÜM ÖNERİLERİ

Özlem OKTAL

Anadolu Üniversitesi, İİBF, İşletme Bölümü, Eskişehir-TURKEY

odogan@anadolu.edu.tr

Özet: Adli kurumların üretkenliğini ve verimliliğini arttırmak için Adalet Bakanlığı tarafından geliştirilen; ölçeklenebilir, çok kullanıcılı ve işe yönelik Ulusal Yargı Ağı Projesi (UYAP)'nin uygulamaya geçirilmesi kararının ardından iç kullanıcıların bilişim sisteminde karşılaştığı problemler ile sektördeki yenilik ve gelişmeler doğrultusunda bazı düzenlemeler yapma ihtiyacı ortaya çıkmıştır. Bu ihtiyaç doğrultusunda mevcut kullanılan sistemde ne tür sorunlar olduğu ve çözüm önerileri geliştirilmesi bu çalışmanın temelini oluşturmaktadır. Çalışmanın kapsamını, Türkiye'deki adli hizmetleri yürüten hâkim, başsavcı, savcı, mahkeme başkanı, kâtip, cezaevi personeli olmak üzere toplam 76.592 iç kullanıcı oluşturmaktadır. Çalışmada sistem iç kullanıcılarının bazı değişkenlere göre UYAP bilişim sisteminden memnuniyetini ortaya koyarak, mevcut durumda karşılaşılan sorunların üstesinden gelebilecek öneriler ortaya konulması amaçlanmıştır.

Anahtar kelimeler: Adli hizmetler, bilişim sistemleri, kullanıcı tatmini

Giriş

Son yıllarda bilişim teknolojilerinde meydana gelen hızlı gelişme ve yeniliklerin tüm kurumları etkisi altına aldığı şüphe götürmez bir gerçektir. Bilişim teknolojileri söz konusu olunca, kurumların üretkenliğini ve verimliliğini arttırmak için geliştirilen; ölçeklenebilir, çok kullanıcılı ve işe yönelik sistemler olan yönetim bilişim sistemleri kullanılması ihtiyacının ortaya çıkmasıyla, Adalet Bakanlığı tarafından Ulusal Yargı Ağı Projesi (UYAP)'nin uygulamaya geçirilmesi kararı verilmiştir.

Adli hizmetlerde otomasyona gitme çalışmalarının başladığı 1998 yılından bugüne geçen sürede iç kullanıcıların bilişim sisteminde karşılaştığı problemler ile sektördeki yenilik ve gelişmeler doğrultusunda bazı düzenlemeler yapılmıştır. Teknik uzmanların UYAP Bilişim Sisteminin etkinlik ve verimliliği ile ilgili düşünce ve deneyimlerinin özellikle sistemi kullanan iç kullanıcıların deneyim ve düşünceleri ile bütünleştirilmesi, sistemin etkinlik ve verimliliğinde önemli bir rol oynamaktadır. Sistemin kullanışlılığı, kullanıcıların teknolojiye yatkınlığı, kullanıcıların teknolojiye yönelik kaygıları, sistemden elde edilen bilginin niteliğinin yürütülen görev ve sorumlulukları yerine getirmeye uygun olması, kullanıcıların sistem ile ilgili karşılaştıkları problemlerin üstesinden gelebilme yetkinlikleri, sistemin kullanımına ilişkin verilen teknik hizmetlerin sistem kullanımını kolaylaştırmaya etkisi gibi boyutların analiz edilmesi ihtiyacı belirmiştir. Bu ihtiyaç doğrultusunda çalışmada mevcut kullanılan sistemde ne tür sorunlar olduğunu belirleyerek, sistem iç kullanıcılarının bazı değişkenlere göre UYAP bilişim sisteminden memnuniyetini ortaya koymak, sorunların üstesinden gelebilecek öneriler geliştirmek amaçlanmıştır.

Çalışmanın Amacı ve Kapsamı

Türkiye'nin dört bir yanında faaliyet gösteren adli hizmetlerin etkin bir şekilde yürütülmesini sağlamak üzere kullanılmaya başlanan UYAP Bilişim Sistemi kullanıcılarının bu sistemi kabulüne ilişkin nasıl bir davranış, niyet, tutum ve eğilim içinde olduklarını belirleyerek mevcut sorunların çözümüne ilişkin bazı öneriler geliştirmek amaçlanmıştır. Bu çalışma, Anadolu Üniversitesi Bilimsel Araştırma Projesi [1] kapsamında ve Adalet Bakanlığı'ndan alınan izinle gerçekleştirilmiştir.

Çalışmanın kapsamını Türkiye'deki adli hizmetleri yürüten hâkim, başsavcı, savcı, mahkeme başkanı, kâtip, cezaevi personeli olmak üzere ankete atanan toplam kullanıcı sayısı toplam 76.592'dir. Ankete cevap veren kullanıcı sayısı toplam 8840'dır. Üst düzey iç kullanıcılar, kâtipler ve cezaevi personelinin farklı iş akışları gerçekleştirdikleri ve farklı kararlar verdikleri dikkate alındığında çalışma grubumuzu üst düzey yöneticiler

[1] Bu çalışma Anadolu Üniversitesi Bilimsel Araştırma Projeleri Komisyonu tarafından kabul edilen 1203E045 nolu proje kapsamında desteklenmiştir. Bu projede Doç. Dr. Özlem Oktal (Yürütücü), Prof. Dr. Berna Yazıcı, Doç. Dr. Özlem Alpu ve Doç Dr. Zerrin Sungur görev almıştır.

 Copyright © International Science and Technology Conference (ISTEC)

(Başsavcı, Savcı, Mahkeme Başkanı ve Hakim), Kâtip ve Cezaevi Personeli olmak üzere üç ana gruba ayırarak ele almanın uygun olacağı düşünülmüştür (Tablo 1).

Bu çalışmada UYAP Bilişim Sistemi iç kullanıcılarının sistemi kullanmaya yönelik davranışlarının çeşitli faktörler çerçevesinde analizi hedeflenmiştir. Başlıca faktörler performans beklentisi, çaba beklentisi, kolaylaştırıcı şartlar, kaygı, teknoloji kullanımına yönelik tutum, teknik etkililik, risk, sistem kalitesi, hizmet kalitesi, içerik kalitesi, sosyal etki, motivasyonel etki, özyeterlilik ve kullanıcı tatminidir.

Araştırma Yöntemi

106 sorudan oluşan anket formunun ilk bölümünde; çalışmanın konusu, önemi, sonuçların nasıl kullanılacağı ve katılımcıdan yapması istenenleri kapsayacak şekilde bir ön tanıtım yazısı yer almaktadır. İkinci bölüm, boyutları ölçmek üzere hazırlanan ölçek maddelerinden oluşmaktadır. Son bölümde ise, katılımcıların bilişim sistemlerini kullanım oranları ve demografik bilgilerine yönelik sorular ve UYAP Bilişim Sistemi ile ilgili önerilerin yapılmasına imkân veren bölüm yer almaktadır. Ankette toplam 83 adet ölçek maddesi bulunmaktadır. Ölçek maddeleri, literatürde yer alan ölçek maddeleri temel alınarak, 5'li Likert ölçeğinde hazırlanmıştır. Bu çalışmada toplanan veriler, IBM Statistics SPSS versiyon 21 istatistik programı ile analiz edilmiş, lojistik regresyon ve log lineer modeller oluşturulmuştur.

Öncelikle sistem iç kullanıcılarının sistem kabulüne ilişkin davranış, tutum, niyet ve eğilimlerinin hangi göstergelerle (değişkenlerle) saptanabileceği araştırılmış, daha sonra çok sayıdaki değişkenlerin arkasında yatan gizli boyutlar(faktörler) ortaya çıkarılmaya çalışılmıştır. Araştırmada değişken kümelerinin güvenirliliği Cronbach alfa istatistiğiyle değerlendirilmiştir. Çalışmada yer alan değişkenlerin (83 değişken için) standart Cronbach alfa istatistiğinin değeri 0.96'dır. Bu istatistik, çalışmada ele alınan anketin güvenilir olduğunu göstermektedir.

Table 1: Genel Demografik Özellikler

Değişken		**Toplam (n=8840)**	**%**
Cinsiyet	Kadın	2628	29.7
	Erkek	6212	70.3
Yaş	18-24	1000	11.3
	25-34	4608	52.1
	35-44	2142	24.2
	45 yaş ve üzeri	1090	12.3
Kullanıcı grubu	Hâkim	274	3.1
	Başsavcı	72	0.8
	Savcı	219	2.5
	Mahkeme Başkanı	28	0.3
	Kâtip	4898	55.4
	Cezaevi personeli	1629	18.4
	Diğer	1720	19.5
Eğitim	İlköğretim	27	0.3
	Lise	1824	20.6
	Üniversite	6479	73.3
	Yüksek lisans	497	5.6
	Doktora	13	0.1
İş deneyimi (yıl)	1 yıldan az	984	11.1
	1-5	2866	32.4
	6-10	2351	26.6
	11-15	1066	12.1
	16 yıl ve üzeri	1573	17.8
Bilişim sistemi kullanma deneyimi (yıl)	1-3	3614	40.9
	4-6	3934	44.5
	7 yıl ve üzeri	1292	14.6

Analiz ve Bulgular Işığında Saptanan Sorunlar ve Çözüm Önerileri

Analiz sonuçları incelendiğinde genel olarak aşağıdaki bulgular ortaya çıkmaktadır:

 Copyright © International Science and Technology Conference (ISTEC)

- ***Katipler***in UYAP bilişim sistemi ile ilgili kullanıcı tatminini en fazla etkileyen yaş değişkenidir. Buna göre sırasıyla 18-24, 25-34 ve 35-44 yaş aralığı iç kullanıcılar diğerlerine (45 yaş ve üzeri) göre bilişim sisteminden daha fazla tatmin olmaktadır. Ardından sırasıyla 11-15 yıl arası iş deneyimi olanlar, sırasıyla 1-3 ve 4-6 yıl bilişim sistemi kullanma deneyimi olanlar ve erkek kâtipler gelmektedir. Bunun dışında, sırasıyla içerik kalitesi, teknolojiye karşı tutum, sistem kalitesi, teknik etkililik, özyeterlilik, performans beklentisi, hizmet kalitesi, çaba beklentisi ve risk bilişim sistemi kullanımından duyulan tatmini etkileyen değişkenler olarak diğerlerini takip etmektedir.

- ***Cezaevi personeli***nin sistem kullanımı tatminini en fazla etkileyen faktörün teknolojiye karşı tutum faktörü olduğu, onu cinsiyet değişkeninin izlediği görülmektedir. Bunun dışında, sırasıyla sistem kalitesi, performans beklentisi, içerik kalitesi, hizmet kalitesi, kaygı ve son olarak da risk, bilişim sistemi kullanımından duyulan tatmini etkileyen faktörler olarak diğerlerini takip etmektedir.

- Üst düzey iç kullanıcılar, kâtipler ve cezaevi personelinin farklı iş akışları gerçekleştirdikleri ve farklı kararlar verdikleri dikkate alındığında, ***mahkeme başkanı, başsavcı, savcı ve hakim***den oluşan üst düzey yönetici grubunun ise UYAP bilişim sistemine uyum sağlamasını etkileyen temel faktörler; güven, kaygı, teknoloji okur-yazarlığı ve algılanan kullanım kolaylığı olarak belirlenmiştir. Değişkenler ise cinsiyet, yaş, meslek grubu, iş deneyimi, bilişim sistemi kullanma deneyimi olarak tanımlanmıştır. Buna göre;
  - Meslek, yaş ve cinsiyet değişkenleri ile kullanıcının kendini güvende hissedecek bir ortam yaratacak yapı ve düzenlemeleri kapsayan kurumsal bir ortam ile ilgili algılaması açısından; 35-44 yaş aralığındaki üst düzey kullanıcıların daha yaşlı üst düzey yönetici meslek grubundakilere göre bilişim sistemine daha fazla uyum gösterdiği söylenebilir. Savcıların bilişim sistemini kullanmaya gösterdiği uyumun mahkeme başkanlarına ve hakimlere göre daha fazla olduğu ifade edilebilir.
  - Meslek, yaş ve cinsiyet değişkenleri ile kullanıcıların bilgiye etkin olarak erişme ve bu bilgiyi iletmede internet gibi ortamları kullanma becerisi; bilgiye erişirken ve ürettiği bilgiyi paylaşırken teknolojiden yararlanma becerisi açısından; mahkeme başkanı ve hakimlerin UYAP bilişim sistemine daha fazla uyum sağladığı söylenebilir. 25-44 yaş aralığındaki üst yönetim düzeyindeki iç kullanıcıların 45 yaş ve üzeri üst yönetim düzeyi iç kullanıcılarına göre sisteme uyumunun daha fazla olduğu söylenebilir.
  - Bilişim sistemi kullanma deneyimi, yaş ve meslek değişkenleri ile kullanıcının sistemi çok fazla çaba sarf etmeden kullanabileceğine inanma derecesi açısından; hakim ve başsavcıların bilişim sistemine daha fazla uyum sağladığı söylenebilir. 25-44 yaş aralığındaki üst düzey yönetici grubunu oluşturan iç kullanıcıların sisteme uyumunun daha fazla olduğu ifade edilebilir. 4-6 yıl bilişim sistemi kullanma deneyimine sahip iç kullanıcıların sisteme uyumunun daha fazla olduğu söylenebilir. UYAP bilişim sisteminin kullanımının kolay olmadığını düşünenlerin sisteme daha fazla uyum gösterdiği belirtilebilir. 45 yaş ve üzeri mahkeme başkanlarının ve başsavcıların, 25-34 yaş aralığındaki mahkeme başkanlarına ve başsavcılara göre bilişim sistemine daha fazla uyum gösterdiği ifade edilebilir.
  - Cinsiyet, yaş ve meslek değişkenleri ile kullanıcının bilişim sistemini kullanırken bireyde kaygı yaratan duygusal reaksiyonlar açısından; 25-34 yaş aralığındaki UYAP üst düzey yönetici grubu iç kullanıcılarının bilişim sistemine uyumu daha fazla olduğu gibi hakimlerin sisteme daha çok uyum gösterdiği ifade edilebilir. Bilişim sistemi kullanımı ile ilgili kaygıları olmayan üst düzey yönetici grubunun daha fazla uyum gösterdiği söylenebilir. Bunun yanında erkek iç kullanıcıların sisteme uyumu çok daha fazladır. Diğer taraftan UYAP bilişim sistemi kullanımı ile ilgili kaygı taşımayan 45 yaş ve üzeri iç kullanıcılar bilişim sistemine daha fazla uyum göstermektedir. Yaşça büyük olan üst düzey yönetici grubu iç kullanıcıların sisteme uyumu çok daha fazladır. Kadın hakimlerin kadın savcılara göre bilişim sistemine uyumunun çok daha fazla olmasının yanı sıra yaşça büyük olan kadın iç kullanıcıların bilişim sistemine daha çok uyum gösterdiği söylenebilir.

Kâtipler, cezaevi personeli ve mahkeme başkanları, hakimler, başsavcılar ve savcılardan oluşan üst yönetim düzeyi olmak üzere belirlenen üç farklı iç kullanıcı grubuna uygulanan anket sonucunda elde edilen bulgular, bu kullanıcı gruplarının sistem ile ilgili karşılaştıkları problemler saptanmış ve bazı öneriler geliştirilmiştir. Aşağıda genel olarak bu sorun ve çözüm önerilerine ilişkin başlıklar yer almaktadır:

- Kullanıcılar sistemin kesintisiz çalıştığı sürece iyi işlediğini, bir sorun olmadığını, zaman ve kırtasiyeden tasarruf edilerek işlerinin kolaylaştığını ifade etmektedirler. Sistemde hızı olumsuz etkileyen süreçlerin iyileştirilmesi ve geliştirilmesine gereksinim duyulmaktadır.
- UYAP bilişim sistemi ile ilgili değerlendirmeler arasında yer alan önemli bir başka başlık da eğitim konusudur. Adliyelerde çalışan uzman kullanıcıların sistem sorunları hakkında yeterli bilgiye sahip olmamaları eğitim gereksinimi üzerinde durulması gerektiğini göz önüne sermektedir. Personele yüz yüze eğitim verilmelidir.

 Copyright © International Science and Technology Conference (ISTEC)

- Eğitimlerin sürekli olarak devam etmesi verilen eğitimlerin hangi düzeye geldiğinin incelenmesi ve verilecek eğitimlerde eksiklerin giderilmesi gerekmektedir.
- UYAP bilişim sistemi ile ilgili sorunlardan bir diğeri genel olarak ekranların ve menülerin sadeleştirilmesi ve daha az modül, işlem adımı ile daha çok iş yapılabileceği yönündedir. Onaylanacak işlem sayısının azaltılması gerekmektedir. Ancak esas sorun, hukuki adımların kısaltılmasının, basitleştirilmesi ya da birleştirilmesinin zorluğudur.
- Bir diğer sorun, UYAP bilişim sistemine yerinden bağlanabilme ile ilgilidir (mobil cihazlar, farklı mekânlar, vs.).
- UYAP yardım masasının daha hızlı ve etkili bir şekilde hizmet vermesi sorunların çözümünde etkili olacaktır.
- Birtakım güvenlik politikaları ve kurallarının oluşturulması, teknik donanım ile ilgili sorunların azalmasında etkili olabilir.
- UYAP'ın kişisel kullanımının Hakim ve Savcı boyutunda artırılması gerekmektedir.
- Diğer kurumlarla entegre olacak alt yapı oluşturulmalıdır. Danıştay'ın UYAP'a tam olarak entegre olması ile birlikte aynı şekilde onaylanmış Danıştay kararlarına da yerel idari yargı yerlerinin ulaşabilmeleri sağlandığı takdirde Mahkemeler arası bilgi belge teminine yönelik ara kararlar yapılmasına gerek kalmayacağı ve yargılamaların bu nedenle uzamasının da önüne geçileceği düşünülmektedir.
- Bilgisayarların ve yardımcı donanımın yenilenmesi gerekmektedir.
- Kâğıtsız ortama geçme gerekliliği, ıslak imzanın yerine e- imza kullanımının yaygınlaştırılması gerekmektedir.

Sonuç

Genel olarak araştırma sonucunda üç iç kullanıcı grubunun UYAP ile ilgili daha etkili ve verimli bir çalışma ortamı içinde yer alabilmesi için düzeltilmesi gereken ortak noktaları şu şekilde sıralayabiliriz: UYAP'ın işlem hızının yükseltilmesi, teknik personelin nitelik ve nicelik açısından yetersizliğinin giderilmesi, iç kullanıcılara UYAP'ın kullanımına ilişkin hizmet-içi eğitim verilmesinin önemle üzerinde durulması, UYAP ile ilgili yapılacak yeniden düzenleme çalışmalarında bu sistemi bizzat kullanan en alttan en üste kadar tüm personelin istek, şikâyet ve önerilerinin öğrenilebileceği bir çalışma grubu oluşturularak bunların hayata geçirilebilecek hale getirilmesi, UYAP'ın kullanımına ilişkin yeni politika ve kurallar oluşturularak bu kural ve politikaların yerine getirilip getirilmediğinin adil bir biçimde denetlenmesi sağlanmalıdır.

TÜRKİYE VE İTALYA ARASINDAKİ TİCARETİN DURUMU VE GELİŞTİRİLMESİNE YÖNELİK ÖNERİLER

Mehmet ÖZCANLI

Harran Üniversitesi, Fen-Edebiyat Fakültesi Coğrafya Bölümü. Şanlıurfa/Türkiye
mehmetozcanli@harran.edu.tr

ÖZ:Türkiye ve İtalya, Akdeniz Havzası'nda ortak çıkarları bulunan, ortak tarih ve değerleri paylaşan iki bölgesel güçtür. İki ülke ilişkilerini stratejik ticari ortaklık olarak tanımlamak mümkündür. İki ülkenin bölgesel ve küresel meselelere çözüm bulunması hususunda işbirliği içinde çalışma iradesi mevcuttur. Nitekim Türkiye ve İtalya, Afganistan'dan Libya'ya geniş bir coğrafyada barış ve istikrarın sağlanması amacıyla çaba göstermekte ve işbirliği yapmaktadırlar. İtalya ile ilişkilerimiz, Akdeniz Havzası'nda ortak çıkarlar ve değerleri paylaşan iki bölgesel güç sıfatıyla stratejik ortaklık boyutu taşımaktadır. AB'nin kurucu üyeleri arasında bulunan İtalya, ülkemizin AB üyelik sürecini güçlü ve görünür şekilde destekleyen ülkelerin başında gelmektedir. İtalya ülkemizin en önemli ticaret ortaklarından biridir. İtalya'da yaklaşık 35 bin vatandaşımız yaşamaktadır. Ülkelerin ekonomik faaliyet farklılıkları ülkeler arası ticaretin artmasında en önemli etkenlerin başında gelir. İtalya ve Türkiye arsındaki bu ekonomik faaliyet farklılık iki ülke ekonomisinin birbirini tamamlayıcı nitelikte farklı ekonomik yapıların ortaya çıkmasına neden olmuştur. Bu durum ihracat ve ithalat açısından Türkiye ve İtalya arsında büyük bir ticari potansiyel yaratmaktadır. Bu çalışmada Türkiye ve İtalya arasındaki ticaretin gelişimi 2000 yılından 2015 yılına kadar incelenerek Türkiye açısından oldukça büyük ve önemli bir pazar olan İtalya ile ithalat ve ihracat durumu ortaya konulmuştur. Yöntem olarak belli başlı ticari kalemlerde Türkiye ve İtalya arsındaki ticaret durumu incelenecektir. Ele alınan ürünler şunlardır: Teknolojik ürünler, Ham madde, Gıda, Tekstil, Makine, Hayvancılık, vb. ürünlerdir. Bu ürünlere ilişkin Türkiye'nin de dış ticaret verileri toplanmıştır. İthalat ve ihracat verileri her bir üründe İtalya ile net ticaret (ihracat-ithalat) hesaplanmış ve Tablo ve grafik olarak verilmiştir. İthalat ve ihracat verileri 2000-2015 dönemini kapsamakta olup TÜİK dış ticaret istatistiklerinden derlenmiştir. Türkiye ve İtalya arasında bu ürünler açısından rekabet gücünün daha iyi anlaşılabilmesi için, her ülkenin her bir üründeki *net ticaretleri* hesaplanmıştır. Bir ülkenin bir üründeki *net ticaret konumu* ihracatı ile ithalatı arasındaki fark olarak tanımlanmıştır. Bu çalışmanın önemi Türkiye'nin İtalya için zaman serisi olarak bu kalemler bazında net ticaretini gösterecek ve potansiyel ticaret için Türkiye ve İtalya arsında bazı seçilmiş kalemlerde dış ticaret ilişkileri ve ticaretinin geleceği hakkında bir fikir verecektir. Dolayısıyla böyle bir bilgi bazı karar alıcı birimlerin uzun dönemli plan ve strateji düzenlemelerine yardım edecektir. Sonuç olarak yaklaşık 60 milyonluk nüfusu ve ticaretinin büyük bölümünü Avrupa Birliği ülkeleri dışına yapan İtalya dış ticaret yapısı gereği Türkiye için önemli bir ticari ortak haline gelmektedir. Ama İki ülke arasında dış ticaret dengesinde Türkiye aleyhine bir durum söz konusudur.İhracatımızın %4,4'ünü İtalya'ya yaparken ithalatımızın %5,2'sini İtalya'dan gerçekleştirmekteyiz. AB üyesi ülkelere gerçekleştirdiğimiz ihracatta İtalya'nın payı %10,7 iken, AB ülkelerinden yapılan ithalatta İtalya'nın payı %14,1'dir. İkili ticaret hacmimiz 2014 yılı itibariyle 19,19 milyar Dolardır (ihracatımız 7,14 milyar Dolar, ithalatımız 12,05 milyar Dolar). Ülkemizde yaklaşık 1.200 İtalyan firması faaliyet göstermektedir. 2002 yılından bu yana İtalya'dan ülkemize gelen toplam yatırım miktarı 2 milyar 699 milyon Dolar olmuştur. 2014 yılında ülkemizi 697.360 İtalyan turist ziyaret etmiştir. 1997 yılında Türkiye ile İtalya arasındaki ticaret hacminin 10 milyar dolar iken 1998 yılında Türkiye ile İtalya arasında yaşanan Öcalan krizi ve dünyadaki global krizin de etkisi ile bu rakamın 1998 yılında 5.8 milyar dolara 1999 yılında da daha düşük seviyelere gerilemiştir. "İtalya, Almanya'dan sonra en büyük ticari partnerimizdir. İki ülke arasındaki ticari potansiyelin tam kullanılmadığı da tespitler arasındadır. Büyük düşüş gösteren ticari ilişkiler daha sonra tekrar yükselme trendine girmiş olmakla birlikte hala Türkiye'nin İtalya'ya olan ihracatı İtalya'nın Türkiye'ye ihracatı arasında büyük fark bulunmaktadır.

Anahtar Kelimeler: Ticaret Coğrafyası, İthalat ve İhracat, İtalya, Ekonomik Coğrafya

Abstract: Turkey and Italy, found common interests in the Mediterranean Basin are two regional powers that share a common history and values. Bilateral relations can be defined as strategic business partners. Finding solutions to regional and global issues of the two countries will work and in cooperation are available in the matter. In fact Turkey and Italy, in a wide region from Afghanistan to Libya in an effort to ensure peace and stability and are cooperating. Our relations with Italy, who share common interests and values in the Mediterranean Basin capacity of the two regional powers, the strategic partnership dimension. Located among the founding members of the EU, Italy has come to our country's EU accession process among the countries that support strong and visible. Italy is one of our country's most important trade partners. about 35 thousand citizens living in Italy. Countries differ in economic activity increased trade between countries is among the most important factors. The economic activities of the differences between the two economies, Italy and Turkey have caused to the emergence of different economic structure complement each other. In this case, in terms of exports and

 Copyright © International Science and Technology Conference (ISTEC)

imports is creating a huge trade potential between Turkey and Italy. This study examined the development of trade between Turkey and Italy from 2000 until 2015, which is a fairly large and important market in terms of import and export situation in Turkey were found with Italy. Method as in certain commercial items trade situation between Turkey and Italy will be examined. The products be addressed are: Technological products, raw materials, food, textile, machinery, livestock, and so on. They are the product. Turkey's foreign trade data is collected on these products. Import and export data, net trade with Italy in each product (export-import) are given as calculated and tables and graphs. Import and export data are compiled from TSI covers the 2000-2015 period, foreign trade statistics. For a better understanding of these products in terms of competitiveness between Turkey and Italy, each country's net trade in each product is calculated. A country's net trade position in exports of a product is defined as the difference between imports. The importance of this study, these items as time series for Turkey to Italy will give you an idea about the future of trade relations and trade in some selected items in Turkey and Italy hypercalcemia will show the net trade basis and potential trade. Therefore, such information will help the long-term plans and strategies of certain decision-makers regulation unit. Therefore, such information will help the long-term plans and strategies of certain decision-makers regulation unit. As a result, about 60 million people and a large part of that trade outside the European Union countries, Italy foreign trade structure should become an important trade partner for Turkey. But it is a case against Turkey in the balance of trade between the two countries. Our 4.4% of our exports while imports are realizing from Italy to 5.2% in Italy. Italy's share of EU exports to the country have realized 10,7%, while the share of imports from EU countries, Italy is 14.1%. Our bilateral trade turnover in 2014 was 19.19 billion dollars (7.14 billion US dollars our exports and imports 12.05 billion US dollars). In our country, it operates about 1,200 Italian company. Since 2002 the total amount of investment has been coming to our country from Italy 2 billion 699 million dollars. We visited our country in 2014, 697 360 Italian tourists. While the $ 10 billion trade volume between 1997 Turkey and Italy in 1998 occurred between Turkey and Italy Ocalan crisis and the world global crisis than this figure with effect in 1998. In 1999, 5.8 billion dollars, also declined to lower levels. "Italy, the biggest trade partner after Germany Dan sturdy. Are among the findings that the use of full trade potential between the two countries. "Italy, the biggest trade partner after Germany Dan sturdy. Are among the findings that the use of full trade potential between the two countries. indicates largest decline in trade relations, but then again it has entered into an upward trend with exports to Italy to Turkey is still a big difference between Italy's exports to Turkey.

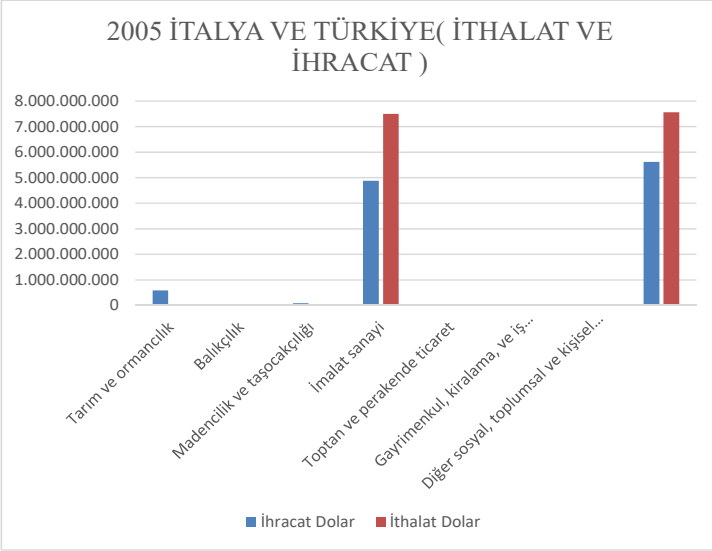
Toplam	1.789.307.437	4.332.788.267	-2.543.480.830

Grafik 4: 2000 yılı Türkiye ve İtalya (ihracat ve ithalat)



Yukarıdaki tabloda 2000 yılı İtalya ve Türkiye arasındaki ithalat ve ihracat payları verilmiştir. Bu verilere göre ulaşabileceğimiz sonuçlar şunlardır; tablodan anlaşılacağı gibi Türkiye'nin 2000 senesinde İtalya'dan en çok ithal ettiği ürün (4.295.889.358 dolar) İmalat sanayi olarak görülmektedir. İtalya'ya ikinci en çok ithal edilen başka bir değişle ürkiye'nin kasasından para çıktığı ürün ise Tarım ve Ormancılık (17.573.908 dolar) yer almaktadır. Bunu 15.449.606 dolarla Maden ve taşocakçılığı takip etmektedir. Türkiye'nin İtalya ile 2000 senesinde yaptığı ihracat paylarına bakılacak olursa Türkiye'nin kasasına en fazla girdiyi 1.602.000.262 dolarla en çok ithal edilen imalat sanayi busefer de ençok ihraç edilen ürün olarak yer almaktadır. İkinci kar edilen dışa satımı yüksek olan ürün ise bakıldığında 109.572.846 dolarla tarım ve ormancılık ikinci kar elde edilen üründür. Türkiye'nin en fazla ithal ettiği ve en çok ihraç ettiği ürün olan imalat sanayi ürünleri ithalat ve ihracat farkına bakıldığında kasadan en çok paranın çıktığı ve Türkiye'nin bundan kar etmediği görülmektedir (-2.693.889.096).

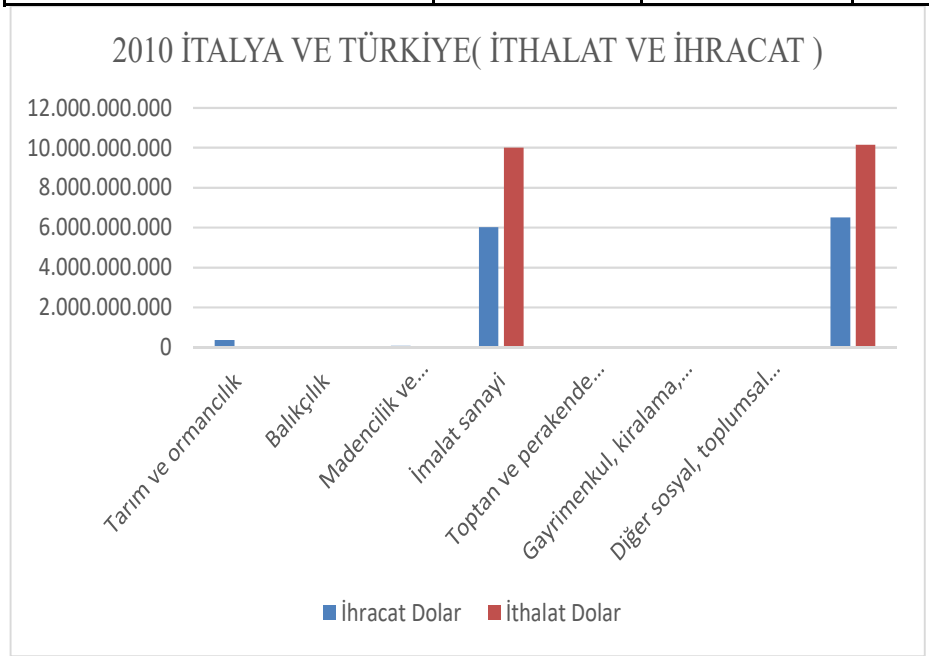
 Copyright © International Science and Technology Conference (ISTEC)

2000 senesi İtalya ile yapılan ihracat ve ithalat farklarına bakıldığında Türkiye'nin İtalya'dan aldığı ve dışa bağımlılığının olduğu gözlenen ürünler ise şöyle sıralanabilir; imalat sanayi ve Gayrimenkul, kiralama ve iş faaliyetleri ürünleri yer almaktadır. Bunun yanı sıra Gayrimenkul, kiralama ve iş faaliyetlerinde ihracatta veri bulunmayıp ithal edildiği görülmektedir.

2.2 2005 Yılında İtalya İle Türkiye Ticari İlişkiler

Ürün Adı	İhracat Dolar	İthalat Dolar	İhracat ve İthalat Farkı
Tarım ve ormancılık	591.839.552	29.081.420	562.758.132
Balıkçılık	41.005.297	45.215	40.960.082
Madencilik ve taşocakçılığı	87.796.760	20.588.148	67.208.612
İmalat sanayi	4.880.007.921	7.506.080.537	-2.626.072.616
Toptan ve perakende ticaret	16.066.489	4.347.173	11.719.316
Gayrimenkul, kiralama ve iş faaliyetleri		3.876.406	-3.876.406
Diğer sosyal, toplumsal ve kişisel hizmetler	39	2.243.171	-2.243.132
Toplam	5.616.754.657	7.566.262.070	-1.949.507.413

Grafik 3: 2005 italya ve Türkiye Ticareti(ithalat ve ihracat)



Yukarıdaki tabloda 2005 yılı İtalya ve Türkiye arasındaki ithalat ve ihracat payları verilmiştir. Bu verilere göre ulaşabileceğimiz sonuçlar şunlardır; tablodan anlaşılacağı gibi Türkiye'nin 2005 senesinde İtalya'dan en çok ithal ettiği ürün (7.506.080.537 dolar) İmalat sanayi olarak görülmektedir. İtalya'ya ikinci en çok ithal edilen başka bir değişle Türkiye'nin kasasından para çıktığı ürün ise Tarım ve Ormancılık (29.081.420 dolar) yer almaktadır. Bunu 20.588.148 dolarla Maden ve taşocakçılığı takip etmektedir. Türkiye'nin İtalya ile 2005 senesinde yaptığı ihracat paylarına bakılacak olursa Türkiye'nin kasasına en fazla girdiyi 4.880.007.921 dolarla en çok ithal edilen imalat sanayi busefer de ençok ihraç edilen ürün olarak yer almaktadır. İkinci kar edilen dışa satımı yüksek olan ürün ise bakıldığında 591.839.552 dolarla tarım ve ormancılık ikinci kar elde edilen üründür. Tabloya bakıldığında en çok ihraç edilen dolar bazında payda imalat sanayi yer alması gerekirken 4.880.007.921 dolarlık bir payla ithalatına bakıldığında girdinin çıktıdan daha fazla olduğu (7.506.080.537 dolar) ve bu yüzden kar edilmediğini aksine kasadan para çıktığını görmekteyiz.

Diğer sosyal, toplumsal ve kişisel hizmetler	54.501	3.037.587	-2.983.086
Toplam	6.505.276.857	10.139.887.874	-3.634.611.017

Grafik 2: 2010 Türkiye ve İtalya arasında yapılan ithalat ve ihracat

Yukarıdaki tabloda 2010 yılı İtalya ve Türkiye arasındaki ithalat ve ihracat payları verilmiştir. Bu verilere göre ulaşabileceğimiz sonuçlar şunlardır; tablodan anlaşılacağı gibi Türkiye'nin 2010 senesinde İtalya'dan en çok ithal ettiği ürün (10.011.293.327 dolar) İmalat sanayi olarak görülmektedir. İtalya'ya ikinci en çok ithal edilen başka bir değişle Türkiye'nin kasasından para çıktığı ürün ise Toptan ve perakende ticaret (66.800.759 dolar) yer almaktadır. Bunu 41.559.500 dolarla tarım ve ormancılık takip etmektedir. Türkiye'nin İtalya ile 2010 senesinde yaptığı ihracat paylarına bakılacak olursa Türkiye'nin kasasına en fazla girdiyi İtalya'ya yapılan ihracatlardan İtalya'ya 3. En çok ithal edilen ürün olan Tarım ve ormancılık 370.248.969 dolarla bu sefer ihracatta başta gelmektedir. İkinci kar edilen dışa satımı yüksek olan ürün ise bakıldığında 78.079.032 dolarla madencilik ve taş

 Copyright © International Science and Technology Conference (ISTEC)

ocakçılığı ikinci kar elde edilen üründür. Tabloya bakıldığında en çok ihraç edilen dolar bazında payda imalat sanayi yer alması gerekirken 6.024.478.371 dolarlık bir payla ithalatına bakıldığında girdinin çıktıdan daha fazla olduğu (10.011.293.327 dolar) ve bu yüzden kar edilmediğini aksine kasadan para çıktığını görmekteyiz.

2010 senesi İtalya ile yapılan ihracat ve ithalat farklarına bakıldığında Türkiye'nin İtalya'dan aldığı ve dışa bağımlılığının olduğu gözlenen ürünler ise şöyle sıralanabilir; imalat sanayi ve Toptan ve perakende ticaret ürünleri yer almaktadır. Türkiye'nin en az ithal ve ihraç ettiği ürün ise Gayrimenkul, kiralama ve iş faaliyetleri yer almaktadır ithalatta payı bulunmayıp ihraç edildiği görülmektedir.

2.4 2015 Yılında İtalya İle Türkiye Arasındaki Ticari İlişkiler

Ürün adı	İthalat Dolar	İhracat Dolar	İhracat ve İthalat Farkı
Tarım ve ormancılık	657.945.013	94.412.105	-563.532.908
Balıkçılık	53.063.094	56.334	-53.006.760
Madencilik ve taşocakçılığı	102.689.255	16.663.708	-86.025.547
İmalat sanayi	6.056.893.130	10.473.059.888	4.416.166.758
Toptan ve perakende ticaret	20.255.514	53.924.781	33.669.267
Gayrimenkul, kiralama, ve iş faaliyetleri		258.133	258.133
Diğer sosyal, toplumsal ve kişisel hizmetler	44.124	1.954.232	1.910.108
Toplam	10.640.329.181	6.890.946.464	-3.749.382.717

Grafik 1: 2015 Yılı Türkiye ve İtalya ihracat ve ithalat

Yukarıdaki tabloda 2015 yılı İtalya ve Türkiye arasındaki ithalat ve ihracat payları verilmiştir. Bu verilere göre ulaşabileceğimiz sonuçlar şunlardır; tablodan anlaşılacağı gibi Türkiye'nin 2015 senesinde İtalya'dan en çok ithal ettiği ürünler 6.056.893.130 dolarla İmalat sanayi ürünleri yer almaktadır. İkinci en fazla ithal edilen ürün ise 657.945.013 dolarla Tarım ve Ormancılık ürünleri mevcuttur. 2015 senesinde İtalya'dan ithal edilen en az ürün ise Gayrimenkul Kiralama ve İş faaliyetleri yer almaktadır. Tabloya göre ihracat ürünlerine bakılacak olursa en çok İtalya'ya ihraç edilen ürün İtalya'dan en çok ithal edilen imalat sanayi ürünleri 10.473.059.888 dolarla yer almaktadır. İkinci en çok ihraç edilen ürün ise tabloda görüldüğü gibi 94.412.105 dolarla Tarım ve Ormancılık

 Copyright © International Science and Technology Conference (ISTEC)

ürünleri yer almaktadır. Türkiye'nin 2015 senesinde İtalya'ya en az ihraç ettiği ürün ise görüldüğü üzere 56.334 dolarla Balıkçılık gelmektedir.

Türkiye'nin İtalya'ya ihraç ettiği ürünlere bakılacak olursa ihracat ve ithalat farkından anlaşılacağı gibi kar ettiği ve Türkiye'ye ekonomik girdi olarak 4 ürün göze çarpmaktadır. Bunlar başta İmalat Sanayi (4.416.166.758 dolar) olmak üzere takiben Toptan ve Perakende Ticaret (33.669.267 dolar). Diğer Sosyal, Toplumsal ve Kişisel Hizmetler (1.910.108 dolar) le devam etmekte ve 4. Ürün ise payı azda olsa kar ettiği ürün Gayrimenkul, kiralama ve iş faaliyetleri (258.133 dolar) yer almaktadır. Türkiye'nin kar ettiği gibi ithalatta kasasından para çıktığını da görmekteyiz bunun için ihracat ve ithalat farklarına baktığımızda Türkiye'nin 3 üründe kasasından para çıktığını ve ihracatın ithalattan az olup dışa bağımlılığı olduğu ürünleri görebilmekteyiz. Bu ürünler şöyle sıralanabilir en çok fark ve en çok para akışı olan ürün Tarım ve Ormancılık (-563.532.908 dolar) dır. İkinci olarak ise Madencilik ve taşocakçılığı (-86.025.547) yer almaktadır son olarakta Balıkçılık (-53.006.760 dolar) Türkiye'nin kasasından para çıkmasına neden olmuş üründür.

3. Sonuç ve Öneriler

İtalya ekonomik ve ticari ilişkileri bakımından Türkiye için olan önemini korumaktadır. Türkiye'nin ithalatında Almanya'dan sonra İtalya ikinci sırada kendini göstermektedir. İtalya ile Türkiye arasında 5 yıllık periyotlarla incelediğimiz ticari ilişkilerde Türkiye ve İtalya ithalat ve ihracatta birbirlerine bağlı olduklarını görmekteyiz. Türkiye'nin ihracatında geleneksel olarak son yıllarda otomotiv sanayi ürünleri (imalat) ve parçaları makineli cihazlar ve beyaz eşya elektrikli cihazlar önemli ölçüde ihracatımızda yer almaktadır. Türkiye'nin kasasına İtalya'ya ihracattan doğan girdiye bakıldığında 2000-2005-2010-2015 senelerinde ençok girdiyi sağlayan ve karı yüksek olan ürünler imalat sanayi olarak görülmekte.

Türkiye'nin üç tarafı denizlerle çevrili olmasına rağmen İtalya'dan balık ithalatı yapması tuhaf ama gerekçesine bakılacak olursa Türkiye'nin tüketimde balıkçılığın İtalya'dan fazla olması ve bunun yetersiz olmasından dolayı İtalya'dan balık ithalatı yapıldığı aşinadır. Tarım ve ormancılığa dayalı sanayi faaliyetlerinde Türkiye'nin İtalya'ya bazen ihraç ettiğini bazen de ithal etmek zorunda kaldığını görmekteyiz. Gayrimenkul, kiralama ve iş faaliyetlerinde verilere bakıldığında 2000-2005-2010-2015 senelerinde Türkiye'nin ihracat verilerinin bulunmayıp bu ürünleri İtalya'dan ithal ettiği görülmektedir. Buda bize İtalya'nın hizmetler sektörüne bağlı olan Gayrimenkul, kiralama ve iş faaliyetlerinde geliştiğini ve rağbet gördüğünü göstermektedir.

İtalya ülkemizin geleneksel tarımsal ürünlerinin ihracatında önemli Pazar konumunu muhafaza etmektedir tarımsal ürünler ihracatımızda başlıca ürünler olan zeytinyağı, fındık, kuru incir ve Antep fıstığı ihracatında İtalya ilk sırada yer almaktadır. Son yıllarda İtalya'ya yönelik ihracatımızın ürün bileşiminde önemli bir gelişme göstermektedir. Türkiye'nin İtalya'yla yaptığı ticari ilişkilerde incelediğimiz 5 yıllık periyotlarda Diğer sosyal, toplumsal ve kişisel hizmetler sektöründe İtalya'nın az farkla da olsa önde olduğunu ve Türkiye'nin İtalya için Pazar konumunda olduğu görülmektedir. İtalya ve Türkiye'nin ticari ilişkilerinin gelişmiş olmasının iki ülkenin de Akdeniz'e kıyısı olup deniz yolu ulaşımında gelişmiş olmasının büyük etkisi bulunmaktadır. Bunun yanı sıra Türkiye ve İtalya arasında imzalanan ticari protokollerde bu ilişkiyi güçlendirmekte ve Türkiye'nin ekonomisinin gelişmesinde etkisi aşikârdır.

TÜRKİYE' DE KÜRESELLEŞMENİN ÇEVRESEL KALİTE ÜZERİNDEKİ ETKİSİ: EKONOMETRİK BİR ANALİZ[1]

Emrah KOÇAK

Ahi Evran Üniversitesi

ekocak@ahievran.edu.tr

Özet

Bu çalışmanın amacı Türkiye' de küreselleşme, ekonomik büyüme ve doğrudan yabancı sermaye yatırımlarının CO2 salınımı üzerindeki potansiyel etkisini eşbütünleşme ve vektör hata düzeltme modeline dayalı nedensellik testi ile araştırmaktır. Bu çalışmada örneklem 1974-2011 dönemini kapsamaktadır. Ampirik sonuçlar değişkenlerin eşbütünleşik olduğunu ve küreselleşme, ekonomik büyüme ve doğrudan yabancı sermaye yatırımlarının CO2 salınımı üzerinde pozitif bir etkisi olduğunu göstermektedir. Nedensellik test sonuçları ise, uzun dönemde küreselleşme, ekonomik büyüme ve doğrudan yabancı sermaye yatırımlarından CO2 salınımına doğru tek yönlü bir nedensellik ilişkisi ortaya koymaktadır.

Anahtar Kelimeler: Küreselleşme, CO_2 salınımı, Türkiye, eşbütünleşme, nedensellik

THE EFFECT OF GLOBALİZATİON ON ENVİRONMENTAL QUALİTY İN TURKEY: AN ECONOMETRİC ANALYSİS

Abstract

The aim of this study to investigate the potential impact of globalization, economic growth and foreign direct investment on CO2 emissions in Turkey using cointegration and causality test within the Vector Error-Correction Model (VECM). This paper covers the sample period from 1974 to 2011. The empirical results show that the variables are cointegrated and globalization, economic growth and foreign direct investment have positive impact on CO2 emissions. The causality test results reveal a unidirectional causality from globalization, economic growth and foreign direct investment to CO2 emissions in the long run.

Key words: Globalization, CO_2 emission, Turkey, cointegration, causality

Giriş

Küreselleşme, dünya genelinde sosyal, kültürel ekonomik ve politik yönden insan hayatının her yönünü etkilemektedir. Küreselleşme ile beraber, ekonomiler arasındaki karşılıklı bağımlılık ve toplumlar arasında bilgi, fikir, teknoloji, sermaye, emek, mal ve hizmet akımları giderek artmış; piyasaları düzenleyen ve kontrol eden ulusal hükümetlerin geleneksel rollerine karşı bir tavır ortaya çıkmıştır (Esty ve Ivanova, 2004). Bu süreç içinde, ekonomilerde finansal gelişme, yabancı sermaye yatırımları ve serbest ticaret hacmi artmış ve tüm piyasalarda artan dış rekabet yüksek büyüme oranları ile sonuçlanmıştır (Shahbaz vd., 2015). Diğer taraftan ekonomik büyümenin ve bütünleşmenin bu hızlı temposu dünya genelinde bir takım sorunlara da yol açmıştır. Bu kapsamda ekonomistler özellikle küreselleşmenin çevre üzerindeki etkisini şiddetle tartışmaya başlamıştır (Baek vd., 2009). Bu tartışmalarda küreselleşme sıklıkla uluslararası serbest ticaret ile eşanlamlı kabul edilmiş (Huwart ve Verdier, 2013) ve bir ülkenin küreselleşme düzeyi o ülkenin serbest ticaret düzeyi/dışa açıklık oranı ile ölçülmüştür (Shahbaz vd., 2015).

Teorik literatürde küreselleşmenin çevre üzerindeki etkisine yönelik iki farklı görüş bulunmaktadır. Bu görüşlerden birincisine göre küreselleşme çevre kalitesini azaltmaktadır. Çünkü küreselleşmenin bir sonucu olarak artan ekonomik faaliyetler- sanayileşme, kentleşme, ticaret, yatırım gibi- büyük miktarlarda doğal kaynak kullanımına neden olmakta ve dünya genelinde biyolojik çeşitlilik, hava, toprak, su ve ormanlar üzerindeki baskıyı giderek arttırmaktadır (Esty ve Ivanova, 2004; Jobert vd., 2015). Buna ilaveten küreselleşme hükümetlerin çevresel koruma kapsamındaki düzenleme güçlerini baltalamakta ve bu durum kirli endüstrilerde faaliyette bulunan çok uluslu şirketler için dünya genelinde önemli yatırım alanları ve imkânları sağlamaktadır (Christmann ve Taylor, 2001).

İkinci görüşe göre ise, küreselleşme çevre kalitesini iyileştirmektedir. Bu görüşe göre, artan ticaretle beraber sanayileşme, sermaye hareketleri, araştırma ve yenilik faaliyetlerinin küreselleşmesi dünya genelinde enerji verimliliği ve daha temiz teknolojilerin gelişimine katkıda bulunarak yeşil büyüme sürecini teşvik etmektedir. Dahası küreselleşen bilgi, dünya genelinde çevresel sorunlar karşısında hassasiyetleri arttırmakta ve çevre

[1] Bu çalışma Ahi Evran Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimince Desteklenmiştir. Proje Numarası: MMY.E2.16.002

 Copyright © International Science and Technology Conference (ISTEC)

politikalarının gelişimi için büyük bir seferberlik sağlamaktadır (Shahbaz vd., 2016). Ayrıca çokuluslu şirketler gelişmiş ülkelerdeki yeşil teknolojileri, çevresel standartları ve uygulamaları gelişmekte olan ülkelere aktararak gelişmekte olan ülkelerde çevresel sorunların azalmasına çok önemli katkılarda bulunabilmektedir (Christmann ve Taylor, 2001).

Bu iki farklı görüş literatürde ampirik çalışmalar ile araştırılmaktadır. Bu kapsamda birinci grup çalışmalar küreselleşmenin çevre üzerinde olumsuz etkisi olduğu yönündeki görüşü destekler sonuçlara ulaşmıştır. Bu kapsamda Dinda (2006), küreselleşmenin göstergesi olarak dışa açıklığın CO2 salınımı üzerindeki etkisini 1965-1990 dönemi 54 ülke için panel veri yöntemi ile araştırmıştır. Ülkeler OECD, OECD üyesi olmayan ülkeler ve toplam ülkeler (her iki grubun toplamı) olmak üzere üç gruba ayrılmıştır. Her üç ülke grubu için bulgular küreselleşmenin CO2 salınımını üzerinde arttırıcı bir etkisi olduğunu göstermektedir. Leitao (2013), 1980-2010 dönemi İrlanda, İspanya, Portekiz ve Yunanistan' da küreselleşmenin CO2 salınımı üzerindeki etkisini sabit etkiler modeli ile tahmin etmiştir. Küreselleşmenin göstergesi olarak sadece dışa açıklığı değil; sosyal, ekonomik ve politik küreselleşmeyi de kapsayan ve Dreher (2006) tarafından hesaplanan küreselleşme endeksini kullanmıştır. Çalışmanın sonucunda küreselleşmenin CO2 salınımını arttırdığı bulgusuna ulaşmıştır. Shahbaz vd. (2015), 1970-2012 dönemi Hindistan' da Dreher (2006) tarafından hesaplanan küreselleşme endeksinin CO2 salınımı üzerindeki etkisini Gecikmesi Dağıtılmış Otoregresif Model (ARDL) yöntemi ile araştırmıştır. Çalışmada küreselleşmenin CO2 salınımı üzerinde artırıcı bir etkisi olduğu bulgusu elde edilmiştir. Mehrara (2016), 1970-2011 dönemi İran' da dışa açıklığın CO2 salınımı üzerindeki etkisini ARDL yöntemi ile araştırmıştır. Çalışmada dışa açıklık oranındaki artışın CO2 salınımını arttırarak çevresel kaliteyi bozduğu sonucuna ulaşılmıştır.

İkinci grup çalışmalar ise küreselleşmenin çevresel kaliteyi iyileştirdiği görüşünü destekler bulgulara ulaşmıştır. Bu yönde Ling vd. (2015), 1970-2011 çeyrek dönemlik veri seti ile dışa açıklığın CO2 salınımı üzerindeki etkisini ARDL yöntemi ile Malezya için tahmin etmiştir. Çalışmada dışa açıklığın CO2 salınımını azaltarak çevre üzerinde olumlu bir etkisi olduğu sonucuna ulaşılmıştır. Shahbaz vd. (2016), 1971-2012 dönemi Afrika ülkelerinde küreselleşme endeksinin CO2 salınımı üzerindeki etkisini ARDL yöntemi ile araştırmıştır. Çalışmada küreselleşmenin Angola, Kamerun, Kenya, Kongo, Libya, Mısır, Tunus ve Zambiya' da CO2 salınımını azalttığı; Fas, Gana, Güney Afrika, Sudan ve Tanzanya'da ise arttırdığı sonucuna ulaşmıştır.

Bu çalışma ise küreselleşmenin çevresel kalite üzerindeki etkisini 1974-2011 Türkiye için eşbütünleşme ve nedensellik yöntemleri ile sınamayı amaçlamaktadır. Çalışmada küreselleşme, Dreher (2006) tarafından hesaplanan küreselleşme endeksi (sosyal, ekonomik ve politik küreselleşmeyi kapsayan) ile temsil edilmektedir. Bildiğimiz kadarıyla bu çalışma, küreselleşme ve CO2 salınımı arasındaki ilişkiyi Türkiye için araştıran ilk çalışmadır. Bu çalışma ile literatüre katkı yapılması hedeflenmiştir. Bu hedef çerçevesinde çalışmanın geri kalanı şöyle düzenlenmiştir: Girişten sonraki birinci bölümde materyal ve yöntem açıklanacaktır. İkinci bölümde ekonometrik bulgulara yer verilecek ve sonuç bölümünde bulgular değerlendirilecektir.

Materyal ve Yöntem

Çalışmada 1974-2011 dönemi Türkiye' de yıllık verilerle küreselleşmenin çevre kalitesi üzerindeki etkisini ekonometrik yöntemler ile sınamak için aşağıdaki gibi bir denklem tanımlanmıştır:

$$CO_{2t} = \beta_0 + \beta_1 Y_t + \beta_2 FDI_t + \beta 3i\ GLOB_{it} + \varepsilon_t \quad (1)$$

(1) numaralı denklemde CO2, çevresel kalite düzeyini temsilen kişi başına düşen CO2 salınımını (metrik ton) ve GLOB, küreselleşme endeksini göstermektedir. Modele kontrol değişken olarak dâhil edilen Y ve FDI sırasıyla kişi başına düşen gayrisafi yurtiçi hasılayı (2010 yılı sabit fiyatlarla $ cinsinden) ve doğrudan yabancı sermaye yatırımlarını (Gayrisafi milli hasıla içindeki % payı) ifade emektedir. Küreselleşme endeksi Dreher (2006) ve Dreher vd., (2008) hesaplamalarından, diğer göstergeler Dünya Bankası Kalkınma göstergelerinden elde edilmiştir. Değişkenlerin tamamının doğal logaritması alınmıştır. (1) numaralı denklemde t indisi dönem aralığını, ε hata terimini, β_0 sabit terimi ve β_1, β_2 ve β_3 ise sırasıyla gelir, doğrudan yabancı sermaye yatırımları ve küreselleşme değişkenlerinin tahmin edilecek esneklik katsayılarını göstermektedir.

Çalışmada ekonometrik analiz için öncelikle değişkenlere ait serilerin durağanlıkları sınanacaktır. Çünkü durağan olmayan seriler ile yapılan tahminlerde sahte regresyon sorunu ortaya çıkmaktadır (Granger ve Newbold, 1974). Bunun için Dickey ve Fuller (1981) ve Phillips ve Perron (1988) tarafından geliştirilen geleneksel birim kök testleri sıklıkla kullanılmaktadır. Birim kök testleri sonucunda genellikle serilerin düzey değerlerinde durağan olmadığını ancak ilk farklarında durağan olduğunu gözlemlenmektedir. Bu durumda değişkenler arasındaki ilişkilerin tespit edilebilmesi için eşbütünleşme analizleri gerekmektedir. Eşbütünleşme

 Copyright © International Science and Technology Conference (ISTEC)

analizi, değişkenlere ait seriler durağan olmasa bile, bu serilerin durağan bir doğrusal kombinasyonunun var olabileceğini ve eğer varsa, bunun ekonometrik olarak belirlenebileceğini işaret etmektedir. Böyle bir ilişki durumda değişkenlere ait katsayı tahmininde sahte regresyon sorunu ortadan kalkacaktır. Literatürde Engle ve Granger (1987), Johansen (1988) ve Johansen ve Juselius (1990) tarafından geliştirilen eşbütünleşme yöntemleri sıklıkla kullanılmaktadır. Bu kapsamda çalışmada Johansen ve Juselius (kısaca JJ, 1990) tarafından geliştirilen eşbütünleşme yöntemi tercih edilmiştir. JJ sınaması, modeldeki tüm değişkenleri endojen (içsel) kabul ettiğinden VAR modeli tahmin edilmekte ve Akaike Information Criterion (AIC), Schwarz (SC), Final Prediction Error (FPE) ve Likelihood Ratio (LR) ve HQ (Hannan-Quinn Bilgi Kriteri) gibi bilgi kriterleri kullanılarak optimal gecikme uzunluğu belirlenmektedir. Ayrıca belirlenen gecikme uzunluğunda otokorelasyon ve değişen varyans probleminin olmaması gerekmektedir. Sonraki aşamada JJ tarafından geliştirilmiş olan maksimum özdeğer istatistiği ve İz (trace) istatistiği testleri kullanılacaktır. İz testi sıfır (null) hipotezini "en çok r kadar koentegre vektör vardır" şeklinde ifade etmektedir. Maksimum özdeğer testi ise, "r kadar koentegre vektör vardır" sıfır hipotezine karşılık r+1 kadar vardır alternatif hipotezini test etmektedir. Testler sonucunda elde edilen λtrace ve λmax istatistik değerlerinin karşılaştırılacağı kritik değerler JJ tarafından oluşturulmuştur. Test sonucu eşbütünleşme ilişkisinin varlığını işaret ediyorsa, normalleştirme işlemi yapılarak (-1 ile çarpma) uzun dönem katsayıları tahmin edilmektedir.

Ekonometrik analizin son aşamasında değişkenler arasındaki ilişkinin yönünü belirlemek için vektör hata düzeltme modeline dayalı Granger (VEC) nedensellik test yöntemi kullanılacaktır. Bu yöntemde serilerin gecikmeli değerleri hata düzeltme terimine eklenerek standart Granger nedensellik testi kullanılabilmektedir. Bu kapsamda X ile Y değişkenleri arasındaki nedensellik ilişkisinin araştırılmasında kullanılan bir hata düzeltme modeli şu şekilde tanımlanmaktadır:

$$\Delta Y_t = \alpha_0 + \sum_{i=1}^{m} \alpha_{1i} \Delta Y_{t-i} + \sum_{i=1}^{m} \alpha_{2i} \Delta X_{t-i} + \psi EC_{t-1} + e_{1t} \quad (2)$$

$$\Delta X_t = \beta_0 + \sum_{i=1}^{m} \beta_{1i} \Delta X_{t-i} + \sum_{i=1}^{m} \beta_{2i} \Delta Y_{t-i} + \Phi EC_{t-1} + \varepsilon_{1t} \quad (3)$$

2-3 numaralı denklemler hem kısa hem de uzun dönem nedensellik ilişkisinin araştırılmasında kullanılmaktadır. Kısa dönem nedensellik araştırması Wald tetsi ile ($\alpha_{2i} = 0$) yapılmaktadır. Uzun dönem nedensellik ilişkisi ise hata düzeltme katsayısının (ψ ve Φ) istatistiki olarak anlamlı olması durumunda geçerli kabul edilmektedir.

Ekonometrik Bulgular

Tablo 1' de birim kök test sonuçları raporlanmıştır. Test sonuçlarına göre değişkenlerin düzey değerlerinin birim kök içerdiği ve bu nedenle durağan olmadığı görülmektedir. Bu nedenle değişkenlerin ilk farkları alınarak tekrar birim kök testine tabi tutulmuş ve tüm değişkenlerin ilk farklarında durağan olduğu görülmüştür.

Tablo 1: Birim Kök Test Sonuçları

Değişkenler*		ADF test istatistiği		PP test istatistiği	
		Sabitli	Sabitli ve Trendli	Sabitli	Sabitli ve Trendli
CO2		-0,63	-2,65	-0,55	-2,77
Y		-0,28	-2,52	-0,15	-2,63
FDI		-1,58	-4,67a	-1,20	-4,63a
GLOB		-1,78	-2,33	-5,02a	-7,47a
ΔCO2		-5,82a	-5,73a	-6,06a	-5,93a
ΔY		-4,20a	-5,83a	-5,84a	-5,92a
ΔFDI		-8,49a	-8,45a	-9,51a	-9,24a
ΔGLOB		-6,02a	-6,68a	-7,47a	-16,61a
Kritik Değerler	%1	-3,62	-4,22	-3,62	-4,22
	%5	-2,94	-3,53	-2,94	-3,53
	%10	-2,61	-3,20	-2,61	-3,20

Not:
* Δ, ilk fark işlemcisini temsil etmektedir.
a, %1 önem düzeyinde istatistiki anlamlılığı göstermektedir.

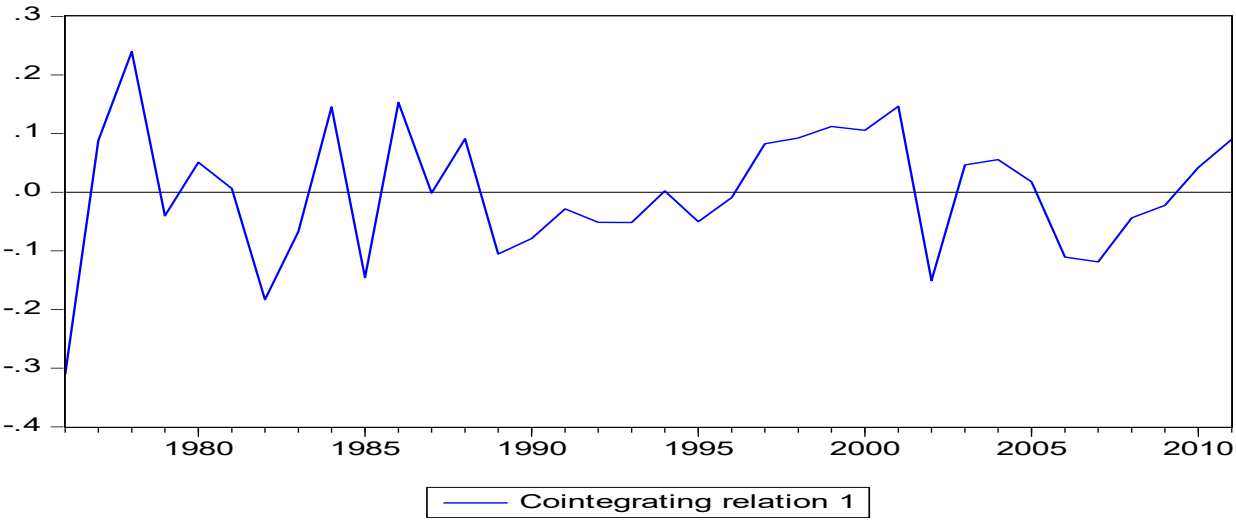
Birim kök testinden sonra, değişkenler arasında uzun dönemli bir ilişkinin varlığını sınamak için JJ eşbütünleşme testi uygulanmış, test sonuçları Tablo 2' de raporlanmıştır. Test için uygun gecikme uzunluğu 1 olarak seçilmiş ve bu gecikmede değişen varyans ve otokorelasyon sorunları gözlemlenmemiştir. Test sonuçlarına göre, maksimum özdeğer istatistiği değişkenler arasında bir eşbütünleşme ilişkisini % 5 anlamlılık

 Copyright © International Science and Technology Conference (ISTEC)

düzeyinde desteklemektedir. Buna göre CO2, gelir, doğrudan yabancı sermaye yatırımları ve küreselleşme arasında uzun dönemli bir denge ilişkisi geçerlidir.

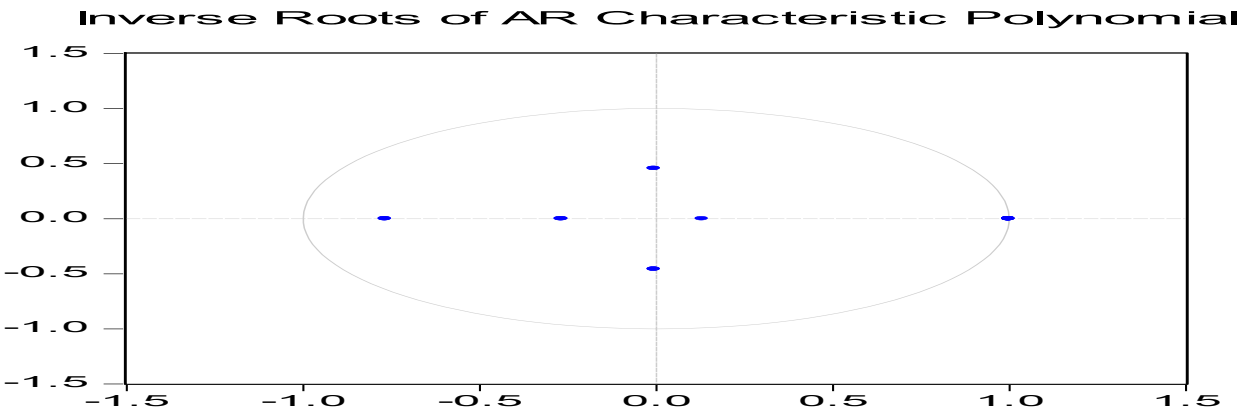
Tablo 2: Eşbütünleşme Test Sonuçları

Sıfır Hipotez (Ho)	Alternatif Hipotez (H1)	Iz (Trace) istatistiği	Kritik değer (%5)	Sıfır Hipotez (Ho)	Alternatif Hipotez (H1)	Maks. Özdeğer istatistiği	Critical value (%5)
r=0	r>0	45,04	47,85	r=0	r=1	28,83*	27,58
r≤1	r>1	16,21	29,79	r=1	r=2	12,75	21,13
r≤2	r>2	3,45	15,49	r=2	r=3	3,41	14,26
r≤3	r>3	0,04	3,84	r=3	r=4	0,04	3,84



Eşbütünleşme ilişkisinin elde edilmesinden sonra gelir, doğrudan yabancı sermaye yatırımları ve küreselleşmenin CO2 salınımı üzerindeki etkisini ortaya koyan uzun dönem katsayıları tahmin edilmiştir. Tablo 3' de tahmin sonuçları gösterilmektedir. Tahmin sonuçlarına göre küreselleşmenin (GLOB) CO2 salınımı üzerindeki etkisi %5 anlamlılık düzeyinde pozitif yöndedir. Buna göre Türkiye' de küreselleşme süreci çevresel kaliteyi azaltıcı yönde bir etkiye neden olmaktadır. Modele kontrol değişken olarak dâhil edilen gelir ve doğrudan yabancı sermaye yatırımların CO2 salınımı üzerindeki etkisi de pozitif yöndedir. Diğer bir ifadeyle gelirde ve doğrudan yabancı sermaye yatırımlarındaki artışın çevresel kalite üzerindeki etkisi olumsuz yöndedir.

Tablo 3: Uzun Dönem Katsayılarının Tahmini



Değişkenler	Katsayı*	Standart Hata	t istatistiği
Y	0,31[b]	0,15	-2,07
FDI	0,12[a]	0,03	-4,19
GLOB	0,08[b]	0,03	-2,23
C (Sabit)	-1,86		

Not:
*, Normalleştirme işlemi içsel değişkenin ters işareti (-1) ile çarpılması sonucu gerçekleştirilmektedir.
[a], %1 ve [b], %5 önem düzeyinde istatistiki anlamlılığı göstermektedir.

Grafik 1'de tahmin edilen model için AR karakteristik polinomunun ters kökleri ve eşbütünleşme grafiği gösterilmektedir. Köklerin tamamının çember içinde olması ve simetrik izdüşümlere sahip olması ekonometrik modelin durağanlık açısından herhangi bir sorun taşımadığını ortaya koyup, eşbütünleşme ilişkisinin normal bir dağılım taşıdığını ve uygun bir matematik formu ile çalıştığını doğrulamaktadır. Sistemin eşbütünleşme grafiği değerlendirildiğinde ise, eşbütünleşme ilişkisine ait grafiksel eğilimin 0 etrafında dalgalanması modelde yer alan ve tek tek durağan olmayan değişkenlerin doğrusal bileşiminin durağan olduğunu ortaya koymaktadır.

Şekil 1: AR Karakteristik Polinomunun Ters Köklerinin Birim Çember İçindeki Konumu ve Eşbütünleşme Grafiği

Ekonometrik analizin son aşamasında değişkenler arasındaki ilişkinin yönünü belirlemek için uygulanan nedensellik test sonuçlarına Tablo 4' de yer verilmiştir. Buna göre kısa dönemde küreselleşme ve doğrudan yabancı sermaye yatırımları arasında çift yönlü bir nedensellik ilişkisi görülmektedir. Uzun dönemde ise; gelir, doğrudan yabancı sermaye yatırımları ve küreselleşmeden CO2 salınımına ve doğrudan yabancı sermaye yatırımları, küreselleşme ve CO2' den gelire doğru tek yönlü bir nedensellik ilişkisi bulunmaktadır. Bu bulgular eşbütünleşme test sonuçlarını desteklemektedir.

Tablo 4: Nedensellik Test Sonuçları

	Kısa Dönem Nedensellik*				Uzun Dönem Nedensellik*

[a], %1 ve [b], %5 ve [c], %10 önem düzeyinde istatistiki anlamlılığı göstermektedir.

Sonuç

Ekonomik, sosyal ve politik yönden insan hayatını her aşamasını etkileyen küreselleşme sürecinin çevresel kalite üzerindeki etkisi olumlu ve olumsuz olmak üzere iki yöndedir. Bu kapsamda ilgili çalışmada 1974-2011 dönemi Türkiye' de küreselleşme, ekonomik büyüme ve doğrudan yabancı sermaye yatırımlarının CO2 salınımı üzerindeki potansiyel etkisi araştırılmıştır. Araştırma için yapılan birim kök testleri sonucunda serilerin ilk farklarında durağan olduğu bulgusuna ulaşılmıştır. Birim kök test sonrasında Johansen ve Juselius (1990) eşbütünleşme testi ve VEC' e dayalı Granger nedensellik testleri uygulanmıştır. Test bulguları; CO2, gelir, doğrudan yabancı sermaye yatırımları ve küreselleşme arasında uzun dönemli bir eşbütünleşme ilişkisinin varlığını işaret etmiştir. Bu ilişkiye göre küreselleşmenin CO2 salınımı üzerindeki etkisi pozitif yönde olup; küreselleşmenin çevresel kaliteyi azalttığı sonucuna ulaşılmıştır. Nedensellik test sonucuna göre ise, uzun dönemde gelir, doğrudan yabancı sermaye yatırımları ve küreselleşmeden CO2 salınımına doğru tek yönlü bir nedensellik ilişkisi olduğu görülmüştür.

Bu sonuçlar literatürde Dinda (2006), Leitao (2013), Shahbaz vd., (2015) ve Mehrara (2016) bulgularını desteklemektedir. Son olarak Türkiye' de gelir ve doğrudan yabancı sermaye yatırımların CO2 salınımı üzerindeki etkisi pozitif yönde olup, gelirdeki artış (ekonomik büyüme) ve doğrudan yabancı sermaye yatırımlarının çevresel kaliteyi olumsuz yönde etkilediği görülmüştür. Bu bulgular değerlendirildiğinde Türkiye' de küreselleşme sürecinin CO2 salınımını arttırarak çevresel kaliteyi olumsuz yönde etkilediği sonucuna

 Copyright © International Science and Technology Conference (ISTEC)

ulaşılmıştır. Bu nedenle çalışmanın temel önerisi küreselleşme sürecinin çevre üzerindeki olumsuz etkilerini minimize edecek politikaların desteklenmesi yönündedir.

ÖZET

Bu çalışmada Türkiye nüfusunun doğduğu ile göre dağılımı ele alınmıştır. Buna göre payın dağılımında iller ve yıllar arasında önemli farklılıklar görülmektedir. 1950 yılında Konya (%3.7), İstanbul (%3.5), Ankara (%3.1), İzmir (%2.9) ve Sivas (%2.8) şeklinde olan ilk beş il sıralaması 2015 yılında İstanbul (%9.7), Ankara (%4.4), İzmir (%3.3), Konya (%2.8) ve Adana (%2.6) şekline dönüşmüştür. Genellikle doğum oranlarının fazla olduğu ve yoğun göç almasından dolayı nüfusun artış hızının yüksek olduğu illerin payı yüksek olmaktadır. Söz konusu dönemde payın gelişiminde illeri çeşitli gruplara ayırmak mümkündür. Buna göre payı sürekli artan en önemli iller İstanbul, Şanlıurfa ve Diyarbakır olmuştur. Nitekim İstanbul'un payı %3,5'ten %9.7'ye, Şanlıurfa'nın %1.5'ten %2.8'e, Diyarbakır'ın ise %1.4'ten %2.5'e ulaşmıştır. Daha düşük oranlarda da olsa, Ankara, Hatay, Mersin, Van, Ağrı, Bitlis, Hakkâri, K.Maraş, Muş gibi illerin de payı artış göstermiştir. Payı artan illere karşın, Türkiye'deki illerin büyük bir kısmı, pay düşüşünün olduğu illerden oluşturmaktadır. Payı düşen illerden en fazla kayıp yaşayan illere Kastamonu, Balıkesir, Çanakkale, Kayseri, Manisa, Denizli, Giresun, Çankırı, Kütahya, Sinop, Sivas, Artvin, Aydın ve Bilecik örnek olarak verilebilir. Üçüncü grubu ise payı çok değişmeyen iller oluşturmaktadır. Buna İzmir, Antalya, Erzurum, Samsun, Tokat, Tunceli, Yozgat, Bingöl, Elazığ, Eskişehir, Amasya, Hakkâri, Ordu, Sakarya, Trabzon gibi iller örnek verilebilir.

Anahtar kelimeler: Nüfus, Türkiye nüfusu, doğum yeri, nüfus coğrafyası

THE ANALYSIS OF TURKEY'S POPULATION ACCORDING TO BIRTH PROVINCE : PROPORTIONATE CHANGES (1950-2015)

ABSTRACT

In this study, it is discussed the distribution of Turkey population according the birthplace and changes in the share of provinces (1950-2015). According to the results, it has been change proportionally in the ranking of provinces between 1950-2015. In 1950, While the first five province was Konya (3.7%), İstanbul (3.5%), Ankara (3.1%), İzmir (2.9%) and Sivas (%2.8), it has changed as İstanbul (9.7%), Ankara (4.4%), İzmir (3.3%), Konya (2.8%) ve Adana (2.6%) in 2015. Generally, the share of the provinces, which birth rates and growth rate of the population are high is more than other provinces. In this period (1950-2015), the provinces can be divided into various groups in the change

* Sorumlu yazar

 Copyright © International Science and Technology Conference (ISTEC)

of the share. According to this, the provinces that the share increase constantly are İstanbul, Şanlıurfa and Diyarbakır. Really, İstanbul's share from 3.5% to 9.7%, Şanlıurfa's share 1.5% to 2.8%, Diyarbakır's share 1.4% to 2.5% has reached. The share of some provinces has increased at lower rates. These provinces are Ankara, Hatay, Mersin, Van, Ağrı, Bitlis, Hakkâri, K.Maraş, Muş. On the other hand, in the most provinces of Turkey, the share has decreased. The provinces that the share decrease the most are Kastamonu, Balıkesir, Çanakkale, Kayseri, Manisa, Denizli, Giresun, Çankırı, Kütahya, Sinop, Sivas, Artvin, Aydın and Bilecik. The third group consists of low-changing provinces in share. These are İzmir, Antalya, Erzurum, Samsun, Tokat, Tunceli, Yozgat, Bingöl, Elazığ, Eskişehir, Amasya, Hakkâri, Ordu, Sakarya and Trabzon.

TÜRKİYE'DE ŞEHİRLEŞME HAREKETLERİ-TERÖR OLAYLARI İLİŞKİSİ

Relation Between Urbanization Movement and Terrorist Incidents in Turkey

Mehmet Sait ŞAHİNALP*

Harran Üniversitesi, Fen-Edebiyat Fakültesi Coğrafya Bölümü. Şanlıurfa-Türkiye

sahinalp@harran.edu.tr

Veysi GÜNAL

Harran Üniversitesi, Fen-Edebiyat Fakültesi Coğrafya Bölümü. Şanlıurfa-Türkiye

vgunal@harran.edu.tr

Özet: Şehirleşme, herhangi bir alandaki şehirli nüfus miktar, oran ve yoğunluğunun artışı, şehir olarak kabul edilen yerleşmelerin sayıca artışını, büyük veya metropol şehirlerin sayıca artışını, şehirsel alanın yatay ve dikeyde gelişmesi, şehirlere özgü yaşam sosyal ve ekonomik ilişkilerin gelişmesi şeklinde tanımlanmaktadır. Şehirleşme hareketleri üzerinde rol oynayan önemli faktörlerden biri de terör olaylarıdır. Terör olaylarının şehirlerde veya kırsal alanlarda meydana gelmesi şehirleşme üzerinde de farklı etkiler oluşturmaktadır. Şehirlerde meydana gelen terör olayları şehirleşme hareketlerini olumsuz etkilerken, kırsal alanda meydana gelen terör olayları da şehirleşme hareketlerini olumlu etkilemektedir.

Türkiye'de meydana gelen terör olayları da ülke genelinde veya lokal olarak şehirleşme hareketlerini etkilemiştir. Bu araştırmada 1975-1980 yılları arasında meydana gelen terör olayları ile 1985-2000 yılları arasında meydana gelen terör olaylarının şehirleşme hareketleri üzerinde nasıl bir etki oluşturduğu ortaya konulmuştur. Bu amaçla ilgili dönemlerde sıkıyönetim ve olağanüstü hal ilan edilen iller belirlenmiş ve bu illerin şehirsel nüfuslarında meydana gelen değişiklikler istatistiksel yöntemlerle analiz edilmiştir. Şehirsel nüfusta meydana gelen değişiklikler ayrıca, idari yapıda meydana gelen değişiklikler ve hükûmet politikalarıyla ilişkilendirilmiştir.

1975-1980 yılları arasında Türkiye'de yaşanan siyasi ve ekonomik krizlerin bir sonucu olarak şehirlerde pek çok terör olayları meydana gelmiştir. Şehirlerde meydana terör olayları şehirlerde can güvenliği ve istihdam sorunlarını ortaya çıkarmış ve şehirler cazibesini kaybetmiştir. Artan terör olayları nedeniyle bu dönemde 22 ilde sıkıyönetim ilan edilmiş olup, bu illerin yıllık şehirsel nüfus artış hızlarında önceki ve sonraki dönemlere göre düşüşler görülmüştür. 1985-2000 yılları arasında ise terör olayları Türkiye'nin Doğu ve Güneydoğu illerinin kırsal kesimlerinde meydana gelmiştir. Bu nedenle 11 ilde olağanüstü hal ilan edilmiştir. Kırsal alanda yaşanan terör olayları nedeniyle bazı köyler devlet eliyle boşaltılırken, birçok köy can güvenliğinin sağlanamaması nedeniyle köylülerce boşaltılmıştır. Boşalan ve boşaltılan köylerde yaşayanların, en yakında bulunan ilçe ve il merkezlerine göç etmeleri nedeniyle bu illerin şehirli nüfus miktarı, oranı ve şehirli nüfus yıllık artış hızı oranlarında önemli artışlar yaşanmıştır.

Anahtar Kelimeler: Terör, Şehir, Şehir Coğrafyası, Şehirleşme, Zorunlu Göç.

Abstract: Urbanization is determined as increasing in urban population, urban population rate, urban population growth rate, number of urban areas and metropolitan areas, vertical and horizontal development of urban areas, and improvement of social end economic features that unique urban areas. One of the factors playing role on urbanization is the terrorist incidents. Terrorist incidents have different effects on urbanization when it occured in rural or urban areas. While terrorist incidents occured in urban areas has a negative effect on urbanization, terrorist incidents occured in rural areas has a positive effect on urbanization.

Terrorist incident carried out in Turkey have effected urbanization movements accros to country or locally. This study aims to find out how to terrorist incidents was carried out in

* Sorumlu Yazar.

1975-1980 period and in 1985-2000 period effected urbanization movement inTurkey. For this purpose, provinces that martial law and state of emergency declared in were determined and changes occured in urban population of these provinces were analyzed by some statistical methods. Changes in urban populations were also associated with the changes in the administrative structure of some provinces and goverment policies.

As a result of economical and social crisis occured in 1975-1980 period in Turkey, many terrorist incidents were carried out in Turkish cities. Those terrorist incidents were carried out in the urban areas revealed some security and employment problems. That's why many cities lost it's urban attractivenes. Because of the increases in the terrorist attacks in this period, Turkish government declared martial law in 22 provinces located in different regions. The annual urban population growth rate of those provinces decreased in this period compared to previous and next population censuses. In 1985-2000 period, terrorist attacks were intensified in the rural areas of Eastern and Southeastern provinces of Turkey. Following the increase of terrorist attacks Turkish government declared state of emergency in 11 Eastern and Southeastern provinces. Because of security problems in rural areas, some villages were evacuated by governmet while some villages were evacuated by local people and their own initiatives. Those people who had left avacuted villages migrated to the nearest towns and cities. This forced migration caused to significant increases in urban population and urban population growth rate of these provinces.

Özet: Bu çalışmada Türkiye'de yaşayan insanların yaşam düzeyi memnuniyetleri üzerine bir çalışma yapılmıştır. Çalışmada Türkiye İstatistik Kurumu (TÜİK) Yaşam Düzeyi verilerinden yararlanılmıştır. Türkiye İstatistik Kurumu verileri 2003-2015 yılları arasında toplam temel alınarak, kadın ve erkek temel alınarak, umutlu ve umutlu değil kategorilerinde oluşturulmuştur. Bu bağlamda Türkiye'de yaşayan insanların yaşam düzeyleri memnuniyetleri analizi tüm verilere göre, cinsiyetlere göre ve cinsiyetler arasında fark olup olmadığına göre yapılmıştır. Verilerin analizinde orana dayalı t testi kullanılmıştır.

Anahtar Kelimeler: Yaşam Düzeyi, Memnuniyet, t-testi

LEVEL OF SATISFACTION PEOPLE LIVING IN TURKEY A STUDY ON LIFE

Abstract: In this study, the level of satisfaction of the people living in Turkey a study on life. Study Turkey Statistical Institute (TÜİK) is taken from Life Level data . Turkey Statistical Institute data for 2003-2015, based on the total, based on women's and men's not hopeful and hopeful, based on categories. In this context the level of satisfaction of life of people living in Turkey are made according to all data. This analysis was conducted by gender.and based on whether the difference between the sexes.. The analysis examines two independent sample t-test is applied.
Key Words: Level Life, Satisfaction, t-test.

GİRİŞ

Çalışmanın amacı, Türkiye' de yaşayan insanların 2003-2015 yılları arasında yaşam memnuniyetlerinin incelenmesidir. Bu bağlamda, ilk olarak Türkiye nüfusunun toplamı için, kadın ve erkek nüfusunun 2003-2015 yılları arasında yaşam memnuniyeti düzeylerinde fark olup olmadığı incelenmiştir. Daha sonra kadın nüfusu için yaşam memnuniyetinin 2003-2015 yılları arasında farkının olup olmadığı incelenmiştir. Son olarak da erkek nüfusu için yaşam memnuniyetinin 2003-2015 yılları arasında farkının olup olmadığı incelenmiştir.

YÖNTEM VE ANALİZ

Türkiye İstatistik Kurumunun (TÜİK) 2003-2015 yılları arasında nüfusun tamamı için yaşam memnuniyeti yüzdelik değerleri tablo 1' de, Kadın nüfusu için yüzdelik değerleri tablo 2' de, Erkek nüfus için yüzdelik değerleri ise tablo 3' de verilmiştir.

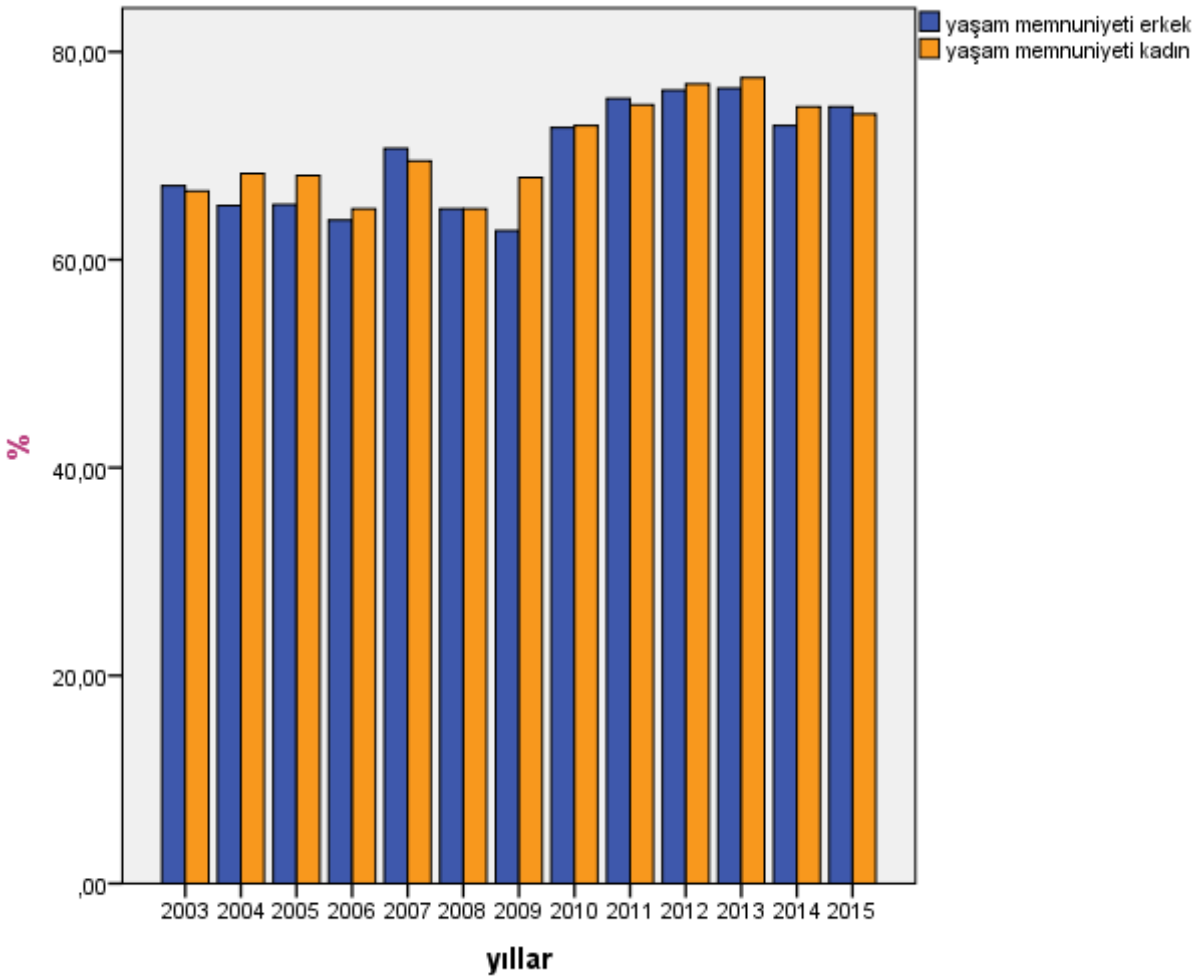
HİPOTEZLER

H_1: Türkiye'de yaşayan erkek ve kadın nüfusun 2003-2015 yıllarındaki yaşam memnuniyetleri arasında fark vardır.

H_2 : Türkiye'de toplam nüfusun 2003-2015 yılları arasında ki yaşam memnuniyetleri arasında fark vardır.



H_3 : Türkiye'de yaşayan Kadınların 2003-2015 yılları arasında ki yaşam memnuniyetleri arasında fark vardır.

H_4 : Türkiye'de yaşayan Erkeklerin 2003-2015 yılları arasında yaşam memnuniyeti arasında fark vardır.

TÜİK veri tabanından alınan 2003-2015 yılları arasındaki yaşam memnuniyeti verilerinin cinsiyete göre bar grafiği Şekil 1 de, ilgili yıllara ait yaşam memnuniyeti verileri için kullanılan parametrik testlerden "iki yüzde arasındaki farkın önemlilik testi" sonuçları Tablo 4 de verilmiştir.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 1:

Tablo 4: Cinsiyete göre yaşam memnuniyet test sonuçları

Cinsiyet	Ortalama yüzde	T	P
Erkek	69,87	-0,516	0,611
Kadın	70,85		

Yapılan test sonucunda kadın ve erkeklerin yaşam memnuniyetleri arasında % 95 güvenle istatistiksel olarak farkın olmadığı söylenebilir.

2003-2015 yılları erkek yaşam memnuniyetleri arasında ki farka ait test sonucu tablo 5 de gösterilmiştir.

Tablo 5: Erkek nüfus için yaşam memnuniyet test sonuçları

Cinsiyet	Ortalama yüzde	s.d	T	P
Erkek	69,87	12	48,78	0,00

Yapılan test sonucunda erkeklerin yaşam memnuniyeti 2013-2015 yılları arasında %95 güvenle istatistiksel olarak anlamlı bir fark göstermektedir.

2003-2015 yılları kadın yaşam memnuniyetleri arasında ki farka ait test sonucu ise tablo 6 da gösterilmiştir.

 Copyright © International Science and Technology Conference (ISTEC)

Tablo 6: Kadın nüfus için yaşam memnuniyet test sonuçları

Cinsiyet	Ortalama yüzde	s.d	t	p
Kadın	70,85	12	57,16	0,00

Yapılan test sonucunda kadınların yaşam memnuniyeti 2013-2015 yılları arasında %95 güvenle istatistiksel olarak anlamlı bir fark göstermektedir.

Herhangi bir cinsiyet ayrımı yapmadan 203-2015 yılları arasında genel nüfusun yaşam memnuniyetine bakıldığında Tablo 7 deki sonuçların ortaya çıktığı görülmektedir.

Tablo 7: Tüm nüfus için yaşam memnuniyet test sonuçları

Cinsiyet	Ortalama yüzde	s.d	t	p
Kadın-Erkek	70,39	12	53,74	0,00

Yapılan test sonucunda tüm nüfusun yaşam memnuniyeti 2013-2015 yılları arasında %95 güvenle istatistiksel olarak anlamlı bir fark göstermektedir

SONUÇ

Türkiye'de 2003-2015 yılları arasında kadın ve erkek yaşam memnuniyeti düzeyleri %95 güvenle istatistiksel olarak farklı değildir.

Türkiye'de toplam nüfusun 2003-2015 yılları arasındaki yaşam memnuniyetleri %95 güvenle anlamlı bir fark göstermektedir.

Türkiye'de 2003-2015 yılları arasında kadınların yaşam memnuniyetleri %95 güvenle istatistiksel olarak anlamlı bir fark göstermektedir.

Türkiye'de 2003-2015 yılları arasında erkeklerin yaşam memnuniyetleri %95 güvenle istatistiksel olarak anlamlı bir fark göstermektedir.

TÜRKİYE'DEKİ YAZILIM MÜHENDİSLİĞİ LİSANS MÜFREDAT PROGRAMLARININ KARŞILAŞTIRILMALI OLARAK İNCELENMESİ

Tuncay Aydoğan[1], Sinan Uğuz[1], Y. Erkan Görgülü[1], Fatih Gençtürk[1]

[1] Süleyman Demirel Üniversitesi, Teknoloji Fakültesi, Yazılım Mühendisliği Bölümü tuncayaydogan@sdu.edu.tr, sinanuguz@sdu.edu.tr, erkangorgulu@sdu.edu.tr, fatihgencturk@sdu.edu.tr

Özet. Dünyada Bilişim Teknolojileri alanında eğitim veren başta üniversiteler ve diğer kurumlar için müfredat geliştiren organizasyonlardan The Associationfor Computing Machinery (ACM) ve The ComputerSociety of the Institutefor Electrical and Electronic Engineers (IEEE), birlikte Computing Curricula 2001 (CC2001)'i, daha sonra da Software Engineering 2004 (SE2004)'ü yayınlayarak Yazılım Mühendisliğinin de aralarında olduğu farklı disiplinler ile ilgili müfredat programı raporu hazırlamışlardır. Bu müfredat serisi CS2013 ile güncellenmiştir. Bu çalışmada, ülkemizdeki mevcut Yazılım Mühendisliği bölümlerinin müfredat programlarındaki derslerin SE2004 raporundaki öneriler ile ne ölçüde örtüştüğünün tespit edilmesi amaçlanmıştır. Çalışma ile ayrıca ülkemizde bulunan Bilişim Teknolojileri alanlarında lisans eğitimi veren bölümlerin sayı, kontenjan, yerleştirme puanları gibi bilgileri de karşılaştırılarak bir değerlendirme yapılmıştır. Çalışma sonunda, çekirdek dersleri müfredat programlarında veren bölümlerin oranı %78, matematik bilimi derslerinde %93 ve giriş seviyesi derslerinde %92 olarak görülmüştür. Çalışmanın mevcut ve yeni kurulacak olan Yazılım Mühendisliği bölümlerine müfredat planlaması açısından faydalı olacağı düşünülmektedir.

Anahtar Kelimeler: Yazılım Mühendisliği Müfredatı, Yazılım Mühendisliği Eğitimi, SE2004

1 Giriş

Dünyada olduğu gibi ülkemizde de Bilişim Teknolojileri (BT) mühendislik alanları günümüzde gençlerin en çok tercih ettikleri alanların başında gelmektedir. Bunun en önemli nedenlerinden birisi BT mühendislerine duyulan ihtiyaç ve gelir seviyeleridir. İŞKUR (Türkiye İş Kurumu)'nun yayınladığı 2013- 1. Dönem Türkiye işgücü piyasası raporu'na göre açık işlerde sayısal büyüklük olarak ilk yirmiye giremeyen Mimar, Makine Mühendisi, Elektrik Mühendisi, Fizyoterapist, Yazılım Mühendisi gibi mesleklerde açık iş oranı Türkiye ortalamasının üzerindedir. Açık iş oranı genellikle mesleki beceri ve nitelik gerektiren mesleklerde daha yüksektir. Ayrıca bu işlerden 50% ila 94% arasında değişen oranlarda bilgisayar kullanma, fiziki ve bedensel yeterlilik, hesap yapabilme (analitik beceri), iletişim ve ifade yeteneği mesleğe ilişkin yeterli bilgi, sorun çözme ve bağımsız karar verme becerileri, proje tabanlı çalışma, takım çalışması ve yabancı dil becerileri ile % 30 oranında satış ve pazarlama becerisi talep edilmektedir (İşkur, 2014).

Bu ilgi, eğilim ve beklentiler beraberinde BT eğitimlerini de ayrı bir yere taşımaktadır. Ülkemizde BT alanlarında ortaöğretim, ön lisans, lisans ve lisansüstü seviyelerinde farklı müfredatlar da eğitim veren birçok kurumsal yapı bulunmaktadır. BT mühendislikleri bunların en önemlilerindendir. BT mühendisliklerinin gelişimi ve müfredatları 1960'lardan itibaren doğan ihtiyaçlar ve geliştirilen teknolojiler bağlamında şekillenerek günümüzdeki yapısına kavuşmuştur.

BT mühendislikleri günümüzde yaygın olarak Bilgisayar, Bilgisayar Bilimleri, Bilgi Sistemleri, Bilgi Teknolojisi ve Yazılım olarak beş mühendislik programında kendilerine tanımlanan görev ve sorumluluk alanlarında faaliyet göstermektedir (Acm, 2014). Bu alanlar arasındaki ortak özelliklerin çok olmasından dolayı müfredatları da birbirine benzemektedir. Nitelikli BT mühendisi yetiştirmek için gösterilen çabalar geçmişten günümüze devam etmektedir.

Bu amaçla The Association for Computing Machinery (ACM), The Association for Information Systems (AIS), The Association for Information Technology Professionals (AITP) ve The Computer Society of the Institute for

 Copyright © International Science and Technology Conference (ISTEC)

Electrical and Electronic Engineers (IEEE) gibi bazı uluslararası kuruluşlar müfredat önerileri geliştirerek, Accreditation Board for Engineering and Technology (ABET), Computing Sciences Accreditation Board (CSAB), The UK Engineering Council (ECUK), British Computer Society (BCS), European Network for Accreditation of Engineering Education (ENAEE) ve Information Systems Engineering (ISE) gibi bazı kuruluşlarda akreditasyon ve standartlar belirleyerek BT eğitimine katkı vermektedirler. Ülkemizde de Mühendislik Eğitim Programları Değerlendirme ve Akreditasyon Derneği (MÜDEK) bu görevi yerine getirmektedir.

Daha iyi müfredatlar tasarlamaya yönelik akademik çalışmaların çok öncelerden beri yapıldığını görmekteyiz. Thomas vd.(1995) çalışmalarında 1986-1995 yıllarındaki müfredatları inceleyerek yazılım mühendisliği temel konularını belirlemeye ve değerlendirmeye çalışmışlardır. Pullan ve Oliver (1995) üç yıllık bir yazılım mühendisliği müfredatı önerisinde bulunmuşlardır. Bagert (1998) çalışmasında, bilgisayar bilimi, bilgisayar mühendisliği ve yazılım mühendisliği alanlarının müfredat farklılıklarını ve akreditasyonlarını inceleyerek yeni hazırlanacak müfredatlar hakkında öngörülerde bulunmuştur. Xing (2012) ise son zamanlarda artış eğilimi gösteren eğitimde küreselleşmenin Çin'deki yazılım mühendisliği eğitimi üzerine etkilerini incelemiştir. Karakaş (2005) araştırmasında ACM & IEEE-CS Curriculum Comittee on Software Engineering 2004 içeriğine uyumlu bir Yazılım Mühendisliği programı önermektedir. Önerilen program ile öğrenci üniversiteye girdikten dört yıl sonra ekonomik bağımsızlık kazanmak yerine, üç yıl sonra ekonomik bağımsızlık kazanmakta ve Yazılım Mühendisi diplomasını alırken iki yıllık bilgisayar programcılığı iş deneyimi oluşmaktadır (Karakaş, 2005).

Bunlar ve benzer birçok araştırmada BT mühendisliklerini birbirinden daha belirgin özelliklerle ayırabilecek müfredat çalışmalarına rastlamaktayız. Ülkemizde de son yıllarda BT eğitiminde önemi gelişmeler hatta arayışlar olduğu söylenebilir. Özellikle geleneksel Bilgisayar Mühendisliği bölümleri yanında önceleri sadece lisansüstü birkaç program olarak başlayan, daha sonra birkaç vakıf üniversitesinde açılarak başlayan ve günümüzde sayıları gittikçe artan Yazılım Mühendisliği bölümleri dikkat çekmektedir.

Bu çalışmada, ülkemizdeki Yazılım Mühendisliği bölümlerinin müfredatları dersler, ulusal ve uluslararası kredileri ve yıllık planları incelenerek kabul gören uluslararası müfredatlar ile olan benzerlik ve farklılıkları ortaya konulmaya çalışılmıştır. Bu sayede ülkemiz Yazılım Mühendisliklerinin uluslararası ölçekte yerini değerlendirme olanağı bulunmuştur.

Araştırmanın devamında, BT disiplinlerinin 1960'lardan günümüze değişimine kısa bir bakış, BT mühendisliklerinin iş, görev tanımları, müfredat geliştirme çalışmaları, ülkemiz müfredatlarının analiz ve değerlendirmeleri irdelenecektir.

1.1 Yazılım Mühendisliğinin Ortaya Çıkma Süreci

Dünyada bilgisayara dayalı disiplinler 1960'larda oluşmaya başladı. O zamanlarda Kuzey Amerika'da Bilgisayar Bilimleri, Elektrik Mühendisliği ve Bilgi Sistemleri olmak üzere 3 farklı program mevcuttu. Her bir program kendi alanını net bir şekilde belirlemişti. Bilgisayar alanına yönelmek isteyen bir öğrenci, yazılım geliştirmek ve bilgisayar alanında teorik bilgiye sahip olmak istiyorsa Bilgisayar Bilimleri bölümünü seçiyor, eğer donanım konusunda uzmanlaşmak istiyorsa Elektrik Mühendisliği programını seçiyor, eğer bir problemi çözmek üzere donanım ve yazılım kullanmak istiyorsa Bilgi Sistemleri programını seçiyordu. 1990 öncesi Amerika'daki tek büyük değişiklik Bilgisayar Mühendisliğinin oluşmasıydı. 1970'li yılların ortalarında çip tabanlı mikro işlemcilerin yapılmaya başlanmasıyla Bilgisayar Mühendisliği Elektrik Mühendisliğinin altında bir disiplin olarak doğdu (Acm, 2014).

1968'de Almanya Garmisch'de NATO sponsorluğunda düzenlenen konferansta Yazılım Mühendisliği kavramı kullanıldı. 1980'lerde Bilgisayar Bilimleri programlarında ders olarak verilmeye başlandı. Amerika'da 1990'larda Yazılım Mühendisliğinin, Bilgisayar Bilimlerinin önemli bir bileşeni olduğu anlaşıldı.

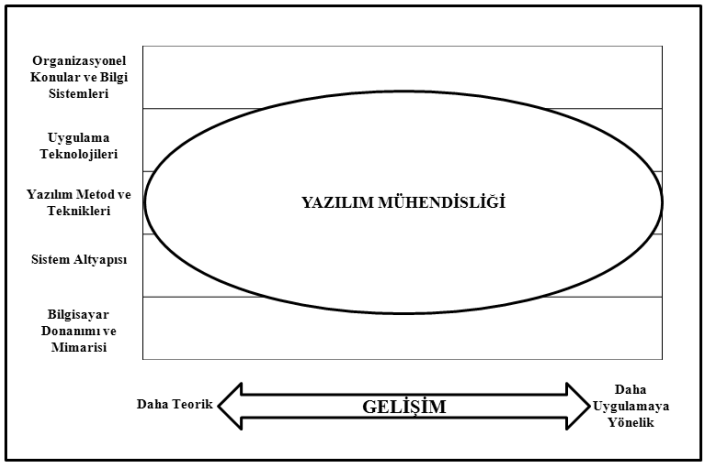
1990'lardan sonra ABD'de, Bilgisayar Mühendisliği, Elektrik Mühendisliğinden ayrı bir disiplin olarak statüsünü pekiştirdi ve bilgisayar donanım ve ilgili yazılım açısından birincil bir rol üstlenmişti. Daha ucuz ve güvenilebilir bir yazılım geliştirirken ortaya çıkan problemlere çözüm bulabilmek için Yazılım Mühendisliği ortaya çıktı.

 Copyright © International Science and Technology Conference (ISTEC)

BT mühendislikleri günümüzde Bilgisayar, Bilgisayar Bilimleri, Bilgi Sistemleri, Bilgi Teknolojisi ve Yazılım olarak beş mühendislik programına ayrılmıştır. Bu programlar arasında eski alışkanlık ve algılardan dolayı zaman zaman kavram yanılgıları meydana gelebilmektedir.

Bilgisayar Mühendisliği, bilgisayar ve bilgisayara dayalı sistemlerin tasarım ve yapımıyla ilgilenir. Donanım, yazılım, haberleşme ve bunların etkileşimini de içerir. Müfredatı; teoriler, ilkeler, elektrik mühendisliği ve matematikçilerin uygulamaları üzerine yoğunlaşmıştır ve bilgisayar ve bilgisayar tabanlı cihazların tasarımında bunları kullanır. Bilgisayar mühendisliği öğrencileri, haberleşme sistemleri de dahil olmak üzere donanım sistemleri, bilgisayarlar ve bilgisayar içeren cihazlar üzerinde çalışırlar. Bilgisayar mühendisliği çalışmaları yazılımdan çok donanımla ilgilenir veya yazılım ve donanım aynı öneme sahiptir. Gömülü sistemler, günümüzde bilgisayar mühendisliğinin baskın alanlarından biridir (Acm, 2014).

Bilgisayar Bilimleri Mühendisliği, teorik ve algoritmik temellerden robotik alanındaki teknolojik gelişmelere, bilgisayar görme, akıllı sistemler, biyoinformatik, ve diğer heyecan verici alanlarda, çok geniş bir yelpazeye sahiptir. Bilgisayar bilimleri çalışmaları "yazılım tasarlama ve uygulama", "bilgisayar kullanım alanını genişletmeye çalışma" ve "bilgisayar alanındaki problemlere etkili çözüm üretme" olarak 3 kategoride toplanabilir. Diğer disiplinlinler işe yönelik kişi yetiştirirken, bilgisayar bilimleri yeni teknolojilere ve fikirlere kolay adapte olabilmelerini sağlayan geniş temel bilgiler vermektedir.



Bilgi Sistemleri Mühendisliği, işletmelerin bilgi ihtiyaçlarını karşılamak için, bilgi teknolojisi çözümleri ve iş süreçlerine odaklanır. Bilgi sistemleri uzmanı, teknik ve organizasyonel etkenleri anlayarak bir kuruluşun bilgi sistemlerine yönelik gereksinimleri belirlemede önemli bir rol oynar ve aynı zamanda bunların özellikleri, tasarımı ve uygulanmasında etkindirler. Organizasyonel ilkeleri ve uygulamaları anlamalı böylelikle teknik ve idari topluluklar arasında köprü kurabilmelidirler. Bilgi Sistemleri Mühendisliği iki isim altında karşımıza çıkabilmektedir. Bilgisayar Bilgi Sistemleri daha çok teknoloji konusunda odaklanırken, Yönetim Bilgi Sistemleri daha çok organizasyonel ve davranışsal bakış açısına odaklanır.

Bilgi Teknolojisi Mühendisliği, iki farklı şekilde tanımlanabilir. En genel anlamıyla bilgisayara dair her şeyin yerine kullanılabilmektedir. Akademik anlamda ise özel sektör, kamu, sağlık hizmetleri, okullar ve diğer birçok kurumun ihtiyaç duyduğu bilgisayar teknolojisini sağlayabilecek öğrenciler yetiştiren bir lisans derecesidir. İşletmeler düzgün çalışabilen, güvenli, geliştirilebilir, yönetimi kolay ve yenilenebilir bir sisteme ihtiyaç duyar. Bilgi teknolojisi uzmanları gerçek, günlük ihtiyaçları karşılamak aynı zamanda yazılım ve donanım seçiminden de sorumludur.

Yazılım Mühendisliği, kullanıcıların bütün gereksinimlerini karşılayabilen, geliştirilmesi ve bakımı pahalı olmayan, güvenli ve verimli yazılım sistemleri tasarlayan ve sürdüren disiplindir. Yüksek maliyetli, büyük yazılımların artması, yazılım güvenliğinin önem kazanmasıyla yazılım mühendisliği gelişmiştir. Somut, fiziksel eserler için geliştirilen mühendislik uygulamaları ile matematik ve bilgisayar bilimleri ilkelerini birleştirmeye çalışmaktadır.

Yazılım mühendisliği, bilgisayar bilimleri müfredatında bir veya daha fazla ders şeklinde verilebildiği gibi enstitüler tarafından lisans programı olarak sunulabilmektedir. Bilgisayar bilimleri ve yazılım mühendisliğinin birçok ortak dersi vardır. Yazılım mühendisliği öğrencileri, doğru yazılım üretme teknikleri, güvenilir yazılım tasarımı, uygulanması ve sürdürülmesi üzerine yoğunlaşırken, bilgisayar bilimleri öğrencileri de, yazılım mühendisliği programlarında elde edilen mühendislik bilgi, tecrübe ve teknikleri hakkında bilgi sahibi olurlar. Yazılım mühendisliği öğrencileri yazılım oluşturulma işlemine bizzat katılır. Yazılım mühendisliği öğrencileri kullanıcıların isteğine cevap verebilecek, güvenli, kullanışlı yazılım geliştirme konusunda eğitim alır. Şekil 1'de Organizasyonel Konular ve Bilgi Sistemleri, Uygulama Teknolojileri, Yazılım Metot ve Teknikleri, Sistem Altyapısı, Bilgisayar Donanımı ve Mimarisi genel müfredat alanlarının Yazılım Mühendislikleri müfredatlarındaki oranı görülmektedir. Şekil 1 incelendiğinde sağ yönde uygulama geliştirmede artış sol yönde ise teoride artış olduğu görülmektedir. Aynı şekilde organizasyonel çalışma alanı ve insan ilişkileri yukarı yönde artmakta, teknik detaylar ve cihazlarla çalışma alanı ise aşağı yönde artmaktadır. Şekilden de anlaşıldığı gibi yazılım mühendisliği, bilgisayar donanımı ve bilgisayar mimarisi ile alakalı çalışma yapmamaktadır. Sağa ve sola olan dengeli dağılım da yazılım mühendisliğinin hem teorik hem de uygulama alanında çalışma yaptığını göstermektedir (Acm, 2014).

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 1. Yazılım Mühendisliğinin Müfredat Alanları (Acm, 2014).

1.2 Türkiye'de Bilişim Alanındaki Mühendislik Lisans Programlarının İstatistiki Bilgileri

2012 ÖSYM verilerine göre, Türkiye'de yükseköğretim veren üniversitelerde 1274 mühendislik programı bulunmaktadır (Ösym, 2014). Bu programlardan bilişim alanında eğitim veren mühendislik programları incelendiğinde, 124 adet Bilgisayar Mühendisliği, 18 adet Yazılım Mühendisliği ve 5 adet Bilişim Sistemleri Mühendisliği olduğu görülmektedir. Tablo 1'de ise bu bölümlerin kontenjan ve doluluk oranları açısından istatistiki verileri bulunmaktadır. 2012 yılında 8872 BT kontenjanının 7683'ü dolarak %13.4'ü boş kalmıştır.

Tablo1. Bölümlerin kontenjan istatistikleri (Ösym, 2014).

Program	Toplam Kontenjan	Doldurulan Kontenjan	Doluluk Oranı
Bilgisayar Mühendisliği	7761	6878	%88.62
Yazılım Mühendisliği	967	699	%80.62
Bilişim Sistemleri Mühendisliği	144	106	%73.61

Türkçe Bilgisayar Mühendislik programlarının puanları ortalama 501–326 arasında, İngilizce Bilgisayar Mühendislik programlarının puanları ortalama 544–267 arasında değişmiştir. Bilişim Sistemleri Mühendisliği programı 379 puan, Yazılım Mühendisliği programı ise 440–279 puanları arasında değişim göstermiştir.

Bu veriler, üzerinde değişik tartışmalara yol açacak, farklı yorumlara açık bir tablo ortaya koymaktadır. Bunun yanı sıra Bilgisayar Mühendisliği ve Yazılım Mühendisliği arasındaki kabul edilebilir sınırların ve algıların ders müfredatlarını nasıl etkilediğini görmek, ihtiyaçlarımız doğrultusunda yapılması gerekenleri planlamak açısından önemlidir.

2 BT'de Müfredat Geliştirme

Günümüzde Bilgisayar, Bilgisayar Bilimleri, Bilgi Sistemleri, Bilgi Teknolojisi ve Yazılım olarak beş mühendislik alanına ayrılan BT'nde müfredat geliştirmek de bir o kadar zor olmaktadır. Bunun başlıca nedenleri;

- Mühendisliklerin birbirlerine çok yakın kavramsal alanlara sahip olmaları
- Hedeflenen iş ve görev tanımlarının çoğunun birbirine yakın/geçişli olması
- İşverenlerin bir mühendislik alanından birden çok alan uzmanlığını beklemesi
- Öğrencilerin iş ve beceri kaygılarıyla birden çok mühendislik alanı uzmanlığına sahip olmak istemeleri
- Eğitim kurumlarının öğrencilerine birden fazla mühendislik alanı uzmanlığını vermek istemesi
- Akademik değerlendirme ve akreditasyon kurumlarının müfredatlar da ki ders türlerini, sayılarını ve kredilerine sınırlamalar getirmesi olarak sıralanabilir.

ACM, AIS, AITP ve IEEE orta ve yükseköğretim kurumları için müfredat geliştiren dört önemli organizasyondur. 1990'lardan önce her bir organizasyon kendi müfredat önerisini sunarken, daha sonraları birlikte hareket ederek tek bir standart oluşturma çalışmaları yaptılar. ACM ve IEEE-ComputerSociety, Curriculum-68 ile başlayarak hemen hemen 40 yıldır ve yaklaşık on yıllık aralıklarla bilişim alanında eğitim

 Copyright © International Science and Technology Conference (ISTEC)

veren yükseköğretim kurumları için uluslararası kılavuz müfredatlar hazırlamaktadır. Son olarak CS2013 yayınlanmıştır. CS2013 BT müfredatını Tablo 2'de görülen 18 temel alana ayırarak planlamıştır. Burada SE (Software Engineering) BT temel alanlarından birisidir.

Tablo 2. CS2013 temel 18 alanı (Software Engineering, 2004).

CS2013 Temel Alanları	
AL(Algorithms and Complexity)	AR(Architecture and Organization)
CN(Computational Science)	DS(Discrete Structures)
GV(Graphics and Visualization)	HCI(Human-Computer Interaction)
IAS (Inf.Assurance and Security)	IM(Information Management)
IS(Intelligent Systems)	NC(Networking and Communications)
OS (Operating Systems)	PBD (Platform-based Development)
PD (Parallel and Distributed Comp.)	PL (Programming Languages)
SDF (Soft. Development Fundamentals)	SE (Software Engineering)
AL (Algorithms and Complexity)	AR (Architecture and Organization)

2.1 SE2004 Yazılım Mühendisliği Müfredat Önerilerinin İncelenmesi

ACM ve IEEE-CS tarafından Yazılım Mühendisliği için geliştirilen SE2004 çalışmasının temel amacı üniversitelere ve akreditasyon kurumlarına Yazılım Mühendisliği lisans eğitimi müfredatı hakkında öneriler sunmaktır. Yazılım mühendislerinin mezun olduklarında bilmesi gereken bilgiler ve kazanmaları gereken temel yetenekler bu çalışmada ifade edilmektedir.

SE2004'de Yazılım Mühendisliği Tablo 3'de ki 10 bilgi alanına ayrılmıştır. Her bir bilgi alanı ünite ve konular şeklinde de açıklanarak ayrılması gereken saatler belirlenmiştir. Çekirdek konuların bulunduğu üniteler Zorunlu(E-Essential), çekirdek konular içinde olmayan ama müfredata dahil edilmesi halinde bütünlüğü bozmayacak üniteler İstenilir (D-Desirable) ve diğer üniteler de Seçmeli (O-Optional) şeklinde kodlarla ifade edilmiştir. Ayrıca bu kodların dışında ünitelerin özellikleri; yeni ve somut durumlarda öğrenilen materyalleri kullanma becerisi: Uygulama (a-Application), bilgi ve materyalin içeriğini anlamak: Kavrama (c-Comprehension) ve geçmiş bilgilerin hatırlanması: Bilgi (k-Knowledge) kodlarıyla belirlenmiştir.

Tablo3. Bilgi alanları tablosu (Software Engineering, 2004).

Kod	Bilgi Alanı	Saat
CMP	Computing Essentials	172
FND	Math & Engineering Fundamentals	89
PRF	Professional Practice	35
MMA	Software Modeling & Analysis	53
DES	Software Design	45
VAV	Software Verification & Validation	42
EVL	Software Evolution	10
PRO	Software Process	13
QUA	Software Quality	16
MGT	Software Management	19

Yazılım Mühendisliği ve Bilgisayar Mühendisliği lisan programları iki farklı program olarak nitelense de özellikle giriş düzeyinde birçok konuda ortaktırlar. Bu yüzden SE2004 çalışmasında müfredat programı önerilirken CC2001'deki (Acm, 2014) (Computer Science volume) derslere de yer verilmiştir. SE2004'de önerilen dersler bir kod sistemi kullanılarak ifade edilmiştir. Bu kod sistemi **XXabc** şeklinde formüle edilmiş ve XX için Tablo 4'teki kodlar kullanılmıştır. Örneğin "Introduction to Software Engineering and Computing" dersi SE101 olarak kodlanmış yani 1. Sınıf yazılım mühendisliği temel ders grubu üyesi bir ders anlamına gelmektedir.

Tablo4. SE2004 ders kodları (Software Engineering, 2004).

XX	Açıklama
CS	CCCS'den gelen dersler için
SE	SE2004'de tanımlanmış yazılım mühendisliği dersleri için
NT	SE2004'de tanımlanmış teknik olmayan dersler için
MA	SE2004'de tanımlanmış matematik dersleri için

abc	Açıklama
a	Kaçıncı yıl olduğunu gösterir.
b	0: Yazılım mühendisliği temel dersleri 1: Tasarım ve hesaplamada önemli ağırlığa sahip dersler 2: Ağılık olarak sonuç odaklı konulara sahip dersler
c	a ve b rakamları aynı ise bu dersleri ayırma için

 Copyright © International Science and Technology Conference (ISTEC)

SE2004'de ilk yıl ve lisans programının yarısında verilebilecek giriş seviyesindeki derslere bir müfredat örneği Tablo 5'te görülmektedir.

Tablo5. SE2004 Giriş seviyesi ders önerileri (Software Engineering, 2004).

YIL 1 SE101 → SE102 → CS103 / SE200	**SE101** Introductionto Software Engineering and Computing **SE102** Software Engineering and Computing II **SE200** Software Engineering and Computing III **CS103** Data Structures and Algorithms

2.2 Türkiye'deki Yazılım Mühendisliği Bölümlerinin SE2004 ile Müfredat Uyumları

Bu çalışmada SE2004'de belirtilen çekirdek derslerden 4, matematik derslerinden 2 ve giriş seviye derslerinden 4 tanesi ele alınmış ve ülkemizdeki 16 Yazılım Mühendisliği bölümünün ders müfredatları incelenerek bu derslerin programlarda yer alma istatistikleri çıkartılmıştır. Çalışmada SE2004'de belirtilen ders isimlerinin ülkemizde aynı içerikte, farklı isimler altında verildiği görülmüş ve bunların birer örnekleri Tablo 8'de verilmiştir. Çalışmada hatalı sayım yapmamak için hazırlanan bu tablodan faydalanılmıştır. Ders içeriği kadar isim bütünlüğünün de müfredat hazırlık aşamasında üniversitelerin belirli bir standardı yakalamaları için dikkat etmeleri gereken hususlardan biri olduğu düşünülmektedir.

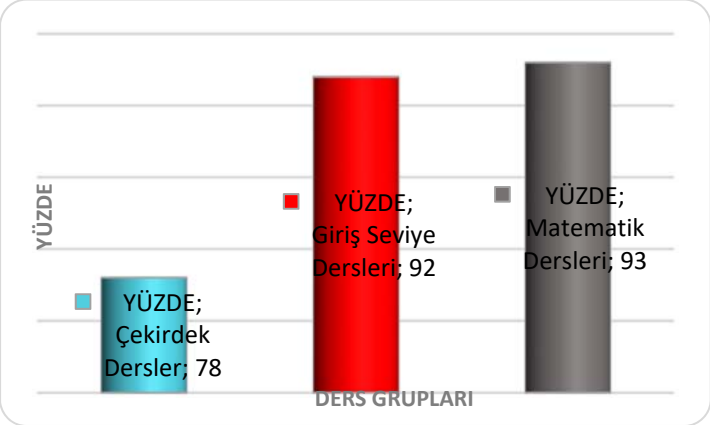
Bilgisayar Programlama 1	

Türkiye'deki 16 Yazılım Mühendisliği bölümünün müfredat programlarının SE2004 çalışmasında önerilen dersler ile uygunluk düzeyleri Şekil 2 ve Şekil 3'te Çekirdek, Matematik ve Giriş Seviyesi Ders Gruplarında verilmiştir.



Şekil 2'deki grafikte çekirdek dersler mavi, matematik bilimi dersleri gri ve giriş düzeyi dersleri kırmızı renkler ile ifade edilmiştir. Çekirdek dersler grubunda "Software Requirements Analysis (Yazılım Gereksinim Analizi)" dersinin müfredatlar da 10 bölümde bulunarak en az yer alan ders olduğu ve "Software Quality Assurance and Testing (Yazılımda Kalite Güvenilirlik ve Test)" dersinin de 14 bölümde bulunaraken fazla yer alan ders olduğu görülmektedir. Matematik dersler grubunda "Statistics and Empirical Methods (İstatistiksel ve Deneysel Metodlar)" dersinin müfredatlar da 13 bölümde bulunarak en az yer alan ders olduğu ve "Discrete Structures (Ayrık Yapılar)" dersinin de 15 bölümde bulunarak en fazla yer alan ders olduğu görülmektedir. Giriş Seviyesi dersler grubunda "The Object-Oriented Paradigm (Nesne Yönelimli Programlama)" dersinin müfredatlar da 11 bölümde bulunarak en az yer alan ders olduğu ve "Data Structure and Algorithm (Veri Yapıları ve Algoritmalar)" ve "Programming Fundamentals (Programlamanın Temelleri)" dersinin de 15 bölümde bulunarak en fazla yer alan ders olduğu görülmektedir.

Şekil 2. SE2004 Derslerinin Türkiye'deki Bölümlerde Okutulma Sayıları

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 3'deki grafikte bölümlerin üç gruptaki tüm derslerinin ortalama uygunlukları görülmektedir. Ülkemizdeki bölümlerin müfredatlarında Çekirdek derslerin 78%, Giriş Seviye derslerin 92% ve Matematik Bilimi derslerinin 93% oranlarında verildiğini görmektedir.

Şekil 3. SE2004 Ders Gruplarının Türkiye'deki Bölümlerde Uygulanma Oranları

3 Sonuç ve Öneriler

Gerçekleştirilen çalışma ile dünyada BT mühendislikleri alanlarındaki şekillenmeye bölümlerin tanım ve genel yapılarına değinilmiştir. Özellikle ülkemizde BT alanında eğitim veren farklı lisans programlarının bu tanımlar çerçevesinde eğitim ve öğretimlerini şekillendirmeleri, müfredatlarını hazırlamaları büyük önem taşımaktadır. Çünkü ülkemizdeki bölümler ile dünyadaki bölümlerin küreselleşmenin zirvede olduğu yüzyılımızda özellikle akreditasyon konusunda uyumlarının önemi yadsınamaz bir gerçektir. Bugün ülkemizde çok az sayıda bilgisayar mühendisliği bölümünün ABET, MÜDEK vb. kuruluşlara akredite olduğu görülmektedir. Bu sayıların hem bilgisayar hem de yazılım mühendisliği alanlarında artması bölümlerin hedefleri açısından önem taşımaktadır.

Yazılım mühendisliği bölümlerinin ülkemizde sayısının az olduğu ve özellikle özel üniversiteler bünyesinde açılmış olduğu görülmektedir. Bu sayının artması ve bölümün ülkemizde de tanınırlık düzeyinin gelişmesi için bölümün çizgilerinin iyi bilinmesi ve müfredat çalışmalarının titiz yapılması büyük önem arz etmektedir. Özellikle bu bölümleri tercih edecek öğrencilerin bilgisayar mühendislerinden ya da diğer BT mühendisliklerinden ne tür farklarının olacağını bilmeleri önemlidir fakat ülkemizde bu ayrımın net olarak farkına varılmadığını görmekteyiz.

Yazılım mühendisliklerinin özel sektörce kabul görmeleri ve iş hayatında daha çok tanınmalarına katkıda bulunacak her türlü çalışmanın bir birliktelik içerisinde uygulanması gerektiği düşünülmektedir. Özellikle teknoloji fakülteleri bünyesinde son yıllarda Yazılım Mühendisliği bölümlerinin açıldığı ve bu fakültelerdeki İş Yeri Eğitimi uygulamaları ile öğrencilerin özel sektörle bütünleşmesi ve bölümün tanınırlığının artmasının gerçekleştirileceği düşünülmektedir.

Çalışmamızda yüksek bir oranda bölümlerin müfredatlarının SE2004 ile uyumlu olduğu görülmüştür. Fakat çalışmada özellikle seçmeli derslerin hangilerinin okutulduğunun net olarak bölümler tarafından açıklanmaması tam bir müfredat analizi yapılmasını engellemiştir. Çünkü seçmeli derslerin oranı programlarda önemli bir yer tutmaktadır.

Çalışmanın mevcut bilişim alanındaki mühendislik bölümlerinin ve yeni kurulma aşamasında olan yazılım mühendisliği bölümlerinin müfredat çalışmalarında aydınlatıcı bir yol gösterici olacağı düşünülmektedir.

ULTRASOUND ASSISTED SYNTHESIS OF ZINC BORATE

Tuğçe Songür
tugcesongur@gmail.com

Hikmet Okkay
hokkay@yalova.edu.tr

Zinc borate has many applications including the polymer additive which serves as the flame retardant, the preservative in wood composites, the smoke and afterglow suppressant due to its ability to undergo endothermic dehydration in fire conditions, and optical properties, and the additive for lubrication. Zinc borate in general is produced with the reaction between zinc oxide, boric acid and water.

The chemical effects of ultrasound derive primarily from acoustic cavitation and the sonochemical method has been extensively used to generate novel materialswith unusual properties. The chemical and mechanical effects of ultrasound are dueto the cavitation phenomena which produces bubbles during the rarefaction (negativepressure) period of sound waves. The eventual collapse of bubbles generates intenselocal temperatures (hot spots), extreme pressures and rapidheating and cooling rates. These high heating and cooling rates hinderthe organization and crystallization of the products. Furthermore the fast kinetics doesnot permit the growth of the nuclei. Due to these extreme conditions, in almost all thesonochemical reactions leading to inorganic products, nanomaterials have been obtained. In this perspective, ultrasonic irradiation has been successfully applied toprepare various nanosized metals and metal oxides.

In this study, will be investigated the results of a systematic study of the effects of ultrasound power, ultrasound pulse ratio and probe type on zinc borate synthesis with the reaction of zinc oxide and boric acid.

Keywords: Zinc borate, Ultrasound, Synthesis, Flame retardancy

UNICEF ÜLKELER RAPORU IŞIĞINDA TÜRKİYE'NİN ÇOCUK GÜVENLİĞİ BAKIMINDAN DÜNYADAKİ YERİ

Tuğrul BAYRAKTAR[1,a], Turgay TÜRKER[1,b], Yasemin ALTUN TÜRKER[1,c]

[1]Endüstri Mühendisliği Bölümü, Karabük Üniversitesi, Karabük, TÜRKİYE

[a]tugrulbayraktar@karabuk.edu.tr

[c]yaseminaltun@karabuk.edu.tr

Özet: Hayata dair yeterli tecrübesi bulunmayan ve hayata dair meseleleri öğrenme aşamasında olan çocukların himayesi birçok ebeveyn için ileri mertebede öneme haizdir. Onların iyi bir hayat sürmesi ve yetişkin bireyler oluncaya dek mümkün mertebe koruma altında olmaları sadece ailelerin değil bütün bir dünyanın meselesi haline gelmiştir. Çocukların gelecekte yaşadıkları ülkenin sahipleri olacakları bilinciyle hareket eden Birleşmiş Milletler Çocuk Acil Durum Fonu (UNICEF) çeşitli faaliyetlerle bu amaca hizmet etmeye çalışmaktadır. Özellikle son zamanlarda dünya gündemini daha fazla işgal etmeye başlayan çocukların her türlü şiddetten korunması meselesi, taciz ve ilgisizlik gibi başlıca problemleri içermektedir. Dünyada olduğu gibi Türkiye'de de çocuklara yönelik üzücü vakaların yaşanması Türkiye'nin çocukların korunması hususunda dünyadaki yerinin nerede olduğu hususunda merak uyandırmıştır. Bu sebeple UNICEF'in 2015 Ülkeler Raporu çerçevesinde kümeleme analizi tekniğiyle bu husus tespit edilmeye çalışılmıştır. Ayrıca bu çalışmada Türkiye'nin yıllara göre çocukların korunması hususunda ne tür bir değişim kaydettiği tespit edilmeye çalışılmıştır.

Anahtar Kelimeler: UNICEF, Çocuk, Çocuk korunumu, Kümeleme Analizi

Giriş

Çocuklar hayata gözlerini açtıkları an ile yetişkinlik dönemleri arasında kalan süre zarfında mensubu oldukları toplumlara göre zihinsel ve fiziksel değişimlere maruz kalmaktadırlar. Bu süre zarfında en çok ihtiyaç duyacakları şey ise içerisinde yaşadıkları toplumun bir başka mensup olan yetişkin bireylerin onlara rehberlik etmeleri ve onları muhtemel tehlikelere karşı koruma altına almalarıdır.

Yetişkin bireylerin yardımının elzem olduğu bilinmesine rağmen maalesef çocuklar dünyada ve Türkiye'de şiddete maruz kalabilmektedir ve çocuklara reva görülen bu şiddet yıllara göre artış göstermektedir (Unicef Report, 2014). Çocukların her türlü şiddetten korunmasını amaçlayan çalışmalar ve faaliyetler Dünya Bankası, Birleşmiş Milletler vb. uluslararası örgütler tarafından mercek altına alınarak desteklenmektedir (Bissell, 2015).

Çocuklara karşı artan trenddeki şiddet eğilimi mevzu bahis uluslararası örgütleri harekete geçirdiği gibi UNICEF'i de konu hakkında tedbir almaya sevk etmiştir. UNICEF çocukların korunması üzerinde özellikle durarak 2006 yılında Birleşmiş Milletler Genel Sekreterliğinin sunduğu raporda bu meseleye özel yer ayırmış ve konu ile alakalı çalışmaları desteklediğini belirtmiştir (Hart et al., 2011).

Literatür

Girişte belirttiğimiz gibi çocuklara uygulanan şiddetin özellikle son yıllarda Türkiye'de olduğu gibi dünyada da yankı bulması ile bu yönde yapılan çalışmaları tetiklemiştir. Tanzanya çocuk güvenliği açısından ciddi zafiyetlerin oluşması sebebiyle mercek altına alınarak çocuklara uygulanan şiddetin nasıl azaltılabileceğinin belirlenebilmesi için 2010-2013 yılları arasında çocuk güvenliği ile alakalı ölçümler yapılmıştır. Çocuğa olan şiddetin daha belirgin olduğu cinsel, fiziksel ve duygusal hasarların ölçümü yapıldığında şiddet mağdurlarının büyük bir kısmının kız çocuğu olduğu ve her yılda elde edilen verilerin bir önceki yılın verilerin 3 katı olacak şekilde arttığı belirlenmiştir. Ayrıca şiddet uygulanan çocuklarının anne ve babasından her ikisinin de hayatta olanlarının oranının 2011-2012 döneminde %48 iken bu oranın 2012-2013 döneminde %91'e çıktığı ve ebeveynlerin çocuklarına şiddet uygulamalarının ailenin içinde bulunduğu maddi sıkıntılar ile bağlantılı olduğu tespit edilmiştir (Ng'ondi, 2015).

Tanzanya'da için yapılan çalışmaya benzer Uganda için de düzenlenerek ülkenin merkez bölgesinde 42 ilkokuldan 3706 öğrenci ile birlikte çocuk güvenliği hizmetleri hakkında bir anket çalışması yapılmıştır. Denek çocuklar üzerinde belirgin seviyede olan darplar türüne, şiddetine ve kaç kere tekrar edildiğine göre sınıflandırılmıştır ve anket çalışması yapıldıktan sonra denek öğrenciler 4 ay boyunca takip edilmişlerdir. İlk bulgulara göre 529 çocuğun darp edilmeye maruz kaldığı ve bu deneklerin yaklaşık 2/3'ünün kız çocuğu olduğu tespit edilmiştir. Bu sonuçlara göre birlikte çalışılan deneklerin %14'lük bir kısmının şiddete maruz kaldığı ve bunun kabul edilebilir seviyenin çok üstünde olduğu belirtilmiştir (Child et al., 2014).

 Copyright © International Science and Technology Conference (ISTEC)

Çocuk güvenliği meselesinin Estonya özelinde başka yönden bir incelemesinin yapıldığı bir çalışmada çocuk merkezli yaklaşımın Estonya'da nasıl uygulanabileceğine cevap aranmaktadır. Bu maksatla çocuk güvenliğinden sorumlu Estonya'nın farklı bölgelerinden 20 kişiye anket uygulaması yapılmıştır. Çalışmalar sonucunda varılan sonuç ise çocuk güvenliğinden sorumlu çalışanların çocuk merkezli yaklaşımlar için daha fazla teşvik edilmesi ve daha fazla bilinçlendirilmeleri gerektiği şeklinde olmuştur (Toros et al., 2013).
Kanada'da yapılan başka bir çalışmada ise çocuk istismarına maruz kalanların ve istismar riski altında olanların tespit edilmesi maksadıyla hazırlanarak elde edilen 2012 Kanada Halk Sağlığı anketi sonuçlarından faydalanılmıştır. Kanada için yapılan işbu çalışmada ise Kanada'da yaygın olarak görülen istismar türlerinden olan fiziksel ve cinsel istismarın yanı sıra yakın akraba kaynaklı şiddete ait verilerle mevzu bahis olan anket sonuçlarının birbiriyle ne kadar örtüştüğü belirlenmeye çalışılmıştır. Ülkenin 10 farklı bölgesinden gelen verilerle yapılan karşılaştırmaya göre her üç istismar türünün de hemen hemen aynı oranda çocuk güvenliğinden sorumlu organizasyonlara anket yoluyla rapor edildiği ve bunların arasından en öne çıkan fiziksel istismar hususu üzerinde eğilmenin gerektiğini belirtmişlerdir (Afifi et al., 2015).
Çocuk istismarı ve çocuk güvenliği hakkında yakın zamanda yapılan çalışmalardan elde edilen sonuçlar vaziyetin ne derecede vahim olduğunu ortaya koymaktadır. İstatistikî verilerden elde edilen sonuçların rakamsal olarak tek başına irdelenmeleri ve yorumlanmalarının yanı sıra bu verileri temsil eden göstergelerin belli düsturlar muvacehesinde kendi aralarında kıyas edilerek daha çok veya az öneme haiz olanlarını tespit etmek nev'inden birtakım çalışmalar da mevcuttur. Lakin kıyas aşamasına geçmeden evvel göstergelerin temsil hususunda güvenilir olması yapılacak çalışmaların sıhhati bakımından önem arz etmektedir.
Elde edilen verilerin daha iyi yorumlanabilmesi için kullanılan göstergeleri geliştirmek ve belli bir kalıp içerisine sokmak maksadıyla yapılan bir çalışmada ise çocuk güvenliği hususunda önerilen göstergelerin iyi tanımlanmasının meseleyi daha iyi kavramamıza imkan sağlayacağı iddia edilmektedir. Bu maksatla Uganda'da yapılan bir çalışmada çeşitli göstergeler kullanılarak çocuk güveliği hususunun güvenilir bir şekilde ölçülebileceği bir mekanizma geliştirilmiştir ve bu mekanizmanın tamsayılı ölçüme uyarlanması çalışması devam etmektedir (Ager et al., 2011).
İngiltere'nin 152 farklı bölgesinden 13 yaş üstü çocuklar üzerinde ihtiyaç sahibi çocuklar ve buna mukabil çocuk güvenliği servislerinin performans ölçümleri ile alakalı ve eğilimler ile kalite göstergeleri arasındaki korelasyonu belirlemeye matuf yapılan bir çalışmada yapılan ölçümler ile Eğitim Standartları Ofisinin derecelendirmelerinin birbirine benzer şekilde olduğu, sonuç olarak ise yapılan ölçümlerin çalışmanın yapıldığı dönemin ilk dönemlerine nazaran son dönemlerine ait derecelendirmelerle daha tutarlı olduğu tespit edilmiştir (Hood et al., 2016).

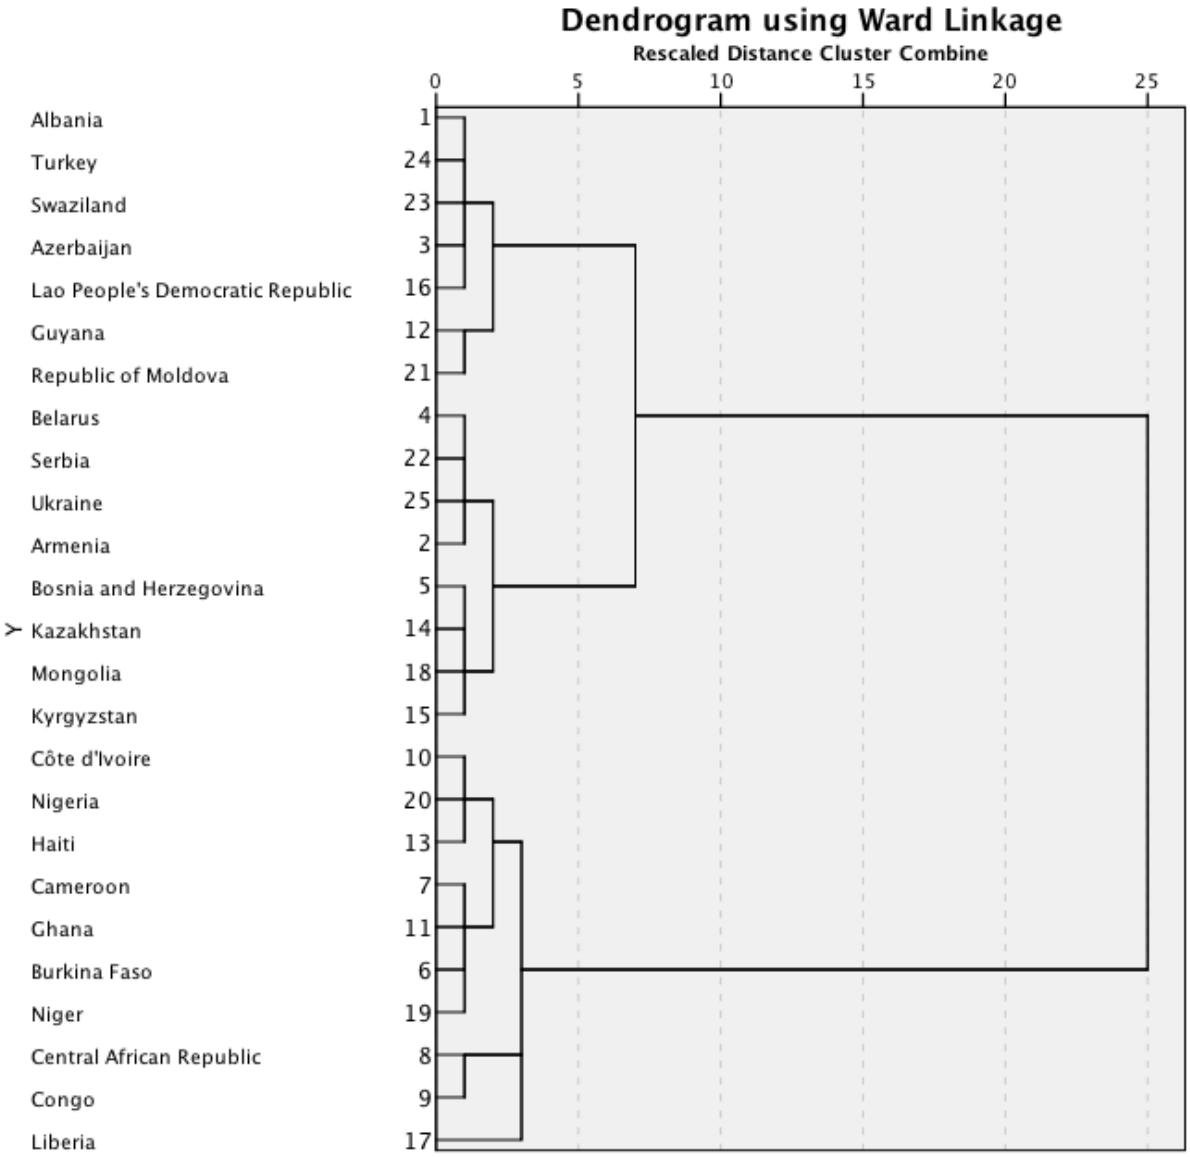
Metodoloji

Yukarıda bahsedilen İngiltere konulu (Hood et al., 2016) yerel bölgeler arasında yapılan kıyaslama çalışması bize daha geniş kapsamda Türkiye ile alakalı bir çalışmanın yapılabileceği fikrini aşılamıştır. Lakin yerel bazda değil küresel bazda yapılacak bir çalışmanın Türkiye'nin karşılaştırmalı olarak nerede olduğunu kavramamıza yardımcı olacağı fikrini taşımaktayız. Yaptığımız bu çalışmadaki temel maksatlar;

- Çocukları korumaya yönelik alınan tavır ve onlara yönelik şiddet hususunda ülkelerin mevcut durumlarını rakamlarla belirtmek
- Türkiye'nin mevzu bahis veriler çerçevesinde diğer ülkelere nazaran nerede durduğunu belirlemek ve
- Çocukların maruz kaldığı istenmeyen durumlarda cinsiyet ayrımcılığının olup olmadığını tespit etmektir.

Çalışmada UNICEF'in 2015 ülkeler raporu dikkate alınmakta ve raporun "Çocuk Güvenliği" alt başlığında aşağıda belirtilen indikatörler değerlendirmeye alınmaktadır:

- Çalışan çocuk işçi oranı
- Doğum kaydı oranı
- Terbiyede şiddete başvurma oranı
- Kadına şiddetin mazur görülmesi oranı



Raporda yer alan verilerin değerlendirilmesi aşamasında kadın sünneti meselesi dar bir coğrafyada gözlemlenmesi cihetiyle göz ardı edilmektedir. Genel olarak çocuk güvenliği hakkında AB ülkelerinden veri elde edilemediği için ülkeler değerlendirmesinde AB ülkeleri değerlendirme dışı kalmıştır.
Cinsiyet ayrımı için kullanılan indikatörler ele alındığında genel olarak verilerin normal dağılıma uymadıkları gözlemlenmektedir. Erkek-Kız karşılaştırması yapabilmek için ise Mann-Whitney testi uygulanarak; çocuk çalışan işçi, kadınlara yönelik şiddetin mazur görülmesi ve terbiyede şiddete başvurulması indikatörleri bakımından cinsiyet ayrımının yapılıp yapılmadığı tespit edilmiştir.

Sonuçlar ve Değerlendirme

Aşağıdaki dendogram sonuçlarından da görülebileceği üzere kümeleme analizi sonuçlarına göre Türkiye; 4 ana gruptan en iyi derecede olan Arnavutluk, Svaziland, Azerbaycan, Lao, Guyana ve Moldova'nın içerisinde

 Copyright © International Science and Technology Conference (ISTEC)

bulunduğu grupta yer almaktadır. Bu sonuçlara göre Türkiye'nin çocuk güvenliği konusunda ne kadar hassas davrandığı açıkça görülmektedir.

Şekil-1: Çocuk Güvenliği Hususunda Ülkelerin Kümeleme Analizine Göre Dendrogramdaki Yerleri

Tablo-1: Belirtilen Göstergelere Göre Erkek-Kız Ayrımının Olup Olmadığına Dair Sonuçlar

İndikatör	Ortalama		Standart Hata		P Değeri
	Erkek	Kız	Erkek	Kız	
Çocuk Çalışan Oranı (%)	15,9761	14,3685	1,1439	1,2169	0,165
Kadına Şiddetin Makul Karşılanması (%)	33,0228	39,1875	2,4570	2,5614	0,226
Terbiyede Şiddete Başvurulması (%)	79,8053	76,5789	1,5201	1,8626	0,288

 Copyright © International Science and Technology Conference (ISTEC)

Çocuk çalışma oranı, kadına şiddetin makul görülmesi ve terbiyede şiddete başvurulmasında cinsiyet ayrımının yapılıp yapılmadığı hususunda yapılan analizlerin yukarıdaki tabloda elde edilen sonuçlarına göre hiçbir hususta cinsiyet ayrımının yapılmadığı tespit edilmiştir.
AB ülkelerinden yeterli verilerin elde edilememesinden dolayı analiz sonuçları her ne kadar net bir tablo ortaya koyamasa da yaklaşık bir değerlendirmeye imkan tanımaktadır. Analiz sonuçlarına göre Türkiye övünülebilecek bir konumdadır lakin %8'lik çocuk işçi oranı bunu gölgelemektedir. Çocuk haklarının ihlali hususunda ise cinsiyet farkı gözetilmeksizin her çocuk tehlike altındadır.

Teşekkür

Karabük Üniversitesi'ne konferansa iştirak edebilmemiz için sağlamış olduğu imkanlardan dolayı teşekkür ederiz.

URLA-ÇEŞME YARIMADASININ MORFOTEKTONİK ÖZELLİKLERİ

Adnan SEMENDEROĞLU
a.semenderoglu@deu.edu.tr
Ahmet Serdar Aytaç
aserdaraytac@yahoo.com
Hurşit Yetmen
hyetmen@harran.edu.tr

Çalışma alanı Batı Anadolu'da, İzmir körfezi ile Kuşadası körfezleri arasında Ege Denizi'ne doğru uzanan yarımadalar kompleksinin güney ve güneybatı kesimlerini oluşturur.

Çalışma alanının en eski arazileri Devonien'e ait kırıntılı birimler ile bunların üzerine konkordant olarak gelen Alt Karbonifer kireçtaşlarıdır. Sahada geniş alanlar kaplayan ve komprehansif seri niteliğinde Mesozoyik birimler, Paleozoyik üzerinde taban konglomeraları ile başlar. Çoğunluğu karbonatlardan oluşan ve Alt Triyas'tan Alt Kretase sonlarına kadar devamlı denizel ortamda çökelmiş tortullardır (Karaburun istifi, Karaburun platformu, Karaburun kuşağı). Mesozoyik yaşlı komprehansif seri üzerine yine taban konglomeraları ile başlayan En Üst Kretase (Maestrihtiyen) yaşlı, fliş karakterli kırıntılı çökeller gelir (İzmir-Ankara zonunun güneybatı kesimini oluşturan Bornova flişi veya Bornova karmaşığı). Sahada Tersiyer Neojen göl ortamında çökelen göl tortulları, volkano-sedimanter formasyonlar ve volkanitlerle temsil edilir (Tersiyer'in ilk yarısı, Orta Miyosen'e kadar süren uzun bir karasal aşınım dönemi ile karakterize edilir). Özellikle kıyı ovalarında ve tektonik, tektono-karstik depresyonlarda bulunan alüvyonlar ise en genç birimlerdir.

Çalışma alanı iki tektonik kuşağın (İzmir-Ankara zonunun bir bölümünü oluşturan Bornova karmaşığı ve Karaburun kuşağı) temas sahasında bulunur. Maestrihtiyen'de fliş çökeliminin meydana geldiği havza kapanmaya başlamıştır. Bu sırada sıkışma tektoniği ile ilgili deformasyonlara bağlı olarak Karaburun karbonat istifi K-G doğrultulu, doğuya eğimli bindirme fayları ile dilimlenerek, Bornova karmaşığı üzerinde naplaşmıştır. Alp orojezine bağlı kompresyonel hareketler, çalışma sahasının dışında kalan doğu kesimlerde, Bornova karmaşığının Batı Anadolu'nun en büyük tektonik birliği olan Menderes masifi üzerine bindirmesine de neden olmuştur. Çalışma alanında genellikle K-G doğrultulu olan neotektonik döneme ait morfotektonik yapılar Batı Anadolu'nun genelinden farklıdır; ancak yarımadadaki K-G doğrultulu paleotektonik yapılarla uyumludur.

Yarımadanın merkezi kesimleri, genel olarak Mesozoyik kireçtaşlarından oluşan ve K-G doğrultusunda uzanan yüksek alanlar durumundadır. Merkezi sırt şeklindeki bu kütle, Pliyosen ve Kuvaterner'deki neotektonik hareketlerle yükselmiş ve yer yer eğim atımlı faylarla parçalanarak, üzerinde kabaca kuzey-güney doğrultulu bazı depresyonlar oluşmuştur. Daha sonra bu çöküntü alanlarında karstik süreçler etkili olduğundan, Barbaros, Kadıovacık ve Nohutalan depresyonları gibi tektono-karstik depresyonlar meydana gelmiştir. Pliyosen ve Kuvaterner'deki tektonik hareketler, yarımada kıyılarındaki kuzey-güney doğrultulu koy ve körfezlerin oluşumunda da rol oynamıştır.

Genel olarak 250-650 metreler arasında yükseltiye sahip merkezi sırtın doğu ve batısında, geniş çapta neojen göl tortullarının bulunduğu alçalım alanları mevcuttur. Kuvaterner'deki tektonik hareketlerle bu alçalım alanları içinde yer yer tali çöküntü alanları oluşmuştur. Denize doğru açılan bu tali çöküntü alanlarının gerisinde önce kıyı setleri ve lagünler, bilehare lagünlerin alüvyonlarla doldurulması bazı kıyı ovaları meydana gelmiştir. Batıda Alaçatı ovası, Gülbahçe Körfezinin güneyinde Malkaça ovası bu şekilde meydana gelmiş, denizel transgresyonlar ve akarsu faaliyetleri sonucu alüvyonlarla doldurulan tektonik kökenli kıyı ovalarıdır.

USE OF MOLTEN SALT METHOD IN THE SYNTHESIS OF METAL HYDRIDE ELECTRODE MATERIALS

Mustafa ANIK[a,b]

[a]Institute of Metallurgy

[b]Metallurgical and Materials Engineering Department

Eskişehir Osmangazi University, 26480, Eskişehir, Türkiye

manik@ogu.edu.tr

Abstract: La-Ni based alloys are being used in the commercial secondary nickel metal hydride batteries. Economical synthesis of these alloys may cause large scale utilization of them especially in the electrical vehicles. The electro-deoxidation, which is accepted as the revolutionary technique in the extractive metallurgy, is very promising in the metal hydride alloy synthesis since it provides direct synthesis of the alloys from their oxide raw materials. In this study $La(Ni_{0.8}Co_{0.2})_5$ (AB_5 type) and $La_2(Ni_{0.8}Co_{0.2})_7$ (A_2B_7 type) alloys were synthesized in the molten $CaCl_2$ electrolyte at 850°C and the charge/discharge characteristics of the synthesized alloys were observed. Sintering caused the hygroscopic La_2O_3 to disappear and the non-hygroscopic $LaNiO_3$ to form. LaOCl was observed to form chemically upon contact of the sintered pellet with the melt. The X-ray diffraction peaks indicated that the sinter products reduced to $LaNi_5$ and La_2Ni_7 phases within 2 h and 6 h electro-deoxidation process, respectively. The sluggish reduction kinetics of LaOCl phase was observed to retard the appearance of La_2Ni_7 phase. The discharge capacities of $La(Ni_{0.8}Co_{0.2})_5$ and $La_2(Ni_{0.8}Co_{0.2})_7$ alloys were determined as 325 mA h g^{-1} and 332 mA h g^{-1}, respectively. The results obtained in this study showed that the electro-deoxidation technique is very promising in the synthesizing of the high performance hydrogen storage alloys.

Keywords: La-Ni Alloys, Electro-deoxidation, Hydrogen Storage

Introduction

A novel technique called electro-deoxidation, which is also known as Fray-Farthing-Chen (FFC) Cambridge process (Chen, 2000, Mohandas, 2004), is reported as very promising for the economical synthesis of the alloys directly from their oxide mixtures (Zhu, 2007, Tan, 2010, Anik, 2014). Lanthanum-Nickel based alloys are generally synthesized by the melting and casting under the protective atmosphere (Srivastava, 1999, Hayakawa, 2005, An, 2013). Of course the individual elements (La and Ni) must be already extracted and refined for the melting and casting processes. The cast products need annealing for several hours to get the structural homogeneity (Huang, 2002). Obviously this production pathway for the La-Ni based hydrogen storage alloys is not very encouraging especially for the large scale applications like battery systems of the electrical vehicles. The electro-deoxidation method looks more cost-effective since it provides direct synthesis of the alloy with final stoichiometry from the raw materials (oxides). In this work AB_5 and A_2B_7 type intermetallic alloys were synthesized by the molten salt electro-deoxidation method and the electrochemical hydrogen storage was applied to the final alloy structures.

Materials and Methods

Commercially available La_2O_3, NiO and CoO powders were obtained from Alfa Aesar. Required amounts of the oxide powders were mixed homogeneously in anhydrous ethanol includes 3% (by weight) polyethylene glycol (PEG) with a planetary ball mill. The powder was then dried overnight at room temperature. Dried powder was cold pressed into pellets of 10 mm in diameter, under a pressure of 1.5 tonne cm^{-2}. The oxide pellets were then sintered at 1200°C for 3 h.

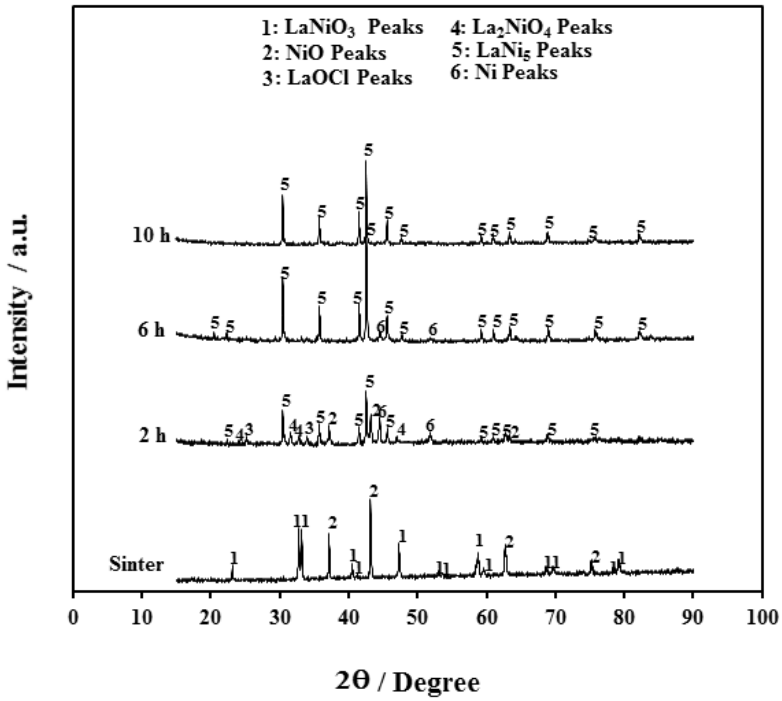
The electrochemical experiments were performed in a quartz cell which was located inside a homemade programmable electrical furnace. The upper end of the quartz cell was closed tightly with a quartz cover which has holes for the electrode leads, thermocouple, gas inlet and outlet. The quartz cell was continuously purged with Ar gas during the electro-deoxidation process.

 Copyright © International Science and Technology Conference (ISTEC)

100 gr $CaCl_2$ was mixed with 1 gr CaO and placed into graphite crucible. Before electro-deoxidation process $CaCl_2$-CaO powder mixture was dried under Ar gas. Drying was carried out by slow heating (about 1°C min^{-1}) to 150°C and holding at 150°C for 15 h and then slow heating to 300°C and holding at 300°C for 15 h and then finally slow heating to the target temperature of 850°C for the electro-deoxidation experiments.

In order to fully remove the water and the possible redox-active impurities, pre-electrolysis were carried out at 2.5 V and 850°C for 4 h. During the pre-electrolysis graphite crucible was used as anode and another graphite rod was used as cathode. For the electro-deoxidation experiments the graphite rod was removed from the cell and the prepared oxide pellet electrode was inserted into the quartz cell as a cathode. The electro-deoxidation was conducted at 3.2 V for various times at 850°C. The potential control was carried out by the programmable direct current source.

After the electro-deoxidation experiments the pellet electrodes were removed from the molten melt and they were located in the upper part of the quartz cell which was cooled down by keeping the Ar gas purging. The solidified salt on the pellet was washed out by tap water. After slight surface grinding the pellets were kept in 1 M HCl for few minutes. Finally the deoxidized pellet samples were dried at 100°C for 24 h under vacuum.



Working electrodes were prepared by mixing 0.1 g alloy powder with 0.3 g nickel powder and then cold pressing into pellets of 10 mm in diameter, under a pressure of 10 tonne cm^{-2}. Hg/HgO reference electrode was used in 6 M KOH solution. Tests were performed with GAMRY Model Reference 3000 potentiostat/galvanostat unit. The charge current density was 100 mA g^{-1} and the charging was carried out down to the severe gassing potential. The discharge current density was 25 mA g^{-1} and the discharge cut-off potential was -0.5 $V_{Hg/HgO}$.

The phase structure of the alloy powders was examined by the X–ray diffractometer (Bruker axs D8) using Cu Kα radiation. The powder morphologies were observed by ZEISS SUPRATM 50 VP Scanning Electron Microscope (SEM).

Results and Discussion

The alloy development stages of $La(Ni_{0.8}Co_{0.2})_5$ alloy during electro-deoxidation are shown in XRD patterns in Figure 1. Sintering of La_2O_3 + NiO + CoO mixture at 1200°C for 3 h yields formation $LaNiO_3$ phase in the expense of La_2O_3 as in the following reaction:

$$La_2O_3 + 2NiO + 1/2O_2 = 2LaNiO_3 \quad [1]$$

 Copyright © International Science and Technology Conference (ISTEC)

Figure 1. XRD patterns show the alloy development stages at various electro-deoxidation times for $La(Ni_{0.8}Co_{0.2})_5$ alloy.

After 2 h electro-deoxidation the sinter product $LaNiO_3$ phase disappears and La_2NiO_4 phase forms probably as a result of the following reduction reaction:

$$2LaNiO_3 + 2e^- = La_2NiO_4 + NiO + O^{2-} \quad [2]$$

The remaining reactions can be expected as in the followings:

$$La_2NiO_4 + 2Cl^- = 2LaOCl + NiO + O^{2-} \quad [3]$$

$$NiO + 2e^- = Ni + O^{2-} \quad [4]$$

$$La_2NiO_4 + 9Ni + 8e^- = 2LaNi_5 + 4O^{2-} \quad [5]$$

After 6 h electro-deoxidation La_2NiO_4 phase disappears due to the completion of Reactions 3 and 5, and the following reactions couple to the above reactions:

$$LaOCl + 3e^- = La + Cl^- + O^{2-} \quad [6]$$

$$La + 5Ni = LaNi_5 \quad [7]$$

10 h electro-deoxidation looks to enough to get stable alloy structure with 100% $LaNi_5$ phase. There is no any Co phase in Figure 1 since Co makes Co-La and Co-La-O phases with the exactly same stoichiometry of Ni-La and Ni-La-O phases. Therefore peak positions of Co phases are exactly same with those of Ni phases and it impossible to differentiate them in the XRD patterns.

Alloy development stages of $La_2(Ni_{0.8}Co_{0.2})_7$ alloy are depicted with the XRD patterns in Figure 2. Reactions 1-7 look also valid for the $La_2(Ni_{0.8}Co_{0.2})_7$ alloy development. In the final stage there is following extra reaction:

$$LaNi_5 + La + 2Ni = La_2Ni_7 \quad [8]$$

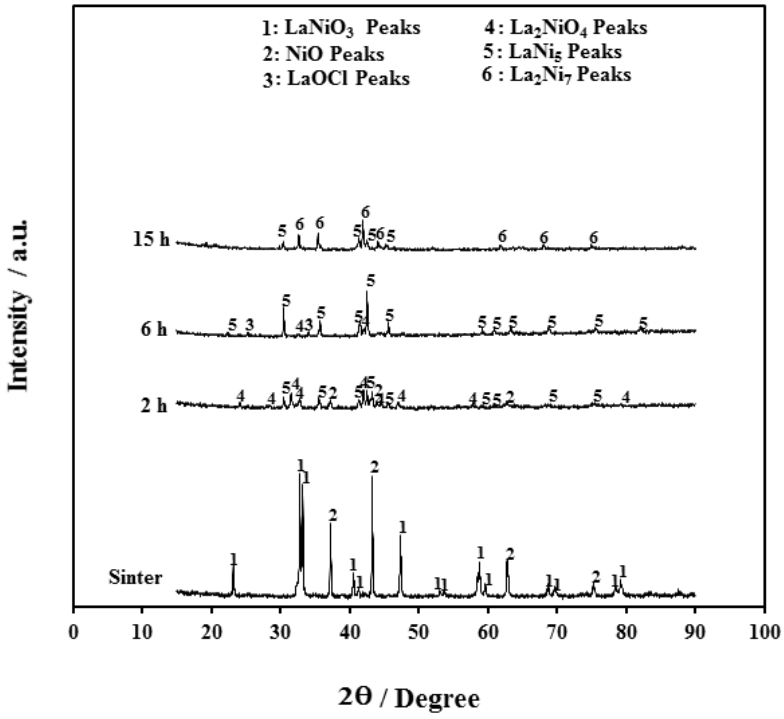


Figure 2. XRD patterns show the alloy development stages at various electro-deoxidation times for $La_2(Ni_{0.8}Co_{0.2})_7$ alloy.

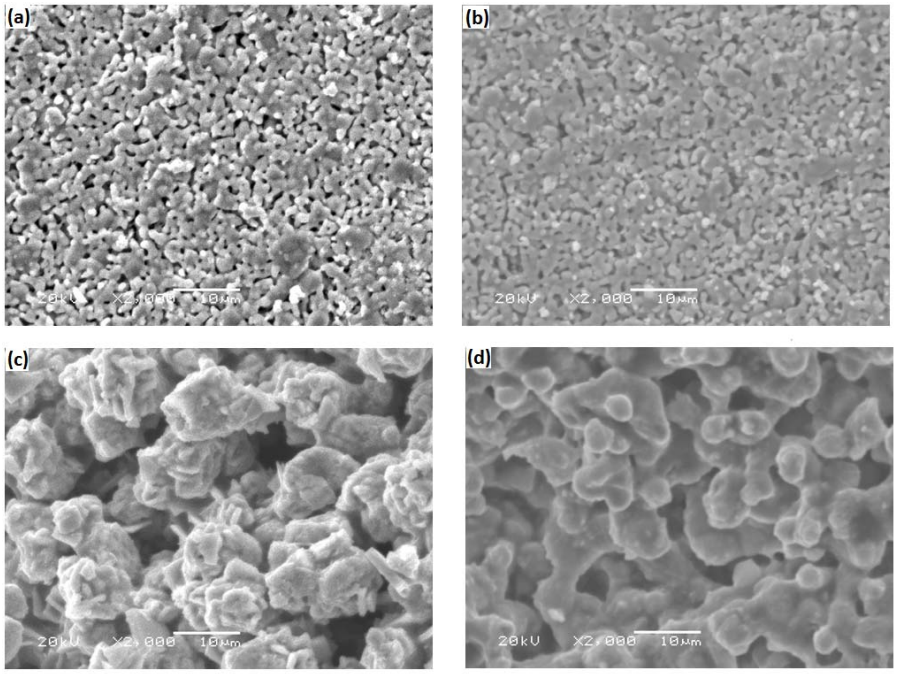
 Copyright © International Science and Technology Conference (ISTEC)

The presence of Reaction 8 retards the gaining of the stable structure for $La_2(Ni_{0.8}Co_{0.2})_7$ alloy and it takes 15 h to complete electro-deoxidation process. There is also retained $LaNi_5$ phase in the alloy structure probably due to the inefficiency of Reaction 8 since it requires elemental diffusion of La and Ni. Segregation of these elements to the pellet surface may destroy the homogeneity of the pellet and Reaction 8 cannot take place completely.

Scanning electron micrographs of the as-sintered oxide powders and fully deoxidized powders of both $La(Ni_{0.8}Co_{0.2})_5$ and $La_2(Ni_{0.8}Co_{0.2})_7$ alloys are provided in Figure 3. As-sintered powders have typical fine oxide powder appearance. At the end of the electro-deoxidation process, however, the large crystalline metallic powder morphology develops. The porous structure of the developed alloys are also apparent in Figure 3.



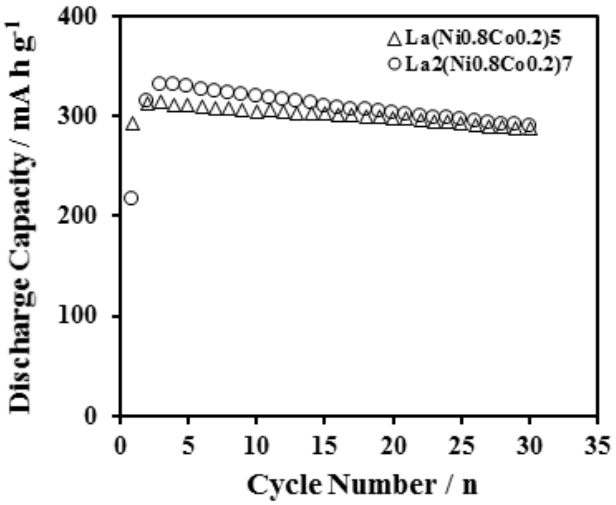


Figure 3. Powder morphology of sintered (a) $La(Ni_{0.8}Co_{0.2})_5$ and (b) $La_2(Ni_{0.8}Co_{0.2})_7$ alloys, and the fully deoxidized powder morphology of (c) $La(Ni_{0.8}Co_{0.2})_5$ and (d) $La_2(Ni_{0.8}Co_{0.2})_7$ alloys.

After synthesizing alloys with a final structure the discharge capacities as a function charge/discharge cycles are obtained as in Figure 4. The synthesized alloys need few cycles for activation to reach their maximum discharge capacities. The maximum discharge capacities of $La(Ni_{0.8}Co_{0.2})_5$ and $La_2(Ni_{0.8}Co_{0.2})_7$ alloys are 325 mA h g^{-1} and 332 mA h g^{-1}, respectively.

 Copyright © International Science and Technology Conference (ISTEC)

Figure 4. Discharge capacities of $La(Ni_{0.8}Co_{0.2})_5$ and $La_2(Ni_{0.8}Co_{0.2})_7$ alloys as a function of charge/discharge cycles.

This work clearly shows that electro-deoxidation may become very effective and probably more economical method in the synthesis of the energy storage materials.

Conclusion

$La(Ni_{0.8}Co_{0.2})_5$ (AB_5 type) and $La_2(Ni_{0.8}Co_{0.2})_7$ (A_2B_7 type) alloys were synthesized in the molten $CaCl_2$ salt at 850°C. Sintering caused the hygroscopic La_2O_3 to disappear and the non-hygroscopic $LaNiO_3$ to form. LaOCl was observed to form chemically upon contact of the sintered pellet with the melt. The X-ray diffraction peaks indicated that the sinter products reduced to $LaNi_5$ and La_2Ni_7 phases within 2 h and 6 h electro-deoxidation process, respectively. The sluggish reduction kinetics of LaOCl phase was observed to retard the appearance of La_2Ni_7 phase. The discharge capacities of $La(Ni_{0.8}Co_{0.2})_5$ and $La_2(Ni_{0.8}Co_{0.2})_7$ alloys were determined as 325 mA h g^{-1} and 332 mA h g^{-1}, respectively. The results indicated that the electro-deoxidation technique is very promising in the synthesizing of the high performance hydrogen storage alloys

Özet: Bu çalışmada Üçgen veya sinüzoidal dinamik yük ile yüklenmiş olan viskoelastik malzemeye sahip dik tabakalanmış sığ küresel viskoelastik kalın kabukların dinamik davranışları birinci mertebe kayma deformasyon teorisi dikkate alınarak Laplace uzayında nümerik olarak incelenmiştir. Bu çalışma ile ayrıca sığ küresel kalın kabukların dinamik analizleri için çok etkin ve aynı zamanda çok basit bir çözüm yaklaşımı önerilmiştir. Önerilen yöntemde, sistemi idare eden hareket denklemi Navier yaklaşımı kullanılarak zaman uzayında elde edilmiştir. Ardından sistem hareket denklemine Laplace dönüşümü uygulanmış ve böylece dönüşmüş uzayda zaman terimlerinden bağımsız hale dönüşen lineer cebrik denklem takımı sayısal olarak çözülmüştür. Dönüşmüş uzayda elde edilen sayısal sonuçları zaman uzayına dönüştürmek için Durbin'in modifiye edilmiş ters Laplace dönüşüm metodu kullanılmıştır. Elde edilen çözümlerin doğrulanması önerilen yöntem ile elde edilen değerlerin farklı yaklaşımlar ile elde edilen değerler ile karşılaştırılması yapılarak sağlanmıştır. Karşılaştırma için Navier yaklaşımı ve Newmark metodunun birlikte kullanılması ile elde edilen değerler ayrıca ANSYS sonlu elemanlar yazılımı ile elde edilen değerler kullanılmıştır. Bu çalışmada elde edilen sayısal değerler, önerilen yöntemin son derece doğru ve basit bir çözüm yöntemi olduğunu ve dik tabakalı viskoelastik sığ küresel kabuk problemlerine kolayca uygulanabildiğini kanıtlamıştır.

Anahtar Kelimeler: Viskoelastik Malzeme; Dinamik Analiz; Ters Laplace Dönüşüm; Dik Tabakalı Sığ Küresel Kabuk

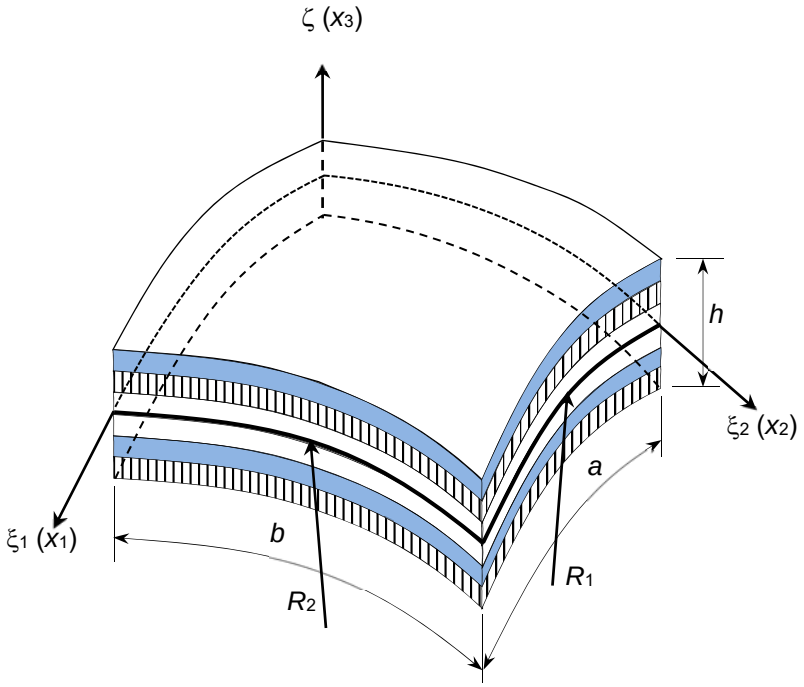
Giriş

Tabakalı kompozit kabuklar sahip oldukları eğrilik ve değişik tabakalanma kombinasyonları nedeniyle yüksek yük taşıma kabiliyeti gibi çok önemli bir avantaja sahiptirler. Tabakalı kompozit kabuklar bu avantajlarından dolayı inşaat sektöründen gemicilik sektörüne, uzay ve havacılık teknolojisinden mobilya sektörüne kadar neredeyse tüm mühendislik alanlarında yüzyıllardır çok yaygın olarak kullanılmaktadır.

Tabakalı kompozit kabukların her alanda kullanılması nedeniyle bu alanda pek çok araştırma yapılmış ve yapılmaya devam etmektedir (Chen ve Huang, 2001; Dey ve Karmakar, 2014; Jung ve Han, 2014; Prusty, ve Satsangi, 2001; Şahan, 2015). Tabakalı kompozit kabuklar taşıdıkları yükler dikkate alındığında çok değişik yük tiplerine maruz kalabilirler. Bu nedenle ani dinamik yük etkisindeki tabakalı kompozit kabukların davranışlarını belirlemek çok önemlidir. Bir başka durum da tabakalı kompozit kabuğun malzeme davranışının problemlerde dikkate alınmasıdır.

Bu çalışmada dik olarak tabakalanmış viskoelastik sığ küresel kabukların ani üçgen veya sinüzoidal dinamik yük etkisi altındaki davranışları incelenecektir.

Bu çalışmada, üçgen veya sinüzoidal dinamik yük ile yüklenmiş olan viskoelastik malzemeli sığ küresel kabukların hareket denklemlerine Laplace dönüşümü uygulanması ve ardından dönüşmüş uzayda elde edilen lineer cebrik denklem takımının sayısal olarak çözülmesi ve son olarak elde edilen çözümlerin Durbin'in modifiye edilmiş ters dönüşüm yöntemi yardımıyla zaman uzayına dönüştürülmesi prosedürünün oldukça etkin bir yöntem olduğu ayrıca gösterilmiştir.



Elde edilen sistem hareket denklemi Laplace dönüşümü yardımıyla lineer cebrik takımına dönüştürülmüş ve Gauss eliminasyon metodu ile Laplace uzayında çözülmüştür..Elde edilen çözümlerin Laplace uzayından zaman uzayına dönüşümü için Durbin'in modifiye edilmiş ters Laplace metodu kullanılmıştır. Kabuk malzemesinin viskoelastik olduğu kabul edilmiştir. Viskoelastik malzeme durumunda Kelvin sönüm modeli kullanılmaktadır.

Bu çalışmada, navier yaklaşımı ile kalın kabuk için elde edilen hareket denklemlerine Laplace dönüşümü uygulanması ve ardından Durbin'in modifiye edilmiş ters dönüşüm yöntemi uygulanması ile oldukça etkin ve doğru sonuçlar bulunabildiği karşılaştırmalı olarak gösterilmiştir.

Teorik Formülasyon

Eşit kalınlıklara sahip *N* adet tabakadan oluşan bir sığ kalın küresel kabuk düşünelim.böyle bir tabakalı kompozit kabuğa ait eksen takımı ve geometrisi Şekil 1'de gösterilmiştir..

Şekil 1. Tabakalı kompozit kabuğun geometrisi ve eksenler takımı

Birinci Mertebe Kayma Deformasyon Teorisi (BKDT) için kabuğun herhangi bir noktasındaki deplasman ifadeleri aşağıdaki şekilde yaılabilir. (Reddy 2004)

$$\begin{Bmatrix} u_1(\xi_1,\xi_2,\zeta,t) \\ u_2(\xi_1,\xi_2,\zeta,t) \\ u_3(\xi_1,\xi_2,\zeta,t) \end{Bmatrix} = \begin{Bmatrix} u_0(\xi_1,\xi_2,t) \\ v_0(\xi_1,\xi_2,t) \\ w_0(\xi_1,\xi_2,t) \end{Bmatrix} + \zeta \begin{Bmatrix} \emptyset_1(\xi_1,\xi_2,t) \\ \emptyset_2(\xi_1,\xi_2,t) \\ 0 \end{Bmatrix} \quad (1)$$

burada (u_1, u_2, u_3) tabakalı kompozit kabuğun herhangi bir noktasının deplasmanlarını, (u_0, v_0, w_0) kabuğun orta düzleminin deplasmanlarını, ($\emptyset_1$, $\emptyset_2$) ise orta düzlemin dönmelerini ifade eder (Reddy 1984).
Kabuğun herhangi bir koktasındaki şekil değiştirmeler aşağıdaki gibi yazılablir.

$$\{\varepsilon\} = \{\varepsilon^0\} + \zeta \{\kappa\}, \qquad \{\gamma\} = \{\gamma_{23}, \gamma_{13}\}^T$$

$$\{\varepsilon\} = \{\varepsilon_1, \varepsilon_2, \gamma_{12}\}^T, \qquad \{\varepsilon^0\} = \{\varepsilon_1^0, \varepsilon_2^0, \gamma_{12}^0\}^T, \qquad \{\kappa\} = \{\kappa_1, \kappa_2, \kappa_3\}^T \quad (2)$$

burada

$$\varepsilon_1^0 = \frac{1}{\alpha_1}\frac{\partial u_0}{\partial \xi_1} + \frac{w_0}{R_1}, \qquad \varepsilon_2^0 = \frac{1}{\alpha_2}\frac{\partial v_0}{\partial \xi_2} + \frac{w_0}{R_2}, \qquad \gamma_{12}^0 = \frac{1}{\alpha_1}\frac{\partial v_0}{\partial \xi_1} + \frac{1}{\alpha_2}\frac{\partial u_0}{\partial \xi_2}$$

$$\gamma_{23} = \frac{1}{\alpha_2}\frac{\partial w_0}{\partial \xi_2} + \emptyset_2 - \frac{v_0}{R_2}, \qquad \gamma_{13} = \frac{1}{\alpha_1}\frac{\partial w_0}{\partial \xi_1} + \emptyset_1 - \frac{u_0}{R_1}$$

$$\kappa_1 = \frac{1}{\alpha_1}\frac{\partial \emptyset_1}{\partial \xi_1}, \qquad \kappa_2 = \frac{1}{\alpha_2}\frac{\partial \emptyset_2}{\partial \xi_2},$$

$$\kappa_3 = \frac{1}{\alpha_1}\frac{\partial \emptyset_2}{\partial \xi_1} + \frac{1}{\alpha_2}\frac{\partial \emptyset_1}{\partial \xi_2} + \frac{1}{2}\left(\frac{1}{R_2} - \frac{1}{R_1}\right)\left(\frac{1}{\alpha_1}\frac{\partial v_0}{\partial \xi_1} - \frac{1}{\alpha_2}\frac{\partial u_0}{\partial \xi_2}\right) \quad (3)$$

olarak tanımlanır.
Tabakalı kompozit kalın kabuklar için *k*-nıncı tabakanın gerilme-şekil değiştirme ilişkisi aşağıdaki gibidir.

 Copyright © International Science and Technology Conference (ISTEC)

$$\begin{Bmatrix}\sigma_{11}\\ \sigma_{22}\\ \tau_{12}\\ \tau_{23}\\ \tau_{13}\end{Bmatrix}^{(k)} = \begin{bmatrix}\overline{Q}_{11} & \overline{Q}_{12} & \overline{Q}_{16} & 0 & 0\\ \overline{Q}_{12} & \overline{Q}_{22} & \overline{Q}_{26} & 0 & 0\\ \overline{Q}_{16} & \overline{Q}_{26} & \overline{Q}_{66} & 0 & 0\\ 0 & 0 & 0 & \overline{Q}_{44} & \overline{Q}_{45}\\ 0 & 0 & 0 & \overline{Q}_{45} & \overline{Q}_{55}\end{bmatrix}^{(k)} \begin{Bmatrix}\varepsilon_{11}\\ \varepsilon_{22}\\ \gamma_{12}\\ \gamma_{23}\\ \gamma_{13}\end{Bmatrix} \quad (4)$$

BKDT için tabakalı kabukların normal kuvvetler, momentler ile şekil değiştirme arasındaki ilişkisi aşağıdaki gibi yazılabilir.

$$\begin{Bmatrix}N_{11}\\ N_{22}\\ N_{12}\\ M_{11}\\ M_{22}\\ M_{12}\end{Bmatrix} = \begin{bmatrix}[A] & [B]\\ [B] & [D]\end{bmatrix} \begin{Bmatrix}\varepsilon_1{}^0\\ \varepsilon_2{}^0\\ \gamma_{12}{}^0\\ \kappa_1\\ \kappa_2\\ \kappa_3\end{Bmatrix} \quad (5)$$

burada

$$(A_{ij}, B_{ij}, D_{ij}) = \sum_{k=1}^{N}\int_{\zeta_k}^{\zeta_{k+1}} \bar{Q}_{ij}^{(k)}(1, \zeta, \zeta^2)d\zeta \quad (i, j = 1,2,6) \quad (6)$$

olarak yazılır. Burada ζ_k ve ζ_{k+1} k.*ncı* tabakanın sırasıyla üst ve alt tabakanın koordinatlarıdır.
Kesme kuvvetleri ise.

$$\begin{Bmatrix}Q_2\\ Q_1\end{Bmatrix} = K_s[A_s]\{\gamma\}$$

şeklinde elde edilir. Burada K_s kayma şekil değiştirme faktörüdür. Bu çalışmada, K_s 5/6 olarak dikkate alınmıştır. (7) denklemindeki $[A_s]$ aşağıdaki şekilde elde edilir.

$$(A_{s_{ij}}) = \sum_{k=1}^{N}\int_{\zeta_k}^{\zeta_{k+1}} \bar{Q}_{ij}^{(k)}d\zeta \quad (i, j = 4,5) \quad (8)$$

Dinamik Analiz

Kenarlarından basit mesnetlenmiş tabakalı kabuk için BKDT'ye göre SS-1 sınır şartları aşağıda verilmiştir.

$$\begin{array}{llll} u_1(x_1,0,t)=0, & u_1(x_1,b,t)=0, & u_2(0,x_2,t)=0, & u_2(a,x_2,t)=0,\\ N_1(0,x_2,t)=0, & N_1(a,x_2,t)=0, & N_2(x_1,0,t)=0, & N_2(x_1,b,t)=0,\\ \phi_1(x_1,0,t)=0, & \phi_1(x_1,b,t)=0, & \phi_2(0,x_2,t)=0, & \phi_2(a,x_2,t)=0,\\ u_3(x_1,0,t)=0, & u_3(x_1,b,t)=0, & u_3(0,x_2,t)=0, & u_3(a,x_2,t)=0,\\ M_1(0,x_2,t)=0, & M_1(a,x_2,t)=0, & M_2(x_1,0,t)=0, & M_2(x_1,b,t)=0, \end{array} \quad (9)$$

Tabakalı kompozit kabuğa ait deplasmanlar (9) denkleminde verilen sınır şartlarını sağlayacak şekilde çift Forurier serisi yardımıyla aşağıdaki şekilde ifade edilmektedir.

$$\begin{Bmatrix}u_0(x_1,x_2,t)\\ v_0(x_1,x_2,t)\\ w_0(x_1,x_2,t)\\ \emptyset_1(x_1,x_2,t)\\ \emptyset_2(x_1,x_2,t)\end{Bmatrix} = \sum_{n=1}^{\infty}\sum_{m=1}^{\infty} \begin{Bmatrix}U_{mn}(t)\cos\alpha x_1 & \sin\beta x_2\\ V_{mn}(t)\sin\alpha x_1 & \cos\beta x_2\\ W_{mn}(t)\sin\alpha x_1 & \sin\beta x_2\\ X_{mn}(t)\cos\alpha x_1 & \sin\beta x_2\\ Y_{mn}(t)\sin\alpha x_1 & \cos\beta x_2\end{Bmatrix} \quad (10)$$

burada $\alpha = m\pi/a$, $\beta = n\pi/b$ olarak verilmektedir.
Kabuk üzerine etki eden yayılı yük, q, çift Fourier serisi yardımıyla aşağıdaki şekilde ifade edilebilir

 Copyright © International Science and Technology Conference (ISTEC)

$$q(x_1, x_2, t) = \sum_{n=1}^{\infty} \sum_{m=1}^{\infty} Q_{mn}(t) \sin \alpha x_1 \quad \sin \beta x_2 \tag{11}$$

burada Q_{mn} aşağıdaki şekilde elde edilir

$$Q_{mn}(t) = \frac{4}{ab} \int_0^a \int_0^b q(x_1, x_2, t) \sin \alpha x_1 \quad \sin \beta y \, dx_1 dx_2 \tag{12}$$

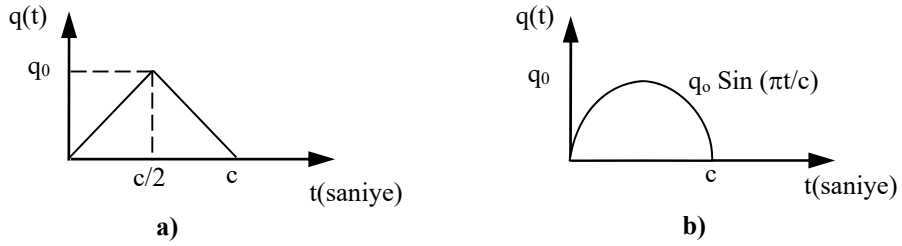
Dik açılı olarak tabakalanmış kabukların Navier çözümü aşağıdaki denklem takımı ile elde edilir

$$[M_{mn}]_{5\times5}\{\ddot{\Delta}_{mn}\}_{5\times1} + [K_{mn}]_{5\times5}\{\Delta_{mn}\}_{5\times1} = \{F_{mn}\}_{5\times1} \tag{13}$$

burada $(\Delta_{mn}) = (U_{mn}, V_{mn}, W_{mn}, X_{mn}, Y_{mn})$ deplasman vektörüdür.
Zaman bağlı olan (13) denklemine Laplace dönüşümü uygulanırsa Laplace uzayında aşağıdaki cebrik denklem takımı elde edilir.

$$[[K] + z^2[M]]\{\bar{\Delta}\} = \{\bar{F}\} + \{\bar{F}_0\} \tag{14}$$

burada, $\{\bar{\Delta}\}$ dönüşmüş deplasman vektörü, $\{\bar{F}\}$ dönüşmüş uzaydaki yük vektörü, $\{\bar{F}_0\}$ başlangıç koşulları nedeniyle yük vektörüne gelen katkı olup $\{\bar{F}_0\}$ aşağıda verilmiştir.,

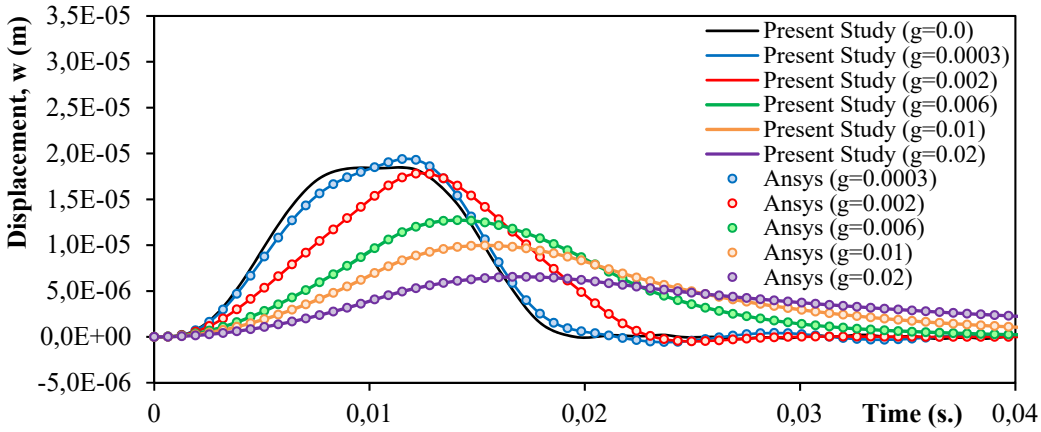


$$\{\bar{F}_0\} = z[M]\ \{\Delta(0)\} + [M]\{\dot{\Delta}(0)\} \tag{15}$$

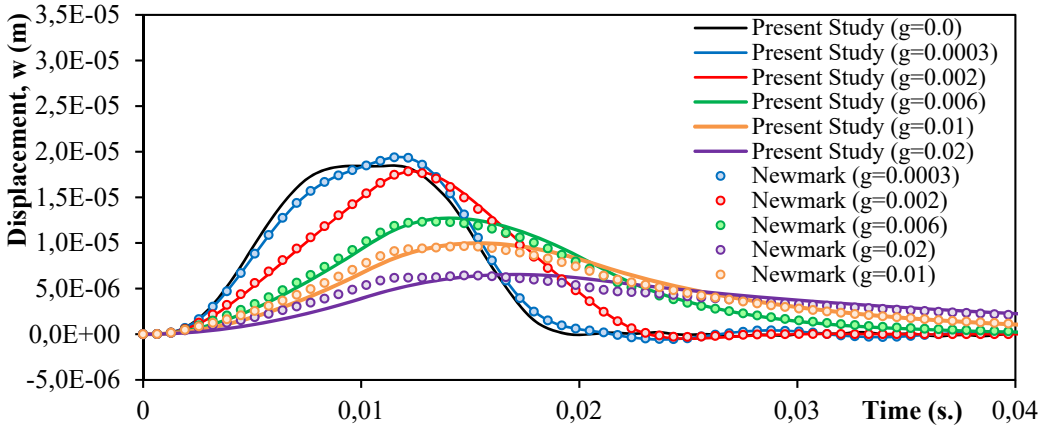
burada, $\{\Delta(0)\}$ ve $\{\dot{\Delta}(0)\}$ sırasıyla başlangıç deplasman ve hız vektörleri olup bu çalışmada sıfır alınmıştır.
Kelvin tipi sönüm modeli için viskoelastik çözüm, elastik-viskoelastik analojisi yardımıyla, Laplace dönüşüm uzayında elastik sabitlerin kompleks karşıtları ile yer değiştirmesinden elde edilmektedir (Boley ve Weiner 1960)

$$E_v = E(1 + g\ z) \quad , \quad G_v = G(1 + g\ z) \tag{16}$$

Sayısal Uygulamalar



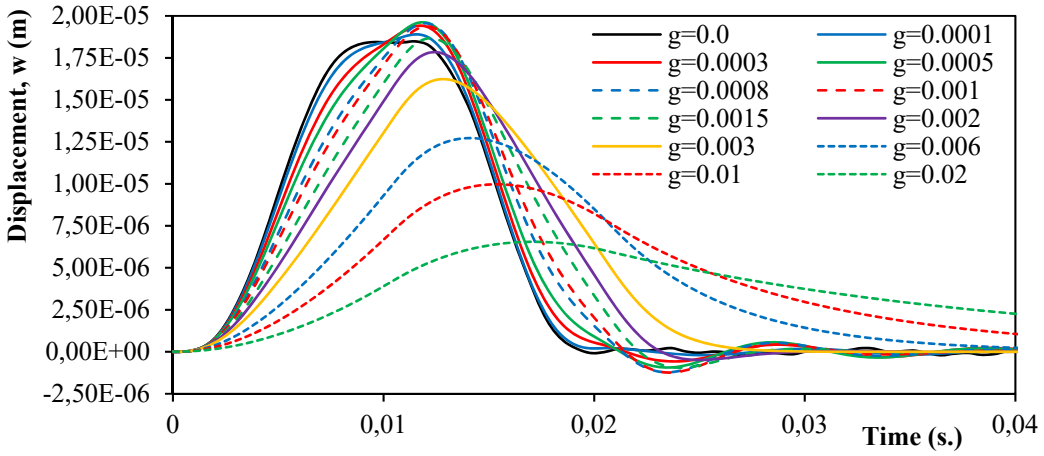
Bu çalışmada önerilen yöntem kullanılarak elde edilen sayısal değerler için basit mesnetlenmiş (0/90) şeklinde tabakalanmış kompozit kabuk (a/b=1, a/h=10, R/a=10) için gösterilecektir. Bu çalışmada önerilen yöntem ile elde edilen sayısal değerler Newmark metodu ile elde edilen değereler ve ANSYS yazılımı ile elde edilen değerler ile karşılaştırılmalı olarak gösterilmiştir. Sayısal örneklerde kabuk geometrisi ve malzeme özellikleri olarak aşağıdaki değerler kullanılmıştır.
a=b=1 m., h=0.1 m., R_1=R_2=R=10 m. (a/h=10, a/b=1, R/a=10).
E_1=25x10^9 N/m^2, E_2=1x10^9 N/m^2, G_{12}=G_{13}=0.5x10^9 N/m^2, G_{23}=0.2x10^9 N/m^2, ν=0.25, ρ=2000 kg/m^3.
Bu çalışmada iki farklı ani dinamik yük dikkate alınmıştır (Şekil 2). Ani dinamik yükler düzgün yayılı olup q_0 = 1000 N/m^2 olarak c ise 0.02048 saniye olarakdikkate alınmıştır.



Şekil 2. Dinamik Yükler **a)** Üçgen Ani Yük, **b)** Yarım Sinüs Ani Yük

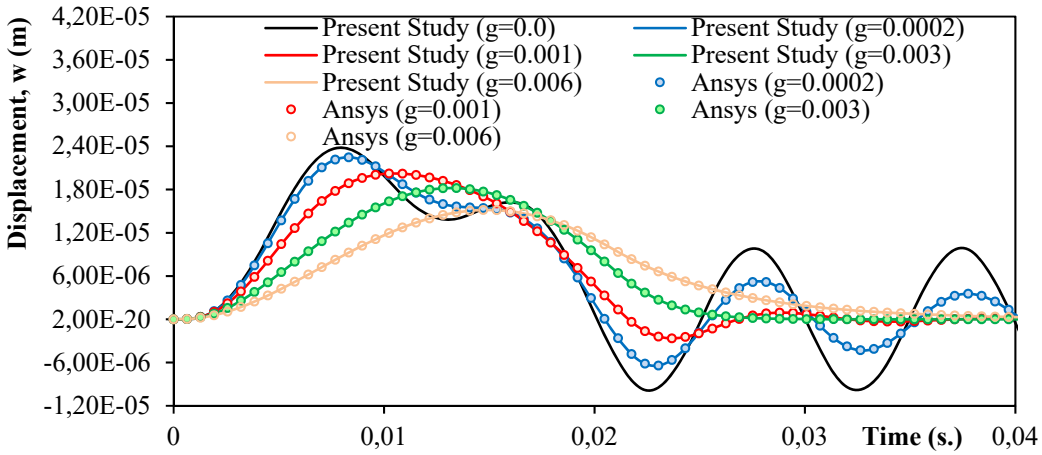
Üçgen ani yük dikkate alındığında elde edilen deplasman değerleri Şekil 3 ve 4'te verilmiştir. Önerilen yöntem ile farklı sönüm oranları (g=0.0003, 0.002, 0.006, 0.01, 0.02) için elde edilen değerlerin Newmark değerleri ile karşılaştırması Şekil 3'te ANSYS değerleri ile karşılaştırılması ise Şekil 4'te verilmiştir.

 Copyright © International Science and Technology Conference (ISTEC)



Şekil 3. Üçgen ani yük için kompozit kabuk merkezinde önerilen yöntem ile elde edilen deplasmanların ANSYS değerleri ile karşılaştırılması.

Şekil 4. Üçgen ani yük için kompozit kabuk merkezinde önerilen yöntem ile elde edilen deplasmanların Newmark değerleri ile karşılaştırılması.



Şekil 3 incelendiğinde farklı sönüm oranları (g=0.0003, 0.002, 0.006, 0.01, 0.02) için önerilen yöntem ile elde edilen değerlerin ANSYS değerleri ile çakıştığı görülmektedir. Şekil 4 incelendiğinde ise farklı sönüm oranları için önerilen yöntem ile elde edilen değerlerin küçük sönüm oranları için çakıştığı fakat sönüm oranı büyüdükçe değerlerin birbirinden uzaklaştığı görülmektedir. Şekil 3 ve 4'ten anlaşıldığı üzere küçük sönüm oranları için pik değerleri elastik duruma göre daha büyüyerek sağa doğru kaymakta büyük sönüm değerleri içinse pik değeri elastik duruma göre küçülerek sağa doğru kaymaktadır. Bu durumun daha iyi incelenmesi için daha çok sayıda sönüm oranı dikkate alınarak çözümler elde edilmiş ve Şekil 5'te gösterilmiştir. Şekil 5'te verilen değerler incelendiğinde küçük sönüm oranları için pik değerlerin elastik değerlere göre artış gösterdiği ve sağa doğru kaydığı büyük sönüm oranları için pik değerlerin elastik değerlere göre azaldığı ve sağa doğru kaydığı görülmektedir.

Şekil 5. Üçgen ani yük için kompozit kabuk merkezinde farklı sönüm oranları için elde edilen deplasmanların karşılaştırılması.

Yarın Sinüs ani yük dikkate alındığında elde edilen deplasman değerlerinin zamanla değişimleri Şekil 6 ve 7'de verilmiştir. Önerilen yöntem ile farklı sönüm oranları (g=0.0002, 0.001, 0.003, 0.006) için elde edilen değerlerin Newmark değerleri ile karşılaştırması Şekil 6'da ANSYS değerleri ile karşılaştırılması ise Şekil 7'de verilmiştir.

Şekil 6. Yarım Sinüs ani yük için kompozit kabuk merkezinde önerilen yöntem ile elde edilen deplasmanların ANSYS değerleri ile karşılaştırılması.

Şekil 7. Yarım Sinüs ani yük için kompozit kabuk merkezinde önerilen yöntem ile elde edilen deplasmanların Newmark değerleri ile karşılaştırılması.

Şekil 6 ve Şekil 7 incelendiğinde farklı sönüm oranları (g=0.0002, 0.001, 0.003, 0.006) için önerilen yöntem ile elde edilen değerlerin ANSYS ve Newmark değerleri ile çakıştığı görülmektedir. Şekil 6 ve 7'ten anlaşıldığı üzere sönüm ile pik değerler sağa doğru kaymakta ve değerler zamanla olmektedir.

Sonuçlar

Önerilen yöntemin temelinde şu sonuçlar çıkarılabilir.

Üçgen ani yük durumunda küçük sönüm oranları için pik değerlerin elastik değerlere göre artış gösterdiği ve sağa doğru kaydığı büyük sönüm oranları için pik değerlerin elastik değerlere göre azaldığı ve sağa doğru kaydığı görülmektedir. Önerilen yöntem ile elde edilen değerlerin ANSYS değerleri ile çakıştığı fakat Newmark değerlerinin yakınsak olduğu görülmektedir.

Yarım Sinüs Ani yük durumunda önerilen yöntem ile elde edilen değerlerin ANSYS ve Newmark değerleri ile çakıştığı görülmektedir.

Bu çalışma ile, navier yaklaşımı ile kalın kabuk için elde edilen hareket denklemlerine Laplace dönüşümü uygulanması ve ardından Durbin'in modifiye edilmiş ters dönüşüm yöntemi ile zaman uzayında sonuçlar elde edilmesi ile oldukça etkin ve doğru sonuçlar bulunabildiği kanıtlanmıştır.

ÜLKEMİZDE ÜNİVERSİTE SANAYİ İŞBİRLİĞİNİN ÖNEMİ

İbrahim Aydın
ibrahim.aydin@cbu.edu.tr

Hasan Zeki Diril
Zeki.diril@cbu.edu.tr

Bu çalışmada Üniversite-Sanayi işbirliği geliştirilerek hem sanayide hem de eğitimde verimliliğin arttırılması, üniversitelerde, sanayinin ihtiyaç duyduğu nitelikte ara eleman yetiştirilmesi, üniversite hocalarının ve öğrencilerin sanayi ile irtibatının sağlanması, mezun öğrencilerin iş bulmalarında kolaylık sağlanması ve sanayinin AR-GE çalışmalarının geliştirilmesinde üniversite tarafından destek sağlanması amaçlanmaktadır.

Çalışmada Manisa bölgesindeki 80 adet firmadaki üst düzey yetkililerle mesleki eğitimden beklentileri ve çözüm önerileri konuşulmuş, yetkili kişilerin üniversite akademik personeli ile ilgili alanlarda görüş alışverişi yapmaları sağlanmıştır. Ayrıca hazırlamış olduğumuz anket formları firma çalışanları ve personeline doldurularak mevcut durumlar analiz edilmiştir.

Çalışma sonucunda işletmelerin talepleri doğrultusunda eğitim ve öğretim planlarının güncellenmesi, teknolojiye adaptasyonu ve işletmelerin eğitim ortamına daha aktif olarak katılmalarının sağlanmasının yararlı olacağı sonucuna varılmıştır. Bu bağlamda belirlenen sorunların tespiti ve çözüm önerileri doğrultusunda sanayi ve üniversite adaptasyonun şekillenmesi, nitelikli işgücü ve bunun getireceği verimli bir ekonominin sağlanmasının ülkemiz için oldukça fayda sağlayacağı kanaatına varılmıştır.

Istanbul University Faculty of Economics Department of Management

Abstract: The main purpose of this study is to analyze the consequences of terror related risks on destination image perceptions of tourists who are vacationing at a destination under terrorism risks. The survey was conducted with tourists, who were visiting Istanbul during a risky period. Before surveying with tourists, several terrorism attacks had took place in Istanbul. This study investigates the impact of terrorism activities on tourists' destination image perceptions of Istanbul as a travel destination, and also its impact on destination satisfaction, which in turn influence tourists revisit intentions and word of mouth behavior. The survey was conducted with 156 respondents at the Sultan Ahmet Square. Destination image of Istanbul is assessed with the destination atmosphere, travel environment, attraction & events, shopping, accommodation, and dining dimensions. Although tourists are vacationing at a destination under terrorism risk, results of this study indicate that the destination image of Istanbul is positive in the mind of tourists. Visiting Istanbul is quite valuable in terms of emotional, functional and overall values. Overall, respondents are highly satisfied with their decision to travel to Istanbul and strongly agree that it is right choice to visiting Istanbul. Majority of the respondents indicated that they are satisfied or extremely satisfied with their visit to Istanbul. Lastly, the findings showed that tourists, who visited Istanbul under terrorism risks, are highly satisfied with their travel experience and expressed that they will recommend Istanbul to others, say positive things about Istanbul, and they stated that they are willing to revisit Istanbul.

Keywords: Destination Image, Perceived Value, Destination Loyalty, Terrorism

Introduction

There has been substantial growth in the tourism industry and it has become one of the most rapid growing economic sectors in the world for last decades. According to World Tourism Organization 2015 Annual Report international tourist arrivals grew by 4.4% in 2015 with an additional 49 million more than in 2014, to reach a total of 1,184 million in 2015 (World Tourism Organization, 2015). Kim, Holland, and Han (2013) state that since tourism has been playing important role for regional development, there are strong competition among destinations to attract more tourists and make them become loyal to destination. Therefore, tourism professionals and destination marketers should re-consider their tourism marketing strategies to increase customer loyalty and build long-term relationships with their customers.

It is commonly recognized that destination image, that is "the sum of beliefs, ideas, and impressions that a person has of a destination", is a key factor in destination marketing (Taşcı & Gertner, 2007). Liu (2014) argues that in order to survive at the global competitive marketplace, it is crucial to create a unique destination image that differentiates a destination from the other destinations to get a positive positioning in the minds of customers. Baloglu and McCleary (1999) state that brand image is mainly shaped by two major forces: stimulus factors (e.g. information sources and previous experiences), and personal factors (e.g. psychological and social factors).

 Copyright © International Science and Technology Conference (ISTEC)

It is argued that favorable destination image leads to higher perceived value. Perceived value is one of the most important key determinant of customer satisfaction and loyalty (Kim, Holland, & Han, 2013) as well as repurchase intentions (Demirgüneş, 2015). Favorable destination image positively influence tourists' satisfaction (Prayag et al., 2015). In other words, it is stated that perceived value has positive effect on future behavioral intentions (e.g. intention to revisit) (Kim, Holland, & Han, 2013). Demirgüneş (2015) argued that customer's perceived value can be determined by money, quality, benefit, and social psychology; while Peng and Liang (2013) identified perceived values as functional, emotional and price values. Lee, Yoon, and Lee (2007) argued that perceived value is identified in the form of emotional, functional and overall value, which can be used to measure tourists' perceived value for a destination.

Buyong and Rajani (2011) state that destination loyalty can be expressed as: behavioral loyalty, attitudinal loyalty, and composite loyalty. While behavioral loyalty can be defined as repeat visits, attitudinal loyalty refers to tourists' psychological expression such as intention to revisit a destination or recommend it to others, and finally composite loyalty is an integration of both attitude and behavior loyalty (Buyong & Rajani, 2011). Kim, Holland, and Han (2013) argue that repeat visits have often been regarded as desirable behaviors in terms of destination loyalty. In the literature it is argued that satisfied the customers are more likely to revisit the same destination, and are more willing to share their positive travel experience with their friends and relatives (Yoon & Uysal, 2005; Chia & Qub, 2008).

The main purpose of this study is to analyze the consequences of terror related risks on destination image perceptions of tourists who are vacationing at a destination under terrorism risks. The survey was conducted with tourists, who were visiting Istanbul during a risky period. Before surveying with tourists, several terrorism attacks had took place in Istanbul. This study investigates the impact of terrorism activities on tourists' destination image perceptions of Istanbul as a travel destination, and also its impact on destination satisfaction, which in turn influence tourists revisit intentions and word of mouth behavior

Research Methodology

The survey was conducted with tourists at the Sultan Ahmet Square. The data for this research were collected by using a self-administrated questionnaire. Destination image scale of this study includes 33 items that is adapted from several studies (Baloglu & McCleary, 1999; Qu, Kim, & Im, 2011; Kim, Holland, & Han, 2013). Perceived value scale embraces 8 items and it is adapted from the study of Kim, Holland, and Han (2013). Lastly, 3- item scale which is also adapted from the study of Kim, Holland, and Han (2013) is used to assess tourist destination loyalty. Destination image, perceived value, and destination loyalty scales are measured with seven-point Likert-type scale (1= "strongly disagree" to 7= "strongly agree"). To measure overall satisfaction, a single-item scale was used and respondents were asked to rate satisfaction level with the visiting experience of Istanbul on a 7-point Likert scale, ranging from 1= "extremely unsatisfied" to 7= "extremely satisfied".

Cronbach's Alpha value for the destination image, perceived value, and destination loyalty scale are 0.95, 0.92, and 0.84, respectively. Since Cronbach's Alpha of 0.70 or above is considered acceptable as a good indication of reliability, it is clear that scales of this study is reliable.

Table 1 Reliability of the scales

	Cronbach's Alpha	**Mean**	**N of Items**
Destination Image (DI)	.945	5.41	33
Perceived Value (PV)	.916	5.85	8
Destination Loyalty (DL)	.837	6.07	3

Findings of the study

The survey was conducted with tourists at the Sultan Ahmet Square and the survey was conducted throughout May 2016. A total of 156 usable responses was gathered and demographic characteristics of the respondents are presented as frequencies and percentages in Table 2. The distribution of gender groups are quite fairly distributed. Among the 156 respondents, 84 were female; while 72 were male. Approximately 60% of the respondents were between the ages of 26-40, 24.4% of them between the ages of 18-24, 11.5% of them between the ages of 41-65, and finally 4.5% of them were above the age of 65. Most of the respondents were the first time visitors (69.9%), 22.8% of them visited Istanbul 2-4 times, and 8.3% of them visited Istanbul 5 and more times. Regarding their country of origin, 12.9% of them were from United Kingdom, while 12.2% of them were from Germany and 7% of them from United States. The majority of the respondents (49%) had come from European countries.

Approximately 65% of tourists visited Istanbul for holiday purpose; while 20% of them had come Istanbul in order to visit their friends or relatives, and 6% of them visited Istanbul for business purposes. While surveying with tourists, 31.4% of tourists had been in Istanbul since 3 or 4 days, and 32.7% of them had been in Istanbul since 5 or 6 days. Since approximately 90% of tourists stayed in Istanbul at least 3 days, it is clear that respondents spent enough time to experience about the city and gain some ideas about Istanbul.

Table 2 Demographic profile of tourists

		N	%			N	%
Gender	Male	72	46.2		1-2 days	16	10.3
	Female	84	53.8		3-4 days	49	31.4
Age	18-25	38	24.4	**Duration of Stay**	5-6 days	51	32.7
	26-40	93	59.6		7-9 days	14	9.0
	41-65	18	11.5		10 and over days	26	16.6
	65 above	7	4.5				
Number of Visit	First time visitors	109	69.9	**Country of Origin**	United Kingdom	20	12.9
	2-4	34	21.8		Germany	19	12.2
	5 and more	13	8.3		U.S.	11	7.0

Table 3 indicates the descriptive analysis of the 33-item destination image scale. Since the mean value of the scale of destination image is (μ: 5.41); it can be said that the destination image of Istanbul are positive in the mind of tourists. Destination image of Istanbul is assessed with the destination atmosphere, travel environment, attraction & events, shopping, accommodation, and dining dimensions. Tourists have favorable perceptions about the destination atmosphere (μ: 5.78), attractions & events (μ: 5.69), and dining (μ: 5.49) in Istanbul. The mean value of these three dimensions are higher than the average mean value of the destination image scale (μ: 5.41). The perceptions of tourists with the other destination image dimensions of Istanbul are also mildly positive.

Tourists strongly agree that Istanbul has distinctive (μ: 6.47), interesting (μ: 6.43), and variety of (μ: 6.38) historic and cultural attractions. Tourists also considered Istanbul as an exciting (μ: 6.19), enjoyable (μ: 6.11), and pleasant destination (μ: 5.94). Moreover, tourists have favorable perceptions about local cuisine (μ: 5.84). Tourists also agree that Istanbul has a wide variety of shop facilities (μ: 5.55) and is a good place for shopping (μ: 5.43). With regard to accommodation, tourists agree that Istanbul has a wide variety of accommodation alternatives (μ: 5.56), accommodation facilities in Istanbul provide satisfactory customer service (μ: 5.33), and they are reasonable priced (μ: 5.32).

Shopping in Istanbul is convenient	156	1.00	7.00	1.31208	5.1987	
Prices are reasonable for shopping in Istanbul	156	2.00	7.00	1.29724	4.9679	
Shops in Istanbul provide satisfactory customer service	154	1.00	7.00	1.41733	4.9351	
Shops in Istanbul sell high quality of merchandise	154	2.00	7.00	1.31216	4.7143	
Accommodation					**5.33**	**.848**
Istanbul has a wide variety of accommodations	156	1.00	7.00	1.17633	5.5577	
Accommodation facilities in Istanbul provide satisfactory customer service	155	1.00	7.00	1.24895	5.3290	
Accommodation in Istanbul is reasonable priced	156	1.00	7.00	1.23386	5.3205	
Accommodations facilities in Istanbul are clean and of good quality	155	1.00	7.00	1.31148	5.1419	
Dining					**5.49**	**.771**
Istanbul has tempting local cuisine	156	3.00	7.00	1.10222	5.8462	
Istanbul has a wide variety of restaurants	156	1.00	7.00	1.26922	5.7692	
Restaurants in Istanbul provide satisfactory customer service	156	2.00	7.00	1.21017	5.5000	
Restaurants in Istanbul has standard hygiene and cleanliness	156	1.00	7.00	1.32187	5.1987	
Restaurants in Istanbul are reasonable priced	156	1.00	7.00	1.18780	5.1218	

Table 4 illustrates the descriptive analysis of the 8-item perceived value scale. Since the mean value of the scale of perceived value is (μ: 5.85); it can be said that perceived value of visiting Istanbul is considered as positive by tourists. Perceived value of visiting Istanbul is assessed with the functional (μ: 5.79), emotional (μ: 5.92), and overall value (μ: 5.85) dimensions. Although, perceived emotional value is higher than perceived functional value of visiting Istanbul, tourists strongly agree that visiting Istanbul is valuable and worth it (μ: 6.07) and good value for the given money (μ: 5.73). They also considered visiting Istanbul is reasonably priced (μ: 5.58). With regard to emotional value, tourists strongly agree that they got pleasant experiences during their visit Istanbul (μ: 6.05) and visiting Istanbul made them feel better (μ: 5.80). Overall, respondents are highly satisfied with their decision to travel to Istanbul and strongly agree that it is right choice to visiting Istanbul (μ: 6.36). Besides, they emphasize that Istanbul is a place where they want to travel always (μ: 5.95).

Table 4 Descriptive statistics for perceived value

	N	**Min**	**Max**	**Std. Deviation**	**Mean**	**Cronbach Alpha**
Functional Value					**5.79**	**.809**
Visiting Istanbul is valuable and worth it	155	1.00	7.00	1.12302	6.0710	
Compared to other tourism destination. Istanbul is a good value for the money	156	1.00	7.00	1.26668	5.7308	

 Copyright © International Science and Technology Conference (ISTEC)

Visiting Istanbul is reasonably priced	156	1.00	7.00	1.19655	5.5833	
Emotional Value					**5.92**	**.893**
I got pleasant experiences during my visit to Istanbul	155	1.00	7.00	1.06504	6.0452	
Visiting Istanbul made me feel better	156	1.00	7.00	1.18278	5.8013	
Overall Value					**5.85**	**.741**
The choice to visit Istanbul was the right decision	155	1.00	7.00	.98045	6.3677	
Istanbul is a place where I want to travel always	156	1.00	7.00	1.22523	5.9551	
After visiting Istanbul. my image of Istanbul was improved	156	1.00	7.00	1.51709	5.2436	

To measure overall satisfaction, a single-item scale was used and respondents were asked to rate their satisfaction level with their visiting experience of Istanbul on a 7-point Likert scale, ranging from 1= "extremely unsatisfied" to 7= "extremely satisfied". 25% of the tourists are extremely satisfied, 51% of them are satisfied, and 19% of them are somewhat satisfied with their visit to Istanbul. Therefore, it can be stated that respondents perceived a positive value and had good travel experiences.

Loyalty to Istanbul was measured with 3-item destination loyalty scale. The value for the scale of destination loyalty is high with a mean of μ: 6.07. As it can be seen from the Table 5, tourists are strongly willing to make positive word of mouth (μ: 6.28), encourage their friends to visit Istanbul (μ: 6.23), and revisit Istanbul (μ: 5.71). Therefore, the results shows that tourists, who visited Istanbul under terrorism risks, are highly satisfied with their travel experience and expressed that they will recommend Istanbul to others, say positive things about Istanbul and they stated that they are willing to revisit Istanbul.

Table 5 Descriptive statistics for destination loyalty

	N	**Min**	**Max**	**Mean**	**Std. Deviation**	**Cronbach Alpha**
Destination Loyalty				**6.07**		**.837**
I will say positive things about Istanbul to other people	155	1.00	7.00	6.2839	.99188	
I will encourage friends and relatives to visit Istanbul	156	1.00	7.00	6.2308	1.06466	
I will definitely revisit Istanbul	154	1.00	7.00	5.7143	1.3658	

Conclusion

Although several terrorism attacks had took place before and during the visit of tourists, it can be said that the destination image of Istanbul in the mind of tourists are positive. Tourists have highly favorable perceptions about the destination atmosphere as well as attractions & events of Istanbul. Tourists strongly agree that Istanbul has distinctive, interesting, and variety of historic and cultural attractions. They also considered Istanbul as an exciting, enjoyable, and pleasant destination. Moreover, tourists have favorable perceptions about local cuisine, as well as shopping and accommodation facilities. Overall, respondents are highly satisfied with their decision to travel to Istanbul and strongly agree that it is right decision to visiting Istanbul. They emphasized that visiting Istanbul is valuable and worth it. The majority of respondents' are highly satisfied with their overall travel experience, and they expressed that they will recommend their visits to others, say positive things about Istanbul, and they are willing to revisit Istanbul.

Özet: Çalışanlar bir yandan kendilerine ait sosyal yaşamlarını sürdürürken bir yandan da çalışma hayatındaki fizyolojik ve psikolojik gerilimlerle mücadele etmek durumdadır. Sanayileşme sürecinin doğal bir sonucu olarak ortaya çıkan ve işletmeler açısından vazgeçilmez olan vardiyalı çalışma düzeni ise bu mücadeleye farklı boyutlar kazandırmaktadır. Ayrıca teknolojik ve bilimsel gelişmelerin çalışma ortamlarında meydana getirdiği değişimler çalışanları özellikle zihinsel anlamda oldukça zorlamaktadır. Bu kapsamda gerek iş güvenliği ve işçi sağlığı açısından gerekse ergonomik açıdan çalışanların iş yüklerinin ölçülmesi ve belirli limitlerde sınırlandırılması önem kazanmaktadır. Bu çalışmanın amacı, farklı vardiya tiplerine göre algılanan zihinsel iş yüklerinin ölçülmesi ve karşılaştırılmasıdır. Çalışma kapsamında metal sektöründe faaliyet gösteren bir firmada çalışan 33 işçi üzerinde, sübjektif iş yükü ölçüm yöntemlerinden olan National Aeronautics and Space Administration's Task Load Index (NASA-TLX) yöntemi uygulanmıştır. Elde edilen sonuçlar SPSS paket programı kullanılarak analiz edilmiştir. Çalışanların vardiyalar arası algıladıkları iş yüklerinde anlamlı farklılıkların olduğu sonucu ortaya çıkmıştır. Bunun yanı sıra görev alanı, yaş ve tecrübe gibi faktörler kapsamında da iş yükü değerlendirmesi yapılmış ve çeşitli önerilerde bulunulmuştur.

Anahtar Kelimeler: İş yükü, vardiyalı çalışma, NASA-TLX

Giriş

Küreselleşen dünyada bilim ve teknoloji alanında gerçekleşen hızlı değişimler firmaların içerisinde bulunduğu çalışma ortamını rekabetçi kılmaktadır. Rekabet yoğun bir ortamda firmalar açısından ayakta kalabilmenin ana koşulu ise bu değişimlere ayak uydurmakla mümkündür. Bu değişimlerle iş hayatına yeni yöntem ve yaklaşımlar girmektedir. Söz konusu yöntem ve yaklaşımlar çalışanların yeteneklerini fiziksel ve zihinsel açıdan çeşitlendirmekte, hatta zorlamaktadır.

Evet, yeni yöntemler ve yaklaşımlardan işletmeler doğru bir şekilde yararlanmalıdır. Ancak ergonomik yaklaşımlardan asla taviz verilmemelidir. Çalışanların fiziksel ve zihinsel yeteneklerinin daha etkin ve verimli olarak kullanılması göz ardı edilmemelidir. Aksi durumda çalışanların özellik ve yeteneklerinin dikkate alınmadan geliştirilmiş her türlü donanım ve yazılım iş verimini azaltacak, iş güvenliği ve işçi sağlığı açısından çeşitli problemlere neden olacaktır.

Bir çalışma ortamında bireylerin performansını ve sağlığını etkileyen çeşitli olumsuz faktörler vardır (Ozkan ve ark., 2015).Bu kapsamda insan-makine etkileşiminin başladığından beri tartışılan bir konu olan iş yükü kavramı ön plana çıkmaktadır. İş yükü genel manada bir çalışanın performansına ve tepkilerine etki eden çeşitli baskılar olarak ifade edilebilir (Weiner,1982). Diğer bir tanımda iş yükü, bir işin yapılması esnasında harcanan işlem kapasitesinin derecesi olarak ifade edilmektedir (Young ve ark. 2008).

İş yükünün ölçülmesi ve belirli seviyeleri aşmasının engellenmesi çalışanların sağlığı, iş tatmini ve dolayısıyla iş verimi açısından oldukça önemlidir. Önceleri fiziksel iş yükünün ölçülmesine yoğunlaşılmasına karşın günümüzde otomasyon sistemlerinin artışına bağlı olarak artan makine kullanım oranı ile iş yükü ölçümü daha çok zihinsel kapsamda değerlendirilmektedir. Zira görevlerin çalışanlar tarafından yapılmasından ziyade denetim ve kontrol ağırlıklı bir düzene geçilmektedir. Zihinsel iş yükünün ölçülmesinin, sayısal olarak ifade edilmesinin fiziksel iş yüküne göre çok daha zor olduğunu da vurgulamak gerekir (Güreşçi ve Fığlalı, 2004).

Zihinsel iş yükü için literatürde genel geçer kabul görmüş tek bir tanım yoktur. Zihinsel iş yükü, bireyin görevlerini gerçekleştirmek için kullandığı zihinsel çaba miktarı olarak tanımlanabildiği gibi (Gao ve ark., 2011) kişilerdeki kullanılabilir kaynakların miktarı ile işin gerektirdiği arasındaki fark olarak ta tanımlanmaktadır (Güreşçi ve Fığlalı, 2004).

 Copyright © International Science and Technology Conference (ISTEC)

Vardiyalı çalışma tüm gün sürenin, aynı günün farklı zaman dilimlerinde farklı işçi gruplarının çalıştırılması şeklinde tanımlanabilir (Odabaşı, 1997). Vardiyalı çalışma düzeni bazı ekonomik, sosyal ve sosyo-politik sebepler gereğince firmalar için artık bir zorunluluktur. Ancak bu düzene göre alışılmış iş saatleri dışında çalışmak, çalışanları fizyolojik ve psikolojik açıdan etkilemektedir. Bu kapsamda etkinin boyutunun araştırılması ve çeşitli önlemlerin alınması önem kazanmaktadır. Fizyolojik etkilerin çeşitli donanım ve ekipmanlarla ölçülebilmesi mümkünken psikolojik etkilenmenin boyutu zihinsel iş yükü ölçümü ile mümkün olabilmektedir.

Zihinsel iş yükü doğrudan ölçülen veya mutlak bir değer atanabilen bir kavram değildir (Ozkan ve ark., 2015). Zihinsel iş yükü ölçümü üç sınıfta incelenebilir: performansa dayalı ölçümler, fizyolojik ölçümler ve öznel ölçümler (Vidulich ve Tsang,2012). Yaygın ve en sık kullanılan öznel ölçüm yöntemleri National Aeronautics and Space Administration-Task Load Index (NASA- Görev Yük Endeksi, NASA-TLX), Cooper-Harper Ölçeği ve Subjective Workload Assessment Technique (Öznel İş Yükü Değerlendirme Tekniği, SWAT)'dir (Kurata ve ark., 2015).Sübjektif yöntemler arasında da NASA-TLX'in kullanım oranı oldukça yüksektir (Zheng ve ark., 2011).

Bu çalışma çalışanların algıladıkları iş yüklerinin üzerine vardiyalı sistemde çalışmanın etkisini araştırmak üzere planlanmıştır. Çalışma kapsamında halen faaliyette olan bir firmadaki çalışanlardan elde edilen veriler ile NASA-TLX yöntemi kullanılarak çalışanların iş yükleri hesaplanmıştır. İlgili iş yükü hesaplamaları aynı çalışanların her bir ayrı vardiyada çalışmaları durumunda hesaplanarak vardiyalar arasında iş yükü algılama farklılığı olup olmadığı araştırılmıştır.

Literatür Araştırması

Bu bölümde çalışmada kullanılan metot ile literatürde yapılan çalışmalara bazı örnekler verilecektir.

Zheng vd. (2011) pilotların hissettikleri zihinsel iş yükünü henüz uçak tasarım aşamasında dikkate alarak en uygun tasarım parametrelerini bulmaya çalışmışlardır. Çalışmada NASA-TLX yöntemini kullanmışlardır.

Akyeampong vd. (2014) hidrolik ekskavatörlerin ergonomisini geliştirmek için bir İnsan-Makine Ara yüzü (HMI) tasarım parametreleri önermişlerdir. Çalışmada operatörlerin zihinsel iş yükü skorlarının hesaplanmasında NASA-TLX metodunu kullanmışlardır.

Şeker (2014) çalışmasında Ar-Ge projeleri değerlendirme faaliyetlerinin temel aşamalarında çalışan uzmanların zihinsel iş yüküne yaş, cinsiyet, medeni durum ve eğitim düzeyi gibi demografik faktörlerin etkisini NASA-TLX metodu ile değerlendirmiştir.

Darvishi ve Meimanatabadi (2015) İran'da faaliyet gösteren bir bankada banka personellerinin zihinsel iş yükünü değerlendirmişlerdir. Çalışma kapsamında NASA-TLX ve Nordic Genel Anketi yöntemleri 200 banka personeline uygulanmış ve çıkan sonuçlar değerlendirilmiştir.

Fallahi vd. (2016) bir şehir trafik kontrol merkezinde çalışan 16 adet operatörün trafik yoğunluğunu izleme sırasındaki zihinsel iş yükünü incelemişlerdir. Zihinsel iş yükü belirlemek için, çalışanlara ait fizyolojik sinyalleri (EKG, EMG) kaydetmişler ve NASA-TLX yöntemini uygulamışlardır. Sonuç olarak operatörlerin yüksek trafik yoğunluğu sırasında düşük trafik yoğunluğuna göre daha büyük bir zihinsel iş yükü altında oldukları ortaya çıkmıştır.

Literatürde bu çalışmalar dışında ayrıca hemşirelerin (Young ve ark. 2008), fiziksel terapistlerin (Liang ve ark. 2014), muhasebe çalışanlarının (Ozkan ve Ozdevecioglu, 2015) ve öğrencilerin (Kurata ve ark., 2015) zihinsel iş yüklerinin değerlendirilmesinde, uçak kokpit ekran ara yüzü tasarım parametrelerinin belirlenmesinde (Wei ve ark., 2014) NASA-TLX yönteminin kullanıldığı görülmektedir.

Nasa-Tlx Yöntemi

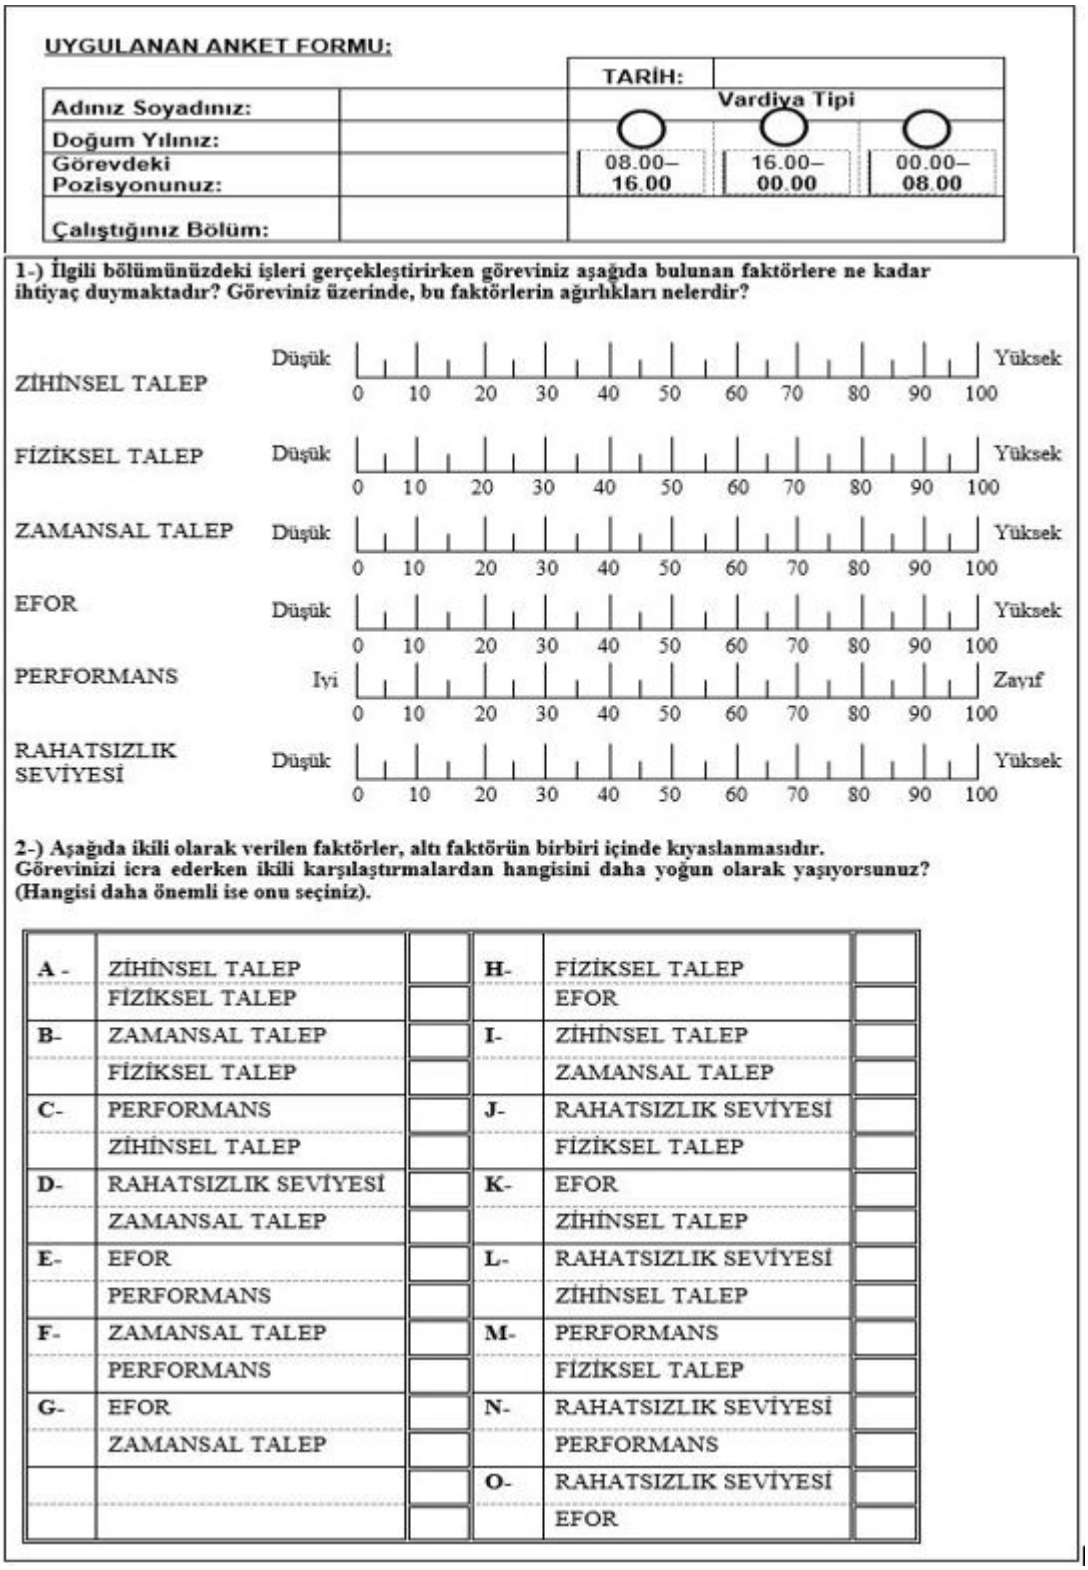
NASA-TLX genel iş yükünü 6 alt farklı ölçekle değerlendiren çok boyutlu oranlamalara sahip öznel bir yöntemdir Bu altı ölçek Zihinsel Talep, Fiziksel Talep, Zamansal Talep, Performans, Efor ve Rahatsızlık Seviyesidir. Bu ölçeklere ait tanımlayıcı bilgiler Tablo 1'deki gibidir.

 Copyright © International Science and Technology Conference (ISTEC)

Tablo 1:NASA-TLX ölçütleri ve tanımları

Ölçek	Değerlendirme Aralığı	Tanım
Zihinsel Talep	Düşük/Yüksek	Ne kadar zihinsel ve algılama aktivitesine ihtiyaç duyulduğu (Düşünme, karar verme, hesaplama, hatırlama, bakma, arama, araştırma vb.). Görevin icrası hatasız ve kesin mi olmalı yoksa hata kabul edilebilir mi? Görev kolay mı zor mu? Sade mi karmaşık mı?
Fiziksel Talep	Düşük/Yüksek	Ne kadar fiziksel aktiviteye ihtiyaç duyulduğu (ittirme, çekme, çevirme, kontrol etme, çalıştırma vb.)? Görev basit mi yoksa yorucu mu, yavaş mı hızlı mı, gelişi güzel yapılabiliyor mu özel bir özen mi istiyor? Sonucunda bedeni olarak yorgunluk oluyor mu? Oluyorsa ne kadar oluyor?
Zamansal Talep	Düşük/Yüksek	Belirli görevin bir aşamasını yerine getirirken ne kadarlık bir zaman baskısı, kısıdı üzerinizde hissetmektesiniz? Görevi yerine getirmek için atılan adımların hızlı ya da yavaş olması? Üzerinizde kısa bir süre içerisinde sıkıştırılmış işler yapma hissi uyanıyor mu?
Performans	İyi/Zayıf (yetersiz)	Verilen görevin hedeflerine ulaşmada size göre veya denetçilere göre ne derece başarılı olduğunuzu düşünüyorsunuz? Görevinizi yerine getirirken ne derece tatmin edilmiş oluyorsunuz? Sizce görevi yerine getirme oranınız nedir?
Efor	Düşük/Yüksek	Görevinizi yerine getirmek için ne kadar ağır çalışma gereklidir (Zihinsel ve fiziksel)? Görevin gerektirdiği performans seviyesini yerine getirmek ne kadar zor?
Rahatsızlık Seviyesi	Düşük/Yüksek	Görevinizi yerine getirirken kendinizi ne kadar güvensiz, gayri memnun, zarar görmüş, gerilmiş, sinirlenmiş, karışık, gevşek ya da karmaşık hissediyorsunuz?

NASA-TLX yöntemi oran, ağırlıklar ve birleştirmeden oluşan üç parçalı değerlendirme işlemlerine sahiptir. İlki "ORANLAMA" olarak adlandırılır ve bu aşamada Tablo 1'de gösterilen tüm ölçekler için 1 ile 100 aralığında olan gösterge çizelgesi üzerinden deneklerden kendi durumlarına göre ilgili boşlukları işaretlemeleri istenir. İkinci aşama ise "AĞIRLIKLAR" olarak adlandırılır ve bu aşamada Tablo 1'de gösterilen 6 ölçeğin 15 tane iki taraflı karşılaştırması yapılır. Bu aşamada çalışanlara görevlerini icra ederken hangi ölçütü daha yoğun olarak yaşadıkları sorulur ve iki seçenekten birinin seçilmesi istenir. Son aşama olan "BİRLEŞTİRME" olarak adlandırılır ve bu aşamada artık oluşan ağırlıklar ve oranların birleştirilmesi ile toplam ağırlıklı iş yükü skoru belirlenmiş olur. Bu yöntemin tüm süreçlerini içinde barındıran NASA-TLX adlı bir bilgisayar programı mevcuttur. Bu program ticari olmayan kullanımlar için ücretsiz olup NASA tarafından kullanıcıların hizmetine sunulmuştur.



Uygulama Çalışması

Çalışma kapsamında kullanılan veriler metal sektöründe faaliyet gösteren bir firmadaki çalışanlardan hazırlanan anketler yoluyla temin edilmiştir. Çalışmaya birer hafta aralıklarla farklı vardiyalarda çalışan 33 mavi yakalı personel katılmıştır (Her bir vardiyada 33/3=11 personel çalışmaktadır). Çalışanlara Şekil 1'de gösterilen anket uygulanmıştır.

Aynı denek için farklı vardiyalarda çalışmaları esnasında anket doldurmalarının birbirinden bağımsız olmasına özen gösterilmiştir. Doldurulan tüm anketlerden elde edilen veriler yukarıda programın kullanılması kısmında anlatıldığı gibi NASA-TLX programına girilerek her bir işçinin her bir vardiyada algıladığı iş yükü hesaplanmaya çalışılmıştır. Tablo 2'de, örnek olarak, bir işçiye ait iş yükü hesabını gösterir program çıktısı 3 vardiyadaki durumunu göstermektedir.

Tablo 2'de oran sütununda gösterilen değerler deneklerin anketin 1.kısmındaki ORANLAMA kısmına vermiş oldukları değerlerdir. Ağırlık sütununda belirtilen değerler ise anketin 2. bölümünde sorulan 15 adet ikili karşılaştırmalardan elde edilen ağırlıklardır. Toplam iş yükü de her bir faktöre karşılık gelen değer ile ağırlıkların çarpımlarının ayrı ayrı toplanması ile elde edilmiştir.

Tablo 2:NASA-TLX program çıktısı birleştirilmiş örneği

NASA Task Data	1.Vardiya		2.Vardiya		3.Vardiya	
Ölçek	**Oran**	**Ağırlık**	**Oran**	**Ağırlık**	**Oran**	**Ağırlık**
Zihinsel Talep	85	0.267	90	0.267	90	0.267
Fiziksel Talep	75	0.000	75	0.000	75	0.000
Zamansal Talep	85	0.267	85	0.267	85	0.267
Performans	25	0.200	25	0.200	20	0.200
Efor	85	0.067	85	0.067	80	0.067
Rahatsızlık Seviyesi	80	0.200	80	0.200	75	0.200
İşçi Numarası (8)						
Toplam İş yükü	**72.00**		**73.33**		**71.00**	

Tablo 3'de her bir deneğin her bir vardiya tipindeki iş yüküne ait tanımlayıcı istatistik bilgileri gösterilmektedir. Tabloya genel olarak bakıldığında vardiyalar arasında toplam iş yükleri arasında 1.vardiyadaki iş yükünün 2. vardiyadan, onunda 3. vardiyadakinden düşük çıktığı gözlenmiştir.

Tablo 3:Farklı vardiya tiplerinde deneklerin algıladıkları iş yüklerine ait genel bilgiler

Tanımlayıcı	**Toplam İş Yükü**				**Yaş**	**Tecrübe**
	1.Vardiya	**2.Vardiya**	**3.Vardiya**	**Ortalama**		**(Yıl)**
Ortalama	69.08±8.70	72.05±10.02	76.14±9.14	72.42±9.66	30.36±4.20	5.67±3.02

İş yükleri 1. vardiyada ortalama 69.08, 2. vardiyada ortalama 72.05 ve 3. vardiyada ortalama 76.14 olarak çıkmıştır. Çalışanların yaş ortalaması 30.36 iken, ortalama tecrübe 5.67 yıldır. Tablo 3'de gözlemlenen vardiyalar arasında algılanan iş yükü farklılığının istatistiki olarak anlamlı olup olmadığı incelenmiştir. Bu kapsamda 2'den fazla grubun varlığı nedeniyle Varyans Analizi (ANOVA) uygulanmıştır. Tüm analizler SPSS paket programı kullanılarak %95 güven aralığında yapılmıştır.

ANOVA (Analysis Of Variance) parametrik bir testtir. Bu testin sağlıklı sonuç vermesi için her grubun normal dağılıma sahip olması gerekmektedir. Yani ANOVA testine başlamadan önce her bir grup için normallik testi yapılmalıdır. Yapılan normallik testine ait hipotezler aşağıdaki gibi olup, analiz sonucu çıkan değerler Tablo 4'de gösterilmiştir.

H_0= Veriler %95 güvenle normal dağılmıştır.
H_1= Veriler %95 güvenle normal dağılmamıştır.

Tablo 4: Normallik testi SPSS çıktıları

Vardiyalar	**Kolmogorov-Smirnov**			**Shapiro-Wilk**		
	Statistic	**df**	**Sig.**	**Statistic**	**df**	**Sig.**
Vardiya1	.102	33	.200	.962	33	.290
Vardiya2	.091	33	.200	.975	33	.632
Vardiya3	.084	33	.200	.970	33	.493

Tablo 4'deki Sig. değerlerine göre Sig>0.05 olduğundan dolayı H_0 hipotezleri her bir grup için ayrı ayrı kabul edilebilir. Yani her bir vardiya türüne ait iş yükü verileri %95 güvenle normal dağılımlıdır. Bu durumda verilerimizin normal dağıldığı sonucuna vardığımıza göre ANOVA testi uygulayabiliriz. Yapılan ANOVA testine ait hipotezler aşağıdaki gibi olup, analiz sonucu çıkan değerler Tablo 5'de gösterilmiştir.

H_0= %95 güvenle, grupların ortalamaları arasında istatistiksel olarak anlamlı bir farklılık yoktur.
H_1= %95 güvenle, grupların ortalamaları arasında istatistiksel olarak anlamlı bir farklılık vardır.

 Copyright © International Science and Technology Conference (ISTEC)

Tablo 5: Varyans analizi SPSS çıktıları

ANOVA					
	Sum of Squares	**df**	**Mean Square**	**F**	**Sig.**
Between Groups	829.549	2	414.775	4.792	.010
Within Groups	8,309.188	96	86.554		
Total	9,138.737	98			

Tablo 5'deki Sig. değerine göre Sig<0.05 olduğundan dolayı H_1 hipotezi kabul edilmektedir. Bu sonuç göstermektedir ki; vardiyalar arası algılanan ortalama iş yükleri arasında %95 güven aralığında istatistiksel olarak anlamlı bir farklılık vardır.

Gruplar arası farkın olduğu durumlarda, farklılığın hangi gruptan kaynaklı olduğunu tespit eden istatistik post-hoc olarak bilinmektedir. Kullanılacak test, varyansın homojen olup olmamasına göre farklılık arz etmektedir. Varyansların homojenliği testine ait hipotezler aşağıdaki gibi olup, analiz sonucu çıkan değerler Tablo 6'da gösterilmiştir.

H_0= %95 güvenle, grup varyansları homojendir.
H_1= %95 güvenle, grup varyansları homojen değildir.

Tablo 6: Varyansların homojenliği testi SPSS çıktıları

Levene Statistic	**df1**	**df2**	**Sig.**
.411	2	96	.664

Tablo 6'daki Sig. değerine göre Sig>0.05 olduğundan dolayı H_0 hipotezi kabul edilmektedir. Bu sonuç grup varyanslarının %95 güvenle homojen olduğunu göstermektedir. O halde post hoc testlerinden varyansın homojen olması durumunda kullanılanlar ele alınabilir. Bu kapsamda Tukey testi tercih edilmiştir. Teste ait hipotezler aşağıda sunulmuş olup, SPSS çıktısı Tablo 7'de gösterilmiştir.

H_0= %95 güvenle, iki grup arasında istatistiksel olarak anlamlı bir farklılık yoktur.
H_1= %95 güvenle, iki grup arasında istatistiksel olarak anlamlı bir farklılık vardır.

Tablo 7:Tukey testi SPSS çıktıları

Test	**(I) Vardiya**	**(J) Vardiya**	**Mean Difference (I-J)**	**Std. Error**	**Sig.**
Tukey HSD	1	2	-2.970	2.290	0.401
		3	-7.061	2.290	*0.007**
	2	1	2.970	2.290	0.401
		3	-4.091	2.290	0.180
	3	1	7.061	2.290	*0.007**
		2	4.091	2.290	0.180

Tablo 7 incelendiğinde Sig. değerinin 0.05'ten küçük olduğu karşılaştırma 1. ile 3. vardiya arasında olmaktadır. Bu durumda ANOVA testinde ortaya çıkan gruplar arasındaki anlamlı farklılığın bu iki vardiyadan kaynaklandığını söyleyebiliriz.

Çalışanlara uygulanan anketlerde her bir çalışana ait yaş ve tecrübe bilgisi de toplanmıştır. İş yükü, yaş ve tecrübe arasında anlamlı bir ilişki olup olmadığını anlamak için Korelasyon analizi yapılmıştır. Analize ait hipotezler aşağıdaki gibi kurulmuş olup, SPSS çıktısı Tablo 8'de gösterilmiştir.

H_0= İki değişken arasında %99 güvenle istatistiksel olarak anlamlı bir ilişki yoktur.
H_1= İki değişken arasında %99 güvenle istatistiksel olarak anlamlı bir ilişki vardır.

 Copyright © International Science and Technology Conference (ISTEC)

Tablo 8:Korelasyon analizine ait SPSS çıktıları

		İş yükü	Yaş	Tecrübe
İş yükü	Pearson Correlation	1	.076	.012
	Sig. (2-tailed)		.457	.909
Yaş	Pearson Correlation	.076	1	.609*
	Sig. (2-tailed)	.457		.000
Tecrübe	Pearson Correlation	.012	.609*	1
	Sig. (2-tailed)	.909	.000	

Tablo 8'e göre iş yükü-yaş ve iş yükü-tecrübe arasındaki ilişkiyi gösteren korelasyon katsayıları sırası ile 0.076 ve 0.012 olduğu gözlemlenmiştir. Sig.>0.01 olması nedeniyle H_0 hipotezi kabul edilebilmektedir. Tablo 8'deki verilerle iş yükünün yaş ve tecrübe ile bir ilişkisinin olduğu istatistiki manada söylenemezken, yaş ile tecrübe arasında doğru yönlü ve orta seviyede bir korelasyon olduğu söylenebilir.

İlgili firmada 6 farklı görev alanı bulunmaktadır. Görev alanlarına ait farklı vardiyalarda ortalama iş yükleri Tablo 9'da gösterilmiştir.

Tablo 9. Görev alanları-vardiyalara göre ortalama iş yükleri

Görev Alanı	İşçi Sayısı	1.Vardiya	2.Vardiya	3.Vardiya
1	4	67.75	72.75	72.25
2	8	63.96	65.92	73.17
3	9	66.22	68.70	74.59
4	4	76.00	81.08	82.00
5	2	70.50	68.84	68.17
6	6	76.00	79.83	83.78

Tablo 9'daki verilerden hareketle deneklerin görevlerinin algıladıkları iş yüklerinde bir değişim yarattığı gözlenmektedir. 6 farklı görev alanının 4'ünde 1.vardiyadan 3. vardiyaya doğru 3 vardiyada giderek artan bir iş yükü, 1'inde giderek azalan bir iş yükü, 1'inde ise 1.vardiyada 2.ve 3.vardiyalara göre düşük, 2. vardiyada 3. vardiyaya göre yüksek bir iş yükü karşımıza çıkmaktadır. Bu da bize görev alanlarının çoğunda gündüz vardiyasından gece vardiyasına doğru 3 vardiyada iş yüklerinde giderek artış olduğunu göstermektedir.

Sonuç Ve Öneriler

Sanayileşme sürecine paralel olarak ekonomik, sosyal ve sosyo-politik sebeplerle çalışma koşullarında çeşitli değişimler gözlenmektedir. Bu değişimler çalışanların algıladıkları iş yüklerini doğrudan veya dolaylı olarak etkileyen faktörlerin ortaya çıkmasına neden olmaktadır. Vardiyalı çalışma düzeni de bu kapsamda ele alındığında bir yandan firmalar açısından elzem olması, bir yandan da ortaya çıkan gece çalışması ile güçleşen çalışma koşullarının oluşması açısından incelemeye değerdir.

Bu çalışmada, gün içindeki farklı vardiya tiplerinde çalışanların algıladıkları zihinsel iş yükleri ölçülmüş ve çeşitli karşılaştırmalarda bulunulmuştur. Uygulama çalışması metal sektöründe faaliyet gösteren bir firmada çalışan işçilere NASA-TLX yönteminin uygulanması şeklinde icra edilmiştir. Yöntemin ortaya çıkardığı sonuçlar SPSS paket programı kullanılarak çeşitli açılardan analiz edilmiştir.

Algılanan iş yüklerinin çalışma saatlerinin başlangıcı olarak düşünülebilen sabah saatlerinden gece saatlerine doğru gittikçe artış gösterdiği ortaya çıkmıştır. Ayrıca 1.vardiyadaki deneklerin %87.88'nin, 3.vardiyada çalışmaları durumunda algıladıkları iş yüklerinde artış olmuştur. Aynı şekilde 1.vardiyadaki deneklerin %75.76'sının iş yükleri, 2.vardiyada çalışmaları esnasındakine göre, 2.vardiyadaki deneklerin de %69.70'inin iş yükleri, 3.vardiyada çalışmalarındakine göre düşük çıkmıştır. Çalışanların vardiyalar arası algıladıkları iş yüklerinde anlamlı farklılıkların olduğu yapılan istatistiki testlerle ortaya konulmuştur. Bunların yanı sıra görev alanı, yaş ve tecrübe gibi faktörler kapsamında da iş yükü değerlendirmesi yapılmıştır.

Algılanan iş yükünün gece vardiyasında yüksek olması doğal olarak karşılanabilir. Fakat yüksek olan bu iş yükünün optimum bir noktaya çekilmesine yönelik önlemler alınmalıdır. Bunu gerçekleştirmek için; gece çalışma ortamı koşullarını gündüz çalışma ortamı koşullarına yakınlaştırmak için çeşitli ergonomik düzenlemeler yapılabilir (aydınlatma, sıcaklık, nem, havalandırma vb.). Gece zammının yeniden düzenlenmesi gibi

 Copyright © International Science and Technology Conference (ISTEC)

çalışanların motivasyonunu yükseltecek, iş doyumu ve tatminini artıracak çalışmalar yapılabilir. Gece vardiyasında dinlenme aralıkları yeniden belirlenebilir (Örneğin gündüz vardiyasına nazaran gece vardiyasında dinlenme zaman aralıklarına -maliyetlere aşırı ek külfetler yüklenmeden- ilave süreler eklenebilir). Çalışanların vardiya tiplerinin değişiminin haftalık olması onların uyku ritimlerinin bozulmasına neden olduğu tartışılmaz bir gerçektir. Bir hafta gece vardiyasında çalışmaları diğer hafta gündüz vardiyasında çalışmaları çalışanların uyku düzenlerini bozmaktadır. Bu sebeple vardiya değişimlerinin mümkün mertebe daha uzun bir sürece oturtulması bu sorunu bir nebze giderecektir (Örneğin 2 haftada bir değişim yapılması).

VARIATION OF DRIVING CONCENTRATION WITH DRIVER PERCEPTION THROUGH IN-CAR VIEW ROAD SCENE AS VISUAL STIMULANT

Sevcan AYTAÇ KORKMAZ

Fırat University, Department of Electronic Technology, Elazığ- TURKEY

sevcanaytackorkmaz@gmail.com

Abstract: To make driver generate a right decision as evaluating scenes perceiving by his brain, several factors (objects with different shapes, movements, and illuminations) that effects on driving concentration are existed. In this study, continuously changing scenes that are seen by driver eyes through windshield are statistically investigated. Here I have initially extracted a set of features. Then I have found optimal feature subset using Linear discriminant analysis. And then I get a measure to indicate driver concentration using Jensen Shannon Inequality and Hellinger distance. It has been validated the measures via relationships between them. Consequently, a model is proposed for seeking how the scene influencing on driver concentration as an effective factor for comfortable driving. It suggests concentration risk rate of *fr* is less than all the other road models. However, concentration risk rate of *rsfs* is more than all the other road models.

Keywords: Vehicle environment perception, Jensen Shannon Divergence and Hellinger measure, feature selection, Linear discriminant analysis

Introduction

Motivation

There are many factors that influence on driver performance such as car interior design, suspension, technical specifications, road conditions, traffic density, changing climatic conditions, behavior of other vehicles, vehicle accessories in the placement. A very important factor that influences on driving comfort is also the scene through the windshield. In many studies conducted so far, one or a few factors have been taken into account. However, scene through windshield plays an important role in driver psychology, which has not been intensively investigated. As a matter of this fact in many trading areas I prefer background decoration with different colors considering customer mood. For instance, blue colors are used in a fishery shop; dresses with white, green or blue colors are preferred in hospital; relaxing wall paintings are chosen in resorts, and different decorations are used to increase working efficiency. Hence, depending on landscape in our environment I can sense specified perceptions in our brain. Therefore, I can come up with different ideas via this hypothesis for vehicle drivers who face with many visual landscapes on steering wheel. Different lights, colors, patterns and geometries of the landscape have positive or negative effect on driving performance. Drivers can be aggressive when they look through specified landscapes although some of scenes can improve his driving performance.

Problem Statement

There are limited studies on driving comfort of psychological impact of landscapes. Therefore, constantly changing landscapes under different light conditions should be classified to estimate impacts of resulting classification on driver visual performance. In order to identify impact of the scenes through windshield on driver concentration, different types of landscapes should also be examined. These visual conditions can be exemplified as light of the sun on the road, watching vehicles in crowded traffic, and driving on dark road.

Proposed Approach

In this study, 40 pictures taken within a car have been examined, which are specified as 10 fr, 10 mrht, 10 drht, and 10 rsfs. The pictures taken through the windshield include some inner part of the car that is not related to whole

 Copyright © International Science and Technology Conference (ISTEC)

the scene. Therefore, this portion of the image is removed using a filter. Then Linear discriminant analysis algorithm is utilized to select some of effective features (C. Ding and H.C. Peng. 2003). I have developed pie charts to sketch minimum and maximum values of selected features. Analyzing the pie charts I have found that probabilistic distribution of features fits an exponential kernel. By substituting correspondent probabilistic values in to an object function, scenes are classified. Using the resulting values of this classification, the concentration of driver on road is probabilistically investigated. In this way, a state of the art model is proposed to estimate driver concentration using respective scenes that driver look through windshield.

Related Work

In one study using spatial vibrotactile clues of landscapes, visual attention of drivers was investigated to get potential emergency response rate (Shankar, Venkataraman, Fred Mannering, and Woodrow Barfield, 1995). In another paper, authors worked on risk factors for traffic accidents with single vehicle in Hong Kong (Treat, John R, 1979). In this article, the effect of district, human, vehicle, safety, and environmental factors are examined (Ho, Cristy, Hong Z. Tan, and Charles Spence, 2005). As to another study, risk of injury of child bruises was strongly associated with traffic volume risk (Yau, Kelvin KW, 2004).. Injuries at region with highest traffic volumes were 14 times greater than less intensity region (Teran-Santos, J., A, 1999). In some of articles, reasons that cause accidents by diverting the attention of the drivers were investigated (Violanti, John M., and James R. Marshall, 1996). In these works, some of the reasons such as Sleep Apnea, Alzheimer disease, and using a cell phone increase the rate of traffic accidents by distracting drivers (Dubinsky, Richard M., Anthony C. Stein, and Kelly Lyons, 2000). In another paper, nearly half of truck drivers expressed a negative view about technological precautions for driver drowsiness (Ansari, S, 2000).

Contribution

The factors effecting on traffic accidents have been investigated in most of the recent studies. However there are a few researches that are focusing effects of environmental landscape on driver. In this way, performing a risk analysis I are seeking how to affect windshield landscape on performance of driver. In this study Linear discriminant analysis based feature reduction method is exploited. Then Jensen Shannon and Hellinger Distance with exponential kernel are utilized to get object function. Additionally, classifications are probabilistically visualized on a pie chart.

Outline of the Paper

Theories and infrastructure information of the study are given in Section II. Experimental results are explained in Section III. Finally the results obtained are discussed in Section IV.

Materials and Methods

There are many visual factors that influence on driver concentration such as monotonous free road (fr), road scene under frontal full sunlight (rsfs), dark road with heavy traffic (drht), and monotonous road with heavy traffic (mrht). For example, sunlight bothering driver's eyes can impair driving comfort and safety. In this study, under stochastic driving conditions, driver concentration effect for changing landscape has been modeled, and introduced a state of the art approach. Hence, investigating pictures with 10 fr, 10 mrht, 10 drht, and 10 rsfs are taken inside a vehicle.

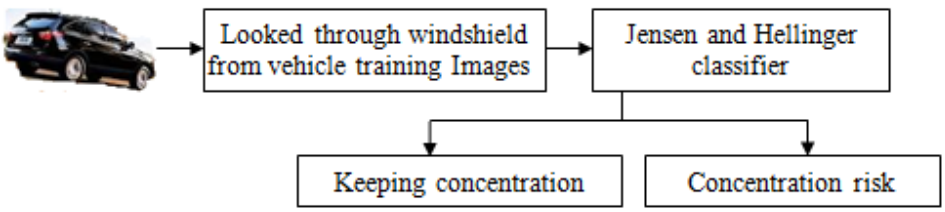

Figure 1. Proposed system

These 40 pictures are preferred as training pictures. The proposed system is shown in Figure 1.

 Copyright © International Science and Technology Conference (ISTEC)

Steps to be followed for the proposed system are

Step 1: 40 pictures are acquired through the windshield. In the pictures, some inner part of the car that is not related to whole the scene is removed using a filter.
Step 2: 10 of them are selected using Linear discriminant analysis.
Step 3: Pie charts are obtained considering minimum and maximum ranges of selected features for pictures with 10fr, 10mrht, 10drht, and 10rsfs as seen in Figure 2. These pie chart limit values are subjected to 3 stages for each feature separately as depicted in Figure 2.

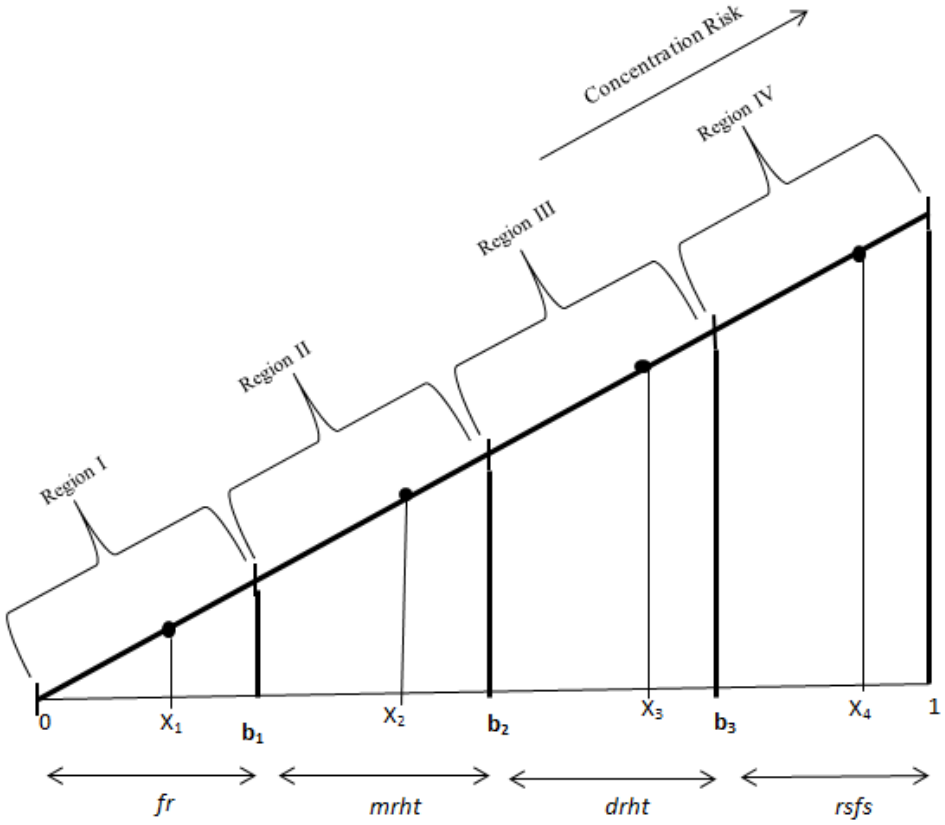

Figure 2. Dial limit values of features in the fr, mrht, drht and rsfs pictures

In Fig. 2, $ffr_i = \{ffr_1, ffr_2, \ldots., ffr_{10}\}$ is feature *i* values of image for *fr*. $frsfs_i = \{frsfs_1, frsfs_2., frsfs_{10}\}$ is feature i values of image for *rsfs*. $fmrht_i = \{fmrht_1, fmrht_2, \ldots., fmrht_{10}\}$ is feature *i* values of image for *mrht*. $fdrht_i = \{fdrht_1, fdrht_2, , fdrht_{10}\}$ is feature *i* values of image for *drht*. ffr_{min} is the smallest feature values of 10 *frv*. ffr_{max} is the biggest feature values of 10 *frv*. $frsfs_{max}$ is the biggest feature values of 10 *rsfs*. $fmrht_{max}$ is the biggest feature values of 10 *mrht*. $fdrht_{max}$ is the biggest feature values of 10 *drht*. Road (R_j) is 10 *fr*, 10 *mrht*, 10 *drht*, and 10 *rsfs*. In Fig. 2, region I is *fr*, Region II is *mrht*, Region III is *drht*, Region IV is *rsfs* . As Stage II is normalized to Stage III, ranges of features can be expressed as

$$x_i = (fR_j - a).1/frsfs_{max} \qquad b_i = (fR_{jmax} - a).1/frsfs_{max} \tag{1}$$

where b_i is the status of maximum feature value normalized to 1, which is obtained from 40 training pictures *fr*, *mrht*, *drht*, and *rsfs*; x_i refers to feature values obtained from pictures. As pie chart values are examined, it is seen that x_i and b_i values are in compliance with exponential distribution. Accordingly, exponential kernel is obtained by

$$P(c|a_{ij}) = 100b_i^{x_i} \tag{2}$$

where $P(c|a_{ij})$ is probabilistic value of the images, *fr*, *mrht*, *drht* and *rsfs*.
Step 4: In Stage II, minimum value of *fr* images is subtracted from each of limit rates so that initial value of these values shall be 0. They are normalized in Stage III by means of Eq. (1), and probabilistic ranges are estimated.
Step 5: After training image is normalized to 1, these values indicate exponential distribution rather linear one. This situation can be seen from b_i and x_i rates on the pie chart.

 Copyright © International Science and Technology Conference (ISTEC)

Step 6: Probabilistic values of *fr, mrht, drht* or *rsfs* are found by means of Eq. (2) for exponential kernel.
Step 7: These probabilistic values are used by Eqs. (2) and (3) for each feature associated with concentration rate.
Step 8: The values obtained by Step 7 are substituted by Eqs. (4) and (5) which are weights according to Jensen divergence and Hellinger measure. Therefore weight values for each feature can be found.
Step 9: These weight values are added and multiplied with the value of each feature separately by means of Eq. (6). As a result of this calculation, a probabilistic measure is obtained. The range of this measure is in between 0 and 1 since the rates obtained by Eq. (9) are estimated in a probabilistic way. Thus, closing to 1 means the increase of "Concentration Risk" as seen in Fig. 2, Stage III.

Jensen-Shannon Divergence and Hellinger

Jensen Divergence (Js) and Hellinger (He) measure are given in Eqs. (3) and (4) for 10 *fr*, 10 *mrht*, 10 *drht* and 10 *rsfs* images taken through windshield of vehicle. $P(c|a_{ij})$, in Eq. (2), can be calculated by Bayesian Network probabilistic approach. However, probabilistic distributions of features show conformity with the Exponential Kernel. Initial values of $P(c|a_{ij})$ are obtained from this kernel. $KL(C|a_{ij})$ is the average mutual information between the events c and a_{ij} with the expectation taken with respect to a posteriori probability distribution of (C Lee, Chang-Hwan, Fernando Gutierrez, and Dejing Dou 2011). I can define Kullback- Leibler divergence with naïve Bayesian as

$$KL(C|a_{ij}) = \sum_c P(c|a_{ij}) \log\left(\frac{P(c|a_{ij})}{P(c)}\right) \tag{3}$$

Progressing Eq. (3) I can find the new measures, which are Jensen Shannon and Hellinger. When Jensen divergence and Hellinger measure in Eq. (4), (5) are put in their place, average weights with respect to Js and He are estimated namely by Eq. (6). Weights calculation Js and He are shown in Eq. (7) as

$$Js(C|a_{ij}) = \sum_c P(c|a_{ij}) \log\left(\frac{P(c|a_{ij})}{P(c)}\right) + (1 - P(c|a_{ij})) \log\left(\frac{(1-P(c|a_{ij}))}{(1-P(c))}\right) \tag{4}$$

$$He(C|a_{ij}) = \sum_c \left(\sqrt{P(c|a_{ij})} - \sqrt{(P(c)}\ \right)^2 \tag{5}$$

$$W_{Jsavg,Heavg}(i) = \sum_{j/i} \frac{(a_{ij})}{N} Js(C|a_{ij}), He(C|a_{ij}) \tag{6}$$

$$W_{Js,He}(i) = \frac{W_{Jsavg,Heavg}(i)}{z \sum_{j/i} P(a_{ij}) \log P(a_{ij})} \tag{7}$$

where $W_{jsavg,Heavg}(i)$ is average weight calculation of the feature i for Js and He. $W_{Js,He}(i)$ is weight of the feature i for Js and He.

On the other hand, Topsøe (F. Topsøe 2000). mentioned about a close relationship between Hellinger distance and Jensen divergence. Therefore the relationship between Jensen-Shannon and Hellinger can be expressed by

$$\frac{1}{2} He\left(P(c|a_{ij}), (P(c)\right) \leq Js\left(P(c|a_{ij}), (P(c)\right) \leq 2 \ln(2)\, He\left(P(c|a_{ij}), (P(c)\right) \tag{8}$$

Decision Making

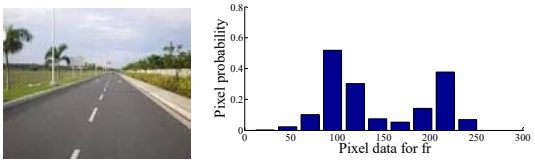
After calculating weights for each selected feature of images, these weights are put in their places as

$$d_{Jsavg,Heavg} = \frac{argmax\ P(c) \prod_{a_{ij} \in d} P(a_{ij}|c)^{W_{Js,He}(i)}}{Si} \tag{9}$$

where a_{ij} is the *j*-th value in *i*-th feature, N is the total number of records, c is the target feature, d_{Js} is test data for Jensen, d_{He} is test data for Hellinger, z is normalization constant, and *Si* is number of sample images for each scene type, that is, *Si*=10 for 10 *fr*, 10 *mrht*, 10 *drht*, and 10 *rsfs*.

$$Concentration\ \ Risk = \frac{d_{Jsavg} + d_{Heavg}}{2} \tag{10}$$

 Copyright © International Science and Technology Conference (ISTEC)



The concentration risk can be estimated using the average of d_{Jsavg} and d_{Heavg} as seen in Eq. (9).

Results and Discussion

Some of samples out of 40 pictures are given in Figure 3.

Figure 3. Sample images through windshield for *fr, mrht, drht, rsfs*

(a) (b)

Figure 4. (a) Image (fr1)(b) Probabilistic distribution of image in (a)

Probabilistic density distributions of the image fr2, in and Figure 4 are shown at right side of same images. All the Equations between (9-10) the values of d_{Js} and d_{He} are obtained in Figure 5.

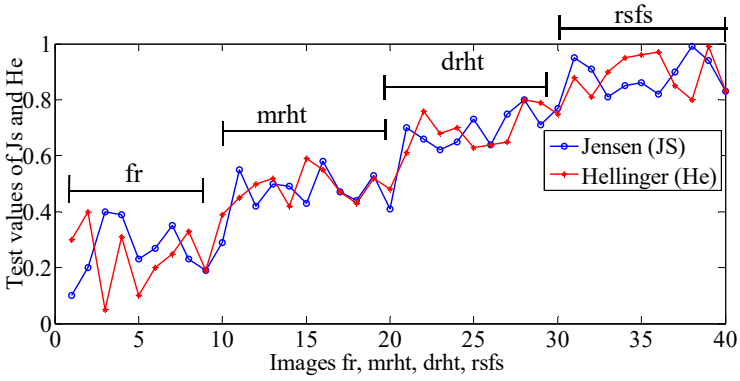


Figure 5. d_{js} , d_{He} values for images fr, mrht, drht and rsfs

Reviewing Figure 5, the $d_{js,he}$ values of fr images are in the range between 0-0.4; the $d_{js,he}$ values of mrht images are in the range between 0.4-0.6; the $d_{js,he}$ values of drht images are in the range between 0.6-0.8, and the $d_{js,he}$ values of rsfs images are in the range between 0.8-1 are found. Table 1 is obtained by Figure 5.

 Copyright © International Science and Technology Conference (ISTEC)

Table 1: D_{Jsort}, D_{Heort} and Concentrarion Risk (*Conr)* Rates of *fr, mrht, drht and rsfs for* 40 İmages

	fr	**mrht**	**drht**	**rsfs**
d_{Jsort}	0.251	0.534	0.701	0.894
d_{Heort}	0.265	0.482	0.703	0.886
$Concentration\ \ Risk\ \ (Conr)$	0.258	0.508	0.702	0.89

According to *Conr* row in Table 1, I can conclude that

$$Conr_{fr} < Conr_{mrht} < Conr_{drht} < Conr_{rsfs}$$

It suggests concentration risk rate of *fr* is less than all the other road models. However, concentration risk rate of *rsfs* is more than all the other road models.

Conclusion

In this work, 40 training images taken through windshield of the vehicle are examined. Object function for the images *fr, mrht, drht*, and *rsfs* is obtained by Jensen Shannon Divergence and Bhattacharya Distance. The results are found as concentration risk via proposed decision-making algorithm. Consequently, I estimate the impact of landscape through the windshield on driver concentration. It suggests concentration risk rate of *fr* is less than all the other road models. However, concentration risk rate of *rsfs* is more than all the other road models. As a next step of this study all the frames along the road could be combined. Hence, this information would be a complementary clue for the studies on driver behavior.

Abstract: Multi directional tools (MDT) that can perform grooving, profiling and cutting processes minimize tool changing and tool setup times on their own, and are an alternative to the classical right/left-hand cutting tool. In the presented paper, wear behavior is investigated in the rough turning of AISI 4140 steel with PVD coated cemented carbide MDT. At the high feed rate and depth of cut conditions, experiments are conducted based on Taguchi's L8 orthogonal array (OA) in different levels of process parameters (cutting speed, chip breaker type and nose radius). Experimental results are assessed through signal to noise (S/N) ratio and analysis of variance at the confidence level of 95%, and optimization of the system is realized sufficiently.

Özet: Bu çalışmada hammadde olarak alümina ve silika esaslı tuğla harcı ve wollastonit kullanılarak CaO-Al_2O_3-SiO_2 (CAS) üçlü denge diyagramına göre düşük ergime sıcaklığına sahip ağ. % 27.5 CaO, 15Al_2O_3 ve 57.5 SiO_2 içeren CAS bileşimi hazırlanmıştır. Aşınma ve korozyon dayanımının gerekli olduğu uygulama alanlarına yönelik CAS seramik sistemini üretmek için belirlenen hammaddeler tartılarak bilyalı değirmende yaş olarak 3 saat 250 devir/dk hızla homojen karıştırma işlemine tabi tutulmuştur. Etüvde kurutulan numuneler hidrolik pres yardımı ile tabletler halinde şekillendirilip 10°C/dk ısıtma hızında 1000°C-1200°C sıcaklık aralıklarında 1, 3 ve 5 saat sürelerde sinterlenmiştir. Kullanılan başlangıç tozlarının ve farklı sıcaklık ve sürelerde sinterlenen CAS seramiklerin mikroyapıları taramalı elektron mikroskobu ile incelenmiş ve XRD ile faz analizleri belirlenmiştir.

Anahtar kelimeler: CAS seramikler, alümina ve silika tuğla harcı, wollastonit

Abstract: In this study, using alümina-silica brick mortar and wollastonite were prepared CaO-Al_2O_3-SiO_2 (CAS) ternary equilibrium diagram has a low melting point composition wt.% 27.5 CaO, 15Al_2O_3 ve 57.5 SiO_2. To produce the CAS ceramic system for applications that require wear and corrosion resistance, homogenization process applied at 3 hour as a dry milled with 250 rpm. Samples are oven-dried and shaped into tablets by a hydraulic press than was sintered at 10 °C/min. heating rate at temperature in the range 1000°C-1200 °C between the range time 1 hour up to 5 hour. The starting powder is used and sintered CAS ceramics at different temperatures and times examined by scanning electron microscopy of the microstructure and phase analysis by XRD was determined.

Giriş

Cam-seramikler camın kontrollü kristallendirilmesi ve çekirdeklendirilmesi yolu ile üretilen seramik malzemelerdir. Cam, kontrollü kristallenme yolu ile seramiğe dönüştürülür (Höland,2012). Kontrollü kristalleşme genellikle çekirdeklenme ve kristalleşme evresi olmak üzere 2 aşamayı içerir [Khater ve arkadaşları, 2012]. Cama ilave edilen metal veya oksitler çekirdekleşme oluşumunu sağlayarak camın kristalizasyonunda etkin rol oynamaktadır. En önemli çekirdekleyiciler TiO_2, Cr_2O_3, ZrO_2, ve P_2O_5 oksitleri ile platin grubu metalleri, diğer soy metaller ve floridlerdir. Oluşan bu çekirdekler etrafında kristal fazlar büyür; ince taneli, düzensiz dağılımlı kristallerle birlikte bir miktar kalıntı faz da içerebilen cam seramiklerin yapısı boşluk, gözenek ve mikro çatlak içermeyen bir karaktere sahip olur. Cam-seramiklerin içerdikleri kristallerin tane boyutlarının küçük olması (1mikron veya 1 mikrondan daha küçük) tokluk, darbe dayanımı, aşınma gibi mekanik özelliklerinin iyi olmasındaki önemli bir etkendir (Yıldız, 1995).

CaO-Al_2O_3-SiO_2 (CAS) seramik sistemleri temel silikat sistemlerinden birisidir ve bu sistemler endüstrinin birçok alanında yaygın olarak kullanılırlar (Duan ve arkadaşları, 1998). CAS sistemli seramikler doğal hammaddelerden üretilebildiği gibi atık hammaddelerden de üretilebilmektedir. Kömür yakma külü, çelik üretim cürufu, atık yakma tesisinden gelen uçucu kül ve filtre tozları ve farklı tipte cürufların yanısıra cam kırıkları veya bunların karışımı gibi çeşitli silikat bazlı atıklar kimyasal bileşim olarak SiO_2, Al_2O_3 ve CaO içermelerinden dolayı CAS esaslı cam-seramikler; başlangıç bileşimi ve ısıl işlem şartlarının kontrolü ile istenilen özelliklere sahip malzemeler olarak üretilebilmektedir (Raupp-Pereira ve arkadaşları, 2006). Bu düşük maliyetli, koyu renkli malzemeler (çünkü atıklar yüksek düzeyde geçiş elementleri içerir), genellikle, mukavemetli, sert ve kimyasal dayanıklıdır. Bunların kullanım amacı aşınma ve kimyasal maddelere dayanıklı

 Copyright © International Science and Technology Conference (ISTEC)

parçalar olarak ya da kimyasal, mekanik ve diğer ağır sanayi veya inşaat alanında yer ve duvar karosu olarak kullanılmasıdır (Zanotto, 2010).

CAS esaslı malzemeler; mükemmel aşınma direnci, kimyasal kararlılık, endüstriyel anlamda aşınma ve korozyon dayanımının gerekli olduğu alanlarda bulk ve kaplama malzemesi olarak kullanılabilirlik ve atık ve doğal hammadde kaynaklarından ekonomik olarak üretilebildiğinden talep edilen malzeme gruplarından birisidir. Optik ve mekanik özellikleri bakımından da tercih edilmektedirler. CAS cam seramikleri içerdikleri iğnemsi veya ağacımsı yapıda β-wollastonit fazı içerdiklerinden ilgi çekici malzeme olmuşlardır. Normal camların aksine içerdikleri bu düşük termal genleşme katsayısına sahip β-wollastonit fazı ile beraber camsı faz içermelerinden dolayı kompozit bir malzemedirler ve β-wollastonit fazının camsı faz ile termal uyumsuzluğu nedeni ile termal mukavemeti düşük olabilir (Xie ve arkadaşları, 2010). CAS sistemi cam-seramikleri yüksek sertlik, çizilme dayanımı ve kimyasal dayanıklılığının yanında düşük hammadde maliyetleri nedeni ile inşaat alanında yer ve duvar kaplama malzemesi olarak iyi bir adaydır (Banijamali ve arkadaşları, 2007). CAS cam-seramikler yüksek mukavemet ve iyi bir tokluğa sahip olduğu için ısıl işlem prosesinin kontrolü cam seramiklerin yapısını ve fonksiyonunu önemli ölçüde etkiler (Fanderlik, 1991).

Mevcut çalışmada; silika, alümina ve CaO kaynağı olarak alümina ve silika esaslı tuğla harcı ve wollastonit kullanılarak CaO-Al_2O_3-SiO_2 (CAS) üçlü denge diyagramına göre düşük ergime sıcaklığına sahip ağ. % 27.5 CaO, %15 Al_2O_3 ve %57.5 SiO_2 içeren CAS bileşimi hazırlanmıştır. Farklı sıcaklık ve sürelerde sinterlenmiş numunelerin faz analizleri, mikroyapısal incelemeleri gerçekleştirilmiştir.

Deneysel Çalışmalar

Mevcut çalışmada; başlangıç hammaddeleri olarak silika, alümina ve CaO kaynağı olarak alümina ve silika esaslı tuğla harcı ve wollastonit tozları kullanılarak CAS üçlü denge diyagramına göre düşük ergime sıcaklığına sahip ağ. % 27.5 CaO, 15Al_2O_3 ve 57.5 SiO_2 içeren CAS bileşimi hazırlanmıştır. Tablo 1 de kullanılan hammaddelerin kimyasal analizleri verilmiştir. Başlangıç malzemeleri belirlenen CAS bileşimini sağlamak üzere tartılmış, yaş olarak saf su ile bilyalı değirmende homojen karışımı sağlanmış, sonrasında presleme yöntemi ile paslanmaz çelik kalıp yardımı ile şekillendirilmiştir. Presle şekillendirilen numuneler 900°C-1200°C sıcaklık aralıklarında 1, 3 ve 5 saat sürelerde sinterlenmiştir. Şekil 1'de Üretim akım şeması üretilen ve üretilen CAS tabletlerin makro görüntüleri verilmiştir. Sinterleme sonrası numunelerin mikroyapısal incelemeleri JEOL 6060 LV marka taramalı elektron mikroskobu ile faz analizleri ise Rigaku DMAX /2200 marka X-ray difraktometresinde CuKα ışınımı kullanılarak gerçekleştirilmiştir

CAS kodlu bileşimlerden hazırlanan numunelerin yoğunluk değerleri Arşimet yöntemi kullanılarak ASTM (c693-93) standardına göre eşitlik 1 yardımıyla hesaplanmıştır. Korozyon dayanımı için başlangıç ağırlıkları tartıldıktan sonra hacimce %10'luk NaOH çözeltisinde 100˚C'de 2 saat süre ile bekletilen numuneler 2 saat süre sonunda oda sıcaklığına kadar soğutulduktan sonra saf su içerisinde yıkanıp ardından etüvde 80˚C'de kurutulduktan sonra ağırlıkları tartılmıştır. Korozyon dayanımı, ağırlıktaki toplam değişim hesaplanarak belirlenmiş olup; bunun için ağırlık kaybı başlangıç ağırlığına oranlanarak ağırlıktaki toplam değişim % cinsinden eşitlik 2 yardımı ile hesaplanmıştır.

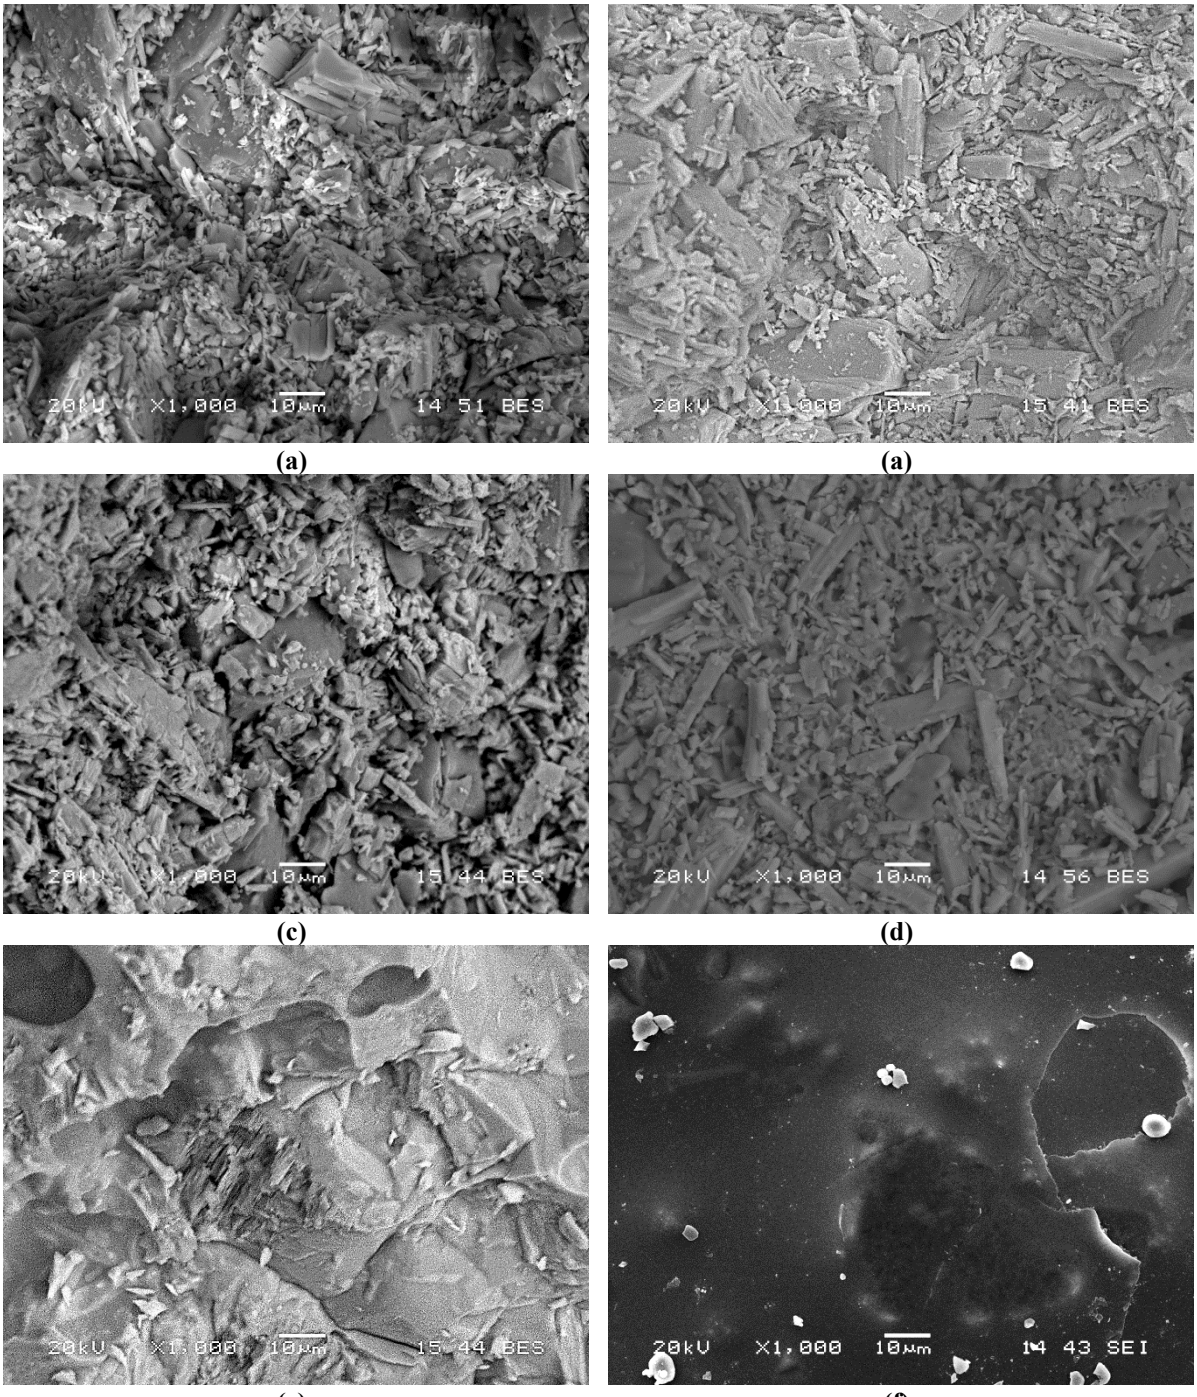
$$\rho = \frac{W_a}{W_c - W_b} d_S \qquad (1)$$

$$L = \frac{W_0 - W_S}{W_0} \times 100 \qquad (2)$$

ρ= numunenin yoğunluğu (g/cm^3),
w_a= numunenin kuru ağırlığı (g),
w_b= sıvı içinde numunenin asılı haldeki ağırlığı (g),
w_c= sıvı emdirilmiş numune ağırlığı (g) ve
d_s= sıvı yoğunluğu (g/cm^3)

L= ağırlıktaki toplam değişim (%)
W_0= numunenin başlangıç ağırlığı (g),
W_s= numunenin korozyon sonrası ağırlığı

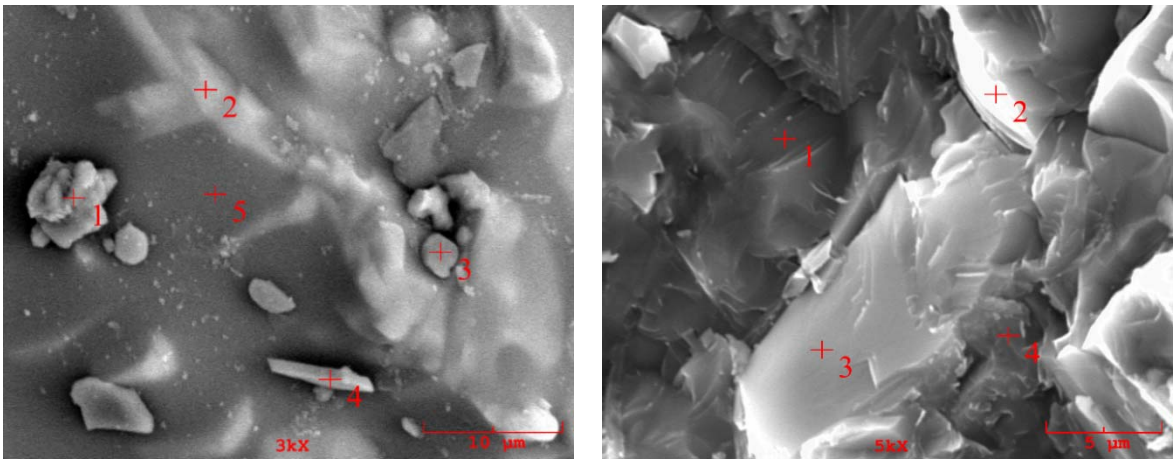
CAS kodlu 1200˚C sıcaklıkta 5 saat sinterlenen numunelerin mikrosertlik değerleri; Leica marka mikrosertlik cihazı ile 100 gr yük altında 30 sn. bekleme süresi ile alınan 5 ölçümün ortalaması hesaplanarak Vickers (HV) sertlik değerleri tespit edilmiştir. Mikrosertlik testi öncesi numuneler metalografik yüzey hazırlama işlem kademelerine tabi tutulmuştur. 60-1200'lük SiC zımpara kağıdı kullanılarak yüzeyler düzgün hale getirildikten sonra alümina pasta yardımıyla parlatılıp HF ile dağlanmıştır.



Deneysel Sonuçlar

Mikroyapı Analizi

Şekil 2.'te CAS kodlu tozların 1000˚C, 1100°C ve 1200 ˚C'lerde 1 ve 5 saat sinterlenmesi sonrası kırık yüzey mikroyapı görüntüleri verilmiştir. Mikroyapı görüntülerinden 1000˚C ve 1100˚C'lerde CAS kodlu tozlar arasında yeterli bağlanmanın olmadığı dolayısı ile sinterlenme sıcaklık ve süresinin yeterli olmadığı, 1200˚C'lerde ise sinterleme sıcaklığının yeterli olduğu ve 5 saatlik sinterleme süresinde (Şekil 2.(f)) camsı yapının hemen hemen tüm yapıya hakim olduğu gözlenmiştir.



Presle şekillendirilmiş CAS tabletlerin 1200 ˚C'de 3 saat ve 5 saat sinterlenmesi sonucu elde edilen numunelerin SEM görüntüsü ve EDS analizi Şekil 3.'de görülmektedir. 1200 ˚C'de 3 saat sinterlenmiş numunelerin EDS tablosu incelendiğinde, Al_2O_3 bakımından en zengin bölgenin 1 kodlu bölge, SiO_2 bakımından en zengin bölgenin 5 kodlu bölge ve CaO bakımından en zengin bölgenin 2 kodlu bölge olduğu EDS tablosundan görülmektedir. Ayrıca CAS bileşimini oluşturan ana bileşenlerin tamamının tüm bölgelerde mevcut olduğu belirtilebilir. Özellikle 2 nolu bölge wollastonit fazını, 5 nolu CAS bileşenlerini içeren camsı matriks görünümündeki bölgenin anortit faz bileşenlerine sahip olduğu, 1 kodlu bölgedeki yüksek Al_2O_3 miktarı ise ısıl işlem işlemi esnasında CAS kodlu numunenin alümina altlık üzerine serpilen alümina tozu ile reaksiyonundan kaynaklandığı düşünülmektedir. 1200 ˚C'de 5 saat sinterlenen numunenin SEM görüntüsü Şekil 3.(b)'de, EDS analizi Şekil 3.(d)'de görülmektedir. EDS tablosu incelendiğinde, 1 kodlu bölgenin CaO ve SiO_2 açısından en zengin olduğu, 4 kodlu bölgenin Al_2O_3 miktarı en zengin bölge olduğu görülmektedir. 1 kodlu bölgenin wollastonit faz bölgesi ve 4 kodlu bölgenin anortit faz bölgesi olduğu belirtilebilir.

Şekil 4'te 1100°C ve 1200°C'lerde 3 saat sinterlenmiş CAS bileşimine sahip numunenin XRD analizleri verilmiştir. Yapılan faz analizinde anortit ve wollastonit ($CaSiO_3$) fazları tespit edilmiş olup; sıcaklık 1200°C'lere yükseldiğinde yapıda anortit ($CaAl_2Si_2O_8$) faz yapısının hakim olduğu görülmektedir. CAS esaslı camlar [SiO_4] ve [AlO_4]Ca[AlO_4] yapısından oluşur. CAS camları çekirdeklenme sıcaklığına ısıtıldığında serbest Ca^{+2} iyonları [SiO_4] birimi ile ilk cam-seramik oluşumunu wollastonit fazını olarak gerçekleştirmek için birleşme eğilimi gösterir. Kristalizasyon sırasında [AlO_4]Ca[AlO_4] birimleri yeniden düzenlenip [SiO_4] yapısı ile birleşerek CAS sisteminde anortit fazını oluşturur (Luan ve arkadaşları, 2010).

Korozyon, yoğunluk ve sertlik

CAS kodlu 1100˚C ve 1200˚C'lerde 1, 3 ve 5 saat sürelerde sinterlenen numunelerin hacimce %10 NaOH çözeltisi içerisinde 100˚C'de 2 saat süre ile gerçekleştirilen korozyon testi sonrası ağırlık değişimi değerleri ve yoğunluk testi sonuçları Tablo 2'de verilmiştir. Tablodan görüldüğü üzere CAS kodlu 1100°C 1 saat sinterlenen numunelerde en yüksek ağırlık kaybı % 6.80 iken, aynı sıcaklıkta süre arttıkça numunede ağırlık artışı tespit edilmiş olup; bu durum bazik çözelti ile numunelerin reaksiyon ürünü oluşturmasından kaynaklanabileceği ile açıklanabilir. Sıcaklık değeri 1200°C'lere çıkarıldığında ağırlık kaybının çok düşük olduğu tespit edilmiştir.

Tablo 2. CAS kodlu numunelerin korozyon, yoğunluk ve sertlik testi sonuçları (NaOH çözeltisi)

Isıl İşlem Şartları		Ağırlık Kaybı (%)	Yoğunluk (gr/cm^3)	Sertlik (Hv)
1100 ˚C	1 saat	6.80	1.96	-
	3 saat	-1.30	1.97	-
	5 saat	-2.40	2.17	-
1200˚C	1 saat	-1.16	2.21	-
	3 saat	0.16	2.22	-
	5 saat	0.15	2.33	815

Zafer Yavuz Merkit (2016), yaptığı yüksek lisans tez çalışmasında hammadde olarak pomza, mermer tozu ve Al_2O_3 tozlarını kullanarak hazırlamış olduğu CAS kodlu numunelere hacimce %10 luk NaOH çözeltisinde korozyon testini uygulamış ve 100°C'de 2 saat süre sonunda numunelerde ağırlık kayıplarının olmadığını tespit etmiştir.

Ren ve arkadaşları CAS esaslı seramikleri CaO Al_2O_3 ve SiO_2 başlangıç hammaddelerinden üretmişlerdir. CAS esaslı bileşimler alümina pota içerisinde 1550°C'de 5 saat ergitildikten sonra ön ısıtılmış 500°C'deki paslanmaz çelik kalıba dökülmüş ardından ön ısıtılmış 650°C deki fırında tavlanmıştır. Isıl işlem şartları 5°C/dk ısıtma hızı ile 700°C'de 2 saat çekirdeklenme ve 910°C'de 3 saat çekirdeklerin büyümesi için olarak belirlemişlerdir. Hazırlamış oldukları CAS esaslı numunelerde sertlik değeri 790 Hv olarak bulunmuştur. Araştırmacılar CAS bileşimine Fe_2O_3'in ağ. % 0-10 katkısını inceledikleri çalışmalarında Fe_2O_3 miktarı %6 oranına kadar sertlik değerini arttırdığını bu değerin üstüne çıkıldığında ise sertlik değerinin 700 Hv'nin altına düştüğünü tespit etmişlerdir (Ren ve arkadaşları, 2015). Mevcut çalışmada ise sertlik değeri en yüksek sinterleme sıcaklık ve süresinde ortalama 815 Hv olarak tespit edilmiştir (Tablo 2). Guo ve ark. kömür gangı (silika ve alümina kaynağı) ve CaO hammaddelerini kullanarak CAS cam-seramikleri üretmek için alümina pota içerisinde 1400°C'de 2 saat ergitme işlemi ardından suya döküm kurutma ve kırma-eleme işlem kademelerini izlemişlerdir. CAS cam-seramiklerin ağ. % 1 HCl ve NaOH çözeltilerinde oda sıcaklığında 28 gün süren ağırlık kaybı değerleri sırasıyla 1.36 ve 0.88 olarak tespit edilmiştir (Yang ve arkadaşları, 2012). S. Banijamali ve ark. ticari saflıkta $CaCO_3$, korundum, SiO_2, TiO_2, CaF_2 ve ZrO_2 hammaddelerini kullanarak homojen karışımlarını sağladıktan sonra zirkon pota içerisinde 1450°C'de 1 saat ergitmişler ve suya döküm yapmışlardır. 850-1200°C'lerde sinterlemiş oldukları CAS numunelerini H_2SO_4 asidik çözeltisinde 1 saat kaynatarak kimyasal dayanımlarını tespit etmişlerdir. Ağırlık kaybını % 1.8-2.28 aralığında bulmuşlardır. Sertlik ölçümünde 100 g yük 30 s bekleme süresi kullanılmış olup, 10 ölçümüm ortalaması alınarak bileşime göre değişen 540-613 Hv sertlik değerlerine ulaşmışlardır (Banijamali ve arkadaşları, 2009).

Genel Sonuçlar

CAS esaslı seramik malzemeler üstün aşınma ve korozyon dayanımı özellikleri yanında radyoaktif kalkanlama malzemesi olarak da önem arz eden malzeme gruplarından birisidir. Mevcut çalışmada wollastonit, alümina ve

 Copyright © International Science and Technology Conference (ISTEC)

silika tuğla harcı başlangıç malzemeleri kullanılarak düşük üretim sıcaklıklarına sahip CAS bileşimi hazırlanmış olup; üretilen CAS seramiklerin mikroyapısal özellikleri, faz yapısı, NaOH çözeltisi içerisindeki korozyon dayanımı, farklı sıcaklık ve sürelerdeki sinterleme şartlarındaki yoğunluk değişimi değerleri hesaplanmıştır. Ayrıca 1200˚C'de 5 saatte en yüksek sinterleme sıcaklık ve süresinde sertlik ölçümü yapılarak ortalama 815 Hv sertlik değerine ulaşılmıştır.

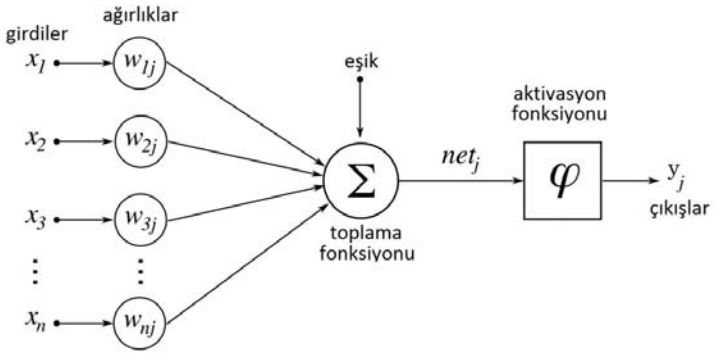
salihtosun@duzce.edu.tr

Özet: Günümüzde tüketicilere ekonomik, güvenilir ve kaliteli güç dağıtımı önemli bir konu haline gelmiştir. Bunu gerçekleştirmek için iyi planlama gereklidir. Planlamanın iyi olması da yük tahminine bağlıdır. Yük tahmini piyasa fiyatlarının oluşmasında da oldukça önem arz eder. Bu çalışmada Batı Karadeniz bölgesinin kısa dönemli yük tahmini Yapay Sinir Ağları (YSA) yöntemi ile gerçekleştirilmiştir. Çalışmada uzaktan okuma ile elde edilen saatlik veriler ve sıcaklık değerleri girdi olarak alınarak saatlik yük tahmini yapılmıştır.

Anahtar Kelimeler: Kısa Dönem Yük Tahmini, YSA, Güç Sistemleri

Giriş

Güç sisteminin planlanması ve işletilmesindeki en önemli sorunlardan biride yük tahmini yapmaktır. Yük tahmini; planlama, güç sistemlerinin güvenirliği ile yakından ilgilidir. Ayrıca doğru tahmin edilen yükler elektrik piyasasında fiyat tahmini içinde gereklidir. Sorun sadece sistem işletmecileri için değil aynı zamanda piyasa işletmecileri için ve iletim şebeke sahipleri veya piyasa işletmecisi için de önem arz etmektedir(Song et. Al, 2005; Chen & Singh2001). İlaveten yük tahminini etkileyen çeşitli sosyo politik ve çevresel faktörler de vardır. İlaveten sistemde yüklerin lineer olmayan ve rastlantısal davranışları vardır. Bu faktörlerden dolayı konu anlaşılması ve uğraşılması zor konu haline gelmektedir(Song et. al, 2005; IEEE Power System Eng. Com., 1980).



Kısa dönem yük tahmini ile saatlik veya günlük yük tahmini yapılmaya çalışılır. Bu tahminlerle santraller arasında yük paylaşımı ve santrallerin devreye girip çıkma zamanları belirlenmiş olur(Azadeh et. al, 2009, March). Yük tahminleri kısa dönemli olduğu gibi uzun dönemli tahminler de olabilir(Campbell & Adamson 2006, September). Literatür araştırıldığında çeşitli yük tahmin metotları geliştirilmiştir. Benzer gün yaklaşımı ile iki veya üç yıl içerisindeki tarihsel verilerin kullanılarak benzer günlerin, tarihsel ve çevre şartları da göz önüne alınarak elde edilen tahminlerdir(Feinberg & Genethliou, 2005). Yaygın kullanılan yöntemlerden birisi de uydurma yöntemleridir. Bu yöntemler hava, gün tipi, tüketici profili gibi faktörleri de modelleyerek tahmin yapar. Bir çok alanda kullanıldığı gibi zaman serileri ile de yük tahmini çok sık kullanılan yöntem olarak karşımıza çıkmaktadır. Sosyal alandan ekonomiye, istatistikten teknik alana kadar bir çok alanda kullanıldığı gibi zaman serileri ile de yük tahmininde çok sık kullanılan yöntem olarak karşımıza çıkmaktadır. Yapay sinir ağlarının yanında bulanık mantık yöntemi de yük tahminlerinde kullanılan yöntemlerden bir olarak görülmektedir. Bilgisayar teknolojisinin gelişimine bağlı olarak son yıllarda çok sık kullanılan uzman sistemlerde yük tahmin modellemesinde kullanılmaya başlanmıştır(Feinberg & Genethliou 2005; Engle et. al, 1992; Yang et. al, 1995, May; Bakirtzis et. al, 1996).

Yük profilleri ve yük tahminleri konusunda dünyanın gelişmiş ülkelerinde çeşitli çalışmalar yapılmıştır. İngiltere'de yapılan çalışmada Runming Yao ve arkadaşı bir evin günlük elektrik tüketim profilini çıkarmıştır(Yao & Steemers, 2005). Yük profilleri üzerine yapılan bir çalışmada ise Norveçde toplam elektriğin %40 ını tüketen konutlar için müşteriler sınıflandırılmıştır ve profilleri elde edilmiştir(Andrei et. al, 2015). Yapılan bir başka çalışma ile de iç enerji tüketimi YSA yöntemiyle yük tahmini yapılmaya çalışılmıştır(Songpu et.al., 2015, May). Diğer önemli ve ilk çalışmalardan bir tanesi uzman sistemler kullanılarak kısa dönem olarak yirmi dört saatlik yük tahmini yapılmıştır(Rahman & Bhatnagar, 1988). Diğer bir çalışmanın konusu ise yük tahmini yanında müşterilerin profilleri belirlenerek yük tahmini yapılmıştır(Felea et. al, 2012). Farklı bir çalışmada ise ticari binaların elektrik tüketim tahminleri yapılmıştır(Frank & Sen 2011, August).

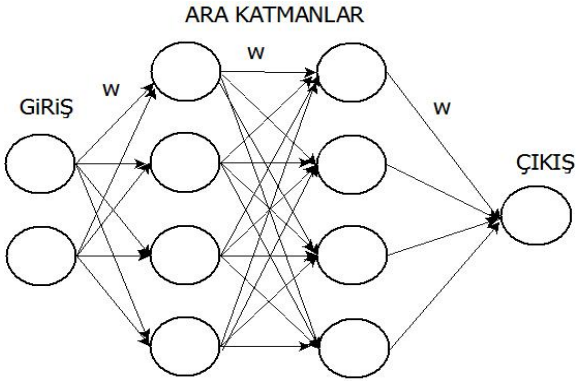
Yapay Sinir Ağları

YSA insanın biyolojik sinir ağlarından ilham alarak ortaya çıkarılan ve sinir ağlarına benzer bazı özellikleri içeren bilgi işleme sistemidir(Fausett, 1994). Basit şekilde insan beyninin taklit yapan YSA ile; öğrenme, optimizasyon, analiz, sınıflandırma, genelleme gibi konulara başarılı bir şekilde uygulanabilmektedir(Öztemel, 2003). YSA'nın kullanıldığı önemli alanlardan biri de ileri yönelik tahminlerdir. YSA'nın çalışmasına teşkil eden en küçük birimler yapay sinir hücresi olarak isimlendirilirler. Şekil 1'de görüleceğe üzere bir yapay sinir hücresi beş katmandan oluşmaktadır.

Şekil 1. Yapay Sinir Hücresi

Bu katmanlar incelenirse, girdiler; dış ortamdan veya diğer hücrelerden yapay sinir hücresine giren bilgilerdir. Ağırlıklar; yapay sinir hücresine gelen bilgiler çekirdeğe ulaşmadan önce bir ağırlık katsayısı ile çarpılarak çekirdeğe iletilir. Böylece girdinin etkisi arttırılıp azaltılabilir. Ağırlıklarla çarpılarak gelen girdiler toplama fonksiyonu vasıtasıyla toplanır. Toplam fonksiyonu eşitlik 1'de verildiği gibidir.



$$Net = \sum_{j=1}^{n} x_j * w_j + b \quad (1)$$

Burada, Net YSA'ya giren değişkenlerin ağırlıklar ile çarpılması sonucu oluşan toplamı, x algoritmaya giren değişkenleri, w değişkenler üzerine etki eden ağırlıkları, b ise eşik değerini ifade etmektedir. Aktivasyon fonksiyonunda hücreye gelen net bilgi işlenerek, bu girdiye karşılık hesaplanıp üretilen çıktıdır. Aktivasyon fonksiyonu olarak genellikle doğrusal olmayan fonksiyon seçilir. Bunun nedeni YSA'nın doğrusal olmayan özelliğinden gelmektedir ve bu durum kolayca türevinin alınması için gereklidir(KAYNAR & TAŞTAN, 2009). Aktivasyon fonksiyonu ile toplamadan gelen bilgiler çıktıya dönüştürülür. Aktivasyon fonksiyonu ile girdi ve çıktı bilgileri arasındaki eşleşme sağlanır. Aktivasyon fonksiyonunun doğru seçilmesi ağın performansını etkileyecek niteliktedir(Hwang & Ding, 1997). Çeşitli aktivasyon fonksiyonları vardır, ancak bu çalışmada aktivasyon fonksiyonu olarak eşitlik 2'de verilen sigmoid fonksiyon seçilmiştir. İfadede geçen y ise çıkışı ifade etmektedir.

$$y = \frac{1}{1-e^{-Net}} \quad (2)$$

YSA'nın önemli bir parçası da ağ yapılarıdır. Ağ yapıları çeşitli özellikte olabilmekte ve giriş çıkış katmanları arasında birden fazla katman olabilir. Ara katmanlar gizli katmanlar olarak da ifade edilmektedir. Bu katmalar ile karmaşık işlemleri hesaplamak daha da kolaylaşır(ELMAS, 2003). YSA temel olarak eğitim ve test şeklinde iki aşamada çalışmaktadır. Eğitim aşaması ile ağırlıklara göre çıktılar hesaplanır. Test aşaması ile de YSA'nın bilgi sahibi olmadığı veriler ile sistem test edilir. Yapılan çalışma için tasarlanan YSA yapısı ve elemanları Şekil 2'de verilmektedir.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 2. Tasarlanan 2-4-4-1 YSA ağ yapısı

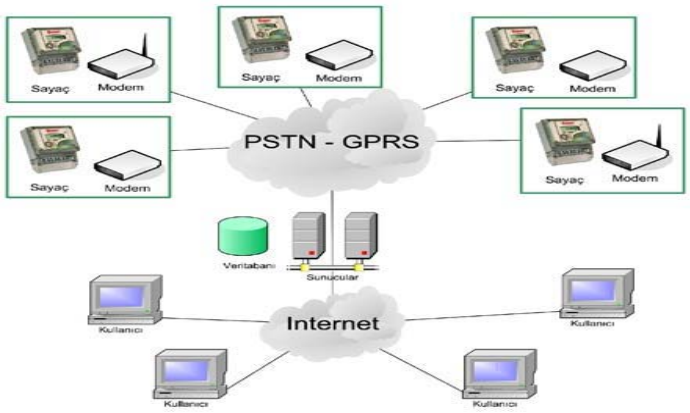
Bu ağ yapısında dışarıdan gelen bilgiler girdi katmanı üzerinden algoritmaya girerler. Ara katman veya gizli katmanlar üzerinden ağırlıklarında etkisi ile çıkış katmanına iletilirler. Bu girdi ve çıktı arasındaki ilişki ile ağın öğrenmesi sağlanır. Yapılan bu çalışmada İleri Beslemeli Geri Yayılım (Feed Forward Back Propagation Neural Network Architecture) YSA algoritmasıyla öğrenme sağlanmıştır. İleri doğru hesaplama işleminde ağa giren bilgiler ağırlık matrisleriyle işleme girerek çıktı değeri hesaplanır. Sonra ağın ürettiği çıktı değeri ile gerçek değer arasındaki hata minimize edilerek geriye doğru ağırlık katsayıları yeniden düzenlenir. Bu işlem ağın istenen çıktı değerini üretmesine kadar devam eder(KALENDER & HAMZAÇEBİ, 2014). Geriye yayılma algoritması, gerçek çıktı t ile istenen çıktı y arasındaki karesel hatayı minimum yapmak için gradyen azalma algoritmasını (gradyen descent algorithm) kullanır ve hata hesaplanır(Kalogirou, 2001; Kalogirou, 1999). Yapılan çalışmada hata fonksiyonun minimize edildiği fonksiyon eşitlik 3'te verilmiştir.

$$E = \frac{1}{2}\sum_{k=1}^{n}(y_k - t_k)^2 \quad (3)$$

Eşitlikte E hata fonksiyonunu, y_k ağın ürettiği çıktıyı, t_k ise gerçek değeri göstermektedir. YSA giren verilerin girdi olmadan önce belli işlemlere tabi tutulması gerekmektedir. Bu işlem normalizasyon olarak ifade edilir ve veriler 0 ile 1 arasında bir değere taşınır. Bu şekilde işlemlerin hızlandırılması sağlanmış olur. Bu çalışmada eşitlik 4'de verilen min-max normalizasyonu kullanılmaktadır(Jayalakshmi & Santhakumaran, 2011).

$$x' = \frac{x_i - x_{min}}{x_{max} - x_{min}} \quad (4)$$

Bu eşitlikte; x' normalleşmiş veriyi, x_i normalleşecek olan girdi değerini, x_{min} girdi değerleri içindeki en küçük değeri, x_{max} girdi verileri içindeki en büyük sayıyı temsil etmektedir.



Yapılan bu çalışmada tahmin sonuçlarını karşılaştırmak amacıyla peformans ölçümü olarak eşitlik 5'de verilen ortalama mutlak yüzde hata (Mean Absulate Percentage Error, MAPE) eşitliği kullanılmıştır. Eşitlikte verilen n sayısı veri sayısını ifade etmektedir.

$$MAPE = \left(\frac{1}{n}\sum\frac{gerçek - tahmin}{gerçek}\right) * 100 \quad (5)$$

Uygulama

Bu çalışmada Batı Karadeniz Bölgesinde (SEDAŞ bölgesi) Otomatik Sayaç Okuma Sistemi (OSOS) ile konut ve ticarethanelerde okunan sayaçlar baz alınarak yapılmıştır. Şekil 3'de verildiği şekilde Sedaş dağıtım bölgesi olan İzmit, Sakarya, Düzce ve Bolu illerinde elektrik enerjisi tüketimi uzaktan sayaç okuması gerçekleştirilmiştir. Bu sistemle, elektrik sayaçları kablosuz (GPRS) erişimle uzaktan okunarak ve verilerin bir merkezde toplanması sağlanmıştır.

 Copyright © International Science and Technology Conference (ISTEC)

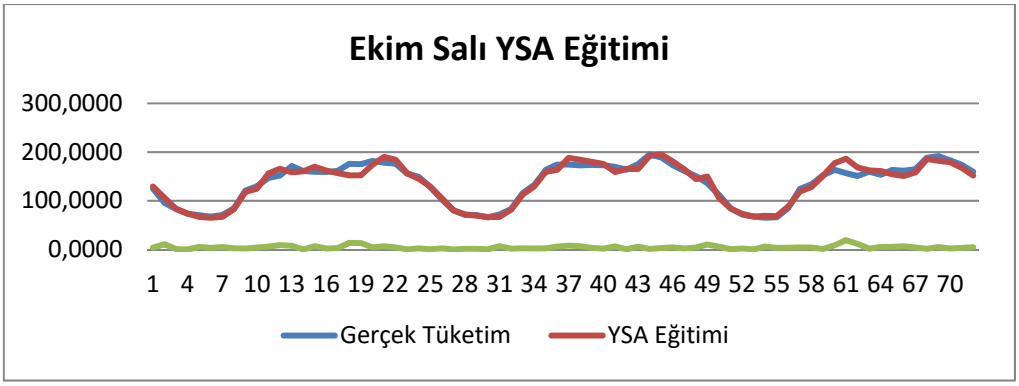
Şekil 3. Otomatik Sayaç Okuma Sistemi(http://www.beyaz.net /otomasyon)

Yapılan çalışma ile Tablo 1'deki kıstaslara göre örnek konut ve ticarethane aboneleri belirlenerek buralara saatlik okunabilen sayaçlar bağlanmıştır. Sayaç sayıları tabloda verildiği şekilde, şehir nüfusu, yerleşim yeri, kullanılan sayaç türü ve aylık enerji tüketim miktarları gibi kısıtlar alınarak belirlenmiştir. Tablo 1'de görüldüğü gibi tüketim miktarı üç grupta toplanmıştır. Aylık Tüketim miktarı 150 kWh'a kadar olan tüketiciler düşük gruptakiler olarak alınmıştır ve 150 sayısı ile kodlanmışlardır. Aylık Tüketim miktarı 151-250 kWh arasında olan tüketiciler normal gruptakiler olarak tanımlanmıştır ve 250 sayısı ile kodlanmışlardır. Aylık Tüketim miktarı 250 kWh'ten fazla olan tüketiciler ise yüksek gruptakiler olarak tanımlanmıştır ve 251 sayısı ile kodlanmışlardır.

Tablo 1. Aylık tüketim miktarına göre grupların oluşturulması

Tüketim Grubu	Gündüz Tük.	Puant Tük.	Gece Tük.
0-150	Düşük	Düşük	Düşük
151-250	Normal	Normal	Normal
251 ve üstü	Yüksek	Yüksek	Yüksek

Bu çalışmada OSOS kapsamında okunmuş verileri olan Ekim ayı incelemeye tabi tutulmuştur. İlk üç hafta saatlik okunan değerler eğitilmişlerdir. Bu değerler normalleştirme işlemine tabi tutulduktan sonra YSA'ya veri olarak girilmişlerdir. Veriler eğitilme işleminden sonra test aşamasına geçilmiştir. Eğitme işlemi Ekim ayı için haftanın her günü için ayrı ayrı gerçekleştirilmiştir. Tablo 2'de sadece Ekim ayı Salı günlerine ait veriler ve eğitime tabi tutulduktan sonra elde edilen tahminler verilmiştir. Ortalama hata değerini ifade eden MAPE (mean absolute percentage error) değeri %4,31 olarak görülmektedir. Bu değer ağın başarı ile eğitildiğini ifade etmektedir.



Tablo 2. 2015 Ekim ayı Salı günlerine ait eğitime tabi tutulan veri seti (kWh)

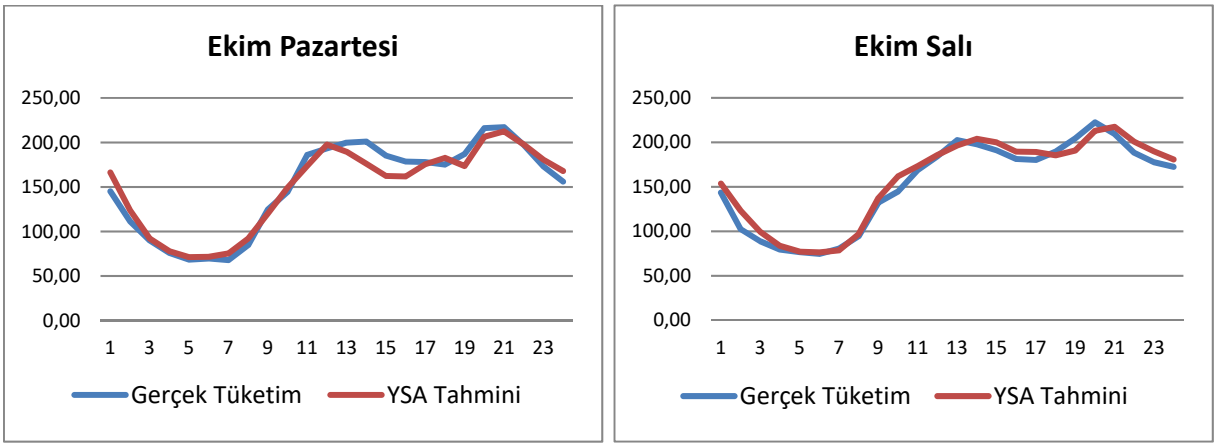
YSA algoritmasının eğitimi sonucunda elde edilen eğitim değerleri ile gerçek değerlerin grafiği şekil 4'de verilmiştir. Burada elde edilen eğri sadece Ekim ayına ait Salı günlerinin eğitimi sonucunda elde edilmiştir. Aynı zamanda ortalama hata değerlerini ifade eden MAPE değerleri de grafik üzerinde gösterilmiştir.

Şekil 4. 2015 Ekim ayı Salı günlerine ait eğitime tabi tutulan değerler ve MAPE değerleri

Bu eğitilme işlemi Ekim ayına yönelik her gün için ayrı ayrı gerçekleştirilmiştir. YSA'da eğitilen üç haftalık değerler belirlendikten sonra son haftaya ait günler teste tabi tutulmuştur. Test işlemi sonucunda gerçek tüketilen değerler ve YSA ile tahmin edilen değerler karşılaştırmalı olarak Tablo 3'de verilmiştir.



Tablo 3. 2015 Ekim ayı üçüncü haftaya yönelik gerçek ve YSA ile tahmin edilen enerji tüketim değerleri

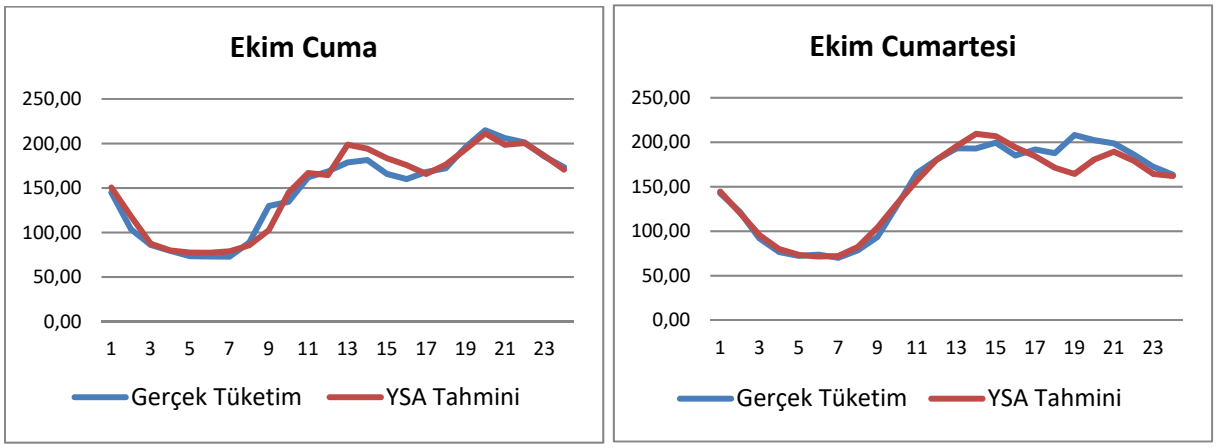
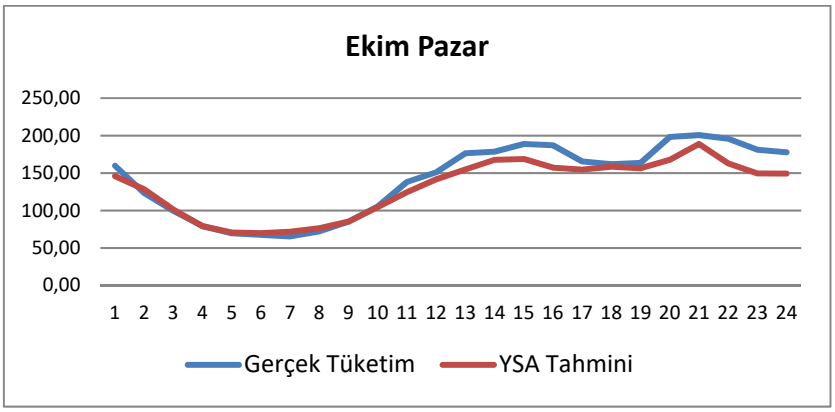
Tablo 3'deki veriler sonucunda her güne ait MAPE değerleri elde edilmiştir. MAPE değerlerinin değişimi %4 ile %7,5 arasında değişmektedir. Bu sonuçlara göre YSA ile tahmin edilen değerler gerçek değerlere yaklaşmıştır. Bu hata değerleri bu yöntem için oldukça başarılı sayılmaktadır[26]. YSA ile tahmin değerler ve gerçek değerlerin günlük profil eğrileri Şekil 5, 6, 7 ve 8'de sırasıyla verilmiştir.



Şekil 5. Pazartesi ve Salı gününe ait gerçek ve YSA ile tahmin edilen enerji tüketim eğrileri



Şekil 6. Çarşamba ve Perşembe gününe ait gerçek ve YSA ile tahmin edilen enerji tüketim eğrileri

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 7. Cuma ve Cumartesi gününe ait gerçek ve YSA ile tahmin edilen enerji tüketim eğrileri

Şekil 8. Pazar gününe ait gerçek ve YSA ile tahmin edilen enerji tüketim eğrileri

Günlük tüketim profilleri incelendiğinde YSA sonucu elde edilen değerler ile başarılı bir şekilde tahmin yaptığı görülmektedir. Oluşan hataların ise özellikle değişimin ani olduğu saatlerde gerçekleştiği görülmektedir.

Sonuçlar ve Tartışma

Bu çalışmada Batı Karadeniz bölgesinde faaliyet gösteren SEDAŞ dağıtım şirketinin kısa dönemli yük tahmini YSA ile gerçekleştirilmiştir. Kullanılan veri seti gerçek değerler olup OSOS kapsamında örnekleme seçilen müşterilere takılan sayaçlardan okunan değerlerdir. Bu değerler, YSA ile elde edilen değerlerle karşılaştırılmış olup metodun geçerliliği incelenmiştir. Elde edilen değerler MAPE performans kıstaslarıyla karşılaştırılmışlardır. Elde edilen değerler hata olarak incelendiğinde Tablo 5'deki sonuçlar elde edilir.

Tablo 5. Ekim ayın ait son haftaya ait hata değerleri

	26 Ekim Pazartesi	27 Ekim Salı	28 Ekim Çarşamba	22 Ekim Perşembe	23 Ekim Cuma	24 Ekim Cumartesi	25 Ekim Pazar	Ortalama
MAPE	% 6,0198	% 5,2920	% 6,4472	% 4,0033	% 5,3645	% 4,9182	% 7,5906	%5,6623

MAPE değerleri incelendiğinde %10'nun altındaki değerler çok iyi, %10-%20 arasındaki değerler iyi, %20-%50 arasındaki değerler kabul edilebilir ve %50'nin üzerindeki değerler yanlış ve hatalı olarak kabul edilmiştir(Var & Türkay, 2014). Ayrıca tablolardan tahmin karakteristiklerine bakıldığında gerçek değerlere benzeştiği görülmektedir. Bu çalışma ile aynı zamanda lineer olmayan verilere sahip modellerin YSA ile başarılı bir şekilde modellendiği gösterilmiştir. İleriki çalışmalarda Enerji tüketimini etkileyen diğer faktörler de göz önüne alınarak çalışma daha da geliştirilebilir. Yeni senaryolar üretilerek yeni

tahminler de gerçekleştirilebilir.

Açıklamalar

Bu çalışma EPDK tarafından 28.05.2014 tarih ve 5036 sıra nolu Kurul Kararı ile desteklenen "Profil Katsayıları Hazırlama Metodolojisinin Dengesizlik Maliyetlerine Etkisi ve Optimizasyonu Projesi" olup, Sedaş ve Düzce Üniversitesi tarafından uygulanmaktadır.

YAZILIM MÜHENDİSLİĞİ LİSANS PROGRAMLARINDA ONTOLOJİNİN ÖNEMİ

Zeynep Altan
zeynepaltan@beykent.edu.tr

Tim Berners Lee 2009 yılındaki TED konferansında "Bağlı Data -Linked Data" kavramının önemini şöyle açıklar: "Günümüzde bu kadar yüklü miktarda bilgi, açık data, bir teknoloji olarak farklı ilişkilerle birbirine bağlanmalıdır. İstenilen Web sonucunu elde etmek için her şeyi anlamlandırmak gerekecektir. Bu, anlamsal web hareketidir ve Wikipedia projesi bu hareketin başlangıcıdır". Modele Dayalı Yazılım Mühendisliğinde bilgi tabanlı uygulamalar bilginin paylaşımı için ontolojileri kullanır. Başlangıçta yapay us uzmanlarının çalışma alanı olduğu kabul edilen ontoloji, günümüz yazılım problemlerinin çözümünde endüstriyel yazılım mühendisliği uygulamalarının bir parçası olmaktadır.

Yazılım Mühendisliği eğitim programının SWEBOK taksonomisindeki bilgi alanlarından biri olan Matematiksel Temeller karmaşık gerçek dünya problemlerine açıklaştırılmış bir mantık ile iyi anlaşılmış çözümler sunulmasını sağlar. Tamlık, diğer bir ifade ile doğrulukla ilişkilendirilen biçimsel sistemlerin incelenmesi ayrık matematiğin temel yapı taşıdır. Yazılım mühendisliği lisans programlarında bu disiplinin bir bilgi alanı olmasının nedeni, yazılım problemlerinin farklı uygulamaları için kesin bir soyutlamaya gereksinim olmasıdır.

SWEBOK taksonomisindeki bir diğer bilgi alanı Yazılım Mühendisliği Modelleri ve Yöntemleri, modellemeyi herhangi bir yazılım bileşenin soyutlaması olarak tanımlar; bu bileşenin tek bir soyutlaması yoktur. Yazılım modeli de bu soyutlamaların birleştirilmesinden oluşur; model yeniden kullanıldığında yeni içerik ile uygunluğunu basitleştirmelerin oluşturduğu varsayımlar sağlayacaktır. Ontoloji, makine tarafından okunabilir bir formatta varlıklar, öznitelikler, ilişkiler ve herkesin anlayabileceği kurallardan, diğer bir ifade ile belitlerden oluşan, herhangi bir alana ait kavramsallaştırmadır. Faklı alanlara ait ontolojiler kavramların modellenmesini amaçlayarak bağımsız olarak geliştirilmiş bu ontolojilerin yeniden kullanılabilmelerini ve genişletilebilmelerini destekler. Yazılım Mühendisliği Modelleri ve Yöntemleri bilgi alanının üç model tipinden biri olan bilgi modelleme, anlamsal ya da diğer bir ifade ile kavramsal bilgi modeli olarak bir soyutlamadır ve bilginin gerçek dünya görünümünü kavramsallaştıran kavramları, özellikleri, ilişkileri ve kısıtları içerir. Sonuç olarak insan-bilgisayarın Web üzerinde daha iyi bir etkileşimi ile heterojen ve dağıtık bilgiye akıllı erişimi sağlayan Semantik Web için standart bilgi simgelenişi gerçekleşir. Bunu aynı bilgi alanının yapısal modelleme tiplerinden biri olan UML diyagramları ile gerçekleştirmek mümkün değildir. Ontoloji dillerinde yaygın kullanılan mantık odaklı olarak bilginin simgelenişi, betimleme mantığı ile gerçekleştirilir ve bu SWEBOK taksonomisinin aynı bilgi alanına aittir. Birinci dereceden önermeler mantığı tüm nesneler arasındaki ilişkilerin küme elemanları şeklinde modellenmesini sağlar. Örneğin W3C, OWL 2 (Web Ontology Language) dilinin sınıf/ kavram yapıcılarını betimleme mantığı sözdizimi ile tanımlamıştır. Ontoloji çalışmalarının açıklaştırılması için bilinen akıl yürütme algoritmaları ile teorik olarak iyi tanımlanmış, biçimsel özelliklerin iyi ifade edilerek karmaşıklığın azaltıldığı semantik tanımlamalar kullanılmalıdır. eBilim, coğrafi incelemeler, mühendislik, tıp, biyoloji, savunma sanayi projeleri ontolojilerin kullanıldığı uygulama alanlarındandır.

Sonuç olarak, yazılım mühendisliği disiplininde iyi tanımlanmış, anlaşılır kavramsal betimlemelerle ilgili alana özel ontolojiler tasarlayabilen, bu alanda günümüz gereksinimlerine cevap verebilecek nitelikte mühendislerin yetiştirilmesi hedeflenmelidir.

YENI SÜBSTITÜE 2-AMINO-1,3,4-TIYADIAZOL TÜREVLERININ SCHIFF BAZLARINI İÇEREN BILEŞIKLERIN SENTEZI VE KARAKTERIZASYONU

Hakan Tahtacı
hakantahtaci@karabuk.edu.tr
Mustafa Er
mustafaer@karabuk.edu.tr

Heterosiklik bileşiklerin önemli bir sınıfı olan 1,3,4-tiyadiazol ve türevlerinin antioksidan, antibakteriyel, antideprasan, antidiyabetik, antifungal, antikonvülzan ve antienflamatuar etkiler de dahil olmak üzere çok çeşitli biyolojik özelliklere sahip olduğu bilinmektedir. Özellikle, Schiff bazları içeren sübstitüe1,3,4-tiyadiazol türevlerinin antikanser aktiviteye sahip olmalarından ötürü, çok daha fazla önem arz etmektedirler. 1,3,4-Tiyadiazol halkasının modifikasyonuna bağlı olarak, bu türevler farklı mekanizma üzerinden farklı etki göstermektedirler. Ayrıca, kükürt atomu içeren 1,3,4-tiyadiazol türevleri çözünürlüğü arttırarak iyi doku geçirgenliği sağlamaktadır. Yine 1,3,4-Tiyadiazol halkasına bağlı amin halkasındaki Schiff bazlarının sentezleri çeşitli farmakolojik özelliklerinden dolayı yaygın şekilde yapılmaktadır.
Bu çalışmada, çeşitli biyolojik aktiviteye sahip olabileceğini düşündüğümüz 1,3,4-tiyadiazol türevlerinin schiff bazlarının sentezi gerçekleştirildi. Bu amaçla, ilk olarak çeşitli nitril türevlerinin TFA eşliğinde tiyosemikarbazit ile olan reaksiyonundan başlangıç bileşiği olan sübstitüe 2-amimo-1,3,4-tiyadiazol türevlerini sentezlendi.
Çalışmanın ikinci aşamasında ise elde edilen çeşitli sübstitüe 2-amimo-1,3,4-tiyadiazol türevlerinin, aromatik aldehit türevleri ile olan kondenzasyon reaksiyonu sonucunda ise sonuç bileşiği olan schiff bazlarının sentezigerçekleştirildi.

Son olarak da sentezi gerçekleştirilen tüm bileşiklerin yapıları; IR, ^{13}C NMR, ^{1}H NMR, MS ve elementel analiz kullanılarak aydınlatıldı.

acelik@harran.edu.tr

Özet: Yerel siyaset, kentte faaliyet gösteren siyasal aktörlerin kentin sorunlarını konu edindikleri ve çözümler ürettikleri, yerel toplumu idare etmek yöntemidir. Bu anlamda yerel siyaset, siyasetin yerelde faaliyet gösteren yerel yönetimler ayağını oluşturmaktadır. Yerel yönetimler ise demokratik sistemlerin temel kurumlarından bir tanesidir. Yerel yönetimlerin varoluşunun siyasal gerekçesi demokrasi düşüncesine dayanmaktadır. Yerel yönetimler denildiğinde, demokrasinin işlevselliği açısından, ilk akla gelen kurumlardan bir tanesi yerel düzeyde karar alma süreçlerini etkileyen belediye meclis üyeleridir. Yerel halkın alt yapı, sosyal ve kültürel sorunları ile ilgili kararlar alan belediye meclis üyelerinin siyasal kültürü - söz konusu yerine getirdiği faaliyetler nedeniyle - toplum yaşamı açısından önemli bir siyasal konu olmaktadır. Bu bağlamda, belediye meclis üyelerinin sahip oldukları siyasal kültür, üzerinde araştırma yapmaya değer bir konu olarak karşımıza çıkmaktadır. Bu çerçevede, bu çalışmada, Şanlıurfa Büyükşehir Belediye Meclis Üyeleri'nin - bireyin tüm siyasal pratiklerini şekillendiren, siyasal alana ilişkin sahip oldukları değerler, ritüeller, semboller ve inançlarını ifade eden - siyasal kültürü anket tekniğine dayanan bir saha çalışması ile ortaya konmaya çalışılacaktır.

Anahtar Kelimeler: Yerel siyaset, siyasal kültür, belediye meclisi, Şanlıurfa

Abstract: Local politics is the method to govern the local people where the political actors address the issues of the city and generate solutions for these issues. In this regard, local politics forms the local government component of the politics that performs political activities on a local level. The local government on the other hand is one of the fundamental institutions of the democratic systems. The political ground for the existence of local governments is based on the democratic edifice. One of the first institutions that come to mind when local governments are concerned in terms of the functionality of democracy is the members of the municipal council that influence the decision making processes at the local level. The political culture of the members of the municipal council has great importance for the politicsbecause of the political activities they perform for the society since these members are the ones who make decisions on infrastructural, social and cultural issues of the local people. For these reasons, the political culture of the members of the council is a political subject worth studying thoroughly. In this framework, we conducted a field study based on survey questionnaire technique to find out the political culture of the members of the municipal council of the Metropolitan Municipality of Şanlıurfa,i.e. the political values, rites, symbols and beliefs that form the political practices of the individuals.

Keywords: Local politics, political culture, municipal council, Şanlıurfa

Giriş

Siyaset, küresel, bölgesel, ulusal ve yerel düzeylerde karar alma ve uygulama mekanizmalarına etki etme sürecidir. Bu süreci aracısız yapan ve karar alıp uygulamaya koyan kişilere siyasetçi denir. Yerel düzeyde siyasetçiler, siyasal partilerin il, ilçe ve belde örgütlerinde, belediye meclislerinde, il genel meclislerinde ve belediyenin yürütme organında yer alırlar. Yerel siyasetçiler yerel halkın beklentileri, talep ve şikâyetlerini karar verme süreçlerine taşıma görevini üstlenirler. Karar ve uygulamalarla ilgili olarak halkı bilgilendirir ve yeni durumun tespit edilmesiyle bu görevi tekrar ederler (Gül vd., 2014: 75).

Yerel siyaset kurumunun başında belediye yönetimi faaliyetini yürüten siyasetçiler gelir. Belediye, "belde sakinlerinin mahallî müşterek nitelikteki ihtiyaçlarını karşılamak üzere kurulan ve karar organı seçmenler

 Copyright © International Science and Technology Conference (ISTEC)

tarafından seçilerek oluşturulan, idarî ve malî özerkliğe sahip kamu tüzel kişisi"dir. Belediyenin özerkliği, kanunlarda belirlenen sınırlar içinde kalmak koşuluyla, kendi görev ve yetki alanında kural koyabilmesi, farklı toplumsal kesimleri dikkate alarak kamu hizmetini sunabilmesi, merkezi yönetimin belediye işlerine müdahale etmesini önleyebilmesi, mahalli müşterek nitelikteki kaynakları oluşturabilmesi, halkın refah düzeyini arttırmada katkıda bulunması ve karar organlarının seçimle göreve gelmesinden oluşmaktadır. Belediyenin karar organı belediye meclisi olup nisbi temsil seçim sistemine göre doğrudan halk tarafından seçilir. Belediye meclisleri yerel topluluğun sahip olduğu siyasal ve kültürel değerleri temsil ederler.

Bu çalışmada ilk önce kuramsal çerçevede yerel siyaset ve siyasal kültür açıklanacaktır. Daha sonra Şanlıurfa Büyükşehir Meclis Üyeleri'nin siyasal ilgi, siyasal bilgi ve siyasal değerleri uygulanan anket çalışmasından elde edilen veriler doğrultusunda analiz edilecektir.

Yerel Siyaset Kavramı ve Belediye Meclis Üyeleri

Siyaset kavramı sözlükte, "devlet işlerini düzenleme" ve "yürütme sanatı" anlamına gelir. Siyaset, Arapça'da, "at talimi", "at öğrenimi" ve "at bakıcılığı" anlamına gelen seyis kelimesinden türetilmiştir. Siyaset biliminde siyaset, "ülke", "devlet" ve "insan" yönetimi biçiminde tanımlanabilir (Daver, 1993: 3-5). Siyaset, ülkeyi yönetme, halkın yönetilmesi, kamusal ve siyasal alanın tasnif edilmesi, uzlaşıyla siyasi kararların alınması, siyasi mücadeleyle iktidara gelinmesi, siyasi iktidar aracılığıyla kaynakların, değer ve sembollerin dağıtılması anlamlarına da gelir (Akdoğan, 2008: 9). Fakat siyaset bilimi literatüründe, siyaset tanımı üzerine ortak bir fikir birliği sağlanamamıştır. Bunun nedeni, siyaset terimiyle ilgili karşılaşılan sorunlar ve bu sorunlara koşut olarak ortak bir tanımın yapılamamasıdır (Kalaycıoğlu, 1984: 3).

Siyaset ile özdeş olan "politika", "polis" ve "polisiye" eski Yunan'da "kent-devlet" anlamına gelen "polis" kelimesine kadar uzanır (Ranciére, 2007: 71). Siyasetin temeli kent yönetiminden meydana geldiği görüşü, yerel siyasetin tanımlanması açısından da anlam taşır. Yerel siyasetin kent yönetimi bağlamında taşıdığı anlam ile siyasetin ilk oluştuğu kent yönetiminden ortaya çıkması önem arz eder. Dolayısıyla yerel siyaset, kentte faaliyet gösteren kişi, kurum ve kuruluşların, kent ve kent halkına ait sorun ve konuları ele alarak sürdürdükleri bir yerel iktidar mücadelesidir. Bu mücadelenin ana aktörleri, valilik, kaymakamlık, il özel idaresi, kamu kurum ve kuruluşlarının taşra örgütleri, belediye başkanları ve belediye meclis üyeleridir (Akdoğan, 2008: 10).

Yerel siyaset aynı zamanda kentsel siyaset kavramıyla eş anlamlı olarak kullanılır. Dar anlamdaki yerel siyaset, yerel düzeyde karar verme süreçlerini etkileyen bütün faktörlerin incelenmesidir. Geniş anlamdaki yerel siyaset ise, kentleşme sürecini ve yerel birimleri ilgilendiren kırsal ve kentsel alanlarla ilgili konular, yerel yönetimlerle merkezi yönetim arasındaki ilişkiler ve yerel seçimleri kapsar. Fakat yerel siyaset kavramını geniş ve dar anlamlarını birbirlerinden ayırmak zordur. Yerel düzeyde karar verme süreçleri ve bu kararları etkileyen faktörler ne yerel yönetim birimi olan belediye yönetimi sınırlarıyla sınırlandırılabilir ne de kendi başlarına bir amaç gibi ele alınabilir. Dar anlamdaki yerel siyaset, merkezi yönetim tarafından benimsenen siyasalardan ve ulusal siyasetten büyük ölçüde etkilenir (Keleş, 2000:102).

Yerel siyasete mekân ve bağlam açısından bakıldığında temel olgu kent ve kent yönetimidir. Kentle ilgili her türlü yönetim birimi, kent üzerinde çalışan her türlü sivil toplum örgütleri ve özel kuruluşlar, kent düzeyinde faaliyet gösteren medya ve diğer yerel düzeyli vakıf ve dernek sıralanabilir (Akdoğan, 2008: 10).

Yerel siyasetin en önemli aktörleri belediye meclis üyeleridir. Belediye meclis üyeleri, belediyenin karar organı olup doğrudan halk tarafından nisbi temsil seçim sistemiyle seçilir. Bu nedenle kentte faaliyet gösteren siyasi partilerin aldığı oy oranı doğrudan belediye meclisine yansır. Meclis üyeleri seçimle göreve gelmelerine karşın, kamuoyunun baskısını pek hissetmezler. Daha çok ildeki siyasi parti yönetiminin baskısını hissederler (Tekeli, 1992: 61).

Öte yandan büyükşehir belediye meclis üyelerinin seçimi, "2972 sayılı Mahallî İdareler ile Mahalle Muhtarlıkları ve İhtiyar Heyetleri Seçimi Hakkında Kanun" hükümlerine göre yapılır. Bu meclis üyeleri doğrudan halk tarafından seçilmezler. Halk doğrudan büyükşehir ilçe belediye meclis üyelerini seçer. Büyükşehir belediye meclisi ise, büyükşehir belediyesine bağlı ilçe belediyeleri için belirlenen belediye meclisi üye sayısının, her ilçe için beşte biri alınmak suretiyle bulunan toplam sayı kadar üyelerden oluşur. Bunlara ilaveten büyükşehir belediye meclis üyeleri için kontenjan (1-6 kişi) üyelikte bulunur. Büyükşehir belediye meclis üyelerinin aynı anda iki meclis üyesi olmaları, onları, tüm kente (il mülki idare sınırı) ilişkin karar almada daha çok bilgi ve tecrübe sahibi olmalarını gerektirir. Büyükşehir belediye meclis üyelerinden hem ilçeye hem de büyükşehir yönetimine önemli katkılar sağlanmaları beklenir. Bu konuda büyükşehir belediye meclis üyeleri üzerine yapılan bir saha çalışmasında, meclis üyeleri, her iki belediyeye aynı düzeyde katkı sunduklarını beyan etmişlerdir (Şengül, 2010: 118).

 Copyright © International Science and Technology Conference (ISTEC)

Büyükşehir belediye meclislerinin görev ve yetkileri konusunda büyükşehir belediye yönetimlerini düzenleyen 5216 sayılı Kanunda ayrı bir başlık halinde düzenleme yapılmamıştır. Fakat kanunun çeşitli maddelerinde meclise çok sayıda görev ve yetkiler verilmiştir. 5393 sayılı Belediye Kanunu hükümleri esas itibariyle büyükşehir belediye meclis üyeleri için de geçerlidir (Dönmez, 2010: 84). Buna göre 5216 sayılı Büyükşehir Belediye Kanunu ile 5393 sayılı Belediye Kanunu birlikte ele alındığında büyükşehir belediye meclisinin görev ve yetkileri arasında şunlar bulunur: Stratejik plân ile yatırım ve çalışma programlarını kabul etmek; bütçe ve kesin hesabı kabul etmek; belediyenin imar plânlarını görüşmek ve onaylamak; büyükşehir ve il belediyelerinde il çevre düzeni plânını kabul etmek; borçlanmaya karar vermek; kanunlarda vergi, resim, harç ve katılma payı konusu yapılmayan ve ilgililerin isteğine bağlı hizmetler için uygulanacak ücret tarifesini belirlemek; şartlı bağışları kabul etmek; belediye adına imtiyaz verilmesine ve belediye yatırımlarının yap-işlet ya da yap-işlet-devret modeli ile yapılmasına karar vermek; meclis başkanlık divanını ve encümen üyeleri ile ihtisas komisyonları üyelerini seçmek; norm kadro çerçevesinde belediyenin ve bağlı kuruluşlarının kadrolarının ihdas, iptal ve değiştirilmesine karar vermek; belediye tarafından çıkarılacak yönetmelikleri kabul etmek; meydan, cadde, sokak, park ve tesislere ad vermek; mahalle kurulması, kaldırılması, birleştirilmesi, adlarıyla sınırlarının tespiti ve değiştirilmesine karar vermek; diğer yerel yönetimlerle birlik kurulmasına, kurulmuş birliklere katılmaya ya da ayrılmaya karar vermek; yurt içindeki ve İçişleri Bakanlığı'nın izniyle yurt dışındaki belediyeler ve yerel yönetim birlikleriyle karşılıklı iş birliği yapma konusunda karar vermek.

Belediyenin görev ve sorumlulukları ise, imar, su ve kanalizasyon, ulaşım gibi kentsel alt yapı; coğrafî ve kent bilgi sistemleri; çevre ve çevre sağlığı, temizlik ve katı atık; zabıta, itfaiye, acil yardım, kurtarma ve ambulans; şehir içi trafik; defin ve mezarlıklar; ağaçlandırma, park ve yeşil alanlar; konut; sosyal hizmet ve yardım; meslek ve beceri kazandırma; kadınlar ve çocuklar için konukevleri açma; sağlıkla ilgili her türlü tesisi açma; mabetlerin yapımı, bakımı, onarımını yapma; kültür ve tabiat varlıkları ile tarihî dokunun ve kent tarihi bakımından önem taşıyan mekânların ve işlevlerinin korunmasını sağlama; sporu teşvik etmek amacıyla gençlere spor malzemesi verme ve gıda bankacılığı yapma.

Siyasal Kültür Kavramı

Siyasal kültür kavramı, 1960'lı yılların başlarında siyaset bilimi literatürüne girmiştir. Siyaset bilimi çalışmalarına yeni bir yaklaşım getiren siyasal kültür kavramı, kamu hukukunun etkisindeki kurumsal yaklaşımın, siyasetin toplumsal boyutunu ihmal eden, formel ilişkilere ve yapılara odaklanmasına bir itirazı ifade etmektedir.

Siyasal kültür kavramı etrafında kümelenmiş bilim çevreleri, kurumları ve yapıları inceleyerek gerçekte siyasetin nasıl işlediğini anlayabilmenin zor olduğunu, siyasetin gerçek mahiyetini ve işleyişini anlayabilmek için kurum ve yapıların içinde var olduğu toplumsal yapıya bakmak gerektiği konusuna yoğunlaşmaktadırlar. Çünkü siyaseti işleten bu kurumlar, toplumsal zeminde yer alan dinamikler tarafından biçimlendirilmektedir (Türköne, 2010: 222). Olgulardan herhangi birine öncelik vermektense, iki olgu (siyasi kültür ve siyasal kurumlar) arasında karşılıklı bir etkileşim olduğunu varsaymak daha uygun bir tespit olacaktır. Yani siyasi kültür, sadece belirleyen bir değişken değildir, aynı zamanda belirlenen bir değişkendir. Bağımsız ya da bağımlı bir değişken olma durumu siyasal kurumlar için de geçerlidir.

Siyasal kültür, içinde barındırdığı farklı unsurlarla bir bütün oluşturan genel kültürün siyasete tekabül eden parçasını oluşturmaktadır. "Bir insan grubu ya da toplumda kişiden kişiye ya da kuşaktan kuşağa geçen bilgi, değerler, görenekler ve maddi değerler" genel kültürün tanımı ise, siyasal kültür de bu genel tanım içinde geçen siyasete ilişkin bilgi, değerler, semboller, ritüeller ve inançlar bütünüdür (Ozankaya, 1971: 1). Buna göre, bir insan grubunda, toplum ya da siyasi kurumda içkin yönetim anlayışı, hoşgörü düzeyi, din algısı, birey ve topluma atfedilen değer, cinsiyet özellikleri, siyasal duygu ve inançlar ve siyasal üslup siyasal kültüre ait unsurlardır.

Siyasal kültürün, ne tür içeriğe sahip olursa olsun hâkim olduğu toplumda bireylerin siyasete ilişkin algılarını, siyasal katılma biçim ve düzeylerini belirlemekte olduğu düşünülmekte ve siyasi olana ilgi duyma, ilgiyi bilgiye dönüştürme, bilgiyi bir değer haline getirme ve bunun sonunda davranış gösterme, ayrıca kamu kurumlarına yönelik beklentilere kadar her insani hal ve tavrı biçimlendirdiği kabul edilmektedir (Oktay, 2005: 214-215). Siyasal kültüre biçilen bu tek taraflı rol abartılı da olsa, siyasal kültürün söz konusu durumları biçimlendirmede önemli bir misyonu yerine getirdiği gerçeğini değiştirmez.

Kültür kavramını, bağımsız değişken olarak ele alan ilk önemli çalışma Almond ve Verba'ya ait *The Civic Culture* başlıklı saha çalışmasıdır. Demokrasi ile siyasi tavırlar arasındaki ilişkiyi esas alan bu çalışma, beş ülkeyi (ABD, Batı Almanya, İngiltere, İtalya ve Meksika) karşılaştırma tekniğine dayanmaktadır. Çalışmada

 Copyright © International Science and Technology Conference (ISTEC)

kültürün oluşum süreci üç boyutta ele alınmaktadır (Almond & Verba, 1963: 15): Siyasi sisteme ilişkin bilgiyi içeren tanıma boyutu, lidere ve siyasi kurumlara bağlılığı içeren duygu boyutu ve siyasi olaylara ilişkin değer yargılarını içeren yargı boyutu.

Almond ve Verba, kültüre ait bu boyutların birlikte oluşturduğu bütüne bağlı olarak üç tür siyasal kültür kalıbından söz etmektedirler (Almond & Verba, 1963: 17-19): Yerel siyasal kültür, uyrukluk (tabiyet) kültürü ve katılımcı siyasal kültür.

Yerel siyasal kültür, milli kültür niteliği kazanmamış, köy, bölge ve etnik kimliklerin yaygın olduğu (daha ulus aşamasına gelmemiş) yerlere ait kültürdür. Bu kültür biçiminde birey, daha çok içinde yaşadığı çevrenin değerleriyle kendisini özdeşleştirmektedir, yerel bir aidiyete sahiptir. Ulusal çaptaki kurumlardan ne haberi, ne de beklentisi vardır. Bundan dolayı, siyasi sisteme yönelik tanıma, duygu ve değer yargıları yerel sınırları aşamamakta, ulusal bir ölçeğe ulaşamamaktadır.

Uyrukluk kültürü, ulus kimliğini kazanmış, belli ölçülerde modernleşmiş ve bireyin sistemin kurumlarının ne şekilde işlediğinin farkında olduğu bir kültürdür. Ancak sistem bireyin siyasete katılımına izin vermediği için, birey, sistemin işleyişi karşısında pasiftir. Siyasal sistemin karar ve eylemlerine karşı etkili olamayacağını düşünen bireyin siyasal etkinlik duygusu zayıftır. Birey, kendi köşesine çekilmiş, sistemden çekinen bir pozisyondadır. Siyaset karşısındaki tavrında ürkeklik ve tevekkül hâkimdir.

Katılımcı kültürün hüküm sürdüğü toplumda birey, siyasi sisteme karşı yeterli bilgiye sahip olduğu gibi sistemi etkileyebileceği ve onu değiştirebileceği inancındadır, yani siyasi etkinlik duygusu güçlüdür. Sistem de açık bir sistem olduğundan katılıma izin vermekte ve birey aktif bir şekilde siyasete katılmakta, siyasi sisteme etki edebilecek – siyasal partiye ve sivil toplum örgütüne üye olma, oy kullanma, gösteri ve yürüyüşe katılma gibi - bütün katılım yollarına başvurmaktadır.

Almond ve Verba'nın yaptığı bu sınıflandırma bir idealize etme halidir. Her toplumda bu üç kültür saf hali ile bulunmazlar. Genelde bir toplumda bu üç kültür biçimi birlikte bulunmaktadır. Ağırlık durumlarına göre biri diğerinin önünde bulunabilmektedir. Bundan dolayı, bir toplumun bu kültür biçimlerinden hangisine sahip olduğu ağırlık durumlarına göre tespit edilmektedir.

Çalışmanın Amacı, Kapsamı ve Araştırmanın Yöntemi

Araştırmanın Amacı ve Kapsamı

Belediyeler, yerel alanda yürütülen siyasetin en önemli unsurunu oluşturmaktadır. Dolayısıyla yerel siyaset denildiğinde ilk akla gelen kuruluş belediyeler olmaktadır. Günümüz demokrasisi yetkilerin olabildiğince yerele aktarıldığı bir siyasi anlayışı ifade etmektedir. Bir bakıma günümüz çoğulcu demokratik sistemleri, yetkileri genişletilmiş belediye yönetimleriyle adeta özdeşleşmiştir. Türkiye'de 2004 yılından bu yana büyükşehir belediyesi kanununda yapılan değişikliklerle belediyelerin görev ve yetkileri arttırılmış, hizmet alanları genişletilmiştir. Buna göre, "5216 sayılı Büyükşehir Belediyesi Kanunu" ve "6360 sayılı On Üç İlde Büyükşehir Belediyesi ve 26 İlçe Kurulması ile Bazı Kanun ve Kanun Hükmünde Kararnamelerde Değişiklik Yapılmasına Dair Kanun" büyükşehir belediyelerinin görev ve yetkilerini arttırdığı gibi hizmet alanlarını da genişletmiştir*. Büyükşehir belediyelerinin sınırlarının il mülki idare sınırı olarak belirlenmesi büyükşehir belediye meclis üyelerinin hizmet alanlarını ilçe ve mahalleri de kapsayacak şekilde genişletmiştir. Bu durum, büyükşehir belediye meclislerinin karar organı hükmündeki meclis üyelerinin önemini daha da arttırmıştır.

Belediye meclis üyelerinin siyasal kültürü, bu çalışma özelinde, üç açıdan önemlidir: Birincisi; belediye meclis üyeleri, belediyenin karar organı olup, aldıkları kararlar ile toplumun sosyal, ekonomik, siyasal ve kültürel yaşamını etkileyebilecek bir konumu işgal etmektedirler. Büyükşehir belediye meclis üyelerinin bu konumu, onların siyasal kültürlerini önemli kılmaktadır. İkincisi; belediye meclis üyeleri, halk tarafından seçildiği için halkın siyasal kültürünü belli ölçüde yansıtma özelliği taşımaktadır. Üçüncüsü; belediye meclis üyeleri, sahip oldukları siyasal değer ve kültür ile mensup oldukları siyasal partinin siyasal kültürünü, kısmi de olsa, yansıtmaktadırlar. Bu çerçeve çalışmanın amacı, belediye meclis üyelerinin siyasal kültürlerini incelemektir. Bu çalışma Şanlıurfa Büyükşehir Belediye Meclis Üyeleriyle sınırlı tutulmuştur.

Araştırmanın Yöntemi

Bu çalışma, betimsel tarama yöntemine dayanmaktadır. Çalışmada, anket tekniği kullanılmıştır. Çalışma grubu, 83 üyeden oluşan Şanlıurfa Büyükşehir Belediyesi Meclis Üyeleri'nin tümünü oluşturmaktadır.

Belediye meclis üyeleri, önceden meclis tarafından belirlenen günde, alışılmış toplantı yerinde toplanmaktadır. Bu çalışmanın 29 sorudan oluşan anket soruları, çalışmanın yürütücüleri tarafından meclis üyelerinin toplandığı

 Copyright © International Science and Technology Conference (ISTEC)

13 Nisan 2016 tarihinde uygulanmıştır. Meclis toplantısına 43 belediye meclis üyesi katılmıştır. Toplantı öncesinde anketin içeriği ve amacı hakkında bilgiler verilmiş ve meclis başkanının yardımı ile anket soruları tek tek toplantıya katılmış 43 meclis üyesine dağıtılmıştır. Geri dönüşümü gerçekleşen anket sorularından beş tanesinin hiç cevaplandırılmadığı ya da değerlendirmede dikkate alınmaması gereken düzeyde eksik cevaplandırıldığı tespit edilmiştir. Sonuç olarak, 39 meclis üyesinin ankete verdikleri cevaplar değerlendirme kapsamına alınmıştır. Geçerliliği kabul edilen 39 anket sayısı Şanlıurfa Büyükşehir Belediye Meclis Üyeleri'nin toplamının % 47'sine denk gelmektedir. Bu oran, Şanlıurfa Büyükşehir Belediye Meclis Üyeleri'ni % 10 yanılma payı ile temsil etme gücüne sahiptir (Baş, 2003: 46). Anket sonuçları SPSS programında analiz edilirken, kayıp değer göz önünde tutulmamıştır. Analizde sadece cevap verilen sorular dikkate alınmıştır.

Bu çalışmada, Şanlıurfa Büyükşehir Belediye Meclis Üyeleri'nin siyasal kültürüne ait iki sorunun cevabı aranacaktır:

- Genel olarak Şanlıurfa Büyükşehir Belediye Meclis Üyeleri'nin siyasal kültürü ne kadar gelişmiştir?
- Demografik özellikler, belediye meclis üyelerinin siyasal kültür anlayışlarını ne ölçüde etkilemektedir?

Araştırma Verilerinin Değerlendirilmesi

Bu çalışmada, ankete katılanların "yaş", "cinsiyet", "öğrenim durumu", "ikamet yeri", "meslek", "gelir", "aşiret mensubiyeti" ve "siyasal parti mensubiyeti" özellikleri siyasal kültür durumları ile değerlendirilmiştir. Ankete katılan meclis üyelerinin % 85'inden fazlası şehirde oturduğundan ve aşiret üyesi olduklarından dolayı, ikamet yeri ve aşiret mensubiyeti değişkenleri analiz dışında tutulmuştur. İkamet yeri ve aşiret üyeliği değişkenleri ankete katılanların kahir ekseriyetinin kentte oturuyor (% 84.6) olmaları ve aşiret mensubu Adalet ve Kalkınma Partisi (AK Parti) % 92.6, Halkların Demokratik Partisi/Demokratik Bölgeler Partisi (HDP/DBP) % 70 ve Milliyetçi Hareket Partisi (MHP) % 100) olmaları dolayısıyla iki değişken analiz dışında tutulmuştur. Geri kalan değişkenler içinde üç değişken ile siyasal kültür sorularına verilen cevaplar (bağımlı değişkenler) arasında anlamlılık ilişkisi tespit edilmiştir. Bu değişkenler cinsiyet, öğrenim durumu ve siyasal parti mensubiyetidir. Bunların dışında yer alan yaş, meslek ve gelir değişkenleri ile belediye meclis üyelerinin siyasal kültür nitelikleri arasında anlamlı bir ilişki tespit edilmemiştir.

Saha çalışması iki alt başlık altında değerlendirilmiştir. Birinci alt başlıkta, ankete katılan büyükşehir belediye meclis üyelerinin demografik özellikleri ele alınmıştır. İkinci alt başlıkta, belediye meclis üyelerinin siyasal kültür bağlamında siyasal ilgi, siyasal bilgi ve siyasal değerleri frekans tabloları biçiminde analiz edilmiştir. Ayrıca, bağımsız değişken durumundaki büyükşehir belediye meclis üyelerinin cinsiyet özellikleri, öğrenim durumları ve siyasal parti mensubiyeti özellikleri, bağımlı değişken durumundaki belediye meclis üyelerinin siyasal ilgi, siyasal bilgi ve siyasal değere ilişkin anket sorularına verdikleri cevaplarla çaprazlama (crosstab) şekilde değerlendirilmiştir.

Demografik Özellikler

Yaş özelliklerine göre, ankete katılan katılımcılar içinden "26-29" yaş kategorisinde yer alan kimse çıkmamıştır. En yüksek oran orta yaş kategorisi olan "30-45" yaş (% 61.5) aralığında bulunanlara ait iken, en düşük oran "56 ve yukarısı" yaş (% 15.4) aralığında bulunanlara aittir. "46-55" yaş aralığına mensup katılımcı oranı ise % 23.1'dir. Bu oranlardan Şanlıurfa Büyükşehir Belediye Meclis Üyeleri'nin büyük çoğunluğunun orta yaş ve üstü kategorisinde yer aldıkları anlaşılmaktadır. Şanlıurfa Büyükşehir Belediye Meclisi Üyeleri'nden ankete katılanların % 84.6'sı erkek, % 15.4'ü kadındır. Dolayısıyla, Şanlıurfa Büyükşehir Belediye Meclisi erkek ağırlıklı bir meclistir. Öğrenim durumuna göre, en yüksek oran lisans (% 46.2) düzeyinde eğitim almış katılımcılara, en düşük oran ise lisansüstü (% 5.1) düzeyinde eğitim almış katılımcılara aittir. Lise mezunlarının oranı % 41, ortaöğretim mezunlarının oranı % 7.7'dir. Katılımcıların % 61.5'i Şanlıurfa kent merkezinde oturuyor iken, % 23.1'i "ilçe"de, % 15.4'ü de "köy"de oturmaktadır. Meslek grupları içinde en yüksek oran profesyonel meslek (% 30.8) grubuna ait iken, en düşük oran emekli meslek (% 10.3) grubuna aittir. Esnaf meslek grubuna ait olanların oranı ise % 20.5'tir. Gelir gruplarına göre, "1500-2500" TL, "2501-3500" TL ve "3501-5000" TL grubuna mensup katılımcıların oranı eşit düzeyde % 28.2'dir. Geri kalan % 15.4'lük oran "5001 ve yukarısı" TL gelir grubuna aittir. Katılımcıların demografik özellikleri açısından en çarpıcı noktalardan bir tanesi aşiret mensubiyetidir. Katılımcıların % 87.2'si gibi çok yüksek bir oranı bir aşirete mensup olduğunu ifade etmiştir. Katılımcıların % 69.2'si AK Parti üyesi, % 25.6'si HDP/DBP üyesidir. Üyelerin % 5.1'i ise MHP'ye mensuptur. Ankete katılan toplam altı kadın üyeden beş tanesi HDP/DBP, sadece bir tanesi AK Parti üyesidir.

Siyasal Kültür

Bu çalışmada, siyasal kültür üç alt başlık altında incelenmiştir: Siyasal ilgi, siyasal bilgi ve siyasal değer. Siyasal ilgi, bireylerin siyasete ne düzeyde alaka gösterdiklerini; siyasal bilgi, siyasete ilişkin sahip oldukları malumatı ve siyasal değer de siyasete dair algılarını, beklentilerini ve moral değerlerini oluşturmaktadır.

 Copyright © International Science and Technology Conference (ISTEC)

Siyasal İlgi

Tablo 1: Siyasi gelişmeleri hangi sıklıkla takip etmektesiniz?

ŞBŞBMÜ	Sayı	Yüzdelik
Düzenli olarak	35	89.7
Ara sıra	3	7.7
Pek takip etmem	1	2.6
Toplam	39	100

Ankete katılanlar, çok yüksek düzeyde gazete, internet gibi sosyal medya iletişim kanalları yoluyla "düzenli olarak" siyasal gelişmeleri takip ettiklerini ifade etmişlerdir (Tablo 1). Cinsiyet özelliklerine göre en yüksek oran kadınlara aittir. Ankete katılan kadınlar % 100 oranında siyasi gelişmeleri düzenli takip ettiklerini ifade etmişlerdir. Öğrenim durumuna göre, daha düşük eğitimli olanlardan (ortaöğretim % 66.7) daha yüksek eğitimli olanlara (lisansüstü % 100) doğru siyasi gelişmeleri düzenli takip etme oranı, düzenli bir şekilde artmaktadır. Siyasal parti mensubiyetine göre HDP/DBP üyeleri çok az bir farkla AK Parti üyelerine göre daha yüksek düzeyde siyasal gelişmeleri düzenli takip ettiklerini ifade etmişlerdir.

Tablo 2: Televizyon programlarındaki siyasi tartışma programlarını hangi sıklıkla takip etmektesiniz?

ŞBŞBMÜ	Sayı	Yüzdelik
Düzenli olarak	15	39.5
Ara sıra	23	60.5
Pek takip etmem	-	-
Toplam	38	100

Televizyon programları üzerinden "düzenli olarak" siyasi tartışma programlarını takip eden üyeler, toplam üyelerin yarısından azdır. Belediye meclis üyeleri daha çok "ara sıra" tartışma programlarını takip ettiklerini ifade etmişlerdir. Bununla birlikte, hiçbir üye "pek takip etmem" cevabını vermemiştir (Tablo 2). Hem kadın hem erkeklerde oran genel oranlara yakındır. Erkekler kadınlara göre az bir farkla daha yüksek oranda düzenli olarak tartışma programlarını takip etmektedirler. Öğrenim durumuna göre, "ortaöğretim" düzeyinde tartışma programlarını düzenli takip ettiğini söyleyen hiçbir üye çıkmamışken, "lise"den (% 33.3) "lisansüstü" (% 100) düzeyine doğru oran düzenli olarak artmaktadır. Siyasal parti özelliklerine göre AK Parti üyeleri HDP/DBP üyelerine göre daha yüksek düzeyde tartışma programlarını takip etmektedirler. HDP/DBP'li üyeler belli bir etnik grubun kimlik hakları üzerinde yürüttüğü siyasi pozisyonu itibariyle daha yüksek düzeyde siyasi tartışmaları takip etmeleri beklenirdi.

Siyasal Bilgi

Tablo 3: Avrupa Birliği ülkelerinde hakim demokratik uygulama biçimi hangisidir?

ŞBŞBMÜ	Sayı	Yüzdelik
Çoğunluk demokrasisi	10	25.6
Çoğulcu demokrasi	20	51.3
Vesayetçi demokrasi	-	-
Bilmiyorum	9	23.1
Toplam	39	100

Ankete katılan belediye meclis üyelerine, Avrupa Birliği ülkelerinde hâkim demokratik uygulamanın ne olduğu sorulmuştur. Belediye meclis üyelerinin verdiği cevaplardan hareketle soruya ilişkin siyasal bilgilerinin yeterli olmadığını söylemek mümkündür. Çünkü üyelerin ancak 1/2'si "çoğulcu demokrasi" cevabını vererek doğru cevabı bilmiştir (Tablo 3). Cinsiyete göre verilen doğru cevaplar hem kadın hem erkeklerde genel ortalama ile aynı orandadır. Öğrenim durumuna göre "ortaöğretim" düzeyinde hiç kimse doğru cevap vermemiştir. "Lise"den (% 50) "lisansüstü"ne (% 100) doğru ise oran düzenli olarak artmaktadır. Siyasal parti mensubiyeti değişkeninde HDP/DBP üyeleri (% 70) AK Parti üyelerine (% 57.7) oranla belirgin bir bilgi üstünlüğüne sahiptirler. MHP'li olan iki üyeden sadece biri doğru cevap vermiştir.

Tablo 4: Avrupa Yerel Yönetimler Özerklik Şartı neyi içermektedir?

ŞBŞBMÜ	Sayı	Yüzdelik
Güçlü bir merkezi yönetim	7	17.9
Yerindelik denetiminin getirilmesi	-	-
Yetkinin yerel yönetimlere aktarılması	24	61.5
Bilmiyorum	8	20.5
Toplam	39	100

"Avrupa Yerel Yönetimler Özerklik Şartı" sadece bilim insanları ve ilgili siyasi çevrelerin bilgisi dâhilinde olan bir konu değildir. Türkiye'deki siyasi konjonktür gereği bir çok kişi yüzeysel de olsa, bu şartın en azından yerel yönetimlerin yetkilerinin arttırılmasını öngören bir belge olduğunu tahmin eder. Ancak belediye meclis üyelerinin sadece yaklaşık 2/3'ü doğru cevap verebilmiştir (Tablo 4). Bu soruya "kadın"ların % 83.3'ü" erkek"lerin % 57.6'sı doğru cevap vermiştir. "Ortaöğretim" düzeyinde eğitime sahip olanların hiç birisi bu soruya doğru cevap vermemiş iken, "lisansüstü" düzeyinde eğitim sahibi olan kişilerin tümü doğru cevap vermiştir. "Lise" ve "lisans" düzeyinde oranlar sırasıyla % 75 ve % 55.6'dır. Siyasal parti özelliklerine göre, MHP'li üyeler (% 100) ve HDP/DBP'li üyeler (% 90) çok yüksek oranda soruya doğru cevap vermişken, AK Parti'li üyelerin (% 48.1) ancak yarıya yakını doğru cevap vermiştir.

Tablo 5: Türkiye Avrupa Yerel Yönetimler Özerklik Şartı'na hangi konularda çekince koymuştur?

ŞBŞBMÜ	Sayı	Yüzdelik
Yetkinin yerel yönetimlere aktarılması	7	17.9
Diğer	7	17.9
Bilmiyorum	25	64.1
Toplam	39	100

Türkiye "Avrupa Yerel Yönetimler Özerklik Şartı"nı imzalamış olmakla birlikte bazı maddelerine (mali kaynaklar, iç örgütlenme, idari vesayet ve yargı yoluna başvurma vb.) çekinceler koymuştur. Geniş anlamda Türkiye'nin çekince koyduğu maddeler "yetkinin yerel yönetimlere aktarılması" konularıdır (Keleş, 2000: 55). Bu soru açık uçlu olarak sorulmuş olup, sorunun cevabı katılımcılar tarafından yazılmıştır. Bu soruya üyelerin sadece % 17.9'u doğru cevap verebilmiştir. "Diğer"i değişkeninde yer alan % 17.9'luk kesim "Kürtler'in hak elde etmesi konuları", "siyasi özerklik", "anadilde eğitim" gibi doğru olmayan cevaplar vermiştir. "Diğer"i değişkeni ile birlikte Avrupa Yerel Yönetimler Özerklik Şartı'na Türkiye'nin çekince koyduğu konuları bilmeyenlerin oranı % 82 gibi çok yüksek bir orandır (Tablo 5). Cinsiyet özelliklerine göre, kadın ve erkeklerde soruya doğru cevap verme oranı genel toplamdaki doğru oran ile hemen hemen aynıdır. Ortaöğretim düzeyinde eğitimlilerde soruya doğru cevap veren kimse olmamıştır. Lise ve lisansüstü eğitimlilerde oran sırasıyla % 25 ve % 50'dir. Siyasal parti mensubiyetine göre MHP üyelerinde oran % 50, HDP/DBP üyelerinde oran % 30 ve AK Parti üyelerinde oran % 11.1'dir.

Tablo 6: Laiklik nedir?

ŞBŞBMÜ	Sayı	Yüzdelik
Din ve devlet işlerinin birbirinden ayrı olması	24	63.2
Bilmiyorum	14	36.8
Toplam	38	100

Laiklik nedir? sorusu da açık uçlu olarak sorulmuştur. Laiklik kavramı, popüler bir kavramdır. Birincisi, Türkiye'de mevcut demokratik sistem laik bir sistemdir ve sistemin bu yönüne sürekli vurgu yapılmaktadır. İkincisi, Laiklik kavramı, Türkiye'de siyasal kültür alanında üzerinde en çok tartışılan kavramlardan bir tanesidir. Bununla birlikte, belediye meclis üyeleri, kendilerinden beklenen oranda söz konusu soruya doğru cevap vermemiştir. Ankete katılan Şanlıurfa Büyükşehir Belediye Meclis Üyeleri'nin ancak 2/3 kadarı laiklik kavramının tanımını bilmiştir (Tablo 6). Ankete katılanların hem öğrenim düzeyleri hem yürüttükleri siyasi faaliyet düşünüldüğünde daha yüksek oranda laikliğin tanımını bilmeleri beklenirdi. Daha önceki sorularda olduğu gibi bu soruda da "kadın"lar (% 50) "erkek"lere (% 34.4) oranla daha yüksek bir doğru cevap verme oranına sahiptir. Öğrenim durumuna göre, laiklik kavramını bilme oranı "ortaöğretim"den (% 33.3) "lisans" (% 76.5) düzeyine doğru düzenli bir şekilde artmaktadır. "Lisansüstü" düzeyinde eğitime sahip üyelerin biri doğru cevap vermişken biri "bilmiyorum" cevabını vermiştir. HDP/DBP'li üyeler ile AK Parti'li üyeler, sırasıyla % 60

 Copyright © International Science and Technology Conference (ISTEC)

ve % 61.5 oranında doğru cevap vermiş iken, MHP'li üyelerin ikisi de laiklik tanımı sorusuna doğru cevap vermiştir.

Siyasal Değer

Tablo 7: Nasıl bir yönetimden yanasınız?

ŞBŞBMÜ	Sayı	Yüzdelik
Demokratik bir yönetimden yanayım	25	64.1
Dine dayanan bir yönetimden yanayım	1	2.6
Demokrasi ve dinin iç içe olduğu bir yönetimden yanayım	12	30.8
Tek kişinin hüküm sürdüğü bir yönetimden yanayım	-	-
Kararsızım	1	2.6
Toplam	39	100

Şanlıurfa Büyükşehir Belediye Meclis Üyeleri'nin demokratik bir sisteme verdikleri desteğin çok güçlü olmadığı görülmektedir. Ankete katılanların % 30.8'i demokrasi ile dinin iç içe olduğu bir sistemi savunmuşken, % 2.6'sı da dini bir yönetimi benimsemiştir. Bu oranlardan da ankete katılan belediye meclis üyelerinin % 33.4'ünün batılı anlamda demokratik bir sisteme sıcak bakmadıkları anlaşılmaktadır. Cinsiyet özelliklerine göre, kadınlar (% 83.3) erkeklere (% 60.6) göre daha yüksek oranda demokratik bir sistemden yana görülmektedirler. Öğrenim durumu ile değişkenler arasında anlamlı bir ilişki tespit edilmemişken, siyasal parti mensubiyeti ile sahip çıkılan yönetim biçimi arasında çok güçlü bir ilişki tespit edilmiştir. Buna göre, AK Parti üyelerinin sadece % 50.6'sı demokratik bir yönetimden yana tutum belirlemişken, HDP/DBP üyelerinin tamamı bu yönde beyanda bulunmuşlardır. MHP'nin iki üyesi ise demokrasi ve dinin iç içe olduğu bir yönetim anlayışını benimsediklerini ifade etmişlerdir.

Tablo 8: Yerel Yönetimlerin yetkileri ile ilgili ne düşünüyorsunuz?

ŞBŞBMÜ	Sayı	Yüzdelik
Yerel yönetimler olabildiğince özerk olmalı	20	51.3
Yerel yönetimler üzerinde merkezi yönetimin sıkı bir denetimi olmalıdır	13	33.3
Kararsızım	6	15.4
Toplam	39	100

Belediye meclis üyelerinin gelişmiş çoğulcu sistemlerin mütemmim cüzü hükmündeki yerel yönetimlerin merkezi yönetim karşısında daha özerk bir konuma sahip olmaları gerektiği yönündeki anlayışa da çok sıcak bakmadıkları anlaşılmaktadır. Ankete katılan üyelerin sadece 1/2'si yerel yönetimlerin özerk olması gerektiğini ifade etmiştir. Geri kalan üyelerin 1/2'sinin bir kısmı bu konuda sıkı merkezi yönetim denetimini benimsediklerini bir kısmı da kararsız olduklarını ifade etmişlerdir (Tablo 8). Demografik özellikler açısından, kadınlar (% 66.7) erkeklere (% 48.5) göre, HDP/DBP üyeleri (% 90) AK Parti üyelerine (% 37) göre daha güçlü bir şekilde yerel yönetimlerin özerkliğine vurgu yapmışlardır. AK Parti'li üyeler en yüksek oranda (% 44.4) yerel yönetimler üzerinde merkezi yönetimin sıkı denetimini savunmaktadırlar. Ayrıca öğrenim düzeyi yükseldikçe daha özerk yönetim anlayışına olan destek de artmaktadır.

Tablo 9: Laik bir yönetimi benimsiyor musunuz?

ŞBŞBMÜ	Sayı	Yüzdelik
Evet	18	46.2
Kararsızım	9	23.1
Hayır	12	30.8
Toplam	39	100

Din ve devlet işlerinin bir birinden ayrılması ilkesi olarak basitçe ifade edilen laiklik, demokratik sistemin ayrılmaz bir parçasını oluşturmaktadır. Bir sistemde egemenliğin halka ait olması için sistemin kaçınılmaz bir şekilde laik olması gerekmektedir. "Laik bir yönetimi benimsiyor musunuz?" sorusuna verilen cevaplar, belediye meclis üyelerinin demokratik bir sisteme sundukları desteğin çok zayıf olduğunu göstermektedir. Belediye meclis üyelerinin sadece % 46.2'si laik bir yönetimden yana olduğunu beyan etmiştir (Tablo 9). Cinsiyet özelliklerine göre, erkekler (% 48.5) kadınlara (% 33.3) göre, HDP/DBP üyeleri (% 60) AK Parti üyelerine (% 40.7) göre daha yüksek oranda laik yönetimi benimsemektedirler. Öğrenim durumu ile söz konusu soruya verilen cevaplar arasında ise anlamlı bir ilişki tespit edilmemiştir. HDP/DBP, ideolojik olarak sosyalist

 Copyright © International Science and Technology Conference (ISTEC)

bir kimliğe sahiptir. HDP/DBP'li üyelerin laiklik düzenine verdikleri desteğin oransal düzeyi, partinin sosyalist ideolojisi ile büyük bir çelişki arz etmektedir (www.hdp.org.tr). HDP/DBP'li belediye meclis üyelerinin büyük çoğunluğunun (% 70) herhangi bir aşirete mensubiyetleri, geleneksel siyasal kültürde içkin değer yargılarını, söz konusu belediye meclis üyeleri için önemli kıldığı düşünülebilir.

Tablo 10: Gösteri ve yürüyüş yapmanın (yasal yollardan) sorunların çözümüne katkıda bulunacağına inanıyor musunuz?

ŞBŞBMÜ	Sayı	Yüzdelik
Evet İnanıyorum	26	66.7
Kararsızım	4	10.3
Hayır inanmıyorum	9	23.1
Toplam	39	100

Gösteri ve yürüyüş yapmak temel demokratik haklardan bir tanesidir. Gösteri ve yürüyüş, sivil toplum örgütlerini mevcut iktidar karşısında bir güç dengesi haline getirmekte ve siyasal iktidarın daha sivil bir kimlik kazanmasında önemli bir işlevi yerine getirmektedir. Ankete katılan belediye meclis üyelerinin şimdiye kadar sorulara verdikleri cevaplar - demografik özelliklerinden bağımsız olarak - güçlü bir demokratik kültüre sahip olmadıklarını ortaya koymaktadır. Ancak gösteri ve yürüyüş konusunda belediye meclis üyelerinin, katılımcı demokratik kültürde görülen güçlü siyasal etkinlik duygusuna yakın bir etkinlik duygusu taşıdıkları görülmektedir (Tablo 10). Siyasal kültür çalışmalarında, kadınların erkeklere göre daha muhafazakâr bir siyasal tutum içinde oldukları tespit edilmektedir (Lipset, 1986: 250, Abadan, 1965: 508). Ancak siyasal iktidardan hesap sormayı ifade eden bu soruda, kadınlar (% 100) erkeklere (% 60.6) göre daha yüksek oranda siyasal iktidardan hesap sorulması gerektiği yönünde beyanda bulunmuşlardır. Öğrenim düzeyi arttıkça gösteri ve yürüyüşün sorunların çözümüne katkı sunacağı yönündeki inanç artmaktadır. Buna göre ortaöğretim düzeyinde oran % 33.3 iken lisan düzeyine gelindiğinde oran % 77.8'e çıkmaktadır. Siyasal parti üyeliğine göre, HDP/DBP üyelerinin % 100'ü gösteri ve yürüyüşün sorunların çözümüne katkı sağlayacağını beyan etmişken, bu oran AK Parti üyelerinde % 59.3'te kalmaktadır. MHP'nin üyelerinden bir tanesi "kararsızım", diğeri de "hayır, inanmıyorum" cevabını vermiştir.

Tablo 11: Sivil Toplum Örgütleri'nin yerel karar alma süreçlerine katılması konusunda ne düşünüyorsunuz?

ŞBŞBMÜ	Sayı	Yüzdelik
Sivil toplum örgütleri yerel karar alma süreçlerine aktif bir şekilde katılmalı	23	59.0
Sivil toplum örgütlerinin yerel karar alma süreçlerine katılması kargaşaya neden olur	9	23.1
Kararsızım	7	17.9
Toplam	39	100

Sivil toplum örgütleri, demokrasinin en gerekli koşullarından bir tanesidir. Demokrasi eğer güçler arasında kurulan bir dengenin sonucu ise ki öyledir, bu anlamda sivil toplum örgütleri devletin devasa gücüne karşı sivil toplumu koruyan bir denge unsuru olmaktadır. Bundan dolayı, gelişmiş katılımcı demokratik sistemde sivil toplum örgütlendiği gibi, devlet de bu örgütlenmeye olanak tanımaktadır. Ankete katılan belediye meclis üyelerinin sivil toplum örgütlerinin karar alma süreçlerinde yer almaları gerektiği konusunda gerekli düzeyde demokratik ve sivil bir tutum içinde olmadıkları, devletçi bir tutum içinde oldukları görülmektedir. Ankete katılanların sadece % 59'u sivil toplum örgütlerinin aktif bir şekilde siyasetin içinde yer almalarına sıcak bakmıştır (Tablo 11). Bu konuda da kadınlar (% 100) erkeklere (% 51.5) göre, HDP/DBP üyeleri (% 90) AK Parti üyelerine (% 48.1) göre daha katılımcı bir sistemden yana tutum sergilemektedirler. AK Parti'li üyelerin 1/3'e yakını sivil toplum örgütlerinin karar alma süreçleri içinde yer almalarının kargaşaya neden olacağını ifade etmişlerdir. Sivil toplum örgütlerinin karar alma süreçleri içinde yer almaları konusunda ortaöğretim düzeyinde eğitime sahip olanlarda oran % 33 iken, diğer öğrenim kategorilerinde oran yaklaşık % 60'tır.

Tablo 12: Kadınların da erkekler gibi aktif bir şekilde siyasete katılmaları konusunda ne düşünüyorsunuz?

ŞBŞBMÜ	Sayı	Yüzdelik
Kadının asıl yeri evidir	6	15.4
Kadınlar da erkekler gibi aktif bir şekilde siyasete katılmalıdır	22	56.4
Kadınların siyasete katılıp-katılmaması çok önemli bir mesele değildir	8	20.5
Kararsızım	3	7.7
Toplam	39	100

 Copyright © International Science and Technology Conference (ISTEC)

Ankete katılan belediye meclis üyelerinin kadınların siyaset içindeki konumları konusundaki görüşleri de demokratik değerleri içerecek özellikleri taşımaktan uzaktır. Katılımcılar, daha geleneksel ve erkek egemen bir anlayışa sahiptirler. Belediye meclis üyelerinin sadece % 56.4'ü kadınların da erkekler gibi faal bir şekilde siyasetin içinde bulunmalarını doğru bulmaktadır. Geri kalan üyeler kadınların siyasetin içinde yer almalarını ya doğru bulmamakta ya da önemli görmemektedir (Tablo 12). Bu soruya verilen cevaplarda da kadınlar erkeklere göre daha çağdaş ve demokratik-katılımcı bir tutum içindedirler. Kadınların % 83.3'ü gibi yüksek bir oran kadınların kamusal alanda siyaset yapmalarını olumlu görmektedirler. Erkeklerde bu oran % 51.5'tir. Öğrenim durumuna göre de, daha eğitimli olanlar (lisansüstü % 100) daha az eğitimli olanlara (ortaöğretim % 33.3) göre daha yüksek oranda kadınların siyaset yapmalarını olumlu bulmaktadırlar. Siyasal parti mensubiyeti açısından HDP/DBP üyeleri (% 80) AK Parti üyelerine (% 48.1) göre daha yüksek oranda kadınların siyaset içinde yer almalarına daha sıcak bakmaktadırlar.

Tablo 13: Bazı ülkelerde uygulanan *"recall"* uygulamasının Türkiye'de de uygulanmasını istiyor musunuz?

ŞBŞBMÜ	Sayı	Yüzdelik
Evet	22	57.9
Kararsızım	6	15.8
Hayır	10	26.3
Toplam	38	100

Recall ya da "geri çağırma", seçilen siyasetçilerden memnun olmayan belli bir orandaki (% 15 ile % 55 arasında değişir) seçmenin seçilen kişileri görevden almasına olanak sağlar. Bu tür görevden alma yöntemine, her seçim döneminde bir defa, basit ya da mutlak çoğunluk seçim sistemlerinde başvurulabilir. Çünkü her seçilmişin ne kadar oyla seçildiği belli olması gerekir. Bu özel seçim sistemi, Türkiye'de, belediye meclis üyelerine uygulanamazken, basit çoğunluk seçim sistemiyle seçilen belediye başkanlarına uygulanabilir.

Şanlıurfa Büyükşehir Belediye Meclis Üyeleri'nin % 57.9'u *recall* uygulamasına sıcak bakmaktadırlar (Tablo 13). Demografik özelliklerine göre, kadınların sadece % 16.7'si *recall*'a olumlu bakarken % 66.7'si kararsız bir tutum içinde olduğunu beyan etmiştir. Erkeklerde ise *recall*'u olumlu görme oranı (% 65.6) kadınların oranından çok daha yüksektir. Öğrenim durumuna göre, ortaöğretim (% 33.3) düzeyinde eğitimli olanlar dışında oranlar bir birine yakın olup % 60 civarındadır. Diğer sorulara verilen cevaplara göre, HDP/DBP belediye meclis üyeleri AK Parti'li üyelere göre daha demokratik ve katılımcı bir kültüre sahip görülüyor iken, bu soruya verilen cevaplarda AK Parti'li üyelerin daha demokratik bir tutum içinde oldukları görülmektedir. AK Parti'li üyelerin % 63'ü *recall*'a olumlu bakarken, HDP/DBP üyelerinde bu yöndeki eğilim % 33.3'tür. Ancak *recall*'a "hayır" diyenlerde AK Parti'li üyelerin (% 29.6) oranı HDP'li üyelerin (% 22.2) oranından daha yüksektir.

Sonuç

Çalışmanın genel sonuçlarına göre, ankete katılan Şanlıurfa Büyükşehir Belediye Meclis Üyeleri'nin siyasete ilişkin ilgileri az, bilgileri - % 37'si laikliğin tanımını bilmeyecek kadar - olabildiğince zayıftır. Aynı zamanda, siyasal değerleri de gelişmiş, modern ve katılımcı demokratik nitelikteki toplumların sahip olduğu değerlerden uzaktır. Ankete katılan belediye meclis üyelerinin önemli bir kısmı, demokratik bir yönetime gereken desteği vermemekte, yerel yönetimler üzerinde merkezi yönetimin sıkı denetimini benimsemekte, demokrasinin vazgeçilmez koşulu olan laikliğe olumlu bir anlam yüklememekte, sivil toplumun yerel alanda siyasal karar alma süreçlerinde yer almalarına gereken önemi vermemekte, kadınların siyasal yaşamda yer almasına çok sıcak bakmamaktadır. Belediye meclis üyelerinin siyasal kültür açısından olumlu görülebilecek tutumları, siyasal etkinlik konusundadır. Buradan hareketle, Şanlıurfa Belediye Meclis Üyeleri'nin katılımcı siyasal kültürlerinin zayıf olduğunu; yerel siyasal kültür, uyrukluk kültürü ve katılımcı siyasal kültürün iç içe geçtiği bir siyasal kültüre sahip olduklarını söylemek mümkündür. Ankete katılan belediye meclis üyeleri, zayıf siyasal ilgileri, az siyasal bilgileri, önemsenecek oranda laik devlet düzenine sıcak bakmamaları ve dine dayanan bir yönetim biçimine yönelik sahip oldukları değer yargıları ile yerel siyasal kültüre; yerel yönetimler üzerinde devlet denetimine atfettikleri önem açısından uyrukluk kültürüne ve belli oranda demokratik yönetimin değerlerini önemsemeleri bakımından da katılımcı siyasal kültüre yaklaşmaktadırlar.

Demografik özelliklerine göre, kadınlar erkeklere oranla, daha eğitimli olanlar daha az eğitimli olanlara oranla ve HDP/DBP'li üyeler, AK Parti'li üyelere oranla siyasete daha ilgili oldukları gibi; siyasal bilgileri de daha yüksektir. Dolayısıyla, katılımcı siyasal kültüre daha yakın durmaktadırlar. Siyasal değerler konusunda da, kadınlar erkeklere oranla, daha eğitimli olanlar daha az eğitimli olanlara oranla, HDP/DBP'li üyeler, AK Parti'li üyelere oranla katılımcı demokratik kültüre daha yakın tutum içindedirler.

 Copyright © International Science and Technology Conference (ISTEC)

Ankete katılan altı kadın üyeden bir tanesi dışında geri kalan üyeler HDP/DBP parti üyesidir. Dolayısıyla, kadın belediye meclis üyelerinin siyasete ilişkin siyasal kültür anlayışlarının cinsiyet özelliklerinden mi kaynaklandığı ya da mensup oldukları siyasal partinin siyasi duruşu yoksa ideolojisinden mi kaynaklandığı tartışmalıdır. Tartışmalı bir diğer konu da HDP/DBP parti üyelerinin AK Parti'li üyelerden daha güçlü bir şekilde katılımcı siyasal kültüre yakın durmalarıdır. Burada da, HDP/DBP'li üyelerin bu tutumunun katılımcı siyasal kültürde içkin siyasal değerler ile onların temsil iddiasında oldukları etnik gruba ilişkin talep ettikleri haklarla örtüşmesinden mi kaynaklandığı, yoksa ideolojik-ilkesel bir duruş mu olduğu tartışmaya açıktır.

* 6360 sayılı Kanunla getirilen yenilikler çerçevesinde büyükşehir belediye sınırı il mülki idare sınırı olarak belirlenmiş; büyükşehir ilçelerinin mülki idare sınırları içerisinde yer alan köy ve belde belediyelerinin tüzel kişiliği ile il özel idarelerinin tüzel kişiliği ve bucak teşkilatı kaldırılmıştır (Resmi Gazete, 6.12.2012).

YEREL ZEMİN KOŞULLARININ EN BÜYÜK İVME DEĞERİNE ETKİSİ

Ercan IŞIK

Bitlis Eren Üniversitesi, Mühendislik- Mimarlık Fakültesi, İnşaat Mühendisliği Bölümü, Bitlis,TURKEY

eisik@beu.edu.tr

Özet: Yerel jeolojik zemin koşullarının sismik hareketlerin karakterlerini doğrudan etkilediği ve değiştirdiği, bu zeminler üzerindeki mevcut yapılar üzerinde hasara sebep olabileceği bilinen bir gerçektir. Bu çalışmada, farklı azalım ilişkileri için farklı yerel zemin koşulları ve değişik fay çeşitleri kullanılarak tahmini en büyük ivme değerleri hesaplanmıştır. Çalışmadaki amaç değişik büyüklükteki depremler için farklı zemin koşullarının, farklı fayların ivme değerleri üzerindeki etkisinin incelenmesidir. Bu amaçla araştırmacılar tarafından önerilen azalım ilişkileri kullanılmıştır. Yerel zemin çeşitleri olarak TDY 2007'de verilen zemin sınıfları olan A, B, C ve D sınıfı zeminler veri olarak alınmıştır. Yerel zemin koşullarının yanı sıra fay cinsi de dikkate alınan parametrelerden biri olmuştur. Fay cinsi olarak normal, ters ve doğrultu atımlı faylar olmak üzere üç farklı fay cinsi dikkate alınmıştır. Deprem magnitüdü değerleri olarak 7.4, 7.2, 7.0, 6.5, 6.0, 5.5 ve 5.0 değerleri alınmıştır. Deprem üssüne 50km uzaklık dikkate alınmıştır. Sonuçlar karşılaştırılmış ve öneriler yapılmıştır.

Anahtar Kelimeler: Yer ivmesi, deprem, fay, yerel zemin koşulları

EFFECT OF LOCAL SOIL CONDITION TO PEAK GROUND ACCELERATION VALUE

Abstract: The local soil conditions affects and changes the characteristics of seismic motions directly. These conditions have also caused damage on the structure which is on these grounds. In this study, variable parameters have been selected such as attention relationship, local soil condition and fault type. The peak acceleration values have been calculated through using these variables. For this purpose attention relationships offered by researchers have been used to calculate peak acceleration values. The soil condition such as A, B, C, D soil type that were given in TEC 2007 have been selected in this study. Normal, reverse and strike-slip fault types have been considered as variable fault parameters. Earthquake magnitude values 7.4, 7.2, 7.0, 6.5, 6.0, 5.5 and 5.0 have been taken into account. The distance to earthquake epicentre, a 50km distance has been used. Results were compared and recommendations made.

Keywords: Ground acceleration, earthquake, fault, local soil condition

Giriş

Dünyanın pek çok yerinde depremlerin beşeri faaliyetler üzerinde oluşturduğu tehdit, yapı ve tesislerin tasarımında depremlerin dikkatli bir şekilde göz önüne alınması için yeterli bir sebeptir. Depreme dayanıklı tasarımın amacı, belirli bir düzeydeki sarsıntıyı, aşırı hasar meydana gelmeden atlatabilecek yapı ve tesisi inşa etmektir. Hasar ve can kaybı yaratabilecek bir depremden kaynaklanan yer hareketinin belirli bir yerde ve belli zaman periyodunda meydana gelme ihtimali deprem tehlikesi olarak tanımlanmaktadır (Kayabalı, 1995; Türkeli,2008; Eyidoğan2003)

Depremsellik, jeolojik ve tektonik verilere ve istatistiksel verilere dayanmaktadır. Depremin zamanı, merkez ve merkez üstü konumu, kaynak parametreleri ve yarattığı etkilerle ilgili makrosismik veriler, bir bölgenin deprem tehlikesinin belirlenmesindeki en önemli parametrelerdir. Bir bölgenin depremselliği o bölgede gelecekte olabilecek bir depremin göstergesidir (Işık, 2010).

Sismik tehlike analizi, belirli bir sahadaki yer sarsıntısı tehlikesinin nicel olarak hesaplanmasıdır. Sismik tehlike analizinin amacı zeminin ve mühendislik yapılarının gelecekte maruz kalacağı depremsel yükleme şartlarının

 Copyright © International Science and Technology Conference (ISTEC)

hesaplanmasında gerekli olan depremsel yer hareketi ile ilgili parametrelerin (ivme, hız, deplasman) hesaplanmasıdır (Giardini,1999).

Yerel zemin koşulları tasarım spektrumunu değiştirecek ve değişen tasarım spektrumu ile bina performansı daha gerçekçi olarak hesaplanacaktır. Bu durumun yer değiştirme istemlerini önemli oranda değiştireceği açıktır. Daha yüksek değerlerde yer değiştirme talepleri karşılanmayan yapılarda hasar tahminlerinin ve bina performansının gerçek değerlerden uzaklaşacağı açıktır (Işık, 2015).

Yerleşim biriminin olasılığa dayalı (probabilistik) sismik tehlike analizi; gelecek depremlerin konumu, oluş zamanı, büyüklüğü ve diğer özellikler, olasılık hesaplarına dayalı olarak tahmin edilmektedir. Bunun devamında, tasarım spektrumlarının veya benzeştirilmiş kuvvetli yer hareketlerinin elde edilmesi; öngörülen deprem parametreleri ile uyumlu "anakaya" yer hareketinin belirlenmesi ve bunun, seçilen çalışma alanında yer alan zemin profiline uygulanarak zemin yüzeyinde tasarım yer hareketinin elde edilmesinde kullanılmaktadır (Işık,2010).

Depreme dayanıklı yapı tasarımında, tasarıma esas deprem hareketinin gerçeğe en yakın şekilde simüle edilmesi konusu giderek önem kazanmaktadır. Tasarım deprem hareketini yer hareketi karakteristikleri cinsinden tanımlandığından, yer hareketi parametrelerini hesaplama yöntemlerine gerek duyulur. Yer hareketi parametrelerini hesaplamada, belirli bir yer hareketi parametresini o parametreyi en kuvvetli şekilde etkileyen büyüklükler cinsinden ifade eden azalım ilişkileri kullanılmaktadır. Azalım ilişkileri, sismik tasarımda kullanılan sismik tehlike analizinde önemli rol oynamaktadır (Erdik, 2003).

Bu çalışmada Türkiye ve dünyada geçerli olan 5 amprik azalım ilişkisi kullanılarak değerlendirilmiştir. Bu çalışmada Ulusay vd. (2004), Çeken vd. (2008), Kalkan – Gülkan (2004), Boore vd. (1997) ve Akkar - Bommer (2010) azalım ilişkileri kullanılmıştır. Bu azalım ilişkileri kullanılarak, farklı yerel zemin koşulları dikkate alınarak tahmini en büyük ivme değerleri hesaplanmıştır. Çalışmadaki amaç farklı zemin koşullarının ivme değerleri üzerindeki etkisinin incelenmesidir.

Materyal ve Metot

Depremler, iç dinamik süreçlerle yerkabuğu içerisinde meydana gelen deformasyonların yarattığı ve jeolojide fay olarak tanımlanan kırılmalar sonucu oluşan yer sarsıntılarıdır. Depremin büyüklüğü (magnitüd), kırılma (faylanma) esnasında açığa çıkan enerjinin miktarına bağlı olarak değişir. Genelde, boşalan enerji kırılma merkezinden uzaklaştıkça giderek azalır. Fakat, bazen lokal jeolojik yapı özelliklerinden kaynaklanan olumsuz zemin koşulları bu durumu değiştirebilir ve kaynaktan uzak olmasına rağmen depremin yıkıcı etkisinin beklenilenden fazla olmasına yol açabilir. Bu nedenle herhangi bir bölgenin deprem potansiyeli değerlendirilirken depreme yol açan fayların (aktif fay) ve yerel zemin özelliklerinin iyi bilinmesi gerekmektedir (Akdeniz, 2003).

Bir deprem sırasında oluşan zemin titreşimleri, deprem odağından çevreye yayılacak ve etkileri zemin koşullarına bağlı olarak odaktan uzaklaştıkça değişecek ve genellikle azalacaktır.

Depreme dayanıklı yapı tasarımında performansa dayalı tasarım yaklaşımının benimsenmesi ile birlikte, kuvvetli yer hareketinin gerçeğe en yakın şekilde benzeştirilmesi konusu önem kazanmıştır. Zaman tanım alanında gerçekleştirilen doğrusal olmayan dinamik analizde kullanılan bilgisayar yazılımları ve yapısal modelleme tekniklerindeki son gelişmeler, bu tip analizlerde girdi olarak kullanılan yapay ivme benzeşimleri konusunu ön plana çıkarmaktadır. Tasarım depremi olarak, benzer özellikler taşıyan mevcut deprem kayıtlarının kullanılması uygun gözükse dahi, tektonik yapı, deprem büyüklüğü, yerel jeoloji ve yakın fay bölgesi koşullarını sağlayan uygun bir veri dizisinin bulunması çok olası değildir (Erdik, 2003).

Depremin ivmesi, deprem anında zeminin ne kadar miktarda ve ne hızla sarsıldığının bir ölçüsüdür. Deprem sırasında yerin sarsılması aynı zamanda ivme olayıdır. Maksimum (Pik) ivme, deprem sırasında kaydedilen en büyük ivme değeridir. Kuvvetli yer hareketi ölçümlerindeki amaç, deprem sırasında oluşan yer ivmesini ölçmektir. İvme kayıtları mühendislik uygulamaların ve bilimsel çalışmalar için önemli veri tabanı oluşturmaktadır. Önemli mühendislik bilgileri içeren bu ivme değerleri, depreme dayanıklı yapı tasarımı konusunda, depremin uzaklıkla olan azalım ilişkileri geliştirilmesinde kullanılmaktadır. Herhangi bir istasyonda kaydedilmiş bir depremin, istasyondan değişik uzaklıklardaki yerleşim birimlerinde beklenen hasar tahmini ve şiddet dağılımı belirlenebilmektedir. Deprem tehlikesi belirlemesinde, en önemli dinamik parametreyi depremin ivmesi teşkil etmektedir. Ancak bazı durumlarda deprem ivmesini kaydetmek mümkün değildir. Bu gibi durumlarda farklı kaynak ve zemin koşullarında daha önce elde edilmiş deprem verileri kullanılarak elde edilen azalım ilişkileri kullanılarak elde edilen azalım ilişkileri kullanılarak bir bölge için en büyük yer hareketinin değeri tahmin edilebilmektedir. Bu azalım ilişkilerinde genel olarak yer hareketinin değişimi; yerel zemin koşulları, deprem

 Copyright © International Science and Technology Conference (ISTEC)

büyüklüğü ile kaynak ve çalışılan bölge arasındaki mesafe ilişkileri kullanılmaktadır. Günümüzde dünyanın çeşitli bölgeleri için ivme azalım ilişkileri mevcut olup, yaygın olarak kullanılmaktadır. Günümüzde kullanılan azalım ilişkilerinin çoğu farklı periyotlara karşılık gelen spektral ivme genliklerinin hesaplanmasına dayanmaktadır. Bunun başlıca nedeni, deprem ile ilgili mühendislik hesaplarında yer ivmesinin çok önemli rol oynamasıdır (Afad, 2016).
Depremler sırasında kuvvetli yer hareketinin ölçülmesi; depremin fiziksel boyutunun, deprem dalgasının yayılım karakteristiğinin, etkin süresinin, frekans içeriğinin, deprem-yer-yapı etkileşiminin, deprem yüklerinin doğru tespitinin ve yıkıcı etkilerinin kestirilmesi gibi çeşitli mühendislik çalışmalarında kullanılmaktadır. Kuvvetli yer hareketi kayıtlarının incelenmesi, mühendislik yapılarının deprem sırasındaki davranışlarının ve hasar görebilirliğinin tahmininde kullanılan temel girdilerden birisidir. Şüphesiz, yıkıcı bir deprem sırasında en önemli dinamik parametrelerden birisi, depremin ivmesidir. Bu sebeple, depremin dinamik etkilerini yerinde ölçmek ve depremi daha doğru değerlendirmek amacıyla deprem potansiyeli yüksek birçok ülkede, çok sayıda ulusal ve yerel ölçekte ivme-ölçer ağları kurularak kuvvetli yer hareketi (ivme) gözlemleri yapılmaktadır (Afad, 2016a).

Azalım ilişkileri kullanılarak yer hareketlerinin tahmin edilmesinde en fazla gereksinim duyulan parametreler; deprem büyüklüğü (M), fay türü, incelenen alan ile deprem kaynağı arasındaki uzaklık (R) ve zemin sınıfı, ya da zeminin kaya, yumuşak ya da sıkı zemin olması gibi yerel zemin koşullarıdır.

Yerel jeolojik zemin koşullarının sismik hareketlerin karakterlerini doğrudan etkilediği ve değiştirdiği, bu zeminler üzerindeki mevcut yapılar üzerinde hasara sebep olabileceği bilinen bir gerçektir. Çalışmada TDY 2007' de verilen zemin sınıfları dikkate alınmıştır (Tablo 1).

Tablo 1. Zemin sınıfları (TDY, 2007)

Zemin Grubu	*Zemin Grubu Tanımı*	*Stand. Penet.*	*Relatif Sıkılık*	*Serbest Basınç Direnci*	*Kayma Dalgası Hızı*
	1. Masif volkanik kayaçlar ve ayrışmamış sağlam metamorfik kayaçlar, sert çimentolu tortul kayaçlar....	(N/30)	(%)	(kPa)	(m/s)

Sonuçlar ve Tartışma

Bu çalışmada Türkiye ve dünyada geçerli olan 5 amprik azalım ilişkisi kullanılarak hesaplamalar yapılmıştır. Bu azalım ilişkileri kullanılarak, farklı yerel zemin koşulları dikkate alınarak tahmini en büyük ivme değerleri hesaplanmıştır. Hesaplamalar yapılırken fay tipleri olarak normal, ters ve doğrultu atımlı faylar seçilmiştir. Deprem magnitüdü değerleri olarak 7.4, 7.2, 7.0, 6.5, 6.0, 5.5 ve 5.0 değerleri alınmıştır. Deprem üssüne 50km uzaklık dikkate alınmıştır.

Zemin koşullarının deprem etkisindeki yapıların davranışını değiştirmektedir. Yöreye özgü zemin hesaplamaları hassasiyetle yapılmalıdır. Özel zemin koşullarına sahip yerleşim bölgelerindeki yapıların maruz kalacakları deprem etkilerinin farklı olabileceği açıkça görülmektedir.

ZİHİNSEL VE RUHSAL ENGELLİLERE YÖNELİK TERAPİ BAHÇELERİ: ÖZEL BAKIM MERKEZLERİ ÖRNEĞİ

Sebahat AÇIKSÖZ, Pınar BOLLUKCU, *Gizem CENGİZ GÖKÇE, Zeynep Setenay YAR

Bartın Üniversitesi, Orman Fakültesi, Peyzaj Mimarlığı Bölümü, Bartın- TÜRKİYE

*gcengiz@bartin.edu.tr

Özet:
Sürdürülebilir kentlerde insanların ruh sağlığının iyileştirilmesinde bir araç olarak karşımıza çıkan terapi bahçeleri, peyzaj mimarlarının ilgi alanlarından biridir. Terapi bahçelerinin planlama ve tasarım aşamaları, ilgili tıp alanında çalışan uzmanların da sürece dâhil olmasını gerektirmektedir. Dünyada hastane ve özel bakım merkezlerinde uygulanan birçok terapi bahçesinin bulunması, bu konuya verilen önemi ortaya koymaktadır. Türkiye'de ise son yıllarda gündeme gelmesine karşın, terapi bahçelerinin uygulanması konusuna yeterince önem verilmediği görülmektedir. Bu çalışmada Zonguldak-Bartın-Karabük (ZBK) Planlama Bölgesi'nde yer alan ve Aile ve Sosyal Politikalar Bakanlığı'na (ASPB) bağlı özel bakım merkezleri incelenmiştir. Çalışma kapsamında araştırılan özel bakım merkezlerinde terapi bahçesi bulunmadığı saptanmış, engelli bireylerin fiziksel ve ruhsal ihtiyaçlarının karşılanabilmesi için gerekli olan terapi bahçelerine ilişkin planlama ve tasarım ölçütleri geliştirilmiştir. Dört aşamada tamamlanan çalışmanın birinci aşamasında konuyla ilgili temel kavramlar, ilgili yasa ve yönetmelikler, teknik raporlar ve istatistiklere ilişkin literatür ve veri taraması yapılmıştır. Çalışma kapsamında terapi bahçeleri konusuna ilişkin yapılmış çalışmalar ile dünyada ve Türkiye'de uygulanmış olan terapi bahçesi örnekleri incelenmiştir. Çalışma alanının seçildiği ikinci aşama arazi çalışmalarını kapsamaktadır. Üçüncü aşamada, elde edilen tüm veriler terapi bahçelerinde göz önünde bulundurulması gereken tasarım ölçütlerinin belirlenebilmesi için analiz edilmiştir. Dördüncü aşamada "sürdürülebilirlik, yönlendirme, ulaşılabilirlik, sosyalleşme, anlamlı aktivite, hatırlatma, duyusal uyarım, güvenlik" başlıkları altında kabul edilen tasarım prensipleri doğrultusunda çalışma alanına ilişkin öneriler geliştirilmiştir.

Anahtar Kelimeler: Terapi Bahçeleri, Özel Bakım Merkezleri, Peyzaj Tasarımı.

Giriş

Gelişen teknoloji ve nüfus artışının getirdiği yoğun kentleşme, insan psikolojisi üzerinde olumlu etkileri olduğu bilinen doğal alanların azalmasına ve insanların doğadan giderek uzaklaşmasına neden olmaktadır. Bu durum, insanlarda depresyon ve bunalım gibi psikolojik ve zihinsel rahatsızlıkların görülme olasılığını artırmaktadır. Bu rahatsızlıklardan kurtulmak, fizyolojik ve psikolojik yönden kendini iyi hissetmek isteyen insanlarda, doğaya yönelme eğiliminin başladığı görülmektedir. Geçmişten günümüze kadar doğanın tedavi amacıyla kullanıldığı bilinmektedir.

Doğa temelli terapi; bahçe etkinlikleri, doğa ile ilişkili algısal deneyimler ve sembolleri içeren farkındalığa dayalı bilişsel tedavi yaklaşımı olarak ifade edilebilir. Özellikle strese dayalı psikolojik hastalıkların tedavisinde doğa temelli terapi yaklaşımının uygulandığı görülmektedir (Sola Corazon vd., 2010; Sahlin vd., 2012).

Doğal peyzajın insan sağlığı üzerine olan etkisinin şehirleşmenin başladığı dönemde kendini göstermeye başladığı söylenebilir (Özgüner, 2004). Doğal peyzajın insan psikolojisi ve fizyolojisi üzerine etkilerini inceleyen araştırmalar ülkemizde yaygın olmamakla birlikte, uygulamaların eskiye dayandığı söylenebilir. Selçuklu ve Osmanlı dönemlerindeki darüşşifaların şifa bahçeleri kapsamında ele alınması, müziğin bir terapi yöntemi olarak kullanılması ve bitkilerin tedavi amaçlı kullanılması bu açıdan önemlidir. Gelişmiş ülkelerde bu konuda yapılan araştırma ve uygulamalar bulunmaktadır (Erer ve Atıcı, 2010). Terapi Peyzajları Ağı'na (*Therapeutic Landscapes Network*) (2013) göre; ABD'de Amerikan Peyzaj Mimarları Topluluğu (*American Society of Landscape Architects*-ASLA) tarafından denetlenen birçok rehabilitasyon bahçesi örneği mevcuttur. Ayrıca 1999'dan beri terapi bahçelerinin çevrimiçi bir veritabanı bulunmaktadır (Balode, 2013).

İyileştirme bahçeleri, psikiyatrik hastaların rekreasyonel gereksinimlerinin karşılanacağı tedavi amaçlı kentsel mekânlar yaratmaktadır. Sağlık kurum ve kuruluşlarında, kurumla koordineli olarak yapılan, bitkisel ve yapısal tasarım elemanlarını içeren bir peyzaj düzenlemesinin tedavinin bir parçası olduğu kabulü giderek yaygınlaşmaktadır (Keçecioğlu, 2014). Özellikle ruh ve sinir hastalıkları hastanelerindeki bahçelerin terapiye yönelik dış mekân planlama ve tasarımına ilişkin çalışmalar (Sakıcı, 2009; Sakıcı vd., 2013; Sakıcı & Var 2013)

 Copyright © International Science and Technology Conference (ISTEC)

bu kapsamda önem taşımaktadır. Hastane bahçeleri ile özel bakım merkezlerine ait bahçelerin de açık-yeşil alanlar içinde yer alan dış mekânlar olduğu unutulmamalıdır. Bu bahçeler; terapi bahçelerinin planlama ve tasarım ölçütlerine uygun olarak kullanıcıların istek ve ihtiyaçlarına göre farklı etkinliklerin gerçekleştirileceği, konforlu ve kullanımı rahat mekânlar olarak düzenlenmelidir. Bu süreçte peyzaj mimarlarına önemli görevler düşmektedir (Sakıcı vd., 2013). Peyzaj mimarlığı alanında, iyileştirme bahçeleri teması henüz yeni ele alınmakla birlikte, uygulama açısından değerlendirildiğinde, peyzaj mimarlarının hastaneler ve yakın çevrelerinin tasarım sürecine olumlu etkileri olduğu saptanmıştır (Akın, 2006).

Terapi bahçelerinin tasarlanması, belirli bir hasta veya hasta grubunun iyileşmesine etki eden ya da tedavide ölçülebilir çıktılar sunan bir süreç olarak ifade edilebilir (Mitrione & Larson, 2007). Terapi bahçelerinin dönüştürücü (*transformative*) mekânlar olarak tasarlanması sürecinde tüm hedef kitlenin -hastalar, aile üyeleri, bakıcılar, gönüllüler, hasta yakınları ve kurum çalışanları- dikkate alınması tasarımın anlamlı olmasını sağlayacaktır (Burt, 2014). Terapi bahçeleri (*therapeutic gardens*) ile literatürde benzerlik gösteren kavramlar olarak; şifa/iyileştirme bahçeleri (*healing gardens*), hortikültürel bahçeler (*horticultural gardens*), rehabilitasyon bahçeleri (*rehabilitation gardens*) ve restoratif bahçeler (*restorative gardens*) sayılabilir. Bu bahçelerin; hastaneler, cezaevleri, ıslahevleri, huzurevleri, toplum ruh sağlığı merkezleri, psikiyatri merkezleri, rehabilitasyon merkezleri ve özel bakım merkezleri gibi kurumlarda uygulanması önerilmektedir. Dünyada birçok özel bakım merkezinde terapi bahçelerinin bulunması, bu konuya verilen önemi ortaya koymaktadır. Türkiye'de ise son yıllarda bu konu sık sık gündeme gelse de gereken önemin yeterince verilmediği görülmektedir.

Türkiye'de özel bakım merkezleri 16.08.2013 tarih ve 28737 sayılı Resmi Gazete'de yayınlanan "Bakıma Muhtaç Özürlü Bireylere Yönelik Özel Bakım Merkezleri Yönetmeliği"ne (ASPB, 2013) bağlı olarak çalışmaktadır. Yönetmelikte "Özel Bakım Merkezleri"; bakıma muhtaç özürlülerin bakımı için yatılı ve/veya gündüzlü hizmet veren, gerçek veya tüzel kişiler tarafından açılan ve sosyal hizmet kuruluşu statüsünde olan merkezler olarak tanımlanmaktadır. Yönetmelikte yer alan 30. ve 31. maddelerde, peyzaj tasarım sürecini etkileyecek olan ifadeler bulunmaktadır. 30. maddenin 1. bendinde yer alan "Merkez, gürültü ve hava kirliliğine maruz olmayan, insan sağlığını olumsuz yönde etkileyecek endüstriyel kuruluşlar ile her türlü gayrisıhhî müesseselerden uzak, ulaşıma elverişli, toplu yaşam alanlarının içinde ve çevre düzenlemesi yapılmış bir yerde açılır. Merkez binasının bulunduğu yerin, bakıma muhtaç engelli bireylerin geliş gidişlerinde trafik yönünden uygun ve emniyetli olması şartı aranır" ifadesi, merkezin konumu ve çevresel şartlarını tanımlamaktadır. Merkez binasının kullanımı ve fiziksel şartlarını tanımlayan 31. maddeye göre ise; bina ahşap olmamalı, engelli grupların özellikleri dikkate alınarak belirlenen erişilebilirlik standartlarına uygun olmalı, merkez binasına ait bahçenin büyüklüğü yatak odası olarak kullanılacak zorunlu alanların toplam büyüklüğünden az olmamalıdır.

Bu çalışmada ZBK Planlama Bölgesi'nde yer alan ve ASPB'ye bağlı özel bakım merkezlerinin incelenmesi ve terapi bahçelerinin tasarımına ilişkin öneriler geliştirilmesi amaçlanmıştır.

Materyal ve Yöntem

Çalışma alanı olarak belirlenen ZBK Planlama Bölgesi, Karadeniz Bölgesi'nin Batı Karadeniz bölümünde yer almakta olup (Şekil 1), Türkiye'nin 3. derecede gelişmiş bölgeleri arasında 11. sıradadır. Bölgenin en önemli özelliği yeraltı kaynakları açısından zengin olmasıdır. Buna bağlı olarak madencilik ve demir-çelik sanayi gelişmiştir. Bölge içindeki en gelişmiş il Zonguldak'tır. Bartın 1991, Karabük ise 1995 yılında Zonguldak'tan ayrılarak il statüsüne kavuşmuştur (BAKKA, 2011).

Türkiye'de en az bir engeli olanların il nüfuslarına oranlarına bakıldığında Zonguldak, Bartın ve Karabük illerinin Türkiye ortalamasının (% 6,9) üzerinde olduğu görülmektedir (TÜİK, 2011). Bu durum, ZBK Planlama Bölgesi'nin çalışma alanı olarak seçilmesinde önemli bir etkendir. Çalışma sonucunda bu bölgede, zihinsel ve ruhsal engellilere hizmet veren, Zonguldak ve Bartın illerinde yer alan 2 adet özel bakım merkezi olduğu saptanmıştır.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 1. ZBK Planlama Bölgesi'nin ülke ve bölge içindeki konumu (TÜİK, 2011).

Çalışma 4 aşamada tamamlanmıştır. Birinci aşamada konuyla ilgili temel kavramlar, ilgili yasa ve yönetmelikler, teknik raporlar ve istatistiklere ilişkin literatür ve veri taraması yapılmıştır. Çalışma kapsamında terapi bahçeleri konusuna ilişkin yapılmış çalışmalar ile Türkiye'de ve dünyada uygulanmış olan terapi bahçesi örnekleri incelenmiştir. Çalışma alanının da seçildiği ikinci aşama arazi çalışmalarını kapsamaktadır. Bu aşamada, derin mülakat yöntemi kullanılarak kurum yetkilileri ve çalışanları ile yüz yüze görüşmeler yapılmıştır. Mekânsal olanakların analiz edilmesi ve değerlendirilmesi amacıyla, kurumlardan 1/50 ölçekli mimari projeler elde edilmiş ve arazi çalışmaları sürecinde yapılan alan analizi aşamasında alandan fotoğraflar çekilmiştir. Üçüncü aşamada, elde edilen tüm veriler terapi bahçelerinde göz önünde bulundurulması gereken tasarım ölçütlerinin belirlenebilmesi için analiz edilmiştir. Bergeman'ın (2012) çalışmasında belirlenen ölçütler (dikkat dağıtma, duygu kontrolü, stres düzenleme, fiziksel hareket olanağı sağlama, sosyal destek fırsatları sunma ve bireysel iletişim kurma) terapi bahçelerinin tedaviye ilişkin tasarım ölçütleri olarak kabul edilmiş ve alanla ilişkilendirilmiştir. Çalışmanın dördüncü ve son aşamasında belirlenen tasarım ölçütleri ve Shamanth (2014) tarafından belirlenen tasarım prensipleri "sürdürülebilirlik (*sustainability*), yönlendirme (*orientation*), ulaşılabilirlik (*accessibility*), sosyalleşme (*socialisation*), anlamlı aktivite (*meaningful activity*), hatırlatma (*reminiscence*), duyusal uyarım (*sensory stimulation*), güvenlik (*safety*) başlıkları altında toplanmış ve çalışma alanına ilişkin öneriler geliştirilmiştir.

Bulgular ve Tartışma

Türkiye'de ASPB'ye bağlı olup, zihinsel ve ruhsal engelli bireylere hizmet veren 156 adet özel bakım merkezi bulunmaktadır. Bu merkezlerin % 61'inin bir bahçeye sahip olduğu, ancak terapi bahçesi niteliğinde bir çalışmanın yapılmadığı saptanmıştır. ZBK Planlama Bölgesi'ndeki zihinsel ve ruhsal engellilere yönelik Özel Çaycuma Bakım Merkezi ve Özel Bartın Bakım Merkezi adlarında 2 adet özel bakım merkezine ilişkin bilgiler Tablo 1'de verilmiştir.

Tablo 1. Çalışma alanlarına ilişkin genel bilgiler.

Adı	**Özel Çaycuma Bakım Merkezi**	**Özel Bartın Bakım Merkezi**
İli	Zonguldak	Bartın
Engel Grubu	Zihinsel/Ruhsal	Zihinsel
Yaş Grubu	18+	18+
Cinsiyet	Karma	Karma
Kapasite	60	57
Terapi Bahçesi Varlığı	Yok	Yok

Özel Çaycuma Bakım Merkezi, 2012 yılının Aralık ayında kurulmuştur. Merkez toplam 60 kişilik yatak kapasitesine sahip olup, şu anda 40 kişiyi barındırmaktadır. Bakıma Muhtaç Özürlülere Yönelik Özel Bakım Merkezleri Yönetmeliği'ne göre 2013 yılı ve öncesinde açılan bakım merkezleri karma (zihinsel/ruhsal/bedensel) olarak açılabiliyorken, 2013 yılı sonrasında güncellenen yönetmelik gereği tek engel grubuna yönelik olarak düzenlenmesi gerekmektedir (ASPB 2006; ASPB, 2013). 2013 yılı öncesi Bakıma Muhtaç Özürlülere Yönelik Özel Bakım Merkezleri Yönetmeliği'ne tabi olan Özel Çaycuma Bakım Merkezi zihinsel ve ruhsal engellilere yönelik olarak açılmıştır. Bu Merkez'de sorumlu müdür, sosyal hizmetler uzmanı, sağlık personeli, bakıcı ve hizmetliler görev yapmaktadır. Hasta bakımından sorumlu olan personel sayısı 16'dır. Binanın oturum alanı yaklaşık 250 m² olup zemin kat dâhil olmak üzere 3 katlıdır. Zemin haricindeki her katta 2

 Copyright © International Science and Technology Conference (ISTEC)

adet yatakhane, banyo ve tuvaletten oluşan 2 daire ve her daireye özel 2 adet de etkinlik odası bulunmaktadır. Etkinlik odaları dinlenme ve serbest etkinlik amaçlı kullanılmaktadır. Zemin katta 2 tane yönetici odası, ortak kullanım alanı (televizyon odası), sağlık odası, özel bakım odası, ibadethane, bireysel görüşme odası, sosyal servis, yemekhane, mutfak, WC ve personel odası bulunmaktadır. Binaya sonradan eklenen bölüm ise çamaşırhane olarak kullanılmaktadır. Bahçenin tamamı kilitli parke taş döşemeli sert zeminden oluşmaktadır ve dört bir kenarı güvenlik gerekçesi ile 2 m yüksekliğinde demir ve plastik içerikli sınır elemanı ile sınırlandırılmıştır. Güvenlik gerekçesi ile bahçe kapısı her zaman kilitli olup, ziyaretçiler kontrollü olarak içeri alınmaktadır. Bahçenin içe bakan kısmında sınır elemanlarının önünde genişliği 1 m olan yeşil bant bulunmaktadır. Bahçede 2 adet kameriye bulunmaktadır. Uygun hava koşullarında taşınabilir oturma birimleri ile bahçe imkânları değerlendirilebilmektedir (Şekil 2).

Şekil 2. Özel Çaycuma Bakım Merkezi'nin konumu, iç ve dış mekânlarına ilişkin görüntüler

Özel Bartın Bakım Merkezi, 2016 yılının Şubat ayında kurulmuştur. Toplam 57 kişilik yatak kapasitesine sahip olan merkezde sadece ağır zihinsel engelli olan toplam 15 kişi barınmaktadır. Bartın Özel Bakım Merkezi de bu yönetmelik gereği (ASPB, 2013) zihinsel engellilere yönelik olarak açılmıştır. Bakım merkezine sadece ağır zihinsel engelli raporu bulunan hastalar, ailelerinin izni ile yerleştirilmektedir. Özel teşebbüsler tarafından açılan ve yönetilen bakım merkezine ASPB her hastanın bakım giderleri için maddi destek sağlamaktadır. Denetleme işlemleri belirli periyotlarda ASPB tarafından yapılmaktadır (ASPB, 2013). Bartın Özel Bakım Merkezi'nde görev yapan 12 personelden 2'si sağlık personeli, 2'si sosyal hizmetler uzmanı, 7'si bakıcı ve 1'i hizmetli olarak çalışmaktadır. Yönetimden sorumlu kişiler 4 yıllık lisans düzeyinde eğitim veren ilgili bölümlerden; hasta bakımından sorumlu çalışanlar ise 2 yıllık ön lisans düzeyinde eğitim veren yüksekokulların ilgili programlarından mezun olmuş kişilerdir. Oturum alanı 1280 m² olan ve zemin kat dâhil olmak üzere toplam 4 kattan oluşan binada; zemin haricindeki her katta 2 adet yatakhane, banyo ve tuvaletten oluşan 2 daire ve her daireye özel 2 adet de etkinlik odası bulunmaktadır. Etkinlik odaları dinlenme ve serbest etkinlik amaçlı kullanılmaktadır. Zemin katta 2 tane yönetici odası, ortak kullanım alanı (televizyon odası), sağlık odası, özel bakım odası, ibadethane, bireysel görüşme odası, sosyal servis, yemekhane, mutfak, WC ve personel odası bulunmaktadır. Bina girişinden itibaren başlayan kılavuz iz ve görme engelliler alfabesinin (Braille) de kullanıldığı yönlendirme levhaları görme engelli bireyler tarafından da mekânın kullanımını kolaylaştırmaktadır. Bakıma Muhtaç Özürlülere Yönelik Özel Bakım Merkezleri Yönetmeliği'nde geçen "Bahçenin büyüklüğü, yatak odası olarak kullanılacak zorunlu alanların toplam büyüklüğünden az olamaz" ibaresine göre (ASPB, 2013); toplam bahçe alanı, 1800 m² olup, yönetmeliğe uygundur. Bahçenin tamamı kilitli parke taş döşemeli sert zeminden oluşmaktadır. Bahçe güvenlik gerekçesi ile 60 cm yüksekliğinde taş duvar üzerine, 2 m yüksekliğinde tel çit ile sınırlandırılmıştır. Bahçe kapısı her zaman kilitli olup, gelen ziyaretçiler kontrollü olarak içeri alınmaktadır. Bahçenin kuzeye bakan bölümünde biri engelli parkı olmak üzere 2 araçlık otopark mevcuttur. Kuzeydoğusu ise çiçek parteri oluşturmak amacıyla planlanmış, ancak uygulamaya aktarılamamış 1 m genişliğinde yeşil bantla çevrilidir. Bahçede herhangi bir oturma alanı, gölgelenmiş mekân ya da bitkisel

 Copyright © International Science and Technology Conference (ISTEC)

düzenleme bulunmamaktadır. Ancak, taşınabilir oturma birimleri ile uygun hava koşullarında bahçe olanaklarından yararlanılabilmektedir (Şekil 3).

Şekil 3. Özel Bartın Bakım Merkezi'nin konumu, iç ve dış mekânlarına ilişkin görüntüler

Terapi bahçelerinde tasarım ilkeleri oluşturulurken dikkate alınması gereken ölçütler, Bergeman (2012) tarafından yapılan çalışmada önerilen terapi bahçeleri hedeflerinden geliştirilmiştir. Bu hedefler oluşturulurken, hastalar, kurum çalışanları ve hasta yakınlarından oluşan farklı kullanıcı grupları göz önünde bulundurulmuştur. Tablo 2'de bu kullanıcı grupları ile ölçütler arasındaki ilişki verilmiştir.

Tablo 2. Terapi bahçelerinde tasarım ilkeleri oluşturulurken dikkate alınması gereken ölçütler ve kullanıcı grupları ilişkisi (Bergeman, 2012)

Ölçütler	Hasta	Kurum Çalışanı	Hasta Yakını
Dikkat Dağıtma	x	x	x
Duygu Kontrolü	x		
Stres Düzenleme	x	x	x
Fiziksel Hareket İmkânı Sağlama	x		
Sosyal Destek Fırsatları Sunma	x	x	x
Bireysel İletişim Kurma	x		x

Terapi bahçelerinin psikolojik, sosyal ve fiziksel yararları bulunmaktadır. Bu bahçelerin özellikleri olarak; zamanlanmış ve programlanmış aktiviteler içermesi, ulaşılabilir olması, sınırlarının iyi tanımlanmış olması, insan-bitki etkileşimini güçlendirmesi, tedaviyi destekleyici koşulların varlığı, çok amaçlı tasarımları içermesi, fark edilebilir mekânların varlığı sıralanabilir (Hazen, 201.).

Bunun yanı sıra; sınırlı zihinsel ve fiziksel beceriye sahip olan engelli bireylerin, kendi içinde farklı potansiyellere sahip olabileceği de hesaba katılmalıdır. Bu potansiyeller doğrultusunda terapi bahçeleri oluşturulurken; hastaları sosyal, psikolojik, fiziksel yönlerden destekleyecek, özgüven duygularını geliştirecek ve bireysel becerilerini artıracak yönde uygulamalar yapılmalıdır (Uslu & Shakouri, 2012).

 Copyright © International Science and Technology Conference (ISTEC)

Tartışma ve Sonuç

Sağlık kuruluşlarına ait bahçelerin de tedavinin bir parçası olarak değerlendirilmeleri gerekmektedir. Bahçelerin tedaviye destek olacak şekilde fonksiyonel ve estetik olarak tasarlanması hastaların tedavi süreçlerini daha huzurlu, stresten uzak, mutlu geçirmesini ve tedaviye daha hızlı yanıt vermesini sağlayacaktır. Özel bakım merkezleri gibi kurum ve kuruluşlarda yalnız iç mekânlar önemsenmiş; dış mekânların kullanıcılara olumlu katkıları göz ardı edilmiştir.

Özel bakım merkezinde uygulanacak bir terapi bahçesinin planlama ve tasarım sürecinde peyzaj mimarı ve terapi bahçeleri konusunda bir klinik uzmandan profesyonel yardım alınması önerilmektedir. Terapi bahçesinin etkin kullanımının sağlanabilmesi amacıyla, mimarlar ve peyzaj mimarlarının tasarım sürecinde iç ve dış mekân arasındaki ilişkiyi kurgulayacak şekilde ortak çalışmaları gerekmektedir. Balode (2013) hedefe ulaşabilmek için küresel deneyimleri ve en iyi uygulamaları özümsemek, yenilikçi çözümler üretmek, bireysel gereksinimleri rehabilitasyon merkezlerine ve peyzajlara uyarlamak gerektiğini ifade etmektedir.

Terapi bahçelerinde; tasarım sürecine başlamadan önce kullanıcı grubunu bilmek önemlidir. İlgi grubunun özellikleri, hastalık tipi ve beklentilerine yönelik tasarımlar yapılmalıdır. Kullanıcı gruplarına bağlı olarak fiziksel aktiviteleri ve bahçeyi pasif biçimde deneyimleme olanakları dengeli olmalıdır. Bu bağlamda; AHTA'ya (2012) göre oluşturulacak terapi bahçelerinde göz önünde bulundurulması gereken tasarım prensipleri aşağıda sıralanmıştır (Shamanth, 2014):

- Sürdürülebilirlik: Bahçenin kullanımının sürdürülebilir olması için, düzenli bir aktivite programı olması ve düzenli bahçe bakımı yapılması gerekmektedir. Tasarım sürecinde peyzaj mimarının varlığı ile uygulama ve bakım sürecinde peyzaj teknikeri, sertifikalı bahçıvan gibi uzmanların ekibe katılması, kurum çalışanlarının bahçeyi iyi tanıması gibi etmenler terapi bahçelerinin başarısına etki edecektir.
- Yönlendirme: Bahçenin, bina içinden de rahatlıkla görünebilecek bir yerde konumlandırılması gerekmektedir. Basit bir yol sistemiyle, bahçe giriş ve çıkışının belirgin olması gerekmektedir.
- Ulaşılabilirlik: Bahçenin fiziksel, zihinsel ve ruhsal engelli tüm bireyler için ulaşılabilir olduğundan emin olunmalıdır. Ulaşılabilir olması için farklı yüksekliklerde bitki yataklarının olması gerekmektedir.
- Sosyalleşme: Yaşam kalitesini geliştirmeli; çalışanlar, hastalar ve aynı zamanda hasta yakınları arasındaki etkileşimi destekleyici ögeler içermelidir.
- Anlamlı aktivite: Terapi bahçelerinde yapılan aktiviteler hastaların iyileşme sürecinin bir parçası olup; hastalara yeni beceriler kazandırabilmelidir. Ruhsal durumu bozulma eğilimi olan hastalardaki gerilemeyi yavaşlatmaya yardımcı olmalıdır.
- Hatırlatma: Aktiviteler ve içerdiği ögelerle hastalar üzerinde hatırlatıcı özelliği olmalıdır.
- Duyusal uyarım: Beş duyuya da hitap etmelidir. Tedavilerine bağlı olarak bazı hastaların güneşe karşı duyarlılığı oluşabilmektedir. Bu nedenle güneşli ve gölge alanların dengeli bir şekilde oluşturulması gerekmektedir.
- Güvenlik: Hastaların, hasta yakınlarının ve kurum çalışanlarının güvenliğinin sağlanması önemlidir.

Özel Bakım Merkezleri gibi tedaviye dayalı kurum ve kuruluşlarda Peyzaj Mimarları ve Mimarların iç ve dış mekân tasarımına ilişkin plan kararlarına terapi peyzajlarını katmaları hem çalışanlar ve hasta yakınları hem de hastalar için önemli fırsatlar doğuracaktır. Sağlıkla ilgili etmenleri inceleyen bir tasarım perspektifi (*salutogenic design*) peyzaj mimarlığı ve tasarım sürecini insan sağlığını destekleyen ve sürekliliğini sağlayan, aynı zamanda masraflı olan sosyal, eğitsel, sağlık ve ekonomik müdahaleleri azaltan değerli bir araç haline getirmektedir (Souter-Brown, 2015). İnsanların doğa ile etkileşim içinde bulunacakları sağlıklı açık-yeşil alanlar yaratmak doğal yollarla, az masraflı ve sağlıklı (kimyasal ilaçlardan arınmış) olarak tedavi edilmelerine önemli katkılar sağlayacaktır.

Terapi bahçelerinin planlama ve tasarım sürecinde değerlendirilmesi gereken konular aşağıda özetlenmiştir: İç mekândan dış mekânın izlenebilir olması, erişilebilir olması, oturma mekânlarına/ kentsel donatılara yer verilmesi, yürüyüş yollarının basit patikalar halinde düzenlenmesi ve sabit döşeme malzemelerinin kullanılması, gölgeleme elemanı, su ögeleri, simgeler (*landmark/lar*) ve yön işaretleri kullanılması, dış mekândan tuvaletlere kolay anlaşılır yönlendirme levhalarının yerleştirilmesi, akşam aydınlatmasının sağlanması, dış mekânda acil durumlarda yardım isteyebilecekleri alarm sisteminin oluşturulması, dış mekân etkinliklerinin mevsimsel olarak süresinin artırılması amacıyla sera/kış bahçesi tasarlanması, çokduyulu (*multisensory*) deneyime yönelik mekânların oluşturulması, bitkisel tasarımda doğal peyzaj özelliklerinin yanı sıra beş duyuya hitap edecek çok yıllık, kokulu, kelebek ve kuşları çeken zehirli/batıcı olmayan süs bitkilerine yer verilmesi, yenilebilir (*edible*) peyzajı içeren tasarım yapılması (Shamanth, 2014; Thorsen Gonzalez & Kirkevold, 2016). Terapi bahçesinin

 Copyright © International Science and Technology Conference (ISTEC)

tüm odalardan görülmesi etkinliklere katılımı sağlamak ve katılamayacak durumda olanlara uzaktan da olsa etkinlikleri izleyebilme olanağı sunulması açısından yararlı olacaktır.

Peyzajın doğallığı ile orantılı olarak sağlık ve memnuniyet de artmaktadır. Yeşil alanların varlığı, kırsal alanların sakinliği, kuş sesleri, çiçek ve toprak kokusu gibi peyzaja ait özelliklerin hastalar üzerinde olumlu etkisi bulunmaktadır. Buna bağlı olarak sağlık ile ilgili kurum ve kuruluşlarının yakınında duyu ya da terapi bahçelerinin gelişme eğiliminde olduğu görülmektedir (Balode, 2013). Terapi bahçelerinde farklı renk, doku ve formlarla duyuların uyarılacağı duyu bahçesi niteliğindeki bitkisel tasarım önem taşımaktadır (Erbino vd., 2015). Terapi bahçeleri hem estetik hem de fonksiyonel ölçütlere uyularak uygulanmak zorundadır. Çoğu bahçe insanları estetik açıdan memnun ederken, duyu ve terapi bahçeleri, insanın beş duyusuna da hitap edecek fonksiyonellikte oluşturulmuştur (Balode, 2013). Zihinsel engelli bireylerin (özellikle çocukların) rehabilitasyon amaçlı bulundukları kurumların bahçe düzenlemeleri yapılırken fiziksel güvenilirlik ve terapi açısından faydaları için fonksiyonellik ön planda tutulmalıdır (Bulut & Göktuğ 2006). Terapi bahçelerinin hedefi insanların iyileşmesi, sağlıklı olması ve doğayla etkileşim içinde bulunmasıdır.

Hastalıklara bağlı bazı etkilere yönelik oluşturulan terapi bahçelerinde planlama yapılırken aşağıdaki etmenlerin göz önünde bulundurulması önerilmektedir: Yön bulamamaya neden olan hastalıklar sebebiyle basit yapılar oluşturulması, kolay algılanabilir yollar ve girişlerin tasarlanması gerekmektedir; düşey peyzaj elemanlarının hastaların fiziksel ve ruhsal yönden emniyette olmalarını sağlaması ve bahçeden kaybolma risklerini azaltması nedeniyle terapi bahçelerinde çit veya ayırıcı duvarlar tasarlanmalıdır; yazın serin ve nemli bir ortam yaratması, sesiyle duyguları etkilemesi, havuz/çeşme/fıskiye olarak bir simge (*landmark*) özelliği ile kaybolma riskini azaltması nedenleri ile terapi bahçesinde su ögesi kullanılması önemlidir; bazı ilaçların kas yorgunluğuna sebep olması nedeniyle kolay erişilebilir dinlenme mekânları oluşturulmalıdır; güneşe karşı duyarlılığı artıran hastalıklar nedeniyle gölgeliklerin tasarlanması gerekmektedir; duyuların uyarılmasının tedavi sürecine katkı sağlayacağı bazı hastalıklar için farklı renklere, dokulara ve kokulara sahip bitkiler kullanılmalıdır; bitkilendirme tasarımı yapılırken hastaların alışık olduğu türden ve kelebek ve kuşları çeken bitkilendirme yapılmalı, toksik ve zararlı olmayan bitkilerin yanı sıra bahçede süreklilik için çok yıllık bitkiler kullanılmalıdır; yalnız çalışanlar için erişilebilir bir alan yaratılması, hastalardan uzak sakin bir dinlenme olanağı sunacağından önem taşımaktadır; dinlenme, okuma, fiziksel aktivite, rehabilitasyon aktivitesi (el işi, sanat terapisi, kutu oyunları vb), hortikültürel terapi, açık havada yemek, yakınlarla buluşma gibi etkinliklere olanak sağlayacak şekilde güneşli ve gölge alanlar, özel ya da sosyalleşme alanları, yürüme ya da dinlenme alanları gibi alternatiflerin sağlanması bahçenin etkin kullanımını sağlamak açısından önemlidir; açık mekân aktivitelerinin tüm yıl boyunca devam etmesi gerektiğinden kış bahçeleri ve seralar gibi korunaklı alanlar tasarlanmalıdır (Balode, 2013; Shamanth, 2014; Erbino vd., 2015).

Sonuç olarak, ilgili meslek disiplinlerinden uzmanları içeren ekiplerle oluşturulan terapi bahçeleri, özellikle toplumdan kendini soyutlamış ve ilaç tedavisinden yeterince verim alamayan zihinsel ve ruhsal engelli bireylerin topluma sağlıklı olarak kazandırılmaları, eksilen özgüven duygularını onarmaları, insanlarla karşılıklı ilişki kurabilmeleri ve kendilerini bir grubun parçası olarak görmeleri için önem taşımaktadır. Tüm odak gruplar için terapi bahçelerinin tedavi sürecine katkı sunacak şekilde doğayı hissedebilecekleri, flora ve faunayı inceleyebilecekleri nitelik taşıması önerilmektedir. Terapi bahçelerinin planlama, tasarım, uygulama ve bakım sürecine ilişkin verilen temel önerilerin yalnız ZBK Planlama Bölgesi'nde yer alan ve çalışma alanı olarak seçilen Özel Çaycuma Bakım Merkezi ve Özel Bartın Bakım Merkezi için değil; bundan sonra yapılması planlanan özel bakım merkezlerinin bahçeleri için de yönlendirici olacaktır.

ZONGULDAK İLİ EMNİYET KEMERİ KULLANIM DURUMUNUN DEĞERLENDİRİLMESİ

Mine Polat
mine_pol@hotmail.com

Mustafa Tanış
tanis@beun.edu.tr

Dünyada, trafik kazaları ve buna bağlı oluşan ölümler, çözüm aranan en büyük sorunların başında gelmektedir. Kazalara bağlı oluşan ölümleri en aza indirebilmek için yapılan çalışmalar ve düzenlemeler devam etmektedir. Bunun yanı sıra kullanımı zorunlu olmasına ve kazalarda oluşacak ölüm riskini ciddi oranda azalttığı bilinmesine rağmen, özellikle ülkemizde emniyet kemeri kullanım oranı oldukça düşüktür.

Zonguldak'ta topoğrafik yapı ve mevcut yollar, trafik güvenliği açısından olumsuzluklar oluşturmaktadır. Sürücülerin, bu farkındalıkla emniyet kemeri kullanımlarının doğru orantılı olup olmadığının anlamlandırılması amacıyla bu çalışma yapılmıştır. Çalışmada, Zonguldak ilinde emniyet kemeri kullanım durumu gözlemlenmiştir. Gözlemler, D010 numaralı devlet karayolu üzerinde yapılmıştır. Hafta içi ve hafta sonu, sabah ve akşam olmak üzere yapılan gözlemlerde sürücüler ve ön koltuktaki yolcuların emniyet kemeri kullanıp kullanmadıkları belirlenmiştir. Buna ek olarak, cinsiyet ve yaş değişkenleri de gözlemlenmiştir. Elde edilen veriler yorumlanarak, emniyet kemeri kullanım oranlarının kadın ve erkeklere göre dağılımları yaşları ile ilişkilendirilmiştir. Elde edilen sonuçlarla ilgili konudaki literatür çalışmaları karşılaştırılarak, Zonguldak ili emniyet kemeri kullanım değerlendirmeleri yapılmıştır.

Keywords: Emniyet kemeri, trafik kazası, trafik güvenliği, Zonguldak.

EXPOSURE ASSESSMENT OF HALOGENATED POPS IN STREET DUST IN AN INDUSTRIALIZED CITY

Merve Kara[1], ***Bilgehan Basaran***[2] and Mihriban Civan[3]

[1, 2 3] Department of Environmental Engineering, Kocaeli University, Umuttepe Campus,41380 Kocaeli, Turkey
(bilgehanbasaran.5@gmail.com)

Abstract: In past few decades, human health and quality of environment are deteriorated due to unrestrained use of Persistent Organic Pollutants (POPs).These chemical substances could remain unweathered (stable) in nature, be transported through different environmental pathways and bio-accumulate easily via lipid storage in adipose tissues. POPs may cause serious health problems like cancer, congenital disorders, immune system disorders or endocrine system disorders, etc. Within this context, in the year of 2001, an international environmental treaty, which is named as Stockholm Convention on POPs, was signed in Stockholm, Sweden. The main purpose of Stockholm Agreement is to eliminate or restrict the production, use, import and export of POPs. One of distribution pathways of POPs is via atmospheric transportation and this happens with street dust mostly. Street dust exposure is one of common and important dust exposures and it has become important to understand its constituents of POPs. In this study, street dust samples were gathered from 20 different points of highly industrialized precincts in Kocaeli Province. Collected dust samples were dedected simultaneously for 14 polybrominated diphenyl ethers (PBDEs) and 15 Poly Chlorinated Biphenyl (PCBs) isomers. For the analysis of PBDEs, Agilent 7890 N GC coupled with an Agilent 5977A mass spectrometer system was employed while PCBs were performed with Agilent 7890 N GC coupled with ECD dedector. Total centrations for Σ_{14}PBDE and Σ_{15}PCBs were measured as 76.52 and 16.87 ng g^{-1} respectively. The average daily intakes of $\sum_{14}$PBDEs were 1.96×10^{-1} ng/kg-day, 8.70×10^{-3} ng/kg-day and 2.99×10^{-5} ng/kg-day for dermal contact, ingestion and inhalation exposure, respectively. The contributions to $\sum_{14}$PBDEs exposure were approximately 95% and 5% for the dermal contact of street dust, whereas the exposure via inhalation of indoor dust was negligible. Exposure to $\sum_{15}$PCBs through dermal contact was the dominant route for human (4.52×10^{-1} ng/kg-day), while exposure by way of and ingestion (1.34×10^{-3}ng/kg-day) and inhalation ($5.94\times10^{-7)}$ ng/kg-day)of dust was negligibleAs a consequence, exposure to both PBDEs and PCBs contaminated street dust through dermal contact was the dominant route.

Keywords: street dust, risk assessment, Polybrominated Diphenyl Ethers (PBDEs), Polychlorinated Biphenyls (PCBs).

Introduction

Street dust as a complex environmental matrix refers to the load of deposited dust on an imperviously paved surface (Klees et al,2015). Furthermore, the term street dust refers not only to dust that exists on surfaces next to a road, but also to dust that accumulates on paved surfaces at industrial sites originating from processes taking place at those premises (Klees et al,2013). Health risks associated with uptake of contaminated dust may need to be evaluated, in particular at industrial sites (Klees et al.,2015).

Persistent organic pollutants (POPs) represent a diverse group of toxic substances that are semi-volatile, mobile in the environment, and prone to long-rang transport, and bioaccumulation. Soil acts as a natural sink for these toxic chemicals (Čupr et al., 2010; Hassanin et al., 2005; Meijer et al., 2002, 2003). Under the framework of the Stockholm Convention on POPs signed in 2001, a list of chemicals whose production, use and storage must be eliminated or severely restricted was produced (Yuan,2014). Polybrominated diphenyl ethers (PBDEs) are a class of additive flame retardants widely used in a variety of commercial and household products, such as polyurethane foam, plastics, textiles and electronics. They are similar in their physicochemical properties such as hydrophobicity, lipophilicity, thermal stability, and toxicity to polychlorinated biphenyls (PCBs), another well-studied group of contaminants (Chen et al., 2008).

Polychlorinated biphenyls (PCBs) are among the most persistent and toxic of the group of chemicals classified as persistent organic pollutants (POPs) (Salihoglu et al., 2011). Polychlorinated biphenyls (PCBs) are xenobiotic compounds of anthropogenic origin that are ubiquitous, toxic and persistent in the environment (Erickson, 1997).

 Copyright © International Science and Technology Conference (ISTEC)

Owing to their properties of industrial interest, PCBs were extensively used in various applications as dielectric fluids, plasticizers, additives, among others, in many countries starting from the 1930s (Gedik,2010). Although their production was banned worldwide by the Stockholm Convention on POPs, they are still in use especially in closed applications, and hence, pose a threat to the environment and human health if handled improperly (Gedik,2010). Wei et al (2009) reported that 80% of polybrominated flame retardants were found in fine particles of indoor dust. However, the information regarding PCB fractionation in different size particles is limited. Besides, bioaccessibility, measured in vitro experiments simulating the digestion process in the human gastrointestinal tract, is often used as a substitute of bioavailability (Xing, 2008; Guney et al., 2010). The human health risk associated with bioaccessible fraction of dust should be used as an indicator to better estimate the absorbed dose after ingestion (Oomen et al., 2002). However, the bioavailability or bioaccessibility of PCBs is seldom reported in risk assessments, especially exposure to PCBs via in and outdoor dust (Wang et al.,2013).

Polybrominated diphenyl ethers (PBDEs) inhibit fires and slow fire burn rates to reduce the loss of property and lives to fire, including a variety of consumer goods such as building materials, textiles furniture, TV sets, computers circuit boards and casings, foams and upholstery (Tan et al., 2007; Lagalante et al., 2009). In 2001, global consumption of the technical PBDE mixtures Penta-, Octa-, and Deca-BDE was 7500, 3800, 56000 tons, respectively (Eguchi et al., 2013). PBDEs also have endocrine disrupting properties and some have been shown to affect the neurotoxic health (Main et al., 2007; Meeker et al., 2009). Due to their toxicological effect, the production and use of PBDE formulations have been banned in Europe, and Pentaand Octa-BDE have now been banned in North America and China (Wu et al.,2015). In 2009, PBDEs were added to the list of banned chemicals included in the Stockholm Convention on Persistent Organic Pollutants (Besis and Samara, 2012).

The aims of the study were to estimate the exposure and cancer risks associated with the ingestion, inhalation and dermal contact of PBDEs and PCBs in outdoor dustand to compare the risks due to exposure to PBDEs and PCBs in the outdoor dust.

Materials & Methods

Sampling

A composit dust samples were gathered from 20 homes floors of the volunteers utilizing a Nilfisk Elit Plus 1600W vacuum cleaner (determined to catch 99.5% of all particles 0.3 µm and bigger). The volunteers were contracted through the individual correspondence. Testing was directed in the winter season from December 2015 to January 2016 to dispense with however much as could reasonably be expected indoor to outside ventilation. To maintain a strategic distance from cross sullying, the vacuum cleaner sack was changed after every example accumulation. In the wake of testing, the pack were put into the golden glass bottles prewashed with isooctane and put away in a cooler at −20 °C until sieving. Field spaces comprising of anhydrous sodium sulfate "tested" utilizing the same hardware and methodology portrayed above for the genuine examples were likewise broke down to figure out whether there was any defilement amid test taking care of and planning (Abdallah et al., 2013).

Extraction and Clean up

Samples were homogenized by sieving through a 100 µm a stainless steel strainer. 1 g of dust sample were weighted and spiked with labaled PBDE 203 and labaled PCB 181 as recuperation standard. Dusts were investigated taking after the strategy prompted by Cetin et al. (2016). 10 ml of acetone:hexane (1:1 v/v) arrangement was included and ultrasonically separated. The blending and extraction was rehashed for a brief moment time. The volume of supernatants was decreased around 2 ml with turning evaporator. A 30 cm× 1 cm glass section was pressed with 3 g silicic corrosive (deactivated with 4.5% deionized water) and 2 g alumina (deactivated with 6% deionized water) and finished with 0.8 g of anhydrous sodium sulfate. The section was pre-washed with 20mL DCM took after by 20 mL petroleum ether (PE). At that point, the concentrated example was added to the segment and PBDEs and PCBs were eluted with 60 mL PE.

For the examination of PBDEs, Agilent 7890 N GC combined with an Agilent 5977A mass spectrometer framework EI mode outfitted with a DB-5HT narrow section (15 m × 0.25mm i.d., 0.10 µm film thickness,J&W Scientific) was utilized, while the investigation of PCB was performed on an Agilent 7890 N GC combined with µECD and furnished with a HP5-MS slender segment (30 m × 0.25mm i.d., 0.25 µm film thickness, J&W Scientific. For the investigation of PCB, the underlying stove temperature was held at 80 ◦C for 2min, raised to 200 ◦C at 30◦C min−1, and raised to 320 ◦C at 10◦C min−1 held for 10 min. The injector temperatures were 300

 Copyright © International Science and Technology Conference (ISTEC)

◦C. PBDE were identified in the framework with the temperature program: 100 °C for 1 min, 8 °C/min to 320 °C, and held for 6 min. The temperatures were 80, 230, 150, and 320 ◦C for the injector quadrupole, particle source, and interface, separately. The recuperation of the PBDE 206 and PCB surrogates in all examples was in the scope of 72–106% and 84–112%for the majority of the specimens. The surrugate standard The PBDE and PCB - spiked dust was utilized to look at the recuperation of the logical strategies for the estimations of PBDE and PCBs focuses, and the recuperations were in the scope of 70–115% and 85-110% for PBDEs and PCBs relying upon individual congeners.

Exposure Scenarios and Risk Assessment

Human introduction to clean by means of three pathways (ingestion, inward breath and dermal contact) was evaluated with the accompanying conditions (US EPA, 1989; US EPA 2009; Kurt-Karakus, 2012).

$$D_{ing} = C_{dust} \times \frac{R_{ing} \times ET \times EF \times ED}{BW \times T_{avg}} \times CF \quad (1)$$

$$D_{inh} = C_{dust} \times \frac{R_{inh} \times ET \times EF \times ED}{PEF \times BW \times T_{avg}} \times CF \quad (2)$$

$$D_{dermal} = C_{dust} \times \frac{SAF \times A_{skin} \times DAF \times ET \times EF \times ED}{BW \times T_{avg}} \times CF \quad (3)$$

Where

D_{ing}, D_{inh}, D_{dermal} is t he chemical daily intake via ingestion; inhalation or dermal contact routes (mg kg^{-1} day^{-1}). C_{dust} is the measured dust concentration (mg kg^{-1}), R_{ing}, R_{inh} is daily ingestion and rate (mg dust day^{-1}) and daily inhalation rate (m^3 day^{-1}). Et, EF and ED are exposure time per day in homes (hours/day), exposure frequency (day $year^{-1}$) and exposure duration (years), respectively, BW is the body weight (kg). T_{avrg} is the averaging lifespan in Turkey (days). A_{skin} is the exposure skin area (cm^2), PEF is the particle emission factor (m^3 kg^{-1}). SAF is the skin adherence factor (mg cm^{-2} h^{-1}), DAF is the dermal absorption factor (unitless),

The values of the exposure parameters for children and adults with reference are provided in Table 1.

Table 1: Exposure parameters for children and adults with references

Exposure Factors	Abbreviations	Adults	Reference
the measured dust concentration (mg kg^{-1})	C_{dust}		this study
Ingestion rate of dust (mg dust day^{-1})	R_{ing}	30	USEPA,2011
Inhalation rate (m^3 day^{-1})	$R_{inhalation}$	20	USEPA, 2016
Exposure time per day in homes (hours/day)	ET	11/24 (0.46)	this study
Exposure frequncy (day $year^{-1}$)[c] (site specific)	EF	350	this study

Results & Discussion

The aggregate centralizations of PBDEs (Σ_{14}PBDEs) extended from 15,22 to 327,61 ng g^{-1}, with a middle of 76,52 ng g^{-1}. BDE-209 (middle: 24,07 ng g^{-1}) was the most overwhelm congener. The aggregate groupings of PCBs (Σ_{15}PCBs) went from 0,01 to 60,96 ng g^{-1}, with a middle of 7,39 ng g^{-1}. PCB-180 (middle: 2,46 ng g^{-1}) was the most rule congener, trailed by PCB-147 (middle: 1,00 ng g^{-1}).

The average daily exposure dosages of PBDEs and PCBs through ingestion, dermal contact and inward breath exposure were depicted in Table 2. The average daily intakes of $\sum_{14}$PBDEs were 1.96×10^{-1} ng/kg-day, 8.70×10^{-3} ng/kg-day and 2.99×10^{-5} ng/kg-day for dermal contact, ingestion and inward breath exposure, individually. The commitments to $\sum_{14}$PBDEs exposure were roughly 95% and 5% for the dermal contact of road dust, though the exposure by means of inward breath of indoor dust was insignificant. Exposure to $\sum_{15}$PCBs through dermal contact was the overwhelming course for human (4.52×10^{-1} ng/kg-day), while exposure by method for and ingestion (1.34×10^{-3} ng/kg-day) and inward breath (5.94×10^{-7}) ng/kg-day) of dust was irrelevant.

 Copyright © International Science and Technology Conference (ISTEC)

As an outcome, exposure to both PBDEs and PCBs polluted road dust through dermal contact was the prevailing course.

The hazard index(HI) values for BDE-47, - 99,- 153 and - 209 demonstrated in Table 3 were lower than safety limit of 1, and this outcome recommended that none of the populace gatherings would be prone to experience potential health risk because of exposure to PBDEs from open air dust in the study range. As exhibited in Table 3, the HQ for BDE-153 was the most noteworthy among the 4 PBDE congeners. The cancer risk of PBDEs was figured just for the congener PBDE 209 whose SF are worked by USEPA and delineated in Table 3. The mean cancer-causing levels were $7{,}49\times10^{-15}$, $1{,}6\times10^{-11}$ and $4{,}9\times10^{-11}$ for inward breath, ingestion and dermal introduction of BDE 209. The ingestion and dermal exposure to PBDE 209 levels represented the most elevated danger, while the dangers connected with inward breath pathways were insignificant among the three pathways.

Conclusion

The hazard index (HI) values for BDE-47, - 99, - 153,- 209 through inward breath pathways were lower than safety limit of 1, recommending that none of the populace gatherings would be prone to encounter a potential health risk because of exposure to PBDEs from outdoor dust in the study zone.

Abstract: Twenty surface dust samples were collected in different areas of Kocaeli proviance such as industrialized area, urban area and street dust between 26-27 December in 2015. After extraction and column clean up, elute was analyzed for 16 PAHs with Agilent 7890 N GC coupled with an Agilent 5977A mass spectrometer system EI mode. ΣPAHs concentrations in the urban surface dust ranged from 46.32 ng/g to 6313 ng/g with median value of 46.32 ng/g. The exposure were assessed in living population via three pathways, namely, ingestion of soil, dermal contact and inhalation of dust particles. The average daily intakes of $\sum_{14}$PAHs were 12.48 ng/kg-day, 0.0092 ng/kg-day and 1.46×10^{-5} ng/kg-day for dermal contact, ingestion and inhalation exposure, respectively. The contributions to $\sum_{14}$PAHs exposure were approximately 99% for the dermal contact of the dust, whereas the exposure via inhalation and ingestion of urban surface dust was negligible. The mean B2-PAH group carcinogenic levels via dermal contact, ingestion and inhalation pathways were 5.5×10^{-4}, 1.2×10^{-10} and $1.9\times10^{-6,}$ indicating dermal pathway was the major route to cause health concern. The total carcinogenic risk level of both B2 PAHs (5.5×10^{-4}) were higher than EPA safe limit range (1×10^{-6}).

Keywords: Urban Surface Dust, Polycyclic Aromatic Hydrocarbons (PAHs), Exosure Assessment

Introduction

The industrialized proviances have faced serious environmental problems due to high population density, hosting huge industrial complex and high traffic loadings. Hence the assessment of expsoure to population living in urban center have drawn much attention in recent years. In the urban areas, the sources such as industrial plants, vehicules and coal combustion process have emitted several pollutants which cause health problems on the population. Polycyclic aromatic hydrocarbons (PAHs) are one of the most ubiquitous group of pollutants found in urban environment such as atmosphere, precipitation, urban surface dust. PAHs are produced as a result of by-products of incomplete burning of petroleum products, and other incomplete combustions such as vehicle exhaust, coal-fired heating, and straw, fuel wood combustion and tobacco smoke (Yu et al., 2014; Finlayso-Pitts and Pitts 1997; Zhou et al. 2004; Li et al. 2006).Several PAHs are known carcinogens and identified by EPA as “priority pollutant” .

 Copyright © International Science and Technology Conference (ISTEC)

Urban surface dust (street dust) referred to the load of deposited dust on an imperviously paved surface next to road or at the industrial sites is major reservoir for organic pollutants because of its sorption quality and holding capacity (Wu_outdoor_2015; Klees et al., 2013). Hence urban surface dust have been a useful indicator of environmental quality of an urban area.

The objectives of the present work were: (i) to investigate PAHs levels in urban surface dust from a Heaviliy Industrialized Proviance; (ii) to estimate the exposure and cancer risks associated with the ingestion, inhalation and dermal contact of PAHs in urban dust;

Materials and Methods

Study Site and Sampling

Geographical coordinates of Kocaeli city hosted one of the most important industrial zones in Turkey are 9°22′–30°21′E, 40°31′–41°13′ N The dust sampling was performed at 20 within the Kocaeli region (29°22′–30°21′E, 40°31′–41°13′ N) hosted one of the most important industrial zones in Turkey. The industrial zone includes petrochemical plant, hazardous and clinical waste incineration and storage facility, textile (185 industrial enterprises) and other (above 1000) industrial plants. Today Kocaeli hosts 1900 industrial investments of which 247 have been established with international capital. In addition, due to D-100 (74 312 vehicles/day), TEM (61 854 vehicles/day) and D-130 (49, 451 vehicles/day) state highways passing through the city, an extensive flow of traffic arises. General layout of the study area is shown in Figure 1. Kocaeli is also home to more than 1,600,000 people and is one of Turkey's most densely populated cities (TUIK,2016).

The dust was collected with the brush prewashed with isooctane from rural,urban, industrial and industrially influenced urban areas during January 2016. The sample dust were put into the amber glass bottles prewashed with isooctane. Field blanks consisting of anhydrous sodium sulfate "sampled" using the same equipment and procedures described above for the real samples were also analysed to determine if there was any contamination during sample handling and preparation (Abdallah et al., 2013). In the laboratory, the samples were nitrogen-dried in hood and cleaned from stones, hairs etc., sieved(<100 μm) and finaly stored in a freezer at −20 °C until extraction.

Sample Extraction and Clean up

The 5 gr sample was spkied with surrogate standards (Acetanapthalene-d10, Chyresene-d10, Perylene-d10, Phenantherene-d10) and extracted by ultrasonicagitation in 10-ml mixture of 1:1 acetone: hexane. The mixing and extraction were repeated a second time with the addition of 10 ml of fresh solvent The extract volumes were reduced and transferred into hexane (2 mL) using a rotary evaporator and a high purity N_2 stream. A 30 cm× 1 cm glass column was packed with 3 g silicic acid (deactivated with 4.5% deionized water) and 2 g alumina (deactivated with 6% deionized water). The column was pre-washed with 20mL DCM followed by 20 mL petroleum ether (PE). Then, the sample in 2mL hexane was added to the column. The column was eluted with 40 ml of DCM. All elute volumes were reduced to approximately 200 μl in a rotary evaporator and under a gentle stream of nitrogen.

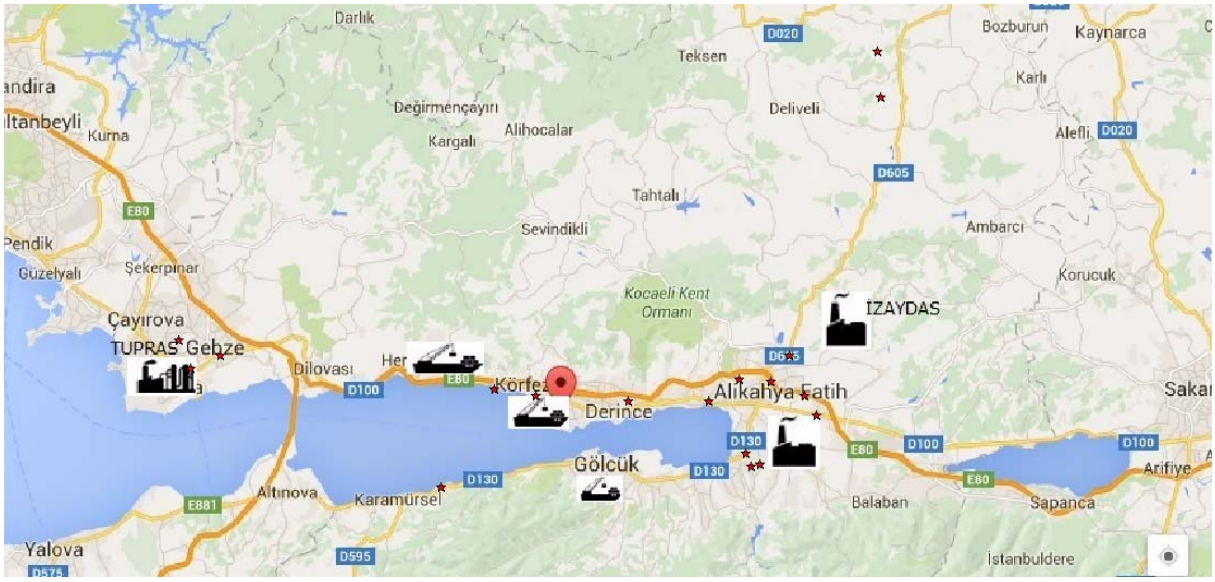

Figure 1: Location of sample point

Elute was analyzed for USEPA's priority 16 PAHs including Naphthalene (Nap), Acenaphthylene (Acy), Acenapthene (Ace), Flourene (Flu), Phenanthrene (Phe), Anthracene (Ant), Fluoranthene (Flt), Pyrene (Pyr), Benzo(a)anthracene (BaA), Chrysene (Chr), Benzo(b)fluoranthene (BbF), Benzo(k)fluoranthene (BkF), Benzo(a)pyrene (BaP), Dibenzo(a,h)anthracene (DahA), Benzo(g,h,i)perylene (BgP) with Agilent 7890 N GC coupled with an Agilent 5977A mass spectrometer system EI mode equipped with a DB-5HT capillary column (15 m × 0.25mm i.d., 0.10 µm film thickness,J&W Scientific) was employed. For the analyzed PAH, the initial oven temperature was held at 50 °C for 1 min, raised to 200 °C at 25 °C min^{-1}, and raised to 300 °C at 8 °C min^{-1}, and held for 8 min.

Health Risk Calculation

The exposure assessment and risk calculation were mentioned in detail in previous work (Civan and Kara, unpublished). Below are the formulas to calculate dose received through ingestion, inhalation and dermal contact pathways (US EPA, 1989, 1996; Shin et al., 2011;Kurt-Karakus, 2012)

$$D_{ing} = C_{dust} \times \frac{R_{ing} \times F_{exp} \times T_{exp}}{BW \times T_{avg}} \times CF \qquad (1)$$

$$D_{inh} = C_{dust} \times \frac{R_{inh} \times F_{exp} \times T_{exp}}{PEF \times BW \times T_{avg}} \times CF \qquad (2)$$

$$D_{dermal} = C_{dust} \times \frac{SAF \times A_{skin} \times DAF \times F_{exp} \times T_{exp}}{BW \times T_{avg}} \times CF \qquad (3)$$

where

D_{ingi}, D_{inhi}, $D_{dermali}$ The chemical daily intake for the age-group i via ingestion; inhalation or dermal contact routes (mg kg^{-1} day^{-1});

 Copyright © International Science and Technology Conference (ISTEC)

C_{dust}	The measured dust concentration (mg kg^{-1}) (human expsosed these pollutants in their homes)
R_{ingi}	Daily ingestion rate for the age-group i (mg dust day^{-1})
R_{inhi}	Daily inhalation rate or the age-group i (m^3 day^{-1})
Et_i	Exposure time per day in homes for the age-group i (hours/day).
EF	Exposure frequency (day $year^{-1}$)
ED	Exposure duration (years) for the age-group i
BW_i	The mean body weigh for the age-group i (kg)
T_{avrg}	The averaging lifespan in Turkey for the age-group i (days)
CF	Unit conversion factor,
A_{skini}	The exposure skin area for the age-group i (cm^2)
PEF	the particle emission factor (m^3 kg^{-1})
SAF	The skin adherence factor (mg cm^{-2} h^{-1}),
DAF	The dermal absorption factor (unitless),

Slope factor of benzo(a)pyrene (Bap) via inhalation, ingestion and dermal pathways are 3.83, 7.3 and 25 mg kg^{-1} day^{-1}, respectively (Peng et al., 2011; USEPA, 1994). Seven carcinogenic PAHs concentrations and their respective toxic equivalency factors (TEFs) including BaP (1), BaA (0.1), BbF (0.1), BkF (0.01), Chr (0.001), DahA (1) and Ind (0.1) were used in the cancer risk assessment applying BaP toxicity equivalence (Man et al., 2013; US EPA 1993).

Result and Discussion

Levels of PAH in urban surface dust

Different levels of 16 PAH homologues were dedected in Kocaeli collected from road rural industrial and industrially influenced urban areas. Table 1 represents the statistical summary of PAHs in urban surface dust. Total PAHs concentration in Kocaeli urban dust display a very wide range with maximum concentration being 9 times greater than the minimum concentration. Σ_{16}PAHs concentrations in the urban surface dust ranged from 358.9 ng/g (at rural site far from the industrial areas) to 3380 ng/g (at located in the vicinity of petroleum refinery)with median value of 1098 ng/g.

Concentrations of Phe, Flt+Pyr, Chry, Bkf, Bbf and Naph were comparatively higher among the 16 individual PAHs at all the locations, accounting for 15.7%, 10.4%, 9.8%, 8.7%, 7.5% and 7.3%, respectively.The HMW-PAH/LMW-PAHs averaged 1.71 (ranged from 0.14 to 4.16) indicating some location affected from noun-exhaust source and most of the locations's Total concentrations of B2 group seven PAHs were comparable to those of the other nine PAHs, accounting for 12% and 61% of the total PAHs. The concentration of BaP, the most potent carcinogenic, ranged between 1.9 (at rural site) and 199.8 ng/g (vicinity of highway) with median of 41.6 ng/g. Fluoranthene+Pyrene (median: 116.5 ng g^{-1}) was the most dominate congener, followed by chrysene (median: 112.6 ng g^{-1}), flourene (median: 109.3 ng g^{-1}), phenanthrene (median: 105.6 ng g^{-1}), benzo(k)fluoranthene (median: 98.04 ng g^{-1}) and Benzo(b)fluoranthene (median: 76.57 ng g^{-1}), while acenapthene (median: 17.4 ng g^{-1}), Dibenzo(a,h)anthracene (median: 21.72 ng g^{-1}) and acenaphthylene (median: 26.9 ng g^{-1})were the least abundant

 Copyright © International Science and Technology Conference (ISTEC)

congener for all the samples. These Flt+Pyr, BkF, BbF, Chr, Flue and Phe varied in quantities, from 48% to 82% of all congeners. The seven most dominate PAHs species are indicative of combustion (Soltani et al., 2015; Hwang et al., 2003) therefore the common source of PAHs in the urban dust in Kocaeli was vehicular emission.

Table 1: The mean, median, minimum and maximum range of PAHs homologues

	Abbr.	**mean**	**median**	**min**	**max**
Naphthalene	Nap	74.86	49.3	31.58	232.45
Acenapthene	Ace	23.69	17.4	1.25	80.01
Flourene	Flue	162.3	109.3	15.54	770
Acenaphthylene	Acy	50.26	26.87	5.12	242.2
Phenanthrene	Phe	112.8	105.58	6.82	251.2
Anthracene	Ant	57.47	43.27	11.06	242.1
Fluoranthene+Pyrene	Flt+Pyr	149.1	116.53	5.09	354.2
Benzo(a)anthracene	BaA	57.48	39.23	10.95	211.3
Chrysene	Chr	129.9	112.64	5.16	379.9
Benzo(b)fluoranthene	BbF	94.69	76.57	12.62	264.4
Benzo(k)fluoranthene	BkF	118.5	98.04	5.92	421.2
Benzo(a)pyrene	BaP	58.55	41.57	1.86	199.8
Indeno(1,2,3-c,d)pyrene	Ind	82.75	64.57	2.99	301.5
Dibenzo(a,h)anthracene	DahA	40.87	21.72	8.98	187.1
Benzo(g,h,i)perylene	BgP	60.78	33.31	3.68	191.6
$\sum_{16}$PAHs		1273	1098	358.9	3380

In this work, three-ring PAHs including contributed between 19 % to 87 % of ΣPAHs, and four to six-ring PAHs including contributed varied from 13% to 81% of ΣPAHs. The lower molecular weights (LMW) of PAHs was the most dominant in the sampling point closed to pethrochemical plants while the higher molecular weights (HMW) of PAHs reached 87%of total PAHs in the proximitey of high ways. The LMW PAHs are emitted from various natural sources and incomplete burning petroleumproducts, while the HMW PAHs sources include various types of complete combustions (Yu et al.,2014;Chen et al. 2005; Wilcke 2007; Yu et al. 2006). In overall data these higher molecular weights of PAH (4-6 ring) makes larger fraction of total PAH concentration, suggesting a common source of vehicle emissions in Kocaeli urban dust.

Risk Assessment

Expsoure of PAHs through inhalation, ingestion and dermal contact were r reported in Tables . The average daily intakes of $\sum_{14}$PAHs were 39.7 ng/kg-day, 0.01 ng/kg-day and 4.6×10^{-5} ng/kg-day for dermal contact, ingestion and inhalation exposure, respectively. The contributions to $\sum_{14}$PAHs exposure were approximately 99% for the dermal contact of the dust, whereas the exposure via inhalation and ingestion of urban surface dust was negligible.

The mean B2-PAH group carcinogenic levels via dermal contact, ingestion and inhalation pathways were 4.3×10^{-4}, 3.4×10^{-7} and $7.9\times10^{-11,}$ indicating dermal pathway was the major route to cause health concern. The total carcinogenic risk level of both B2 PAHs (5.5×10^{-4}) were higher than EPA safe limit range (1×10^{-6} and 1×10^{-4}).

 Copyright © International Science and Technology Conference (ISTEC)

Our estimated results suggested that drivers in both sites are exposed to moderate/high carcinogenic risk via both dust ingestion and dermal contact pathways.

Conclusion

ΣPAHs concentrations in the urban surface dust ranged from 46.32 ng/g to 6313 ng/g with median value of 46.32 ng/g. The exposure were assessed in living population via three pathways, namely, ingestion of soil, dermal contact and inhalation of dust particles. The average daily intakes of $\sum_{14}$PAHs were 39.7 ng/kg-day, 0.1 ng/kg-day and 4.6×10^{-5} ng/kg-day for dermal contact, ingestion and inhalation exposure, respectively. The contributions to $\sum_{14}$PAHs exposure were approximately 99% for the dermal contact of the dust, whereas the exposure via inhalation and ingestion of urban surface dust was negligible. The mean B2-PAH group carcinogenic levels via dermal contact, ingestion and inhalation pathways were 4.3×10^{-4}, 3.4×10^{-7} and $7.9\times10^{-11,}$ indicating dermal

pathway was the major route to cause health concern. The total carcinogenic risk level of both B2 PAHs (5.5×10^{-4}) were higher than EPA safe limit range (1×10^{-6} and 1×10^{-4}).

ADSORPTION OF METHYLENE BLUE FROM AQUEOUS SOLUTION BY USING SURFACTANT MODIFIED POMELO PEEL

Chakkrit Umpuch and Pariwat Namduang

Ubon Ratchathani University, Department of Chemical Engineering, Ubon Ratchathani- Thailand

Chakkrit.u@ubu.ac.th

Abstract: This work, the potential of using surfactant modified pomelo peel for adsorbing methylene blue was studied. Experiments were carried out as function of contact time, initial adsorbate concentration, initial solution pH and temperature. The dynamic data fit well with the pseudo-second-order kinetic model (R^2> 0.9999) with the apparent activation energy of +45.67 kJ/mol. The Langmuir model agrees very well with the experimental data (R^2>0.9900). On the basis of the Langmuir analysis, the maximum adsorption capacities were determined to be 294.20 mg/g at 25°C, 304.31 mg/g at 35 °C and 306.56 mg/g at 45°C and 308.42 mg/g at 55°C. The negative values of gibbs free energy indicate the spontaneous nature of the adsorption. It is suggested that the adsorption is likely to be chemical adsorption.

Keywords: surfactant modified pomelo peel, methylene blue, adsorption, kinetics, isotherm

INTRODUCTION

Water pollution from dye contamination in natural stream in Ubon Ratchathani province, Thailand is one of significant problems. The problem gains more serious due to the rapid growth of household scale textile industries to meet increasing population and exporting demands. Two types of dye which are natural and synthetic dyes are usually used in dyeing process. The synthetic dyes are preferred because of their bright and lasting colors, resistance to heat and light and ease applications. After dyeing process, approximately 40% dye amount is left in water body and usually find their way into nearby rivers and/or spaces under houses. The synthetic dyes are high water solubility, heat and light resistance and low biodegradability (Chuah et al., 2005). High amount of accumulated synthetic dyes in water support can cause unsightly scenery, obstruction of light transmission into water body and being harmful to humans, animal, and aquatic life. Therefore, it is very important to remove the synthetic dyes from wastewater before discharge. In order to persuade the villagers in household scale industries concern water pollution and pay attention to wastewater treatment, the treatment methods should be simple, fast and low cost. Adsorption technology is one of treatment methods which can achieve those suggestions. Adsorption process is the adhesion of dye molecules, adsorbate, from wastewater to a solid surface, adsorbent.

The activated carbon is a well known adsorbent and widely used in dye removal from wastewater; however, the commercial activated carbon is expensive due to high energy consumption during its preparation. Recently, alternative ways to develop biosorbent from natural materials as biosorbent also exist to decrease the cost. The materials that have received considerable attention to use biosorbent for dye removal are fruit peel, corncob, sugarcane bagasses, rice hull, bacteria, fungi and algae (Jayarajan et al., 2011; Umpuch and Jutarat, 2013). Pomelo is a fruit which is widely grown in Thailand so that it is plentiful and cheap. Pomelo peel (PP) is composed of insoluble monomers such as pectin, cellulose and hemicelluloses which have important functional groups such as carboxyl and hydroxyl groups. These functional groups can interact with cations in aqueous solution.

In addition, the adsorption capacity of biosorbent can enhance by various modifications (Wibulswas, 2004; Charuwong and Kiattikomol, 2004). Adsolubilization technology is a process to form admicelle of cationic surfactant on the external surface of adsorbent. The adsolublization causes the surface properties of adsorbent altering from hydrophilic to hydrophobic. It has been proven that the surfactant modified biosorbent is effective for organic compound adsorption. However, the adsorption of cationic dyes by surfactant modified biosorbent is seldom studied.

This study focused on preparation of surfactant modified pomelo peel (SMPP) which is a novel material for cationic dye, methylene blue, removal from aqueous solution. Experiments were carried out as function of contact time, initial dye concentration, initial solution pH and temperature. Also, the dye removal efficiency of SMPP was determined by single-stage batch adsorption tests including kinetic model, adsorption isotherms and thermodynamic study.

MATERIALS AND METHODS

 Copyright © International Science and Technology Conference (ISTEC)

Methylene blue (MB) supplied by Aldrich, Ireland was used as an adsorbate. Distilled water was employed for preparing all the solutions and reagents. MB has a molecular weight of 373.9 g/mol which corresponds to methylene blue hydrochloride with three group of water ($C_{16}H_{18}ClN_3S.3H_2O$). A stock solution of MB was prepared by dissolving 1.0 g in 1 L of distilled water, and the solutions for adsorption tests were prepared from the stock solution to the desired concentration by successive dilutions.

The natural pomelo peel was purchased from a local market at Warin Chamrap, Ubon Ratchathani province, Thailand as a solid waste. The yellow-green peel (flavedo) was removed from the pomelo peel with a knife. The residue, white spongy peel (albedo), was then washed with distilled water several times to remove all impurities. Then, the clean material was dried at a temperature of 40°C in an air-circulating oven until weight being constant. The dried pomelo peel was crushed and shredded in a blender for about 15 min and sieved to obtain a particle size below 300 µm, designated as precursor. An amount of 1.0 g of the precursor was treated with 100 mL of 1000 mg/L tetradecyltrimethylammonium bromide ($C_{17}H_{38}NBr$) surfactant. Agitation at 200 rpm was allowed for 15 min at room temperature using an orbital shaker. Afterwards, the surfactant modified pomelo peel (SMPP) particles were filtered with a microfilter (Whatman, UK), washed with distilled water several times to remove superficially retained surfactant, and dried in an oven at 40 °C until weight being constant. To have uniform modification and reproducible results, the SMPP particles were sieved (50 mesh) before use for adsorption studies. All adsorbents were packed in plastic bags and stored in desiccators for further use.

The batch sorption experiments were carried out in a set of Erlenmeyer flasks (250 mL) by agitating desired amounts of SMPP particles with 100 mL of dye solutions of desired concentration and pH, in an isothermal shaker. A series of adsorption experiments were investigated in different operating conditions related to the contact time, initial MB concentration, initial solution pH and temperature. First, the effect of contact time was investigated. A series of 250 mL Erlenmeyer flasks containing 100 mL of the 300 mg/L MB solutions were mixed with 0.1 g of SMPP. These flasks were closed with paraffin to avoid evaporation and then horizontally shaken at 200 rpm. The samples were measured at 2, 5, 15, 30 and 60 min. Second, the effect of initial MB concentrations was carried out in the same fashion with that in the first experiment, but the initial concentrations were varied in a range of 50 to 300 mg/L of MB solution (pH_0 = 5.0) and the contact time was assigned at 24 hours. The effect of the initial solution pH was carried out in the same manner with the second experiments but varying the pH_0 of 300 mg/L MB solution from 2.0 to 10.0. Finally, the effect of temperature was investigated by repeating the first and second experiments but investigating at other temperatures such as 35, 45 and 55°C (Umpuch and Jutarat, 2012).

The collecting samples were filtered by micro-filter to remove adsorbent particles and the MB concentration in the filtrate was analyzed by UV-Vis Spectrophotometer at wavelength corresponding to the maximum absorbance for MB of 663 nm. The absorbance values were converted to MB concentration by calibration curve. The MB adsorbed quantity and the removal MB percentage (%MB Removal) were calculated using the following equations:

$$q_t = \frac{V(C_0 - C_t)}{m} \quad (1)$$

$$\%\ MB\ \text{Removal} = \frac{C_0 - C_t}{C_0} \times 100\ \% \quad (2)$$

where q_t (mg/g) is the quantity of MB biosorbed per unit mass of biosorbent, C_0 (mg/L) is the initial MB concentration, C_t (mg/L) is the MB concentration after biosorption, m (g) is the mass of biosorbent, and V (L) is the volume of aqueous solution. In addition, the %MB removal of pomelo peel and SMPP determined by using second experiment but fixed initial MB concentration as 300 mg/L were 46.30% and 65.74%, respectively.

RESULTS AND DISCUSSION

The effect of contact time on the instantaneous adsorption capacities of MB by SMPP, q_t, is shown in Fig.1. The dye uptakes increased in the first 2 min and then gradually increased with time until reaching a constant. The rapid rate in the initial stage was probably due to the abundant availability of active sites on the external surface of the SMPP particles. The adsorption rate gradually increased in the later stages because of the reduction in available active sites. The saturation of MB molecules on the SMPP was addressed at the final stage. The equilibrium time required for the adsorption of the MB was approximately 30 min.

To find the mechanism controlling the adsorption process, pseudo-first-order, pseudo-second order, and intraparticle diffusion models were used to check the experimental data. The q_t (mg/g) is the amount of MB adsorbed at time t. The pseudo-first order kinetic model is normally applicable for only the initial 30 min of adsorption process. If the diffusion rate of adsorbate across the boundary layer to adsorbent surface is at a rate of limiting step, the kinetic data are well fitted to the pseudo-first order model (Lagergren and Svenska, 1898). It is

 Copyright © International Science and Technology Conference (ISTEC)

generally expressed as follows:

$$\ln(q_e - q_t) = \ln q_e - k_1 t \quad (3)$$

where k_1 (min^{-1}) is the rate constant of first-order adsorption.

The pseudo-second order kinetic model was proposed by Ho in 1995 (Ho and McKay, 1998). If the chemical sorption is the rate-limiting step, the experimental data follow the pseudo-second order expression according to Eq.(4). It is expressed as:

$$\frac{t}{q_t} = \frac{1}{k_2 q_e^2} + \frac{1}{q_e} t \quad (4)$$

where k_2 ($g/(mg.min)^{-1}$) is the rate constant of second-order adsorption.

If the diffusion of cadmium ions into the pores and capillaries of the adsorbent is the rate of limiting step, the adsorption data can be presented by the following Eq.(5):

$$q_t = k_p t^{1/2} + C \quad (5)$$

where k_p represents intraparticle diffusion rate constant ($mg/(g.min^{1/2})$) and C is a constant (mg/g) which gives information on the thickness of the boundary layer.

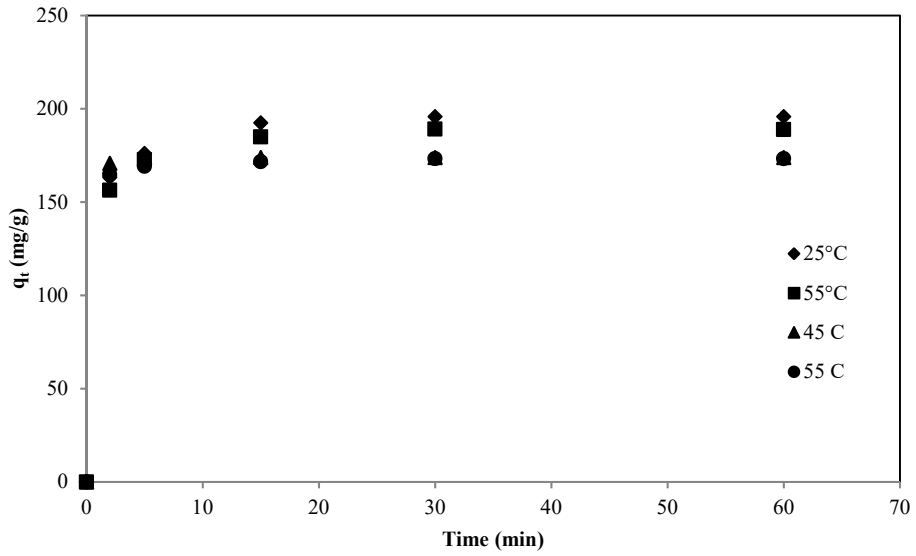

Figure 1. Effect of temperature on the adsorption of MB onto SMPP for a solution initially containing 300 mg/L of MB as a function of time.

Table 1 Constants from three kinetic models for MB adsorption on SMPP

Model	**Parameters**	**T(°C)**			
		25	**35**	**45**	**55**
	$q_{e,exp}$(mg/g)	195.83	189.17	173.89	173.33
Pseudo-first order	k_1 (min^{-1})	1.68	1.62	1.24	1.29
	$q_{e,cal}$ (mg/g)	6.75×10^{31}	3.61×10^{30}	6.98×10^{22}	1.17×10^{24}
	R^2	0.2573	0.2547	0.1631	0.1834
Pseudo-second order	k_2 (g/(mg*min))	0.0163	0.0176	0.567	0.0639
	$q_{e,cal}$ (mg/g)	196.97	189.97	173.93	173.58
	R^2	0.9999	0.9999	0.9999	0.9999

	C (mg/g)	88.13	85.31	92.23	88.68
	R^2	0.4981	0.4953	0.3662	0.3952

The calculated values of $q_{e,cal}$ (Table 1) from the pseudo-first-order kinetics model and intraparticle diffusion model

 Copyright © International Science and Technology Conference (ISTEC)

were dramatically lower than the experimental value (q_{exp}). The linear plot of t/q_t against t according to Eq. (4) was observed. The constant k_2 and the corresponding linear regression correlation coefficient values, R^2, are given in Table 1. As the values of R^2 were limited to unity (R^2>0.9986), the adsorption data conform to the pseudo-second order model. This indicated that the rate of limiting step was the formation of chemical bonding between the MB and the dissociated functional groups on the surface of the SMPP.

The activation parameter can be determined by the Arrhenius equation. The slope of the plot of log k_2 vs. 1/T can then be used to evaluated the activation energy, E_a, according to equation (6). The Arrhenius equation is expressed as:

$$\log k_2 = \log A - \frac{E_a}{RT} \tag{6}$$

where E_a is the activation energy (J/mol) and A is the Arrhenius factor (g/(mol.s))

The experimental results obtained gave E_a = +45.67 kJ/mol for the adsorption of MB onto SMPP. Low E_a values (<42 kJ/mol) indicate diffusion control processes, and the higher E_a values (>42 kJ/mol) indicate chemically controlled process. In this study, low value of the E_a indicates that the adsorption process of MB adsorption on SMPP might be a chemical adsorption.

The study of adsorption isotherm is fundamental, and plays an important role in the determination of the maximal capacity of adsorbent. Adsorption isotherm of MB on SMPP which is the plot of MB concentration in solid vs. MB concentration in liquid at equilibrium stage was illustrated in Fig.2.

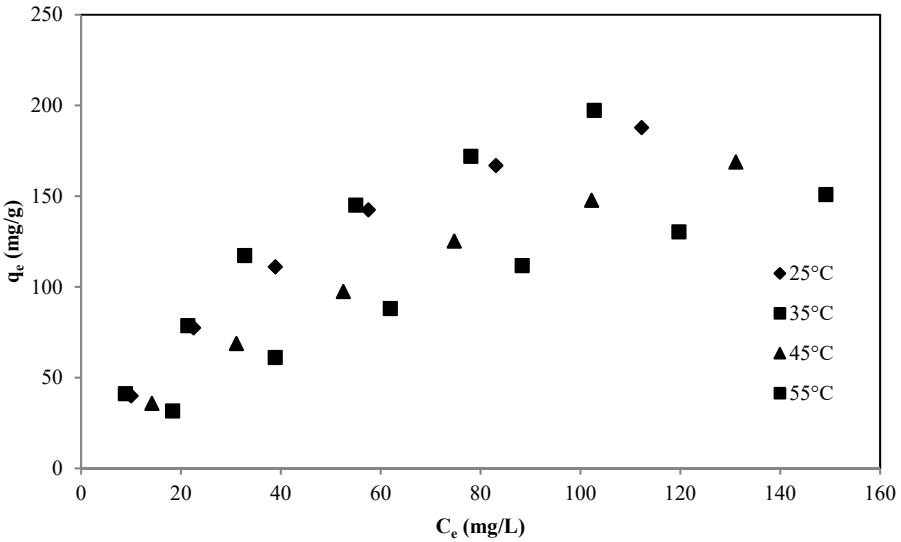

Figure 2. Effect of temperature on the adsorption of MB onto SMPP for a solution initially containing 300 mg/L of SMPP as a function of equilibrium MB concentration.

The equilibrium data usually were correlated by well established isotherm models such as Langmuir and Freudlich isotherms. For the adsorption on a totally homogeneous surface, generally the Langmuir equation applies because here interactions between adsorbed molecules are negligible. The Langmuir equation is most often used to describe equilibrium sorption isotherm (Anwar et al., 2010) which is valid for monolayer sorption with a finite number of identical sites. The linear form of Langmuir isotherm is given below.

$$\frac{C_e}{q_e} = \frac{C_e}{q_m} + \frac{1}{K_L q_m} \tag{7}$$

where q_m (mg/g) is the maximum sorption of monolayer, C_e (mg/L) is a final equilibrium concentration of cadmium, q_e (mg/g) is the MB adsorbed per unit weight of the SMPP at final equilibrium concentration, and K_L (ml/g) is the Langmuir constant related to the affinity of binding sites.

The essential characteristics of the Langmuir isotherm can be expressed by means of "R_L" which is a dimensionless constant referred to as a separation factor of equilibrium parameter. The R_L is defined by

 Copyright © International Science and Technology Conference (ISTEC)

$$R_L = \frac{1}{1 + K_L C_0} \quad (8)$$

This parameter suggests the type of isotherm is irreversible ($R_L=0$), favorable ($0<R_L<1$), linear ($R_L=1$), or unfavorable ($R_L>1$). As can be seen from Table 2, the R_L values are between 0 and 1.0, indicating that the adsorption of MB onto SMPP is favorable.

The widely used empirical Freundlich equation based on sorption on a heterogeneous surface is given by

$$\log(q_e) = \log(K_F) + \frac{1}{n}\log(C_e) \quad (9)$$

where K_F ($mg^{1-1/n}.L^{1/n}.g^{-1}$) and n are the physical constants of the Freundlich isotherm. The K_F and n are the indicators of adsorption capacity and adsorption intensity respectively (Salleh et al., 2011).

The results showed the Langmuir isotherm was best fitted to the experimental data for MB indicating that the monolayer of MB molecules covers along the SMPP surface. Table 2 shows the monolayer capacity of absorbed MB onto SMPP was 294.20 mg/g at 25°C, 304.31 mg/g at 35 °C and 306.56 mg/g at 45°C and 308.42 mg/g at 55°C.

Table 2: Isotherm constants and correlation coefficients for the adsorption of MB on SMPP at different temperatures

Model	Parameters	T(°C)			
		25	35	45	55
Langmuir isotherm	q_m (mg/g)	294.11	304.31	306.56	308.42
	K_L (L/mg)	0.0159	0.0174	9.31×10^{-3}	6.47×10^{-3}
	R_L	0.173	0.161	0.264	0.340
	R^2	0.9993	0.9907	0.9975	0.9952
Freundlich isotherm	K_F (l/g)	9.89	11.00	5.97	3.90
	n	1.56	1.57	1.44	1.35
	R^2	0.9839	0.9814	0.9962	0.9915

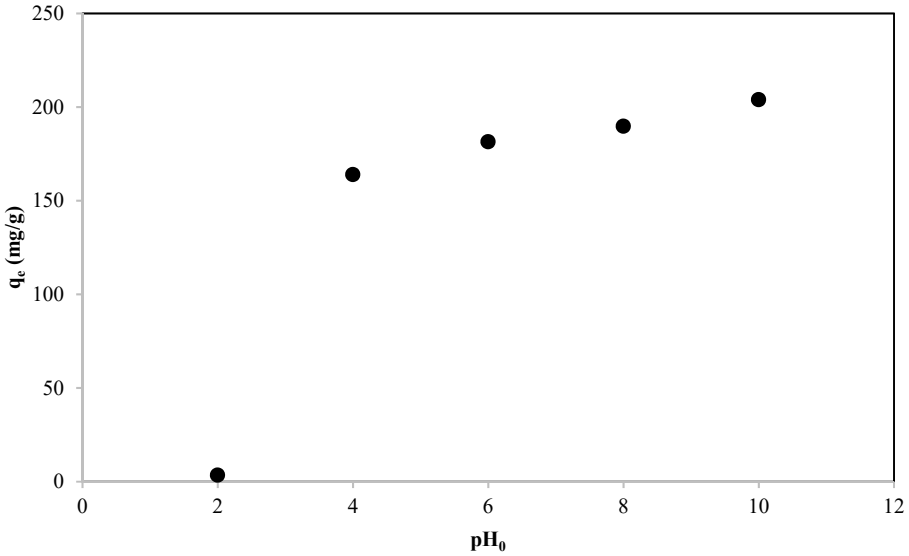

Figure 2. Effect of initial solution pH on the adsorption of MB onto SMPP for a solution initially containing 300 mg/L of SMPP.

The effect of initial solution pH on the equilibrium adsorption capacities of MB by SMPP, q_e, is shown in Fig.2. The uptakes of the MB dye increased with increase in the initial solution pH. The sorption capacity increased greatly when the pH increased from 2.0 to 4.0 and gradually increased further when the pH increased from 4.0 to 10.0. The interaction between MB and admicelle coating on the PP surface is suggested as hydrophobic-hydrophobic interactions since the MB is co-ions with positive charge on the adsorbent surface. At acidic medium, there is a small quantity of hydroxide ions so that the MB is in cationic form. The adsorption capacity is very small in this condition because electrostatic repulsion between the MB and active site. On the other hand, the increase

 Copyright © International Science and Technology Conference (ISTEC)

of pH levels provides higher amount of hydroxide ion which compensate with MB cations to form neutral molecules. In addition, the positive charge on the adsorbent surface also compensate with hydroxide ions become neutral surface. Consequently, the electrostatic repulsion is weaker and the MB and admicelle forms hydrophobic-hydrophobic interactions. This results in higher adsorption capacity of MB in the alkali medium.

The effect of operating temperature on the instantaneous and equilibrium adsorption capacities of MB by SMPP is shown in Fig.1 and 2. The increase of temperature in the system caused a decrease of the adsorption capacity. This indicated that the reaction was exothermic process. This result was in accordance with those observed in the previous literature (Yan et al., 2007). Thermodynamic parameters can be determined from the variation of the thermodynamic equilibrium constant K_L with temperature.

$$\Delta G^0 = -RT \ln K_L \quad (9)$$

where R is the universal gas constant (8.314 J/mol.K) and T is temperature in Kelvin. The average standard enthalpy change (ΔH^0) and the standard entropy change (ΔS^0) are determined from the Van't Hoff equation (Umpuch and Sakaew, 2013).

$$\ln K_L = -\frac{\Delta H^0}{RT} + \frac{\Delta S^0}{R} \quad (10)$$

As seen in Table 3, all ΔG^0 shifted to a less negative value when the temperature increased suggesting the adsorption occurred less spontaneously at higher temperature. The negative value of the enthalpy change (ΔH°) indicated that the sorption was an exothermic process. This also suggested that the adsorption process takes place without energy consumption. The negative value of entropy change (ΔS°) corresponded to an decrease in the degree of freedom of the adsorbed species. However, a little change of entropy can be observed showing that SMPP did not change significantly as a result of adsorption.

Table 3: Thermodynamic parameters for the adsorption of MB on SMPP

T(°C)	K_L (L/mol)	ΔG° (kJ/mol)	ΔH° (kJ/mol)	ΔS° (kJ/(mol.K))
25	5.95	-4.42	-26.75	-0.080
35	6.51	-4.64		
45	3.48	-3.09		
55	2.42	-2.19		

CONCLUSION

The cationic surfactant adsolubilized on pomelo peel caused a presence of admicelle which is organophilic on the external surface of the precursor enhancing adsorption capacity to MB blue dyes. The MB uptakes rapidly increased in the first 2 min and achieved equilibrium at 30 min. The SMPP sorbs MB effectively in alkali solution and sorption of MB is strongly pH dependent. The sorption process is well described by Langmuir and Freundlich equations. The kinetic study demonstrated that the adsorption kinetics followed pseudo-second order kinetic model. The activation energy of +45.67 kJ/mol was determined. The calculated ΔH^0, ΔS^0 and ΔG^0 suggested that the adsorption was exothermic and spontaneous. From the above results, the SMPP was an effective adsorbent for the removal of the organic dyes from synthetic effluents.

ÇAĞDAŞ ARAP ŞİİRİNDE SEMBOLİZM AKIMI ÜZERİNE BİR İNCELEME

Salih TUR

Harran University, Department of Arabic Language and Literature, Şanlıurfa/ TURKEY

stur@harran.edu.tr

Özet: Sembolizm 19. yüzyılın ikinci yarısında parnasizme tepki olarak Fransa'da ortaya çıkmış bir sanat akımıdır. Fransa'da gelişerek diğer Avrupa ülkelerine yayılmıştır. Dönemin Kant, Henri Bergson, Richard Wagner gibi filozof ve sanatkârlar bu akımın düşünce alt yapısının oluşmasını sağlamıştır. Daha sonra C. Baudelaire (1821-1867), P. Verlaine (1844-1896), A. Rimbaud (1854-1891) ve S. Mallarme (1842-1898) gibi Fransız şairler bu akımın prensiplerini, yaratıcı gücünü ortaya koyarak geliştirmişlerdir. Özellikle Baudelaire "Correspondances" adlı şiiriyle dünyanın "semboller ormanı " olduğunu ifade etmiş ve ilişkiler teorisi düşüncesini ortaya koymuştur. Dünya edebiyatını etkileyen sembolizm şüphesiz ki Arap edebiyatını da derinden etkilemiştir. Özellikle Arap şiirinin klasik gelenekten kurtulup, çağın değişimine ayak uydurması gerektiğini savunan genç Arap şairlerinin bu isteğini karşılayan sembolizm akımı olmuştur. Bu çalışmamızda sembolizmin Çağdaş Arap şiiri üzerinde etkisi ve yansıması üzerinde durularak, bu bağlamda çeşitli örnekler verilmiştir.

Anahtar Kelimeler: Modern Arap Şiiri, Sembol, Sembolizm, Simge, Parnasizm

A STUDY ON SYMBOLISM IN MODERN ARABIC POETRY ABSTRACT

Abstract: Symbolism is an art movement emerged in France in the second half of the 19th century as a response to Parnassianism. It developed in France and has spread to other European countries. The philosophers and artists of this period such as Kant, Henri Bergson and Richard Wagner has provided the background of this movement. Then, French poets such as C. Baudelaire (1821-1867), P. Verlaine's (1844-1896), A. Rimbaud (1854-1891) and S. Mallarmé (1842-1898) have developed the principles of this movement by putting forward its creative powers. Especially Baudelaire has expressed the World as a "forest of symbols" with his poem, "Correspondences" and has asserted the idea of the theory of relations. Undoubtedly, symbolism affecting world literature has deeply influenced Arabic Literature as well. It is symbolism which meets especially the request of young Arab poets who claim the necessity of getting rid of the classical traditions of Arabic poetry and adapting to changes in the current era. This study examines the impact of the symbolism on the contemporary Arabic poetry and its reflections and several examples are given in this context.

Keywords: Modern Arabic Poetry, Symbol, Symbolism, Symbolic, Parnassianism

Giriş

Sembolizm, ilk olarak İngiliz ve Alman romantizminde görülmüşse de, bir akım olarak XIX. yüzyılın son çeyreğinde parnasizme (şiirde gerçekçiliğe) tepki olarak Fransa'da ortaya çıkmıştır. Bilhassa Fransa, Almanya gibi batılı ülkelerinde başlayan Rönesans ve reform hareketleri bu akımın doğuşuna zemin hazırlamıştır. Batı toplumlarında başlayan bu aydınlanma hareketleri ardından insan ve hayatın tek gerçeği sadece materyalizm olmuştur. Hayatı ve insan zihnini sadece madde ve ilimle sınırlandırmaya çalışmıştır. Batı toplumunda egemen olmaya başlayan materyalist düşünce, belli bir süre sonra insanı bunalıma sevk etmiş ve kendi ruh dünyasını tatmin edecek yeni arayışlara girmiştir. Bu arayışın içinde olanların başında Alman filozof Kant olmuştur. Kant'a göre her türlü bilgi ve düşünce sübjektif ve görecelidir. Bilginin elde edilmesinde sezgi gücü çok önemli ve kaçınılmazdır. Buna ilaveten bilginin elde edilmesinde dış dünyanın gerçekleri ve tabiatı göz ardı edilmemelidir.
Kant insanın yaratıcı hayal gücüne inanır. Ona göre insanın duyularla kazandığı izlenimleri, duyular ötesi bir seviyede sezgiye dayanan akıl sayesinde "fikir öbekleri" olarak adlandırılan kavramlara dönüştürme melekesi olmalıdır. Yani yaratıcı hayal gücü, insanın zihninde doğuştan getirdiği ve sezgiyle özdeşleştirdiği sentetik bir meleke ve bir yaratma gücü kendinde olmalıdır. Dolayısıyla Kant, bilginin sübjektifliğine ve sezginin bu konudaki önemine dikkat çeker. Çünkü her gerçek bilginin özü bir sezgidir. Her yeni gerçek de bir sezgiden ortaya çıkar(Çetişli, 2001:93-94).
Aynı şekilde Fransız filozofu Henri Bergson (1859-1941) pozitivist felsefeye karşı çıkarak bilimin sonsuz olanaklarının bulunduğunu inancı, ruhun imkânlarını reddetmek anlamına geldiğini ifade eder. Ona göre akıl her türlü bilgiye götüren tek kaynak değildir. Aklın karşısında bilincin doğrudan doğruya bilgilerine, bilincin yeteneklerine önem verilmesi gerekmektedir. Gerçeğe varmak, bilinç olaylarını kavramak, muhakeme yoluyla

 Copyright © International Science and Technology Conference (ISTEC)

bilinenden bilinmeyene doğru metotlu bir biçimde giden akılla değil, ancak sezgiyle mümkündür. (Çetişli, 2001:95).
Yine materyalist dünya görüşüne karşı çıkan bir başka düşünür de Alman müzisyen Richard Wagner (1813-1883)'dır. Mistik bir dünya görüşünü benimseyen Wagner, sanatın önemine işaret ederek müzikal öğenin sembolizmin üzerinde tartışılmaz bir etkisinin olduğunu vurgulamıştır. Ona göre sanatın işlevi insanın ruhunda var olan gizli gerçeği gün ışığına çıkarmaktır. Bu da ancak duygusallık, canlılık ve sezgiyle mümkündür. He ne kadar müzik duyular bakımından ruhun içeriğini ifade etmekte ise de bu içeriği anlaşılır biçimde yansıtmaktan oldukça uzaktır. Bu açıklığı getirecek kişi de ozandır. İnsan ruhunun derinliklerinde var olan gerçekleri ifade etmek ancak duyguyla düşüncenin bir araya gelmesiyle mümkün olacaktır(Çetişli, 2001:95).
"Sembolizm" adı ilk defa 1886 yılında akımın bildirisini hazırlayan Jean Moreas tarafından kullanılmıştır. Maurice du Plessys (1864-1924), Jean Moreas (1856-1910), Laurent Tailhed (1854-1919), Georges Rodenbach (1855-1898) gibi dekadanlar diye bilinen bir grup şair sembolizmin bir akım olarak ortaya çıkmasına zemin hazırlamıştır. (Çetişli, 2001:93)
Sembolizm ilkeleri Charles Baudelaire (1821-1867), Stephane Mallarme (1842-1898), Paul Verlaine (1844-1896), Arthur Rimbaud (1854-1891), Jean Moreas, Henri de Regnier (1864-1936) gibi Fransız şairler tarafından ortaya konulmuş ve tüm dünya edebiyatçılarını etkilemiştir. Özellikle Charles Baudelaire yazdığı "*Correspondances"* adlı şiirle sembolizm akımının birçok prensiplerini ortaya koymuştur. Dünyanın "semboller ormanı " olduğunu ifade ederek sözcüklere yeni ve farklı anlamlar yüklemiştir. Örneğin "*La Beauté*" (Güzellik) adlı şiirinde şair, bir rüyasını katı bir nesne olan taşa şöyle benzeterek nitelemiştir(Baudelaire, 2001:40):
Je suis belle, ô mortels! comme un rêve de pierre,
Et mon sein, où chacun s'est meurtri tour à tour,
Est fait pour inspirer au poète un amour
Eternel et muet ainsi que la matière

Taştan bir rüyâ kadar güzelim;
Her birinin sırayla ölümünü bulduğu göğsüm
Şaire ilham verir bir aşkla ölümsüz
Çamur kadar yalnız ve sessiz.

Yukarıdaki mısralarda görüldüğü gibi Baudelaire, aralarında ortak bir özellik bulunmayan "rüya" ile "taşı" birbirine benzetmeye çalışmıştır.
Fransız sembolist şairler, yukarıda ifade ettiğimiz gibi sanatta gerçekçilik anlayışına karşı çıkarak insanın iç dünyasına yönelmesi gerektiği görüşünü dile getirirler. Onlara göre somut varlıklar, dış dünya ile insanın duyuları arasında köprü kurmaya yarayan birer simgeden ibarettir. Çünkü dış gerçek ancak insanın algılayış biçimiyle var olmaktadır. Bir başka ifadeyle dış dünyanın görüntülerini somut nesnel gerçeklikleriyle değil, bu görüntülerin sezgilerinden, izlenimlerden yansıyan niteliklerini şiire aktarılmalıdır. Bir insan onu nasıl algılıyorsa öyle değerlendirilmelidir.
Sembolistler şiirde müzikal öğeye çok önem vermişlerdir. Şiiri de sesiz bir şarkı olarak tarif etmişlerdir. Onlara göre şiir düşüncelere değil duygulara seslenmelidir. Bir şey anlatmak için yazılmaz. Ayrıca sözcükler insanın duygularını ifade etmek için yetersizdir. Bu nedenle insanların duygularını harekete geçirmek için müziğe önem verilmelidir. Çünkü şiirde sözcüğün anlam değerinden çok, müzikal değeri önemlidir. Nitekim Baudelaire "*La Musique*" (Müzik) adlı şiirinde müzikal öğenin şiirde ne kadar önemli olduğunu şöyle dile getirmiştir(Baudelaire, 2001:113):
La musique souvent me prend comme une mer!
Vers ma pâle étoile,
Sous un plafond de brume ou dans un vaste éther,
Je mets à la voile;

Müzik çok zaman beni deniz gibi taşıyor
Taşıyor beni solgun yıldızıma
Bir sis tavan altında veya sonsuza dek
Böyle açarım yelkeni.
Sembolistler, şiirlerinde alışılmışın dışında ve farklı çağrışımlar elde etmek için çeşitli istiare, teşbih, kinaye ve mecaz gibi söz sanatları kullanmışlardır. Bu da manayı derinleştirmiş, herkesin anladığı şekilde yorum getirme olanağını yaratmıştır.
Yine gerçeklerden kaçarak hayale sığınılması, hayatta mevcut olan çirkinlikleri hayal gücüyle güzel gösterilmesi sembolistlerin temel özelliklerindir.
Sembolizm, tüm dünya edebiyatını etkilemiş bir akımdır. Amerika Birleşik Devletleri'nde Edgar Allan Poe (1809-1849), İngiltere'de Oscar Wilde (1854-1900), Almanya'da Stefan George (1868-1933), Rusya'da Konstantin Dimitriyevic Balmont (1867-1942), Turkiye'de Ahmet Haşim (1883-1933) gibi bu akımın etkisinde kalan

şairlerdir. Arap dünyasında ise başta Lübnanlı şairleri olmak üzere birçok Arap dünyasının genç şair ve edebiyatçılarını etkilemiş bir akımdır.

Çağdaş Arap Şiirinde Sembolizm

Çağdaş Arap şiirinde sembolizm akımını incelemeye geçmeden önce, klasik Arap edebiyatı geleneğinde sembolizmin bilinip bilinmediği veya kullanılıp kullanılmadığı hususuna değinmekte konunun daha kapsamlı anlaşılması bakımından yarar vardır.

Arapçada sembol kavramının sözcük karşılığı "*remz*"dir. Arapların bu sözcüğü bildiklerini ve edebî ürünlerinde kullandıklarını görmekteyiz. Bazı Arap dilciler, *remz* sözcüğünü, "dudak, göz, kaş ve elle yapılan bir tür işaret" şeklinde açıklar. Bazıları da *remz*in anlaşılmayacak derecede "kısık bir sesle konuşmak veya işaret etmek" anlamına geldiğini belirtir. Nitekim Kuran'ı Kerim'de *remz* sözcüğü"bir alamet, bir işaret" anlamına gelecek şekilde şöyle kullanılmıştır (Ali İmrân/14):

"قَالَ رَبِّ اجْعَل لِّيَ آيَةً قَالَ آيَتُكَ أَلاَّ تُكَلِّمَ النَّاسَ ثَلاَثَةَ أَيَّامٍ إِلاَّ رَمْزًا"

"Zekeriya, "Rabbim! (çocuğum olacağına dair) bana bir alâmet ver" dedi. Allah da şöyle dedi: "Senin için alâmet, insanlarla üç gün konuşmaman, ancak işaretleşebilmendir."

İbn Manzûr, *remz* sözcüğünün anlamını"iki dudağın hareketiyle mırıldamak gibi dille çıkarılan kısık bir ses veyahut dudakla yapılmış bir işaret" olduğu şeklinde açıklar (İbn Manzûr, 1994: "remz" mad.).

el-Câhız söz sanatlarından bahsederken "işaret" kavramıyla ilgili daha geniş bir bilgi vererek mananın sadece sözle değil, aynı zamanda yazı veya işaretler kullanılarak ifade edildiğini söyler. (el-Câhız, 1998:69).

Araplar, *remz* sözcüğünü ıstılahı bir kavram olarak ilk defa Abbasî Dönemi'nde kullanmaya başlamıştır. Bilindiği üzere Abbasî Dönemi edebiyat, ilim, fikir ve sanat alanında gelişmelerin yaşandığı bir dönemdir. *Remz* sözcüğünü ıstılahî anlamda ilk defa kullanan eleştirmen Kudâme b. Ca'fer(ö. 337/948) olmuştur (Kudâme, tsz:90). Kudame b. Cafer'den sonra İbn Reşîk el-Keyravânî (ö. 456/1064) bu sözcüğü kavramsal anlamda kullanmış ve işaretin taşıdığı anlamları ortaya koyarak açıklamaya çalışmıştır. İbn Reşîk işaret kavramını"*tüm söz çeşitlerinde bulunan ve sözün genelinden anlamı anlaşılan, zahiri manasından uzak bir mana ima eden veciz bir söz"* olarak açıklar (İbn Reşîk, 1981:305).

Klasik Arap şairlerinin, Arapçada karşılığı *remz* olarak bilinen sembolü bir kavram olarak şiirlerinde kullanıp kullanmadıkları hususunda edebiyat eleştirmenlerinin iki farklı görüşü bulunmaktadır. Bunlardan biri Arap şairlerin sembolü bir kavram olarak bilmedikleri ifade etmektedir. Bu görüşü dile getiren eleştirmenlerin başında da İlyâ Havî (1929-2000) gelmektedir. Cahiliye şairlerinin sembolü bir edebî sanat olarak bilmediklerini ifade eden İlyâ Havî, bu dönemin şairlerinin düşünce ve kültürel yapısında bir derinlik olmadığını ifade eder. Ona göre cahiliye şairi, çevresinde gördüklerini şiirine konu edinirdi ve bununla yetinirdi. Kâinatın karmaşık ve derin yapısını düşünecek bir kabiliyet veya bilimsel bir altyapıya sahip değildi. Bu yüzden şiirlerindeki manalar basit ve yüzeyseldi. Kapalılıktan uzaktı. Okuyucunun zihninde farklı çağrışımlar yaratacak bir mana yoktu. Hatta dinî inançlarında dahi bu yüzeysellik ve basitliği görmek mümkündür. Taş, odun parçası veya yediği gıdalardan kendine bir tanrı edinirdi. İhtiyaç duyduğunda da kutsallık atfettiği bu nesneleri günlük hayatta kullanmaktan sakınmazdı. Ayrıca cahiliye edebiyatında dolaylı anlatım üslubu pek yoktur. Daha çok icaz üslubu egemendir.

Yine İlyâ Havî'ye göre metafizik âlem hakkında cahiliye Araplarının bilgilerinin olmayışı onları şiirlerinde tabiatın görünen gerçekleri ele almalarına ve konu edinmelerine sevk etmiştir. Şayet kâinatın sır dolu gizemleriyle ve onu harekete geçiren güç hakkında yeterli bir bilgiye sahip olsaydılar, bugün cahiliye şiiri Yunan şiiri gibi mitolojik unsurlarla dolup taşmıştı. Eski Yunanlılarda mitolojik inançlar, insanların düşünce dünyalarının ayrılmaz bir parçasıydı. Oysa cahiliye Arap şiirinde insan hayatını ve onun hayal ve düşünce dünyasını etkileyen mitolojik bir tanrısal güç yoktu. Cahiliye insanı yaşamında tanrı gücünden çok sahip olduğu maddî güce güvenirdi. Bu nedenle cahiliye şairi şiirlerinde bineğini betimlerken onun korku dolu ıssız çölü nasıl kat tetiği üzerinde dururdu. Şair Antara b.Şeddâd (ö.21/642) ve 'Amr b. Kelsûm(ö.540. civarı)'un şiirlerinde olduğu gibi.

Diğer bir görüş ise yukarıdaki görüşün tam aksini iddia ederek Arapların sembolü bildiklerini dile getirir. Bu görüşe göre cahiliye döneminde kâhinlik düşüncesi yaygındı. Kâhinler, günlük hayatta kullanılan dilden farklı bir dil kullanırdı. Kendilerine özgü bir dilleri vardı. Bu dil oldukça müphem ve kapalıydı. Sembolik anlatımlarla doluydu. Kâhinler, dinleyicinin üzerinde etki yaratmak için dildeki müzikaliteye de önem verirdi. Kapalılık, ima ve sezgi bakımından bu dil daha çok batılı sembolistlerin kullandıkları dile yakındı. Bu dönemde yazılmış olan gazel şiirlerinin tümü sembolik anlatımlarla doluydu. Çünkü bu şiirlerde ismi anılan sevgili gerçek sevgili değildi. Bu isimlerin çoğu sembolik anlamlar taşıyordu.(el-Cundî, tsz:160). Buna ilaveten cahiliye şairleri şiirlerinde sembolik anlatımlara çokça yer vermişlerdir. Örneğin cahiliye şairlerinden İmru'l-Kays bir şiirinde geceyi tasvir ederken gece sözcüğüne pek çok anlam yüklemiştir (Ceviz, 2004:34):

وَلَيْلٍ كَمَوْجِ البَحْرِ أَرْخَى سُدُوْلَهُ عَلَيَّ بِأَنْوَاعِ الهُمُوْمِ لِيَبْتَلِي
فَقُلْتُ لَهُ لَمَّا تَمَطَّى بِصُلْبِهِ وَأَرْدَفَ أَعْجَازاً وَنَاءَ بِكَلْكَلِ
لاَ أَيُّهَا اللَّيْلُ الطَّوِيْلُ أَلاَ انْجَلِي بِصُبْحٍ، وَمَا الإِصْبَاحُ مِنكَ بِأَمْثَلِ

Beni sınamak için, türlü türlü kederlerle deniz dalgaları misali perdelerini üzerime salan nice geceler var.
Gece yoğunluğu ile boynuzunu uzatıp, arkasına süre ekleyip, göğsünü şişirdiğinde ona dedim ki:
Ey uzun gece! Açıl da sabah olsun; sabah da senden daha iyi değil ya!

 Copyright © International Science and Technology Conference (ISTEC)

Yukarıdaki mısralarda görüldüğü üzere şair geceyi yere çöken cüsseli bir deveye benzetir. Ancak şair, mısralarda deve sözcüğünü zikretmez. Onun levazımlarından olan deve için kullanılan yere çöküş fiili olan "*kelkele*"yi zikreder. Bir başka ifadeyle geceyi azgın, cüsseli ve efsanevi bir devenin yere çöküşüne benzetir. Görüldüğü gibi burada zımni bir istiare bulunmaktadır Bu da sembolün bir çeşidi olarak kabul edilmektedir.

Dolayısıyla şair, karamsarlığını, üzüntüsünü ve hayal kırıklığını ifade etmek için gece sözcüğünü kullanarak içinde bulunduğu durumu veya ruh halini ifade etmeye çalışmıştır.

Cahiliye Araplarının sembolü şiirlerinde kullandıkları bir gerçektir. Örneğin Temimoğulları kabilesine esir düşen bir şairin sembolik anlatımlarla kabilesini şöyle uyardığı görülmektedir (İbn Reşîk, 1981:308):

خَلُّوا عن الناقة الحمراء أرْحُلَكُمْ والبازلَ الأصْهَبَ المعقولَ فاصْطَنِعُوا
إن الذِّئابَ قدْ اخْضَرّتْ بَرَاثِنُهَا والنَّاسُ كُلّهُـــمُ بَكْـرٌ إذا شَبِعُـــــوا

Sert ve kumsal bir dağın üzerinde yürüyen kırmızı bir dişi deve görüyorum. Kumral devenin üzerinden eşyalarınızı indirin.

Kurtların ayağı yeşil oldu(otların üzerinde) yürümekten, insanların tümü Bekr b.Vâi'il'dir (düşmanınızdır) doyduklarında.

Şair yukarıdaki mısralarında "kurt" sözcüğüyle düşmanı, "kırmızı dişi deve"yle çölü, "kumral deve"yle bir dağı sembolize etmiştir.

Yukarıda verdiğimiz örneklerde görüldüğü gibi cahiliye şairlerinin şiirlerinde çeşitli sembolik ifadeler kullandıkları görülmektedir. Ancak kavramsal olarak sembol, ilk defa Abbasî döneminde kullanılmaya başlanmıştır. Abbasî şairlerinden Beşşâr b. Burd (**ö**. 167/783-84) alışıla gelmiş şiir kalıplarının dışına çıkarak, batılı sembolistlerin önemli kuramlarından olan "ilişkiler teorisi"ne benzer bir şiir söylemiştir (http://www.adab.com/):

فرمت بي خلف الستور لأفواهِ الْمَنَايَـا مَنْ بَيْنِ حمْرٍ وَسـودِ
أيُّها السَّاقِيانِ صُبَّا شرابِـيواسقِياني من ريق صفـراء رود
ولها مضحكٌ كغر الأقاحـيوَحَدِيثٌ كَالْوَشْـي وَشْـيِ الْبرودِ

Beni gizemler arkasında ölümün siyah ve kırmızı pençelerine attı
Ey iki saki! Şarabımı doldur ve bana sarı rüzgârların salyasından içir
Onun bir gülüşü var papatya ağzı gibi ve yeleğin süslemesi gibi nakışlı sözleri var.

Yukarıdaki mısralarda görüldüğü üzere şair, sevgilisinin sözlerini nakışla süslenmiş bir yeleğe benzetir. Dolayısıyla söz duyulur; görülmez. Ancak şair dinleme duyusunun yerine görme duyusunu kullanır. Yine ölüme pençeler ve pençelere de renkler, canlılara has olan salya sözcüğünü de rüzgâra izafet etmesi oldukça dikkat çekicidir. Bilindiği üzere klasik Arap şairleri, genelde teşbih yaparken iki kavramın yani müşebbeh/benzeyen ve müşebbehbih'in/benzetilen vech-i şebehte/benzeyen açısından ortak yanı bulunması gerekmektedir. Ortak yanı yoksa benzetme sanatı yapılmazdı. Örneğin Baudelaire'in yukarıdaki mısralarda hayalini taşa benzetmesi gibi bir benzetme yapılmazdı. Bu tür benzetmeler de şairler tarafından bilinmezdi.

Aynı şekilde Abbasî şairlerinde Ebû Temmâm(ö. 231/846)'ın şiirlerini incelediğimizde pek çok sembolik ifadelere rastlamak mümkündür. Bilindiği üzere dolaylı anlatım ve kapalılık Ebû Temmâm'ın şiir özelliklerindendir(el-Kazvinî, 1994).

Yine el-Müttennebî (905-965)'nin şiirlerini incelediğimizde şiirlerinde oldukça derin anlamları olan ve orijinal sembolleri kullandığını görmekteyiz. Özellikle onun gazellerinde sembolik anlatımlara sık rastlamaktayız. Örneğin bir şiirinde şöyle der (el-Mutenebbî, tsz:429):

وَزِدْنَا من حسْنِ وَجْهِكمـا دامَ فَحسْنُ الوجُوهِ حَالٌ تَحَـــولُ
وَصِلْنَا نَصِلْكِ فِـي هَذِهِ الدُّنيَـا فإن المُقـــامَ فيها قليـــــــلُ

Yüz güzelliğinden bize de ver var olduğu sürece, zira yüz güzelliği değişkendir
Sen bize, biz sana kavuşalım, zira bu dünyada ikamet geçicidir.

Şair, bu beyitlerinde klasik gazel şairlerindeki alışılmışın dışına çıkarak âşık ve maşukun geleceği, akıbeti hakkında bilgi vermeye çalışmaktadır. Kullandığı semboller vasıtasıyla insanı düşünmeye sevk etmektedir. Son beyitte yer alan"ikamet" sözcüğü oldukça derin ve geniş anlamlar taşımaktadır. Bu sözcüğü kullanırken aslında ölümü kastetmektedir; bilindiği üzere "ikamet" sözcüğü "göç" sözcüğünün zıddıdır. Şair "göç etmek" sözcüğüne metafizik bir anlam yüklemeye çalışmıştır. Âdeta şunu ifade etmek istemektedir; bir yerde her ne kadar uzun bir süre ikamet edilirse edilsin sonunda bir göç, bir yolculuk vardır. Bir başka ifadeyle, göçten sonra bir göçün daha olduğunu ifade etmeye çalışmaktadır ki o da ölümdür.

Yine şair Ebû Firâs el-Hemedânî (932-968)'nin, Rumların elinde tutsakken yazdığı bir kısım gazelleri sembolik anlatımlarla doludur.

Endülüs şairlerinin şiirlerinde de sembolik anlatımların yoğun olduğu görülmektedir. Örneğin İbn Hafâce (1058-1139) bir dağı nitelerken hiçbir zaman dağın adını zikretmeden çeşitli semboller kullanarak onu betimlemeye çalışmıştır (el-Muleycî, 1989:204):

وَقورٌ على ظَهرِ الفلاةِ كأنَّــه طِـوالَ اللَّيالي مُفكرُ في العَواقبِ

Sahranın üzerinde vakur (bir insan) gibi duruyor, geceler boyu zamanın sorunlarını düşünüyor.

Dolayısıyla klasik Arap şairlerinin Arapçada *remz* olarak bilinen sembolü kullandıkları bir gerçektir. Ancak klasik şairlerin *er-remziye* olarak bilinen sembolizmi bir akım olarak bilmedikleri de bir vakadır. Sembolizm, batı şair ve

 Copyright © International Science and Technology Conference (ISTEC)

edebiyatçılarının genç Arap şairleri üzerindeki etkisinin bir sonucu olarak 1936'dan sonra Arap edebiyatında ortaya çıkmaya başlamıştır.

Bilindiği üzere ilk önce Lübnanlı edebiyatçıların ürünlerinde görülmeye başlamıştır. Lübnan, nüfusunun bir kısmının Katolik Araplardan oluşması ve misyoner okullarının burada açılması sebebiyle, diğer Arap ülkelerine göre Batıyla, bilhassa Fransa ile çok erken dönemlerde temasa geçmiş ve tarih boyunca hep yakın ilişkiler içinde olmuştur.

Ayrıca Birinci Dünya Savaşı'ndan sonra gerek Lübnan, gerekse Suriye uzun bir dönem Fransız işgalinin altında kalmıştır. Her iki ülkenin entelektüelleri arasında Fransızca, Arapçadan sonra kullanılan ikinci bir dil olmuştur. Bu da onlara Fransız edebiyatında yaşanan gelişmeleri yakından takip etme olanağı sağlamıştır(el-Cundî, tsz:416). Böylece Baudelaire, Rimbaud, Mallarmé, Valéry, Paul Verlaine gibi Fransız sembolist şairlerin şiirlerinin yanı sıra eleştiri türünde ve edebiyat kuramları gibi pek çok eser Arapçaya çevrilmiştir. Çevrilen bu eserler, Ebû Şebeke, Sa'îd 'Akl, Yûsuf Gassûb, Salâh Lebkî, Bişr Fâris, Emîn Nahle, Nakûlâ Feyyâd gibi dönemin genç şairleri tarafından büyük ilgi görmüştür(el-Hamdânî, 1989:279).

Çağdaş Arap şiirinde sembolizm akımına zemin hazırlayan pek çok faktör bulunmaktadır. Bunların başında da neo-klasik (el-Klâsîkiyye'l-Cedîde)şairleri gelmektedir. Arap şiirinde ilk değişim belirtileri neo-klasik şairlerin şiirlerinde görülmeye başlamıştır. Bu akımın ilk temsilcisi Mahmûd Sâmî el-Barûdî (1837-1904) olduğu için *Medresetu'l-Barûdî* (Barudî ekolu) olarak da bilinmiştir (Brugman,1948:926). Ayrıca Mısır'da Sâmî el-Barûdî'nin yanı sıra Ahmed Şevkî (1869-1932), Hâfız İbrâhîm (1871-1932), Halîl Mutrân (1872-1949), Irak'ta Cemîl Sıdkî ez-Zehâvî (1863-1936), Ma'rûf er-Rusâfî (1875-1945), Lübnan'da Şekîb Arslân, Halîl el-Yâzıcî, Suriye'de Muhammed el-Bezm, Tunus'ta Muhammed eş-Şâzlî, bu ekole mensup ünlü şairlerdir(el-Fâhûrî, 1987:926). Bu ekolün şairleri, edebiyatın "altın çağı" diye nitelendirilen Abbâsî döneminin, Ebû Temmâm (796-843), el-Buhturî (821-897), Ebû Nuvâs (762-813), Beşşâr b. Burd (714-784), el-Mutenebbî (915-965) gibi ünlü şairleri taklit etmişse de Arap şiirinde muhteva bakımından yenilik getirme çabasında olmuşlardır. (Brugman,1948:26). Örneğin Avrupa kültürünü yakından tanıma olanağını bulan Ahmed Şevkî,1897yılında Cenevre'de Uluslararası Oryantalizm Konferansı'nda okuduğu *Kibâru'l- Havâdis fî Vâdî'n-Nîl* (Nil Vadisinde Meydanâ Gelen Önemli Olaylar) adlı ünlü kasidesinin Victor Hugo'nun *La Legende de Siecles* (Asırların Efsaneleri) adlı kasidesinden esinlenerek Mısır tanrıçalarından olan İsis, Ramsis, Amun, Kıloptra, Anka kuşu, Hz. Mesih kuşu gibi mitolojik semboller kullanmaya başlamıştır (Şevkî,1988:17-33; Dayf; 1997:47).

Neo-Klasik şairlerinden sonra sembolizmin belirtileri Avrupa'da olduğu gibi romantik şairlerin şiirlerinde görülmeye başlamıştır. Arap romantik şiirine geçişi sağlayan Halil Mutrân, Arap kasidesinde gerek içerik gerekse biçim yönünden değişikliğe gidilmesi ve kasidenin organik bütünlüğünün sağlanması, yeni kural ve kavramlar geliştirmesi gerektiğini vurgulamıştır. Ayrıca şiirde bireysel özgürlük, duygu, hayal gibi konuların üzerinde durmuştur. Mutrân, Fransız romantiklerin, özellikle Hugo'nun şiirsel anlatımlarının, Musset'nin liriklerinin ve Baudelaire'in etkisinde kalarak Arap şiirinin gelişimine büyük katkı sağlayarak sembolizm akımının Arap şiirinde yerleşmesine bir basamak hazırlamıştır(Tur, 2005:7). Özellikle onun "*İlâ Gurûbi'ş-Şems"*(Güneşin Batışına) ve *el-Mesâ'* (Akşam) adlı şiirlerinde hayatın son baharını ima eden pek çok sembol kullanmıştır.

Aynı şekilde sembolizmin ilk belirtilerini, Mehcer edebiyatçılarının romantik ürünlerinde görmek mümkündür. Bilindiği üzere Arap şiirinin modernleşme sürecinde en büyük katkı sağlayan, gerek romantizm gerekse sembolizm akımlarının Arap edebiyatında ekolleşmesine zemin hazırlayan, Suriye ve Lübnan'dan dinî, siyasî ve iktisadî nedenlerden dolayı Kuzey ve Güney Amerika'ya göç etmiş şair ve yazarlardır ki bunlar "Mehcer Ekolü" diye anılırlar. Bu ekolün önde gelen şair ve yazarları Cubrân Halîl Cubrân (1883-1931), Mihâ'îl Nu'ayme (1889-1988), Emîn er-Reyhânî (1876-1940), İliyyâ Ebû Mâdî (1889-1957), Nesîb 'Arîda (1887-1946)'dır. Bu şahsiyetlerin tümü, Amerika'ya göç etmeden önce Lübnan ve Suriye'deki misyonerlik okullarında iyi eğitim almış Hıristiyan Araplardı. Kendi anavatanlarındayken dahi Arap şiirinin daha köklü bir değişime ihtiyacı olduğu inancını taşıyorlardı.

Mehcer şairleri, Arap şiirinin gerek şekil gerekse muhteva bakımından klâsik anlayışından kurtulması gerektiğini vurgulamışlardır. Bu grubun başını çektiği yenilikçi isimlerinden Cubrân Hâlîl Cubrân, 1908 yılında resim bilgisini artırmak amacıyla Paris'e gitmiş ve orada Rodin'den resim dersi almıştır. Bu sırada Rodin, Cubrân'a İngiliz romantik akımının öncüsü ve şiirlerinde mistisizm sembollerini öne çıkaran şair ve ressâm William Blake (1757-1827)'in eserlerini okumasını önermiştir. William Blake'in eserlerini büyük bir beğeniyle okuyan Cubrân, onun etkisinde kalarak, Batı'daki teknik anlamıyla sembolizmi Arap edebiyatında ilk kullanan kişi olarak kabul edilmiştir(el-Cundî, tsz: 405). Arap şiir anlayışının değişiminin öncülüğünü yapan Cubrân, şiir ile nesir arasındaki ayrımları kaldırmıştır. Yazdığı serbest nazım şiirleriyle de Arap şiirindeki biçim sorununun çözümüne yönelik girişimlerde bulunmuş, Arap şiirinde serbest kasidenin ortaya çıkmasına zemin hazırlamıştır(bkz.el-'Azma, 1988: 108 v.d.). Nitekim eleştirmen Mârûn 'Abbûd, Arap edebiyatında romantizm ve sembolizmin ilk kurucusunun Cubrân Halîl Cubrân olduğunu belirtirken, (el-Cundî, tsz:185). İlyâs Ebû Şebeke de, Cubrân, Mîhâ'il Nu'ayme ve İliyyâ Ebû Mâdî'nin eserlerinde sembolü ustaca kullandıklarını ve sembolizmin Arap edebiyatında müstakil bir akım olarak gelişmesine zemin hazırladıklarını ifade etmiştir(el-Hamdânî, 1989:410).

Batı edebiyatının etkisinde kalan Mehcer şairlerinin şiirleri, gerek içerik gerekse biçim yönünden klâsik Arap şiir anlayışından farklı olduğu için Mısır'da "Apollo Grubu" olarak bilinen şairler tarafından benimsenmiştir. 1932

Yılında Kahire'de, Ahmed Zekî Ebû Şâdî tarafından oluşturulan ve Batı edebiyatından daha çok yararlanarak şiirde modernleşmeyi teşvik eden bu grubun yaşlı şairleri, farklı fikir eğilimlerinden oluşmuşsa da 'Alî Mahmûd Tâhâ, Zekî Mubârak (1892-1952), Ebu'l-Kâsım eş-Şâbbî, İlyâs Ebû Şebeke, İbrâhim Nacî gibi ikinci kuşağın hepsi romantik şairlerden oluşuyordu. Bu grup, çalışmalarını kendi kuruluş amacına uygun olarak, adını Yunan mitolojisindeki sanat ve ilham tanrısından alan *Apollo* dergisinde yayımlamışlardır. Şiirlerinde manalara derinlik katmak için çeşitli semboller kullanmışlardır. Özellikle Yunan mitlerinin birer sembol olarak kullanılması hususunda çokça yararlanmışlardır. Örneğin Alî Mahmûd Tâhâ, bir şiirinde manayı güzelleştiren ve anlama derinlik katan ve bir de musiki ahengi sağlayan sembolik anlam taşıyan bir ifadeyi şöyle kullanır (Taha, 2012:25):

فِـي يَدِه زَهـرةُ تَقطـرُ مـاءً عَرَفتُ عيْنـي بِهـا أدمُع قَلْبِـي

Elimde su damlatan bir çiçek var, gözüm onunla kalbimin gözyaşlarını tanıdı.

Yukarıdaki mısrada görüldüğü gibi şair, kalbi gözyaşı akıtan bir çiçek misaliyle simgelemektedir.

Mehcer edebiyatçılarının Lübnanlı genç şairler üzerindeki etkisinin göz ardı edilmemesi gerekmektedir. Özellikle şiirde yenilik arayışı içinde olan Lübnanlı genç şairler, aradıkları yeniliği sembolizm akımında bulmuşlardır. Zira sembolist akım, sembolistlerin şiirdeki klâsik kalıpları zorlaması sonucu ortaya çıkmıştır. Sembolistler, klâsik kalıpların musikiyi, ahengi, sezginin serbest çağrışımını, sembolün gizemini ve sanatkârın bunları elde etme hürriyetini engellediği düşüncesini taşıyorlardı. Onlara göre şiirin yapısı, önceden ve başkaları tarafından belirlenmiş olan değil, bilakis şairin dehası ve yeteneği ve bir ölçüde de şiirin muhtevası tarafından belirlenmelidir. Sembolistlerin bu yaklaşımı, serbest şiirin esas olmasını da beraberinde getirmiştir (Fettûh, 1984:304; el-Cundî, tsz: 399 v.d.).

Modern Arap şiirinde sembolizmi bir akım olarak ilk defa kullanan Lübnanlı şairlerden, edebî hayatına romantik bir şair olarak başlayan Edîb Mazhar (1898-1929)dır. Mazhar'ın, sembolizmi ilk defa *en-Nesîmu'l-Esved* (Siyah Meltem), *Neşîdu's-Sukûn* (Sesizliğin Şarkısı), *el-Veteru'd-Dâmî* (Kanlı Tel) adlı şiirlerinde kullandığı kabul edilmektedir. Edîb Mazhar, Fransız sembolist şairi Albert Samain(1858-1900)'ın şiirlerinden etkilenerek bu akımın özelliklerinden olan "ilişkiler teorisi"ni şiirlerinde kullanmıştır. Mazhar'dan sonra Sa'îd 'Akl (1911-2/2014), *Bint Yiftâh*, *el-Mecdeliyye*, *Kadmûs* ve *Randelli* adlı müzikal çalışmalarıyla, çağdaş Arap şiirinde sembolizme bir ivme daha kazandırmıştır. Sa'îd 'Akl, *Muftaraku't-Turuk* (Yol Ayrımı) adlı sembolik nesir türünde yazdığı tiyatro eserinin ön sözünde musiki, ilişkiler teorisi, görme, sezme, muğlaklık ve dil gibi sembolizmin özellikleri hakkında görüşlerini ortaya koyarak sembolizmin Arap edebiyatında müstakil bir akım oluşturmasına ve kökleşmesine vesile olmuştur (bkz. el-Hamdânî, 1989:278 v.d;).

Çağdaş Arap şiirinde ikinci büyük sembolist şair, Nizâr Kabbânî (1923-1998)'dir. Ayrıca Salâh Lebkî (1906-1955), Bişr Fâris (1906-1963), Bedr Şâkir es-Seyyâb (1926-1964), Ahmed 'Abdulmu'tî Hicâzî (1935-?), Adonis('Ali Ahmed Sa'îd (d.1930), İlyâs Ebû Şebeke (1903-1947), Emîn Nahle, Abdulvahhâb el-Beyyâtî (1926-1996) gibi şairler de bu akımın önde gelen temsilcilerindendir(Fettûh, 1984 305).

Şunu da hatırlatmak gerekir ki serbest kasideye yönelmeyi tercih eden sembolist Arap şairler, vezin ve kafiyenin kullanılmamasından doğan müzikal boşluğu gidermek için, şiirde tekrar sanatına başvurmuş, iç ve dış kafiyeyi kullanmış ve kelimenin taşıdığı fonetik değere önem vererek mısralarda yeni taksimlere gitmiştir. Ali Ahmed Bâkesîr, Nâzik el-Melâ'ike, Sa'îd 'Akl, Adonis, Nizâr Kabbânî'nin şiirlerinde olduğu gibi.

Arap dünyasında sembolizm akımının genç edebiyatçılar arasında büyük bir ilgi görmesi ve geniş bir zemin bulmasının sebeplerinden biri de siyasi nedendir. Bilindiği üzere Arap dünyası diktatörlük ve baskıcı rejimlerle yönetilmektedir. Şair ve yazarlar siyasilerin hışmından çekindikleri için onları açık ve doğrudan eleştirmekten çekiniyorlardı. Bu nedenle siyasal eleştiride bulunurken hep sembolik anlatımlar kullanarak sembolleri bir nevi maske şeklinde kullanıp kendilerini gizliyorlardı. Nitekim Bedr Şakir es-Seyyâb bu bağlamda şöyle der: " *Sembolizmin Irak'ta ortaya çıkış nedenlerinden biri de tamamen siyasiydi. Irak'ın baskıcı yönetiminin başında bulunan Nurî Said Paşa (1888-1958)'nın hükümetini açık bir şekilde eleştirmekten çekiniyorduk. Ona karşı ayaklanmamızı ifade etmek için sembolik ifadelere başvuruyorduk. Daha sonra edebî çevrelerde siyasi sebepler olmaksızın sembolizm daha geniş bir şekilde yayıldı. Çünkü siyasî sebepler geçiciydi."*(el-Ğarfî,1986:118).

Örneğin Nizâr Kabbânî,Arap dünyasının baskıcı diktatörlerini eleştirirken kendini siyasilerin hışmından korumak için şu şekilde sembolik ifadeler kullanır (Kabbânî, 1999:491-492):

لو أحدٌ يمنحني الأمانْ..
لو كنتُ أستطيعُ أن أقابلَ السلطانْ
قلتُ لهُ: يا سيّدي السلطانْ
كلابكَ المفترساتُ مزّقت ردائي
لو أحدٌ يمنحُني الأمانْ
من عسكرِ السلطانْ..
قُلتُ لهُ: لقد خسرتَ الحربَ مرتينْ..

Birisi bana güven verirse
Sultanla görüşebilirsem
Ona derim ki: Sultan hazretleri!
Yırtıcı köpeklerin elbisemin kolunu parçaladılar
Birisi bana güven verirse

 Copyright © International Science and Technology Conference (ISTEC)

Sultanın askerlerinden
Ona "savaşı iki defa kaybettin" derdim..

Çağdaş Arap şairleri, Arap şiirine yeni bir soluk katmak amacıyla, sembolizm akımının birçok özelliğini taşıyan ve sembolistlerin bir manifestosu ve "semboller ormanı" olarak kabul edilen Baudelaire'in (Correspondances) ilişkiler teorisine şiirlerinde geniş yer vermeye başlamışlardır. Batı sembolizm akımının çağdaş Arap şairlerinin üzerindeki etkisinin daha iyi anlaşılabilmesi için Baudelair'in, *Correspondances* (İlişkiler) adlı manzumesi üzerinde durmakta yarar vardır. Bu manzume şöyledir (Kolcu, 2002:91-92; Göker, 1982:72):

La Nature est un temple ou de vivants piliers
Laissent parfois sortir de confuses paroles:
L'homme y passe a trvers des foréts de symboles
Qui l'observent avec des reğards familiers.

Comme de longs échos qui de loin se confondent
Dans une ténébreuse et profonde unité
Vaste comme la nuit et comme la clarté
Les parfums, les couleurs et les sons serépondent.

Il est des parfums frais comme des chairs d'enfants,
Doux comme les hautbois, verts comme les prairies,
Et d'autres, corrompus, riches et triomphants,

Ayant l'expansion des choses infinies,
Comme l'ambre,le musc, le benjoin et l'encens,
Qui chantent les transports de l'esprit et des sens.

Bir tapınaktır doğa, orada canlı sütunlar
Anlaşılmayan sözler fısıldar zaman zaman;
Tanıdık bakışlarla kendisini gözleyen
Sembol ormanları arasından geçer insan.
Uzaktan birbirine karışan uzun yankılar gibi

Karanlık ve derin bir birlik içinde ki,
Gece gibi, aydınlık gibi geniştir
Kokular, renkler, sesler arasında ilişki vardır.

Kokular vardır çocuk tenleri gibi taze,
Fülütler gibi tatlı, çayırlar gibi yeşil,
Başka kokular da vardır, bozulmamış, zengin, kuvvetli

Sonsuz şeyler gibi yayılan
Misk ve amber, aselbent, buhur gibi kokular,
Ruhun ve duyumların heyecanlarını söyler.

Baudelaire, bu manzumesinde madde ile ruh ilişkisini, büyük bir birliğin ahengiyle açıklar. Ona göre doğa, madde ile ruhun bir arada bulunduğu bir tapınak olup, ilâhî bir yönü bulunmaktadır. Tapınak taştan, kireçten, ağaçtan yapılan maddî bir mekândır. Fakat içinde bir ruhaniyet taşımaktadır. İnsan da tıpkı tapınak gibi madde ve ruhtan inşa edilmiştir. O, bu tapınakta (doğada) manevî dünya ile iletişim kurmaktadır. Bir başka ifadeyle doğada bulunan her şey canlıdır ve konuşmaktadır. Ancak söylediği şeyler açık değildir, karışık ve gizlidir. Dolayısıyla doğa, gizli, esrarlı şeylerle doludur. O "karışık sözlerle" konuşur. Çünkü insan doğanın içinde objelerin kendilerini değil, onların belirtileri, işaret ve kanıtları olan sembolleri görür. Baudelaire'deki bu düşünce, Eflatun felsefesinin, "*Gerçek olan şey, yaşanan, gözle görülen olaylarda değil, olayların arkasında, saf, sonu olmayan, önceden var olan fikirlerdir*" diyen "fikirler teorisi"ne dayanmaktadır.

Yaratılan şeylerin hem maddî hem manevî yönleri vardır. Yaratılan şeyler bir bütündür. Bu nedenle maddî dünya ile manevî dünya birbirine yabancı değildir. İnsan diğer yaratılan şeylerden farklı değildir. Çünkü Baudelaire'e göre insan, doğada semboller arasından geçerken bu semboller kendisini "aşina bakışlarla süzmektedirler", onu tanımaktadırlar. Dolayısıyla doğa ile insan arasında bir ilişki vardır ve doğadaki her şeyin bir bütün olarak meydana gelmesine de "evrensel benzerlik" denilmektedir.

Doğanın söylediği gizli sözleri bize açıklayabilmek için değişik türdeki duyumlar birbirleriyle uyum ve ilişki kurmaktadırlar. Değişik duyumlar arasında kendiliğinden bir çağrışım olup, birbirlerini anımsatmaktadırlar. Bir başka ifadeyle kokular, renkler ve sesler arasında ilişki vardır. Öyle ki, "kokular tazelik kazanabilmekte", "çocuk tenleri gibi" ses olup kulağa hitap edebilmekte "fülütler gibi tatlı" ya da "çayırlar gibi yeşil" renk olabilmektedir.

 Copyright © International Science and Technology Conference (ISTEC)

Bu ilişki sadece duyumlar arasında değil, duyumlarla insan ve ruh halleri arasında da vardır. “Kokular vardır, ruhun ve duyumların heyecanlarını söyler.”
Yine sembolistler, dış dünya veya tabiatta görülen ve duyularla algılanan her nesnenin, bir varlık özünün (idea) dış görüntüsünden; “göz alıcı giysileri”nden başka bir şey olmadığı kanaatindedirler. Yani onlar hiçbir zaman asıl gerçek değildir. Asıl gerçek, söz konusu görüntünün arkasında gizlidir. Akılla elde edilen bilgi gerçeğin sadece küçük bir bölümüdür.
Dolayısıyla ilişkiler teorisine göre kâinatta var olan her şey bir bütündür; bu bütünlük içindeki varlıklar veya madde-ruh arasında bir ilişki ağı bulunmaktadır. Bir başka ifadeyle; madde-ruh, beden-ruh, evren-insan, kırmızı-sıcak, ses-renk, görme işitme gibi farklı renkler ve duyular arasında ilişkiler ağı vardır. Şayet dikkatle bakar ve görenin ötesine geçebilirsek, bunu yakalamak mümkün olabilecektir (Nevfel,1995:164 v.d.; Kolcu, 2002:188-190). Sembolist bir sanatkârın görevi de dış gerçeği değil, görünenin arkasında saklı bulunan hakikî gerçeği, gizli manayı, ilâhî gerçeği eserlerinde verebilmesi veya en azında sezdirebilmesidir(Çetişli, 2001:96).
Çağdaş Arap sembolist şairler, Baudelaire’in (Correspondances) ilişkiler teorisinden hareketle şiirlerinde yeni istiare ve teşbihler getirmiştir. Kendi renkleri olmayan nesnelere farklı renkleri izafet etmiştir. Gerçekte aralarında herhangi bir bağ bulunmayan nesneler arasında da bir ilişki kurmuştur. Farklı duyuları birbirinin yerine kullanmıştır. Örneğin Nizâr Kabbânî bir şiirinde bu bağlamda şöyle der(Kabbânî,1986:857):

صَنَعْتُ الأَصْوَاتَ التي لَهَا رَائِحَةٌ ..
والرَّائِحَةَ التي لَهَا صَوتٌ ..

Yarattım kokulu sesleri …
Ve sesli kokuyu ..
İşitme duyusunun yerine koku alma duyusunu kullanır(Kabbânî,1983:476):

فَفِي الظِّلِّ يَغْدُو لِعطركِ صَوْتٌ وتُصبِحُ أَبْعَادُ عَينيكِ أَكبَرْ

Gölgede senin kokunun bir sesi var ve gözlerinin boyutları daha büyük olur.
Algılama duyusunun yerine koku alma duyusunu kullanır(Kabbânî,1983:121):

قَبْلَ المَجِيءِ أَشُمُّ فِكْرَتَهَا …وأَحِسُّ خطوتَهَا عَلَى عِرْقِي

Gelmeden önce düşüncesini koklarım... ve adımını da damarımda hissederim.
Görme duyusunun yerine de işitme duyusunu kullanır(Kabbânî,1983:477):

فِـي مَرفَـأ عَيْنَـيكِ الأزْرَق أَمْطَـارٌ مِنْ ضَـوءٍ مَسْمُوعْ

Gözlerinin mavi limanında duyulan ışık yağmurları var.
Çağdaş Arap şairleri, ilişkiler teorisini pek çok şiirlerinde kullanarak kelimelerin görünür anlamını değil, görünenin arkasında saklı bulunan hakikî gerçeği, gizli manayı ortaya koymaya çalışmışlardır.
Şairin şiirlerinde bazen soyut kavramları somut kavramlarla nitelediği de görülür. Örneğin bir şiirinde seslere mavi parmaklar izafet eder(Kabbânî,1983:223):

أَنَامِـلُ صَوتُـكِ الزَّرقَاءُ تُمْعِنُ فِـيَّ تَمْزِيقـاً

Sesinin mavi parmakları parçalarcasına bana dik dik bakıyor.
Şair, başka şiirinde de şehvetinin bir sesi ve açlığının bir eli olduğunu vurgular(Kabbânî,1983:55):

وأَبْحِرِي فِي جَرْحِ جَرْحِي أَنَا لِشَهْوَتِي صَوْتٌ … لِجُوعِي يَدَانِ

Benim yaramın yarasında yol al, benim şehvetimin bir sesi ve açlığımın iki eli var.

Yenilikçi bazı Fransız sembolist şairler, duyguları renklerle teşbih ederek açıklamaya çalışırlar. Sevinci, üzüntüyü, sıkıntıyı, lezzeti, tokluğu birer renkle sembolize ederler.(el-Cundî, tsz:404). Aynı durumu sembolist Arap şairlerinde de görüyoruz. Örneğin Nizâr Kabbânî bir şiirinde sevgilisinin yaşadığı sıkıntıyı şu renkle imgeler(Kabbânî,1983:485):

هِيَ الأُخْرَى
تُعَانِي مَا أُعَانِيه
تَعِيشُ السَّاعةَ الصَّفْراء
تُعَانِي عُقْدَةَ سَوْدَاء

O da
Benim çektiğim sıkıntıyı çekiyor
Sarı anı yaşıyor
Siyah bir kompleks yaşıyor.
Bir başka şiirinde de üzüntüsünü şu renkle ifade eder(Kabbânî,1983:615):

أَنَا حُزْنِي رَمَادِيٌّ
كَهَذا الشَّارِعِ المُقْفَرْ

Benim hüznüm gri
Tıpkı bu ıssız cadde gibi.
Tunuslu şair Ebu’l-Kâsım eş-Şâbbî’nin bu bağlamda şu şiirlerini örnek verebiliriz. Bu şiirinde şair, tatma duyusunu, işitme duyusu yerine şöyle kullanmıştır(eş-Şâbbî, 1993:200-201):

أيها الطائـــر الكئـــب تَغـــرَّدْ إن شَدْوَ الطيـــوُر حلوُ رَخِيمُـهْ

 Copyright © International Science and Technology Conference (ISTEC)

وارتشفْ مِنْ فَمِي الأناشيدَ سَكرَ فالهوى ساحـــرُ الدلالِ، وَسيمُـهْ

Ey üzgün kuş öt, zira kuşların nameli ötüşü tatlıdır.
Ağzımdan sarhoş olmuş şarkıları yudumla, aşk güzel ve şımarık bir sihirdir.
Aynı şekilde "kuşların ötüşü" kulakla duyulur, fakat bir "tatlı" gibi ağızla tadılmaz.
Yine bir başka şiirinde şair, işitme duyusunu görme duyusu yerine şu şekilde kullanmıştır(eş-Şâbbî, 1993:207):

سَيُسـمَعُ صوتٌ كلحنٍ شجيٍ تَطايَرَ مـن خَفَقاتِ الوتـــرْ
يُرَدِده حُزنُنـا فـي سكـــونٍ على قَبْرِنا الصَّامتِ المطمئنْ

Çalgı tellerinin titreyişinden bir ses duyulacak hüzünlü bir beste gibi.
Hüznümüz eşsiz ve huzur dolu olan mezarımızın üzerine tekrarlayıp duracaktır bu şarkıyı.
Çalgı tellerinden uçuşanlar gözle görülür, kulakla işitilmez.
Sembolist Çağdaş Arap şairlerinin şiirlerinde dikkat çeken bir başka husus da mitolojik, dinî, tarihî ve folklorik unsurları birer sembol olarak geliştirip kullanmasıdır. Çağdaş Arap şiirinde mitolojik, dinî ve tarihî figürlerin sembol olarak kullanımı *Temmuzî Şairler* grubuyla başlamıştır. Bu grup adını, Sümer mitolojisinde geçen, baharı ve yeniden dirilişi simgeleyen "Tammuz veya Domuzi ile İştâr (İnanna)" efsanesinden alır(bkz. Hooke, 2002: 25v.d).
Temmûzî Şairler terimini ilk defa Cebrâ İbrâhîm Cebrâ, Yûsuf el-Hâl'ın *el-Bi'r el-Mehcûr* (Terkedilmiş Kuyu) adlı şiir koleksiyonu için yazdığı mukaddimede kullanır. Cebrâ, bu terimle şiirlerinde daha çok dirilme, canlanma, verimlilik ifade eden mitolojik sembollere yer veren çağdaş Arap şairlerini kasteder(Ebû Gâlî, 1998:74; İsma'il 1978:232). Bu hareketin öncüleri Bedr Şâkir es-Seyyâb, Cebrâ İbrâhîm Cebrâ, Yûsuf el-Hâl, Halîl Hâvî olarak kabul edilirken, daha sonra yazar ve eleştirmen Es'ad Rezzûk bu öncü gruba Adonis ('Ali Ahmed Sa'îd)'i de dâhil eder(Sâ'î, 1978:360).
Çağdaş Arap şiirinde Temmûzî Şiir Hareketi'nin ortaya çıkışı, Ezra Pound ve T. S. Eliot'ın bu hareketin öncü şairlerinin üzerindeki etkisinin bir sonucudur. Özellikle Eliot'ın Yunan, Sümer, Roma gibi değişik uluslara ait mitleri kullandığı *The Waste Land* adlı şiiri, çağdaş Arap şairlerinin büyük ilgisini çekmiştir. Bu ilginin bir sonucu olarak çağdaş Arap şairleri dikkatlerini, Eliot'ın diğer çalışmaları üzerine yoğunlaştırmışlardır. Başta es-Seyyâb olmak üzere Halîl el-Hâvî, Yûsuf el-Hâl,'Ali Ahmed Sa'îd, Nâzik el-Melâ'ike, el-Beyâtî, Salâh Lebkî gibi şairler Eliot'ın etkisinde kalan şairler arasındadır (el-'Abdulhammûd, 1996:157-158). Nizâr Kabbânî T. S. Eliot'ın çağdaş Arap şairleri ve özellikle de Irak ve Mısır şairleri üzerinde olumlu etkiler bıraktığını, Eliot ve Ezra Pound sayesinde serbest şiir yazımını ve şiirde mitolojik, dinî ve tarihî sembollerin kullanımını öğrendiklerini ifade etmiştir.(Kabbânî, 1963:56-57).
Temmûzî Şairler, Arapların Haziran 1967 yenilgisinden sonra yeniden dirilişi simgelemek için Temmûz, Anka, Lazarus, Sezif, İsis, Osiris gibi mitleri şiirlerinde genişçe işlemeye başlamışlardır. Ayrıca Arap dünyasında yaşanan sosyo-politik sorunları dile getirmek ve eleştirilere derin bir mana kazandırmak için Arap tarihinden ve folklorundan alınmış Sinbâd, Şehrazâd, Şehriyâr, Hârûn er-Reşîd gibi pek çok sembolü de ustaca kullanmışlardır. *Temmûzî Şairler*, tarihî ve folklorik figürleri bir sembol olarak kullanmalarının yanı sıra kutsal kitaplarda geçen Hâbîl ve Kâbîl, İbrâhîm, Nuh, Hızır, Mehdî, Deccâl, Burâk, Hira mağarası, Ashabu'l-Kehf, Mesih, Meryem, 'Âd ve Semûd gibi dinî kaynaklı hikâyelerde geçen figürleri yeni bir üslûpla şiirlerinde işlemişlerdir. Ayrıca bu şairler, bazı şahsiyetleri efsaneleştirerek yeni semboller geliştirmişlerdir. Örneğin, pek çok çağdaş Arap şairi, Fransız işgaline karşı direniş gösteren Cezayirli halk kahramanı Cemîle Buhayrad'ın adını efsaneleştirmişlerdir. Artık bu isim, Cezayir devriminin tanınmış bir halk kahramanı olmaktan çok özgürlük uğruna mücadele eden bir insanı sembolize etmektedir (el-'Abdulhammûd, 1996:159; İsmâ'il, 1979: 218). Aynı şekilde el-Beyâtî, büyük tasavvuf şairlerinden olan ve idam edilen Hallâc Mansûr'u işkence ve eziyet çeken günümüz Arap insanını simgeleyen bir figür olarak geliştirmiştir(İsmâ'il, 1978). es-Seyyâb da, 1959 yılında komünist göstericiler tarafından Musul'un şehir meydanında idam edilen Hafsa'yı, mitolojide yer alan İştâr değil, çağın İştâr'ı olarak sembolleştirip şiirlerinde işlemiştir(el-'Azma, 1988:272). Örneğin Bedr Şâkir es-Seyyâb, *"el-Mesih bade es-Salb"* (Çarmıha Gerildikten Sonra Hz. Mesih) adlı şiirinde Hz. Mesih'i yeniden dirilişi imgeleyen bir figür olarak şöyle kullanır(es-Seyyâb, 2000:242):

و الصليب الذي سمروني عليه طوال الأصيل
لمتمتني . و أنصت : كان العويل
يعبر السهل بيني و بين المدينه
موته البعث ،يحيا بمن يأكل
في العجين الذي يستدير

Gurup vaktinde üzerine beni astıkları çarmıh
Beni öldürmedi. Dinle!: Çığlık sesi
Benim ile şehir arasındaki düzlüğe kadar gidiyordu
Onun ölümü diriliş,
Kendisine sunulan hamurdan yediği şeyle canlanır.
Aynı şekilde es-Seyyâb, Hz. Eyyûb karakterini sabır ve şükrün imgesi olarak "*Sifru Eyyûb"* (Eyyub'un Kitabı) adlı şiirinde şu şekilde ele alır (es-Seyyâb, 2000:149-150):

 Copyright © International Science and Technology Conference (ISTEC)

لكَ الحمدُ مَهمَا استطالَ البلاءومَهمَــا اسْتبدَّ الألـــــمُ
لك الحمدُ، إن الرزايا عَطاءوانْ المصيباتِ بعضُ الكرَم

Musibetler ne kadar artarsa artsın ve her ne kadar acı şiddetli olursa olsun, sana şükürler olsun ya Rabb! .
Sana şükürler olsun, belalar bir nimettir, musibetler de keremin bir parçasıdır.

Çağdaş Arap şairleri, tarihi, dinî gibi pek çok şahsiyetleri şiirlerinde sembolleştirerek yeni imgeler geliştirerek bu imgelere yeni anlam ve kavramlar yüklemişlerdir. Şair Nazım Hikmet'i direniş ve başkaldırıyı, Sultan Abdülhamit ve Harun er-Reşîd doğu erkeğini, cahiliye şairi Antara b. Şeddâd günümüzün cahil, şiddet yanlısı Arap insanını, cahiliye şairlerinden el-Hanse Arap gözyaşını, Sinbad yeniliği, azim ve kararlığı sembolize eden karakterler olarak kullanmıştır.

Sonuç

Sembolizm XIX. yüzyılın son çeyreğinde Batı edebiyatında realizme tepki olarak ortaya çıkmış bir sanat akımdır. Bu akım, dış dünya ile gerçek ilkesinden hareket etmiştir. Dünyada var olan benzerlikleri ve bunların arasındaki ilişkileri bulmaya çalışmıştır. Mana ve anlamda kapalılık ilkesini benimsemiş ve şiirde musikiye önem vermiştir. Serbest şiir ilkesini benimsemiş, ferdiyetçi bir düşünceyi tercih etmiştir.

Klasik Arap şairlerinin şiirlerinde çeşitli sembolleri kullandıkları görülmüştür. Şiirlerindeki teşbih, istiare, kinaye gibi edebî sanatlar bilinen teşbihlerdir. Bir başka ifadeyle okuyucunun anlamı algılama konusunda pek fazla düşünmeye sevk etmezdi. Şiirleri gerçeğe daha yakındı, içindeki hayal pek derin değildi.

Ancak Abbâsî döneminde ilmî, siyasî, dinî ve kültürel gelişmeler sayesinde Arap şiirinde yeni gelişmeler yaşanmıştır. Şairler alışılmışın dışına çıkarak yeni teşbih ve istiareler getirmişlerdir. Bu da şiirin anlamına derinlik katmıştır. Ebû Temmâm, el-Mutenebî gibi bazı şairlerin dilinin kapalı olmasına neden olmuştur.

Her ne kadar klasik Arap şiirinde sembol kullanılmışsa da sembolizm, ilkeleri olan bir akım olarak Arap şiirinde 1940'lı yıllardan sonra kullanılmaya başlanmıştır. Sembolizmin ilk belirtileri batı edebiyatında olduğu gibi Birinci Dünya savaşından sonra gerek Divan Ekolü, gerek Mehcer şairleri gerekse Halîl Mutrân'ın romantik eserlerinde görülmeye başlanmıştır. Özellikle Arap edebiyatının gerek içerik ve gerekse şekil bakımından değişime ihtiyacı olduğunu düşünen Mehcer edebiyatçılarının ve başında da Cubrân Halîl Cubrân'ın romantik ve tasavvufi eserlerinde sembolizmin ilk belirtileri görülmeye başlanmıştır. Daha sonra batıyla ve özellikle Fransa'yla yakın temas içinde olan Sa'id 'Akl, Edîb Mazhar, Yûsuf Gassûb gibi Lübnanlı şairler Fransız sembolistlerin etkisinde kalmışlardır. Sembolizm bir akım olarak bu genç şairlerin şiirlerinde görülmeye başlanmıştır. Arap şiirinin taklitten kurtulması ve yeniliğe gidilmesi gerektiğini savunan dönemin genç Arap şairlerinin bu isteklerini karşılayan, sembolizm akımı olmuştur. Bu yüzden Çağdaş Arap şairleri tarafından bu akım büyük bir ilgi görmüş Arap şairleri sembolizmin batı edebiyatındaki temsilcilerinin eserlerini yakından takip etmişlerdir.

Dahasonra sembolizm, Mısırlı Ahmed Zekî Ebû Şâdî (1892-1955), 'Ali Mahmûd Tâhâ, (1902-1949), İbrâhim Nacî (1898-1953), Muhammed 'Abdulmu'tî el-Hemşerî, Suriyeli Ömer Ebû Rîşe (1910-1990), Nizâr Kabbânî, Lübnanlı İlyâs Ebû Şebeke (1903-1947), Tunuslu Ebu'l-Kâsım eş-Şâbbî (1909-1934), Sudanlı Beşîr et-Ticânî (1912-1937), Iraklı Muhammed Mehdî el-Cevâhirî(1899-1997)', Abdulvahhâb el-Beyyâtî, Nâzik el-Melâ'ike Flistinli Mahmud Dervîş gibi şairlerin şiirlerinde olgunlaşarak Arap şiirinin modernleşmesine ivme kazandırmıştır. Çağdaş Arap şairleri, Sembolizmin manifestosu olarak kabul edilen "ilişkiler teorisi"nden hareket ederek şiirlerinde yeni istiare ve teşbihler getirmiştir. Şiirlerinde mitolojik, dinî ve tarihî karakterleri kullanarak yeni semboller geliştirmişlerdir.

Özet: Çalışmada farklı kür ve vibrasyon koşullarda dökülen dört adet 40x40x250 cm3 ebatlarındaki kolonun derinlik değişimine bağlı olarak ultrases boyuna dalga hız ölçümleri yapılmıştır. Ultrasonik yöntem beton içerisinden geçirilen ultrasonik boyuna dalga hızının betona hasar vermeden ölçülmesi esasına dayanmaktadır. Bu amaçla dökülen kolonlarda üç seviyede (alt-orta-üst) düşey yönde, karot örnekler alınarak ultrases hız ölçümleri yapılmış ve dayanımları tahmin edilmiştir. Sonuçlarda vibratör ve kür uygulaması ile ultrases hızının arttığı, ancak aşırı vibrasyona maruz kalan bölgede ayrışmaya sonucu bölgesel olarak ultrases hızının düştüğü görülmüştür. Tüm kolonlarda en yüksek ultrases hızının alt bölgede, en düşük ultrases hızının ise üst bölgede olduğu belirlenmiştir. Buna bağlı olarak en yüksek dayanım alt bölgede, en düşük dayanımlarda üst bölgelerde çıkmıştır.

Anahtar kelimeler: Kolon beton, ultrases, dayanım.

Giriş

Beton uzun yıllardan beri kullanılan en önemli yapı malzemelerinden biridir. Yapılarda kullanılan betonun kalitesi, o yapının depreme karşı dayanımını etkileyen en önemli etkenlerden biridir. Gerek taze beton üzerinde, gerekse sertleşmiş beton üzerinde dayanım belirlemek amacıyla kullanılan birçok yöntem vardır. Betonun kalitesi standart olarak, taze betondan alınan silindirik ya da kübik numunelerin 28 gün laboratuvar ortamında bakımı yapılarak kırılması sonucu belirlenmektedir. Fakat döküm aşamasında alınan bu numune en ideal şartlar altında kalıplanarak, standartlara uygun laboratuvar şartlarında kür edildiğinden, dayanımının şantiye şartlarına oranla yüksek çıkması olağan bir durumdur. Yoğunluğu yüksek olan betonların basınç dayanımlarıda genellikle yüksek olur. Su/çimento oranı yüksek olan betonlar daha çok kapiler boşluk içerdiğinden, bu betonların yoğunluğu ve basınçlarıda yüksek değildir (Erdoğan, 2003).

Beton kalitesi tasarım, üretim, taşıma, yerleştirme, sıkıştırma ve bakım aşamaları sonucunda oluşmaktadır. Bu aşamaların her birinde aynı ve yeterli özen gösterildiğinde istenen sonuç alınabilir (Yılmaz ve Canpolat, 2002). Şantiye şartlarında dökülen betonun kalitesini etkileyen başlıca faktörler arasında sıkıştırma (vibrasyon) ve bakım (kür) gelmektedir. Sıkıştırma işlemi kaba ve ince agreganın kümeleşmemesi, beton içerisinde hava boşlukları kalmaması, her beton döküm tabakasının bir alt tabaka ile karışarak bağlantısının sağlanması, çelik donatı ile çevresinin beton ile tam olarak sarılması ve kalıpla temas halinde olan beton yüzeylerinde yeterince ince malzeme birikerek düzgün bir beton yüzey elde edilmesi amacı ile yapılır (Arslan, 2001). Vibrasyon ile beton kuvvetli bir titreşime tabi tutulmaktadır. Sıkıştırma sonucu içerisindeki hava boşlukları azalan beton daha dayanıklı ve geçirimsiz olmaktadır.

Sertleşmiş betonun mukavemetini etkileyen önemli faktörlerden biri ise betonun bakımıdır. Betonun santralden çıkış ve yerine yerleştirme aşamalarında herhangi bir problem olmasa bile uygun şekilde bakımı yapılmazsa mukavemetinde önemli oranlarda azalma olmaktadır. Çimentonun hidratasyonu betona mukavemet kazandıran etkenlerin başında gelmektedir. Çimento hidratasyonu haftalarca, hatta aylarca devam edebilmektedir. Beton içerisinde çimentonun suyla tepkimeye girerek oluşturduğu bu etki sonucu beton yeterli dayanımı kazanmaktadır. Beton içerisindeki bu hidratosyon tepkimesinin devam etmesi için yeterli su ve sıcaklığın betonda muhafaza edilmesi gerekmektedir. Teorik olarak bu şartlar sağlandığı takdirde betonun mukavemet kazanmaya devam edeceği kabul edilmektedir. Betonun hidratasyon için gerekli olan suyu kaybetmesini engelleyerek yeterli dayanımı kazanmasını sağlamak amacıyla çeşitli kür yöntemleri vardır. Bunların başında, betonun yüzeyini sulayarak sürekli nemli kalmasını sağlamak, kimyasal kür katkılarıyla beton yüzeyini kaplamak ve su geçirmeyen bir örtü ile beton yüzeyini kaplamak gelmektedir.

Sertleşmiş betonun mukavemeti tahribatlı ve tahribatsız yöntemler olarak iki şekilde yapılmaktadır. Tahribatsız deneyler, bir malzemenin gelecekte faydalılığını etkilemeyecek teknolojilerle inceleyerek, betonun yerinde değerlendirilmesi, zararın mertebesinin belirlenmesi, nitelik güvencesi, fiziksel özellikler olan yoğunluk, elastisite

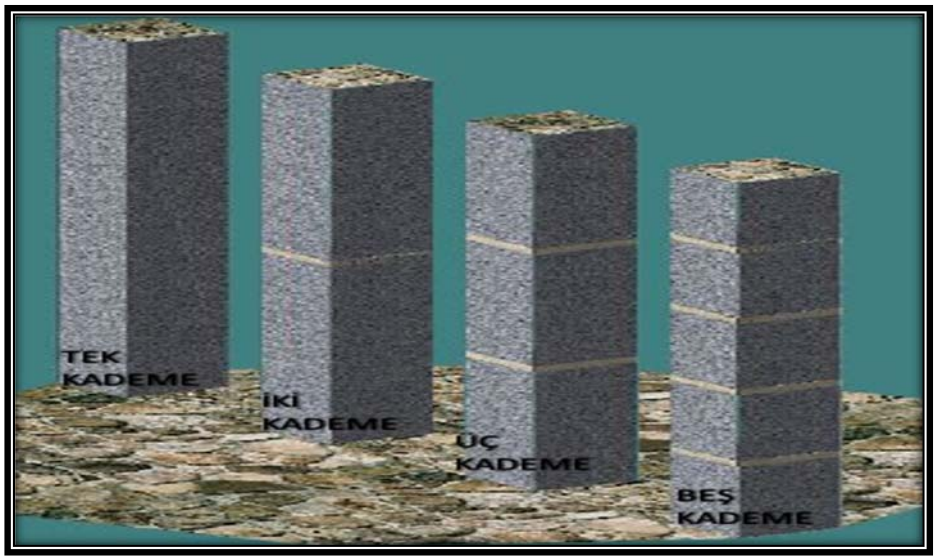
modülü, dayanım ve sıklığın belirlenmesinde kullanılır (Tikalsky, 2004). Literatürde ultrasonik ses hızı ve beton dayanımları konusunda yapılmış pek çok çalışma mevcut olup bunlardan bazıları özetlenecek olursa; Bungey (1989), betonarme yapıların farklı seviyelerinde ölçümler yaparak dayanım değişimlerini beton seviyeleri ile ilişkilendirerek kontur haritaları yapmış. Kheder [1998] yaptığı çalışmada, ıslak ve havada kurumuş betonların basınç dayanımını tahmin etmek için ultrasonik ses hızı ve beton test çekici yöntemlerini kullanmıştır. Qasrawi (2000), hasarsız deney yöntemleri ile beton dayanımı tahminlerini özetlemiş ve yaptığı çalışmada beton numunelere, hem test çekici hem de ultrasonik ses hızı testleri uygulamış ve beton dayanımının belirlenmesinde ultrasonik ses hızı yönteminin daha etkili olduğu sonucuna varmıştır. Demirboğa ve ark. (2004), yaptıkları çalışmada; ultrasesi, mineral katkılı betonun basınç dayanımını ölçmede kullanmışlar, Ultrases hızı ve basınç dayanımı arasındaki ilişkinin, mineral katkı ile üstel ilişkili olduğunu, ancak, her mineral katkı için katsayıların değiştiği belirtmişler. Abo-Qudais (2004), yaptığı çalışmada betondaki agrega granülometrisinin, s/ç oranının ve kür süresinin ultrasonik ses hızı üzerindeki etkilerini incelemiştir. del Rio ve ark. (2006), yaptıkları çalışmada beton basınç dayanımı ile ultrasonik ses hızı arasında üstel bir matematiksel ilişki olduğunu ortaya koymuşlardır. Khan ve ark. (2007), yaptıkları çalışmada ultrasonik ses hızı ile yüksek performanslı betonların dayanımları arasında bir gerilme modeli kurmuşlardır. Turgut ve Küçük (2007), yaptıkları çalışmada beton döküm yönünde ve yatay yönde doğrudan, dolaylı ve yarı dolaylı ultrasonik ses hızı ölçümleri yapmışlar ve doğrudan yapılan ultrasonik ses hızlarının dolaylı olarak döküm yönündeki ultrasonik ses hızı oranlarını ortaya çıkarmışlardır. Hobbs ve Kebir (2007), tarafından yapılan çalışmada ultrasonik ses hızı yönteminin beton dayanımının belirlenmesinde daha etkili olduğu gözlenmiş, fakat bu yöntemin tek başına kullanımı yerine ultrasonik ses hızı ve test çekici yöntemlerinin birlikte kullanılarak elde edilen sonuçların daha güvenilir olduğu fikrine ulaşılmıştır. Turan ve Tanrıkulu (2013), betoton test çekici ile ultrasonik ses hız deneyler sonuçları ile beton basınçları arasındaki ilişkiyi incelemişlerdir.

Tahribatsız yöntemler arasında en yaygım olarak bilinen ve kullanılan yöntemlerin başında Schmidt çekici ile betonda sertlik ölçümü ve ultrases dalga hız ölçümü gelmektedir. Tahribatlı yöntemlerden en yaygın kullanılanı ise karot alma yöntemidir. Tahribatlı yöntemlerle beton mukavemeti tayininde kesin sonuçlar vermesine rağmen zaman açısından, maliyet açısından ve yapıya verdiği zarar açısından bazı durumlarda tahribatsız yöntemler tercih edilebilmektedir.

Bu çalışmada farklı kür ve vibrasyon koşullarda dökülen dört adet 40x40x250 cm^3 ebatlarındaki kolonun derinlik değişimine bağlı olarak ultrases boyuna dalga hız ölçümleri yapılmıştır. Kolonlarda üç seviyede (alt-orta-üst) düşey yönde, karot örnekler alınarak ultrases hız ölçümleri yapılmış ve dayanımları tahribatsız olarak ultrases ile tahmin edilmiştir. Çalışma, Adıyaman Üniversitesi Fen Bilimleri Enstitüsünde hazırlanmış olan "*Farklı koşullarda dökülen kolonlarda Vibrasyon ve Kür Koşullarının Değişiminin Beton Dayanımına Etkisi*" isimli tez çalışmasının ön bulgularını içermektedir.

Materyal ve Metod



Çalışmada beton santralinde üretilen C 30/37 basınç dayanım sınıfında hazır beton kullanılmıştır. Tasarlanan betonda CEM I 42.5 R çimento ve agrega olarak doğal dere malzemesi kullanılmıştır. 1 m^3 beton için; 320 kg çimento, 160 kg su, 800 kg ince agrega, 1200 kg kaba agrega kullanılarak 2480 kg/m^3 birim kütleye sahip taze beton bileşimi tasarlanmıştır. Çalışmada 4 adet 40x40x250 cm boyutlarında film kaplı (playwood) düz yüzeyli çıplak beton kalıbı kurulmuştur (Şekil 1).

Şekil. 1. Çalışma için kurulan kalıp

 Copyright © International Science and Technology Conference (ISTEC)

Hazır beton santralinden mikserlerle getirilen taze beton, hazırlanan 40x40x250 cm ebatlarındaki kalıplara farklı aşamalarda vibrasyon uygulanarak dökülmüştür. Dört kolon için beton döküm aşamaları ve vibrasyonlar faklı seçilmiştir. Birinci kolonda (K1) beton tek kademede dökülerek vibrasyon uygulanmamıştır. İkinci kolonda (K2) beton iki eşit kademede dökülerek her kademeye şantiye koşullarında eşit miktarda vibrasyon uygulanmıştır. Üçüncü kolonda (K3) beton dökümü üç eşit kademede ve vibratör uygulanarak yapılmıştır. Dördüncü ve son kolonda (K4) beton 5 eşit kademede ve her aşamaya vibratör yapılarak standartlara uygun döküm yapılmıştır (Şekil 2).

Şekil. 2. Kolonlara uygulanan beton döküm planı

Üretimi yapılan kolonlar kalıpların sökülmesinden sonra farklı kür uygulamalarına tabi tutulmuştur. 1. kolona kür uygulaması yapılmamış, 2. kolona 7 gün, 3. kolona 7 gün, 4. kolona 28 gün şantiye ortamında su ile kür uygulanmıştır. 1., 2. ve 3. kolonlar beton dökümünden 7 gün sonra üzerlerine naylon örtü serilerek ortam koşullarınadan etkilenmemesi için korunmuştur. 4. kolon ise beton dökümünden 28 gün sonra üzerlerine naylon örtü serilerek korunmuştur (Şekil 3).

Şekil. 3. Kolon numunelerin şantiyede kür edilmesi ve korunması

Kolon betonları şantiye ortamında 5 ay muhafaza edilmiş, bu süre sonunda kolonlar kesilmek üzere mermer fabrikasına götürülmüş ve kolonların her biri alt, orta ve üst bölgelerinden este ile kesilerek 40x40x25 cm ölçülerinde 4x3=12 adet dikdörtgen prizmalı beton numuneleri çıkarılmıştır (Şekil 4).

 Copyright © International Science and Technology Conference (ISTEC)

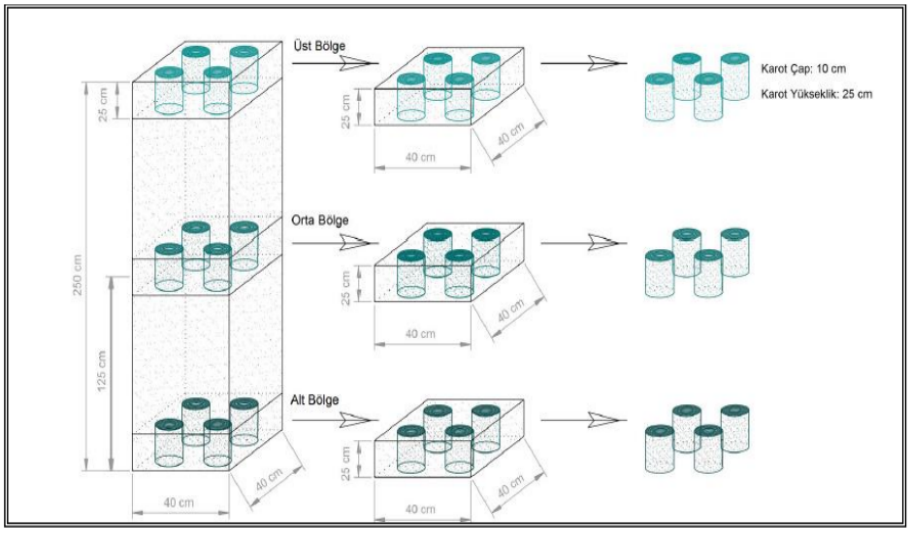
Şekil. 4. 40x40x25 cm boyutlarına kesilen beton numuneleri

Daha sonra kesilen kolon numunelerinden her numuneden 4 adet olmak üzere (12x4) toplam 48 adet, 10x25 cm boyutlarında beton döküm doğrultusunda düşey yönde karot alınmıştır (Şekil 5). Prizmatik numunelerden alınan 10 cm çapındaki karotlar narinlikleri 2 olacak şekilde (1/2) ölçülerek alt ve üst yüzey birbirine paralel olacak şekilde boyutlandırılmıştır. Elde edilen karotlar 15 gün laboratuvar şartlarında korunduktan sonra tartılarak ultrases deneyi ile karot boyunu kat etme süresinden gidilerek ulrases hızları 1 nolu eşitlik ile hesaplanmıştır.

$$V = \frac{X}{t} \quad (1)$$

Burada; V hız (km/sn), X kat edilen mesafe (km) ve t süre (sn) dir.

Bulunan bu hız değerleri Bal ve ark., (2010) önerdikleri eşitlik 2'den gidilerek beton dayanımları tahmin edilmiştir.



$$fck = 2.6\ Vp\ 1.8 \quad (2)$$

Burada; fck beton basınç dayanımı (MPa), Vp ulrasonik hız (km/sn) dır.

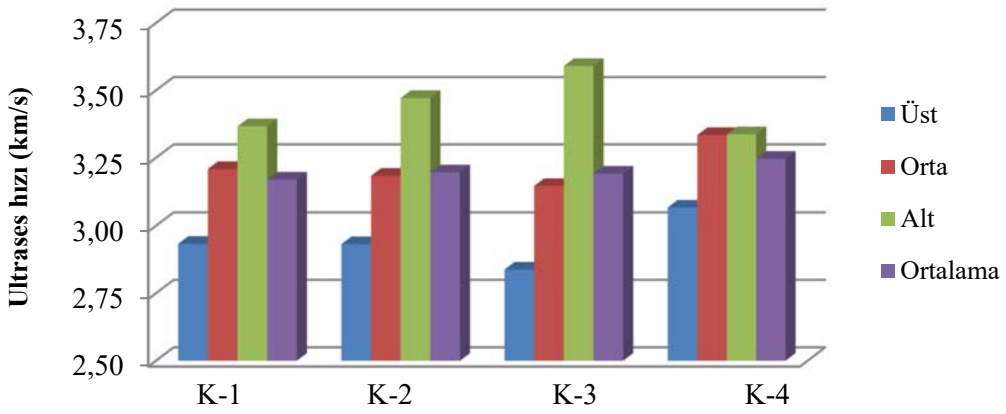
Şekil. 6. Karot alma planı



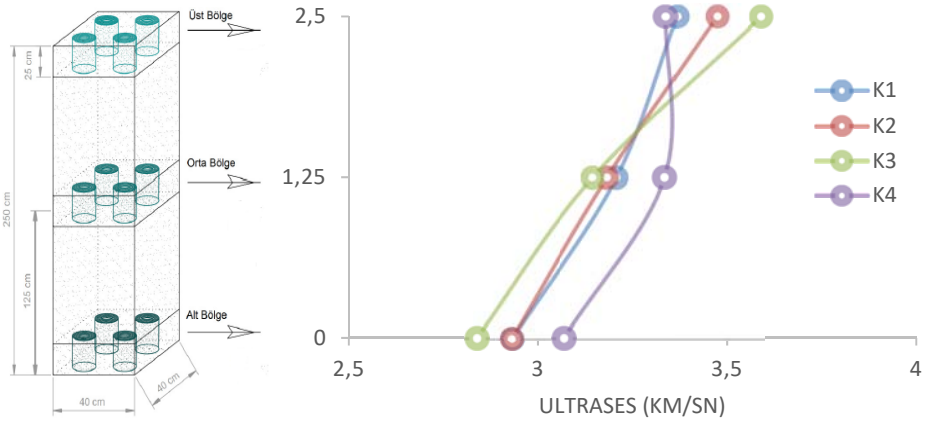
Araştırma Bulguları

Hazır beton firmasından alınan C 30/37 basınç dayanım sınıfındaki betona ait 1 m³ de betonda kullanılan malzeme miktarları Tablo 1'de verilmiştir. Çalışmada farklı kür ve vibrasyon koşullarda dökülen K1, K2, K3 ve K4 kolonlarından düşey yönde, üç seviyede (alt-orta-üst) alınan karot örneklerinden yapılan ölçümler sonucunda Ultrases hızları ile yoğunluk değerleri hesaplanmış ve ultrases hızlarından tahmini beton dayanım değerleri belirlenmiştir (Tablo 2).

Tablo 1. 1 m³ betonda kullanılan malzeme miktarları

Kullanılan Malzeme Cinsi	**Miktarı (kg)**
Çimento CEM I 42.5 R	320
Su	160
İnce agrega	850
Kaba agrega	1150
TOPLAM	**2480 kg/m3**

Kolonların ultrases hızı değerleri ile ortalamaları incelendiğinde, her kolonda en düşük üst bölgede, en yüksek alt bölgede olduğu, kendi aralarında genel ortalama ultrases hızların da en düşük ultrases hızının K1 (tek kademe vibratörsüz kürsüz) kolonunda, en yüksek ultrases hızının K4 (beş kademe vibratörlü kürlü standartlara uygun dökülen ve bakılan numune) kolonunda olduğu belirlenmiştir (Şekil 6-7)).



Şekil. 7. Kolon seviyelerinde ultrases hız değişimi

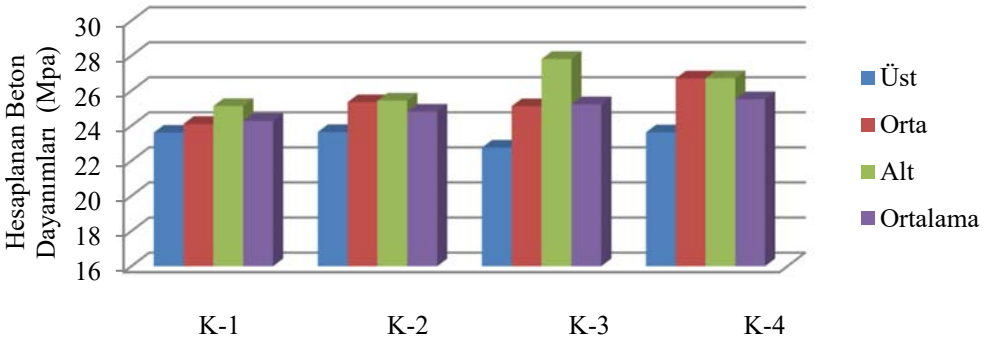
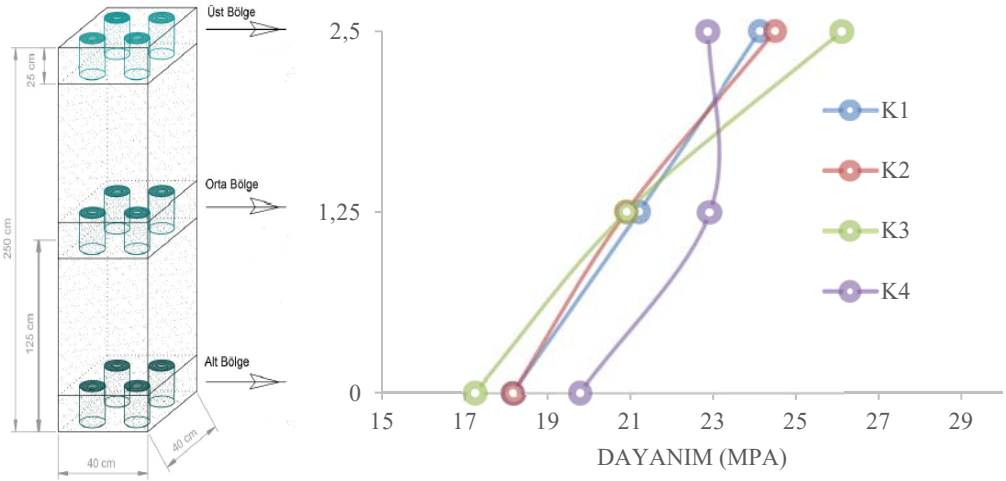
Şekil. 8. Kolon seviyelerinde ultrases hız değişimi

Kolonların ultrases hızı ortalama değerlerinin alt, orta ve üst seviye değerlerinin korelasyonlarında yüksek regresyon (R^2= 0.75- R^2= 0.99) katsayıları elde edilmiştir (Şekil 9).

Şekil. 9. Kolon seviyelerinde ultrases hız korelasyonları



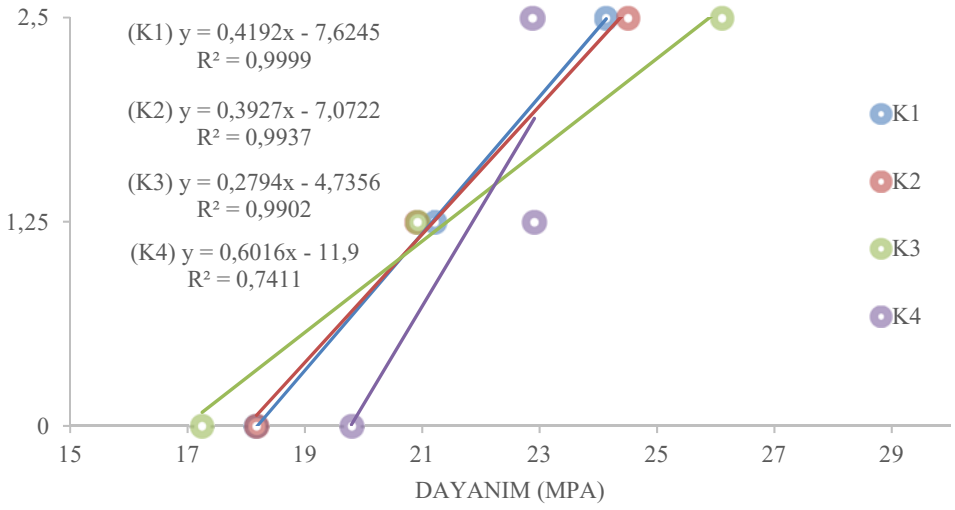
Kolonların kendi içerisindeki ortalama yoğunlukları incelendiğinde, K1 kolonunda üst bölgede düşük alt bölgede yüksek olmak üzere doğrusal bir artış gözlenmiş, K2, K3 ve K4 kolonlarında üst bölge yüksek orta bölge düşük alt bölge yüksek olacak şekilde dağılım gözlemlenmiştir (Şekil 10).



Şekil. 10. Kolon seviyelerinde yoğunluk değişimi

 Copyright © International Science and Technology Conference (ISTEC)

K1, K2, K3 ve K4 kolonlarının kendi içerisindeki hesaplanan tahmini dayanımlar beklenildiği gibi ultrason hız değerleri ile paralellik göstermiş ve her kolonda en düşük dayanım üst bölgede, en yüksek dayanım alt bölgede çıkmıştır. Kolonların kendi aralarında genel ortalama dayanımları incelendiğinde; en düşük dayanım tek kademe vibratörsüz kürsüz numunede, en yüksek dayanım beş kademe vibratörlü kürlü standartlara uygun dökülen ve bakılan numunede çıkmıştır (Şekil 11-12).



Şekil. 11. Kolon seviyelerinde tahmin edilen dayanımlar

Şekil. 12. Kolon seviyelerinde tahmin edilen dayanımlar

Kolonların hesaplanan dayanım değerlerin için alt, orta ve üst seviye için yapılan korelasyonlarında yüksek regresyon (R^2= 0.74- R^2= 0.99) katsayıları elde edilmiştir (Şekil 13).

Şekil. 13. Kolon seviyelerinde dayanım korelasyonları

Sonuçlar ve Öneri

Tahribatsız yöntemlerden biri olan ultrases hızı ile beton dayanımının güvenilir bir şekilde öngörülmesi mümkündür. Bu da inşaatı bitmiş beton elemanların zarar görmeden dayanımlarının yerinde tespit edilmesinde ekonomiklik ve hız sağlar. Çalışmada kolonlardan alınan karotlardan ultrases hızlarının değerlendirilmesinde;

Ultrases hızlarının her kolonda en düşük üst bölgede, en yüksek alt bölgede çıktığı,

Genel olarak vibratör ve kür uygulaması ile ultrases hızının arttığı,

Kolonların kendi aralarında genel ortalama ultrases hızı ortalamalarında, en düşük ultrases hızının K-1 (tek kademe vibratörsüz kürsüz) numunesinde, en yüksek ultrases hızının K-4 (beş kademe vibratörlü kürlü) numunesinde çıktığı,K-1, K-2 ve K-3 kolonlarında alt, orta ve üst bölümlerde ölçülen ultrases hız değerleri arasında ki farkın K-4 kolonunda farklı seviyelerden ölçülen ultrases hız değerlerinden fazla olduğu ve buradan K-4 kolonun daha homojen bir yapıya sahip olduğunu,

Ultrases hızlarından gidilerek hesaplanan dayanım değerleri kolonlarda en düşük üst bölgede, en yüksek alt bölgede olduğu,

K-2, K-3 ve K-4 (vibratörlü ve kürlü) kolonlarının yoğunluk değerleri K-1 (vibratörsüz ve kürsüz) kolonundan yüksek yoğunlukta olduğu,

Çalışmada şantiye koşullarında beton dökümünde geleneksel yapılan beton dökümü ile standartlarda önerilen beton döküm koşullarının beton özeliklerindeki etkisi deneysel veriler ile araştırılmış ve beton dökümünde standartlara uymanın daha homojen bir yapı elamanın elde edileceği görülmüştür. Şantiye koşullarında standartlara uygun dökümlerin yapılması ve yapı denetim firmalarının da bunun kontrolunu ciddi yapmaları önemlidir.

HEAVY METAL REMOVAL BY POLYMER – ZEOLITE BASED ADSORBENT

Hasan Emre ASLAN, Barış ŞEKER, Çiğdem KIVILCIMDAN MORAL

Akdeniz University, Department of Environmental Engineering, Antalya-TURKEY

cigdemmoral@akdeniz.edu.tr

Abstract: Water resources are threatened by a lot of pollutants such as heavy metals. Copper, a heavy metal, is quite toxic at high concentrations similar to the other heavy metals. These metals can also accumulate fatty tissues of livings. Due to these reasons heavy metals should be removed from wastewaters before being discharged. There are many methods to remove heavy metals such as chemical precipitation, ion exchange, membrane technologies, etc. Adsorption is an alternative method which is cheap, easy to apply and effective. Various adsorbents including biopolymers are used efficiently for heavy metal removal. Alginate is one of them composed of mannuronic and guluronic acid monomers. Alginate can form beads by adding mostly calcium which were used for heavy metal removal. Recent studies were particularly focused on improvement of these beads by adding some materials capable of capturing heavy metals such as clay, bentonite, activated carbon, etc. In this study, a natural zeolite, clinoptilolite was used to increase copper removal capacity of alginate beads. For copper removal, series of adsorption experiments were performed under constant temperature and mixing rate. Alginate-clinoptilolite beads were found to be more effective (almost 20 % of higher copper removal) compared to alginate beads alone. Adsorption of copper was equilibrated after about 8 hours of incubation and the highest copper reduction was observed as 87 mg Cu^{2+}/g alginate-clinoptilolite beads at initial Cu^{2+} concentration of 100 mg/L.

Keywords: Alginate, Clinoptilolite, Copper, Toxicity

Introduction

Environmental pollution is particularly get worse by industrial evolution. A lot pollutants become wide spread in the biosphere, such as heavy metals. Heavy metals are generally toxic even at considerably low concentrations. Also, they can accumulate in fatty tissues which resulted increase in heavy metal levels in the food web. Therefore, heavy metals are required to be treated before discharge into the environment (Papageorgiou et al, 2008). There are many methods used for the treatment of heavy metals such as chemical precipitation, filtration, ion exchange, membrane technologies and adsorption. One of the alternatives is adsorption by natural polymers. For instance, alginates are found to be effective in heavy metal uptake (Vieira and Volesky, 2000).

Alginates are polysaccharides composed of mannuronic (M) and guluronic (G) acid monomers. These monomers can be arranged as MM-, MG- and GG-blocks (Hay et al, 2010). Carboxylic acid groups linked to these monomers are claimed to be the main functional groups in heavy metal removal. Also, complexation reactions together with divalent cations might have a role in heavy metal uptake. Alginates with high GG-blocks content can form strong gels with divalent ions particularly calcium ions (Davis et al, 2003). Generally alginate beads formed by gelation investigated in related studies. However, in recent years, studies especially focused on improving heavy metal removal capacity of alginate beads by forming composite structures. For example, heavy metals like Pb^{2+}, Mn^{2+}, Cd^{2+}, Cu^{2+}, Zn^{2+}, Fe^{2+}, Al^{3+} and Hg^{2+} were removed by magnetic alginate beads (Bee et al, 2011; Idris et al, 2010; Idris et al, 2012; Ngomsik et al, 2009; Park et al, 2007), alginate montmorillonite beads (Shawky, 2011), pectin alginate beads (Harel et al, 1998) and ceramic membrane alginate beads (Athanasekou et al, 2009). Similarly, this study aimed to improve heavy metal uptake capacity of alginate beads by combining alginate and clinoptilolite.

Clinoptilolite is a natural zeolite having ability to remove metals from wastewaters by ion exchange. Cd^{2+}, Cu^{2+}, Ni^{2+}, Cr^{3+}, Pb^{2+}, Fe^{3+} could be removed by using clinoptilolite effectively (Kocaoba et al, 2007; Inglezakis et al, 2002; Inglezakis et al, 2003; Iznaga et al, 2007; Petrus et al, 2005; Sprynskyy et al, 2006). Also, it is a cheaper source and very abundant in Turkey (DPT, 1996). As a result, the main purpose of this study is determination of optimal conditions for composite alginate-clinoptilolite beads formation and then testing these beads for their ability to take copper from a synthetic wastewater. It is thought that this study might be useful in order to have a new designed and effective adsorbent for heavy metal removal by using cheaper and natural materials, one of which has major sources in our country.

 Copyright © International Science and Technology Conference (ISTEC)

Materials and Methods

Alginate was purchased and used directly. Clinoptilolite was first ground and then sieved into different sizes. The lowest size clinoptilolite (<100 µm) was selected due its possible higher surface area. It was washed with 2M NaCl solution for 1 day at 150 rpm in order to increase heavy metal uptake capacity. After that, it was washed with distilled water, then dried at 100 ºC for 1 day and stored in a desiccator.

Essentially, alginate beads are produced by pouring alginate solution drop by drop into $CaCl_2$ solution. However, there is no standard procedure for the production these beads. For this reason, 1, 2 and 4% alginate solutions were prepared and added dropwise into 50, 100, 250 mM $CaCl_2$ solutions by using a peristaltic pump under constant stirring at 50 rpm. After that these beads were incubated overnight for hardening and separated by filtration through 0.45 µm filter under vacuum by washing with distilled water. At the end, optimal concentrations for alginate and calcium ion were selected for bead preparations. This procedure was used for both alginate and alginate-clinoptilolite (1g / 1g) beads formation.

For the removal of copper, first, the efficiencies of alginate and alginate-clinoptilolite beads were compared by using 100 mg (i) alginate beads and (ii) alginate-clinoptilolite beads. These beads were added into 100 mg/L Cu^{2+} solution (100 mL in 250 mL erlenmeyer flasks) at pH 4, 25 °C and 200 rpm for 72 hours. Two samples, collected at time zero and 72 hours, were filtered through 0.45 µm filter and acidified by HNO_3. Finally, copper analyses were performed by Inductive Coupled Plasma-Mass Spectroscopy (ICP-MS).

In the second experimental set, the kinetics of copper adsorption by alginate-clinoptilolite beads were followed by using 100 mg alginate-clinoptilolite beads. These beads were added into 100 mg/L Cu^{2+} solution (100 mL in 250 mL erlenmeyer flasks) at pH 4, 25 °C and 200 rpm for 72 hours. Samples, collected at 1, 4, 8, 12, 24 and 72 hours, were filtered through 0.45 µm filter and acidified by HNO_3. Finally, copper analyses were performed by ICP-MS.

Results and Discussion

Optimization of the Procedure Used for Alginate Beads Production

Essentially, alginate beads are formed by combining two solutions under constant and gentle stirring: alginate and calcium salts. However, there is no standard procedure for the bead production. For this reason, first different concentrations of alginate and $CaCl_2$ solutions were prepared and alginate beads were formed. Second, the results were evaluated in terms of homogeneity of the beads' size, shape and hardness of the beads. For this purpose, three different alginate solutions, 1, 2 and 4 %, dropped into 50, 100 and 250 mM calcium ion containing solutions.

Alginate solution at 4 % concentration showed considerably high viscosity, probably because of its polymeric nature. In general, solution of a polymer has high viscosity particularly when the polymer has high polymerization degree. If this kind of a polymer is used at high concentration, the solution would have high viscosity. Thus, the beads formed by alginate solution at 4 % concentration had irregular shapes independent of calcium concentration. When the beads produced by 1 and 2 % of alginate solutions were compared, the ones formed by 2 % of alginate solutions were found hard enough to use in the experiments although beads formed by 1 % of alginate solutions were a bit softer.

On the other hand, there were no obvious variations between the beads formed at different calcium ion concentrations. Only the beads formed at 50 mM of $CaCl_2$ solutions seemed to have smaller and more homogenous size distribution when they were observed visually. This could also reduce the chemical usage compared to other calcium doses tested (100 and 250 mM) in the study. As a result, alginate beads were determined to produce by dropping 2 % of alginate solution into 50 mM of $CaCl_2$ solutions (Figure 1). This procedure was also utilized for the production of alginate-clinoptilolite beads.

Copper Removal by Alginate-Clinoptilolite Beads

The main goal of this study is to form a new composite alginate bead by cheaper and possibly local sources which is more effective in heavy metal uptake. Clinoptilolite is selected for this purpose since it is a low cost material with abundant sources in Turkey. Then, in order to determine the effectiveness of zeolite addition into alginate beads, first, copper removal capacities of alginate beads and alginate-clinoptilolite beads were investigated for 72 hours at constant temperature and mixing rate. Results showed that both alginate and alginate-clinoptilolite beads could remove copper efficiently from the synthetic wastewater having about 100 mg/L of Cu^{2+}. Alginate-clinoptilolite beads had higher heavy metal uptake capacity. About 20 % more copper removal could be achieved by new composite beads after 72 hours (Table 1). Therefore, there should be no diffusional limitations for copper migration due to clinoptilolite addition and functional groups of clinoptilolite appeared to be used for the exchange of copper.

Figure 1. Alginate beads produced by 2% alginate and 50 mM Ca^{2+}

Table 1. Copper removal by alginate and alginate-clinoptilolite beads

Bead type	Initial copper concentration (mg/L)	Final copper concentration (mg/L)	Removal (%)
Alginate	103.3	37.5	64
Alginate-clinoptilolite	107.5	18.4	83

Since alginate-clinoptilolite beads were found to be more efficient compared to alginate beads alone, this combination was subjected to further experiments. For these experiments, first, kinetics of copper removal by alginate-clinoptilolite beads were investigated during 72 hours. The main purpose was to determine the equilibrium time for adsorption process at which there should be no drastic change of copper concentration in the solution.

Samples were collected at previously determined time intervals and variation of copper concentration in solution is presented in Figure 2. When the results were evaluated, adsorption of copper seemed to be considerably fast onto alginate-clinoptilolite beads. For example, only after 1 hour, copper removal efficiency was reached up to 60 %. In addition, copper concentration decreased from 100 to 30 mg/L after 4 hours of incubation period while it was measured around 18 mg/L after 8 hours. Then, until 72 hours, there were no significant changes in copper concentrations. As a result, the maximum copper removal was observed around 83 % and the equilibrium time for the adsorption phenomena was about 8 hours.

Amount of adsorbed copper per mass adsorbent is an important indication for adsorption capacity. In literature, it is generally noted as q_e (mg/g), which is defined as the amount of metal adsorbed per unit mass of adsorbent. The changes of q_e are also illustrated in Figure 2. As it is shown in the figure, at the beginning, the trend is opposite to copper concentration in the solution as expected. Thus, q_e values were first increased and then it was somehow fixed through the end of the experiment. The maximum q_e value was reached around 8 hours that is corresponded to 87 mg Cu^{2+}/g alginate-clinoptilolite beads.

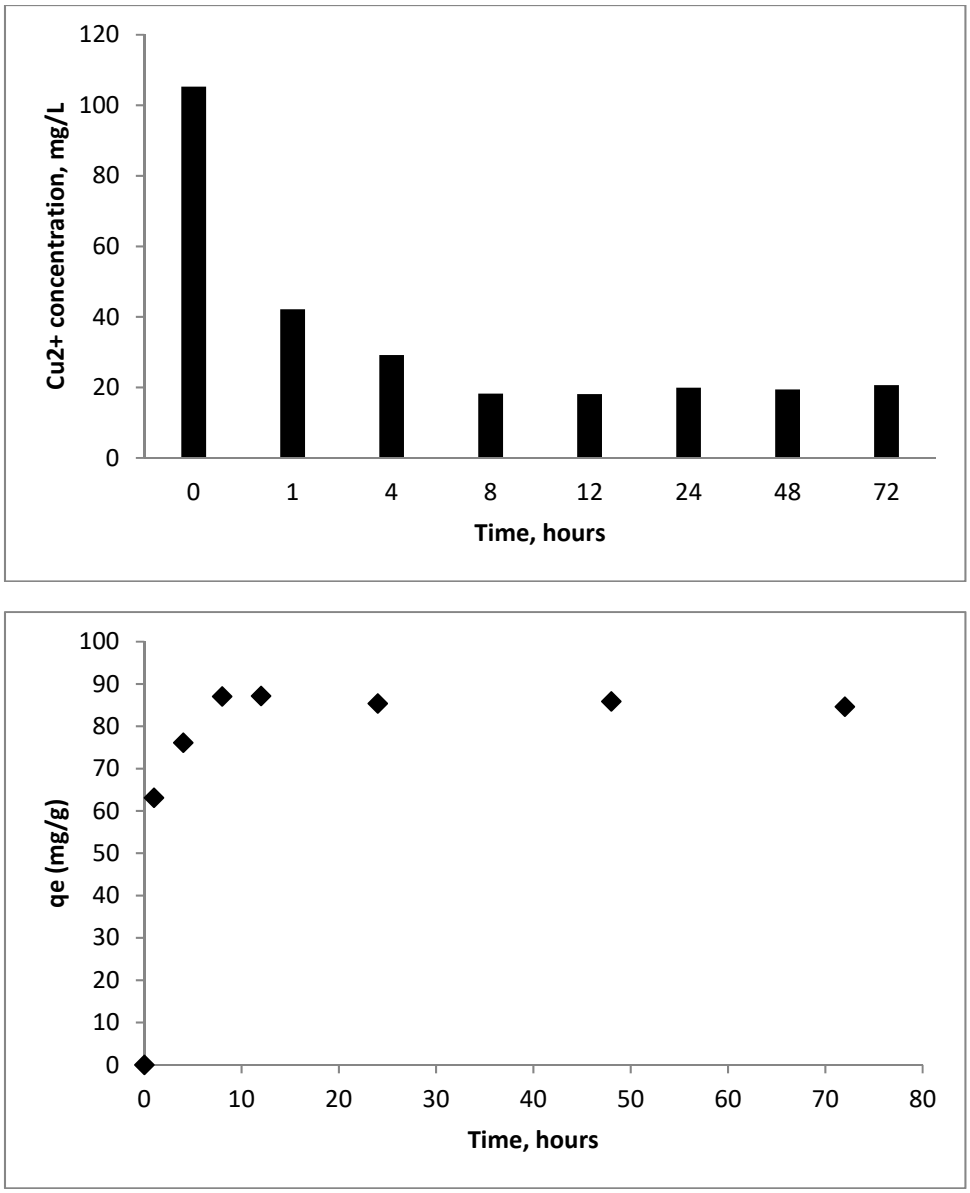

Figure 2. Changes in copper concentration and adsorption with time by alginate-clinoptilolite beads

Conclusion

Heavy metals are one of the major pollutants in industrial wastewater streams. They are required to be treated so that these metals are not harmful for the livings. Alginate – clinoptilolite beads are found to be effective combinations for heavy metal removal according to the results of the current study. These composite alginate beads can be suggested to use as alternative adsorbents since clinoptilolite is one of the local and cheaper sources in Turkey. Also, the results of the study might be helpful for further investigations particularly for column adsorption systems operated in continuous mode.

ÖZET

Bu çalışmada, mikrodenetleyici ile Saman ve benzeri kuru ot balyalarının sıcaklık ve bağıl nem ölçümünü için cihaz tasarımı yapılmıştır. Gerçekleştirilen çalışmada bağıl nem ve sıcaklık sensöründen gelen bilgi Arduino Uno mikrodenetleyicisi aracılığıyla işlendikten sonra Grafik LCD de ortam bağıl neminin ve sıcaklığının ölçülmesi sağlanmaktadır.

Cihazın gövde kısmı saman balyalarına girişinin kolay olması için tasarlanmıştır. Böylelikle ölçülen bölgedeki sıcaklık ve bağıl nem oranları saman ve benzeri kuru ot balyasının iç kısmından alınan sıcaklık ve bağıl nem oranları ile kıyaslanabilmektedir. Saman ve benzeri kuru ot balyasının balyalama süreci sonrası satış vb. işlemlerde standartlarda bir nem oranına sahip olup olmadığı görülebilmektedir.

Anahtar Kelimeler: Sıcaklık, Bağıl Nem, Mikrodenetleyici, Kuru ot balyası, Arduino

DESIGN AND IMPLEMENTATION TEMPERATURE AND HUMIDITY METER FOR STRAW AND HAYSTACK

ABSTRACT

In this work, a device has been designed for measuring temperature and relative humidity of straw and this kind of haystack by the way of microcontroller. In the work after processing the information coming from relative humidity and heating censor via Arduino uno microcontroller, it is being provided that measuring the heat and the humidity on graphic LCD.

Body of the device has been designed for accessing easily to haystack. With the help of this designing, we can compare the heat and humidity rates inside the haystack and in the measuring zone. After baling process of straw and hay, it can be seen if there's any humidity rate or not up to standard in the process like trading

Keywords: Temperature, Relative humidity, Microcontroller, Haystack, Arduino

1.Giriş

Ülkemizde de saman yıllık olarak yenilenebilen, belli zamanlarda bol ve kolay bulunabilen bir malzemedir. Tahıl üretiminde buğday, yulaf, pirinç, arpa gibi ürünlerin sap kısımları hayvanlara yem olarak saklanır (Irklı Eryıldız,2000)

Yeşil yem bitkilerinin çiçeklenme döneminde hayvana yararlı besin maddeleri miktarı yönünden, bitkilerin biçme işleminin gecikmesi nedeniyle % 30-35 oranında kayıp olabilmektir. Üreticinin, yoncanın çiçek açma döneminden 10- 12 gün sonra biçme işlemini uygulaması ve bu devre içinde yonca tarlada serili iken üzerine yağmur düşmesi, yoncadaki yem değerinin % 30'una yakını kaybolmakta ve bu üreticinin yılda 30 ton kaba yem zararı olmaktadır. Halbuki üretici yoncanın çiçek açma döneminde biçme işlemi ve yonca tarla koşullarında % 25-30 nem oranına geldiğinde yuvarlak balyalama makinası ile balyalama veya sıkıştırmalı yığın yapma makinası ile yığın haline getirme işlemini yaptığında bu kayıplar % 3- 5'e kadar düşmektedir. Böylece üreticinin yıllık yem kaybı 3~5 tona kadar azalma görülmektedir (Ülger, 1978). Ürün nem oranı en iyi balyalama nem oranı olan % 20 dir. Uygulama sürelerinde bölgede mevsim gereğince yağış olmadığında, ürünün geceleyin almış olduğu nem miktarının kuruma süresine etkilemediği ortaya çıkmıştır. Bölgede yoncanın biçme işleminden sonra tırmıkta karıştırma, alt üst etme ve namlu haline getirme işlemleri uygulandığında, biçme işleminden bir gün sonra yoncanın nem oranı balyalama sınırına erişebilmekte ve dolayısıyla balyalanabilmektedir (Ülger, 1979)

Yonca hasatında kayıpların hepsi tırmıklama sırasında yaprakların dökülmesi şeklinde olduğu kabul edilmektedir. Yaprak kayıpları, kullanılan tırmığın teknik özelliklerine ve buna bağlı olarak yoncanın biçildiği yerden sıra yığınına kadar kat ettiği uzaklığa, tırmığın çalışma hızına, ortalama ot hızına, hareket halindeki ota tırmık parmaklarının çarpmasıyla hızın yükselmesi veya azalması durumuna, ürünün çeşidine, nem oranına, ürünün tarla verimine ve tarla koşullarına bağlı olarak değişmektedir. Yonca % 20 nem oranında tırmıklandığı

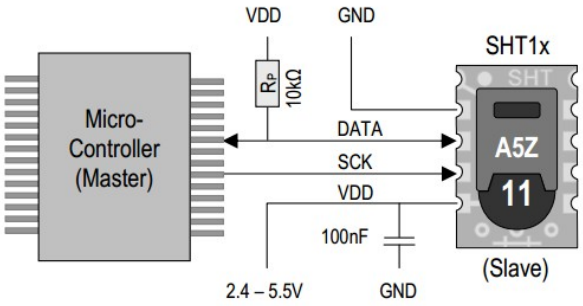
 Copyright © International Science and Technology Conference (ISTEC)

zaman yaprak kaybı % 21, %30 nemde namlu yapıldığında yaprak kaybı % 13 ve % 40 nemde yapılan namlularda ise, yaprak kayıpları % 8 olmaktadır. Yeşil yem bitkilerinin biçilme işleminden sonra balyalanması için % 25-30 ürün nem oranına sahip olması gerekmektedir. Balyalama sırasındaki kayıpları etkileyen faktörler; balya makinasının teknik özellikleri, ürünün nem oranı, ürün çeşidi, ürün verimi, namlu yoğunluğu, balya yoğunluğu ve namlunun düzgünlüğüdür (Baştaban, 1983). Birim kuru maddede bulunan besin madde içeriği yüksek olan hayvan beslemede kullanılan yemlere kesif yem, düşük olanlara ise kaba yem denilmektedir. Ülkemizde bir yıllık kaba yem ihtiyacı, yaklaşık 50 milyon ton kuru ota eşittir. Yem bitkileri üretim alanlarından ve çayır meralardan elde edilen kaliteli kaba yem üretim miktarı ise 17 milyon ton civarındadır (Yıldız, 2008).

Hayvansal üretimin artırılması için beslenme, bakım, ıslah ve hayvan barınaklarının verimi ile mümkündür. Bitkisel ürünlerin nitelik ve niceliklerini bozulmadan korunmaları uygun çevre koşullarını (sıcaklık, nem vb.) sağlayacak şekilde projelenmiş depolar ile mümkün olmaktadır (Yağanoğlu 1994). Tarım sektöründe saman yonca vb. hayvan gıdalarının biçme işlemi, balyalama işlemi, saklama işlemi ve balya halinde satılma işlemi gibi işlemlerde sıcaklık, nem gibi çevre koşulları önem arz etmektedir.

Uygun sıcaklık ve nem oranlarında saman ve kuru otlarda, hem hayvan gıdalarının besin değerleri yüksek olmakta hem saklanma koşulları uzamakta hem de satın alma işlemlerinde saman ve kuru ot ağırlık değerleri doğru hesaplanarak yıl boyu yetecek miktar doğru olarak hesaplanabilmektedir.

Bu çalışmada saman ve kuru ot gibi hayvan gıdalarının balyalama işlemi yapıldıktan sonra balya neminin kontrolünün yapılması için gerekli cihazın tasarımı ve gerçekleştirilmesi yapılmıştır.



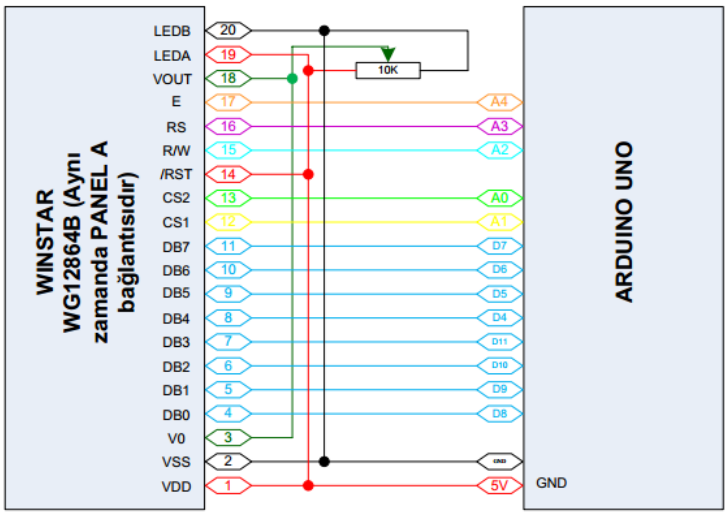
2. Materyal ve Metod

Bu çalışmada, Arduino Uno mikrodenetleyici kartı, SHT10 sıcaklık ve nem sensörü ve Grafik LCD kullanılarak ortam sıcaklığı ve bağıl nem miktarının ölçümü yapılıp, grafik LCD ' ye aktarımı yapılmıştır.

Şekil 1: Devre Bileşenleri

Kullanılan Sıcaklık sensörü SHT10 Metal koruyuculu tipinde seçilmiş olup, nem ölçüm aralığı 0~100% RH, sıcaklık ölçüm aralığı -40 ~ +123.8 °C dir.

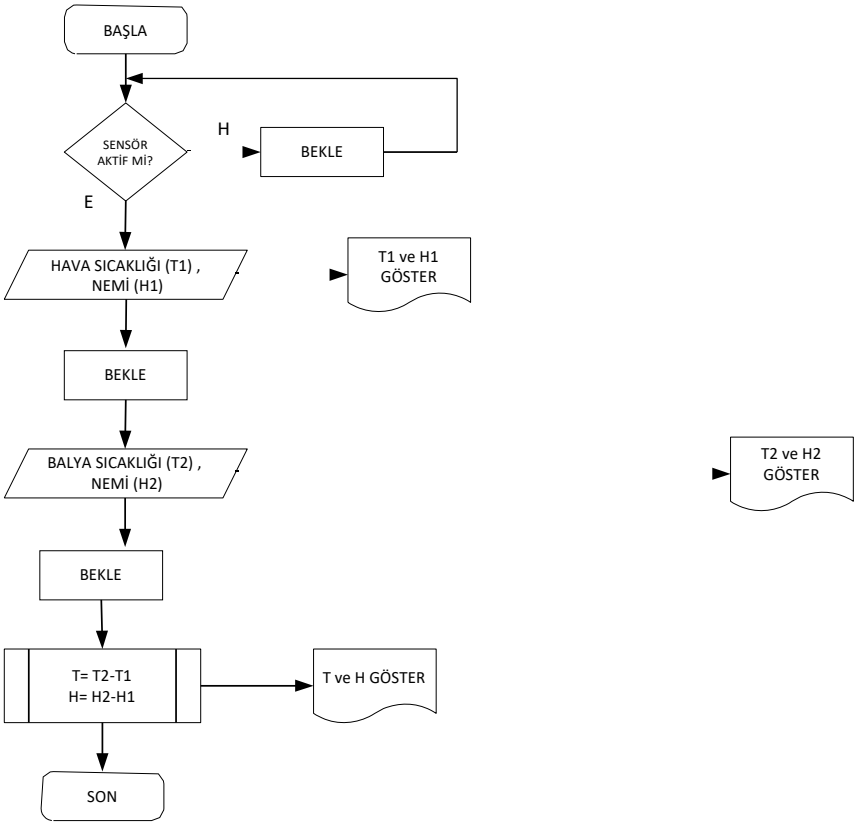
Şekil 2. SHT10 bağlantı şeması (Datasheet SHT1x,2011)



Kullanılan Arduino UNO Rev.3 kartında ATmega328 mikrodenetleyici kullanılmış olup kartın 14 Dijital I/O Pini (6 PWM pini) 6 ADC giriş pini bulunmaktadır. 16 MHz çalışma frekansına, 32 KB Flash hafızasına sahiptir. (arduino.cc,2016)

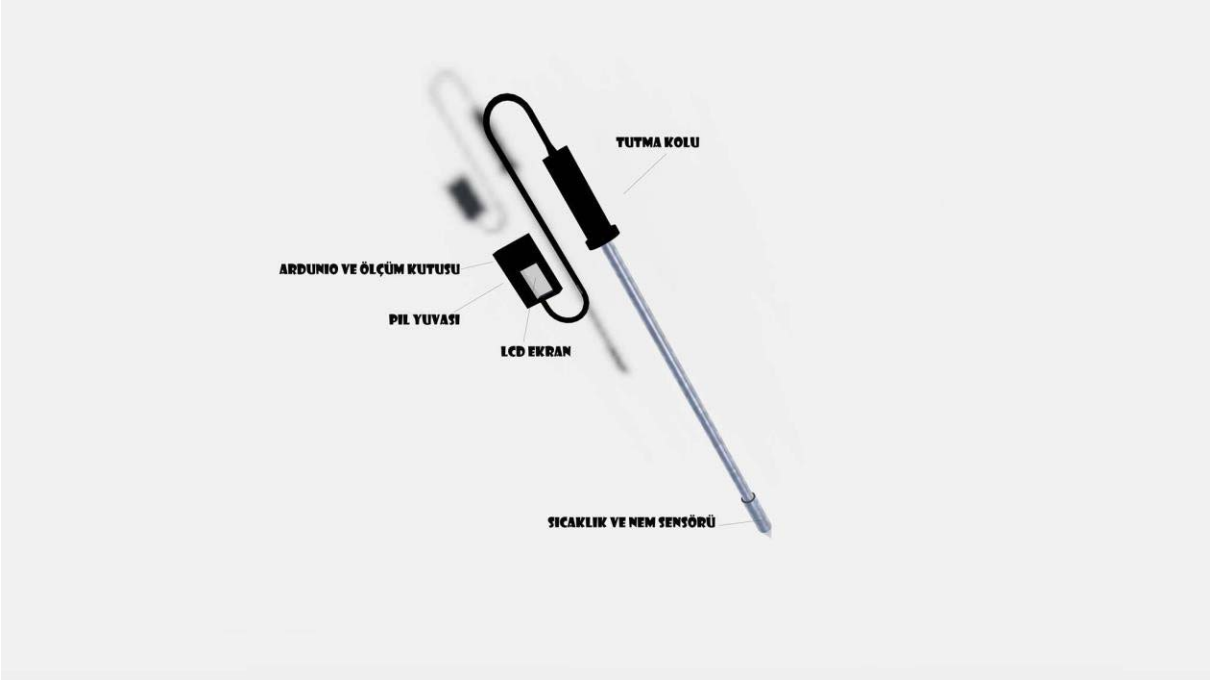
 Copyright © International Science and Technology Conference (ISTEC)

Şekil 3. Arduino Uno Rev.3 kartı



Kullanılan Grafik LCD, Winstar WG12864B-Mavi olup, 20 pinli Mavi ekran ışığına sahiptir. Ekranda sıcaklık ve nem oranının kolay görülebilmesi. Saman tozlarından etkilenmemesi için tercih edilmiştir.

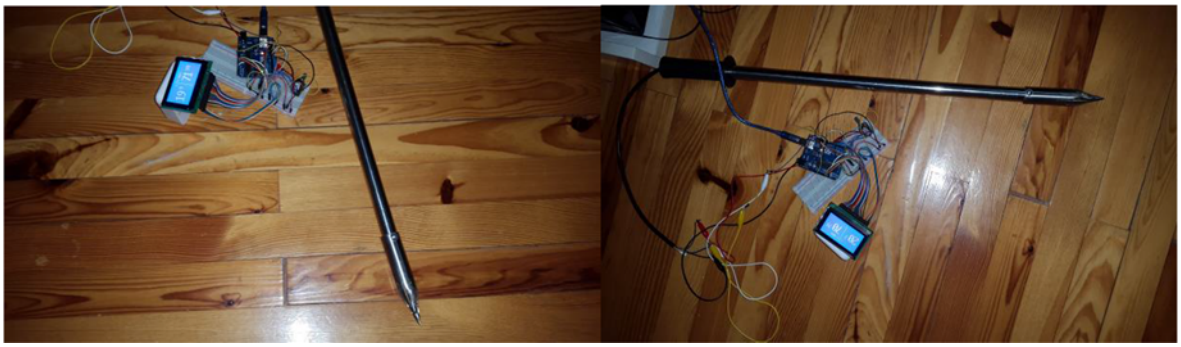
Şekil 4. Grafik LCD'nin Mikrodenetleyici bağlantısı



Cihazın tasarımı yapılırken daha stabil ölçüm yapılabilmesi için algoritma şekil 5'de detaylandırılmıştır.

 Copyright © International Science and Technology Conference (ISTEC)

Şekil 5. Cihazın algoritması



Cihazın tasarımı yapılırken, saman balyasına kolay girebilmesi için ucu sivri metal bir parça tasarlanmış ve sıcaklık/nem sensörü içerisine yerleştirilmesi planlanmıştır. Şekil 6' da cihaz yapımına başlanmadan üç boyutlu tasarımı yapılmıştır.

Şekil 6. Cihazın 3 boyutlu tasarımı

 Copyright © International Science and Technology Conference (ISTEC)

Metal kısımda ölçümün sağlıklı yapılabilmesi için sivri kısmında oyuklar açılmıştır. Cihazın kullanımını kolaylaştırmak için elin kolay kavrayabilmesi için tutma kısmı yerleştirilmiştir.

Şekil 7. Cihazın tasarım aşamaları

Cihazın mikrodenetleyicisi, Grafik LCD, batarya, açma anahtarı bir kutu içerisine yerleştirilmiş olup, saman ve/veya kuru otun sıcaklık ve nem miktarının kolay okunabilmesi için el tutma kısmından uzak tutulmuştur.

Şekil 8. Cihazın tüm montajının tamamlanmış hali

Cihaz balyaların sıcaklık ve nem miktarını en az hata ile ölçebilmesi için, önce balyaya saplanmadan önce havanın sıcaklık ve bağıl nemi ölçülmekte daha sonra balya içerisine batırıldıktan sonra balya sıcaklık ve nemini ölçmektedir. Bütün ölçümler Grafik LCD'de gösterildikten sonra, iki sıcaklık ve nem arasındaki farkta en son olarak ekranda gözükmektedir.

Şekil 9. Cihaz ile sıcaklık ve nem ölçüm işlemi

3. Sonuç ve Öneriler

Bu çalışmada tasarımı yapılan cihaz, tarım ve hayvancılık sektörüne özellikle saman ve kuru ot satın alma işlemlerinde kullanılması ve yardımcı olması için gerçekleştirilmiştir. Balya neminin ölçülme işlemi, saman ve kuru otun toplanmasından kullanımına kadar çoğu aşamasında ihtiyaç olarak görülmüştür. Hayvancılık ile uğraşan kişiler genelde yıllık ihtiyaçlarını balya ağırlığına göre karşılamaktadır. Balyaların olması gereken ideal nem oranından fazla nemli olması durumunda ise balyalar fazla kilo gösterecek bu olay da satan kişinin maddi olarak lehine bir durum olarak ortaya çıkarken satın alan kişinin maddi zararına ve yıl boyunca yetmesi gereken hayvan yiyeceğinin erken bitmesine yol açacaktır. Böylelikle balya halindeki saman ve/veya kuru otun fazla nemli olması durumunda, ağırlığının artmış olması ihtimali göz önüne alındığında alım satım işleminde yanlışlıkların önüne geçilmiş olacaktır.

4. Tartışma

Günümüz teknolojisinde, elektrik-elektronik teknolojisi bir çok disiplin ile birlikte çalışmakta ve teknolojinin imkanları kullanılmaktadır (Aydın, 2013). Bu çalışmanın ortaya çıkması hayvancılık sektöründen gelen talep üzerine olmuş, elektronik malzemelere ve balyaya kolay girip doğru ölçüm yapabilmesi için ilk tasarım aşamasında 3 boyutlu olarak cihazın tasarımı yapılmış olup, ardından 3 boyutlu tasarımına göre mekanik kısmı gerçekleştirilerek cihaz tamamlanmıştır.

Bu ve benzeri cihaz tasarımları farklı disiplinlerin bir araya gelmesi sayesinde ortaya çıkacak ve ihtiyaca göre cihazın geliştirilmesine devam edilebilecektir.

A STUDY ON MICROSTRUCTURE AND FABRICATION OF TI-NB ALLOY BY CONVENTIONAL SINTERING

Mehmet Kaya
mehmetkaya75@hotmail.com

Abdurrahman Yolun
abdurrahmanyolun@gmail.com
Adıyaman Üniversitesi, Adıyaman-Turkey

ABSTRACT:
The binary titanium alloys show attractive properties for biomedical applications. The most important factors for an implant material are biocompatibility, osseointegration, corrosion and mechanical resistances and also porous structure to nutrition exchange within human bodies. The purpose of this study is to investigate the effect of sintering temperature on microstructure and fabrication of porous Ti-10Nb alloys via conventional sintering for use as hard-tissue implants. The porous Ti-10Nb alloy was fabricated using conventional sintering method at different temperatures (1200 ºC, 1300 ºC and 1400 ºC). Later, the microstructures of synthesized specimens were examined by optical microscopy, scanning electron microscopy (SEM) and X-ray diffraction (XRD). The results indicated that the Ti-10Nb alloys were mainly composed of α and β phases and also are seen needle-like morphology of martensites in the microstructure.

ABSTRACT
High rise building was the most remarkable new building type to emerge in the late 19th century which has entirely changed the scale, appearance, concept and image of cities with its great visual impact. With advanced technologies the skylines of the cities dominated by high rise buildings all over the world in 20th century. In the 21st century it can be expected that more and more innovative high rise buildings will be built, utilizing the cutting-edge techniques also in historic cities with World Heritage Sites. High rise buildings' relationship with their context is more problematic than any other structure, the subject of what they add and what they take away to the city is quite controversial. Introducing a new building in a historic city has a dramatic impact on traditional urbanistic structure. In this study high rise buildings in historic cities with World Heritage Sites, their development, and impact on the city and the urban image are examined by selected examples from different historic cities. The current approaches for designing high rise buildings in a historical setting will be also examined.
Keywords: High rise building, historic city, architecture

INTRODUCTION

High rise buildings which are an indispensable part of our cities, will continue to exist in the future due to certain reasons such as evolving and changing social needs, rapid urbanization and population growth. There are different terms that define this building type; such as tall buildings, high rise buildings, skyscrapers depending on various contexts. In this study the term high-rise building is used which is substantially taller than their neighbours and/or which significantly changes the skyline.

High rise buildings have the potential to create a powerful image in the context of urban memory, even the potential to change the climate of the region. Technically, architecturally, socially and spatially their impact on the environment is quite strong. High rise buildings' relationship with their context is more problematic than any other structure, the subject of what they add and what they take away to the city is quite controversial. The most intense debates take place in historic cities while the separation or harmony between traditional and contemporary is more sharp and decisive here. High rise building was the most remarkable new building type to emerge in the late 19th century which has entirely changed the scale, appearance, concept and image of cities with its great visual impact. A high-rise building, can be a residential block an office tower or has a mixed use function. With advanced technologies the skylines of the cities dominated by high rise buildings all over the world in 20th century. In the 21st century it can be expected that more and more innovative high rise buildings will be built, utilizing the cutting-edge techniques also in historic cities with World Heritage Sites (WHS).

The global urban population has increased from 0.7 billion in 1950 to 3.9 billion in 2014. UN forecasts another 60 percent by 2050, as 6.3 billion people are projected to live in urban settlements (UN, 2014). A majority of people will be living in urban areas and vertical development is inevitable for the urban growth in the future cities. Cities, which can only be analyzed and understood by interdisciplinary study, are growing and developing constantly day by day. Christine Boyer, the author of 'The City of Collective Memory', suggests in her book that the city consists of three major layers; the city as a work of art (one common to the traditional city), the city as panorama(one characteristic of the modern city) and the city as spectacle (one appropriate to the contemporary city) (Boyer, 1994). These different architectural layers touch each other heterogeneously and form the diversity.

Every new proposed high rise building in a historic city should have a good architectural quality and bring a sustainable approach (Abel, 2006). By the architectural quality of the building is meant; scale, form and massing proportion and silhouette, facing materials, relationship to other structures, effect on the skyline, effect on

 Copyright © International Science and Technology Conference (ISTEC)

streetscape and near views (CABE 2007). These type of buildings should be more urban and as well as respectful to a historic city as its impact on public space and the skyline is distinctive due to its scale and density. In this study high rise buildings in historic cities with World Heritage Sites, their development, and impact on the city and the urban image are examined by selected examples from different historic cities. The current approaches for designing high rise buildings in a historical setting will be also examined.

Historic City – High Rise Building

Historic cities with World Heritage Sites have more exclusive place among world cities while they have common value for all humanity with Outstanding Universal Value. The urban conservation for these cities is important for the human history. Introducing a new building in a historic city has a dramatic impact on traditional urbanistic structure. High rise building and a historic city is perceived as two contrasting concepts while high rise building concept is fundamentally different from other contemporary building due to their scale and visual impact on the surrounding. Building a high rise building in a historical setting the protection of the authenticity and integrity is essential as it is an instantly recognizable addition to the city's skyline.

Historic area or city is defined in 1976 UNESCO Recommendation as: *"Historic and architectural (including vernacular) areas" shall be taken to mean any groups of buildings, structures and open spaces including archaeological and palaeontological sites, constituting human settlements in an urban or rural environment, the cohesion and value of which, from the archaeological, architectural, prehistoric, historic, aesthetic or sociocultural point of view are recognized. (URL1)*

Cities are changing and developing rapidly and uncontrolled development can deteriorate the urban heritage with its tangible and intangible values that has shaped through the history. UNESCO defines its approach for the management of historic urban landscape as holistic; the goal is to integrate the conservation and social and economic development. It is crucial[1] to manage the urban development around a World Heritage site and there are two important factors that should be considered; buffer zone regulation, maintenance. Buffer zone is intended to protect World Heritage sites from negative influences. It defines a neighboring zone that may influence a World Heritage site. Although it is not a must the majority of World Heritage sites have a buffer zone which guarantees the protection of the sites. They are not formal components but they contribute to the attributes of the Outstanding Universal Value and to the setting.

High-rise buildings in historical settings are added as new layers into the city and may become the elements which enrich the urban texture without destroying the local environment. CABE (Commission for Architecture and the Built Environment) and English Heritage published Guidance on Tall Buildings in 2007. The main principle is defined as: *to secure high quality design and ways to enhance and improve places in which people live their lives and conserve heritage assets for this and future generations*. Well-designed tall buildings in the right place can be a force for good, but that they also have the potential to cause a destruction of the historical fabric. The destruction can occur in two ways; *Visual character, Urban life quality.*

City can have various silhouettes depending on the viewing direction and the viewpoint. Silhouettes of cities possess their personal individuality, gives the first emotion, first perception for that city thus the first image is created in our minds. Key elements, historic -cultural landmarks and its historic characters of the setting can be observed by a viewer and tall buildings have the potential to determine and create a silhouette or to break the existing. Besides forming the built heritage some buildings in historic cities become the symbol of the city they characterized the urban policies, new developments or new decisions about tall buildings which will be analyzed in the case cities. Preserving the free sky and vistas around these specific buildings is directly related to the perception of the image of the city.

Lynch specifies three separate components of the city's image as follows: "identity, structure & meaning" and verifies that "in reality they always appear together" and determines the image. (Lynch, 2010). The Urban identity is created by urban images in long time process through the history and composed of various

[1] New development which can affect the World heritage site has the risk for the site to be admitted to the list of endangered World Heritage.

 Copyright © International Science and Technology Conference (ISTEC)

components. In the historical process cities have been shaped by various factors such as wars, religion and economy. Initially they were designed for defensive purposes then in medieval times religion shaped the city and religious structures became the focal point and identified the silhouette and image of the city. It is an indisputable fact that the image or identity of a city is not merely identified by the silhouette. The Urban identity of a city is determined by its own idiosyncratic features that are its geography, socio-cultural values of the community and the architectural production. In this respect the urban identity is dependent on meeting the needs of the present with the preservation of the past.

The Case of İSTANBUL

The city of İstanbul is a harmonised combination of the works of nature and man and one of the most significant centers for Civilization and Culture of the world. During Marmaray excavations it has been observed that the history of the city starts in BC 8500. The city protected its status as a capital from Constantine the Great until the 20th century. Great empires like the Eastern Roman, Byzantine and Ottoman made this city their capital for 16 centuries long (Batur, 2011). Among its history the unique geography makes the city special, which is located on three pieces of land separated by the sea. The city was founded on a peninsula and surrounded by the Golden Horn (Halic) on the north, the Bosphorus on the east and the Marmara Sea on the south. Its relationship with the sea and its topography formed the original character of the city. Throughout the history peninsula has radically changed in the context of social-culturally and spatially and also through the fire and the impact of earthquakes. The four regions of Istanbul Historic Peninsula were declared as World Heritage Site on 06.12.1985 by UNESCO.

Figure 1. The Location of Historic Peninsula in the City

2 The Süleymaniye Mosque and Environs Protected Area

3 Zeyrek Mosque (Pantokrator Church) and Environs Protected Area

4 İstanbul Land Walls

The four sites of the property are first Degree Conservation Sites, the masterpieces are the ancient Hippodrome of Constantine, the 6th-century Hagia Sophia and the 16th-century Süleymaniye Mosque. The Historic Peninsula was surrounded by ancient walls which were built by Theodosius in the early fifth century.

 Copyright © International Science and Technology Conference (ISTEC)

Figure 3.View of Istanbul's historic peninsula, looking from Galata. Abdullah Fréres, ca. 1880-93 and a collage of WHS.

The total area is 2,110 hectares; 1,562 hectares of which is covered by the Historic Peninsula and 548 hectares by the Buffer Zone. The "Buffer Zone" is determined in the Management Plan lying parallel to the Land Walls is within the boundaries of Eyup, Bayrampasa and Zeytinburnu Districts. The skylines of the Historic Peninsula express the Outstanding Universal Value of the property. In the Prost's İstanbul Master Plan (1936-58)[2] the first principles and regulations were determined to protect the silhouette of the Historic Peninsula. He put 40 m height limit: that allows max. 3-storey buildings with heights not exceeding 9.50 meters in locations those are above sea level by 40 meters or more, with the purpose of protecting the silhouette of the Historic Peninsula. (Bilsel,C,Pinon, P.,2010)

After the proclamation of the Republic, Ankara became the capital city and contrariwise to other metropolises the population of Istanbul has reduced in 1930s. In 1950s the city started witnessing demographic expansion due to migration which still continues increasingly. High rise buildings appeared first in 1950s and until to the mid 1970s averaging 25 stories office and hotel buildings were built. 1980s were megapolization period (Akdağ, et.al 2010), after 1980s the new urban regeneration process is started (Tekeli, 2014). The remarkable high-rise buildings were built in 1990s in new commercial districts (Zincirlikuyu, Maslak and Beşiktaş) in European side. In the 20th and 21th century the number of high rise buildings is increased rapidly in the city. There are 43 high rise buildings taller than 150 m and 33 of them are completed. The tallest completed building is the Sapphire Tower (2010) with 261 m height. 56 percent of these buildings have residential functions, 21 percent have mixed-use and the rest have hotel and office function. The Cluster of tall buildings are established around Levent-Maslak district and forming a highly visible and attractive symbol of the modern metropolis which change the symbolic perception. The number of tall buildings increasing in both sides of the city and from different locations of the city various characteristics of skylines can be observed. (CTBUH)

Figure 4: Cluster of tall buildings in İstanbul (CTBUH)

The startling development is occured with the construction of 16/9 residential tower complex with 3 buildings of 27, 32 and 37 storeys in the western district of Zeytinburnu which began in 2010 and damaged the silhouette of the highly valued Historic Peninsula when viewed from Bosphorus. Many objections were raised by public before and during the construction of the buildings regarding the negative impacts that they could cause, but somehow the legal procedures have been fitted or changed in order to complete the construction. Despite all these objections and the on-going court processes the buildings were completed. The 3 blocks obstructed the view and caused an adverse impact by changing the background setting of the Blue Mosque, Topkapi Palace and Hagia Sophia. The court ruled that those buildings were illegally built as they "negatively affected the world heritage site that the Turkish government was obliged to protect" (URL 2). According to the expert report[3] these 3 buildings located in the buffer zone area and they harm the appreciation of the Outstanding Universal Value of the World heritage Site from different viewpoints. Even though Turkish top administrative court affirmed a decision which imposes the demolition of the buildings it has not been implemented yet.

[2] Prof. Henri Prost, Head City Planner of Paris Region was invited to Istanbul in 1936 to make a Master Plan for Istanbul. Although he is criticized for not having evaluated Istanbul within a general development perspective and for transforming the fabric of the city's historic core to rationalize the traffic circulation, his role was significant in the protection of the unique silhouette of the historic peninsula . He mentioned that the Marmara shore of the old city was endowed with "one of the most beautiful views of the world" (Bilsel,C,Pinon, P.,2010)

[3] According to the İstanbul 4th Administrative Court expert report. The impact of the skyscrapers on the silhouette of the city has been documented after it has been observed from several points such as the ferry passing the Bosphorus, Bosphorus Bridge, Salacak, Harem, Maiden's Tower, Kadıköy and Çamlıca. (URL 3)

 Copyright © International Science and Technology Conference (ISTEC)

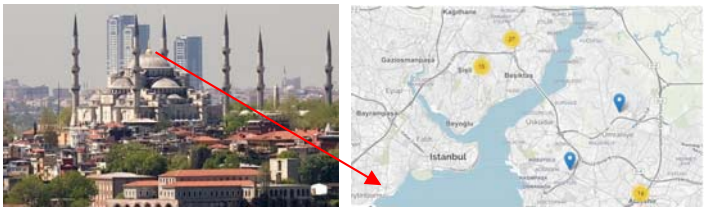

Figure 5: 16/9 Buildings and Historic Peninsula

The 1/100.000 scale Istanbul Master Plan is a reference document that shapes Istanbul's future silhouette concerning the spaces and guiding plans which emphasize a holistic silhouette main plan for the districts including the Historic Peninsula, the Golden Horn and the Bosphorus. Those districts have a direct influence on the silhouette of Istanbul and therefore it is very important to consider them while preparing a study regarding Istanbul's silhouette. Several significant viewpoints like the Bosporus Bridge, the Üsküdar coastline, Harem, Haydarpaşa, Kadıköy Center coastline, Moda, Kabataş coast, the Unkapanı Bridge, the Galata Bridge etc. were identified in order to observe the effects of high buildings on the silhouette. While doing this the natural surface differences and average eye level observation were taken into the consideration. By digital analysis the ultimate height of the buildings that would not affect the silhouette of the Historic Peninsula was defined. (İstanbul Hist.Penin. Site M.P. 2011)

The Case of LONDON

Another historic city that changed its silhouette in time due to the high rise development is London, which is one of the world cultural capital with its 2000 years history. St Paul's Cathedral (1711) has been the tallest building in London until the early twentieth century. After the construction of Faraday Building and Unilever House in the 1930s, the views of St. Paul's Cathedral from the River Thames were obstructed. Consequently 'St Paul's Heights Policy' (a local view protection policy) was implemented in 1937 to protect and enhance important local views from different directions. Until 1970 during post war reconstruction period some high rise building were built in city as the number increased in 1980s the sensitivity to conservation and heritage considerations and also view protection agenda revived.(part 2) . Through history the dynamics of building high-rise buildings in the city has been shaped by different policies and in the 2000s, a cluster of tall buildings were built in the east of the City. They are set in the background of The Tower of London4 which is a palace-fortress and the best-preserved example of a royal Norman castle. The Tower of London(3) (Insc. 1988) is one of the four (The Royal Botanic Gardens at Kew(1), The Palace of Westminster (2), Maritime Greenwich) inscribed prominent UNESCO World Heritage Sites in London. The relationship between the Tower of London and the city in the background is a very sensitive point that should not harm the appreciation of the Outstanding Universal Value of the World heritage Site. In order to conserve the cultural heritage and to protect the skyline of the four towers of the White Tower some visual separation should be obtained between the upper parts of the White Tower and the tall buildings in the background.

Figure 6:WHS in London

The free sky space around the White Tower enhances the value of its visual dominance and where this space has been compromised then the visual appearance has been depreciated. Some prominent tall buildings of the late20th and early 21st centuries and earlier periods such as spires of city churches are rising behind the tower(Konuk, G. 2008).

[4] The centrepiece is the 11th century White Tower - "white" because of its massive whitewashed walls.

 Copyright © International Science and Technology Conference (ISTEC)

Figure 7. Tower of London

In 1991 to protect the strategic views the Secretary of State for the Environment determined Protected Vistas and directions with planning guidance. However, in 2007, the Government's Strategic Views protection was devolved on the Mayor of London and in this year narrow-scoped Mayor's London View Management Framework (LVMF) was published which has been revised and significantly widened in 2010. Although new regulations implemented to protect the perspectives and views of historic monuments in 2007, it failed to ease tensions between different actors (Appert 2015). The London Plan 2011 and the City of London Local Plan are the planning policies that manage the construction of high rise buildings in the city. Conservation areas and also the areas where would adversely affect the protected views are considered as inappropriate areas for the construction of high rise buildings. These determined protected views are 'protected views of St Paul's Cathedral', 'the Tower of London' and 'Views from the Monument'

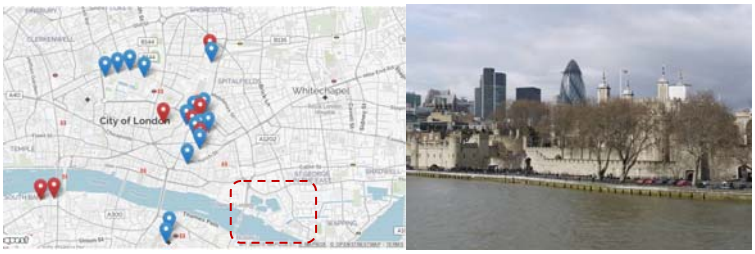

Figure 8: Buildings 100 m+ completed/under construction around Tower Of London

64 percent of tall buildings in London have office functions, 20 percent have residential and the rest have mixed-use function. There are 49 high rise buildings taller than 100 m and 16 of them are taller than 150 m. The tallest completed building in London is the Shard (2013) with 306 m height. (CTBUH)
Tall buildings are permitted to be proposed on suitable sites only if they have potential effect on (city of London):

- *the City skyline*
- *character and amenity of their surroundings including their relationship with existing tall buildings*
- *significance of heritage assets and their setting*
- *effect on historic skyline features*

Figure 9: The LVMF protected vistas map

 Copyright © International Science and Technology Conference (ISTEC)

CONCLUSION

Each city has its own unique dynamics of urbanization and those dynamics differ depending on the cultural, political, economical and geographical position of the country that the city belongs to. Cities, which can only be analyzed and understood by interdisciplinary study, are growing and developing constantly day by day and this is also valid for historic cities. Building a high rise building in a historical setting has a direct effect on the surrounding heritage and unfortunately there are many examples of unsightly designed, improperly settled buildings which have visually adverse impact over a wide neighborhood. High rise buildings which are an indispensable part of our cities will continue to exist in the future due to certain reasons such as evolving and changing social needs, rapid urbanization and population growth. These building types have the potential to create a powerful image in the context of urban memory, even the potential to change the climate of the region. Technically, architecturally, socially and spatially their impact on the environment is quite strong. Where should they fit in a city and their relation to existing heritage and their height should be clearly determined by needed planning guidance with the participation of different stakeholders. Every new proposed high rise building in a historic city should have a good architectural quality and bring a sustainable approach and not destruct the Visual character and Urban life quality of the city. These type of buildings should be more urban and as well as respectful to a historic city as its impact on public space and the skyline[5] is distinctive due to its scale and density. In the historical process different urban policies, political decisions, global actors and economic systems influenced decision-making mechanism. Regarding urban interventions which are produced by legal policies change the urban image and shaped the historic cities as analyzed in case cities above. The Urban identity of a city is determined by its own idiosyncratic features that are its geography, socio-cultural values of the community and the architectural production therefore each city has its own story.

Historic cities with World Heritage Sites have more exclusive place among world cities while they have common value for all humanity with Outstanding Universal Value. Any proposed building in a historic city has to consider the existing skyline and should not harm the views and the major landmarks of the city. These assessments have to be done by digital analysis methods to understand the effects of those buildings on the context and the silhouette. Not only conservation of the cultural and historical heritage of the city has to be considered but also the fulfillment of the needs of a living and dynamic city has to be taken into the consideration. A sensitive balance has to be obtained between both phenomenon as high rise buildings have the potential to create a powerful and positive image in the context of collective urban memory, and may become the elements which enrich the urban texture. Urban identity is dependent on meeting the needs of the present with the preservation of the past.
